The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

## GEAR RATIOS The 42RE gear ratios are:

| | |
|---|---|
| **1st** | 2.74:1 |
| **2nd** | 1.54:1 |
| **3rd** | 1.00:1 |
| **4th** | 0.69:1 |
| **Rev.** | 2.21:1 |

## OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 42RE (Continued)

### PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

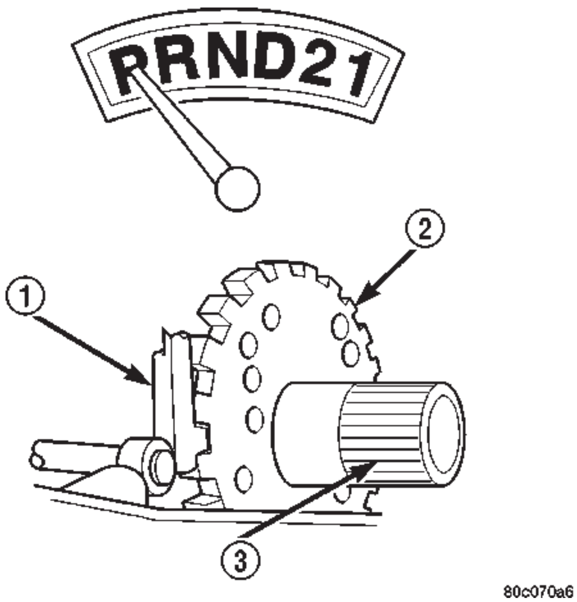

***Fig. 3 Park Powerflow***

1 - PAWL ENGAGED FOR PARK
2 - PARK SPRAG
3 - OUTPUT SHAFT

### NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

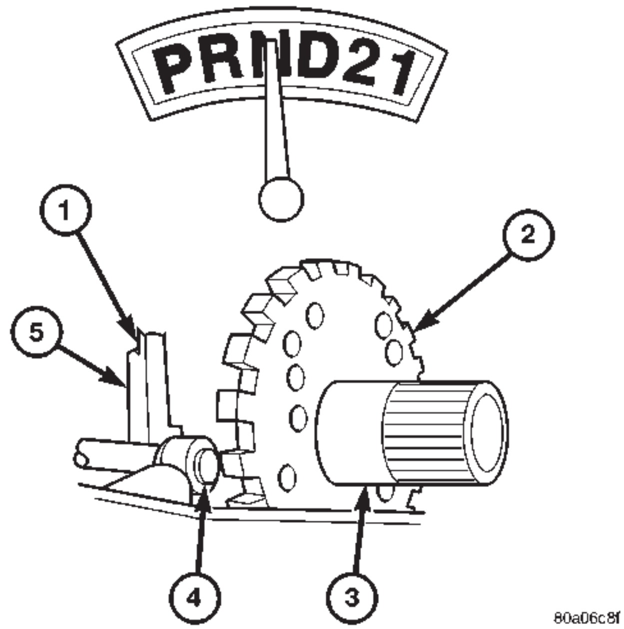

***Fig. 4 Neutral Powerflow***

1 - PAWL DISENGAGED FOR NEUTRAL
2 - PARK SPRAG
3 - OUTPUT SHAFT
4 - CAM
5 - PAWL

AUTOMATIC TRANSMISSION - 42RE (Continued)

## REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

AUTOMATIC TRANSMISSION - 42RE (Continued)

## FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

AUTOMATIC TRANSMISSION - 42RE (Continued)

## SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed. Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

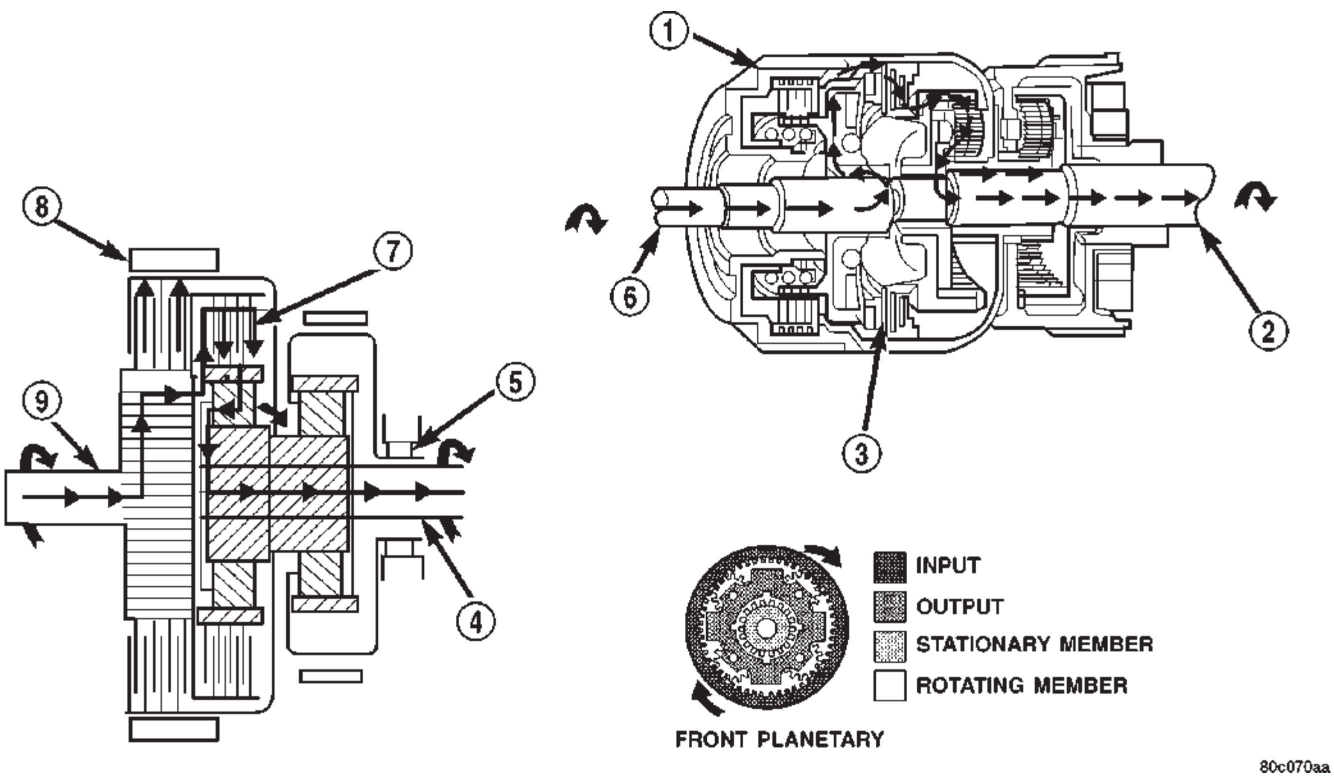

*Fig. 7 Second Gear Powerflow*

4 - OUTPUT SHAFT
5 - OVER-RUNNING CLUTCH FREE-WHEELING
6 - INPUT SHAFT
7 - REAR CLUTCH APPLIED
8 - KICKDOWN BAND APPLIED
9 - INPUT SHAFT

## DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

## FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

## DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

## DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

### VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB® scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform hydraulic pressure test if shift problems were noted during road test.

(6) Perform air-pressure test to check clutch-band operation.

### VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

- (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
- (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.
- (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

## DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 42RE (Continued)

**CLUTCH AND BAND APPLICATION CHART**

| SHIFT LEVER POSITION | TRANSMISSION CLUTCHES AND BANDS | | | | | OVERDRIVE CLUTCHES | | |
|---|---|---|---|---|---|---|---|---|
| | FRONT CLUTCH | FRONT BAND | REAR CLUTCH | REAR BAND | OVER-RUNNING CLUTCH | OVER-DRIVE CLUTCH | DIRECT CLUTCH | OVER-RUNNING CLUTCH |
| Reverse | X | | | X | | | X | |
| Drive - First | | | X | | X | | X | X |
| Drive - Second | | X | X | | | | X | X |
| Drive - Third | X | | X | | | | X | X |
| Drive - Fourth | X | | X | | | X | | |
| Manual Second | | X | X | | X | | X | X |
| Manual First | | | X | X | X | | X | X |

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

## DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

AUTOMATIC TRANSMISSION - 42RE (Continued)

### Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

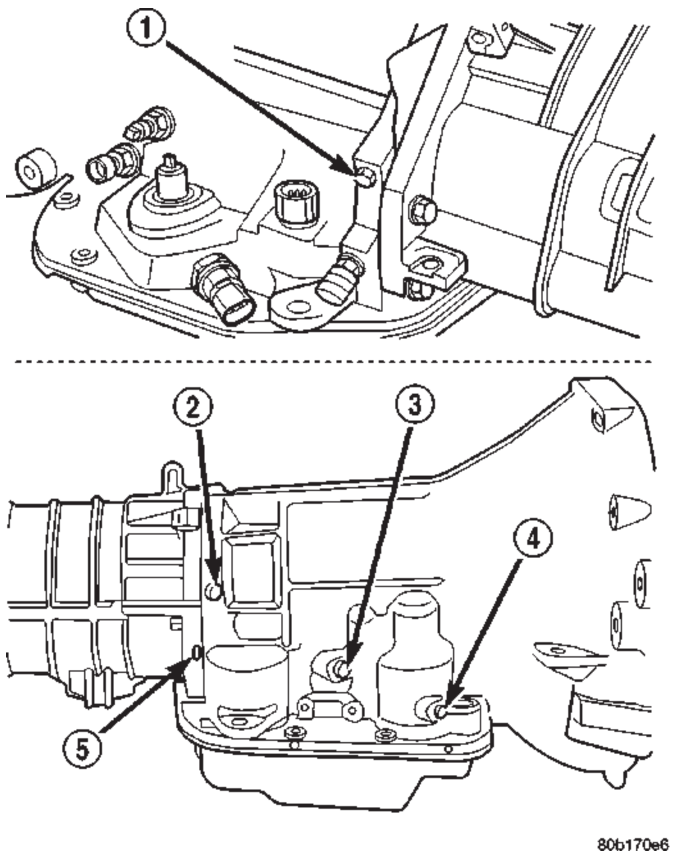

*Fig. 9 Pressure Test Port Locations*

1 - OVERDRIVE CLUTCH TEST PORT
2 - GOVERNOR TEST PORT
3 - ACCUMULATOR TEST PORT
4 - FRONT SERVO TEST PORT
5 - REAR SERVO TEST PORT

#### Test One - Transmission In Manual Low

**NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.**

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

#### Test Two - Transmission In 2 Range

**NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.**

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

#### Test Three - Transmission In D Range Third Gear

**NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.**

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle

AUTOMATIC TRANSMISSION - 42RE (Continued)

lever forward and increase as lever is moved rearward.

• Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

#### Test Four - Transmission In Reverse

**NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.**

(1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.

(2) Move 300 psi Gauge C-3293-SP back to rear servo port.

(3) Have helper start and run engine at 1600 rpm for test.

(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.

(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.

(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

#### Test Five - Governor Pressure

**NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.**

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

• Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

• If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

#### Test Six - Transmission In Overdrive Fourth Gear

**NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.**

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

AUTOMATIC TRANSMISSION - 42RE (Continued)

*PRESSURE TEST ANALYSIS CHART*

| TEST CONDITION | INDICATION |
|---|---|
| Line pressure OK during any one test | Pump and regulator valve OK |
| Line pressure OK in R but low in D, 2, 1 | Leakage in rear clutch area (seal rings, clutch seals) |
| Pressure low in D Fourth Gear Range | Overdrive clutch piston seal, or check ball problem |
| Pressure OK in 1, 2 but low in D3 and R | Leakage in front clutch area |
| Pressure OK in 2 but low in R and 1 | Leakage in rear servo |
| Front servo pressure in 2 | Leakage in servo; broken servo ring or cracked servo piston |
| Pressure low in all positions | Clogged filter, stuck regulator valve, worn or faulty pump, low oil level |
| Governor pressure too high at idle speed | Governor pressure solenoid valve system fault. Refer to diagnostic book. |
| Governor pressure low at all mph figures | Faulty governor pressure solenoid, transmission control module, or governor pressure sensor |
| Lubrication pressure low at all throttle positions | Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter. |
| Line pressure high | Output shaft plugged, sticky regulator valve |
| Line pressure low | Sticky regulator valve, clogged filter, worn pump |

## DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

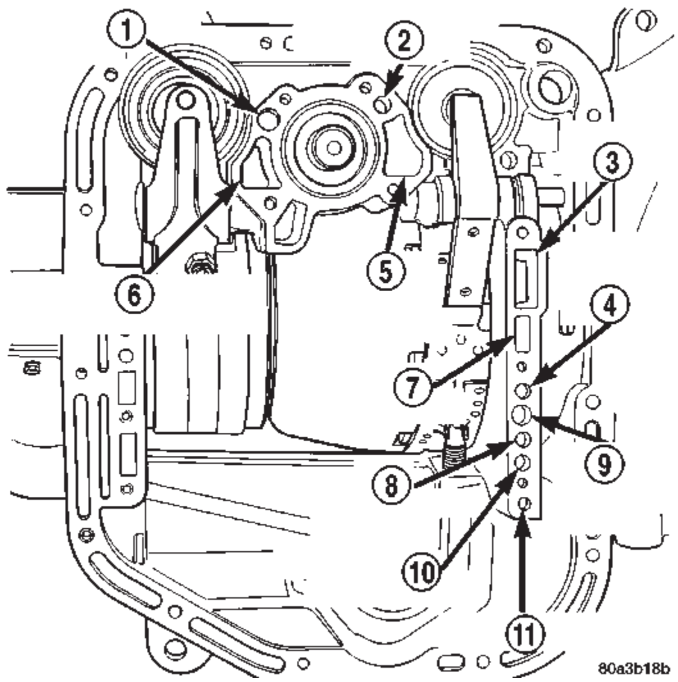

**Fig. 10 Air Pressure Test Passages**

1 - REAR SERVO APPLY
2 - FRONT SERVO APPLY
3 - PUMP SUCTION
4 - FRONT CLUTCH APPLY
5 - FRONT SERVO RELEASE
6 - LINE PRESSURE TO ACCUMULATOR
7 - PUMP PRESSURE
8 - TO CONVERTER
9 - REAR CLUTCH APPLY
10 - FROM CONVERTER
11 - TO COOLER

### Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage.

AUTOMATIC TRANSMISSION - 42RE (Continued)

Piston movement can be felt and a soft thump heard as the clutch applies.

### Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

### Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

## DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

(1) Verify that a leak condition actually exists.

(2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

### TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

(1) Leaks at the weld joint around the outside diameter weld (Fig. 12).

(2) Leaks at the converter hub weld (Fig. 12).

### CONVERTER HOUSING AREA LEAK CORRECTION

(1) Remove converter.

(2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.

(3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

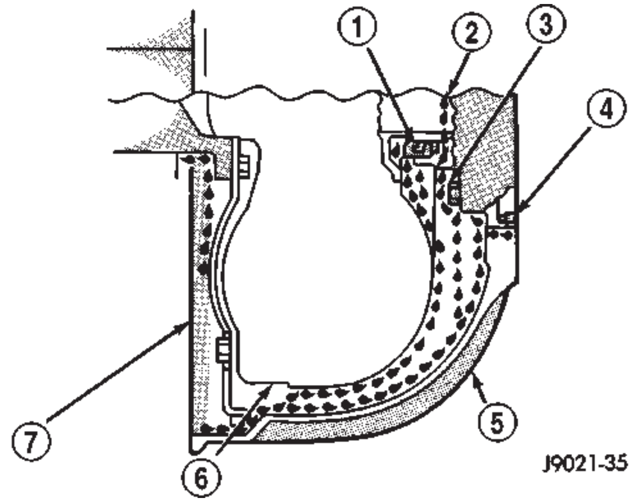

*Fig. 11 Converter Housing Leak Paths*

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

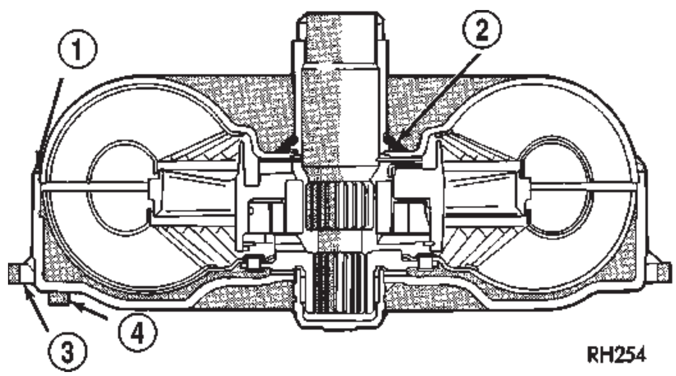

*Fig. 12 Converter Leak Points - Typical*

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to

AUTOMATIC TRANSMISSION - 42RE (Continued)

plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

## DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

**DIAGNOSIS CHARTS**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Add Fluid |
| | 2. Throttle Linkage Mis-adjusted. | 2. Adjust linkage - setting may be too long. |
| | 3. Mount and Driveline Bolts Loose. | 3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts. |
| | 4. U-Joint Worn/Broken. | 4. Remove propeller shaft and replace U-Joint. |
| | 5. Axle Backlash Incorrect. | 5. Check per Service Manual. Correct as needed. |
| | 6. Hydraulic Pressure Incorrect. | 6. Check pressure. Remove, overhaul or adjust valve body as needed. |
| | 7. Band Mis-adjusted. | 7. Adjust rear band. |
| | 8. Valve Body Check Balls Missing. | 8. Inspect valve body for proper check ball installation. |
| | 9. Axle Pinion Flange Loose. | 9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged. |
| | 10. Clutch, band or planetary component damaged. | 10. Remove, disassemble and repair transmission as necessary. |
| | 11. Converter Clutch Faulty. | 11. Replace converter and flush cooler and line before installing new converter. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Correct level and check for leaks. |
| | 2. Filter Clogged. | 2. Change filter. |
| | 3. Gearshift Linkage Mis-adjusted. | 3. Adjust linkage and repair linkage if worn or damaged. |
| | 4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump). | 4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house. |
| | 5. Rear Band Mis-adjusted. | 5. Adjust band. |
| | 6. Valve Body Filter Plugged. | 6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary. |
| | 7. Oil Pump Gears Worn/Damaged. | 7. Remove transmission and replace oil pump. |
| | 8. Governor Circuit and Solenoid Valve Electrical Fault. | 8. Test with DRB® scan tool and repair as required. |
| | 9. Hydraulic Pressure Incorrect. | 9. Perform pressure test, remove transmission and repair as needed. |
| | 10. Reaction Shaft Seal Rings Worn/Broken. | 10. Remove transmission, remove oil pump and replace seal rings. |
| | 11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged. | 11. Remove and disassemble transmission and repair as necessary. |
| | 12. Regulator Valve Stuck. | 12. Clean. |
| | 13. Cooler Plugged. | 13. Transfer case failure can plug cooler. |
| NO DRIVE RANGE (REVERSE OK) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Repair or replace linkage components. |
| | 3. Rear Clutch Burnt. | 3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed. |
| | 4. Valve Body Malfunction. | 4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged. |
| | 5. Transmission Overrunning Clutch Broken. | 5. Remove and disassemble transmission. Replace overrunning clutch. |
| | 6. Input Shaft Seal Rings Worn/ Damaged. | 6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts. |
| | 7. Front Planetary Failed Broken. | 7. Remove and repair. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts. |
| | 3. U-Joint/Axle/Transfer Case Broken. | 3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section. |
| | 4. Filter Plugged. | 4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary. |
| | 5. Oil Pump Damaged. | 5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary. |
| | 6. Valve Body Malfunctioned. | 6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition. |
| | 7. Transmission Internal Component Damaged. | 7. Remove and disassemble transmission. Repair or replace failed components as needed. |
| | 8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck. | 8. Remove, disassemble, repair. |
| | 9. Torque Converter Damage. | 9. Inspect and replace as required. |
| SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES) | 1. Fluid Level Low/High. | 1. Correct fluid level and check for leaks if low. |
| | 2. Fluid Filter Clogged. | 2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage as described in service section. |
| | 4. Throttle Linkage Binding. | 4. Check cable for binding. Check for return to closed throttle at transmission. |
| | 5. Gearshift Linkage/Cable Mis-adjusted. | 5. Adjust linkage/cable as described in service section. |
| | 6. Clutch or Servo Failure. | 6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed. |
| | 7. Governor Circuit Electrical Fault. | 7. Test using DRB® scan tool and repair as required. |
| | 8. Front Band Mis-adjusted. | 8. Adjust band. |
| | 9. Pump Suction Passage Leak. | 9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO REVERSE (D RANGES OK) | 1. Gearshift Linkage/Cable Mis-adjusted/Damaged. | 1. Repair or replace linkage parts as needed. |
| | 2. Park Sprag Sticking. | 2. Replace overdrive annulus gear. |
| | 3. Rear Band Mis-adjusted/Worn. | 3. Adjust band; replace. |
| | 4. Valve Body Malfunction. | 4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged. |
| | 5. Rear Servo Malfunction. | 5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary. |
| | 6. Direct Clutch in Overdrive Worn. | 6. Disassemble overdrive. Replace worn or damaged parts. |
| | 7. Front Clutch Burnt. | 7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required. |
| HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT) | 1. Governor Circuit Electrical Fault. | 1. Test using DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Repair stuck 1-2 shift valve or governor plug. |
| | 3. Front Servo/Kickdown Band Damaged/Burned. | 3. Repair/replace. |
| MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW | 1. Valve Body Malfunction. | 1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug. |
| NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY) | 1. Governor Circuit Electrical Fault. | 1. Test with DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs. |
| | 3. Front Servo Piston Cocked in Bore. | 3. Inspect servo and repair as required. |
| | 4. Front Band Linkage Malfunction | 4. Inspect linkage and look for bind in linkage. |
| NO KICKDOWN OR NORMAL DOWNSHIFT | 1. Throttle Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Accelerator Pedal Travel Restricted. | 2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets. |
| | 3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments. | 3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |
| | 4. Governor Circuit Electrical Fault. | 4. Test with DRB® scan tool and repair as required. |
| | 5. Valve Body Malfunction. | 5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 6. TPS Malfunction. | 6. Replace sensor, check with DRB® scan tool. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if required. |
| | 8. Valve Body Malfunction. | 8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve. |
| STUCK IN LOW GEAR (WILL NOT UPSHIFT) | 1. Throttle Linkage Mis-adjusted/ Stuck. | 1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage and repair linkage if worn or damaged. |
| | 3. Governor Component Electrical Fault. | 3. Check operating pressures and test with DRB® scan tool, repair faulty component. |
| | 4. Front Band Out of Adjustment. | 4. Adjust Band. |
| | 5. Clutch or Servo Malfunction. | 5. Air pressure check operation of clutches and bands. Repair faulty component. |
| CREEPS IN NEUTRAL | 1. Gearshift Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Rear Clutch Dragging/Warped. | 2. Disassemble and repair. |
| | 3. Valve Body Malfunction. | 3. Perform hydraulic pressure test to determine cause and repair as required. |
| BUZZING NOISE | 1. Fluid Level Low | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Mis-assembled. | 2. Route cable away from engine and bell housing. |
| | 3. Valve Body Mis-assembled. | 3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws. |
| | 4. Pump Passages Leaking. | 4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts. |
| | 5. Cooling System Cooler Plugged. | 5. Flow check cooler circuit. Repair as needed. |
| | 6. Overrunning Clutch Damaged. | 6. Replace clutch. |
| SLIPS IN REVERSE ONLY | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage. |
| | 3. Rear Band Mis-adjusted. | 3. Adjust band. |
| | 4. Rear Band Worn. | 4. Replace as required. |
| | 5. Overdrive Direct Clutch Worn. | 5. Disassemble overdrive. Repair as needed. |
| | 6. Hydraulic Pressure Too Low. | 6. Perform hydraulic pressure tests to determine cause. |
| | 7. Rear Servo Leaking. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Band Linkage Binding. | 8. Inspect and repair as required. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN FORWARD DRIVE RANGES | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Fluid Foaming. | 2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage. |
| | 4. Gearshift Linkage Mis-adjusted. | 4. Adjust linkage. |
| | 5. Rear Clutch Worn. | 5. Inspect and replace as needed. |
| | 6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines. | 6. Perform hydraulic and air pressure tests to determine cause. |
| | 7. Rear Clutch Malfunction, Leaking Seals or Worn Plates. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only). | 8. Replace Clutch. |
| SLIPS IN LOW GEAR ″D″ ONLY, BUT NOT IN MANUAL 1 POSITION | Overrunning Clutch Faulty. | Replace overrunning clutch. |
| GROWLING, GRATING OR SCRAPING NOISES | 1. Drive Plate Broken. | 1. Replace. |
| | 2. Torque Converter Bolts Hitting Dust Shield. | 2. Dust shield bent. Replace or repair. |
| | 3. Planetary Gear Set Broken/ Seized. | 3. Check for debris in oil pan and repair as required. |
| | 4. Overrunning Clutch Worn/Broken. | 4. Inspect and check for debris in oil pan. Repair as required. |
| | 5. Oil Pump Components Scored/ Binding. | 5. Remove, inspect and repair as required. |
| | 6. Output Shaft Bearing or Bushing Damaged. | 6. Remove, inspect and repair as required. |
| | 7. Clutch Operation Faulty. | 7. Perform air pressure check and repair as required. |
| | 8. Front and Rear Bands Mis-adjusted. | 8. Adjust bands. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| DRAGS OR LOCKS UP | 1. Fluid Level Low. | 1. Check and adjust level. |
| | 2. Clutch Dragging/Failed | 2. Air pressure check clutch operation and repair as required. |
| | 3. Front or Rear Band Mis-adjusted. | 3. Adjust bands. |
| | 4. Case Leaks Internally. | 4. Check for leakage between passages in case. |
| | 5. Servo Band or Linkage Malfunction. | 5. Air pressure check servo operation and repair as required. |
| | 6. Overrunning Clutch Worn. | 6. Remove and inspect clutch. Repair as required. |
| | 7. Planetary Gears Broken. | 7. Remove, inspect and repair as required (look for debris in oil pan). |
| | 8. Converter Clutch Dragging. | 8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required. |
| NO 4-3 DOWNSHIFT | 1. Circuit Wiring and/or Connectors Shorted. | 1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required. |
| | 2. PCM Malfunction. | 2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty. |
| | 3. TPS Malfunction | 3. Check TPS with DRB® scan tool at PCM. |
| | 4. Lockup Solenoid Not Venting. | 4. Remove valve body and replace solenoid assembly if plugged or shorted. |
| | 5. Overdrive Solenoid Not Venting. | 5. Remove valve body and replace solenoid if plugged or shorted. |
| | 6. Valve Body Valve Sticking. | 6. Repair stuck 3-4 shift valve or lockup timing valve. |
| NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF | 1. Control Switch Open/Shorted. | 1. Test and replace switch if faulty. |
| | 2. Overdrive Solenoid Connector Shorted. | 2. Test solenoids and replace if seized or shorted. |
| | 3. PCM Malfunction. | 3. Test with DRB® scan tool. Replace PCM if faulty. |
| | 4. Valve Body Stuck Valves. | 4. Repair stuck 3-4, lockup or lockup timing valve. |
| CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT | 1. Transmission Fluid Low. | 1. Add Fluid. |
| | 2. Throttle Cable Mis-adjusted. | 2. Adjust cable. |
| | 3. Overdrive Clutch Select Spacer Wrong Spacer. | 3. Replace overdrive piston thrust plate spacer. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| 3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT | 1. Overdrive Solenoid Connector or Wiring Shorted. | 1. Test connector and wiring for loose connections, shorts or ground and repair as needed. |
| | 2. TPS Malfunction. | 2. Test TPS and replace as necessary. Check with DRB® scan tool. |
| | 3. PCM Malfunction. | 3. Test PCM with DRB® scan tool and replace controller if faulty. |
| | 4. Overdrive Solenoid Malfunction. | 4. Replace solenoid. |
| | 5. Valve Body Malfunction. | 5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed. |
| WHINE/NOISE RELATED TO ENGINE SPEED | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Incorrect Routing. | 2. Check shift cable for correct routing. Should not touch engine or bell housing. |
| NO 3-4 UPSHIFT | 1. O/D Switch In OFF Position. | 1. Turn control switch to ON position. |
| | 2. Overdrive Circuit Fuse Blown. | 2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit). |
| | 3. O/D Switch Wire Shorted/Open Cut. | 3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary. |
| | 4. Distance or Coolant Sensor Malfunction. | 4. Check with DRB® scan tool and repair or replace as necessary. |
| | 5. TPS Malfunction. | 5. Check with DRB® scan tool and replace if necessary. |
| | 6. Neutral Sense to PCM Wire Shorted/Cut. | 6. Test switch/sensor as described in service section and replace if necessary. Engine no start. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if necessary. |
| | 8. Overdrive Solenoid Shorted/Open. | 8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool). |
| | 9. Solenoid Feed Orifice in Valve Body Blocked. | 9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice. |
| | 10. Overdrive Clutch Failed. | 10. Disassemble overdrive and repair as needed. |
| | 11. Hydraulic Pressure Low. | 11. Pressure test transmission to determine cause. |
| | 12. Valve Body Valve Stuck. | 12. Repair stuck 3-4 shift valve, 3-4 timing valve. |
| | 13. O/D Piston Incorrect Spacer. | 13. Remove unit, check end play and install correct spacer. |
| | 14. Overdrive Piston Seal Failure. | 14. Replace both seals. |
| | 15. O/D Check Valve/Orifice Failed. | 15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN OVERDRIVE FOURTH GEAR | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Overdrive Clutch Pack Worn. | 2. Remove overdrive unit and rebuild clutch pack. |
| | 3. Overdrive Piston Retainer Bleed Orifice Blown Out. | 3. Disassemble transmission, remove retainer and replace orifice. |
| | 4. Overdrive Piston or Seal Malfunction. | 4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission. |
| | 5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction. | 5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned. |
| | 6. Overdrive Unit Thrust Bearing Failure. | 6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft). |
| | 7. O/D Check Valve/Bleed Orifice Failure. | 7. Check for function/secure orifice insert in O/D piston retainer. |
| DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Throttle Valve Cable Mis-adjusted. | 2. Adjust throttle valve cable. |
| | 3. Overdrive Clutch Pack Worn/ Burnt. | 3. Remove unit and rebuild clutch pack. |
| | 4. TPS Faulty. | 4. Test with DRB® scan tool and replace as necessary |
| | 5. Overdrive Clutch Bleed Orifice Plugged. | 5. Disassemble transmission and replace orifice. |
| | 6. Overdrive Solenoid or Wiring Shorted/Open. | 6. Test solenoid and check wiring for loose/corroded connections or shorts/ grounds. Replace solenoid if faulty and repair wiring if necessary. |
| | 7. Overdrive Excess Clearance. | 7. Remove unit. Measure end play and select proper spacer. |
| | 8. O/D Check Valve Missing or Stuck. | 8. Check for presence of check valve. Repair or replace as required. |
| TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR | Lockup Solenoid, Relay or Wiring Shorted/Open. | Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary. |
| HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS | Lockup Solenoid Malfunction. | Remove valve body and replace solenoid assembly. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO START IN PARK OR NEUTRAL | 1. Gearshift Linkage/Cable Mis-adjusted. | 1. Adjust linkage/cable. |
| | 2. Neutral Sense Wire Open/Cut. | 2. Check continuity with test lamp. Repair as required. |
| | 3. Park/Neutral Switch, or Transmission Range Sensor Faulty. | 3. Refer to service section for test and replacement procedure. |
| | 4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty. | 4. Connectors spread open. Repair. |
| | 5. Valve Body Manual Lever Assembly Bent/Worn/Broken. | 5. Inspect lever assembly and replace if damaged. |
| NO REVERSE (OR SLIPS IN REVERSE) | 1. Direct Clutch Pack (front clutch) Worn. | 1. Disassemble unit and rebuild clutch pack. |
| | 2. Rear Band Mis-adjusted. | 2. Adjust band. |
| | 3. Front Clutch Malfunctioned/ Burned. | 3. Air-pressure test clutch operation. Remove and rebuild if necessary. |
| | 4. Overdrive Thrust Bearing Failure. | 4. Disassemble geartrain and replace bearings. |
| | 5. Direct Clutch Spring Collapsed/ Broken. | 5. Remove and disassemble unit. Check clutch position and replace spring. |
| OIL LEAKS. | 1. Fluid Lines and Fittings Loose/ Leaks/Damaged. | 1. Tighten fittings. If leaks persist, replace fittings and lines if necessary. |
| | 2. Fill Tube (where tube enters case) Leaks/Damaged. | 2. Replace tube seal. Inspect tube for cracks in fill tube. |
| | 3. Pressure Port Plug Loose Loose/Damaged. | 3. Tighten to correct torque. Replace plug or reseal if leak persists. |
| | 4. Pan Gasket Leaks. | 4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket. |
| | 5. Valve Body Manual Lever Shaft Seal Leaks/Worn. | 5. Replace shaft seal. |
| | 6. Rear Bearing Access Plate Leaks. | 6. Replace gasket. Tighten screws. |
| | 7. Gasket Damaged or Bolts are Loose. | 7. Replace bolts or gasket or tighten both. |
| | 8. Adapter/Extension Gasket Damaged Leaks/Damaged. | 8. Replace gasket. |
| | 9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged. | 9. Replace switch and gasket. |
| | 10. Converter Housing Area Leaks. | 10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug. |

AUTOMATIC TRANSMISSION - 42RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 11. Pump Seal Leaks/Worn/ Damaged. | 11. Replace seal. |
| | 12. Torque Converter Weld Leak/Cracked Hub. | 12. Replace converter. |
| | 13. Case Porosity Leaks. | 13. Replace case. |
| NOISY OPERATION IN FOURTH GEAR ONLY | 1. Overdrive Clutch Discs, Plates or Snap Rings Damaged. | 1. Remove unit and rebuild clutch pack. |
| | 2. Overdrive Piston or Planetary Thrust Bearing Damaged. | 2. Remove and disassemble unit. Replace either thrust bearing if damaged. |
| | 3. Output Shaft Bearings Scored/ Damaged. | 3. Remove and disassemble unit. Replace either bearing if damaged. |
| | 4. Planetary Gears Worn/Chipped. | 4. Remove and overhaul overdrive unit. |
| | 5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored. | 5. Remove and overhaul overdrive unit. |

## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

## REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

(1) Disconnect battery negative cable.

(2) Disconnect and lower or remove necessary exhaust components.

(3) Remove engine-to-transmission struts, if equipped (Fig. 13).

(4) Disconnect fluid cooler lines at transmission.

(5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)

(6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.

(7) Remove torque converter access cover.

(8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

(9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

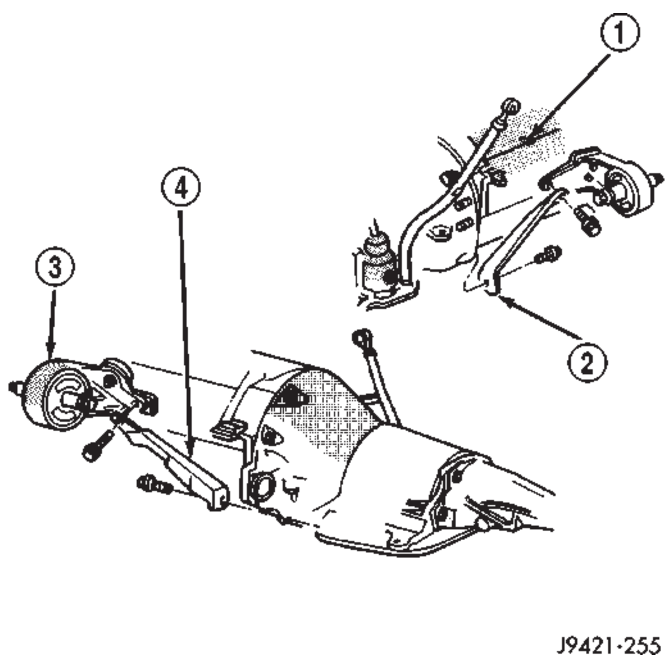

*Fig. 13 Transmission-To-Engine Strut Attachment*

1 - ENGINE BLOCK
2 - STRUT (PASSENGER SIDE)
3 - ENGINE MOUNT
4 - STRUT (DRIVER SIDE)

(10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIV-

AUTOMATIC TRANSMISSION - 42RE (Continued)

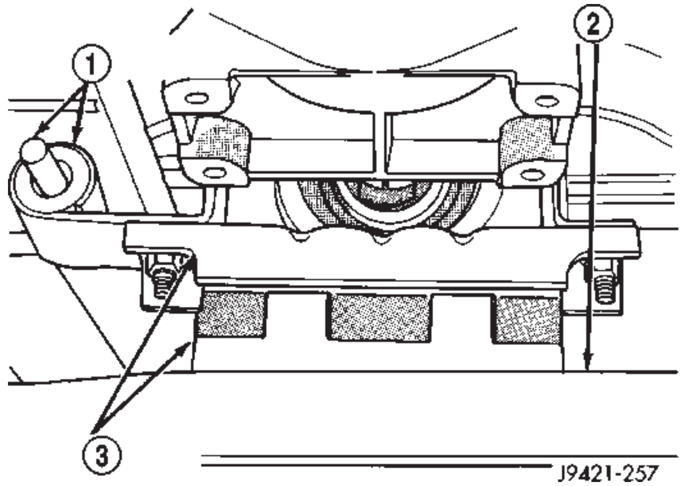

*Fig. 15 Rear Support Cushion*

1 - EXHAUST PIPE ARM AND BRACKET
2 - CROSSMEMBER
3 - REAR SUPPORT AND CUSHION

ELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(12) Disconnect wires from park/neutral position switch and transmission solenoid.

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

## DISASSEMBLY

(1) Clean transmission exterior with steam gun or with solvent. Wear eye protection during cleaning operations.

(2) Place transmission in a vertical position.

(3) Measure input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move the input shaft in and out. Record the maximum travel for assembly reference.

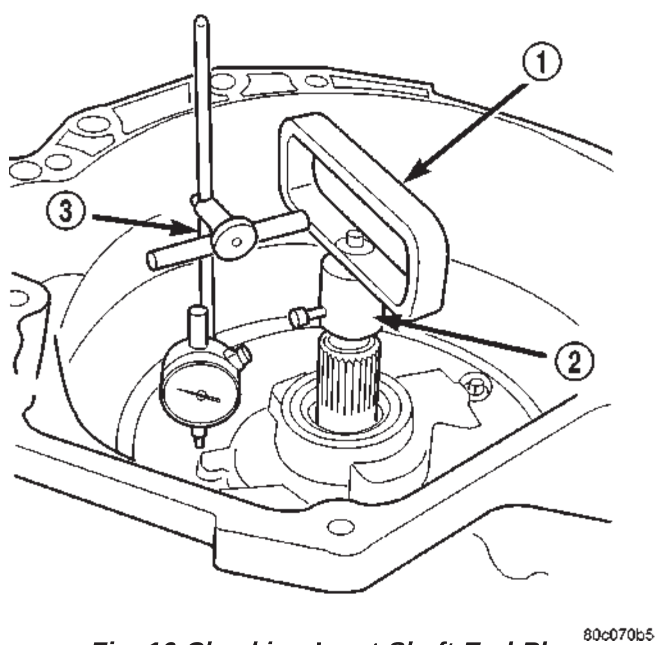

*Fig. 16 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-6
3 - TOOL C-3339

AUTOMATIC TRANSMISSION - 42RE (Continued)

(4) Remove shift and throttle levers from valve body manual lever shaft.

(5) Place transmission in horizontal position.

(6) Remove transmission oil pan and gasket.

(7) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

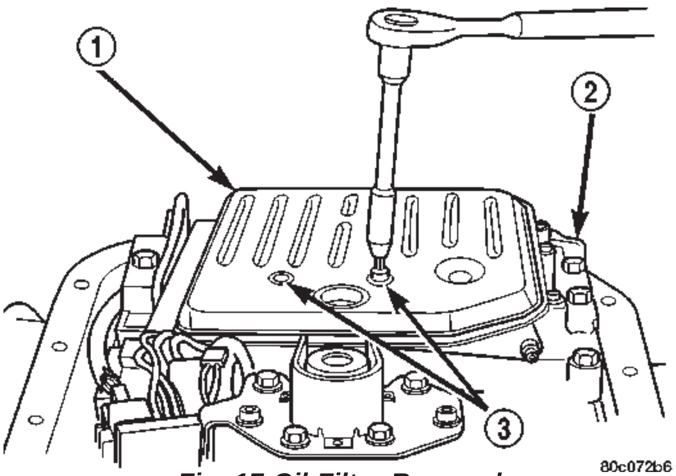

*Fig. 17 Oil Filter Removal*

1 - OIL FILTER
2 - VALVE BODY
3 - FILTER SCREWS (2)

(8) Remove park/neutral position switch.

(9) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

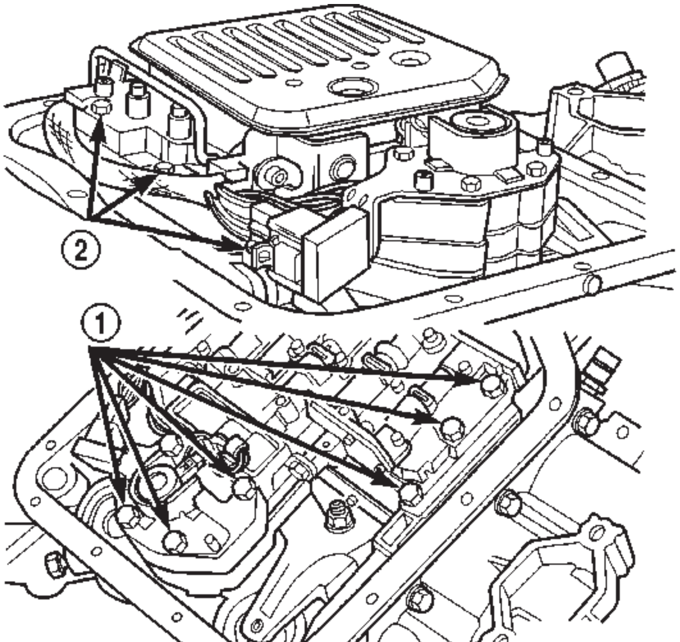

*Fig. 18 Valve Body Bolt Locations*

1 - VALVE BODY BOLTS
2 - VALVE BODY BOLTS

(10) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

(11) Remove accumulator piston and inner and outer springs (Fig. 20).

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

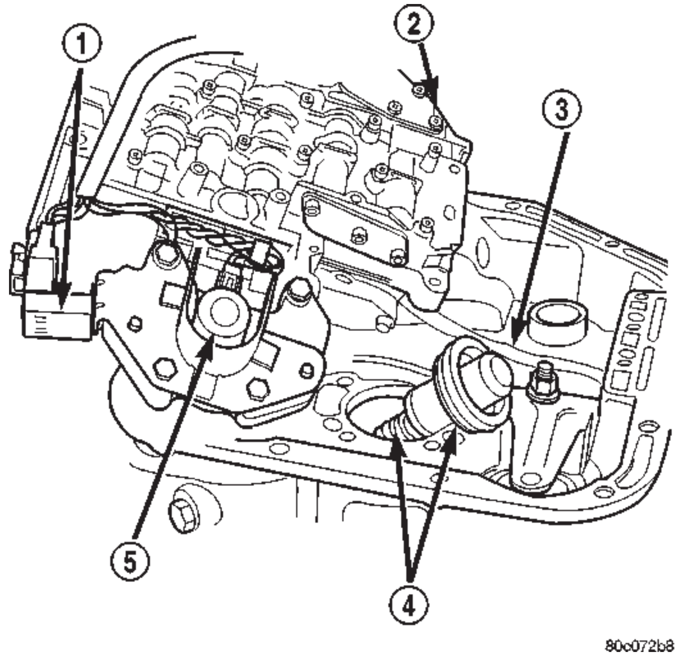

*Fig. 19 Valve Body Removal*

1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY
3 - PARK ROD
4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

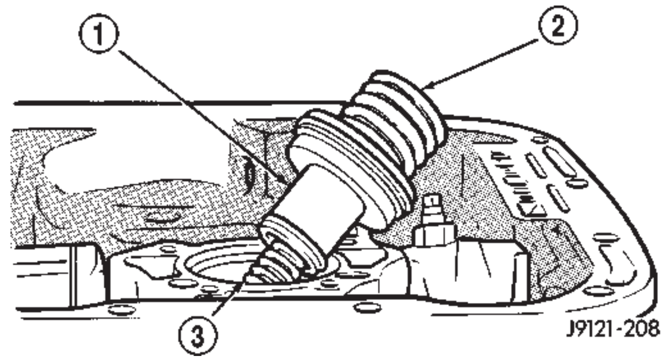

*Fig. 20 Accumulator Piston And Springs*

1 - ACCUMULATOR PISTON
2 - OUTER SPRING
3 - INNER SPRING

AUTOMATIC TRANSMISSION - 42RE (Continued)

(13) Loosen front band adjusting screw locknut 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 21).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 21).

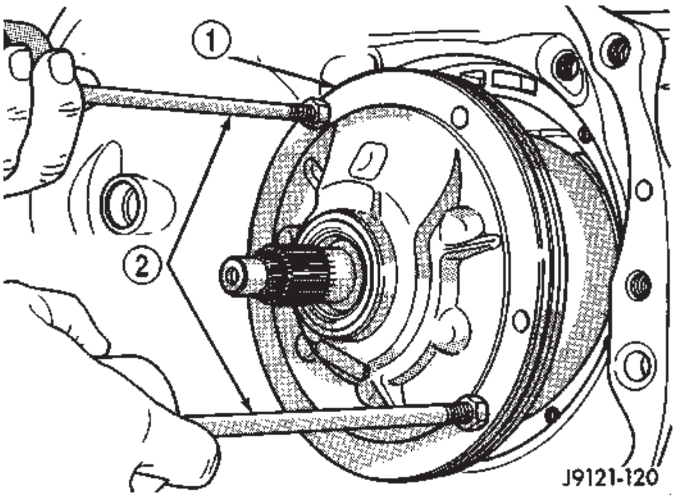

**Fig. 21 Removing Oil Pump And Reaction Shaft Support Assembly**

1 - OIL PUMP AND REACTION SHAFT SUPPORT ASSEMBLY
2 - SLIDE HAMMER TOOLS C-3752

(17) Loosen front band adjusting screw until band is completely loose.

(18) Squeeze front band together and remove band strut (Fig. 22).

(19) Remove front band lever (Fig. 23).

(20) Remove front band lever shaft plug, if necessary, from converter housing.

(21) Remove front band lever shaft.

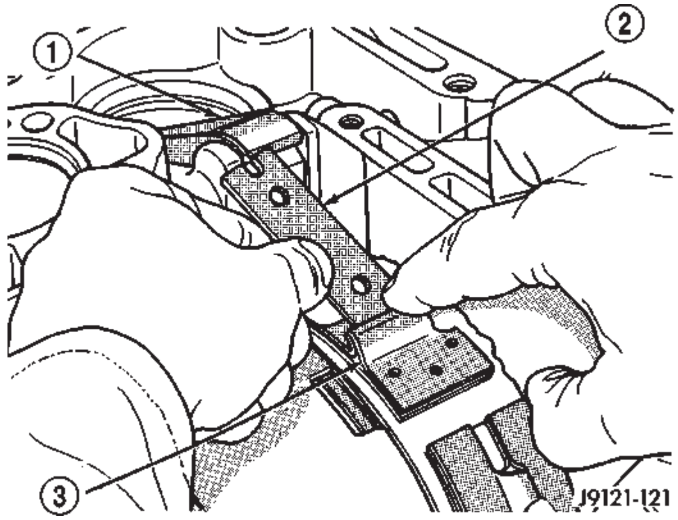

**Fig. 22 Removing Front Band Strut**

1 - BAND LEVER
2 - BAND STRUT
3 - FRONT BAND

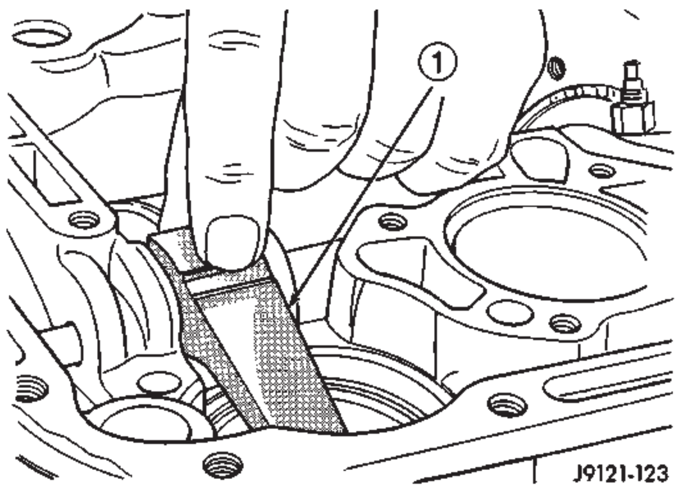

**Fig. 23 Removing Front Band Lever**

1 - FRONT BAND LEVER

AUTOMATIC TRANSMISSION - 42RE (Continued)

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 24).

(23) Lift front clutch off rear clutch (Fig. 25). Set clutch units aside for overhaul.

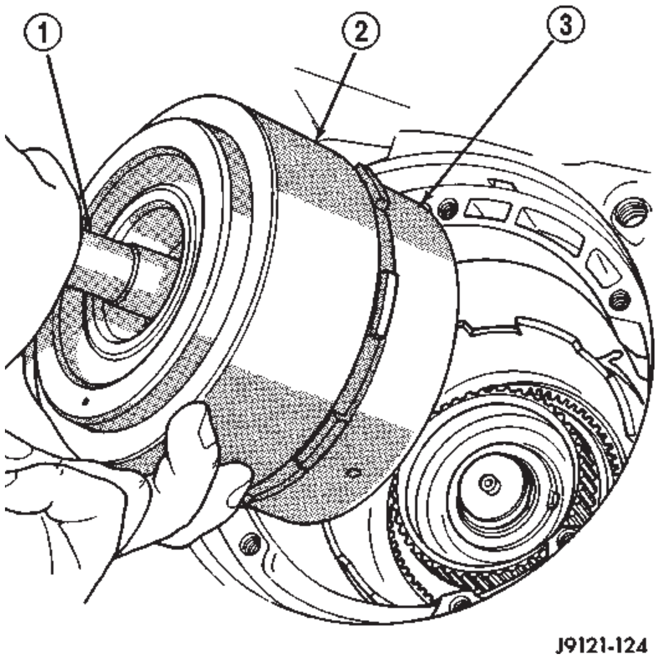

**Fig. 24 Removing Front/Rear Clutch Assemblies**

1 - INPUT SHAFT
2 - FRONT CLUTCH
3 - REAR CLUTCH

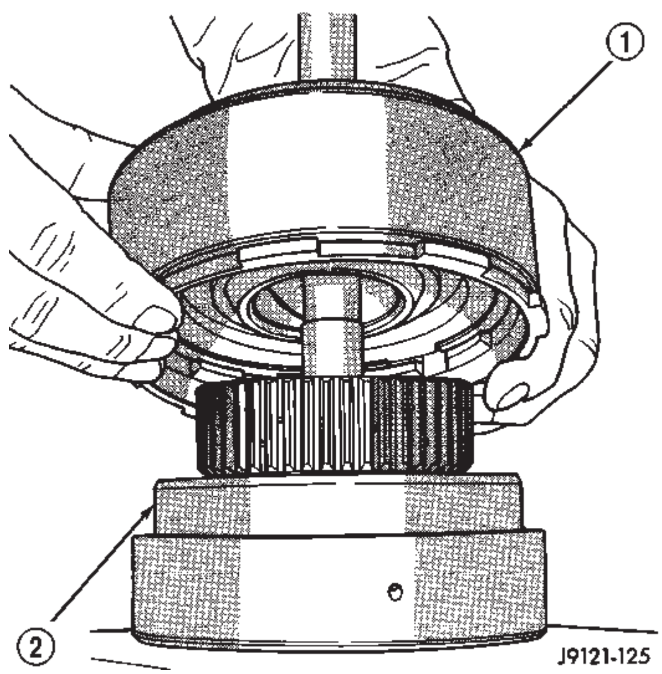

**Fig. 25 Separating Front/Rear Clutch Assemblies**

1 - FRONT CLUTCH
2 - REAR CLUTCH

(24) Remove intermediate shaft thrust washer from front end of shaft or from rear clutch hub (Fig. 26).

(25) Remove output shaft thrust plate from intermediate shaft hub (Fig. 27).

(26) Slide front band off driving shell (Fig. 28) and remove band from case.

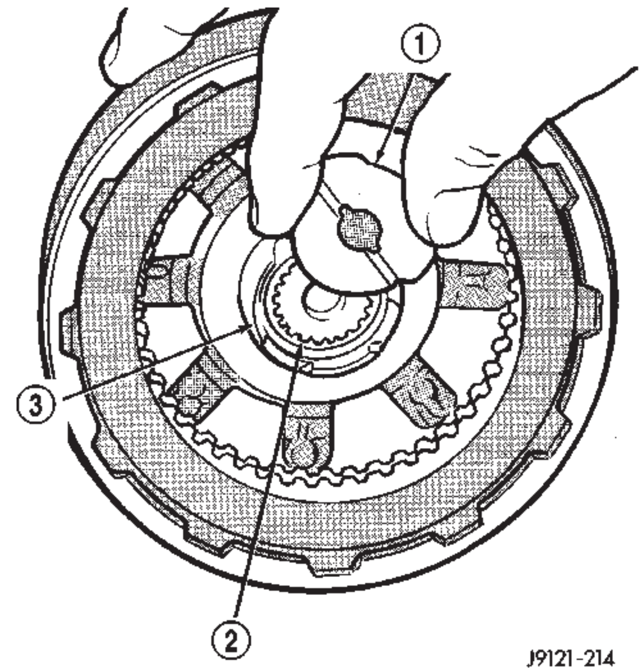

**Fig. 26 Removing Intermediate Shaft Thrust Washer**

1 - INTERMEDIATE SHAFT THRUST WASHER
2 - INPUT SHAFT
3 - REAR CLUTCH RETAINER HUB

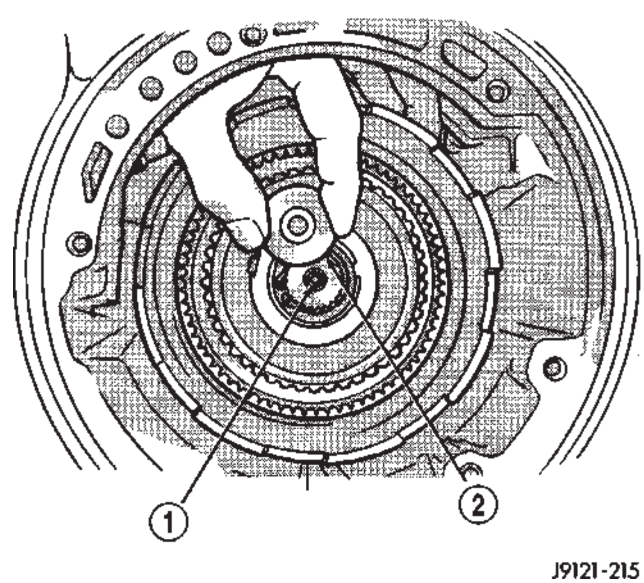

**Fig. 27 Removing Intermediate Shaft Thrust Plate**

1 - INTERMEDIATE SHAFT HUB
2 - INTERMEDIATE SHAFT THRUST PLATE

AUTOMATIC TRANSMISSION - 42RE (Continued)

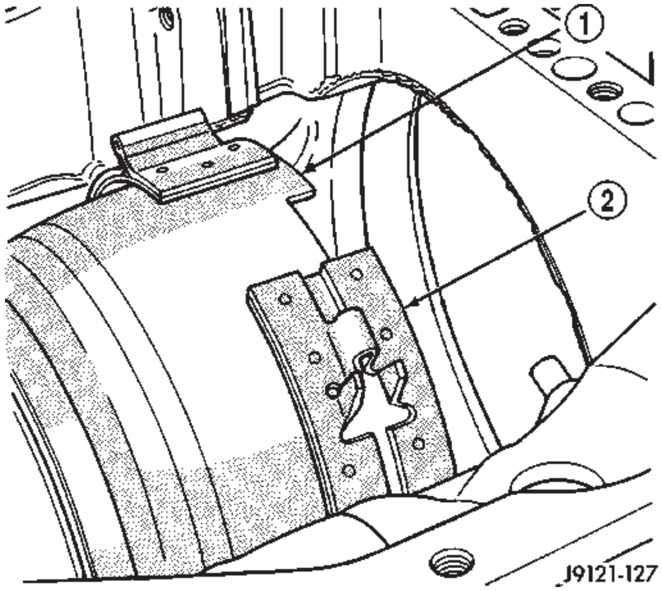

*Fig. 28 Front Band Removal*

1 - DRIVING SHELL
2 - FRONT BAND

(27) Remove planetary geartrain as assembly (Fig. 29). Support geartrain with both hands during removal. Do not allow machined surfaces on intermediate shaft or overdrive piston retainer to become nicked or scratched.

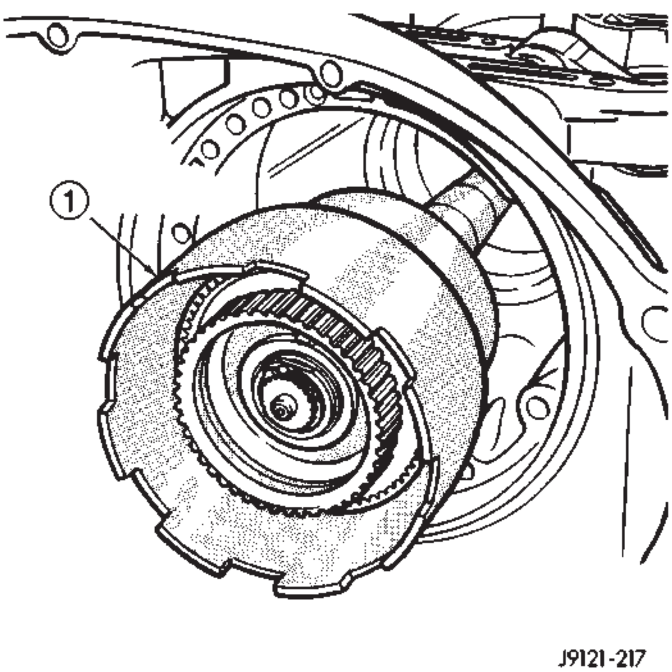

*Fig. 29 Removing Planetary Geartrain And Intermediate Shaft Assembly*

1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(28) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(29) Loosen rear band adjusting screw 4-5 turns.

(30) Remove low-reverse drum snap-ring (Fig. 30).

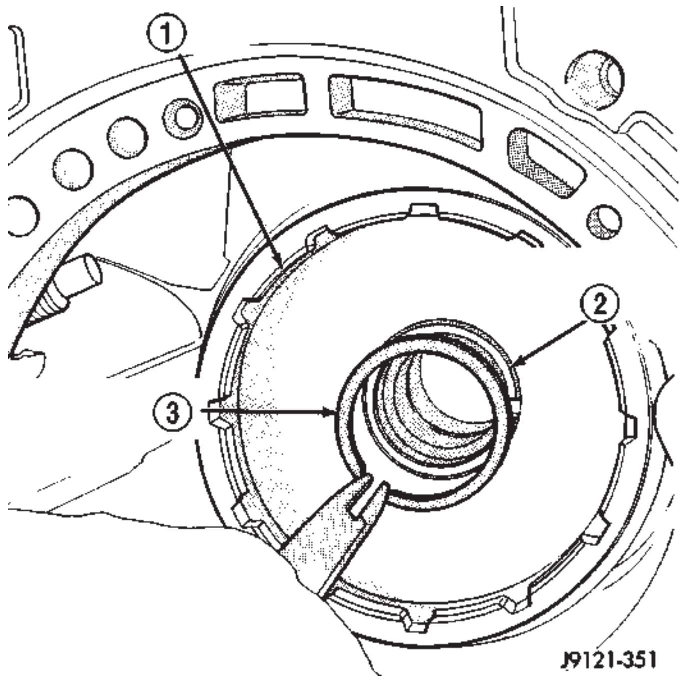

*Fig. 30 Removing Low-Reverse Drum Snap-Ring*

1 - LOW-REVERSE DRUM
2 - HUB OF OVERDRIVE PISTON RETAINER
3 - LOW-REVERSE DRUM SNAP-RING

(31) Remove low-reverse drum and reverse band.

(32) Remove overrunning clutch roller and spring assembly as a unit (Fig. 31).

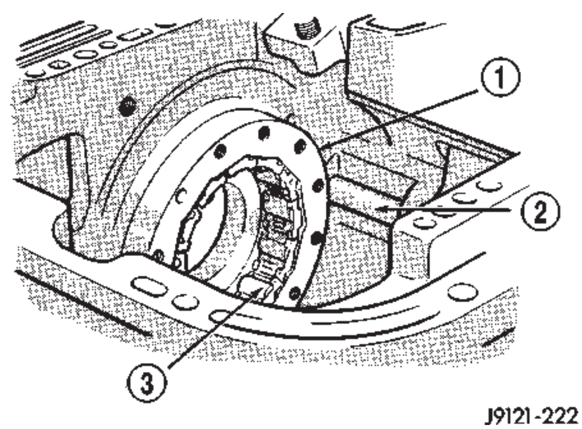

*Fig. 31 Overrunning Clutch Assembly Removal*

1 - OVERRUNNING CLUTCH CAM
2 - REAR BAND REACTION PIN
3 - OVERRUNNING CLUTCH ASSEMBLY

AUTOMATIC TRANSMISSION - 42RE (Continued)

(33) Compress front servo rod guide about 1/8 inch with Valve Spring Compressor C-3422-B (Fig. 32).

(34) Remove front servo rod guide snap-ring. Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.

(35) Remove compressor tools and remove front servo rod guide, spring and servo piston.

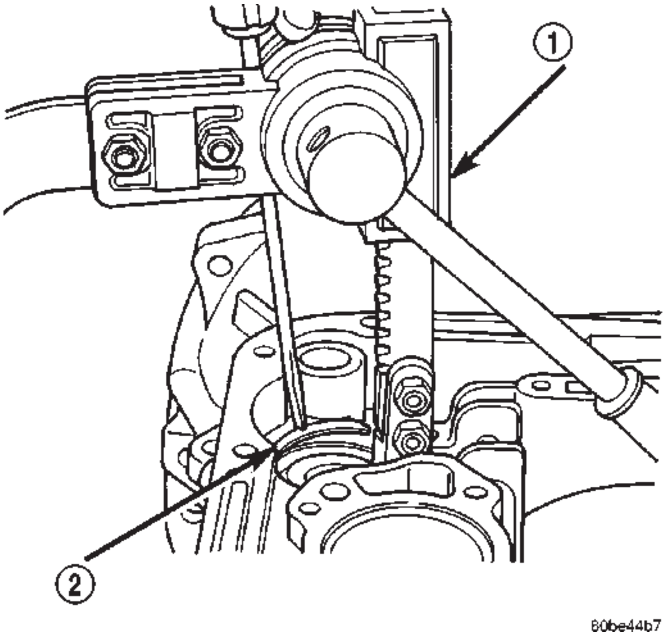

*Fig. 32 Compressing Front Servo Rod Guide*

1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP-RING

(36) Compress rear servo spring retainer about 1/16 inch with Valve Spring Compressor C-3422-B (Fig. 33).

(37) Remove rear servo spring retainer snap-ring. Then remove compressor tools and remove rear servo spring and piston.

(38) Inspect transmission components.

**NOTE: To Service the overrunning clutch cam or overdrive piston retainer, refer to the Overrunning Clutch Cam service procedure in this section.**

## CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

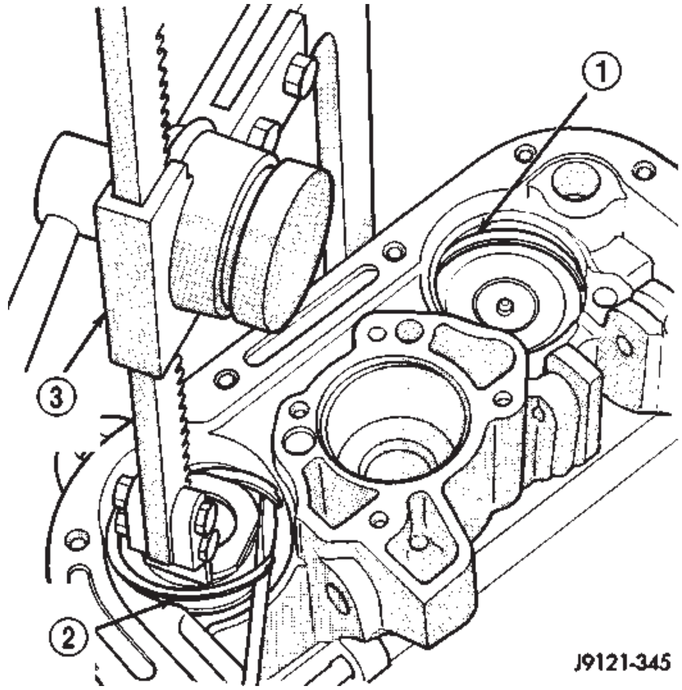

*Fig. 33 Compressing Rear Servo Spring*

1 - FRONT SERVO SNAP-RING
2 - REAR SERVO SNAP-RING
3 - SPECIAL TOOL

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

## INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and

AUTOMATIC TRANSMISSION - 42RE (Continued)

seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

## ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for assembly operations are equally clean.

Shop towels used for wiping off tools and hands must be made from **lint free** material. Lint will stick to transmission parts and could interfere with valve operation, or even restrict fluid passages.

Lubricate the transmission components with Mopar® transmission fluid during reassembly. Use Mopar® Door Ease, or Ru-Glyde™ on seals and O-rings to ease installation.

Petroleum jelly can also be used to hold thrust washers, thrust plates and gaskets in position during assembly. However, **do not** use chassis grease, bearing grease, white grease, or similar lubricants on any transmission part. These types of lubricants can eventually block or restrict fluid passages and interfere with valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and subassemblies are easily installed by hand when properly aligned.

If a part seems extremely difficult to install, it is either misaligned or incorrectly assembled. Also verify that thrust washers, thrust plates and seal rings are correctly positioned before assembly. These parts can interfere with proper assembly if mis-positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright.

(1) Install rear servo piston, spring and retainer (Fig. 34). Install spring on top of servo piston and install retainer on top of spring.

(2) Install front servo piston assembly, servo spring and rod guide (Fig. 35).

(3) Compress front/rear servo springs with Valve Spring Compressor C-3422-B and install each servo snap-ring (Fig. 36).

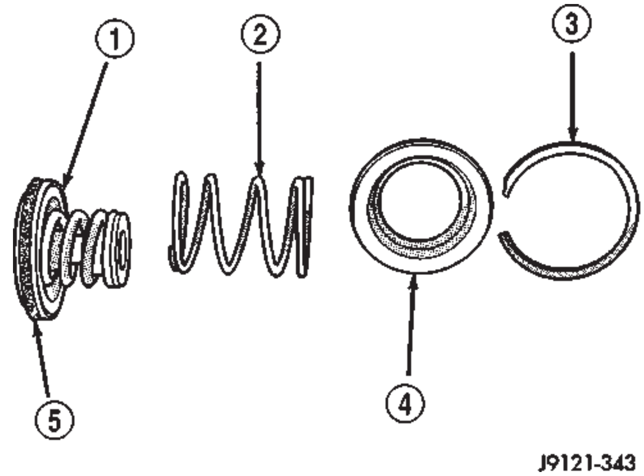

*Fig. 34 Rear Servo Components*

1 - SERVO PISTON
2 - PISTON SPRING
3 - SNAP-RING

6 - ROD

AUTOMATIC TRANSMISSION - 42RE (Continued)

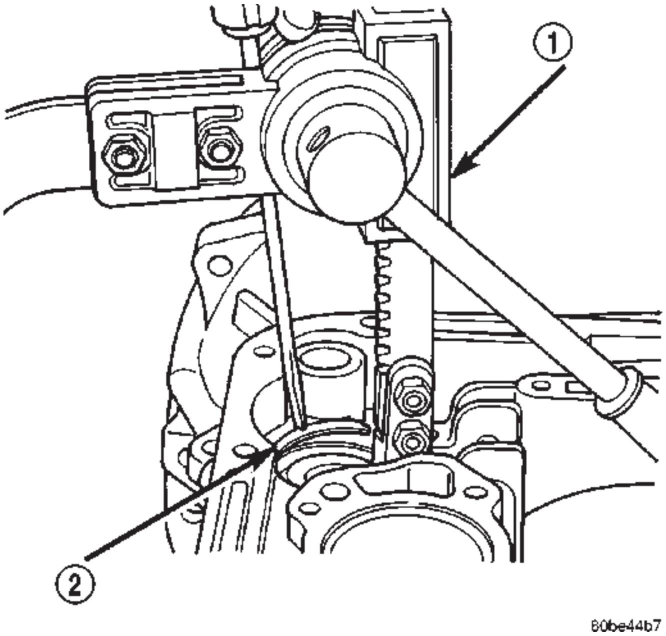

*Fig. 36 Compressing Front/Rear Servo Springs*

1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP-RING

(4) Lubricate clutch cam rollers with transmission fluid.

(5) Install rear band in case (Fig. 37). Be sure twin lugs on band are seated against reaction pin.

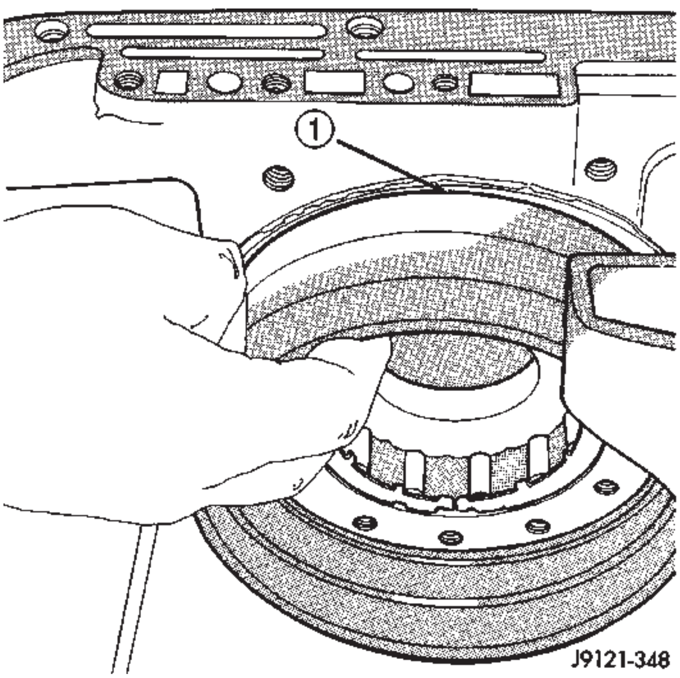

*Fig. 37 Rear Band Installation*

1 - REAR BAND

(6) Install low-reverse drum and check overrunning clutch operation as follows:

(a) Lubricate overrunning clutch race (on drum hub) with transmission fluid.

(b) Guide drum through rear band.

(c) Tilt drum slightly and start race (on drum hub) into overrunning clutch rollers.

(d) Press drum rearward and turn it in clockwise direction until drum seats in overrunning clutch (Fig. 38).

(e) Turn drum back and forth. Drum should rotate freely in clockwise direction and lock in counterclockwise direction (as viewed from front of case).

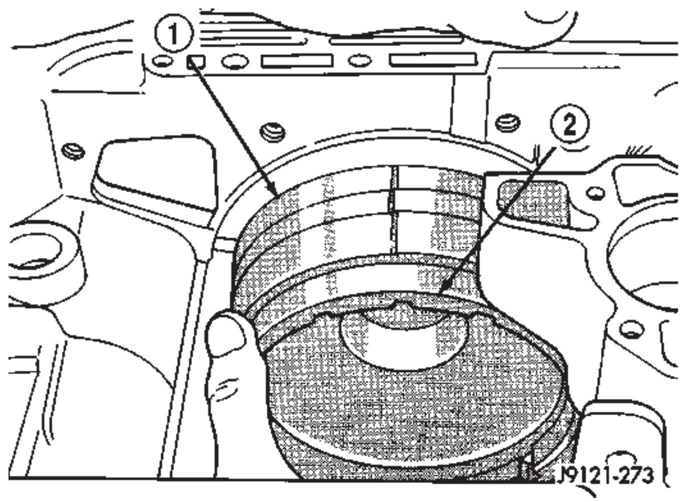

*Fig. 38 Installing Low-Reverse Drum*

1 - REAR BAND
2 - LOW-REVERSE DRUM

AUTOMATIC TRANSMISSION - 42RE (Continued)

(7) Install snap-ring that secures low-reverse drum to hub of overdrive piston retainer (Fig. 39).

(8) Install rear band lever and pivot pin (Fig. 40). Align lever with pin bores in case and push pivot pin into place.

(9) Install planetary geartrain assembly (Fig. 41).

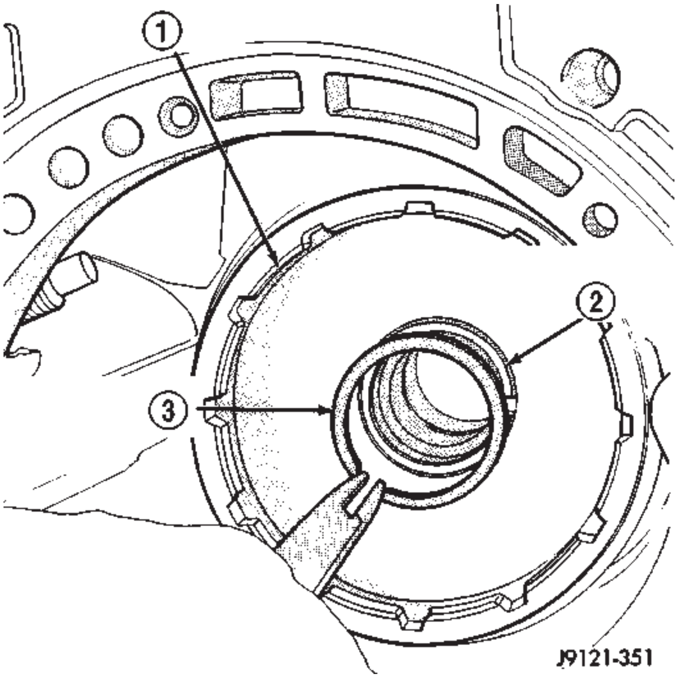

***Fig. 39 Installing Low-Reverse Drum Retaining Snap-Ring***

1 - LOW-REVERSE DRUM
2 - HUB OF OVERDRIVE PISTON RETAINER
3 - LOW-REVERSE DRUM SNAP-RING

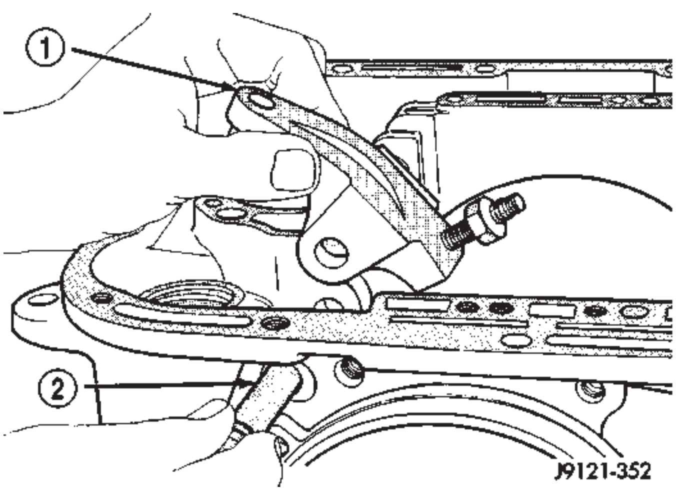

***Fig. 40 Rear Band Lever And Pivot Pin Installation***

1 - REAR BAND LEVER
2 - LEVER PIVOT PIN

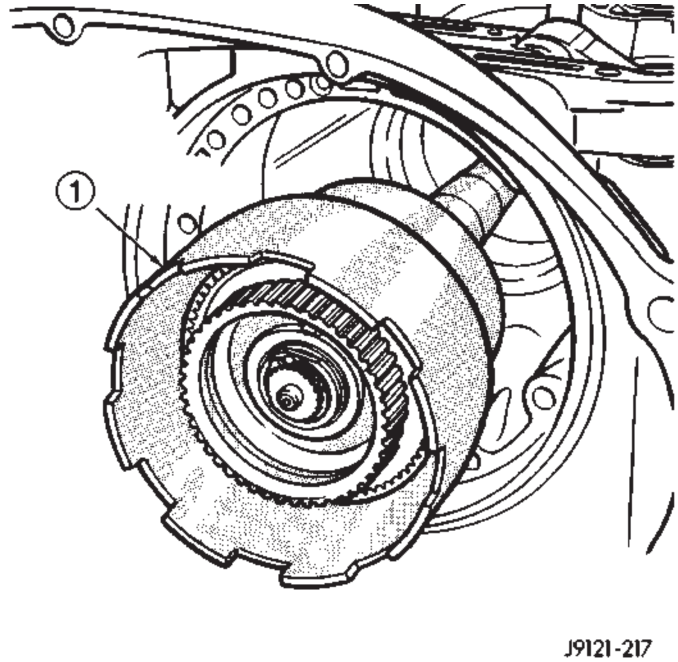

***Fig. 41 Installing Planetary Geartrain***

1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(10) Install thrust plate on intermediate shaft hub (Fig. 42). Use petroleum jelly to hold thrust plate in place.

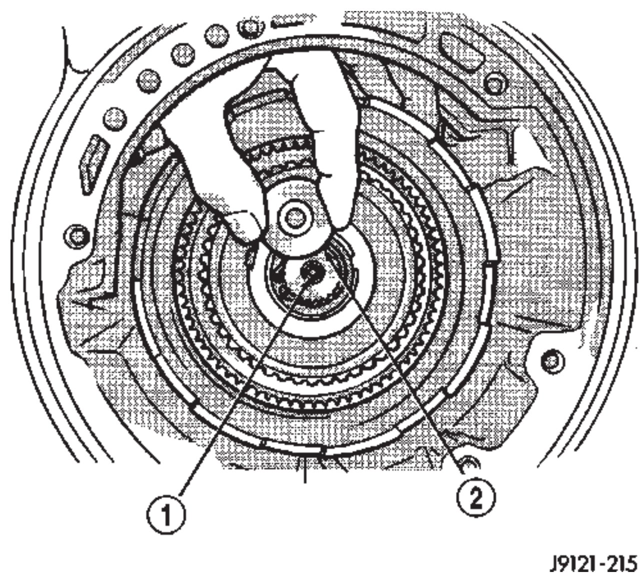

***Fig. 42 Installing Intermediate Shaft Thrust Plate***

1 - INTERMEDIATE SHAFT HUB
2 - INTERMEDIATE SHAFT THRUST PLATE

AUTOMATIC TRANSMISSION - 42RE (Continued)

(11) Check seal ring on rear clutch retainer hub and seal rings on input shaft (Fig. 43). Also verify that shaft seal rings are installed in sequence shown.

(12) Install rear clutch thrust washer (Fig. 44). Use additional petroleum jelly to hold washer in place if necessary.

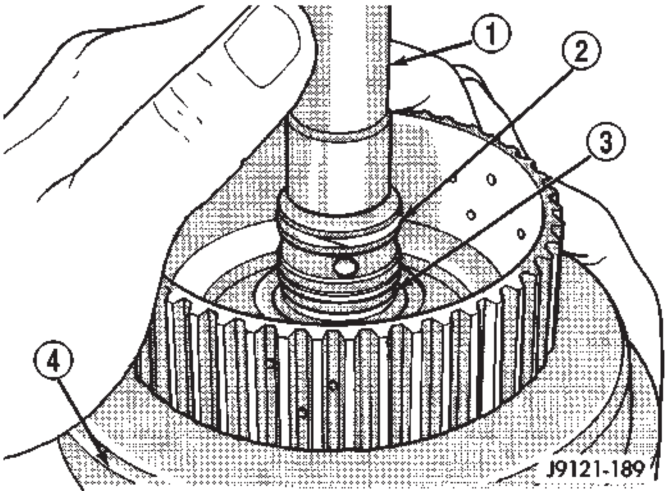

***Fig. 43 Input Shaft Seal Ring Location***

1 - INPUT SHAFT
2 - TEFLON SEAL RING
3 - PLASTIC SEAL RING
4 - REAR CLUTCH RETAINER

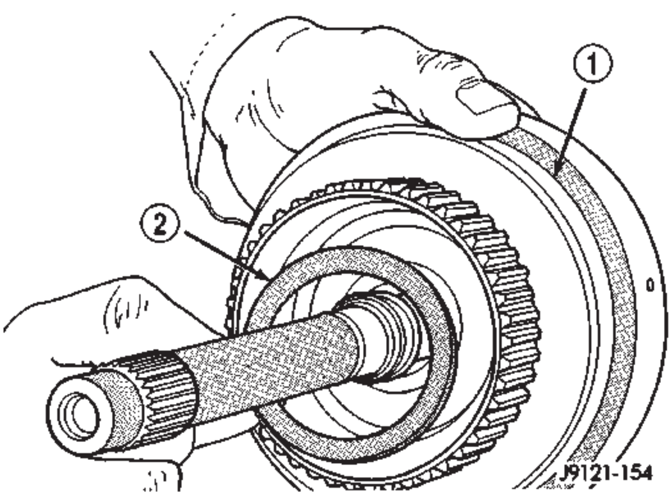

***Fig. 44 Installing Rear Clutch Thrust Washer***

1 - REAR CLUTCH RETAINER
2 - REAR CLUTCH THRUST WASHER (FIBER)

(13) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 45). Rotate front clutch retainer back and forth until completely seated on rear clutch retainer.

(14) Coat intermediate shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 46). Use enough petroleum jelly to hold washer in place. Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub. Note thickness of this washer. It is a select fit part and is used to control transmission end play.

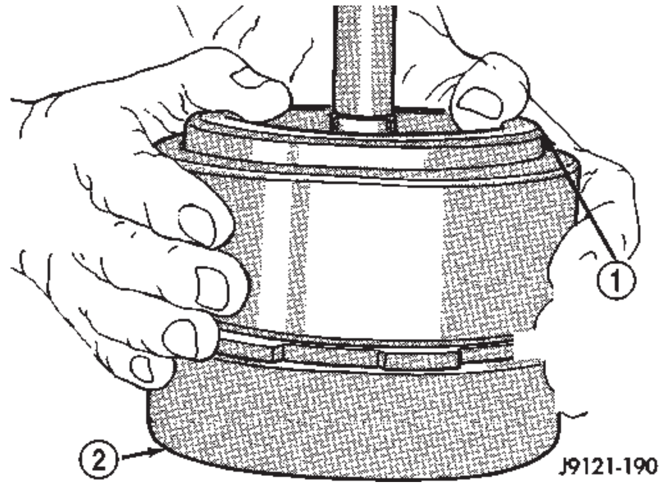

***Fig. 45 Assembling Front And Rear Clutch Units***

1 - TURN FRONT CLUTCH BACK & FORTH UNTIL SEATED
2 - REAR CLUTCH ASSEMBLY

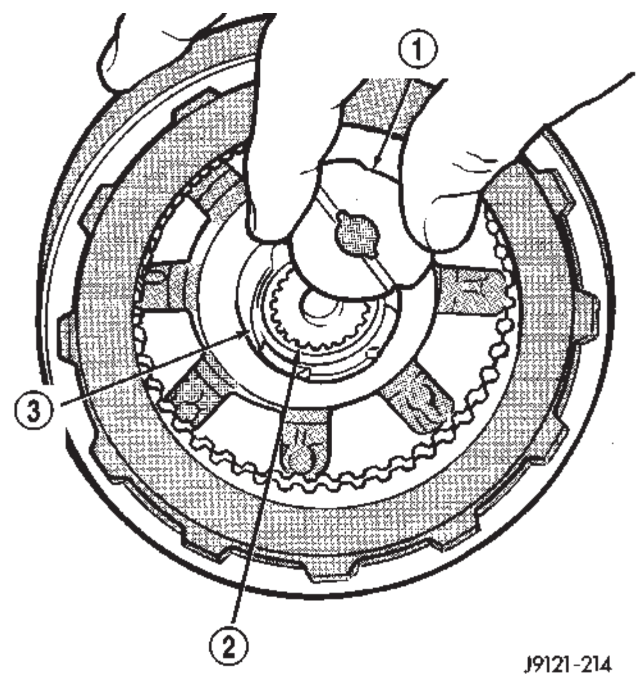

***Fig. 46 Installing Intermediate Shaft Thrust Plate***

1 - INTERMEDIATE SHAFT THRUST WASHER
2 - INPUT SHAFT
3 - REAR CLUTCH RETAINER HUB

AUTOMATIC TRANSMISSION - 42RE (Continued)

(15) Align drive teeth on rear clutch discs with small screwdriver (Fig. 47). This makes installation on front planetary easier.

(16) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(17) Slide front band into case.

(18) Install front and rear clutch units as assembly (Fig. 48). Align rear clutch with front annulus gear and install assembly in driving shell. Be sure output shaft thrust washer and thrust plate are not displaced during installation.

(19) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Also be sure front clutch drive lugs are fully engaged in slots of driving shell after installation.

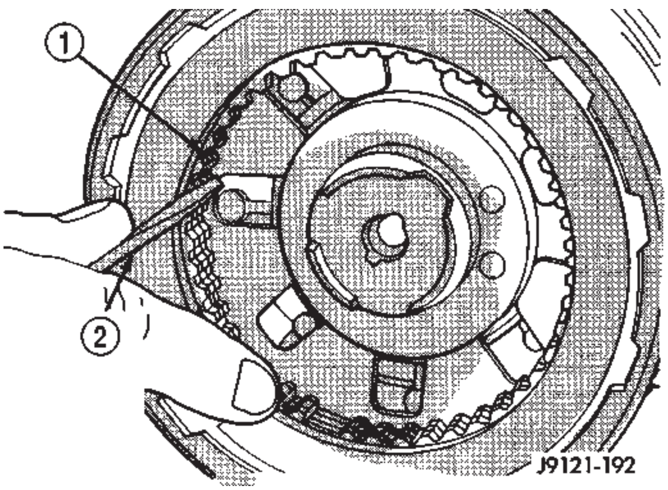

**Fig. 47 Aligning Rear Clutch Disc Lugs**

1 - REAR CLUTCH DISCS
2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

(20) Assemble front band strut.

(21) Install front band adjuster, strut and adjusting screw (Fig. 49).

(22) Tighten band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

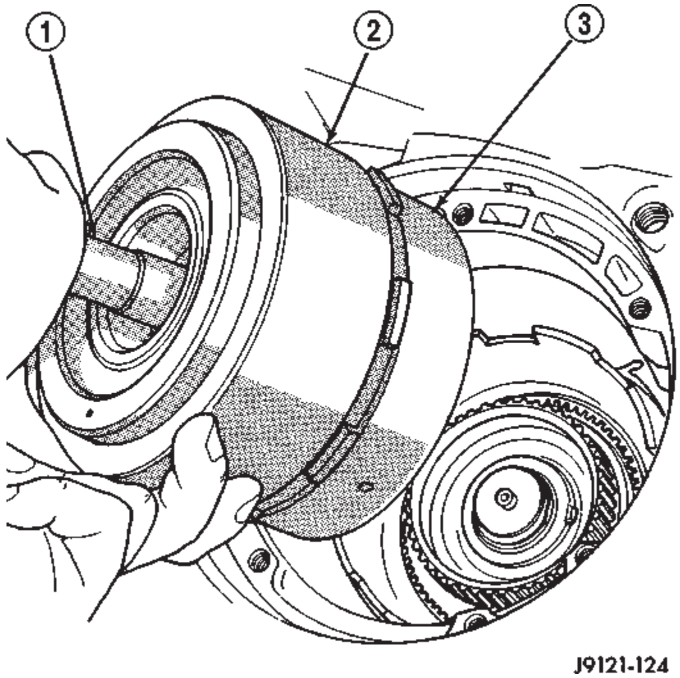

**Fig. 48 Installing Front/Rear Clutch Assemblies**

1 - INPUT SHAFT
2 - FRONT CLUTCH
3 - REAR CLUTCH

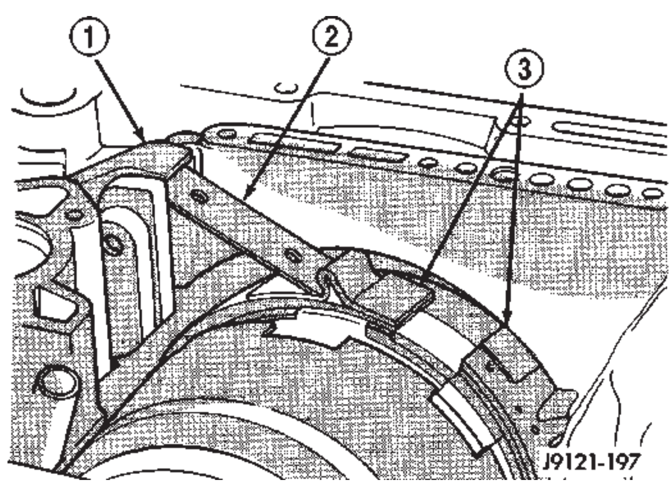

**Fig. 49 Front Band Linkage Installation**

1 - BAND LEVER
2 - BAND STRUT
3 - FRONT BAND

AUTOMATIC TRANSMISSION - 42RE (Continued)

(23) Check seal rings on reaction shaft support hub. Verify that seal rings are hooked together and that front clutch thrust washer is properly positioned (Fig. 50). Use petroleum jelly to hold thrust washer in place if necessary.

(24) Lubricate oil pump body seal with petroleum jelly. Lubricate pump shaft seal lip with petroleum jelly.

(25) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump bore flange (Fig. 51).

(26) Align and install oil pump gasket (Fig. 51).

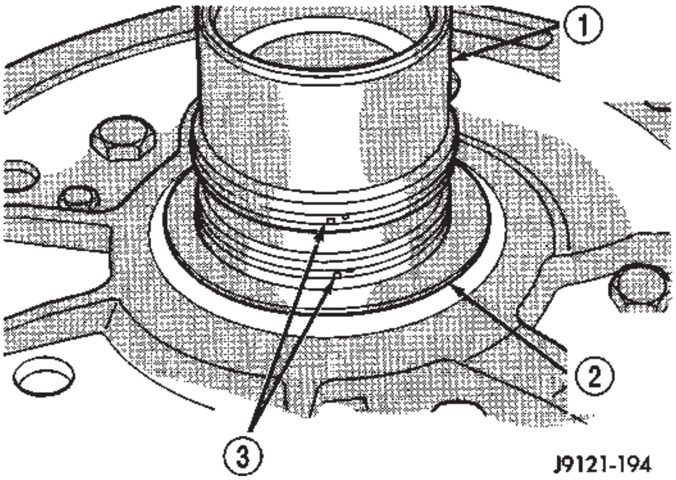

***Fig. 50 Reaction Shaft Support Seal Rings And Front Clutch Thrust Washer***

1 - REACTION SHAFT SUPPORT HUB
2 - FRONT CLUTCH THRUST WASHER
3 - SEAL RINGS

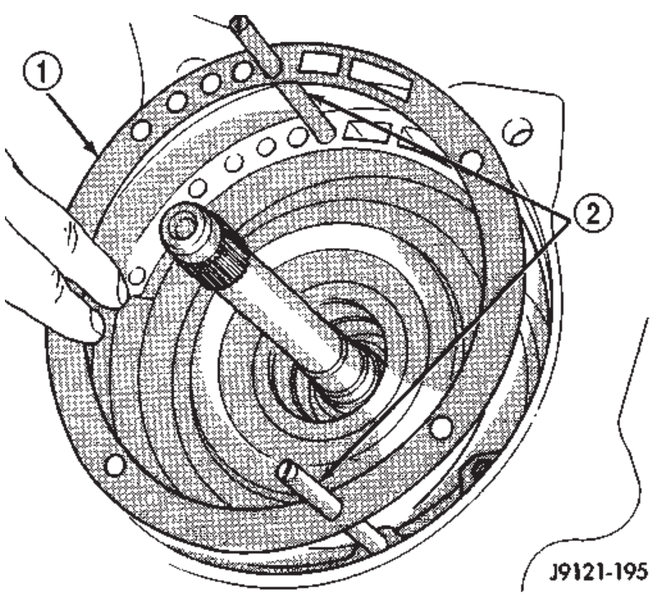

***Fig. 51 Installing Pilot Studs And Oil Pump Gasket***

1 - OIL PUMP GASKET
2 - PILOT STUD TOOLS C-3288-B

(27) Install oil pump (Fig. 52). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install 2 or 3 pump bolts to hold pump in place.

(28) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

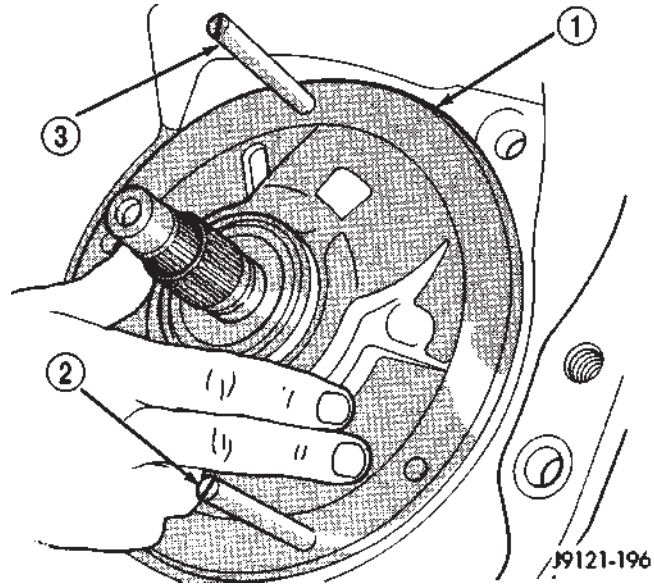

***Fig. 52 Installing Oil Pump***

1 - OIL PUMP
2 - PILOT STUD TOOL
3 - PILOT STUD TOOL

(29) Measure input shaft end play (Fig. 53).

**NOTE: If end play is incorrect, transmission is incorrectly assembled, or the intermediate shaft thrust washer is incorrect. The intermediate shaft thrust washer is selective.**

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. End play should be 0.56-2.31 mm (0.022-0.091 in.). Adjust as necessary.

(30) Install accumulator piston and inner and outer springs (Fig. 54).

(31) Verify that valve body solenoid harness is secured in 3-4 accumulator housing cover plate.

(32) Install valve body as follows:

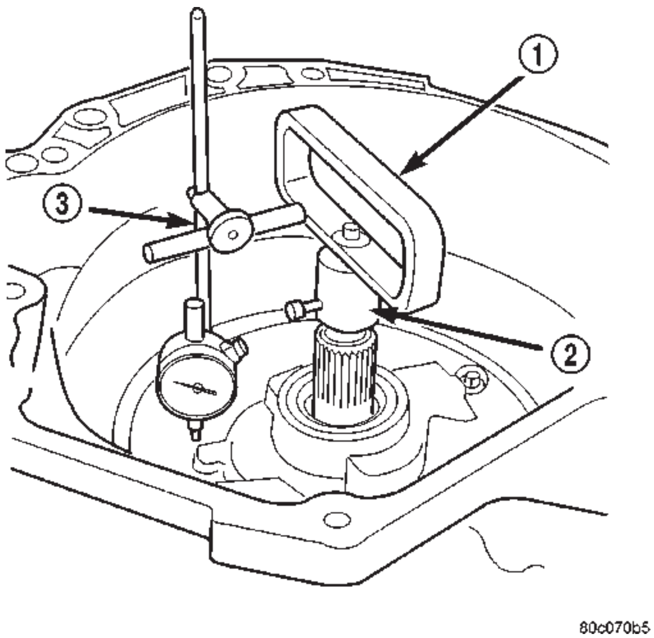

*Fig. 53 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-6
3 - TOOL C-3339

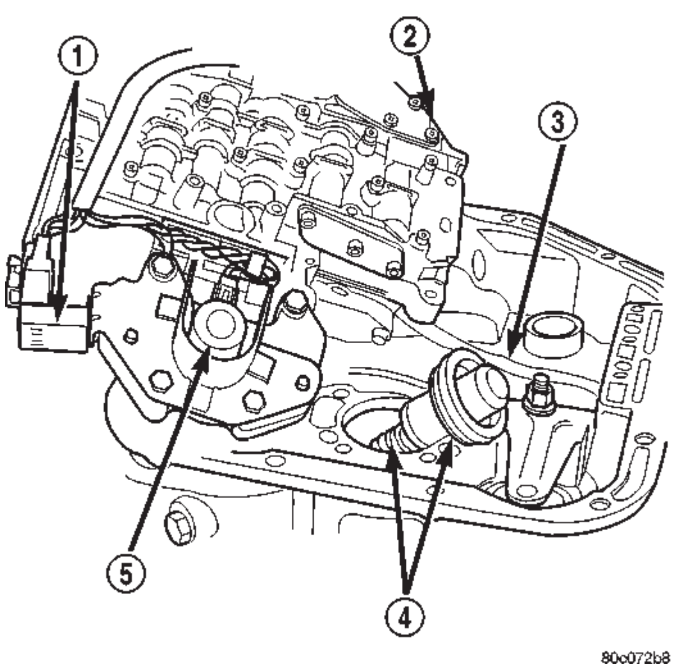

*Fig. 54 Accumulator Piston And Springs*

1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY
3 - PARK ROD
4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

(a) Align and carefully insert park rod into pawl. Rod will make click noise as it enters pawl. Move rod slightly to check engagement.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case. Also be sure valve body wiring is not pinched or kinked.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.

**CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into the cavity.**

(33) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(34) Adjust front and rear bands.

(35) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

(36) Install magnet in oil pan. Magnet goes on small protrusion at corner of pan.

(37) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(38) Install new valve body manual shaft seal in case (Fig. 55). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

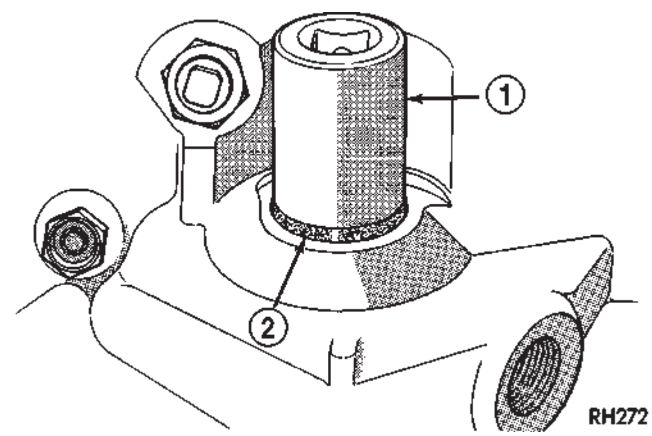

*Fig. 55 Installing Manual Lever Shaft Seal*

1 - 15/16" SOCKET
2 - SEAL

(39) Install throttle valve and shift selector levers on valve body manual lever shaft.

AUTOMATIC TRANSMISSION - 42RE (Continued)

## INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 56). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

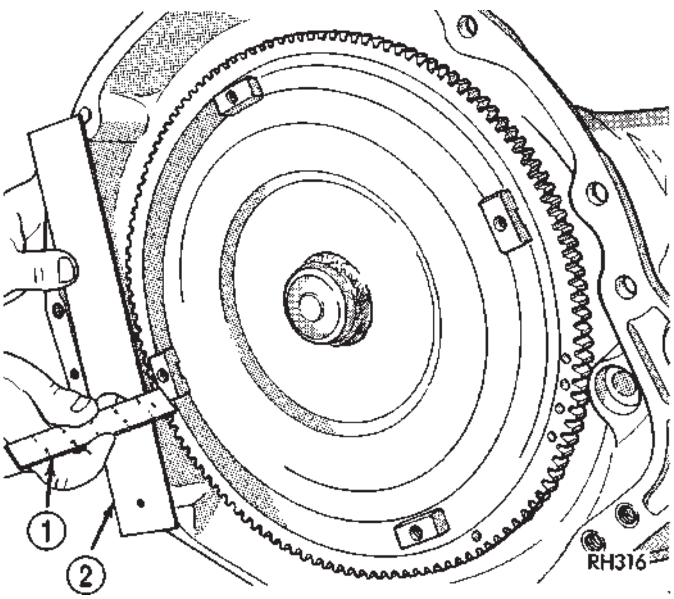

*Fig. 56 Checking Converter Seating - Typical*

1 - SCALE
2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

**CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.**

(20) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to 31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(27) Adjust gearshift linkage and throttle valve cable if necessary.

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

## SPECIFICATIONS

### TRANSMISSION

**GENERAL**

| Component | Metric | Inch |
|---|---|---|
| Planetary end play | 0.127-1.22 mm | 0.005-0.048 in. |
| Input shaft end play | 0.56-2.31 mm | 0.022-0.091 in. |
| Clutch pack clearance/ Front. | 1.70-3.40mm | 0.067-0.134 in. |
| Clutch pack clearance/ Rear. | 0.559-0.914 mm | 0.022-0.036 in. |
| Front clutch | 4 discs | |
| Rear clutch | 4 discs | |
| Overdrive clutch | 3 discs | |
| Direct clutch | 6 discs | |
| Band adjustment from 72 in. lbs. | | |
| Front band | Back off 3 turns | |
| Rear band | Back off 4 turns | |
| Recommended fluid | Mopar® ATF +4, type 9602 | |

**GEAR RATIOS**

| | |
|---|---|
| 1ST GEAR | 2.74:1 |
| 2ND GEAR | 1.54:1 |
| 3RD GEAR | 1.0:1 |
| 4TH GEAR | 0.69:1 |
| REVERSE | 2.21:1 |

**THRUST WASHER/SPACER/SNAP-RING DIMENSIONS**

| Component | Metric | Inch |
|---|---|---|
| Front clutch thrust washer (reaction shaft support hub) | 1.55 mm | 0.061 in. |
| Rear clutch thrust washer (clutch retainer) | 1.55 mm | 0.061 in. |
| Intermediate shaft thrust plate (shaft hub pilot) | Select fit to set end play | |
| Output shaft thrust washer (rear clutch hub) | 1.5-1.6 mm | 0.060-0.063 in. |
| Rear clutch pack snap-ring | 1.5 mm<br>1.95 mm<br>2.45 mm | 0.060 in.<br>0.076 in.<br>0.098 in. |
| Planetary geartrain snap-ring (at front of output shaft) | Select fit (three thicknesses avalible) | |
| Overdrive piston thrust plate | Thrust plate and spacer are select fit. Refer to size charts and selection procedures in Overdrive Unit D&A procedures | |
| Intermiediate shaft spacer | | |

AUTOMATIC TRANSMISSION - 42RE (Continued)

**PRESSURE TEST**

| | | |
|---|---|---|
| Overdrive clutch | Fourth gear only | Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle. |
| Line pressure (at accumulator) | Closed throttle | 372-414 kPa (54-60 psi). |
| Front servo | Third gear only | No more than 21 kPa (3 psi) lower than line pressure. |
| Rear servo | 1 range<br>R range | No more than 21 kPa (3 psi) lower than line pressure.<br>1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm. |
| Governor | D range closed throttle | Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting. |

# ACCUMULATOR

## DESCRIPTION

The accumulator (Fig. 57) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 58).

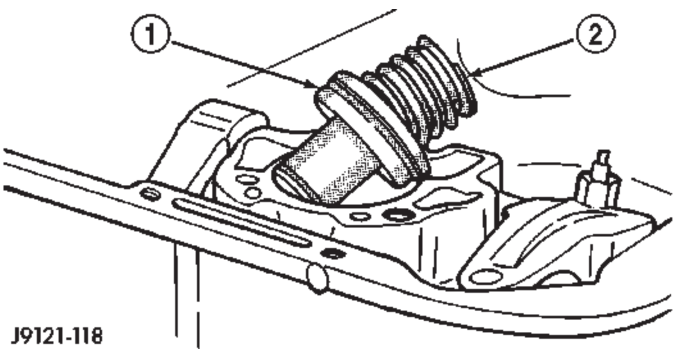

*Fig. 57 Accumulator*

1 - ACCUMULATOR PISTON
2 - PISTON SPRING

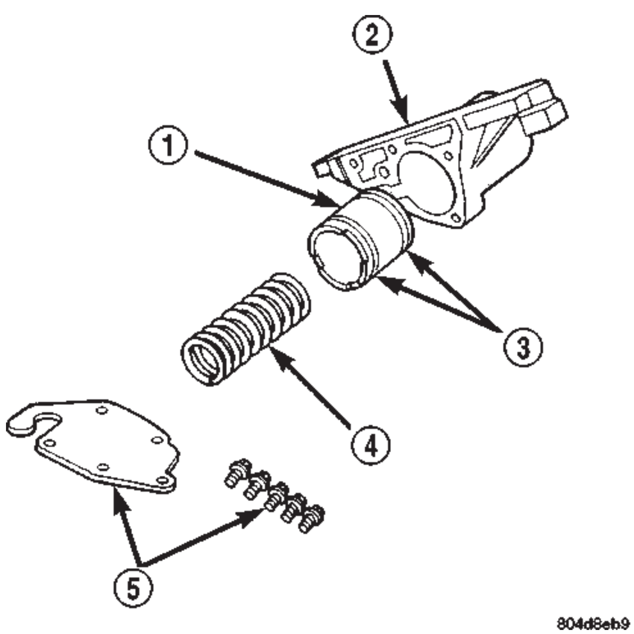

*Fig. 58 3-4 Accumulator and Housing*

1 - ACCUMULATOR PISTON
2 - 3-4 ACCUMULATOR HOUSING
3 - TEFLON SEALS
4 - PISTON SPRING
5 - COVER PLATE AND SCREWS

## OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 59), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 60), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

**NOTE: The accumulator is shown in the inverted position for illustrative purposes.**

1 - LINE PRESSURE

ACCUMULATOR (Continued)

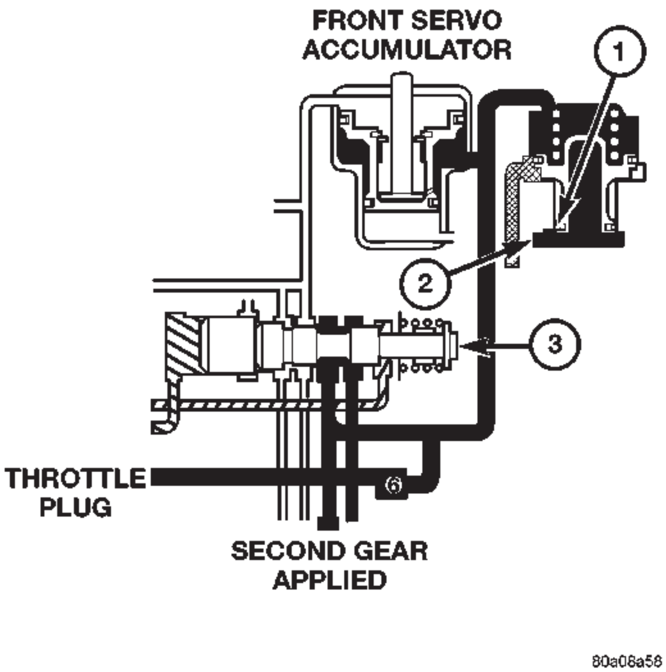

*Fig. 60 Accumulator in SECOND Gear Position*

1 - BOTTOM OF BORE
2 - LINE PRESSURE
3 - SHUTTLE VALVE

## INSPECTION

Inspect the accumulator piston and seal rings (Fig. 61). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 61). Replace the springs if the coils are cracked, distorted or collapsed.

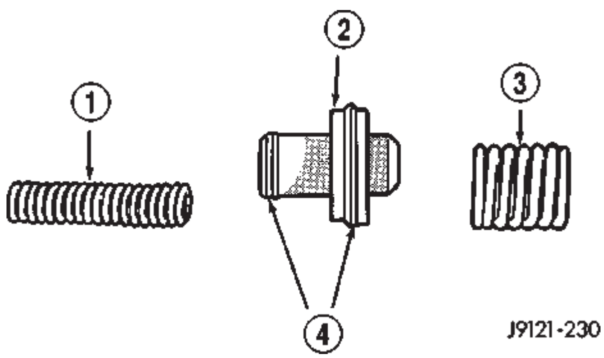

*Fig. 61 Accumulator Components*

# BANDS

## DESCRIPTION

### KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 62) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

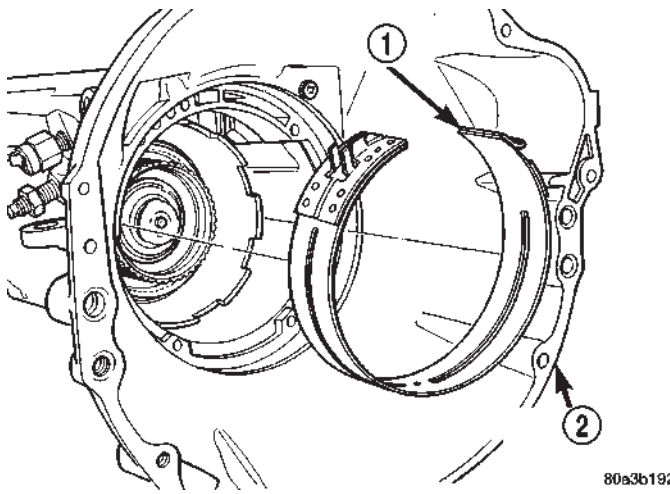

*Fig. 62 Front Band*

1 - FRONT BAND
2 - TRANSMISSION HOUSING

### LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 63) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

## OPERATION

### KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

BANDS (Continued)

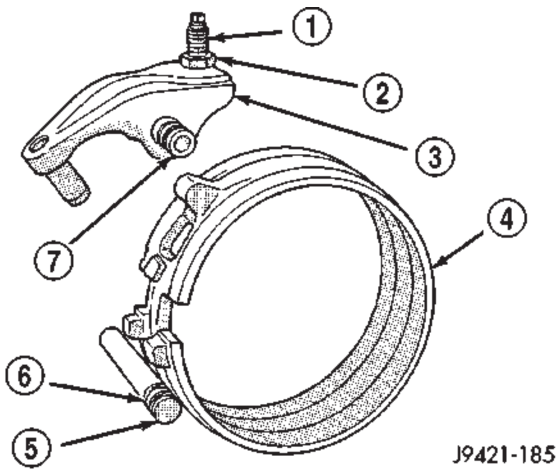

*Fig. 63 Rear Band*

1 - ADJUSTING SCREW
2 - LOCKNUT
3 - LEVER
4 - REAR BAND
5 - REACTION PIN
6 - O-RINGS
7 - PIVOT PIN

## LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

## ADJUSTMENT - BANDS

### FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Raise vehicle.

(2) Loosen band adjusting screw locknut (Fig. 64). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.

(3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and appropriate Torx™ socket.

**CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.**

(4) Back off front band adjusting screw 3 turns.

(5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

(6) Lower vehicle.

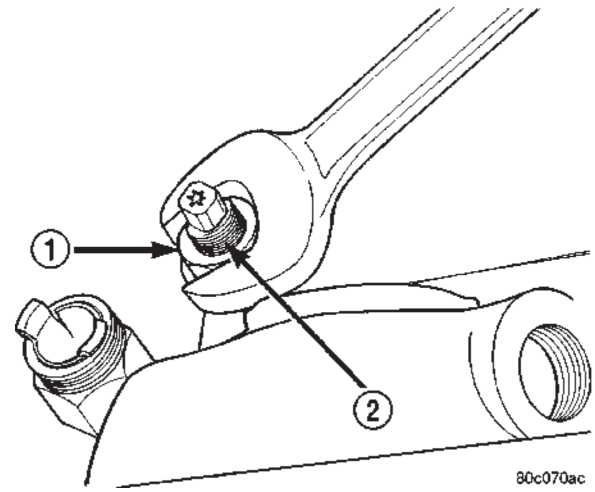

*Fig. 64 Front Band Adjustment Screw Location*

1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

### REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

(1) Raise vehicle.

(2) Remove transmission oil pan and drain fluid.

(3) Loosen band adjusting screw locknut 5-6 turns (Fig. 65). Be sure adjusting screw turns freely in lever.

(4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque.

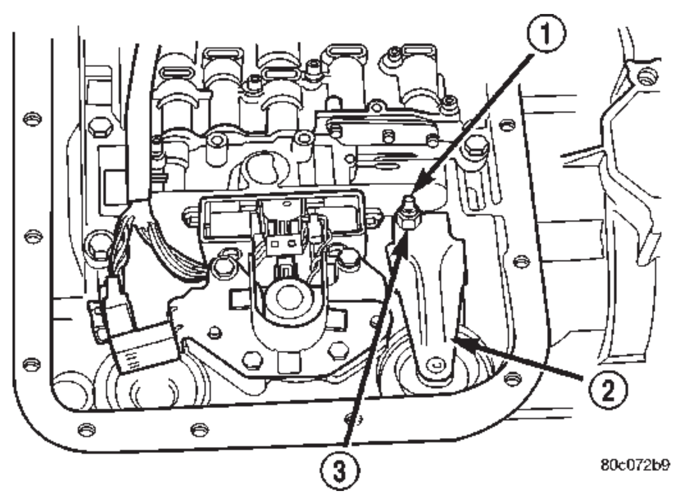

*Fig. 65 Rear Band Adjusting Screw Location*

1 - ADJUSTING SCREW
2 - REAR BAND LEVER
3 - LOCKNUT

(5) Back off adjusting screw 4 turns.

(6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

BANDS (Continued)

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(8) Lower vehicle and refill transmission with Mopar® ATF +4, type 9602, fluid.

# ELECTRONIC GOVERNOR

## DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

### GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 66).

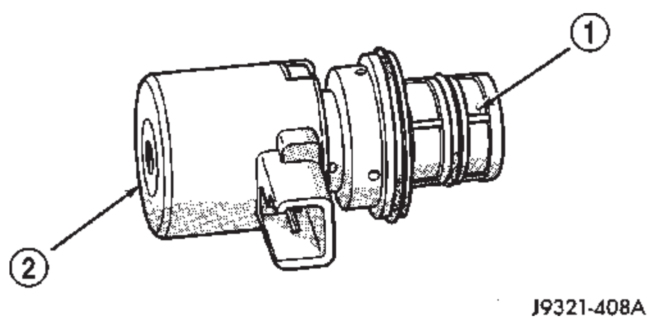

*Fig. 66 Governor Pressure Solenoid Valve*

1 - SOLENOID FILTER
2 - GOVERNOR PRESSURE SOLENOID

### GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 67).

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 67).

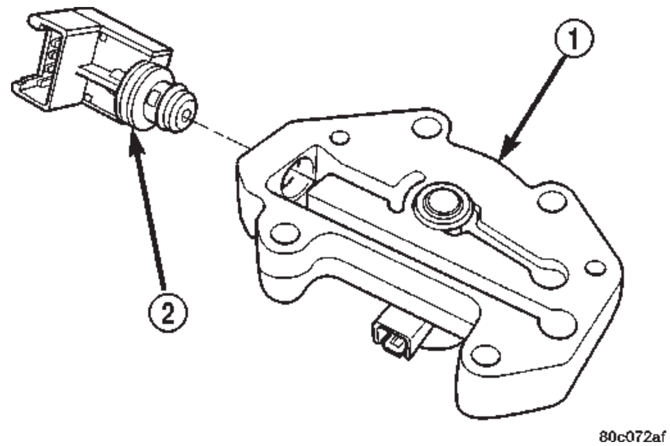

*Fig. 67 Governor Pressure Sensor*

1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

### GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, –1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

## OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

ELECTRONIC GOVERNOR (Continued)

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output valves are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the ″cold″ period of operation.

## GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

## GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

## GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

## GOVERNOR PRESSURE CURVES

### LOW TRANSMISSION FLUID TEMPERATURE

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

### NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade ″hunting″ prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

### WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

### TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine ″flare.″ The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

ELECTRONIC GOVERNOR (Continued)

## REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Remove transmission fluid pan and filter.

(3) Disengage wire connectors from pressure sensor and solenoid (Fig. 68).

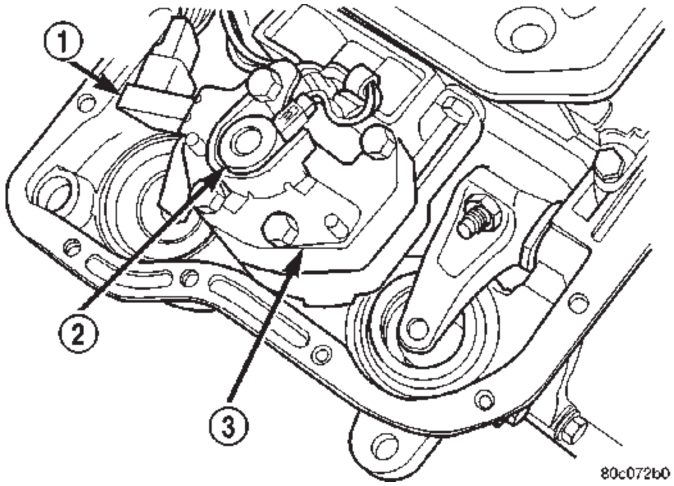

*Fig. 68 Governor Solenoid And Pressure Sensor*

1 - PRESSURE SENSOR
2 - PRESSURE SOLENOID
3 - GOVERNOR

(4) Remove screws holding pressure solenoid retainer to governor body.

(5) Separate solenoid retainer from governor (Fig. 69).

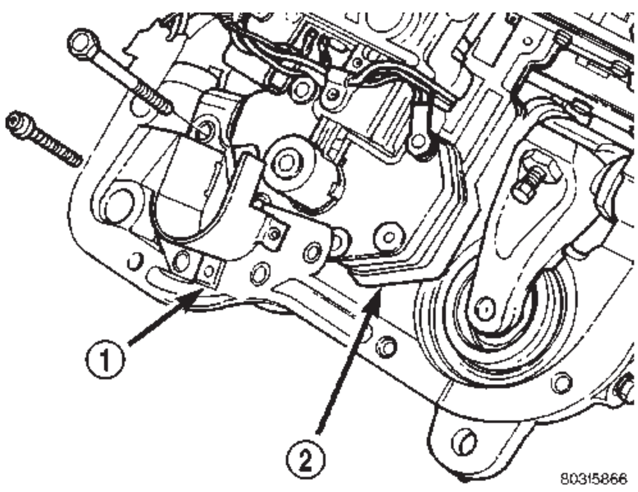

*Fig. 69 Pressure Solenoid Retainer*

1 - PRESSURE SOLENOID RETAINER
2 - GOVERNOR

(6) Pull solenoid from governor body (Fig. 70).

(7) Pull pressure sensor from governor body.

(8) Remove bolts holding governor body to valve body.

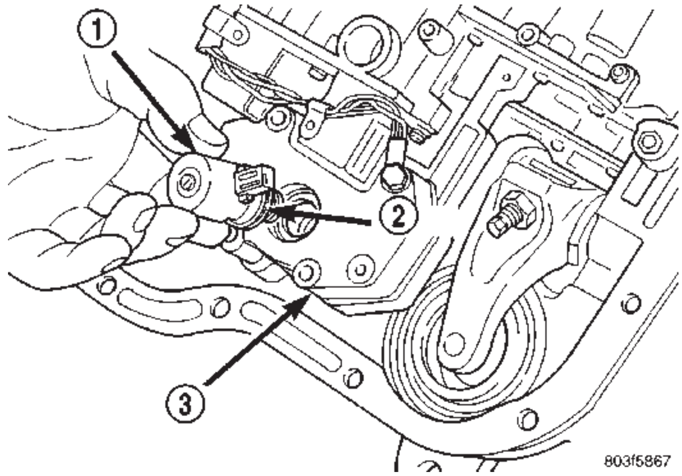

*Fig. 70 Pressure Solenoid and O-ring*

1 - PRESSURE SOLENOID
2 - O-RING
3 - GOVERNOR

(9) Separate governor body from valve body (Fig. 71).

(10) Remove governor body gasket.

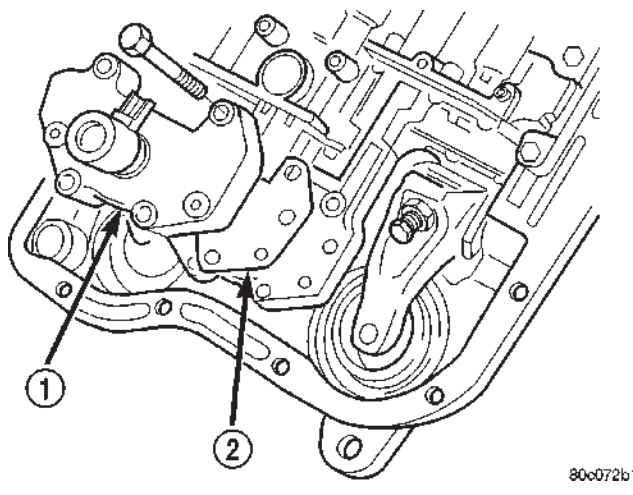

*Fig. 71 Governor Body and Gasket*

1 - GOVERNOR BODY
2 - GASKET

ELECTRONIC GOVERNOR (Continued)

## INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace o-ring seals, clean the gasket surfaces and replace gasket.

(1) Place gasket in position on back of governor body (Fig. 72).

(2) Place governor body in position on valve body.

(3) Install bolts to hold governor body to valve body.

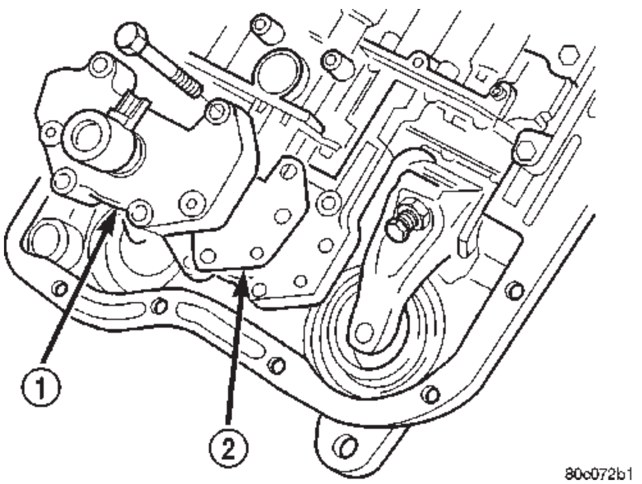

***Fig. 72 Governor Body and Gasket***

1 - GOVERNOR BODY
2 - GASKET

(4) Lubricate o-ring on pressure sensor with transmission fluid.

(5) Align pressure sensor to bore in governor body.

(6) Push pressure sensor into governor body.

(7) Lubricate o-ring, on pressure solenoid, with transmission fluid.

(8) Align pressure solenoid to bore in governor body (Fig. 73).

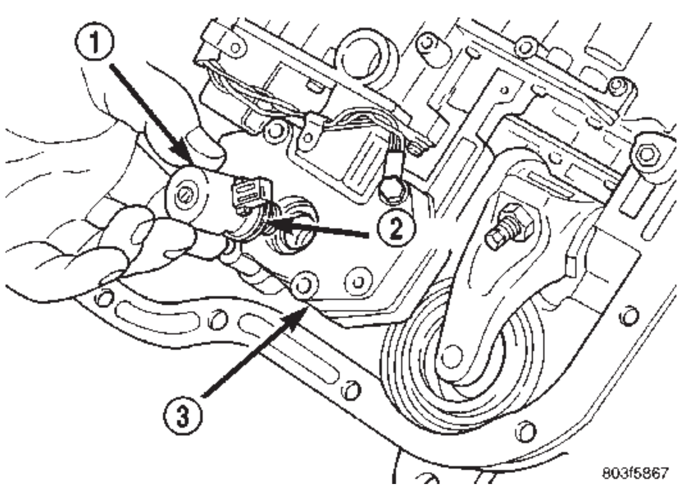

***Fig. 73 Pressure Solenoid and O-ring***

1 - PRESSURE SOLENOID
2 - O-RING
3 - GOVERNOR

(9) Push solenoid into governor body.

(10) Place solenoid retainer in position on governor (Fig. 74).

(11) Install screws to hold pressure solenoid retainer to governor body.

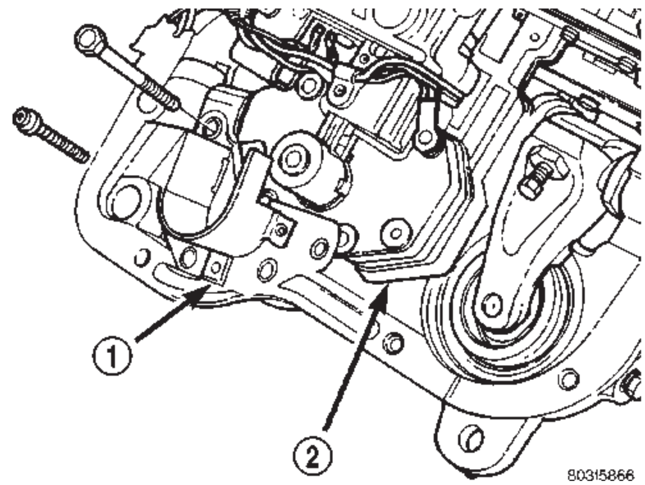

***Fig. 74 Pressure Solenoid Retainer***

1 - PRESSURE SOLENOID RETAINER
2 - GOVERNOR

(12) Engage wire connectors into pressure sensor and solenoid (Fig. 75).

(13) Install transmission fluid pan and (new) filter.

(14) Lower vehicle and road test to verify repair.

# EXTENSION HOUSING BUSHING

## REMOVAL

(1) Remove extension housing yoke seal.

(2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 76).

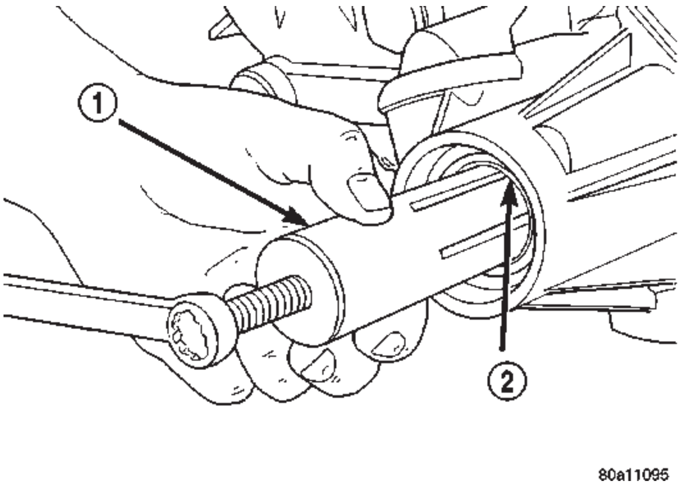

*Fig. 76 Bushing Removal - Typical*

1 - REMOVER
2 - EXTENSION HOUSING BUSHING

## INSTALLATION

(1) Align bushing oil hole with oil slot in extension housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 77).

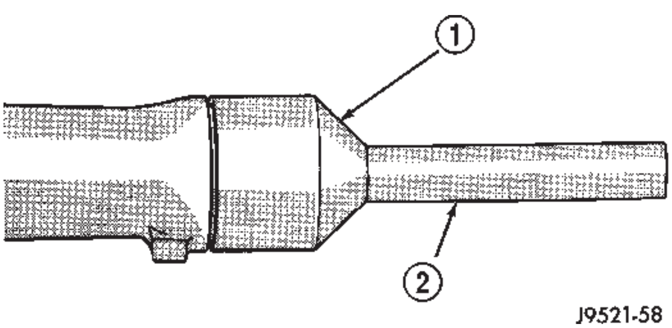

*Fig. 77 Extension Housing Seal Installation*

1 - SPECIAL TOOL C-3995-A OR C-3972-A
2 - SPECIAL TOOL C-4471

# EXTENSION HOUSING SEAL

## REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 78) from overdrive housing.

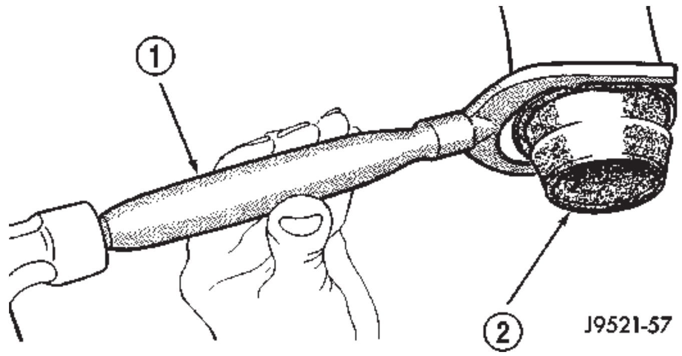

*Fig. 78 Removing Overdrive Housing Yoke Seal*

1 - SPECIAL TOOL C-3985-B
2 - SEAL

## INSTALLATION

(1) Place seal in position on overdrive housing.

(2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 79).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

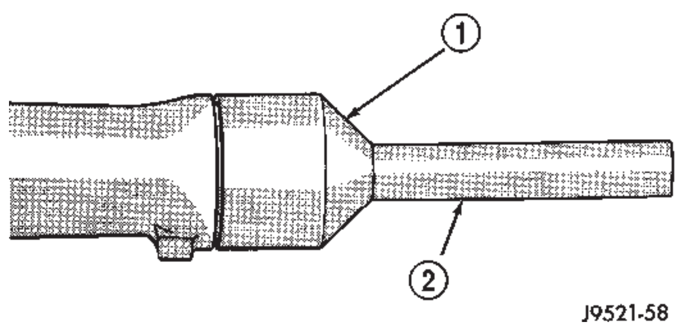

*Fig. 79 Installing Overdrive Housing Seal*

1 - SPECIAL TOOL C-3995-A OR C-3972-A

# FLUID AND FILTER

## DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

## DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

## DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmssion has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

FLUID AND FILTER (Continued)

### PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 80) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not overfill.

### PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

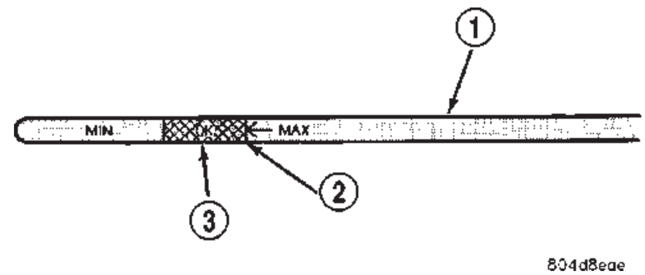

*Fig. 80 Dipstick Fluid Level Marks - Typical*

1 - DIPSTICK
2 - MAXIMUM CORRECT FLUID LEVEL
3 - ACCEPTABLE FLUID LEVEL

(5) Hook up DRB® scan tool and select engine.

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the figure. (Fig. 81)

(9) Adjust transmission fluid level shown on the dipstick according to the figure.

**NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

(10) Check transmission for leaks.

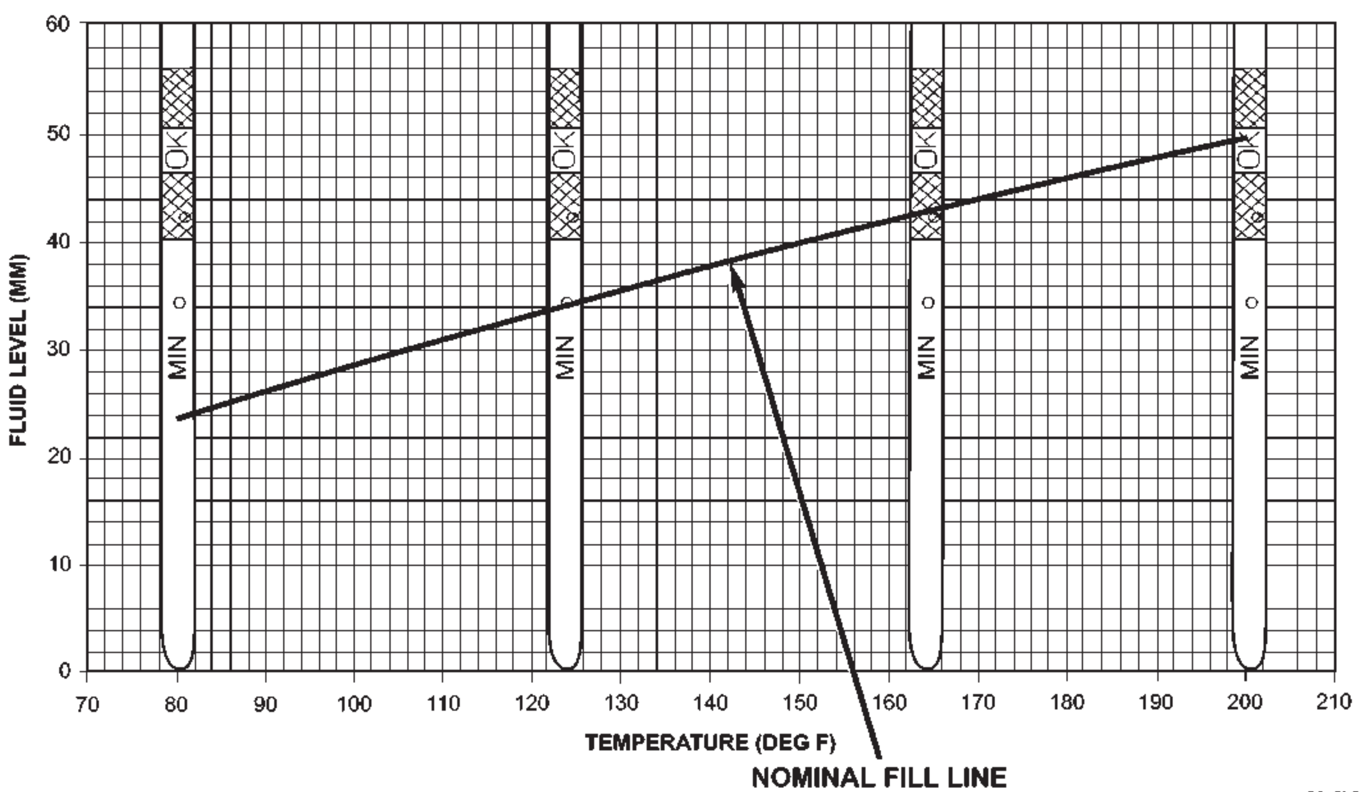

*Fig. 81 42/44RE Fluid Fill Graph*

FLUID AND FILTER (Continued)

## STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 82).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 83).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

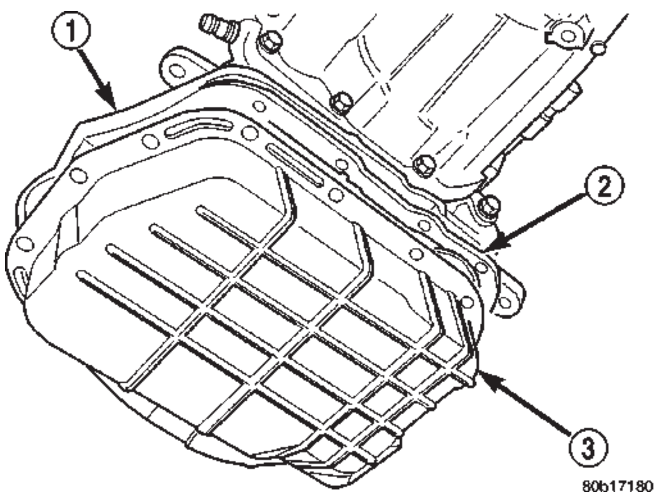

*Fig. 82 Transmission Pan*

1 - TRANSMISSION
2 - GASKET
3 - PAN

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

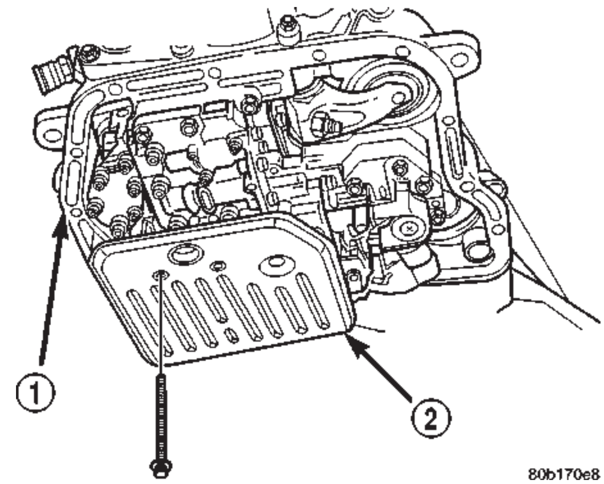

*Fig. 83 Transmission Filter*

1 - TRANSMISSION
2 - FILTER

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.**

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

# FRONT CLUTCH

## DESCRIPTION

The front clutch assembly (Fig. 84) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## DISASSEMBLY

(1) Remove waved snap-ring and remove pressure plate, clutch plates and clutch discs (Fig. 85).

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 86). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

(6) Remove seals from clutch retainer piston bore and clutch retainer hub. Discard both seals as they are not reusable.

## INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, or if the facing is flaking off. Replace the steel plates if heavily scored, warped, or broken. Be sure the driving lugs on the plates are in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the clutch spring and spring retainer if either is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged.

Check action of the check ball in the retainer (Fig. 87). The ball must move freely and not stick.

**NOTE: Inspect the clutch retainer bushings carefully (Fig. 88). The retainer bushings are NOT serviceable. It will be necessary to replace the retainer if either bushing is scored, or worn.**

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

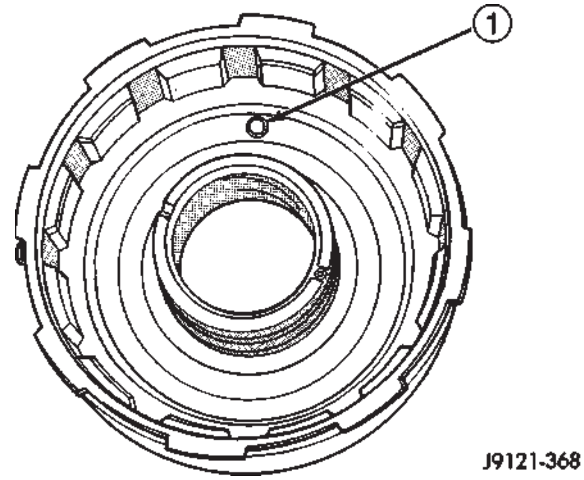

*Fig. 87 Front Clutch Piston Retainer Check Ball Location*

1 - RETAINER CHECK BALL

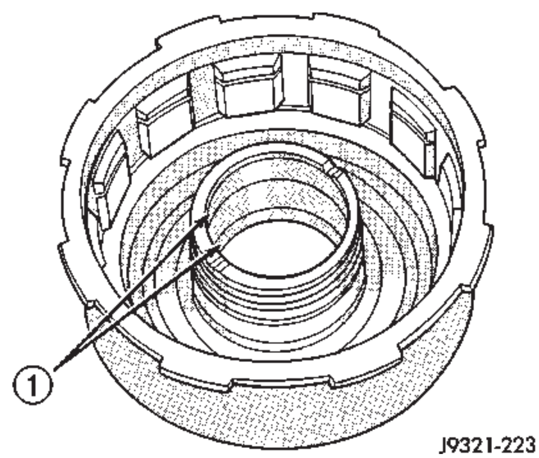

*Fig. 88 Retainer Bushing Location/Inspection*

1 - FRONT CLUTCH RETAINER BUSHINGS (NON-SERVICEABLE)

FRONT CLUTCH (Continued)

## ASSEMBLY

**NOTE: The 42RE transmission uses four plates and discs for the front clutch.**

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seals in the clutch retainer lower groove and on outer diameter of the retainer hub. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of the retainer seals with liberal quantity of Mopar® Door Ease. Then lubricate retainer hub, bore and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 89). Use twisting motion to seat piston in bottom of retainer.

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip.**

(5) Position spring in clutch piston (Fig. 90).

(6) Position spring retainer on top of piston spring. Make sure retainer is properly installed (Fig. 85).

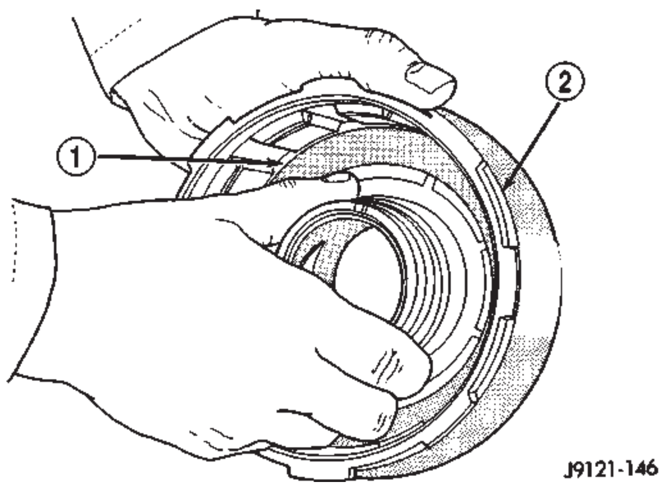

*Fig. 89 Front Clutch Piston Installation*

1 - CLUTCH PISTON
2 - FRONT CLUTCH RETAINER

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 86). Then install new snap-ring to secure spring retainer and spring.

(8) Install clutch plates and discs (Fig. 85). Install steel plate then disc until all plates and discs are installed. The front clutch uses 4 clutch discs and plates in a 42RE transmission.

(9) Install pressure plate and waved snap-ring (Fig. 85).

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs,

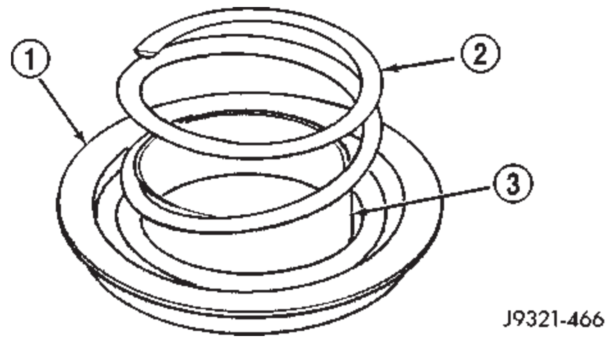

*Fig. 90 Clutch Piston Spring Installation*

1 - RETAINER
2 - CLUTCH SPRING
3 - PISTON

plates, pressure plates and snap-ring may have to be changed.

# FRONT SERVO

## DESCRIPTION

The kickdown servo (Fig. 91) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

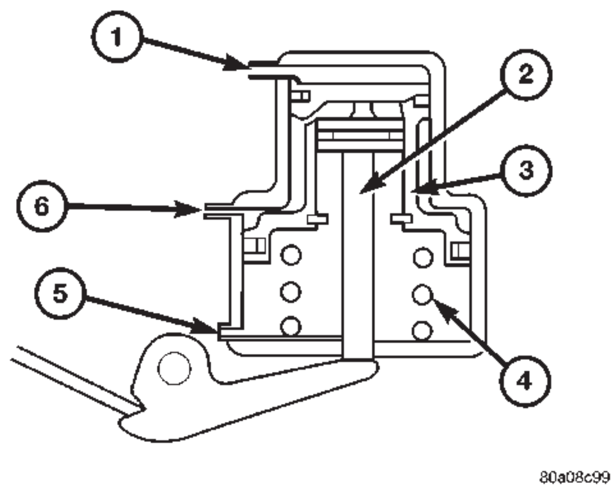

*Fig. 91 Front Servo*

1 - VENT
2 -PISTON ROD
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE

FRONT SERVO (Continued)

## OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend though its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

## DISASSEMBLY

(1) Remove seal ring from rod guide (Fig. 92).

(2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.

(3) Remove and discard servo component o-ring and seal rings.

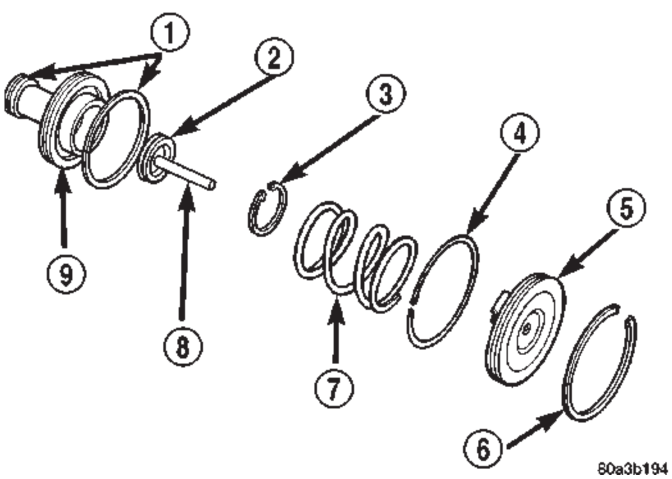

*Fig. 92 Front Servo*

2 - O-RING
3 - SNAP-RING
4 - SEAL RING
5 - PISTON ROD GUIDE
6 - SNAP-RING
7 - SERVO SPRING
8 - PISTON ROD
9 - SERVO PISTON

## CLEANING

Clean the servo piston components (Fig. 93) with solvent and dry them with compressed air.

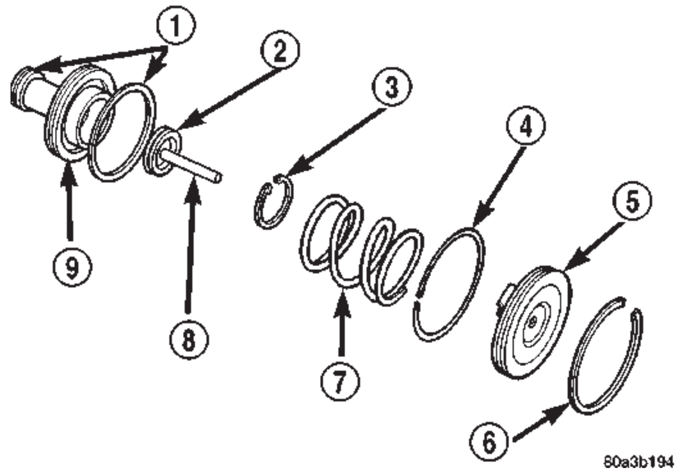

*Fig. 93 Front Servo Piston*

2 - O-RING
3 - SNAP-RING
4 - SEAL RING
5 - PISTON ROD GUIDE
6 - SNAP-RING
7 - SERVO SPRING
8 - PISTON ROD
9 - SERVO PISTON

## INSPECTION

Inspect the servo components (Fig. 94). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap-ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

FRONT SERVO (Continued)

8 - PISTON ROD
9 - SERVO PISTON

## ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 95).

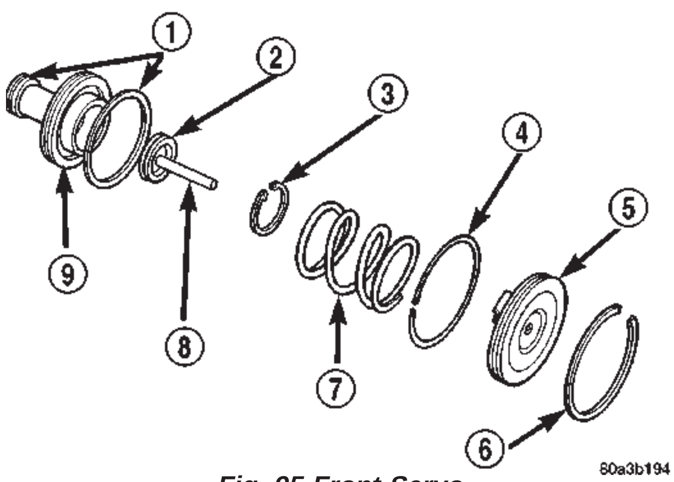

*Fig. 95 Front Servo*

# OIL PUMP

## DESCRIPTION

The oil pump (Fig. 96) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear (Fig. 97), a housing, and a cover that also serves as the reaction shaft support.

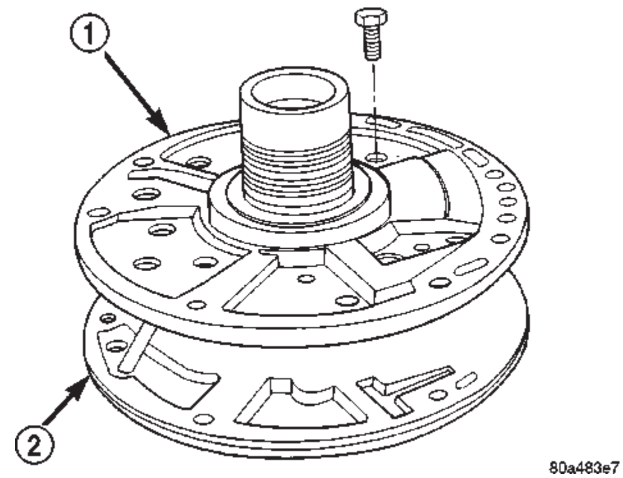

*Fig. 96 Oil Pump and Reaction Shaft Support*

1 - REACTION SHAFT SUPPORT
2 - PUMP

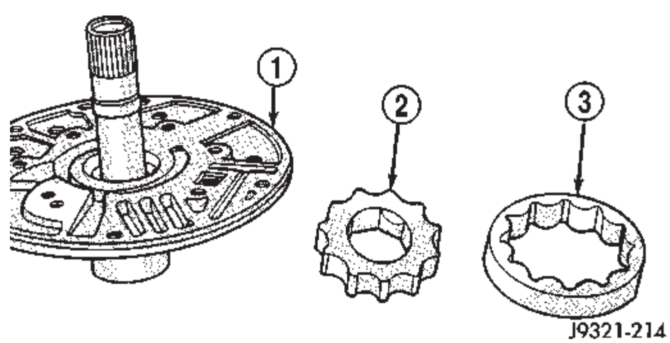

*Fig. 97 Pump Gear Removal*

1 - REACTION SHAFT SUPPORT
2 - INNER GEAR
3 - OUTER GEAR

## OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

OIL PUMP (Continued)

## STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

**CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.**

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

## DISASSEMBLY

(1) Remove seal ring from housing and reaction shaft support (Fig. 98).

(2) Mark pump housing and support assembly for alignment reference.

(3) Remove bolts attaching pump body to support (Fig. 99).

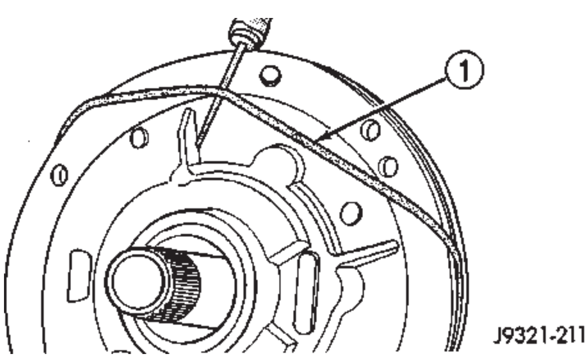

***Fig. 98 Removing Pump Seal Ring***

1 - PUMP HOUSING SEAL RING

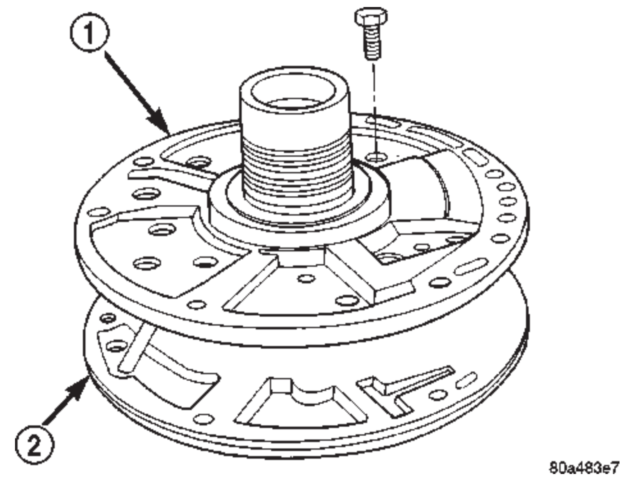

***Fig. 99 Pump Support Bolts***

1 - REACTION SHAFT SUPPORT
2 - PUMP

(4) Separate support from pump housing (Fig. 100).

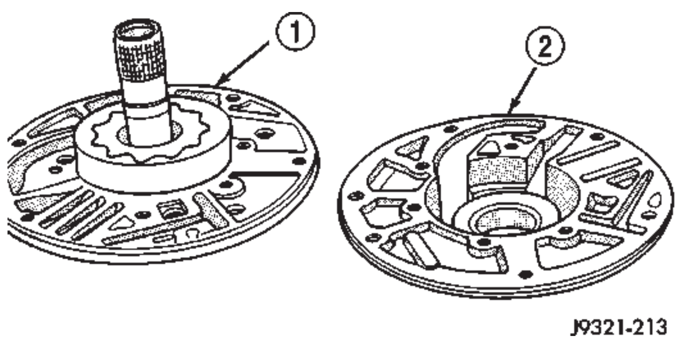

***Fig. 100 Separating Pump Housing From Reaction Shaft Support***

1 - REACTION SHAFT SUPPORT
2 - PUMP HOUSING

OIL PUMP (Continued)

(5) Remove inner and outer gears from reaction shaft support (Fig. 101).

(6) If pump seal was not removed during transmission disassembly, remove seal with punch and hammer.

(7) Remove front clutch thrust washer from support hub (Fig. 102).

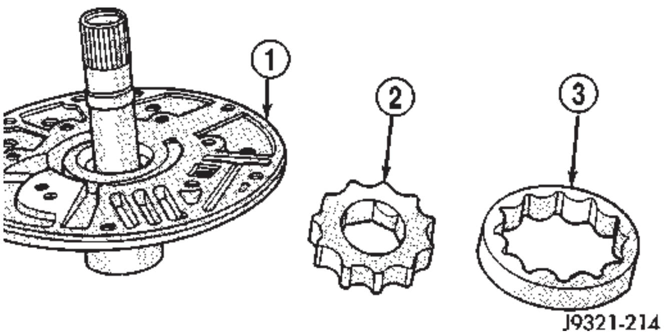

*Fig. 101 Pump Gear Removal*

4 - HUB

## OIL PUMP BUSHING REPLACEMENT

(1) Remove pump bushing with Tool Handle C-4171 and Bushing Remover SP-3551 from Tool Set C-3887-J (Fig. 103).

(2) Install new pump bushing with Tool Handle C-4171 and Bushing Installer SP-5117 (Fig. 103). Bushing should be flush with pump housing bore.

(3) Stake new pump bushing in two places with blunt punch (Fig. 104). Remove burrs from stake points with knife blade afterward.

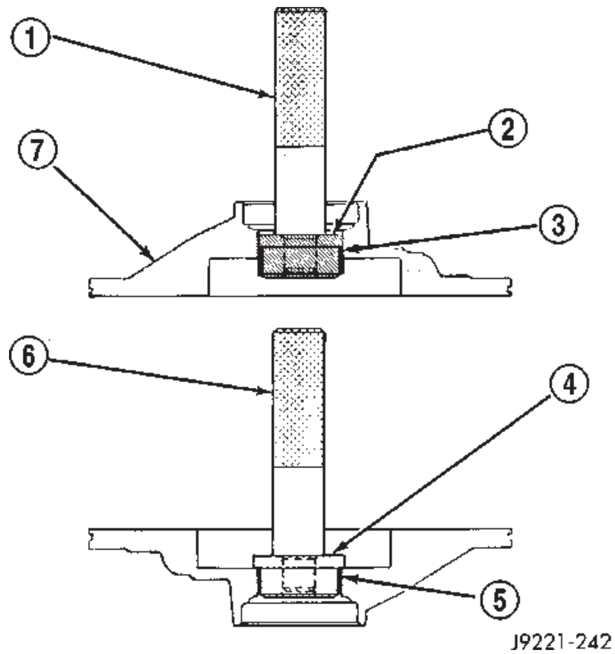

*Fig. 103 Removing Oil Pump Bushing*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL SP-3551

3 - TWO STAKES

OIL PUMP (Continued)

## REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Bushing Remover Tools SP-1191, 3633 and 5324 (Fig. 105). Do not clamp any part of reaction shaft or support in vise.

(2) Hold Cup Tool SP-3633 firmly against reaction shaft and thread remover SP-5324 into bushing as far as possible by hand. Then thread remover tool 3-4 additional turns into bushing with a wrench.

(3) Turn remover tool hex nut down against remover cup to pull bushing from shaft. Clean all chips from shaft after bushing removal.

(4) Lightly grip old bushing in vise or with pliers and back remover tool out of bushing.

(5) Assemble Bushing Installer Tools C-4171 and SP-5325 (Fig. 105).

(6) Slide new bushing onto Installer Tool SP-5325.

(7) Position reaction shaft support upright on a clean smooth surface.

(8) Align bushing in bore. Then tap bushing into place until Bushing Installer SP-5325 bottoms.

(9) Clean reaction shaft support thoroughly after installing bushing.

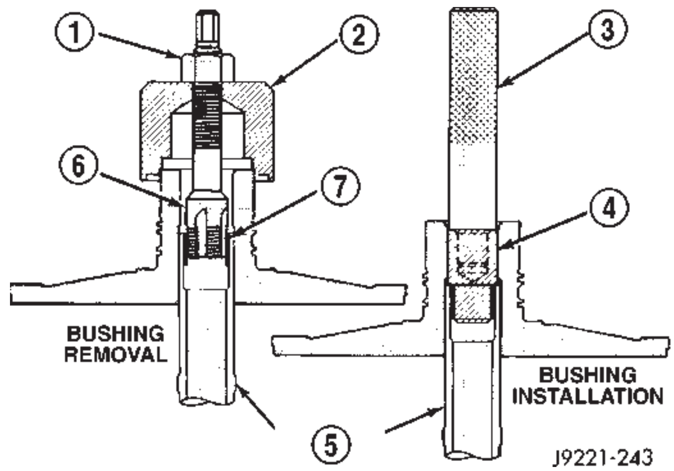

*Fig. 105 Replacing Reaction Shaft Support Bushing*

1 - SPECIAL TOOL SP-1191
2 - SPECIAL TOOL SP-3633
3 - SPECIAL TOOL C-4171
4 - SPECIAL TOOL SP-5325
5 - REACTION SHAFT
6 - SPECIAL TOOL SP-5324
7 - BUSHING

## CLEANING

Clean pump and support components with solvent and dry them with compressed air.

## INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

OIL PUMP (Continued)

## ASSEMBLY

(1) Lubricate gear bore in pump housing with transmission fluid.

(2) Lubricate pump gears with transmission fluid.

(3) Support pump housing on wood blocks (Fig. 106).

(4) Install outer gear in pump housing (Fig. 106). Gear can be installed either way (it is not a one-way fit).

(5) Install pump inner gear (Fig. 107).

**CAUTION: The pump inner gear is a one way fit. The bore on one side of the gear inside diameter (I.D.) is chamfered. Be sure the chamfered side faces forward (to front of pump).**

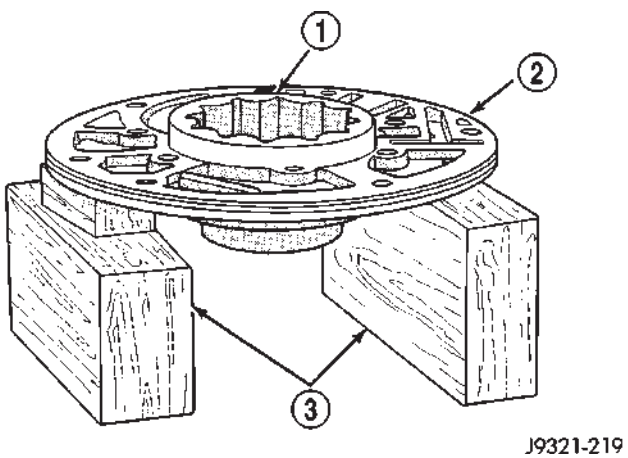

*Fig. 106 Supporting Pump And Installing Outer Gear*

1 - OUTER GEAR
2 - PUMP HOUSING
3 - WOOD BLOCKS

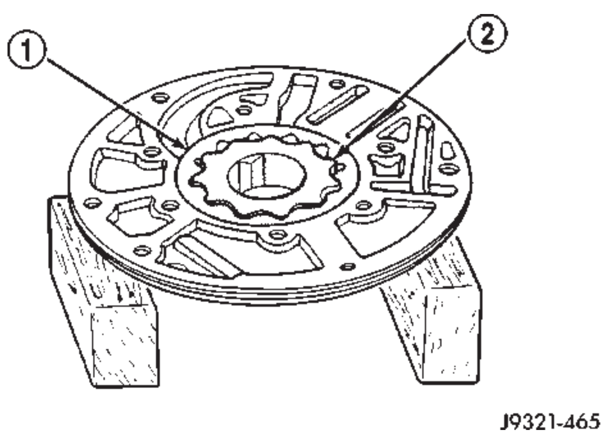

*Fig. 107 Pump Inner Gear Installation*

1 - OUTER GEAR
2 - INNER GEAR

(6) Install new thrust washer on hub of reaction shaft support. Lubricate washer with transmission fluid or petroleum jelly.

(7) If reaction shaft seal rings are being replaced, install new seal rings on support hub (Fig. 108). Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

**CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.**

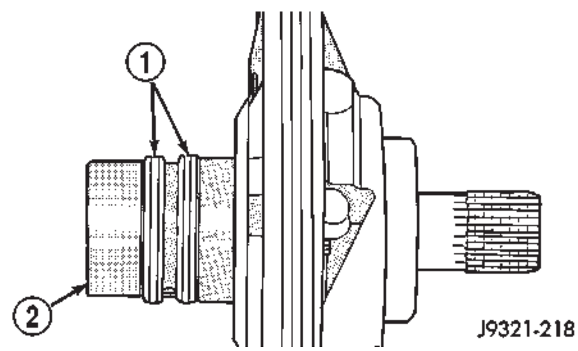

*Fig. 108 Hub Seal Ring Position*

1 - SEAL RINGS
2 - SUPPORT HUB

(8) Install reaction shaft support on pump housing (Fig. 109).

(9) Align reaction support on pump housing. Use alignment marks made at disassembly. Or, rotate support until bolt holes in support and pump housing are all aligned (holes are offset for one-way fit).

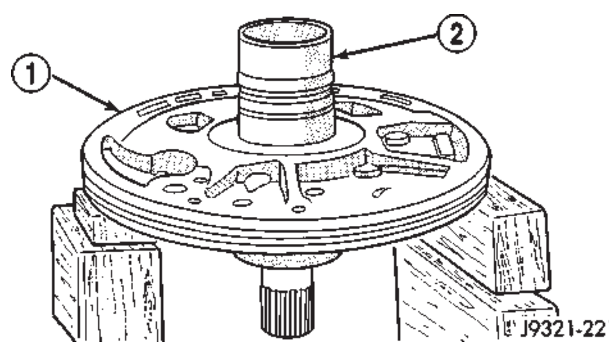

*Fig. 109 Assembling Reaction Shaft Support And Pump Housing*

1 - PUMP HOUSING
2 - REACTION SHAFT SUPPORT

OIL PUMP (Continued)

(10) Install all bolts that attach support to pump housing. Then tighten bolts finger tight.

(11) Tighten support-to-pump bolts to required torque as follows:

(a) Reverse pump assembly and install it in transmission case. Position pump so bolts are facing out and are accessible.

(b) Secure pump assembly in case with 2 or 3 bolts, or with pilot studs.

(c) Tighten support-to-pump bolts to 20 N·m (15 ft. lbs.).

(d) Remove pump assembly from transmission case.

(12) Install new oil seal in pump with Special Tool C-4193 and Tool Handle C-4171 (Fig. 110). Be sure seal lip faces inward.

(13) Install new seal ring around pump housing. Be sure seal is properly seated in groove.

(14) Lubricate lip of pump oil seal and O-ring seal with transmission fluid.

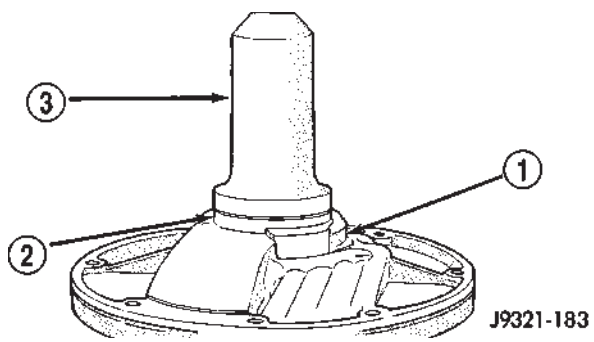

*Fig. 110 Pump Oil Seal Installation*

2 - PUMP SEAL
3 - SPECIAL TOOL C-4193

# OUTPUT SHAFT FRONT BEARING

## REMOVAL

(1) Remove overdrive unit from the vehicle.

(2) Remove overdrive geartrain from housing.

(3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 111).

(4) Pull bearing from output shaft.

## INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.

(2) Push bearing onto shaft until the snap-ring groove is visible.

(3) Install snap-ring to hold bearing onto output shaft.

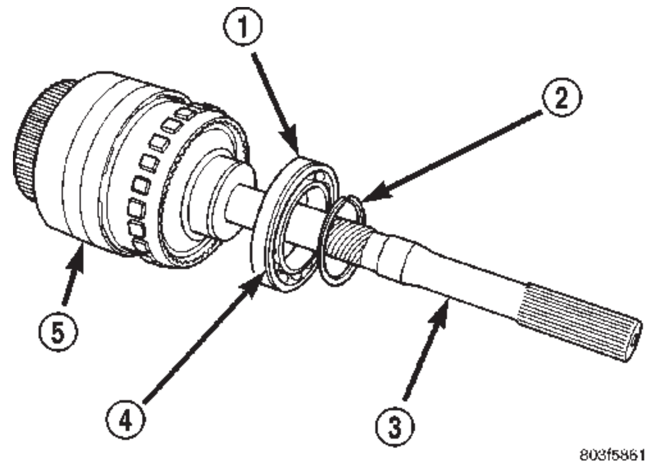

*Fig. 111 Output Shaft Front Bearing*

1 - OUTPUT SHAFT FRONT BEARING
2 - SNAP-RING
3 - OUTPUT SHAFT
4 - GROOVE TO REAR
5 - OVERDRIVE GEARTRAIN

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

# OUTPUT SHAFT REAR BEARING

## REMOVAL

(1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/OVERDRIVE - REMOVAL)

(2) Remove overdrive geartrain from housing.

(3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 112).

(4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

## INSTALLATION

(1) Place replacement bearing in position in housing.

(2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.

(3) Install snap-ring to hold bearing into housing (Fig. 112).

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

OUTPUT SHAFT REAR BEARING (Continued)

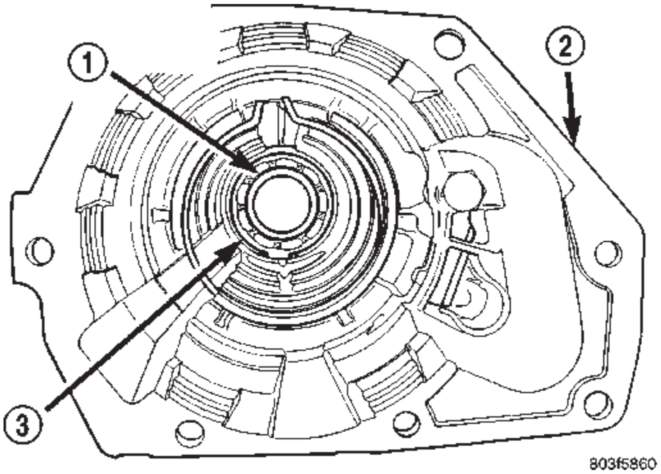

*Fig. 112 Output Shaft Rear Bearing*

1 - OUTPUT SHAFT REAR BEARING
2 - OVERDRIVE HOUSING
3 - SNAP-RING

# OVERDRIVE CLUTCH

## DESCRIPTION

The overdrive clutch (Fig. 113) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

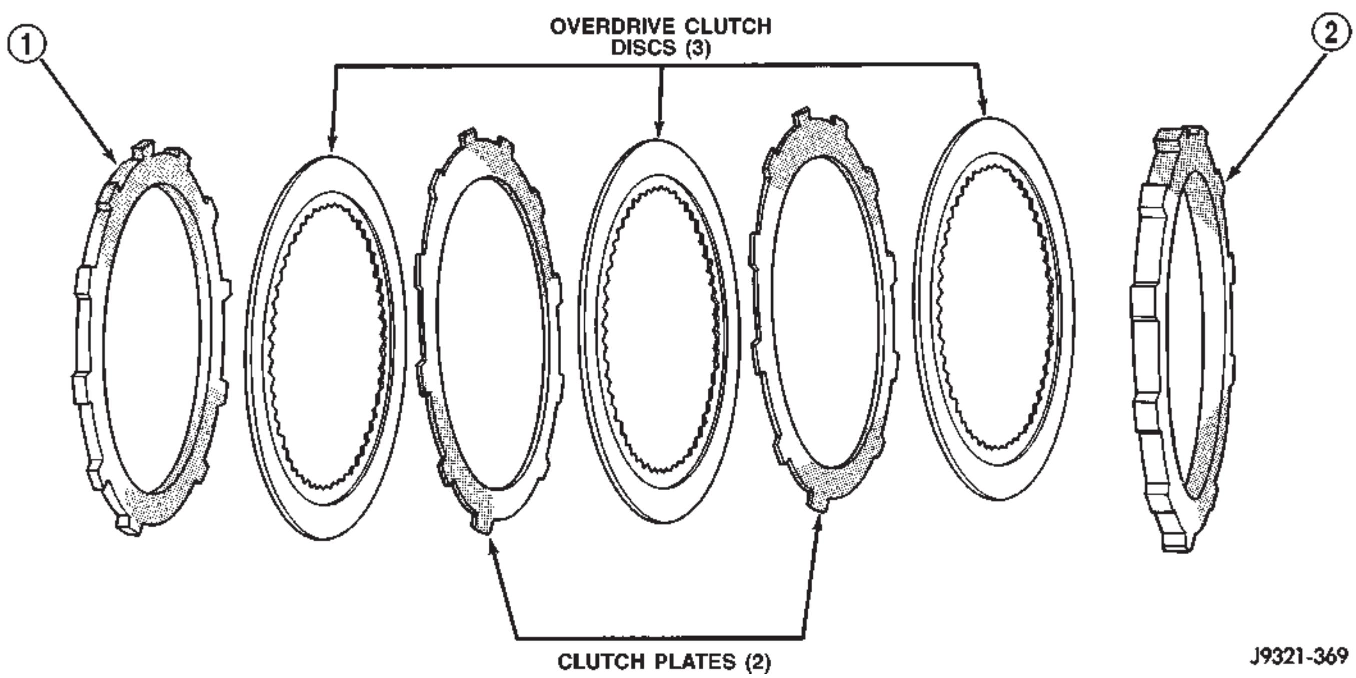

*Fig. 113 Overdrive Clutch*

1 - REACTION PLATE
2 - PRESSURE PLATE

# OVERDRIVE OFF SWITCH

## DESCRIPTION

The overdrive OFF (control) switch is located in the shift lever arm (Fig. 114). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

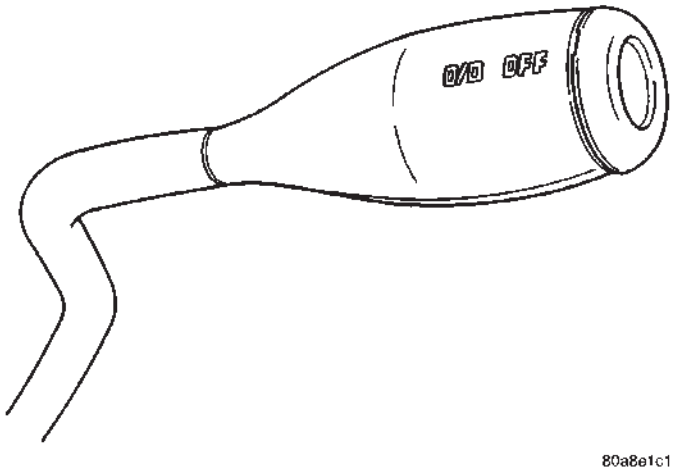

*Fig. 114 Overdrive Off Switch*

## OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

## DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

## REMOVAL

(1) Using a plastic trim tool, remove the overdrive off switch retainer from the shift lever (Fig. 115).

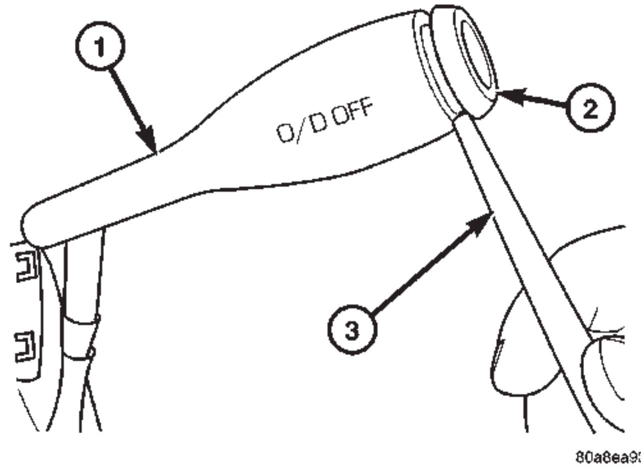

*Fig. 115 Overdrive Off Switch Retainer*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH RETAINER
3 - PLASTIC TRIM TOOL

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 116)

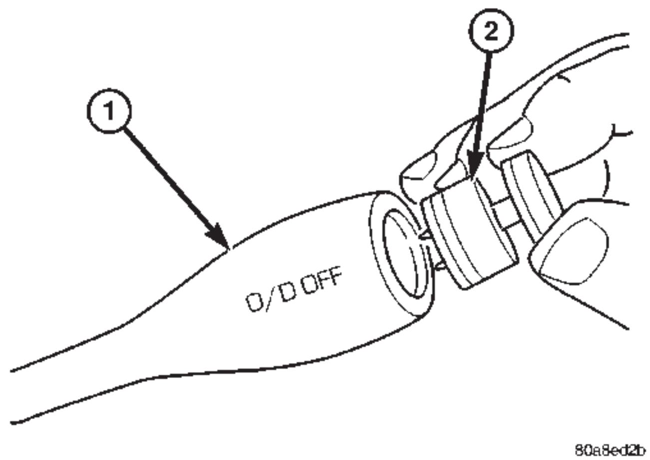

*Fig. 116 Remove the Overdrive Off Switch*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH

## INSTALLATION

**NOTE: There is enough slack in the wire to pull out the connector from the lever.**

(1) Pull the connector out of the lever just enough to grasp it.

**CAUTION: Be careful not to bend the pins on the overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.**

OVERDRIVE OFF SWITCH (Continued)

(2) Install the overdrive off switch into the connector (Fig. 117)

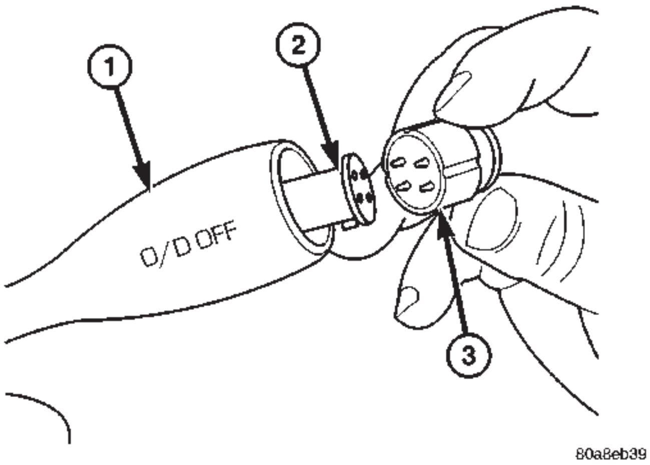

***Fig. 117 Install the Overdrive Off Switch***

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH WIRING CONNECTOR
3 - OVERDRIVE OFF SWITCH

(3) Push the overdrive off switch and wiring into the shift lever.

(4) Install the overdrive off switch retainer onto the shift lever.

# OVERDRIVE UNIT

## REMOVAL

(1) Shift transmission into PARK.

(2) Raise vehicle.

(3) Remove transfer case, if equipped.

(4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if neccesary.

(5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.

(7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.

(8) Support transmission with transmission jack.

(9) Remove bolts attaching overdrive unit to transmission (Fig. 118).

**CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.**

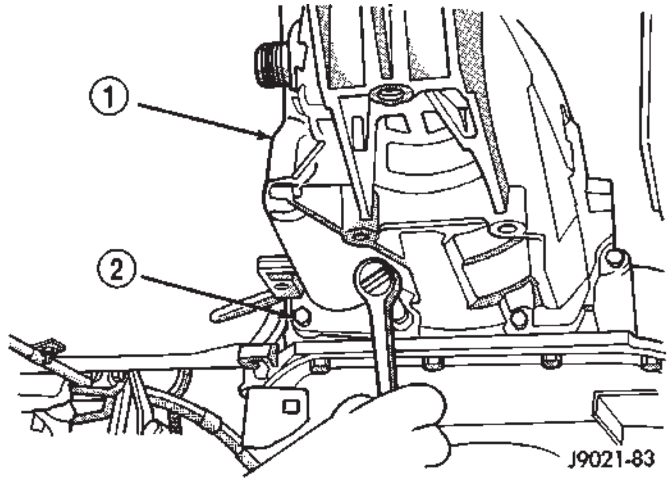

***Fig. 118 Overdrive Unit Bolts***

1 - OVERDRIVE UNIT
2 - ATTACHING BOLTS (7)

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

OVERDRIVE UNIT (Continued)

## DISASSEMBLY

(1) Remove transmission speed sensor and O-ring seal from overdrive case (Fig. 119).

(2) Remove overdrive piston thrust bearing (Fig. 120).

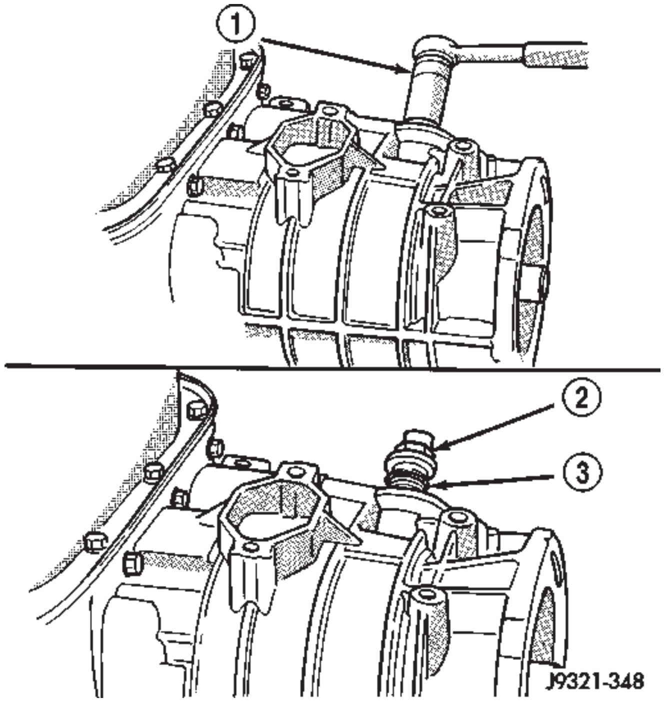

*Fig. 119 Transmission Speed Sensor Removal*

1 - SOCKET AND WRENCH
2 - SPEED SENSOR
3 - O-RING

(6) Lift gear case up and off geartrain assembly (Fig. 132).

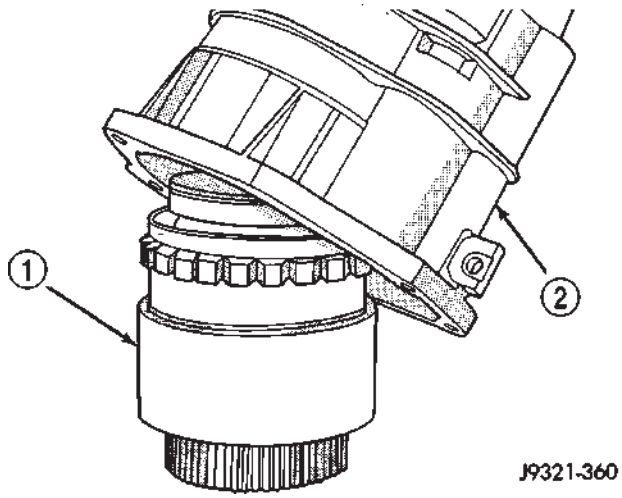

*Fig. 132 Removing Gear Case From Geartrain Assembly*

1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

(7) Remove snap-ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 133).

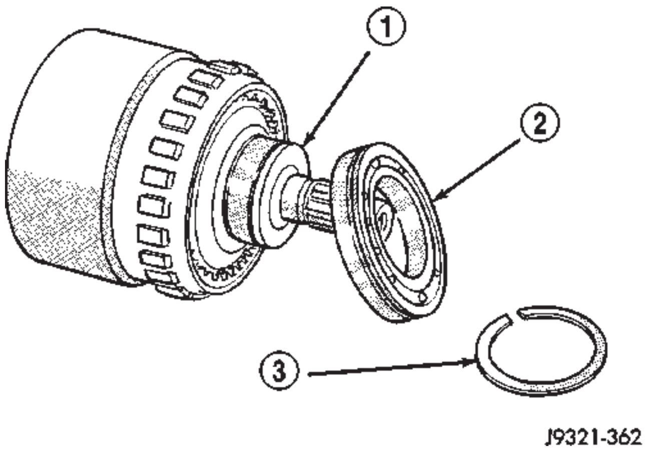

*Fig. 133 Rear Bearing Removal*

1 - OUTPUT SHAFT
2 - REAR BEARING
3 - SNAP-RING

## DIRECT CLUTCH, HUB AND SPRING

**WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(1) Mount geartrain assembly in shop press (Fig. 134).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 134). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 134).

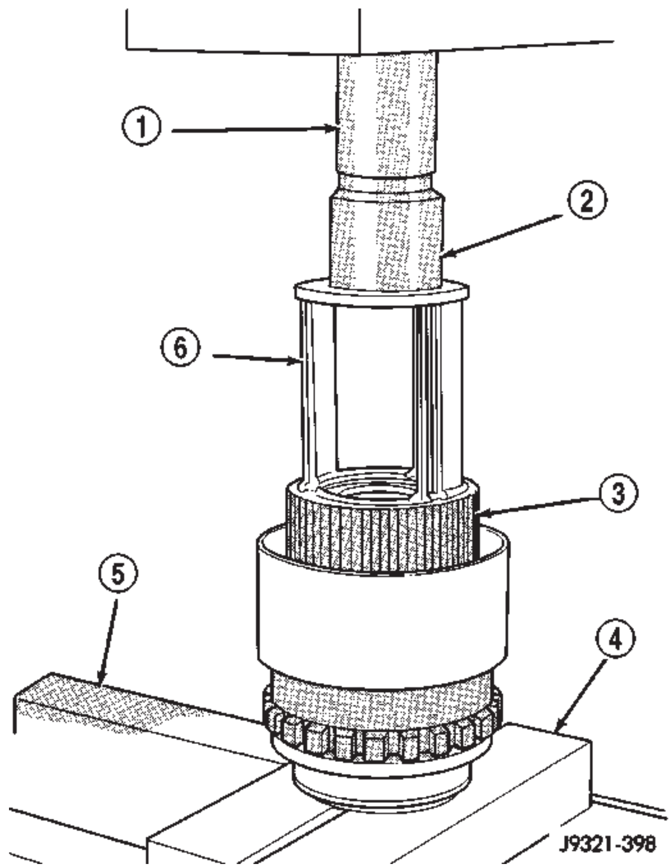

*Fig. 134 Geartrain Mounted In Shop Press*

2 - ANNULUS GEAR

## GEAR CASE AND PARK LOCK

(1) Remove locating ring from gear case.

(2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.

(3) Remove reaction plug snap-ring and remove reaction plug.

(4) Remove output shaft seal.

## CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

## INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

OVERDRIVE UNIT (Continued)

## ASSEMBLY

### GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 147). Lubricate bushings with petroleum jelly, or transmission fluid.

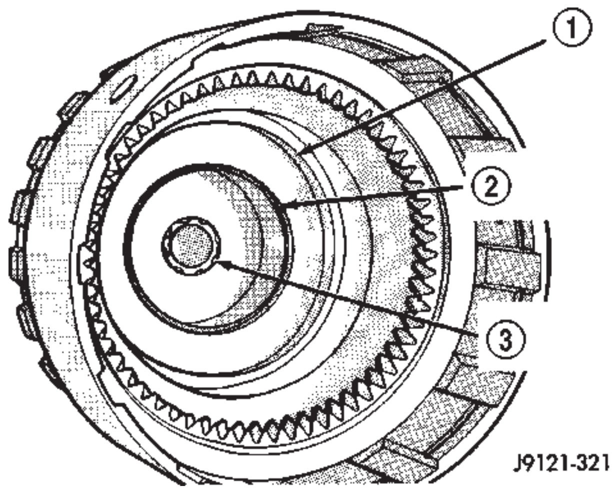

***Fig. 147 Output Shaft Pilot Bushing***

1 - OUTPUT SHAFT HUB
2 - OVERRUNNING CLUTCH HUB BUSHING
3 - INTERMEDIATE SHAFT PILOT BUSHING

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 148).

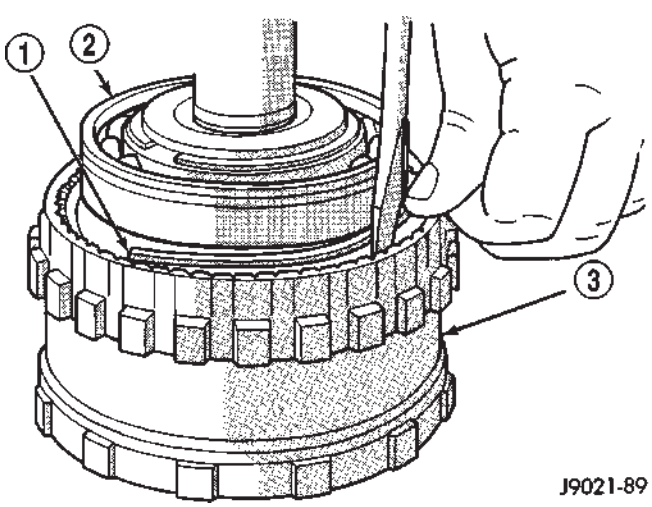

***Fig. 148 Annulus Gear Installation***

1 - SNAP-RING
2 - OUTPUT SHAFT FRONT BEARING
3 - ANNULUS GEAR

(4) Align and install clutch drum on annulus gear (Fig. 149). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 149).

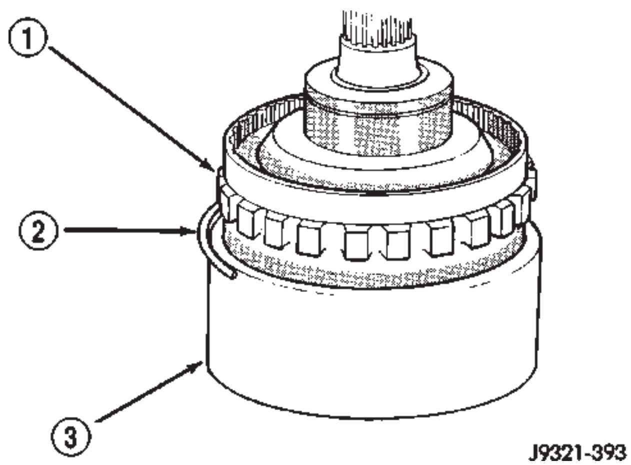

***Fig. 149 Clutch Drum And Outer Retaining Ring Installation***

1 - ANNULUS GEAR
2 - OUTER SNAP-RING
3 - CLUTCH DRUM

(6) Slide clutch drum forward and install inner retaining ring (Fig. 150).

(7) Install rear bearing and snap-ring on output shaft (Fig. 151). Be sure locating ring groove in bearing is toward rear.

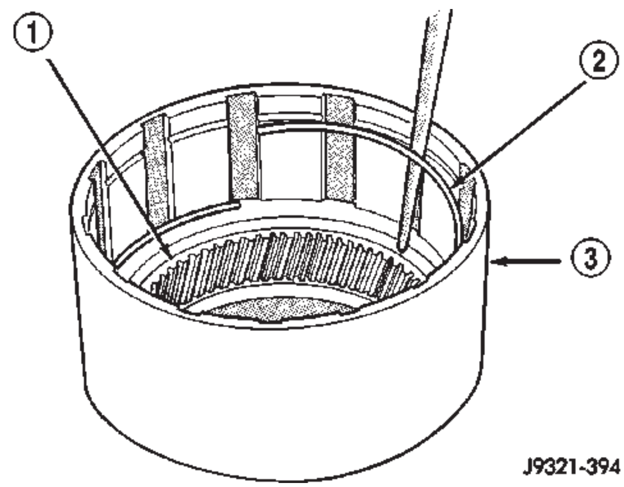

***Fig. 150 Clutch Drum Inner Retaining Ring Installation***

1 - ANNULUS GEAR
2 - INNER SNAP-RING
3 - CLUTCH DRUM

OVERDRIVE UNIT (Continued)

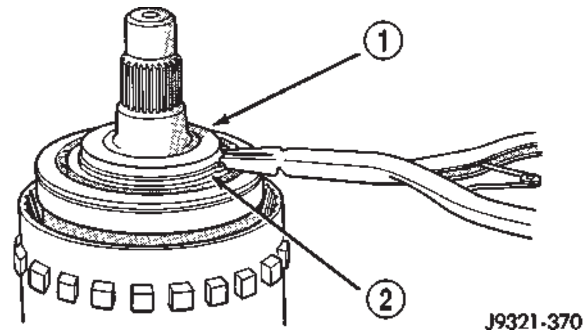

*Fig. 151 Rear Bearing And Snap-Ring Installation*

1 - REAR BEARING
2 - SNAP-RING

(8) Install overrunning clutch on hub (Fig. 152). Note that clutch only fits one-way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one-way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

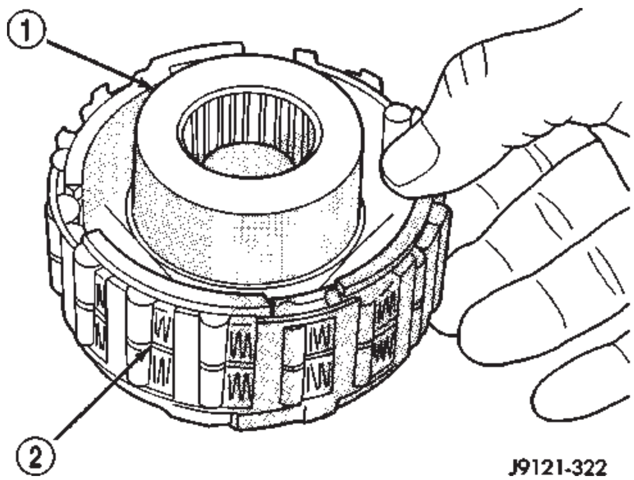

*Fig. 152 Assembling Overrunning Clutch And Hub*

1 - CLUTCH HUB
2 - OVERRUNNING CLUTCH

(10) Install overrunning clutch in output shaft (Fig. 153). Insert snap-ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 154). Be sure planetary pinions are fully seated in annulus gear before proceeding.

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

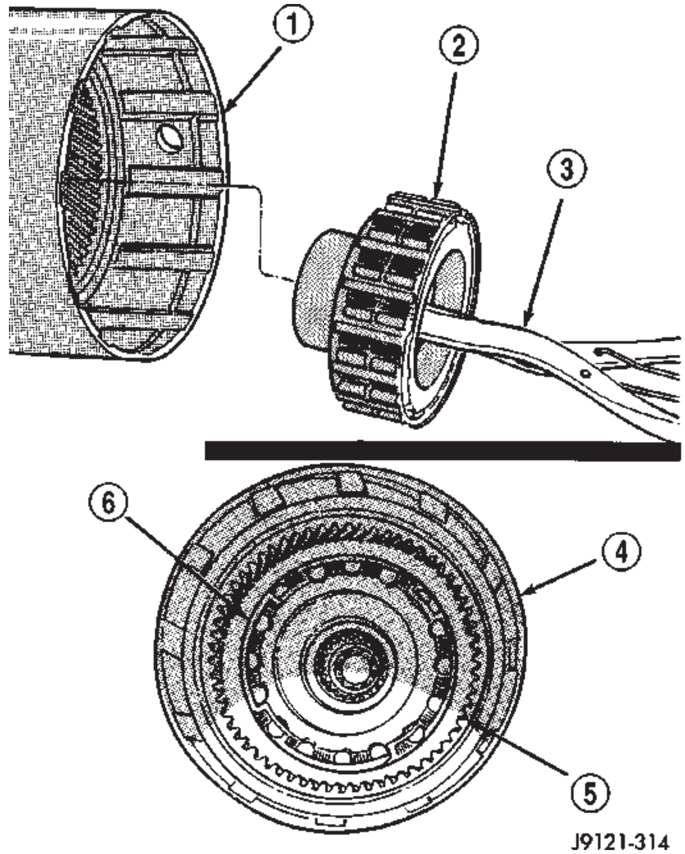

*Fig. 153 Overrunning Clutch Installation*

1 - CLUTCH DRUM
2 - OVERRUNNING CLUTCH ASSEMBLY

5 - ANNULUS GEAR
6 - OVERRUNNING CLUTCH ASSEMBLY SEATED IN OUTPUT SHAFT

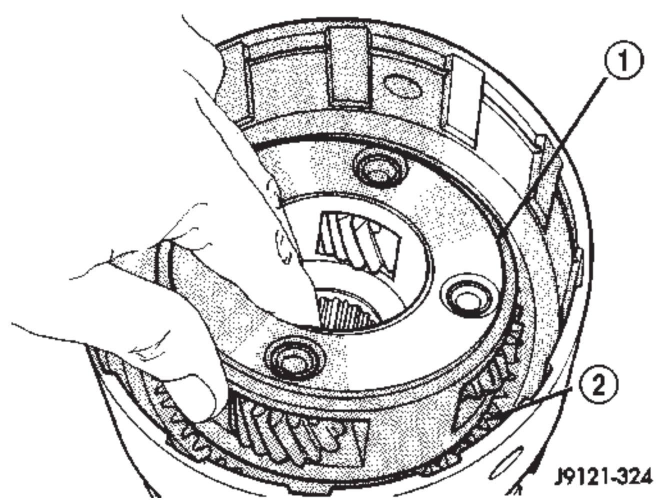

*Fig. 154 Planetary Gear Installation*

1 - PLANETARY GEAR
2 - ANNULUS GEAR

OVERDRIVE UNIT (Continued)

(13) Install planetary thrust bearing on sun gear (Fig. 155). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one-way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 156). Be sure sun gear and thrust bearing are fully seated before proceeding.

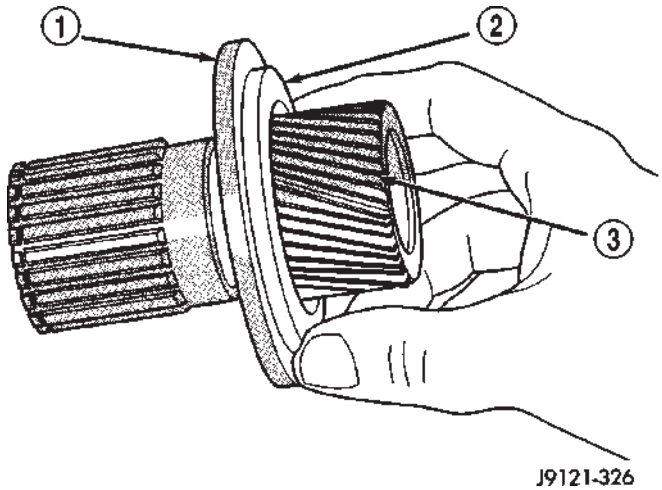

***Fig. 155 Planetary Thrust Bearing Installation***

1 - SPRING PLATE
2 - PLANETARY THRUST BEARING
3 - SUN GEAR

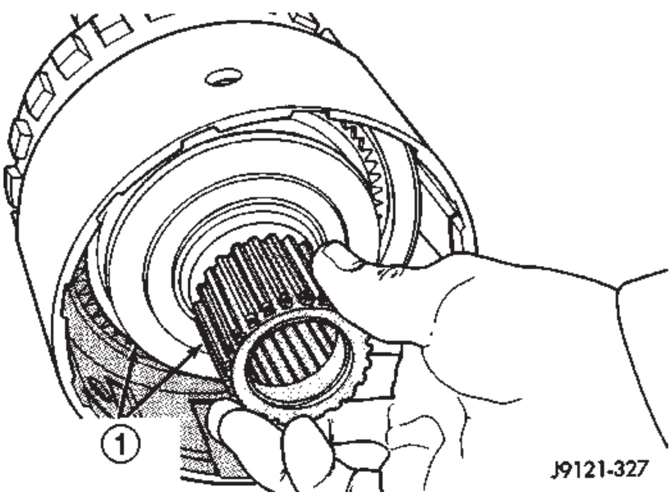

***Fig. 156 Sun Gear Installation***

1 - SUN GEAR AND SPRING PLATE ASSEMBLY

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 157). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 158). Be sure spring is properly seated on spring plate.

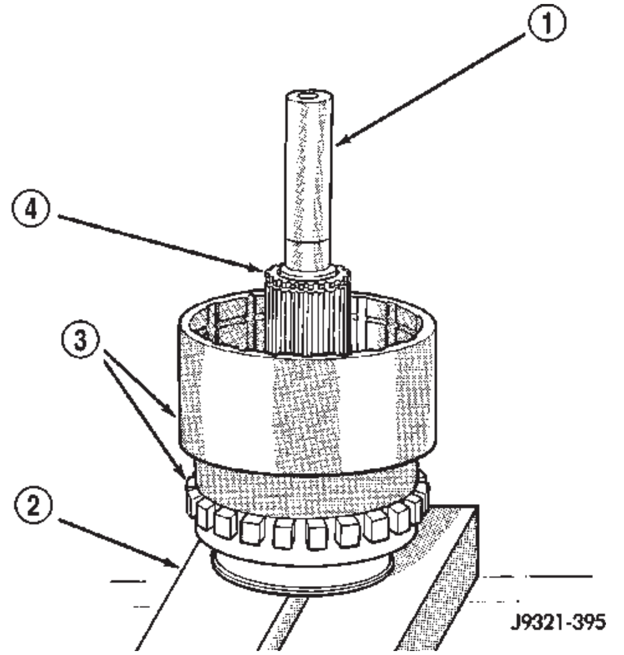

***Fig. 157 Alignment Tool Installation***

1 - SPECIAL TOOL 6227-2
2 - PRESS PLATES
3 - ASSEMBLED DRUM AND ANNULUS GEAR

2 - DIRECT CLUTCH SPRING
3 - CLUTCH HUB
4 - PRESS PLATES

OVERDRIVE UNIT (Continued)

**NOTE: The 42RE transmission has 6 direct clutch discs and 5 clutch plates.**

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 159).

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 160).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 161).

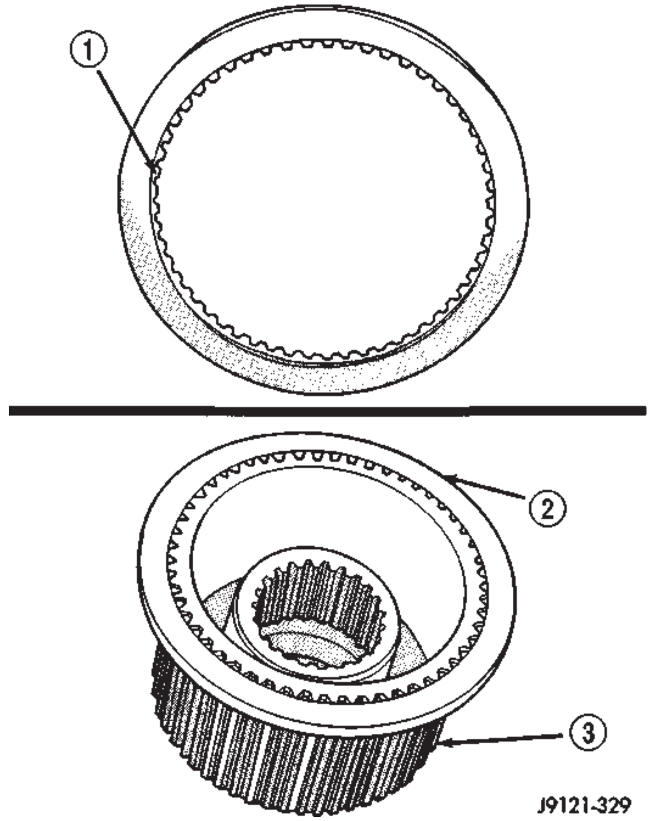

***Fig. 160 Correct Position Of Direct Clutch Reaction Plate***

1 - REACTION PLATE COUNTERBORE

2 - DIRECT CLUTCH REACTION PLATE (FLUSH WITH END OF HUB)

3 - CLUTCH HUB

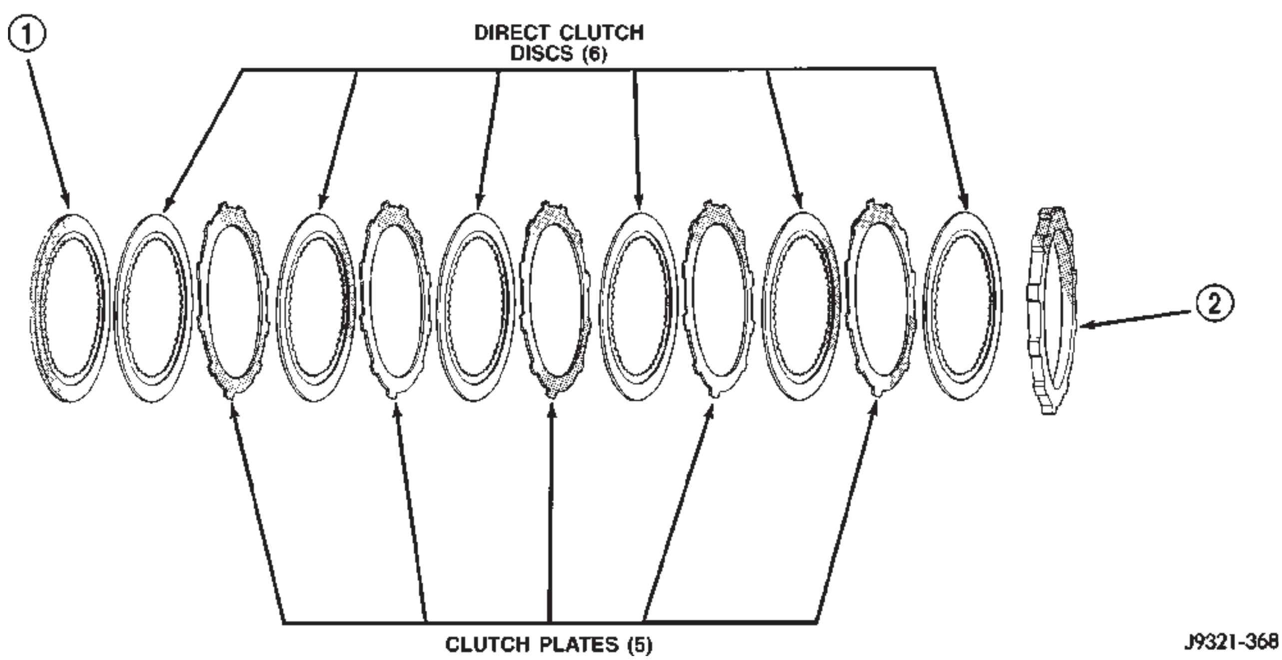

***Fig. 159 42RE Direct Clutch Pack Components***

1 - REACTION PLATE

2 - PRESSURE PLATE

OVERDRIVE UNIT (Continued)

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 162). Be sure hub is started on sun gear splines before proceeding.

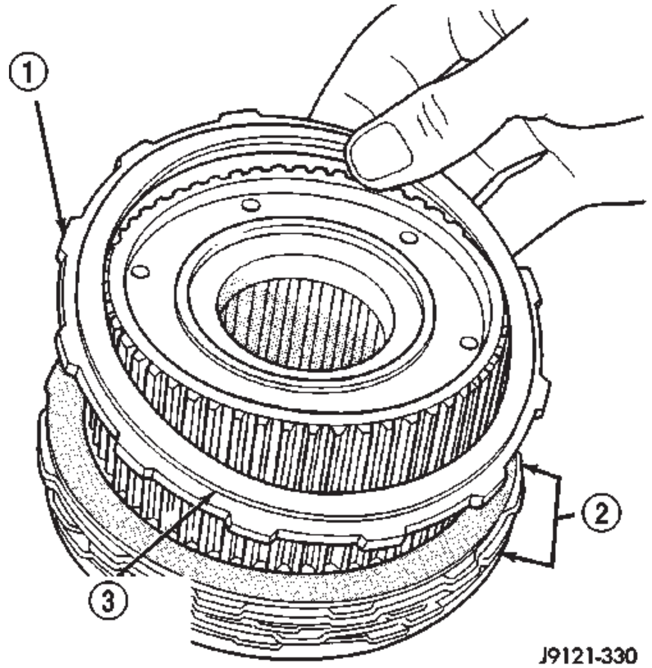

*Fig. 161 Correct Position Of Direct Clutch Pressure Plate*

1 - DIRECT CLUTCH PRESSURE PLATE
2 - CLUTCH PACK
3 - BE SURE SHOULDER SIDE OF PLATE FACES UPWARD

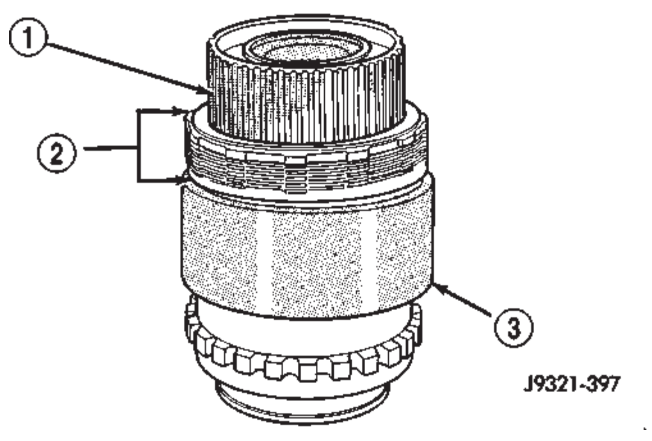

*Fig. 162 Direct Clutch*

1 - CLUTCH HUB
2 - DIRECT CLUTCH PACK
3 - CLUTCH DRUM

**WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap-ring (Fig. 163). Be very sure snap-ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 164). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

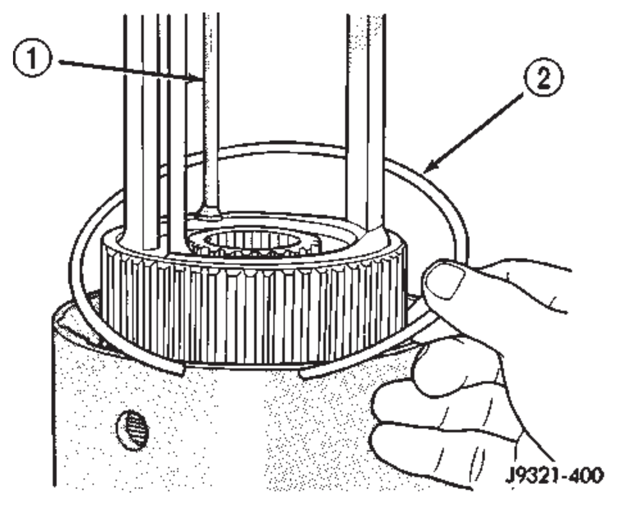

*Fig. 163 Direct Clutch Pack Snap-Ring Installation*

1 - SPECIAL TOOL 6227-1
2 - DIRECT CLUTCH PACK SNAP-RING

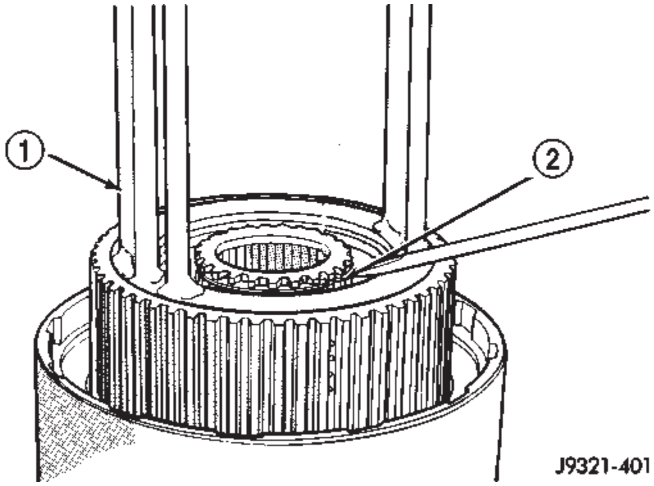

*Fig. 164 Clutch Hub Retaining Ring Installation*

1 - SPECIAL TOOL 6227-1
2 - CLUTCH HUB RETAINING RING

## GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 165). Be sure pin is seated in hole in case before installing snap-ring.

(4) Install reaction plug snap-ring (Fig. 166). Compress snap ring only enough for installation; do not distort it.

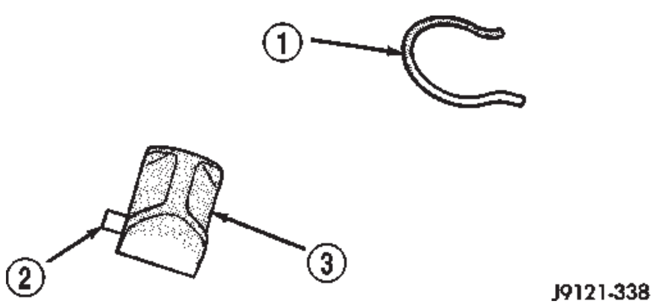

*Fig. 165 Reaction Plug Locating Pin And Snap-Ring*

1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)
2 - LOCATING PIN
3 - PARK LOCK REACTION PLUG

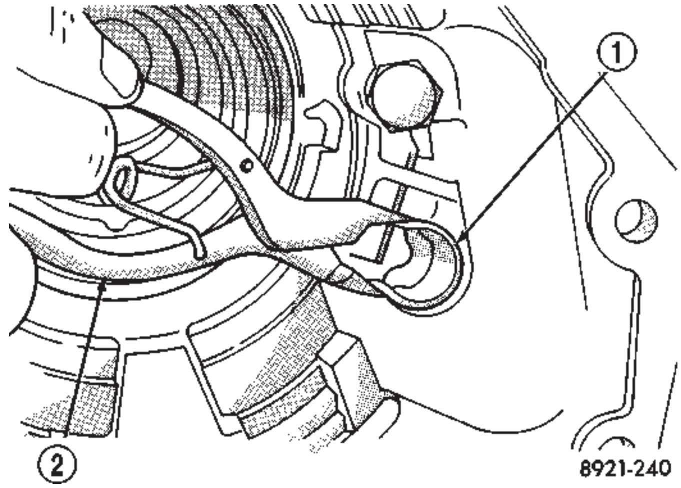

*Fig. 166 Reaction Plug And Snap-Ring Installation*

1 - REACTION PLUG SNAP-RING
2 - SNAP-RING PLIERS

(5) Install new seal in gear case. On 4x4 gear case, use Tool Handle C-4171 and Installer C-3860-A to seat seal in case. On 4 x 2 gear case, use same Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 167).

(7) Support geartrain on Tool 6227-1 (Fig. 168). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 168).

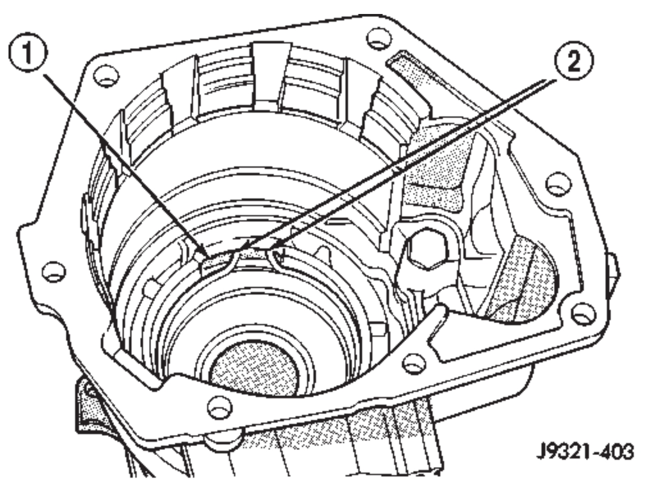

*Fig. 167 Correct Rear Bearing Locating Ring Position*

1 - CASE ACCESS HOLE
2 - TAB ENDS OF LOCATING RING

OVERDRIVE UNIT (Continued)

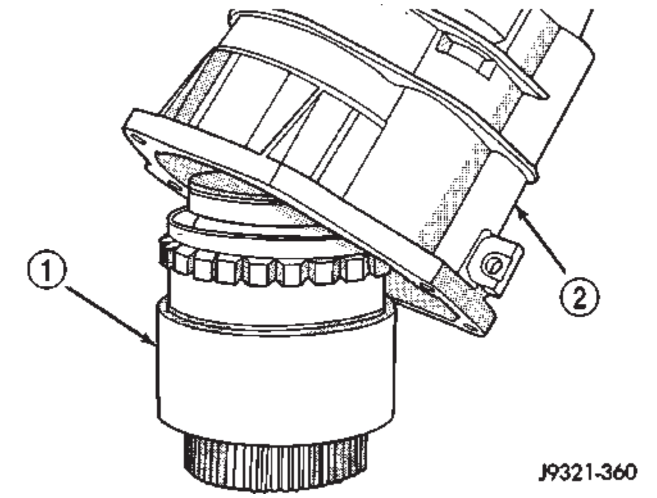

***Fig. 168 Overdrive Gear Case Installation***

1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

(9) Expand front bearing locating ring with snap-ring pliers (Fig. 169). Then slide case downward until locating ring locks in bearing groove and release snap-ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 170).

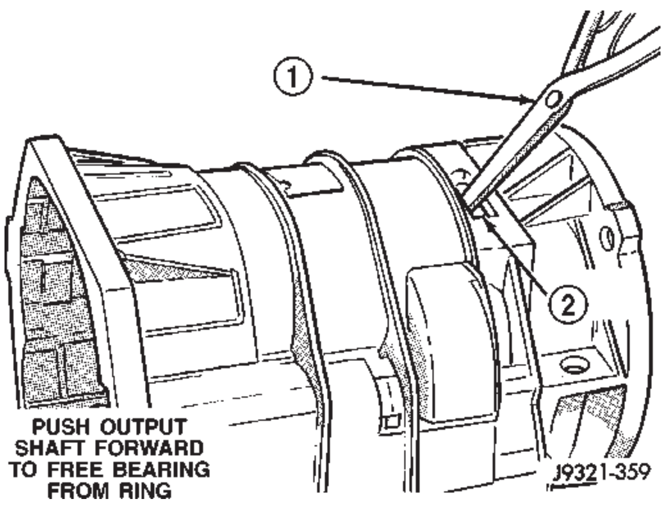

***Fig. 169 Seating Locating Ring In Rear Bearing***

1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

## OVERDRIVE CLUTCH

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 171).

(2) Install wave spring on top of reaction ring (Fig. 172). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

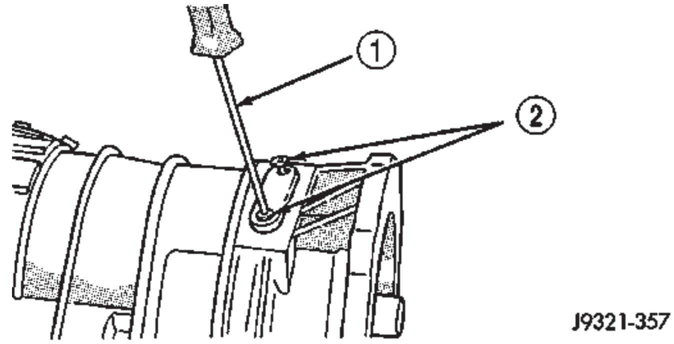

***Fig. 170 Locating Ring Access Cover And Gasket Installation***

1 - TORX SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

**NOTE: The 42RE transmission has 3 overdrive clutch discs and 2 plates.**

(3) Assemble overdrive clutch pack (Fig. 173).

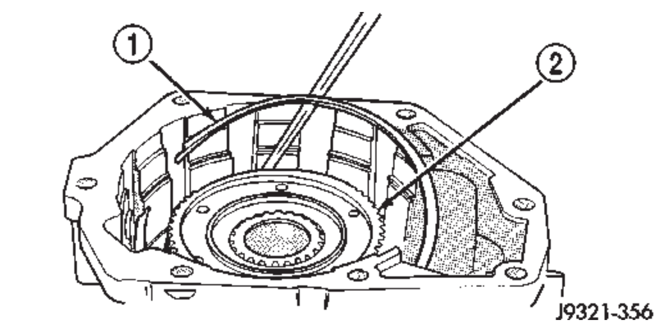

***Fig. 171 Overdrive Clutch Reaction Ring Installation***

1 - REACTION RING
2 - CLUTCH HUB

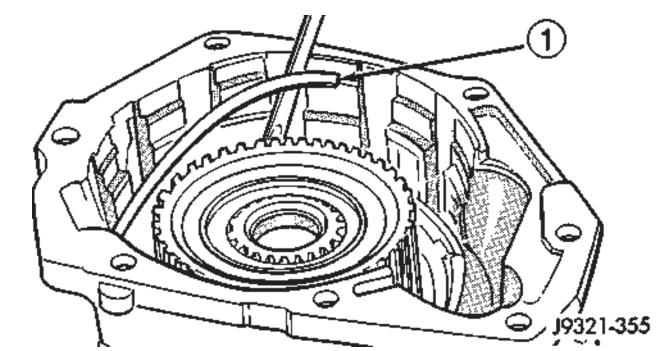

***Fig. 172 Overdrive Clutch Wave Spring Installation***

1 - WAVE SPRING

(4) Install overdrive clutch reaction plate first.

**NOTE: The reaction plate is thinner than the pressure plate in a 42RE transmission.**

OVERDRIVE UNIT (Continued)

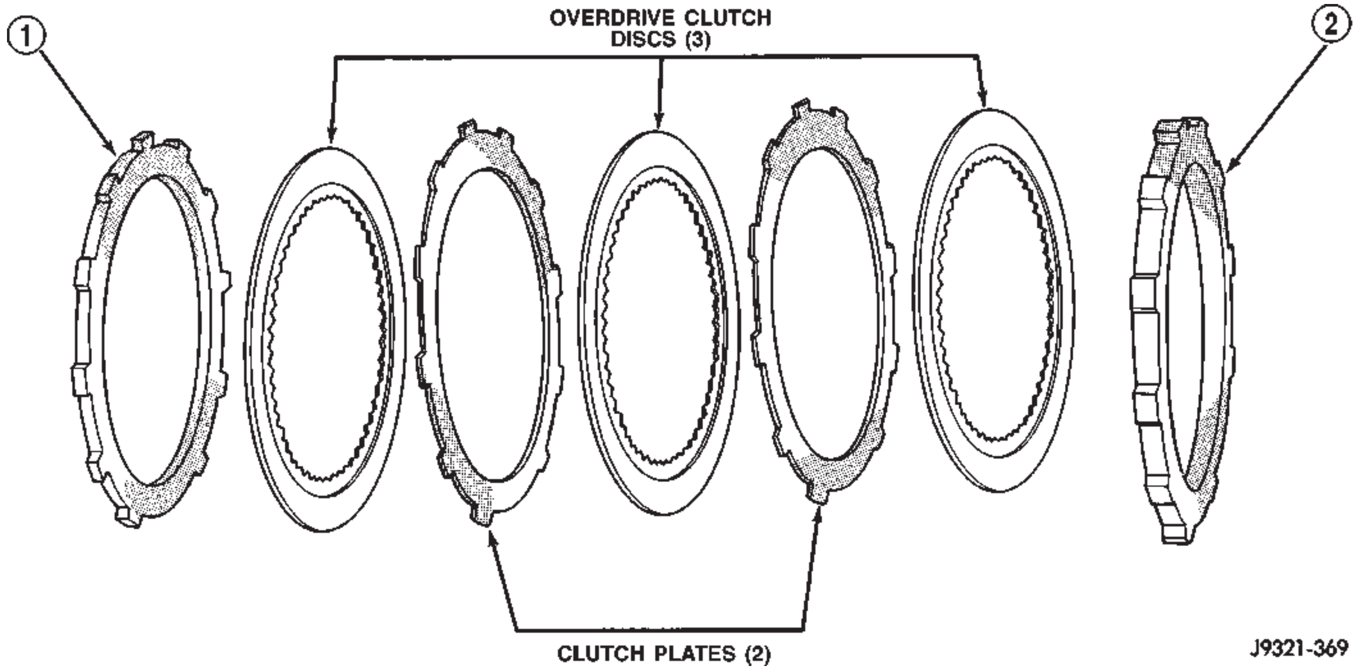

*Fig. 173 42RE Overdrive Clutch Components*

1 - REACTION PLATE
2 - PRESSURE PLATE

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 174).

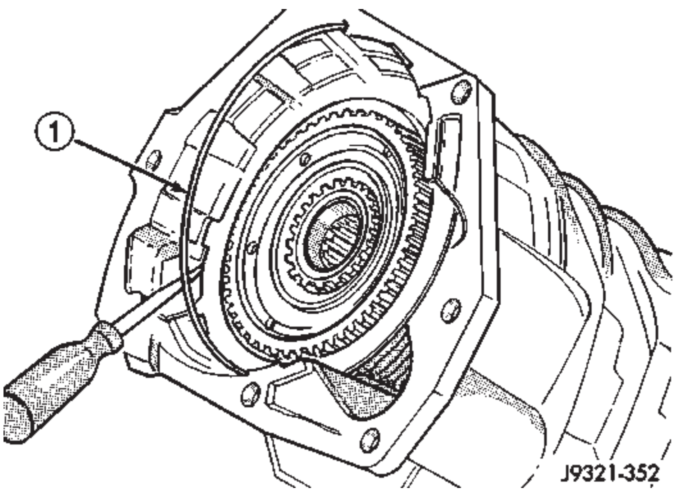

*Fig. 174 Overdrive Clutch Pack Retaining Ring Installation*

1 - OVERDRIVE CLUTCH PACK RETAINING RING

## INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 175). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 175).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 176).

(e) Remove Gauge Alignment Tool 6312.

## OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size

OVERDRIVE UNIT (Continued)

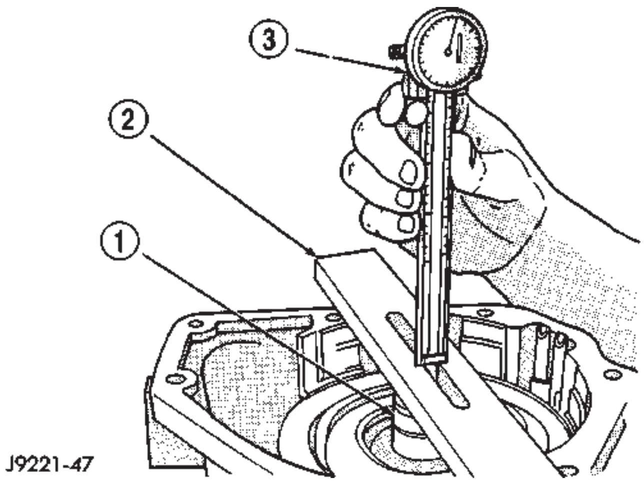

*Fig. 175 Shaft End Play Measurement*

1 - SPECIAL TOOL 6312
2 - SPECIAL TOOL 6311
3 - SPECIAL TOOL C-4962

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| .7336 - .7505 | .158 - .159 |
| .7506 - .7675 | .175 - .176 |
| .7676 - .7855 | .193 - .194 |
| .7856 - .8011 | .211 - .212 |

*Fig. 176 Intermediate Shaft End Play Spacer Selection*

mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 177).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 178).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

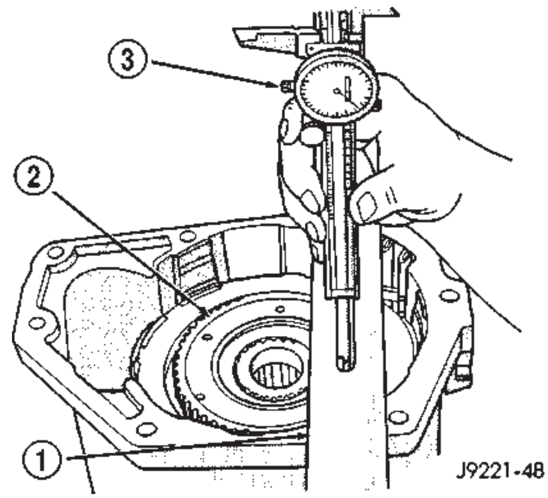

*Fig. 177 Overdrive Piston Thrust Plate Measurement*

1 - SPECIAL TOOL 6311
2 - DIRECT CLUTCH HUB THRUST BEARING SEAT
3 - SPECIAL TOOL C-4962

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| 1.7500 - 1.7649 | .108 - .110 |
| 1.7650 - 1.7799 | .123 - .125 |
| 1.7800 - 1.7949 | .138 - .140 |
| 1.7950 - 1.8099 | .153 - .155 |

J9121-342

*Fig. 178 Overdrive Piston Thrust Plate Selection*

## OVERDRIVE PISTON

(1) Install new seals on over drive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

OVERDRIVE UNIT (Continued)

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case (Fig. 119).

## INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 179).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

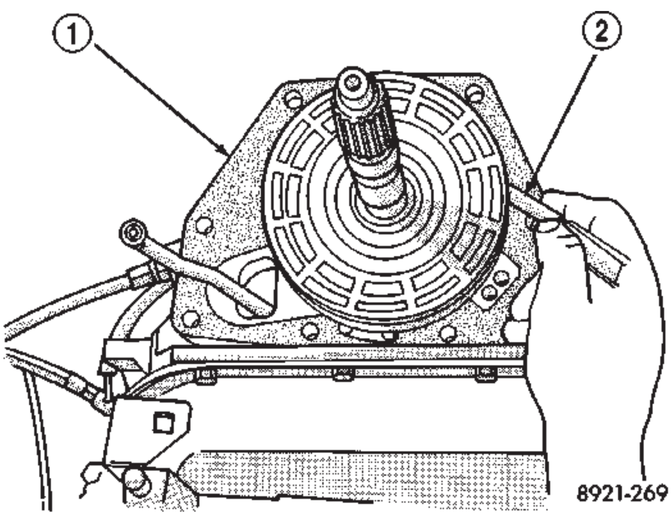

*Fig. 179 Trimming Overdrive Case Gasket*

1 - GASKET
2 - SHARP KNIFE

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 180).

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

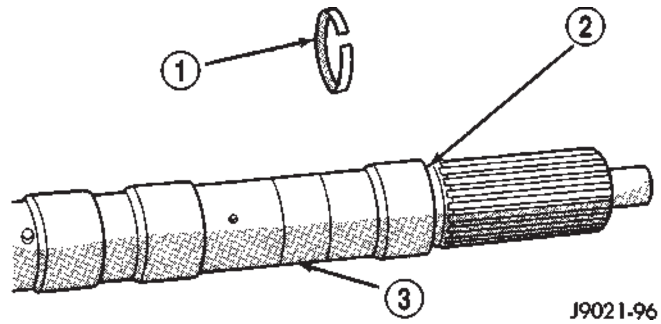

*Fig. 180 Intermediate Shaft Selective Spacer Location*

1 - SELECTIVE SPACER
2 - SPACER GROOVE
3 - INTERMEDIATE SHAFT

**CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.**

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

# OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

## DESCRIPTION

The overrunning clutch (Fig. 181) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

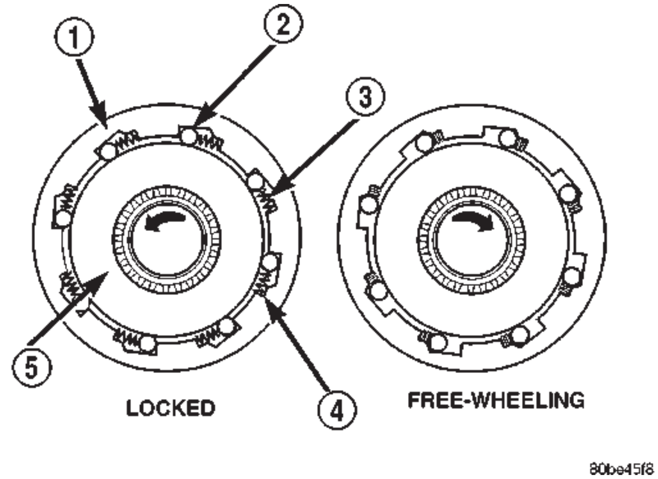

*Fig. 181 Overrunning Clutch*

1 - OUTER RACE (CAM)
2 - ROLLER
3 - SPRING
4 - SPRING RETAINER
5 - INNER RACE (HUB)

## OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a freewheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

## DISASSEMBLY

**NOTE: To service the overrunning clutch cam and the overdrive piston retainer, the transmission geartrain and the overdrive unit must be removed from the transmission.**

(1) Remove the overdrive piston (Fig. 182).
(2) Remove the overdrive piston retainer bolts.
(3) Remove overdrive piston retainer.
(4) Remove case gasket.
(5) Mark the position of the overrunning clutch cam in the case (Fig. 183).
(6) Remove the overrunning clutch cam bolts.
(7) Remove the overrunning clutch cam.

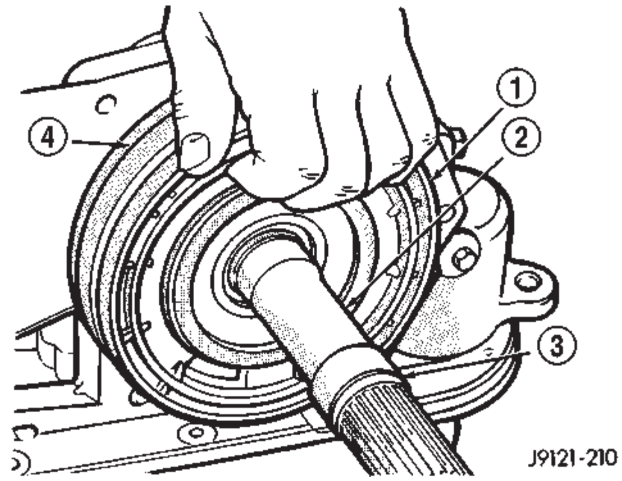

*Fig. 182 Overdrive Piston Removal*

1 - OVERDRIVE CLUTCH PISTON

2 - OVERRUNNING CLUTCH ASSEMBLY

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

## CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

## ASSEMBLY

(1) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 184). This hole must align with blank area in clutch cam bolt circle (Fig. 185). Mark hole location on clutch cam and blank area in case with grease pencil, paint stripe, or scribe mark for assembly reference.

(2) Mark location of non-threaded hole in clutch cam and blank area in bolt circle with grease pencil.

(3) Align and install overrunning clutch and cam in case (Fig. 186). Be sure cam is correctly installed. Bolt holes in cam are slightly countersunk on one side. Be sure this side of cam faces rearward (toward piston retainer).

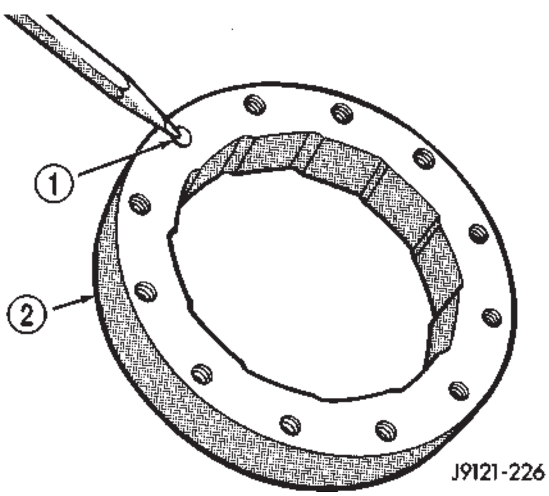

*Fig. 184 Location Of Non-Threaded Hole In Clutch Cam*

1 - NON-THREADED HOLE
2 - OVERRUNNING CLUTCH CAM

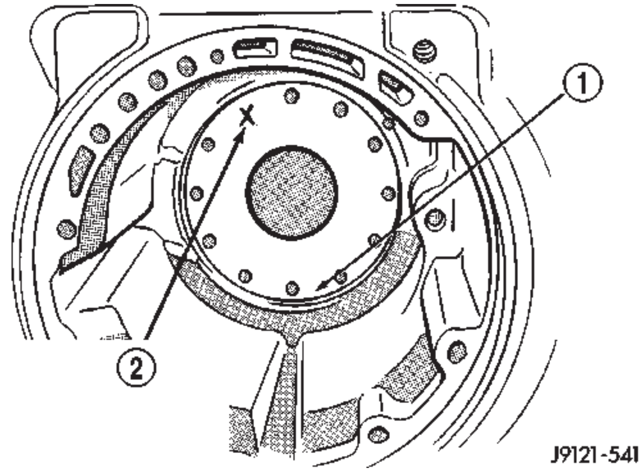

*Fig. 185 Location Of Blank Area In Clutch Cam Bolt Circle*

1 - OVERRUNNING CLUTCH CAM SEAT IN CASE
2 - NON-THREADED HOLE IN CLUTCH CAM ALIGNS HERE (BLANK AREA) OF SEAT

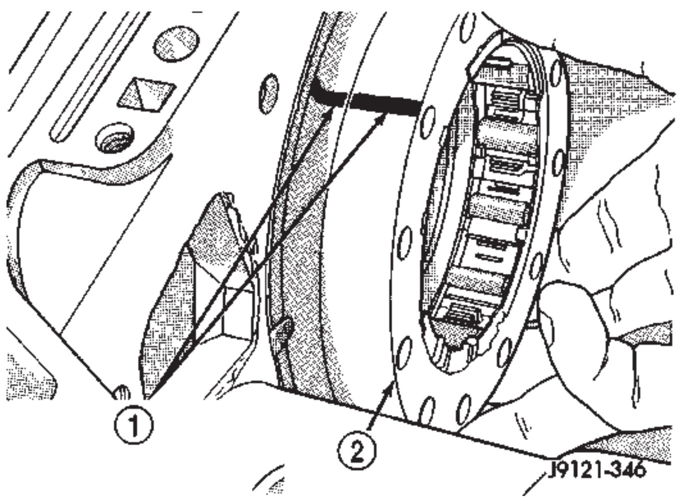

*Fig. 186 Overrunning Clutch Installation*

1 - ALIGN MARKS IDENTIFYING NON-THREADED HOLE IN CAM AND CASE
2 - OVERRUNNING CLUTCH ASSEMBLY

(4) Verify that non-threaded hole in clutch cam is properly aligned. Check alignment by threading a bolt into each bolt hole. Adjust clutch cam position if necessary.

(5) Install and tighten overrunning clutch cam bolts to 17 N·m (13 ft. lbs.) torque. Note that clutch cam bolts are shorter than piston retainer bolts.

(6) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 187). Also install gasket before

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

(7) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 188). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

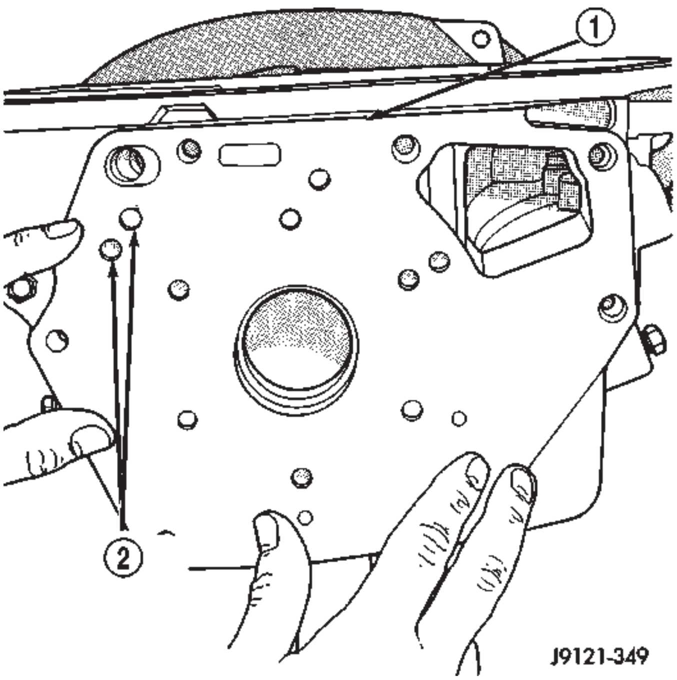

***Fig. 187 Installing/Aligning Case Gasket***

1 - CASE GASKET
2 - BE SURE GOVERNOR TUBE FEED HOLES IN CASE AND GASKET ARE ALIGNED

(8) Install new seals on over drive piston.

(9) Stand transmission case upright on bellhousing.

(10) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(11) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(12) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

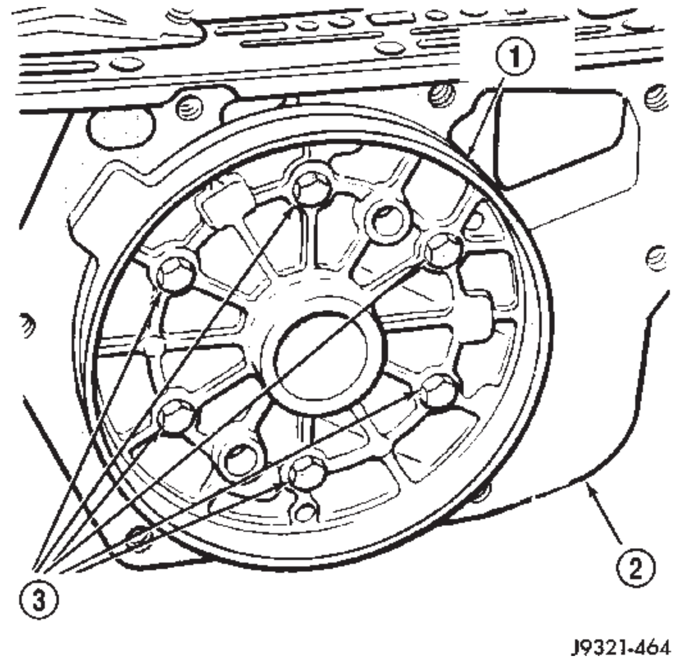

***Fig. 188 Aligning Overdrive Piston Retainer***

1 - PISTON RETAINER
2 - GASKET
3 - RETAINER BOLTS

**NOTE: Install the remaining transmission components and the overdrive unit.**

# PARK/NEUTRAL POSITION SWITCH

## DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

### SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

PARK/NEUTRAL POSITION SWITCH (Continued)

### REMOVAL

(1) Raise vehicle and position drain pan under switch.

(2) Disconnect switch wires.

(3) Remove switch from case.

### INSTALLATION

(1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 189).

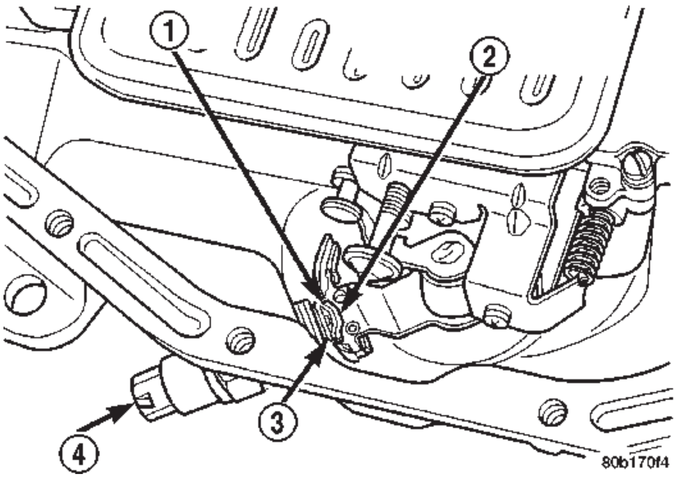

*Fig. 189 Park/Neutral Position Switch*

1 - NEUTRAL CONTACT

2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION

3 - PARK CONTACT

4 - SWITCH

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

(3) Test continuity of new switch with 12V test lamp.

(4) Connect switch wires and lower vehicle.

(5) Top off transmission fluid level.

## PISTONS

### DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

### OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

#### PRESSURE

Pressure (Fig. 190) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

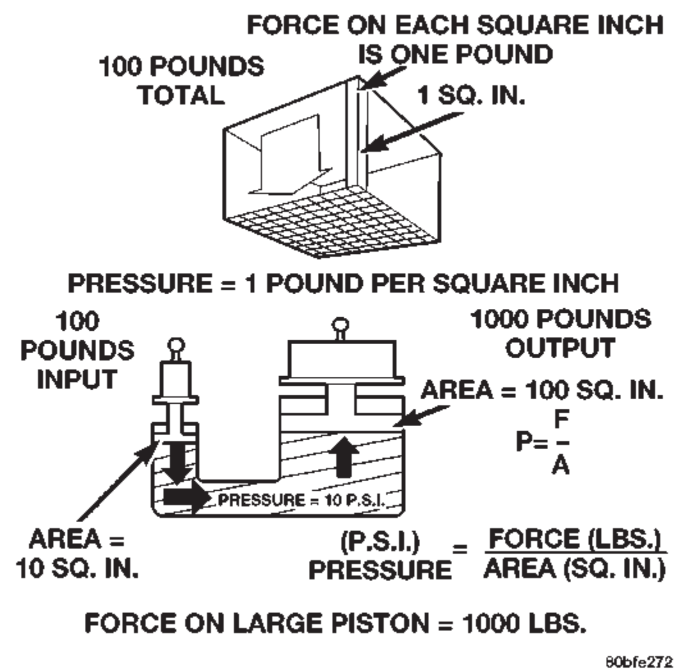

*Fig. 190 Force and Pressure Relationship*

#### PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 191) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken.

PISTONS (Continued)

The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

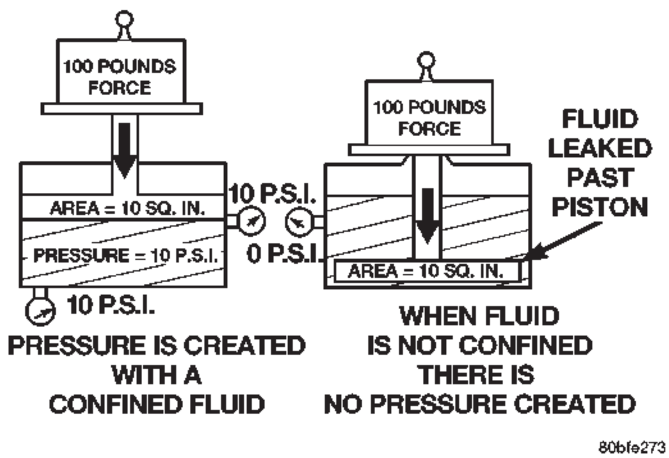

*Fig. 191 Pressure on a Confined Fluid*

## FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 192), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 192), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

## PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 193) has to move ten times the distance required to move the larger piston one inch. There-

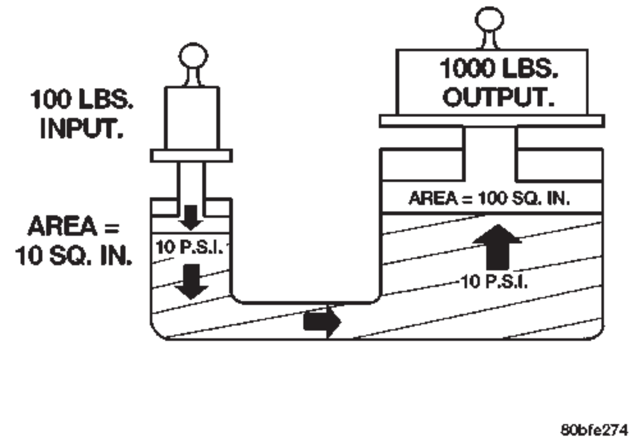

*Fig. 192 Force Multiplication*

fore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

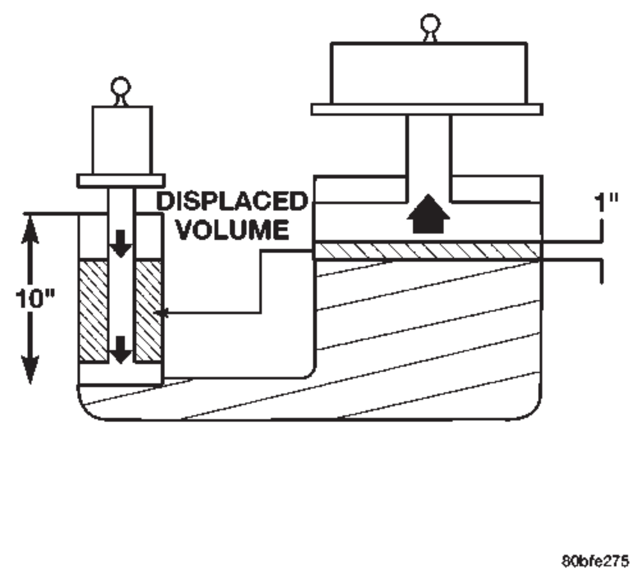

*Fig. 193 Piston Travel*

# PLANETARY GEARTRAIN/ OUTPUT SHAFT

## DESCRIPTION

The planetary gearsets (Fig. 194) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

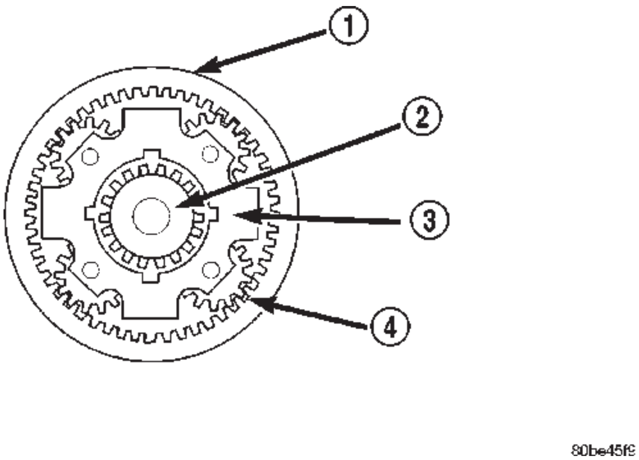

*Fig. 194 Planetary Gearset*

1 - ANNULUS GEAR
2 - SUN GEAR
3 - PLANET CARRIER
4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

**NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.**

## OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

**NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.**

## DISASSEMBLY

(1) Remove planetary snap-ring (Fig. 195).
(2) Remove front annulus and planetary assembly from driving shell (Fig. 195).
(3) Remove snap-ring that retains front planetary gear in annulus gear (Fig. 196).

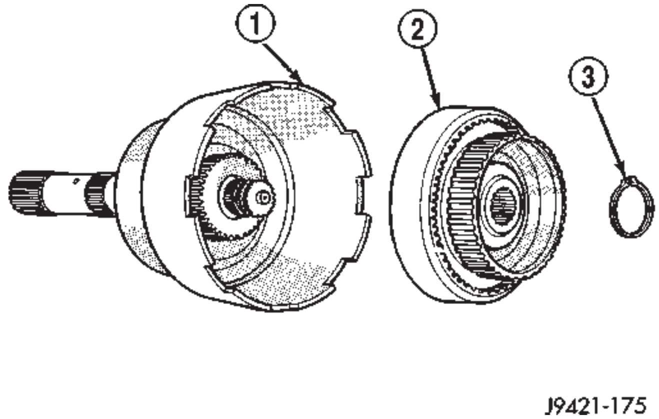

*Fig. 195 Front Annulus And Planetary Assembly Removal*

1 - DRIVING SHELL
2 - FRONT ANNULUS AND PLANETARY ASSEMBLY
3 - PLANETARY SNAP-RING

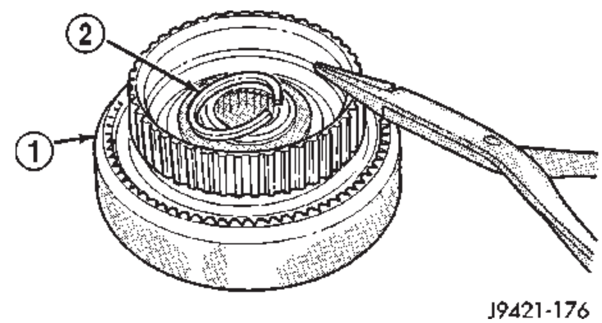

*Fig. 196 Front Planetary Snap-Ring Removal*

1 - FRONT ANNULUS GEAR
2 - PLANETARY SNAP-RING

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(4) Remove tabbed thrust washer and tabbed thrust plate from hub of front annulus (Fig. 197).

(5) Separate front annulus and planetary gears (Fig. 197).

(6) Remove front planetary gear front thrust washer from annulus gear hub.

(7) Separate and remove driving shell, rear planetary and rear annulus from output shaft (Fig. 198).

(8) Remove front planetary rear thrust washer from driving shell.

(9) Remove tabbed thrust washers from rear planetary gear.

(10) Remove lock ring that retains sun gear in driving shell. Then remove sun gear, spacer and thrust plates.

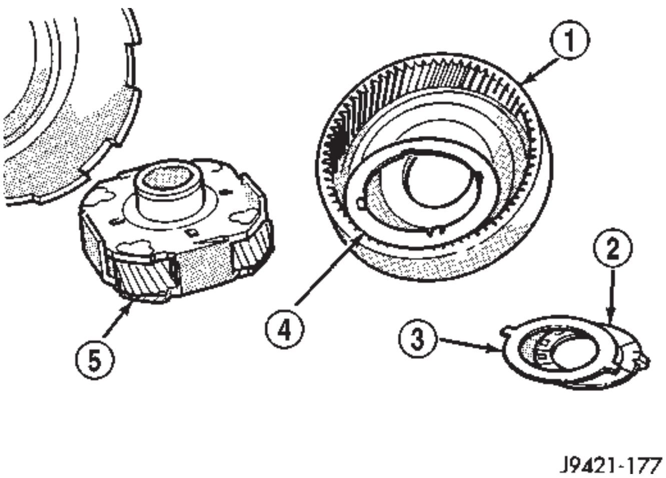

***Fig. 197 Front Planetary And Annulus Gear Disassembly***

1 - FRONT ANNULUS
2 - THRUST WASHER
3 - THRUST PLATE
4 - FRONT THRUST WASHER
5 - FRONT PLANETARY

## INSPECTION

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Inspect the geartrain spacers, thrust plates, snap-rings, and thrust washers. Replace any of these parts that are worn, distorted or damaged. Do not attempt to reuse these parts.

The planetary gear thrust washers are different sizes. The large diameter washers go on the front planetary and the smaller washers go on the rear planetary. All the washers have four locating tabs on them. These tabs fit in the holes or slots provided in each planetary gear.

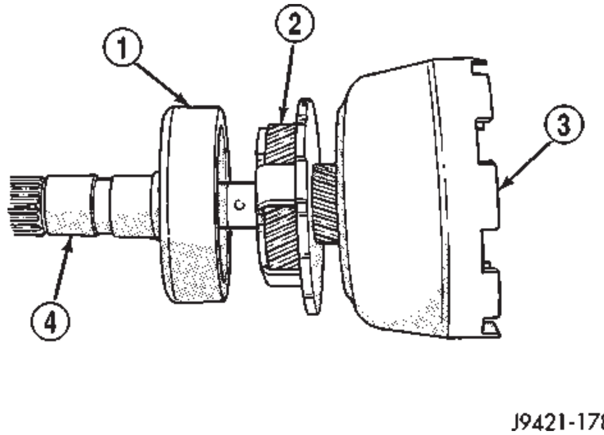

***Fig. 198 Removing Driving Shell, Rear Planetary And Rear Annulus***

1 - REAR ANNULUS
2 - REAR PLANETARY
3 - DRIVING SHELL
4 - OUTPUT SHAFT

Inspect the output shaft carefully. Pay particular attention to the machined bushing/bearing surfaces on the shaft and the governor valve shaft bore at the shaft rear.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location (especially at the governor valve shaft bore).

The annulus gears can be removed from their supports if necessary. Just remove the snap-rings and separate the two parts when replacement is necessary. In addition, the annulus gear bushings can be replaced if severely worn, or scored. However it is not necessary to replace the bushings if they only exhibit normal wear. Check bushing fit on the output shaft to be sure.

## ASSEMBLY

(1) Lubricate output shaft and planetary components with transmission fluid. Use petroleum jelly to lubricate and hold thrust washers and plates in position.

(2) Assemble rear annulus gear and support if disassembled. Be sure support snap-ring is seated and that shoulder-side of support faces rearward (Fig. 199).

(3) Install rear thrust washer on rear planetary gear. Use enough petroleum jelly to hold washer in place. Also be sure all four washer tabs are properly engaged in gear slots.

(4) Install rear annulus over and onto rear planetary gear (Fig. 199).

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(5) Install assembled rear planetary and annulus gear on output shaft (Fig. 200). Verify that assembly is fully seated on shaft.

(6) Install front thrust washer on rear planetary gear (Fig. 201). Use enough petroleum jelly to hold washer on gear. Be sure all four washer tabs are seated in slots.

(7) Install spacer on sun gear (Fig. 202).

(8) Install thrust plate on sun gear (Fig. 203). Note that driving shell thrust plates are interchangeable. Use either plate on sun gear and at front/rear of shell.

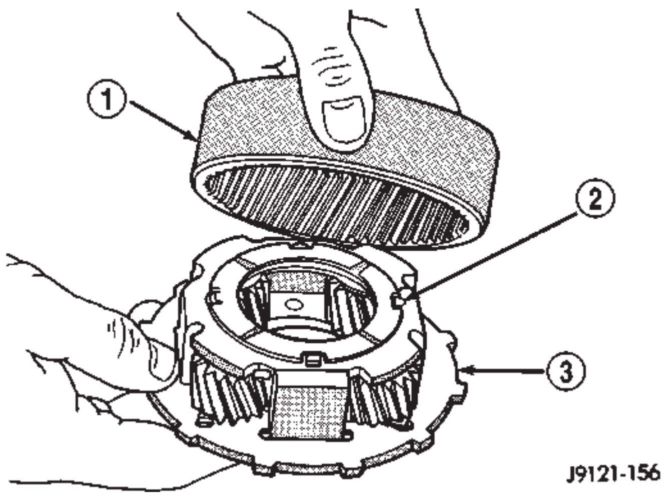

*Fig. 199 Assembling Rear Annulus And Planetary Gear*

3 - THRUST PLATE

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(9) Hold sun gear in place and install thrust plate over sun gear at rear of driving shell (Fig. 204).

(10) Position wood block on bench and support sun gear on block (Fig. 205). This makes it easier to align and install sun gear lock ring. Keep wood block handy as it will also be used for geartrain end play check.

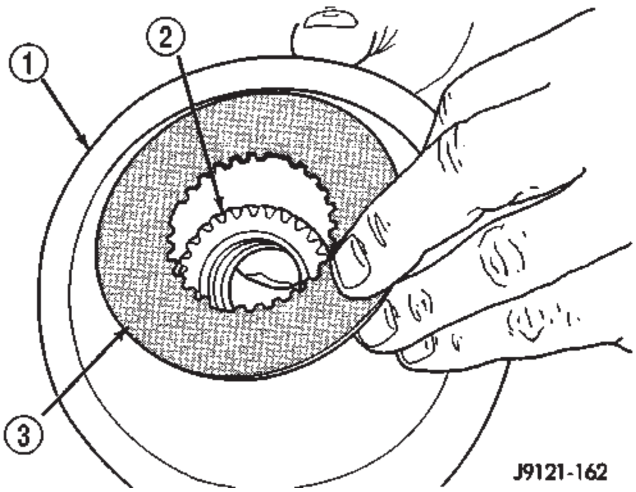

***Fig. 204 Installing Driving Shell Rear Thrust Plate***

1 - DRIVING SHELL
2 - SUN GEAR
3 - REAR THRUST PLATE

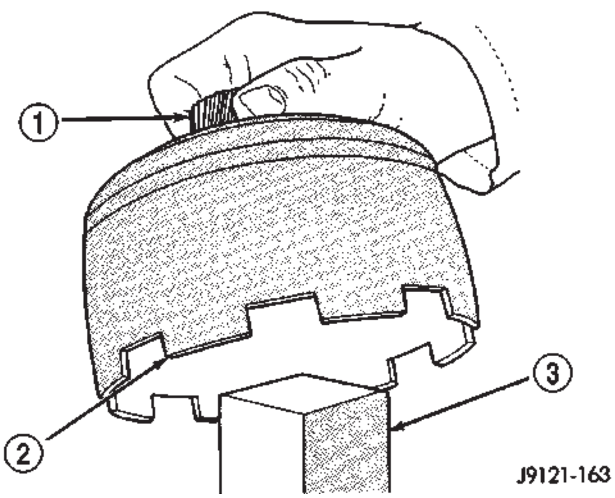

***Fig. 205 Supporting Sun Gear On Wood Block***

1 - SUN GEAR
2 - DRIVING SHELL
3 - WOOD BLOCK

(11) Align rear thrust plate on driving shell and install sun gear lock ring. Be sure ring is fully seated in sun gear ring groove (Fig. 206).

(12) Install assembled driving shell and sun gear on output shaft (Fig. 207).

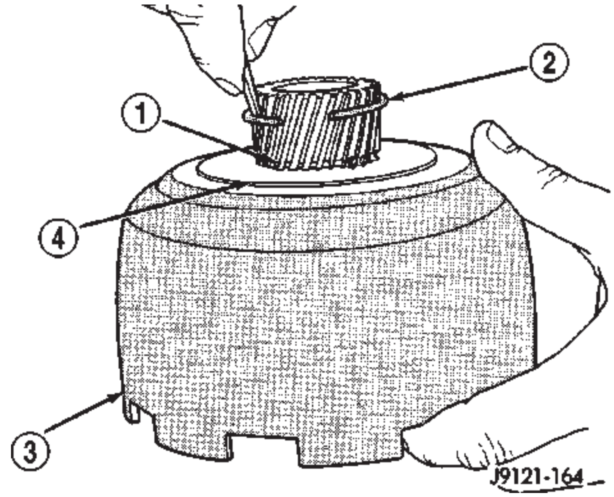

***Fig. 206 Installing Sun Gear Lock Ring***

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(13) Install rear thrust washer on front planetary gear (Fig. 208). Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

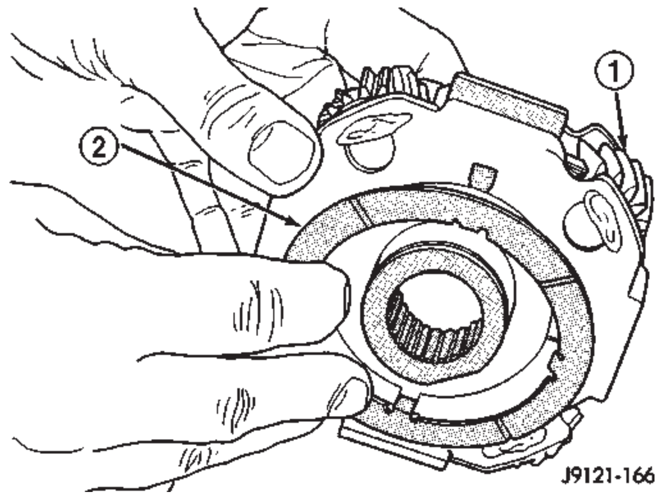

***Fig. 208 Installing Rear Thrust Washer On Front Planetary Gear***

1 - FRONT PLANETARY GEAR
2 - REAR TABBED THRUST WASHER

(14) Install front planetary gear on output shaft and in driving shell (Fig. 209).

(15) Install front thrust washer on front planetary gear. Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

(16) Assemble front annulus gear and support, if necessary. Be sure support snap-ring is seated.

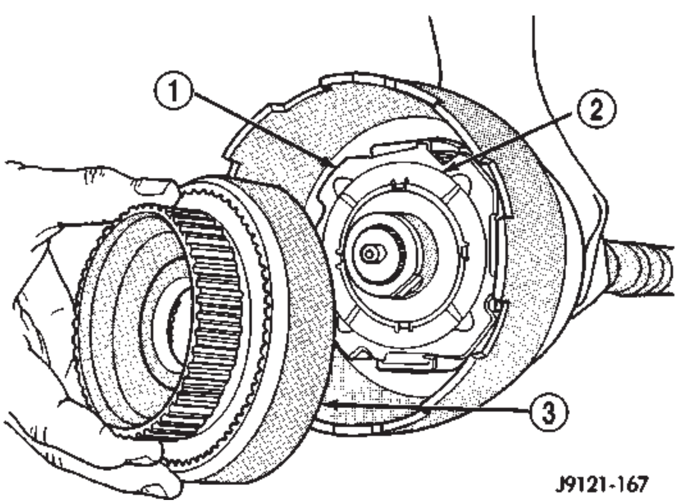

***Fig. 209 Installing Front Planetary And Annulus Gears***

1 - FRONT PLANETARY GEAR
2 - FRONT THRUST WASHER
3 - FRONT ANNULUS GEAR

(17) Install front annulus on front planetary (Fig. 209).

(18) Position thrust plate on front annulus gear support (Fig. 210). Note that plate has two tabs on it. These tabs fit in notches of annulus hub.

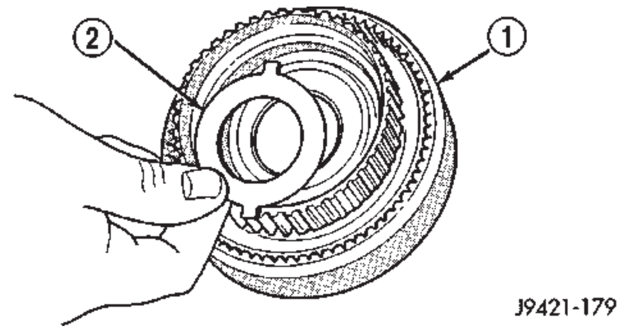

***Fig. 210 Positioning Thrust Plate On Front Annulus Support***

1 - FRONT ANNULUS
2 - THRUST PLATE

(19) Install thrust washer in front annulus (Fig. 211). Align flat on washer with flat on planetary hub. Also be sure washer tab is facing up.

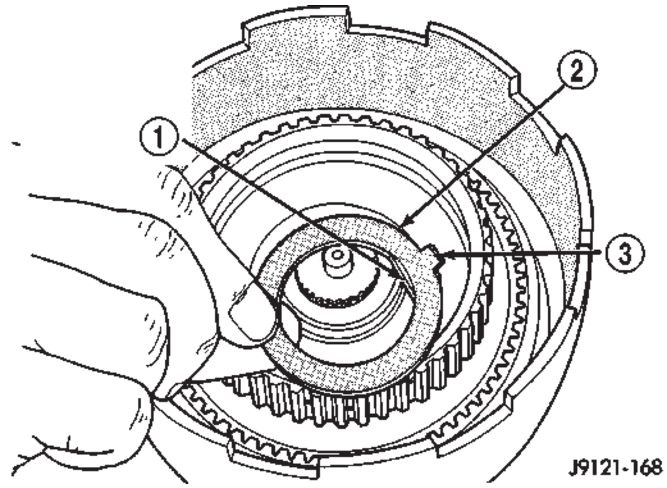

***Fig. 211 Installing Front Annulus Thrust Washer***

1 - WASHER FLAT ALIGNS WITH FLAT ON PLANETARY HUB
2 - FRONT ANNULUS THRUST WASHER
3 - TAB FACES FRONT

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(20) Install front annulus snap-ring (Fig. 212). Use snap-ring pliers to avoid distorting ring during installation. Also be sure ring is fully seated.

(21) Install planetary selective snap-ring with snap-ring pliers (Fig. 213). Be sure ring is fully seated.

(22) Turn planetary geartrain assembly over so driving shell is facing workbench. Then support geartrain on wood block positioned under forward end of output shaft. This allows geartrain components to move forward for accurate end play check.

(23) Check planetary geartrain end play with feeler gauge (Fig. 214). Gauge goes between shoulder on output shaft and end of rear annulus support.

(24) Geartrain end play should be 0.12 to 1.22 mm (0.005 to 0.048 in.). If end play is incorrect, snap-ring (or thrust washers) may have to be replaced. Snap-rings are available in three different thicknesses for adjustment purposes.

# REAR CLUTCH

## DESCRIPTION

The rear clutch assembly (Fig. 215) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position

and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front/rear seal rings.

(3) Remove selective clutch pack snap-ring (Fig. 216).

(4) Remove top pressure plate, clutch discs, steel plates, bottom pressure plate and wave snap-ring and wave spring (Fig. 216).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft snap-ring (Fig. 217). It may be necessary to press the input shaft in slightly to relieve tension on the snap-ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

## CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such

materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

## INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

## ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft, if necessary, (Fig. 218) and (Fig. 219).

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then press input shaft into retainer (Fig. 220). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft snap-ring (Fig. 217).

(5) Invert retainer and press input shaft in opposite direction until snap-ring is seated.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020″ thick), can be used to guide seals into place if necessary.

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.**

(9) Install piston spring in retainer and on top of piston (Fig. 221). Concave side of spring faces downward (toward piston).

(10) Install wave spring in retainer (Fig. 221). Be sure spring is completely seated in retainer groove.

(11) Install bottom pressure plate (Fig. 216). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of bottom pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 216).

(13) Install top pressure plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

REAR CLUTCH (Continued)

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 222).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 222).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.559 - 0.914 mm (0.022 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap-ring thicknesses are:

- 0.107-0.109 in.
- 0.098-0.100 in.
- 0.095-0.097 in.
- 0.083-0.085 in.
- 0.076-0.078 in.
- 0.071-0.073 in.
- 0.060-0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 223). Use enough petroleum jelly to hold washer in place.

# REAR SERVO

## DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

## OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

REAR SERVO (Continued)

## DISASSEMBLY

(1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 224).

(2) Remove and discard servo piston seal ring.

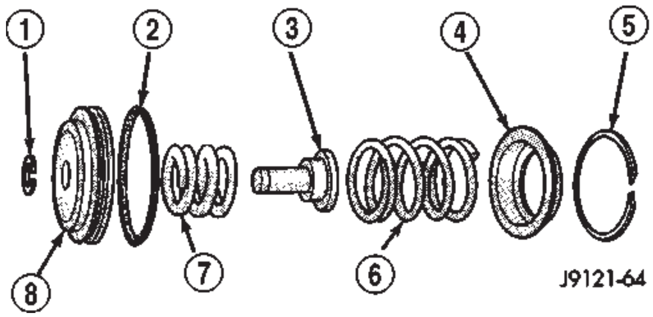

***Fig. 224 Rear Servo Components***

# SHIFT MECHANISM

## DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

## OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position.

SHIFT MECHANISM (Continued)

No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

## ADJUSTMENT

Check linkage adjustment by starting engine in PARK and NEUTRAL. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

### LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 227). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

(1) Shift transmission into PARK.

(2) Raise and support vehicle.

(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 227).

(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.

(5) Move transmission shift lever fully rearward to the Park detent.

(6) Center adjusting swivel on shift rod.

(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).

(8) Lower vehicle and verify proper adjustment.

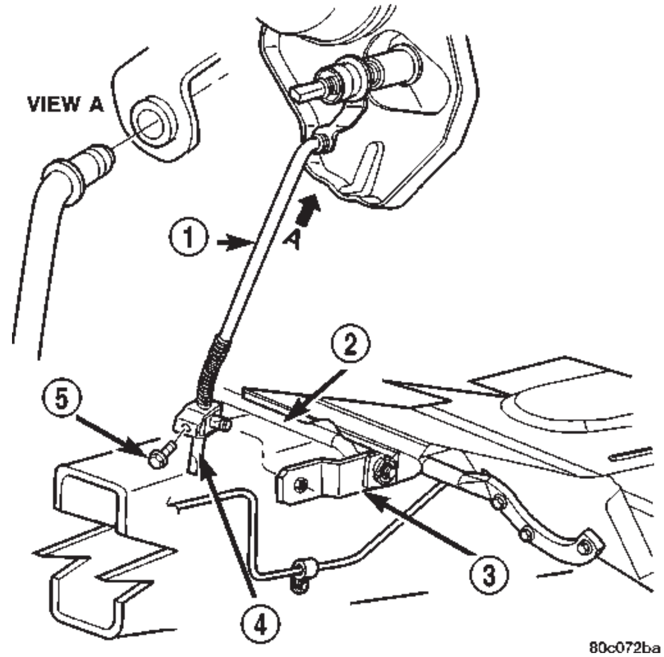

*Fig. 227 Linkage Adjustment Components*

# SOLENOID

## DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the

SOLENOID (Continued)

plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

### OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## SPEED SENSOR

### DESCRIPTION

The speed sensor (Fig. 228) is located in the overdrive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

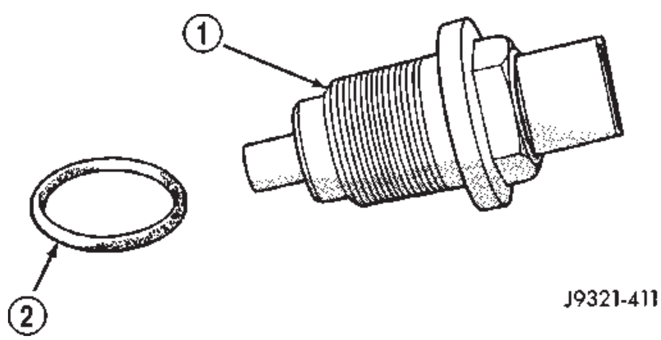

*Fig. 228 Transmission Output Speed Sensor*

1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
2 - SEAL

### OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

## THROTTLE VALVE CABLE

### DESCRIPTION

Transmission throttle valve cable (Fig. 229) adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

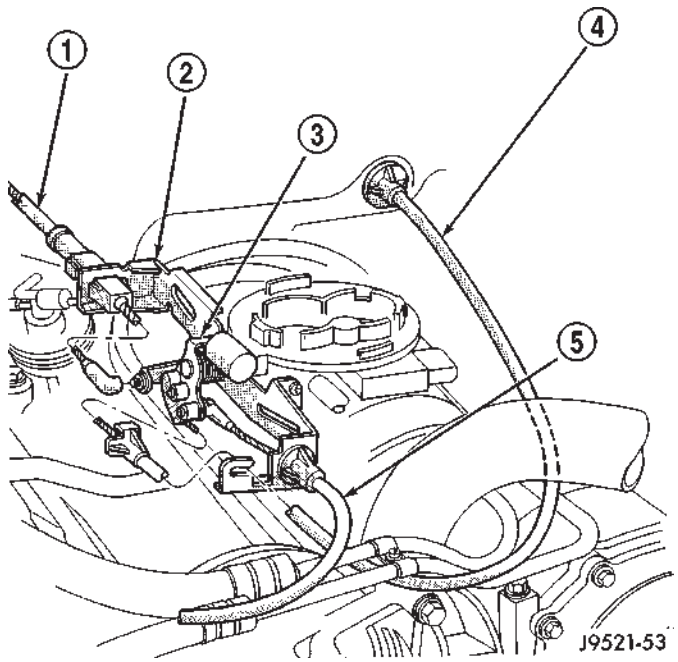

*Fig. 229 Throttle Valve Cable Attachment - At Engine*

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 230). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable

THROTTLE VALVE CABLE (Continued)

is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

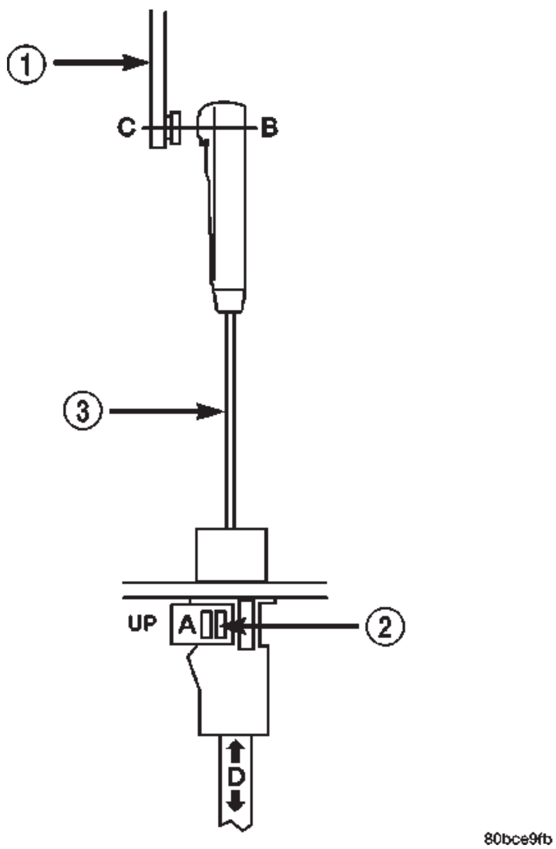

*Fig. 230 Throttle Valve Cable at Throttle Linkage*

1 - THROTTLE LINKAGE
2 - THROTTLE VALVE CABLE LOCKING CLIP
3 - THROTTLE VALVE CABLE

## ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

### ADJUSTMENT VERIFICATION

(1) Turn ignition key to OFF position.

(2) Remove air cleaner.

(3) Verify that lever on throttle body is at curb idle position (Fig. 231). Then verify that the transmission throttle lever (Fig. 232) is also at idle (fully forward) position.

(4) Slide cable off attachment stud on throttle body lever.

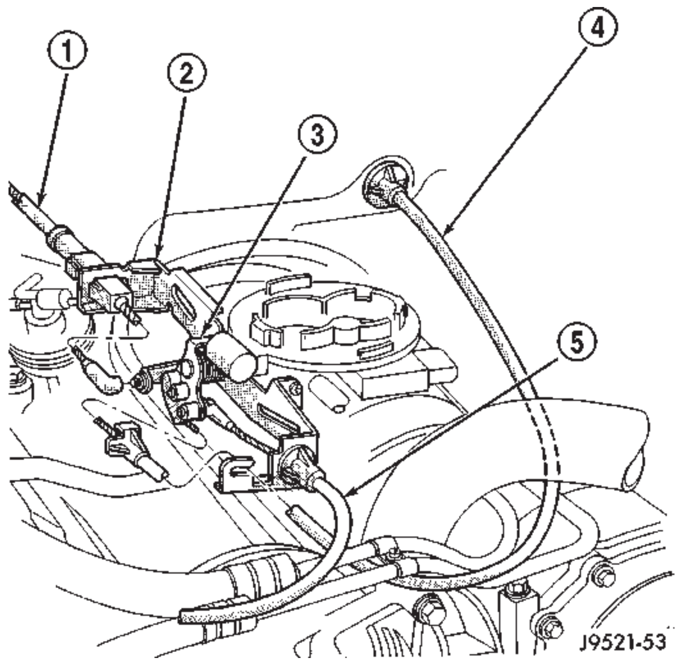

*Fig. 231 Throttle Valve Cable Attachment - At Engine*

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

(5) Compare position of cable end to attachment stud on throttle body lever:

• Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 233).

• If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

• If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

• If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
6 - ELECTRICAL CONNECTORS
7 - TRANSMISSION FLUID LINES

## ADJUSTMENT PROCEDURE

(1) Turn ignition switch to OFF position.

(2) Remove air cleaner if necessary.

(3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Pry the T.V. cable lock (A) into the UP position (Fig. 233). This will unlock the cable and allow for readjustment.

(6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable.**Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 233).

(7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 233). This will lock the present T.V. cable adjustment.

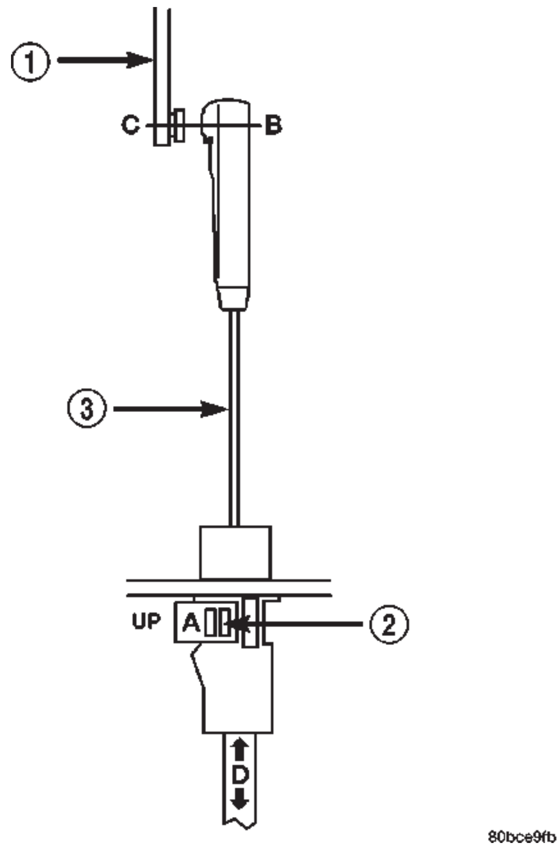

*Fig. 233 Throttle Valve Cable at Throttle Linkage*

1 - THROTTLE LINKAGE
2 - THROTTLE VALVE CABLE LOCKING CLIP
3 - THROTTLE VALVE CABLE

**NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.**

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

# TORQUE CONVERTER

## DESCRIPTION

The torque converter (Fig. 234) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.**

TORQUE CONVERTER (Continued)

## IMPELLER

The impeller (Fig. 235) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

## TURBINE

The turbine (Fig. 236) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

## STATOR

The stator assembly (Fig. 237) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 238). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 239) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

TORQUE CONVERTER (Continued)

## OPERATION

The converter impeller (Fig. 240) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 241). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

## TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the

vehicle begins to go uphill or the throttle pressure is increased.

## REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.**

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

## INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

**CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.**

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 242). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

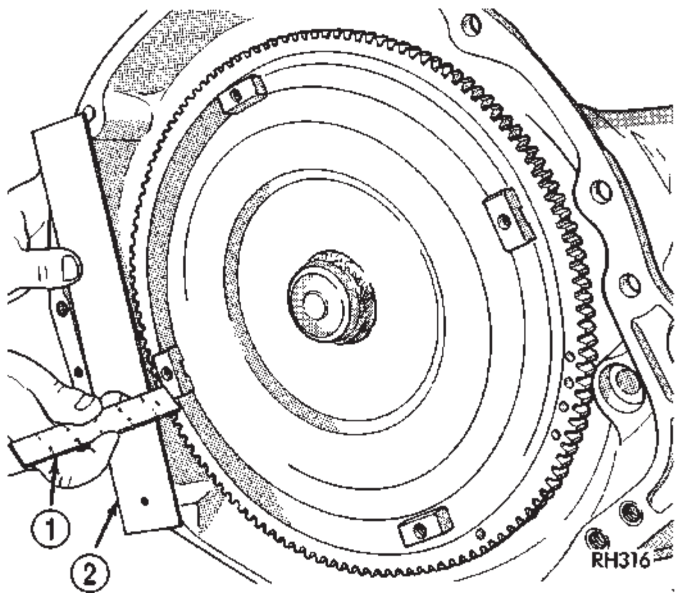

*Fig. 242 Checking Torque Converter Seating - Typical*

# TORQUE CONVERTER DRAINBACK VALVE

## DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

## OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

## STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

**CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.**

# TRANSMISSION TEMPERATURE SENSOR

## DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 243). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

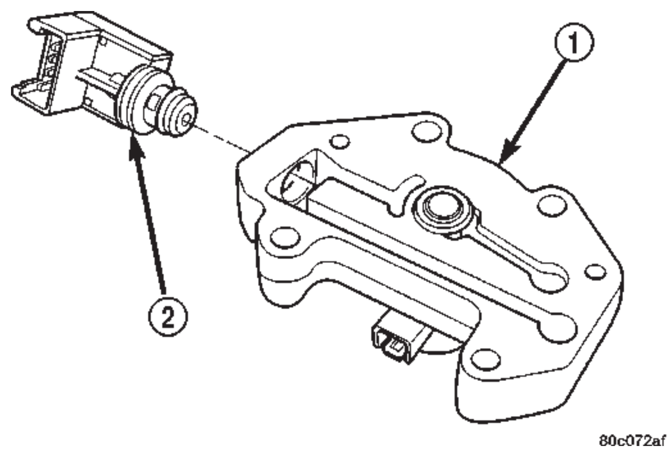

***Fig. 243 Governor Pressure Sensor***

1 - GOVERNOR BODY

2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

## OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

# VALVE BODY

## DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 244), (Fig. 245), (Fig. 246), and (Fig. 247):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

## OPERATION

**NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.**

### CHECK BALLS

| CHECK BALL NUMBER | DESCRIPTION |
|---|---|
| 1 | Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug. |
| 2 | Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug. |
| 3 | Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch. |
| 4 | Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo. |
| 5 | Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure. |
| 6 | Provides a by-pass around the front servo orifice so that the servo can release quickly. |
| 7 | Provides a by-pass around the rear clutch orifice so that the clutch can release quickly. |
| 8 | Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient. |
| 9 | Provides a by-pass around the rear servo orifice so that the servo can release quickly. |
| ECE (10) | Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown. |

VALVE BODY (Continued)

## REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as “line pressure.”

The regulator valve (Fig. 248) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 249), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of

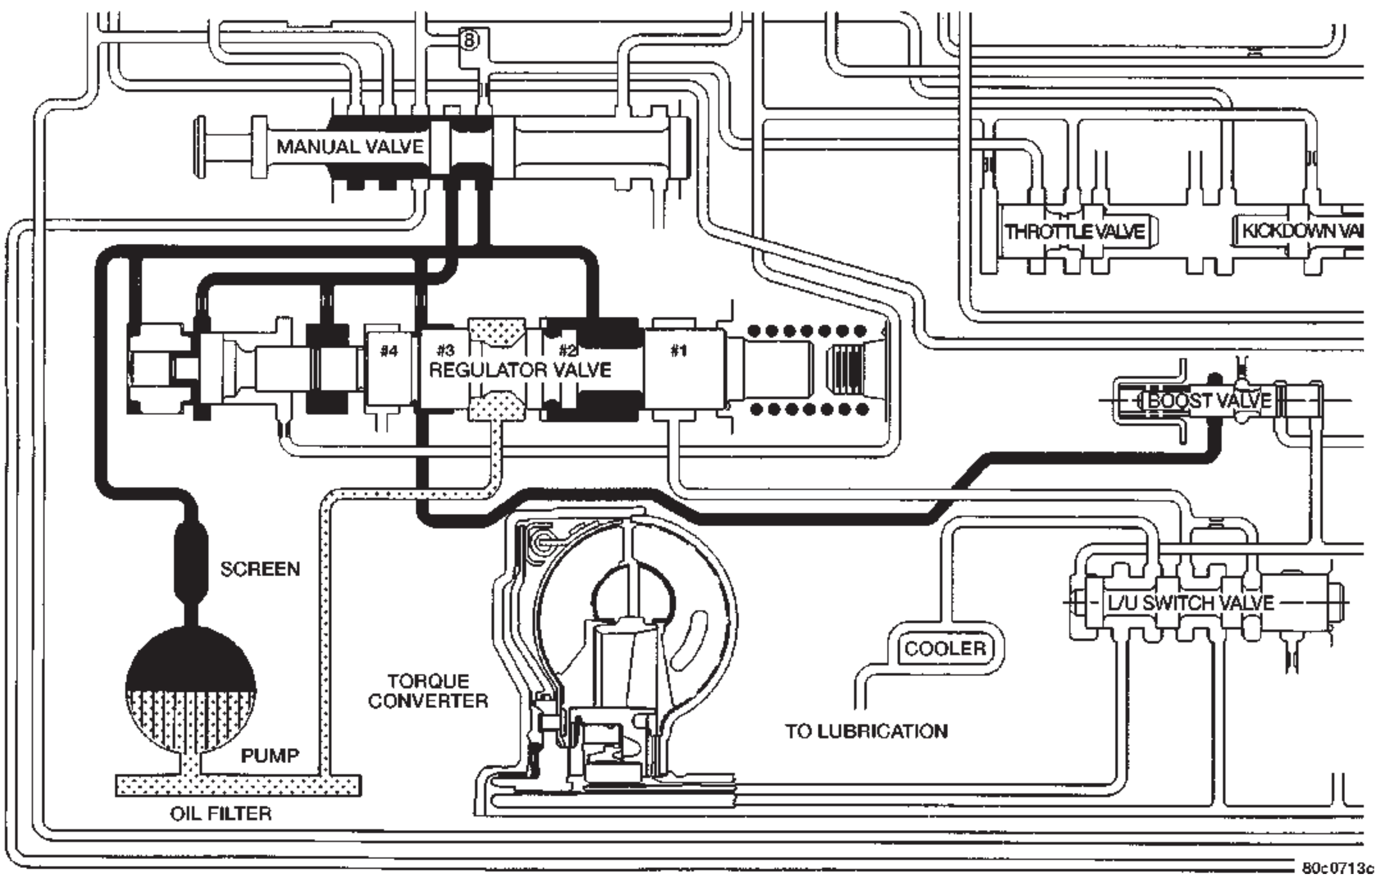

*Fig. 248 Regulator Valve in PARK Position*

VALVE BODY (Continued)

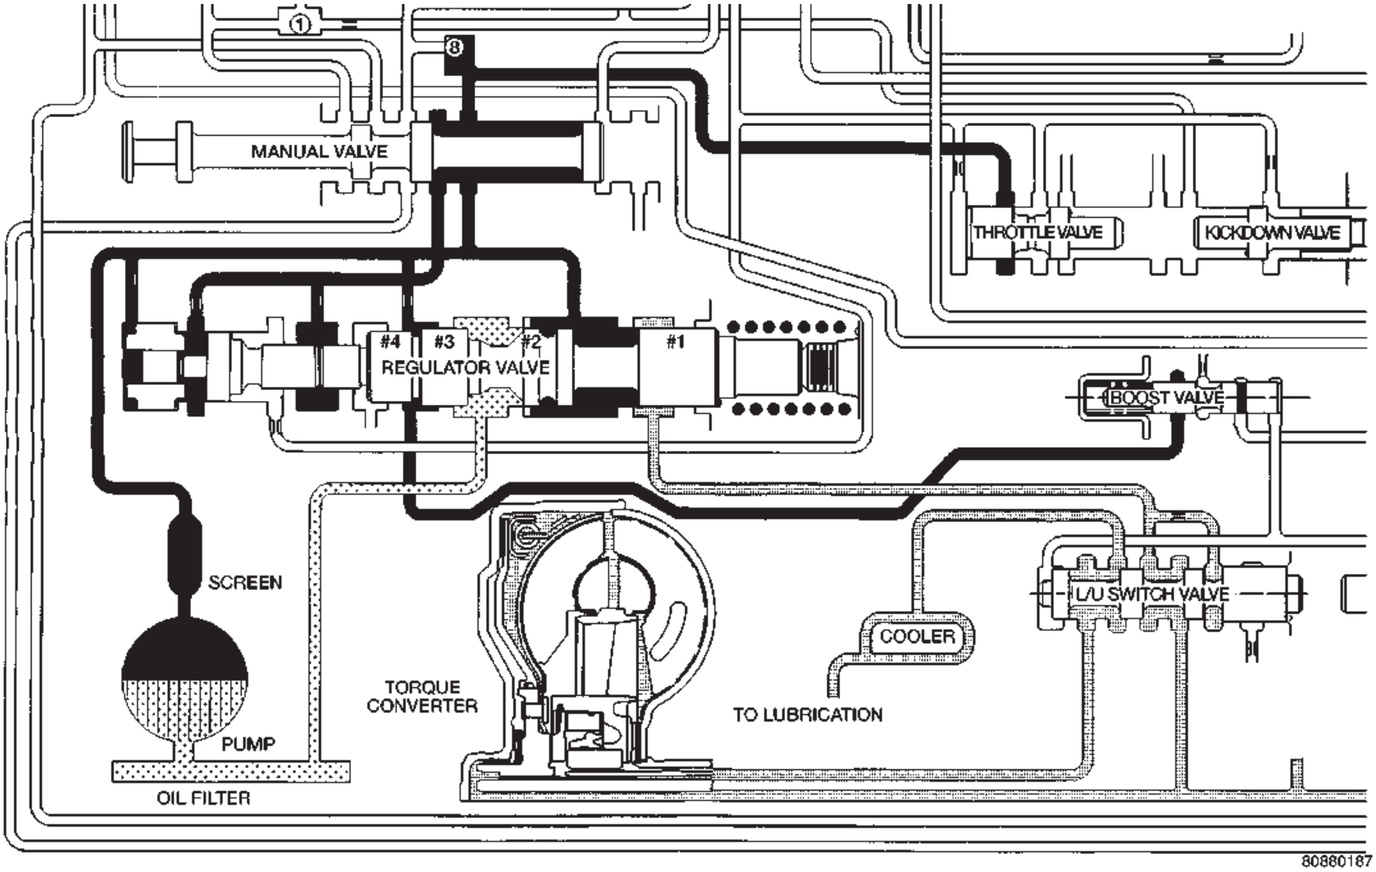

*Fig. 249 Regulator Valve in NEUTRAL Position*

57-94 psi (except in REVERSE) (Fig. 250). The regulated line pressure in REVERSE (Fig. 251) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

VALVE BODY (Continued)

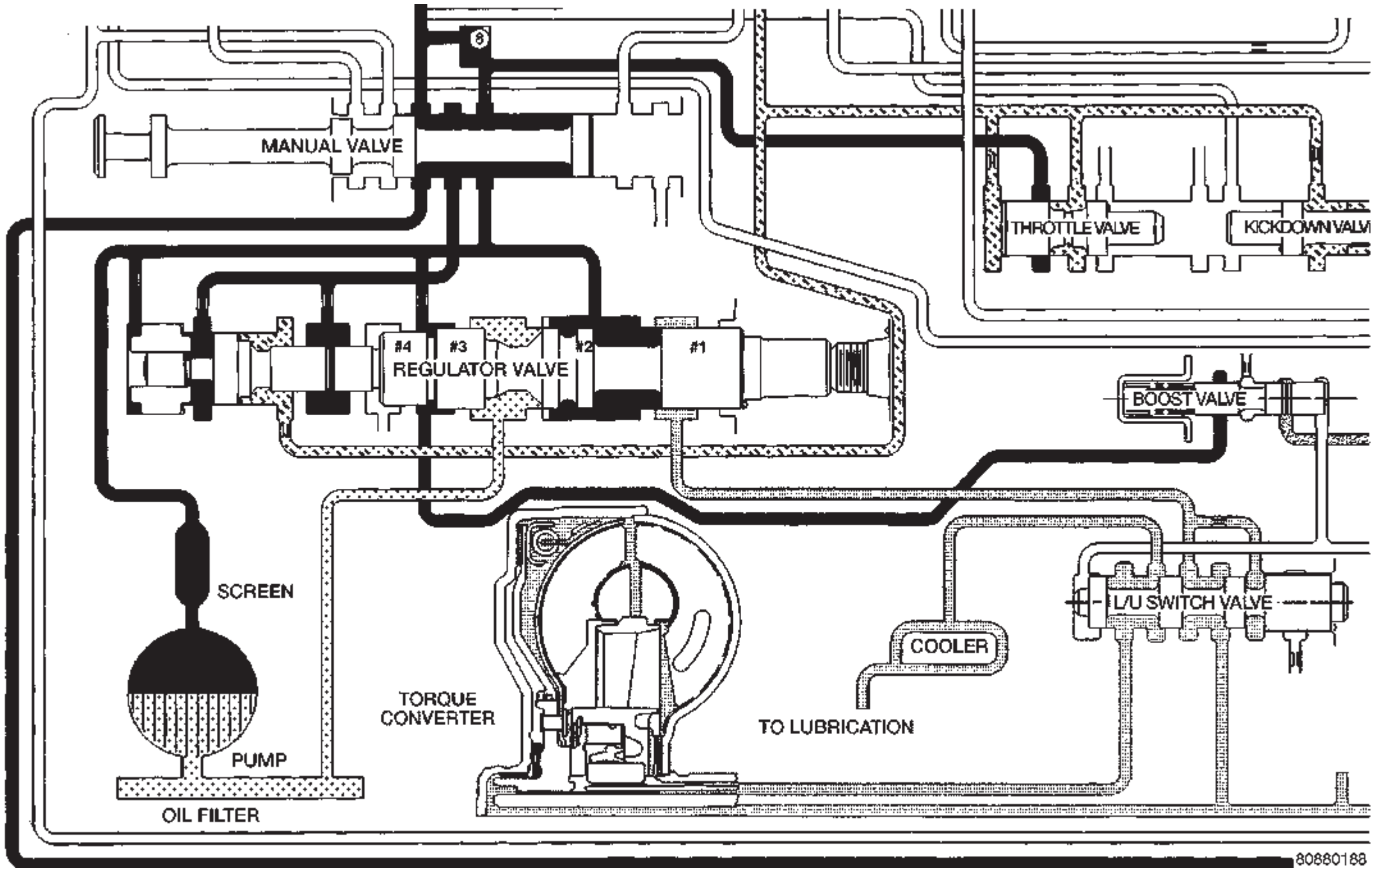

**Fig. 250 Regulator Valve in DRIVE Position**

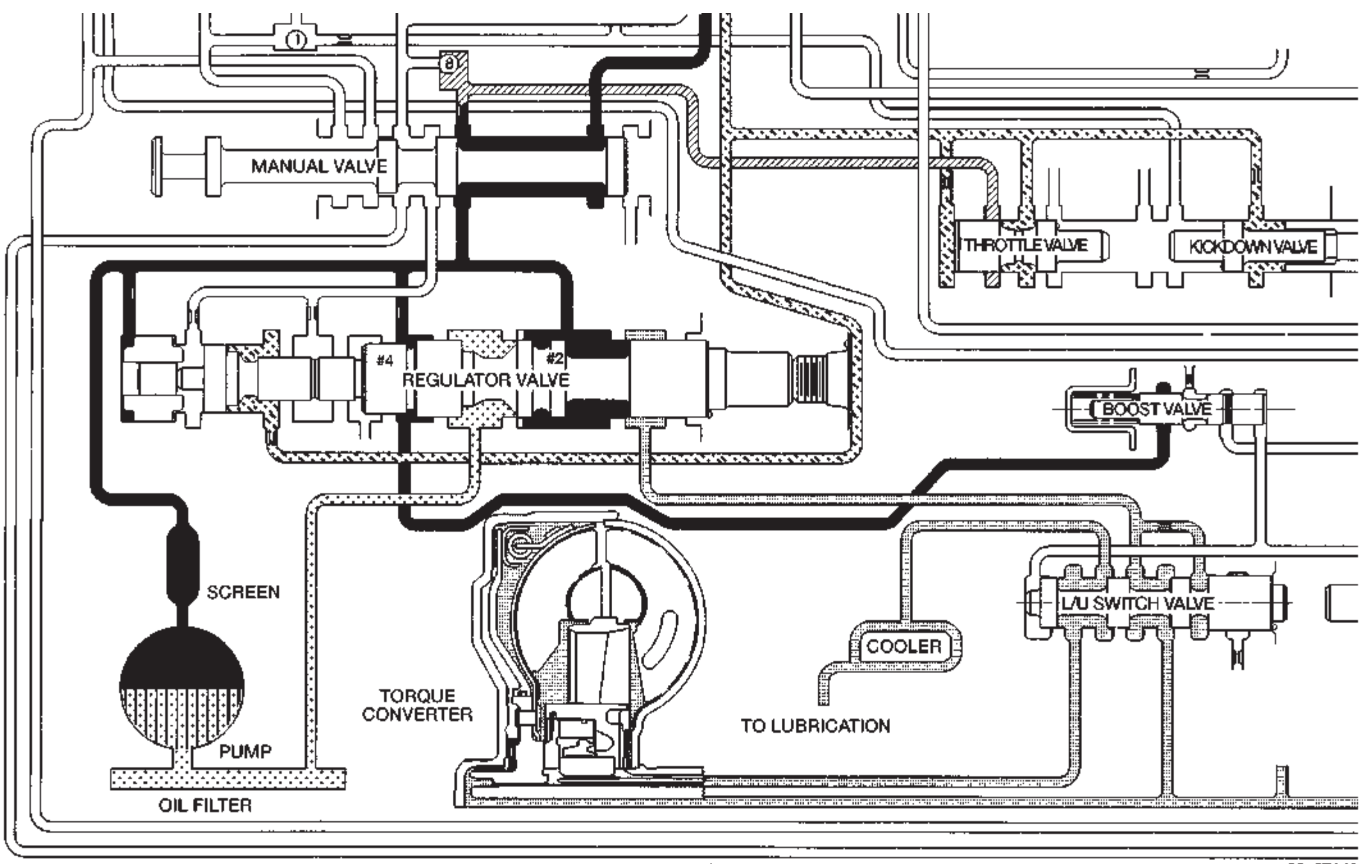

**Fig. 251 Regulator Valve in REVERSE Position**

VALVE BODY (Continued)

## KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 252) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

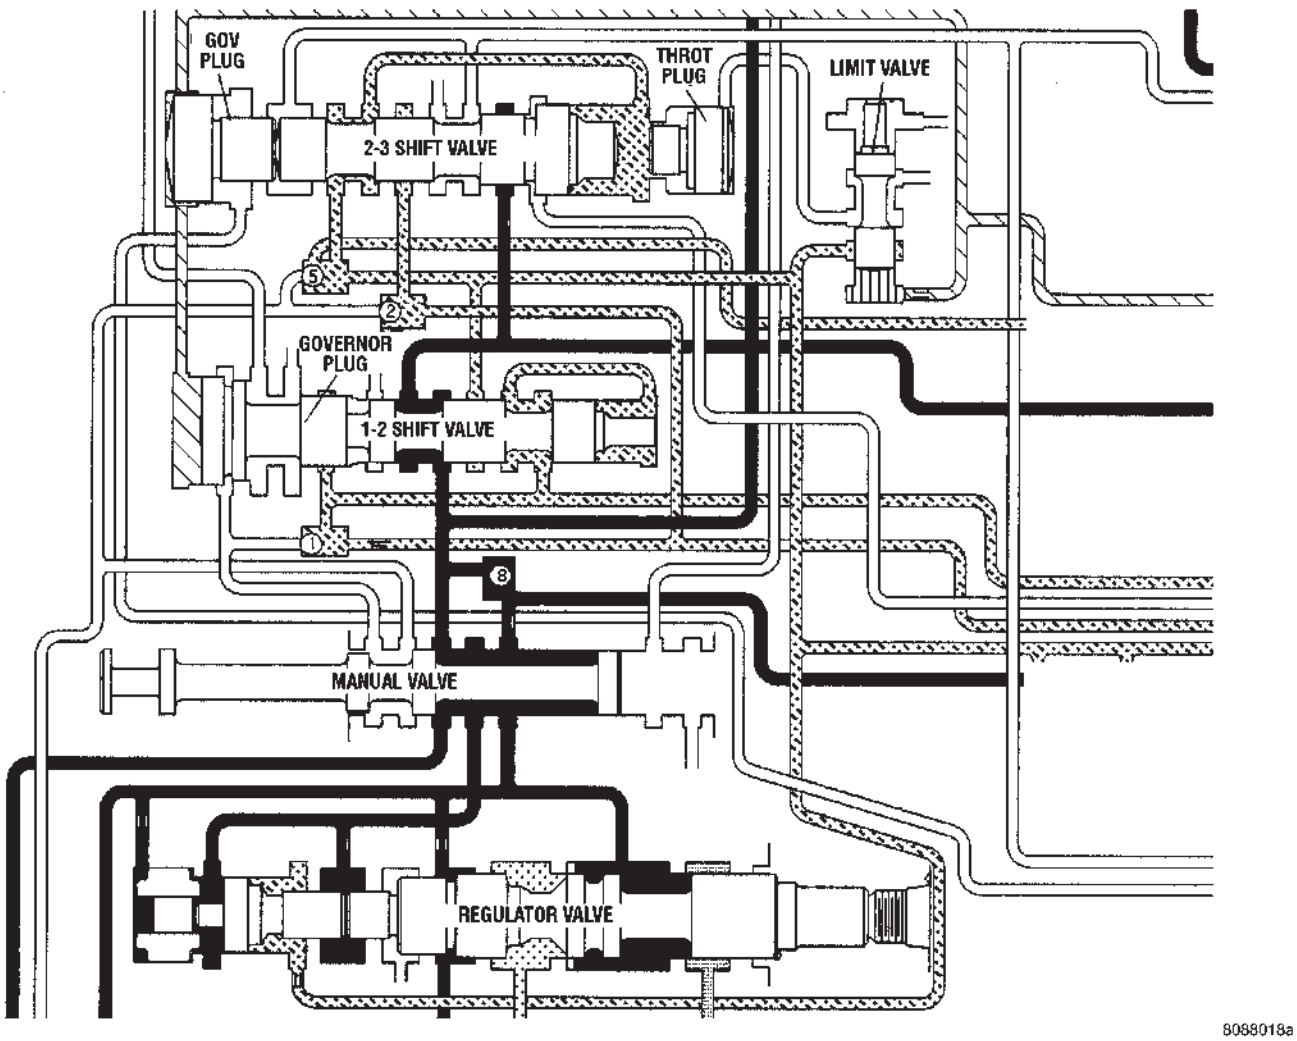

*Fig. 252 Kickdown Valve-Wide Open Throttle*

VALVE BODY (Continued)

## KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 253) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 254), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

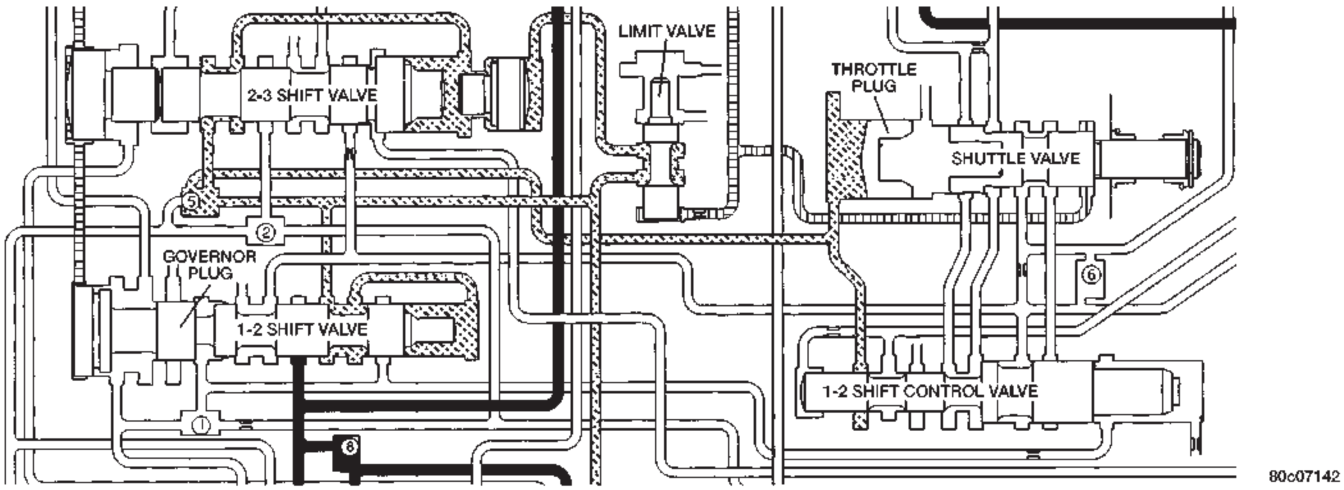

*Fig. 253 Kickdown Limit Valve-Low Speeds*

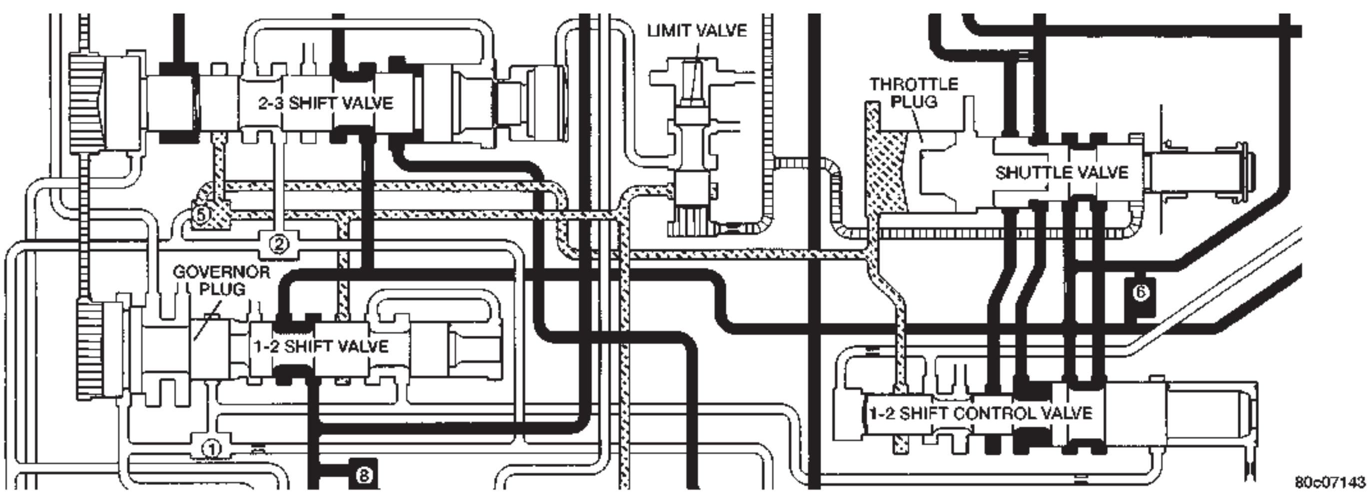

*Fig. 254 Kickdown Limit Valve-High Speeds*

VALVE BODY (Continued)

## 1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 255), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 256).

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically “blocked” into position so no upshift can occur.

The physical blocking of the upshift while in the manual “1” position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

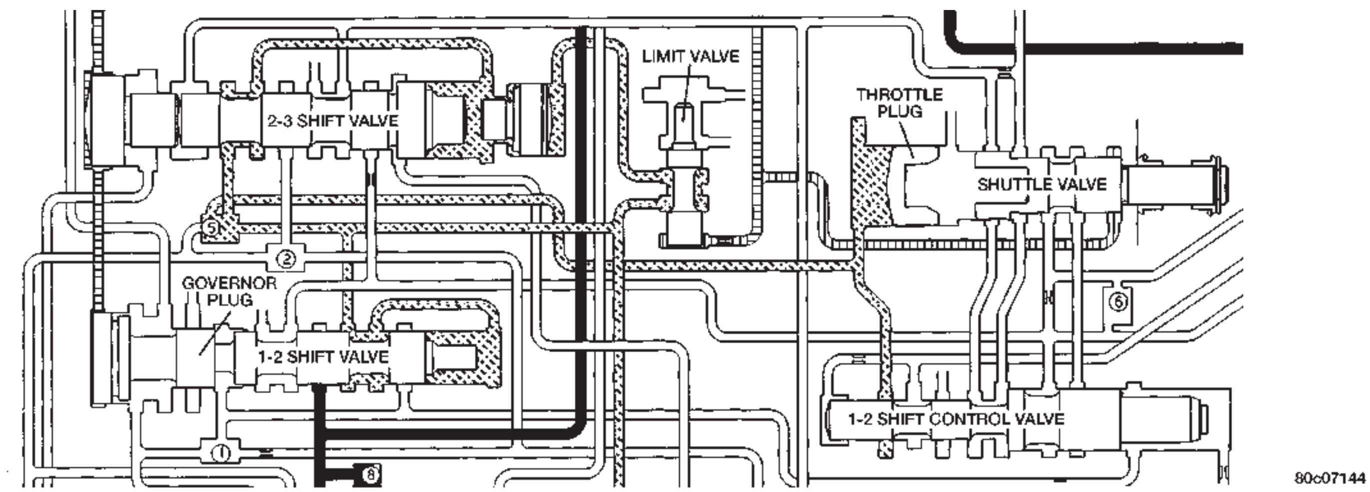

*Fig. 255 1-2 Shift Valve-Before Shift*

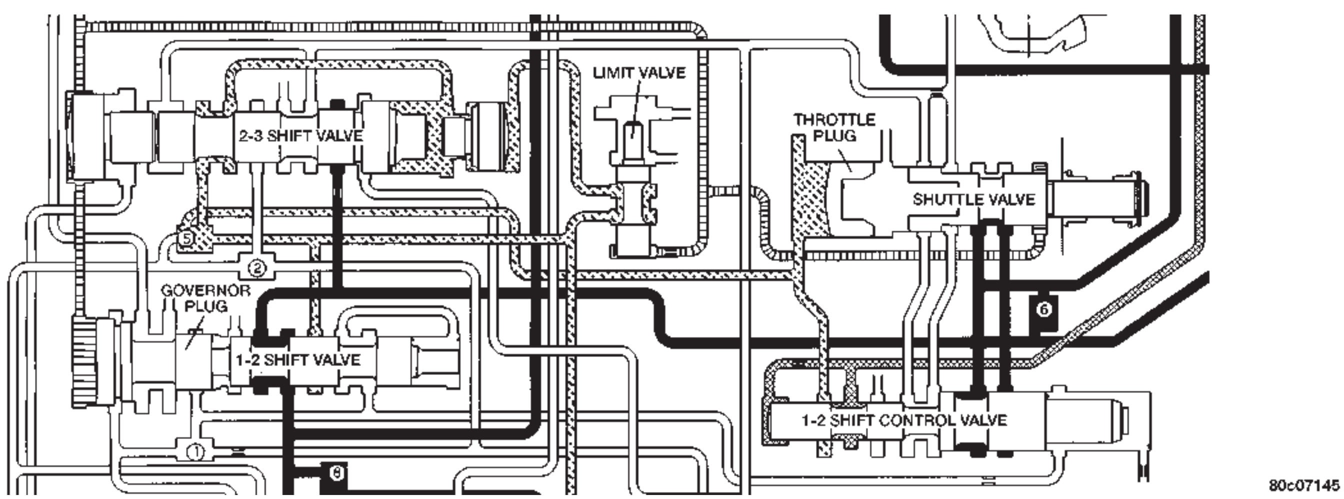

*Fig. 256 1-2 Shift Valve-After Shift*

VALVE BODY (Continued)

## 1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

The valve has two specific operations (Fig. 257):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kick-down ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

## 2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 258) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead–end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 259), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

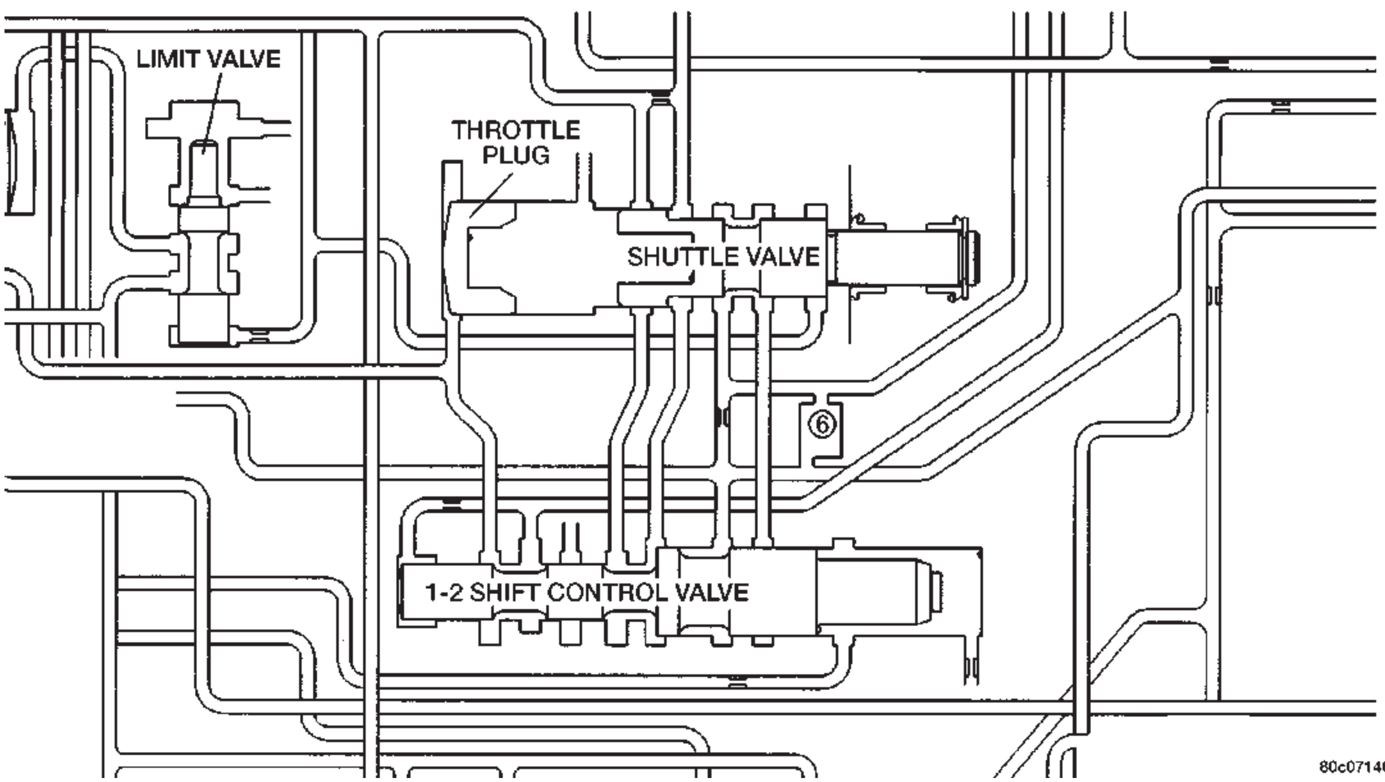

*Fig. 257 1-2 Shift Control Valve*

VALVE BODY (Continued)

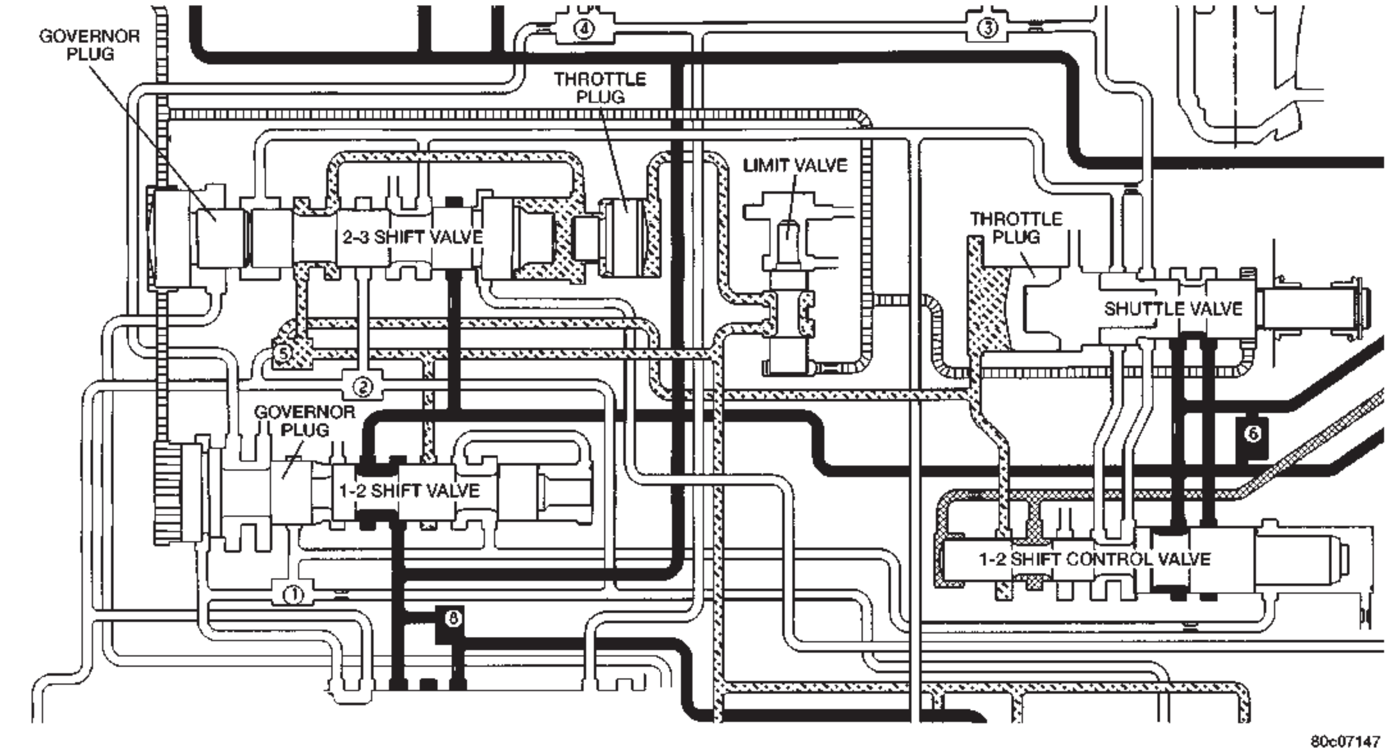

*Fig. 258 2-3 Shift Valve-Before Shift*

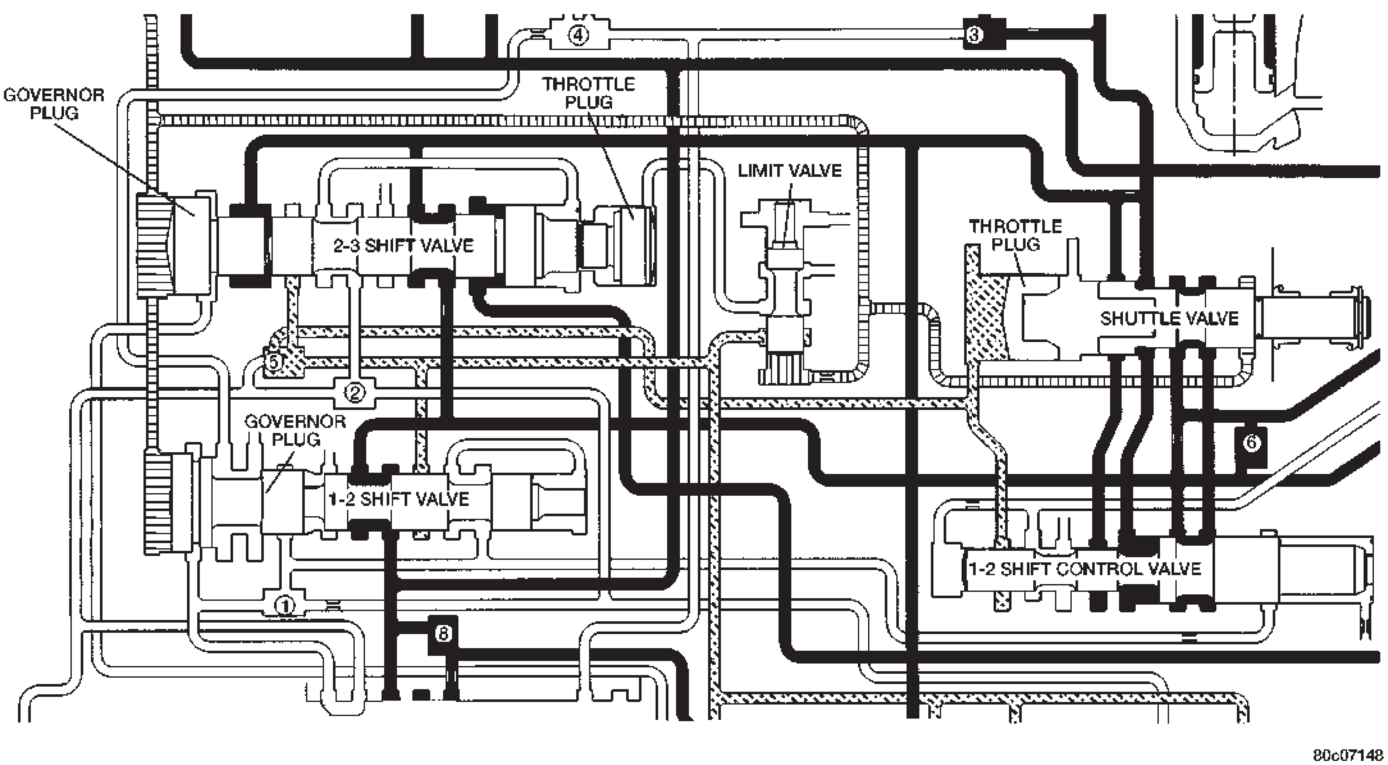

*Fig. 259 2-3 Shift Valve-After Shift*

VALVE BODY (Continued)

## 3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 260). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 261). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

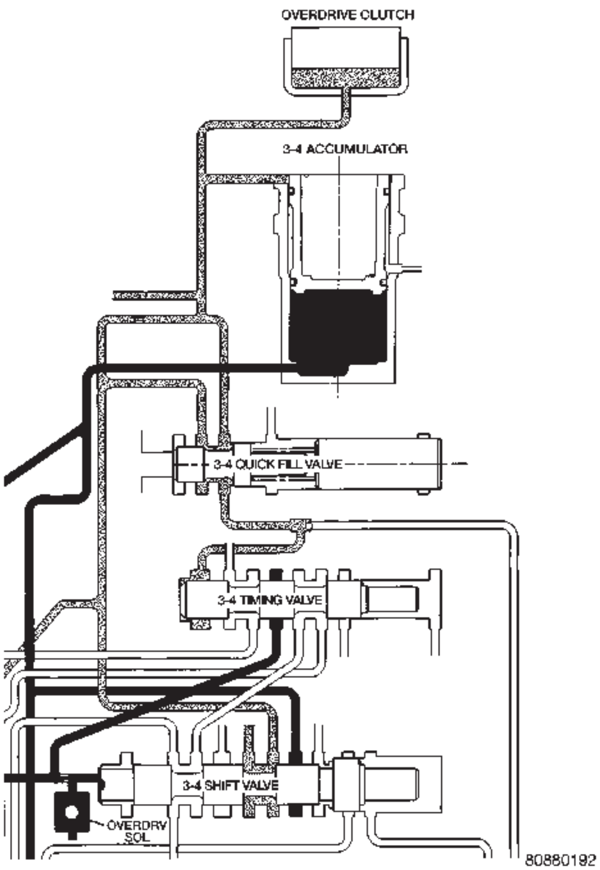

*Fig. 260 3-4 Shift Valve Before Shift*

## 3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 261). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 260).

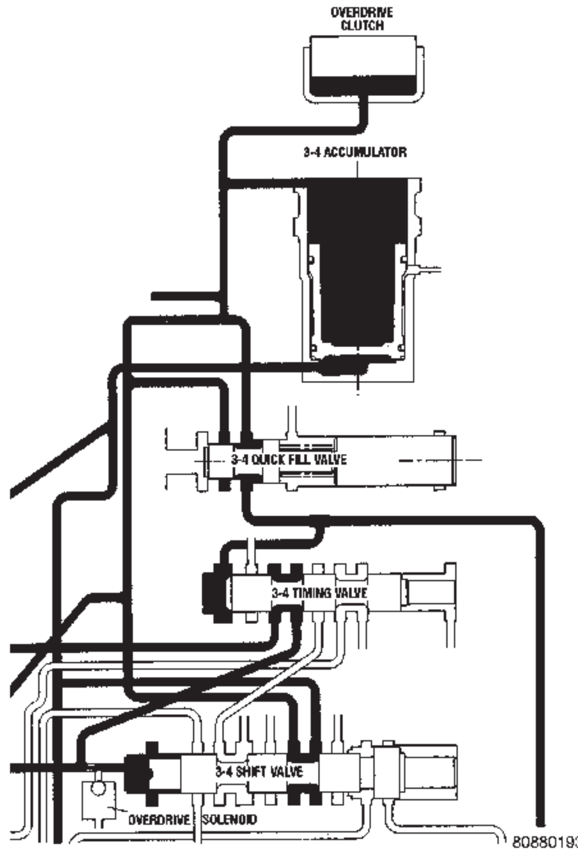

*Fig. 261 3-4 Shift Valve After Shift*

## 3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 260). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 261). Clutch fill is then completed through the regular feed orifice.

VALVE BODY (Continued)

## THROTTLE VALVE

In all gear positions the throttle valve (Fig. 262) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

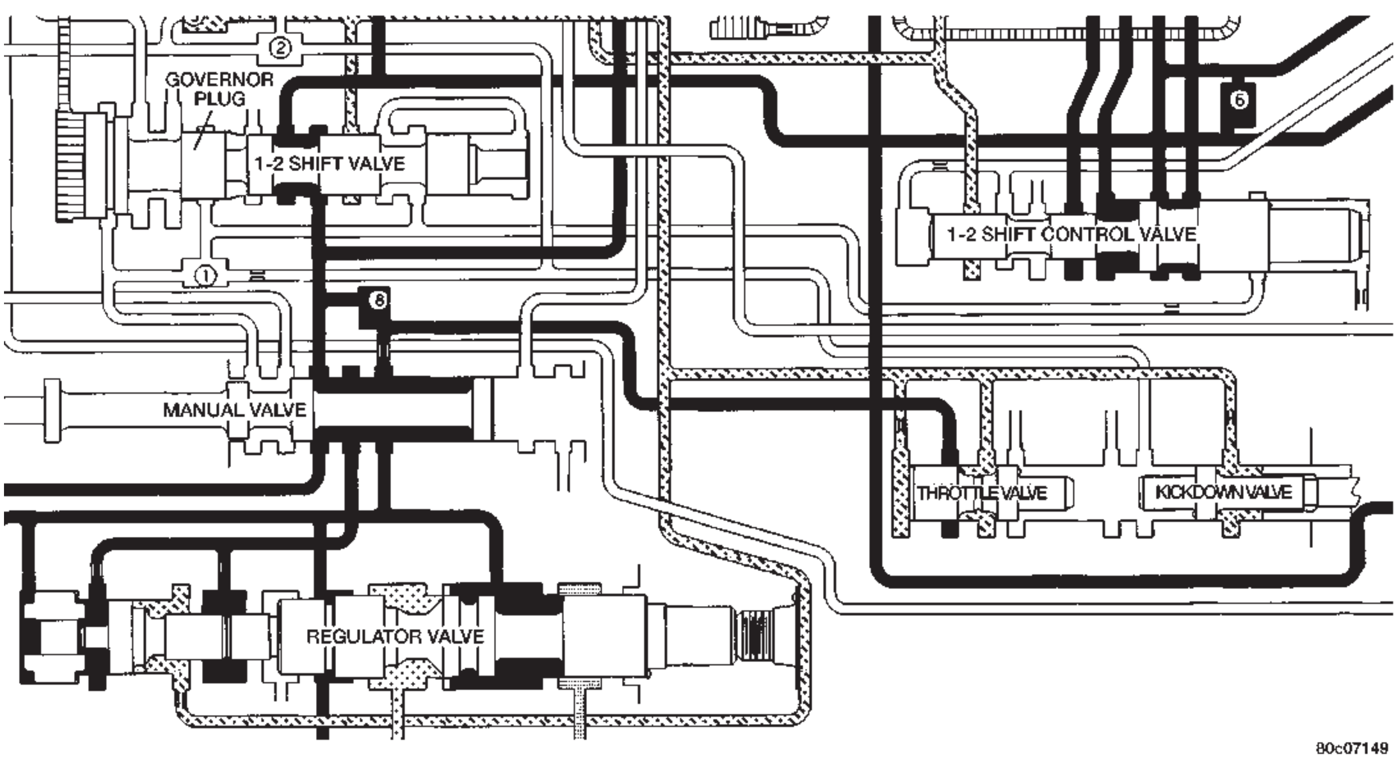

*Fig. 262 Throttle Valve*

VALVE BODY (Continued)

## SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 263), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

Once the TCC control valve has moved to the right (Fig. 264), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

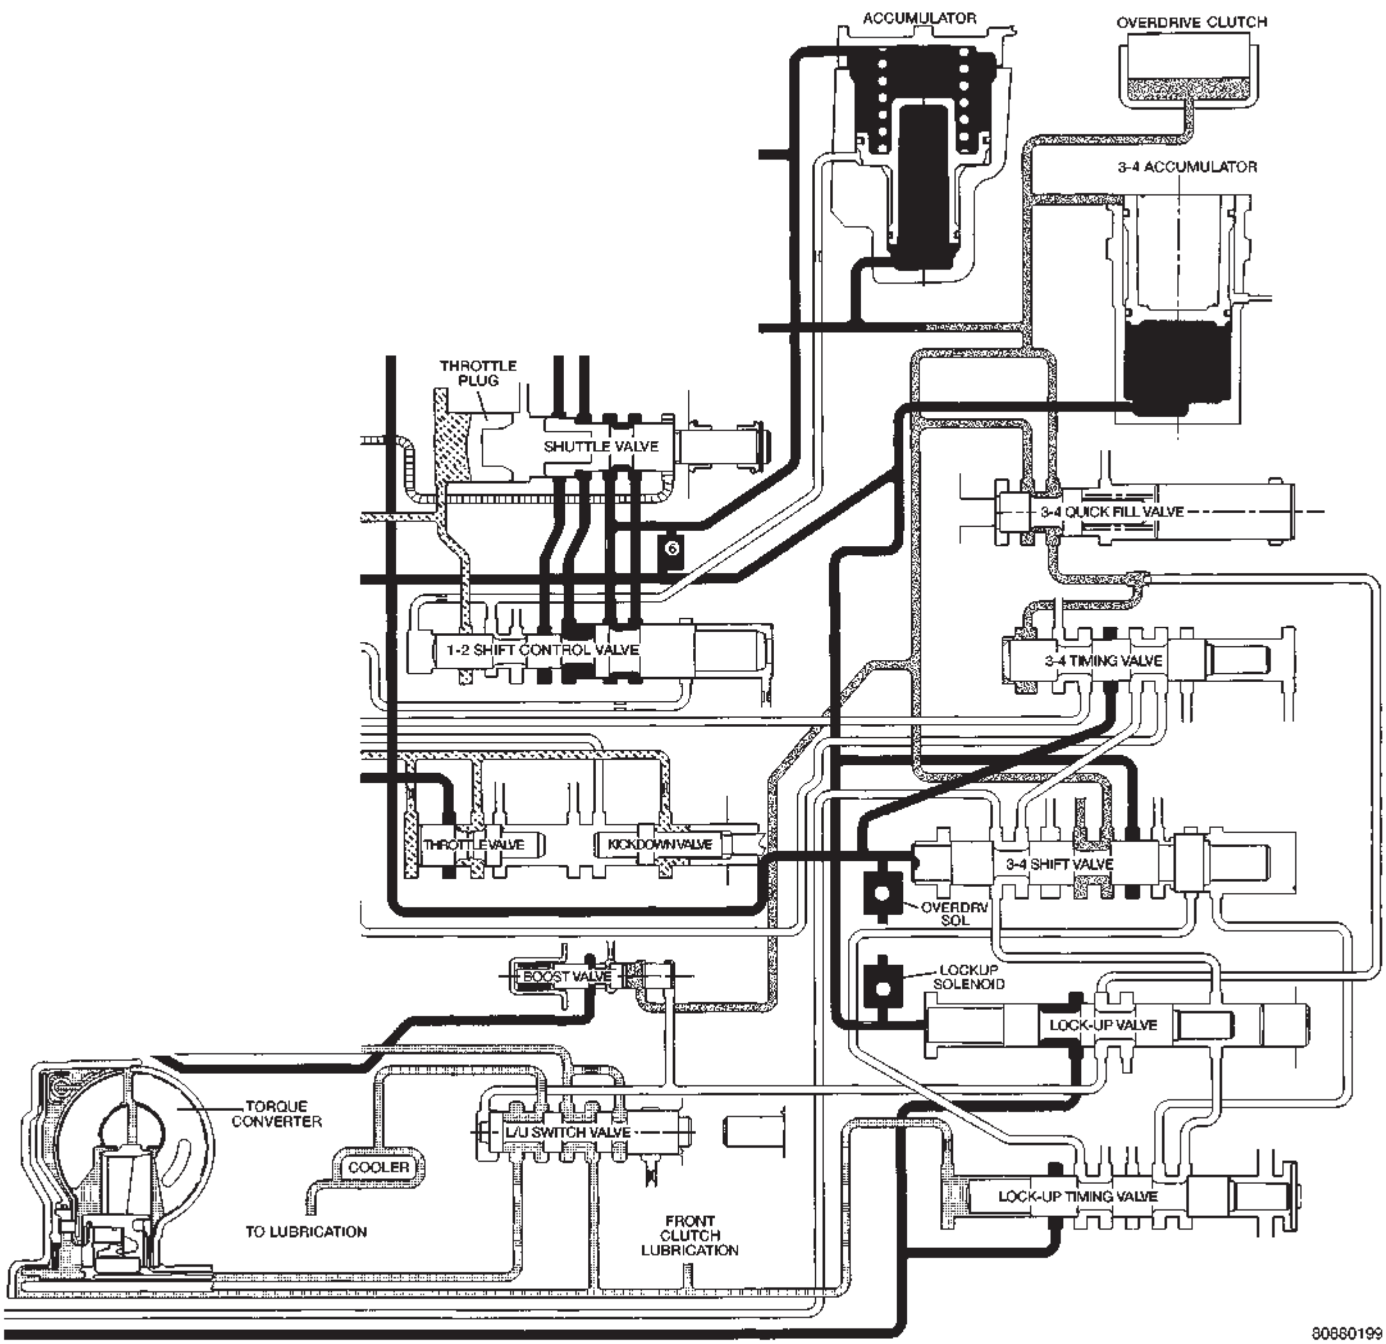

*Fig. 263 Switch Valve-Torque Converter Unlocked*

VALVE BODY (Continued)

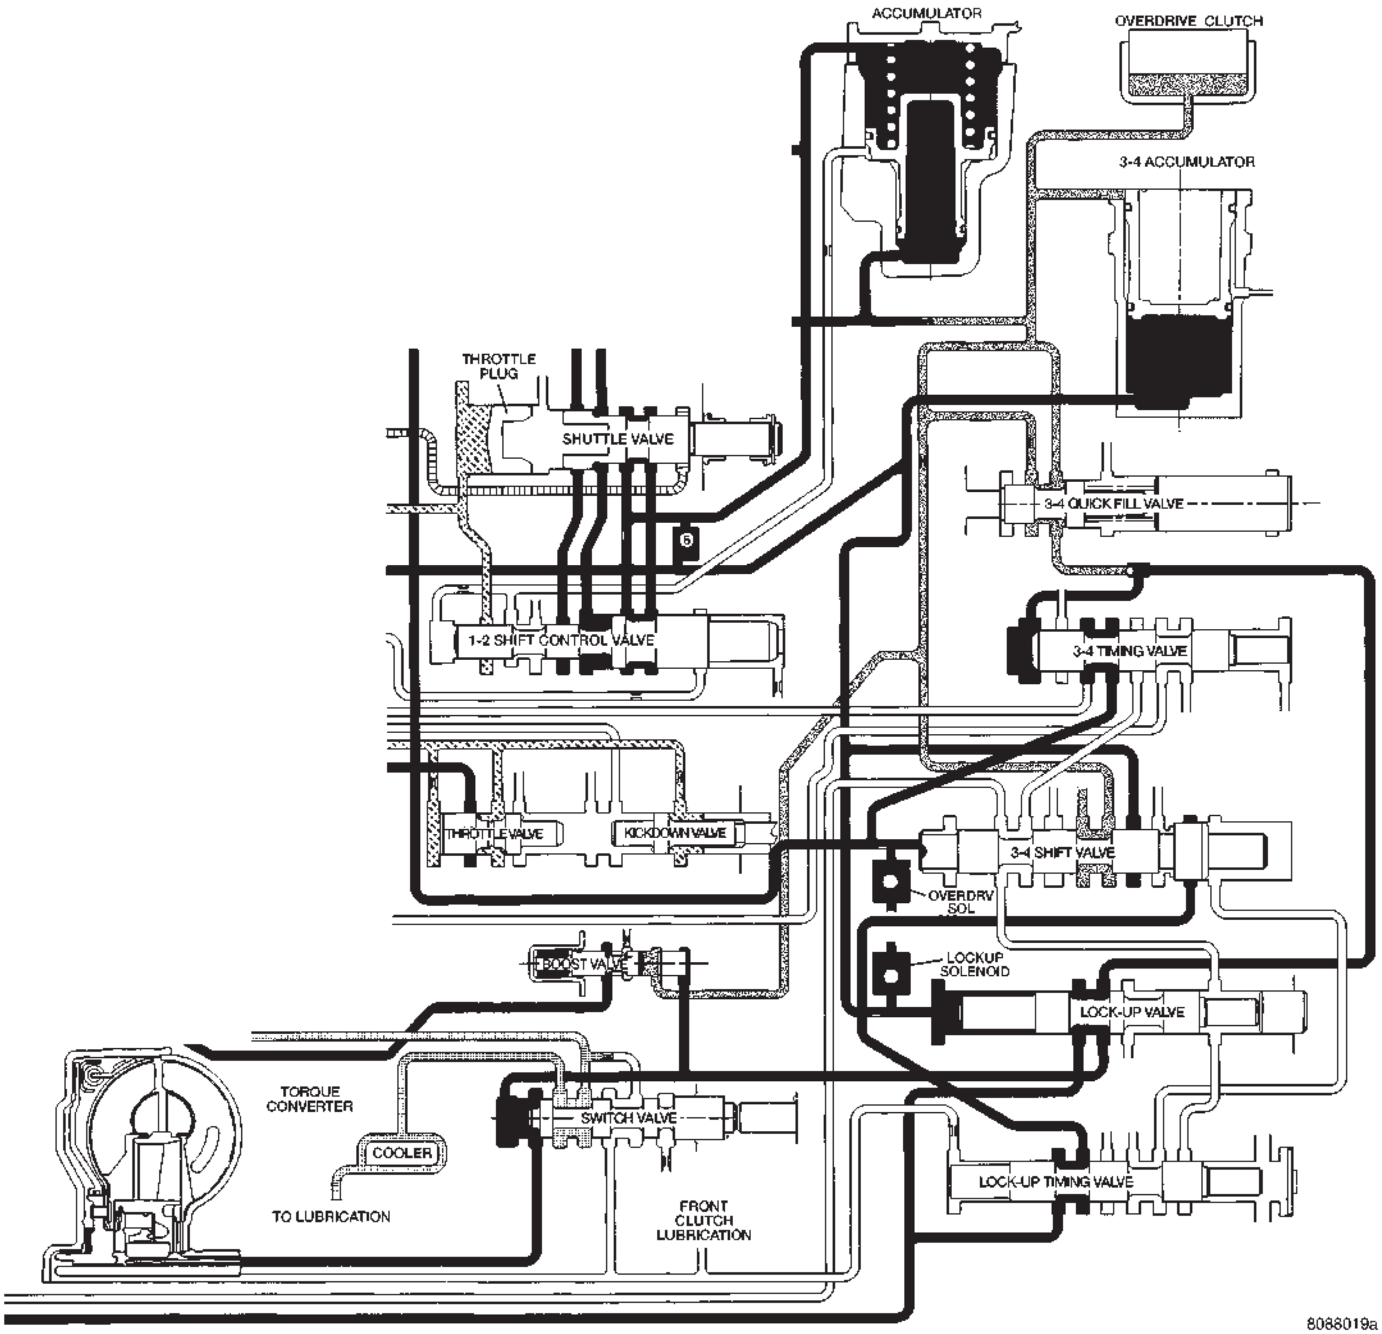

*Fig. 264 Switch Valve-Torque Converter Locked*

VALVE BODY (Continued)

## MANUAL VALVE

The manual valve (Fig. 265) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

## CONVERTER CLUTCH LOCK-UP VALVE

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

## CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

## SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 257) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by–pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 "lift foot" upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

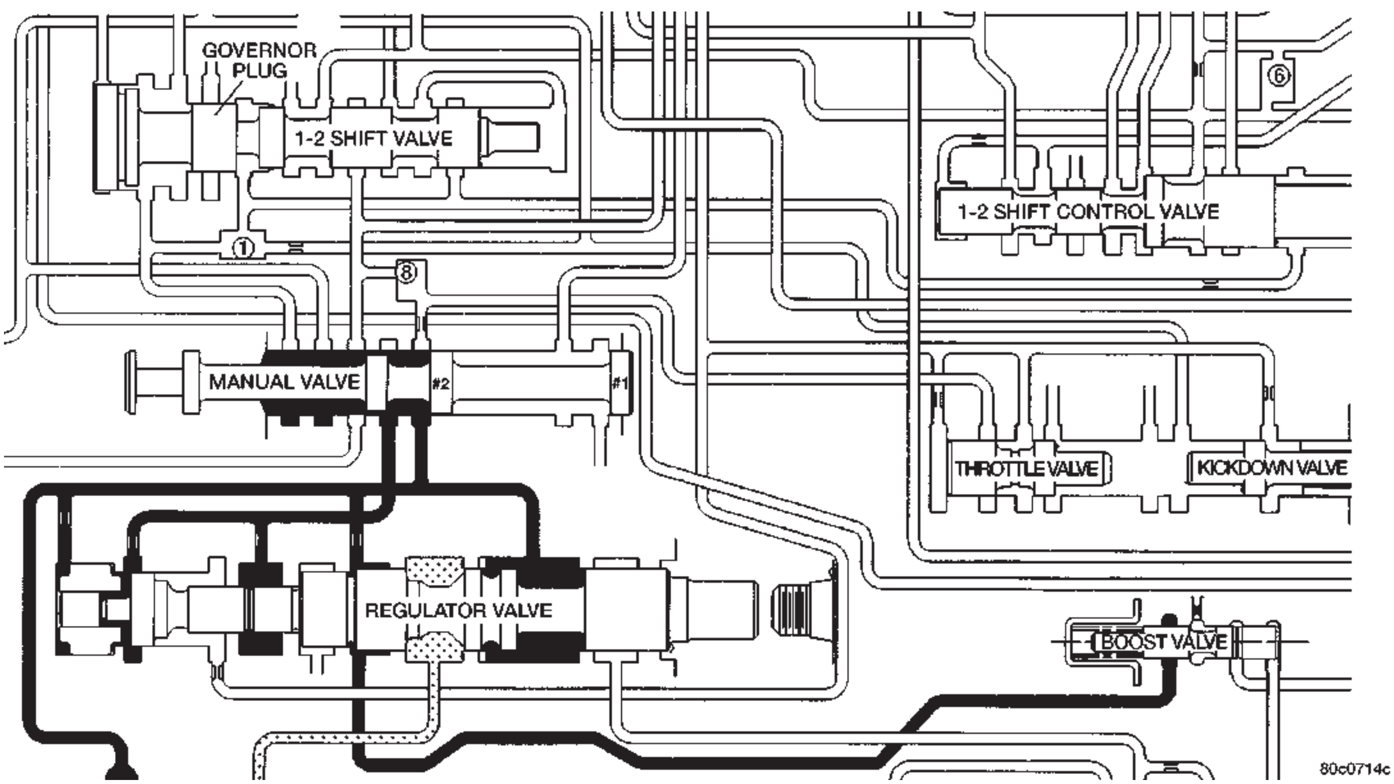

*Fig. 265 Manual Valve*

VALVE BODY (Continued)

## BOOST VALVE

The boost valve (Fig. 266) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 267), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

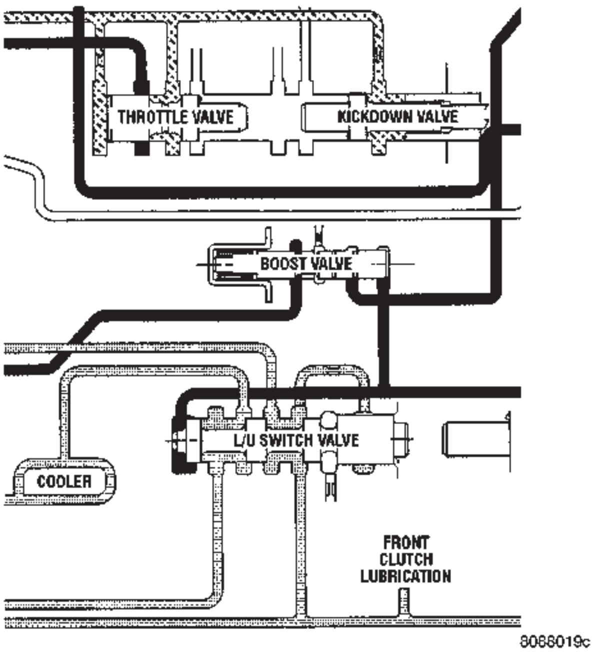

*Fig. 266 Boost Valve Before Lock-up*

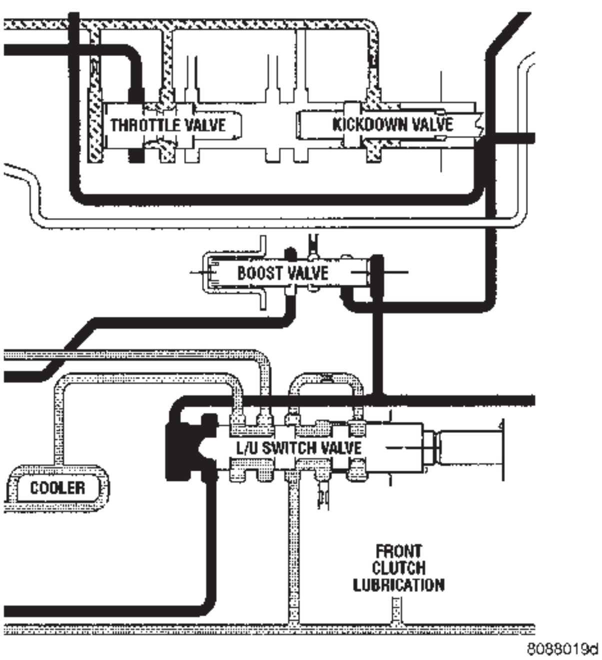

*Fig. 267 Boost Valve After Lock-up*

## REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).
- Converter clutch/overdrive solenoid assembly and harness .
- Governor housing gasket.
- Solenoid case connector O-rings.

(1) Shift transmission into NEUTRAL.

(2) Raise vehicle.

(3) Remove gearshift and throttle levers from shaft of valve body manual lever.

(4) Disconnect wires at solenoid case connector (Fig. 268).

(5) Position drain pan under transmission oil pan.

(6) Remove transmission oil pan and gasket.

(7) Remove fluid filter from valve body.

(8) Remove bolts attaching valve body to transmission case.

(9) Lower valve body enough to remove accumulator piston and springs.

(10) Work manual lever shaft and electrical connector out of transmission case.

(11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 269).

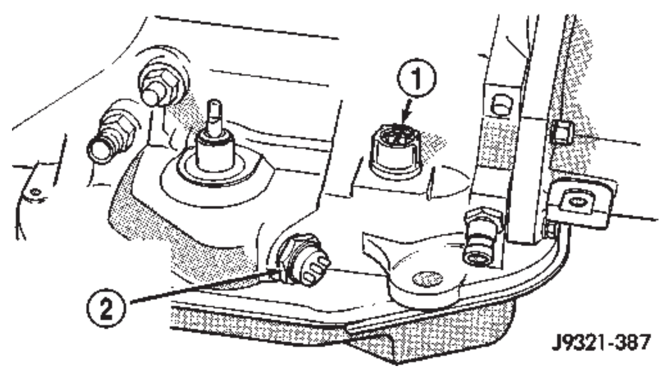

*Fig. 268 Transmission Case Connector*

## DISASSEMBLY

**CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.**

(1) Disconnect wires from governor pressure sensor and solenoid.

(2) Remove screws attaching governor body and retainer plate to transfer plate.

(3) Remove retainer plate, governor body and gasket from transfer plate.

(4) Remove governor pressure sensor from governor body.

(5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 270). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

(7) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 271).

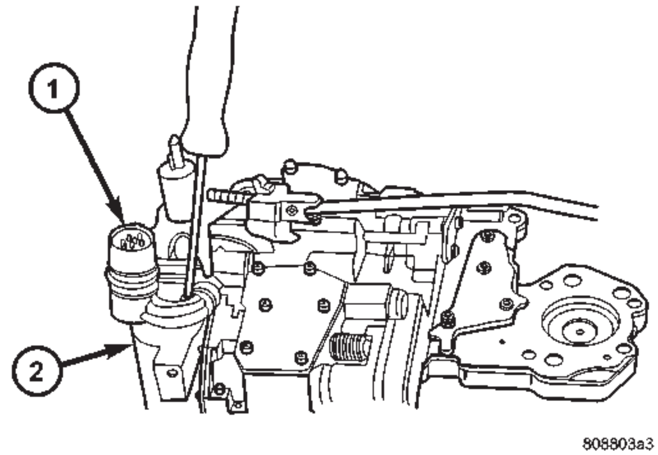

*Fig. 270 Solenoid Harness Case Connector Shoulder Bolt*

3 - BRACKET
4 - BRACKET
5 - REMOVE THIS SCREW LAST

(18) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 282). Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.

(19) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 283).

(20) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 283).

(21) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 284).

(22) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 285).

2 - CONVERTER CLUTCH VALVE SPRING AND PLUG
3 - 3-4 ACCUMULATOR HOUSING

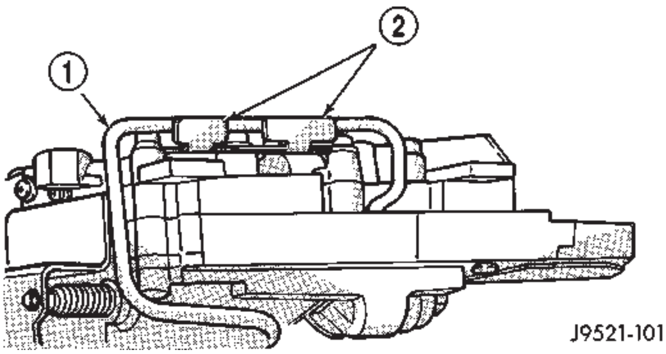

***Fig. 287 Boost Valve Tube Brace***

1 - BOOST VALVE TUBE
2 - TUBE BRACE (DOUBLE TAB)

(25) Remove boost valve connecting tube (Fig. 288). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

**CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.**

(26) Turn valve body over so lower housing is facing upward (Fig. 289). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

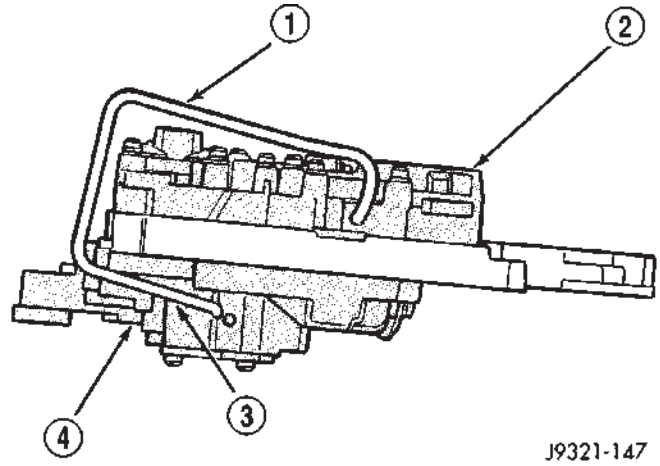

***Fig. 288 Boost Valve Tube***

1 - BOOST VALVE TUBE
2 - LOWER HOUSING
3 - DISENGAGE THIS END OF TUBE FIRST
4 - UPPER HOUSING

(27) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 289). Note position of boost valve tube brace for assembly reference.

(28) Remove lower housing and overdrive separator plate from transfer plate (Fig. 289).

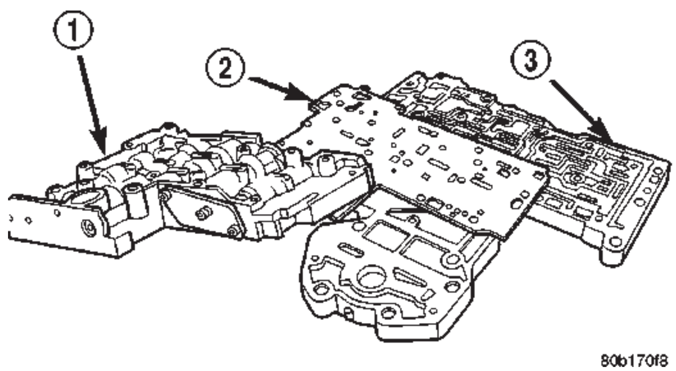

***Fig. 289 Lower Housing***

1 - LOWER HOUSING
2 - OVERDRIVE SEPARATOR PLATE
3 - TRANSFER PLATE AND UPPER HOUSING

VALVE BODY (Continued)

(29) Remove the ECE check ball from the transfer plate (Fig. 290). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(30) Remove transfer plate from upper housing (Fig. 291).

(31) Turn transfer plate over so upper housing separator plate is facing upward.

(32) Remove upper housing separator plate from transfer plate (Fig. 292). Note position of filter in separator plate for assembly reference.

(33) Remove rear clutch and rear servo check balls from transfer plate. Note check ball location for assembly reference (Fig. 293).

VALVE BODY (Continued)

### VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 294). Then remove the one large diameter and the six smaller diameter check balls.

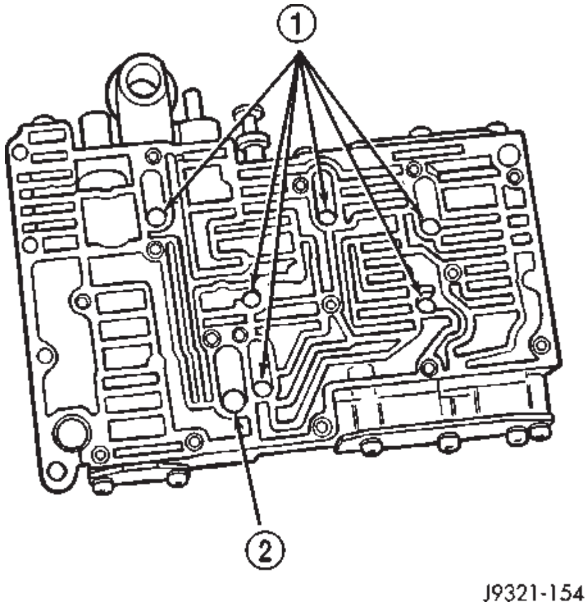

*Fig. 294 Check Ball Locations In Upper Housing*

1 - SMALL DIAMETER CHECK BALLS (6)
2 - LARGE DIAMETER CHECK BALL (1)

(2) Remove governor plug and shuttle valve covers (Fig. 296).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 295).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 296).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 283).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 297).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 297).

(9) Remove 1-2 shift control valve and spring (Fig. 297).

(10) Remove 1-2 shift valve and spring (Fig. 297).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 297).

(12) Remove pressure plug cover (Fig. 297).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 297).

## CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either part has sustained physical damage (dented, deformed, broken, etc.).

**CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.**

## INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

**CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.**

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer

VALVE BODY (Continued)

plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

## ASSEMBLY

**CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.**

### LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 298).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

### 3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 299).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

### TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 300).

(2) Install filter screen in upper housing separator plate (Fig. 301).

(3) Align and position upper housing separator plate on transfer plate (Fig. 302).

(4) Install brace plate (Fig. 302). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

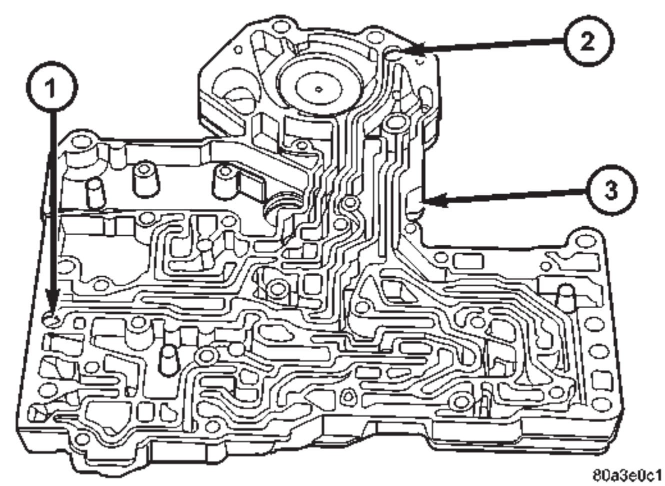

***Fig. 300 Rear Clutch And Rear Servo Check Ball Locations***

3 - SEPARATOR PLATE

## UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 303). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 304). Be sure filter screen is seated in proper housing recess.

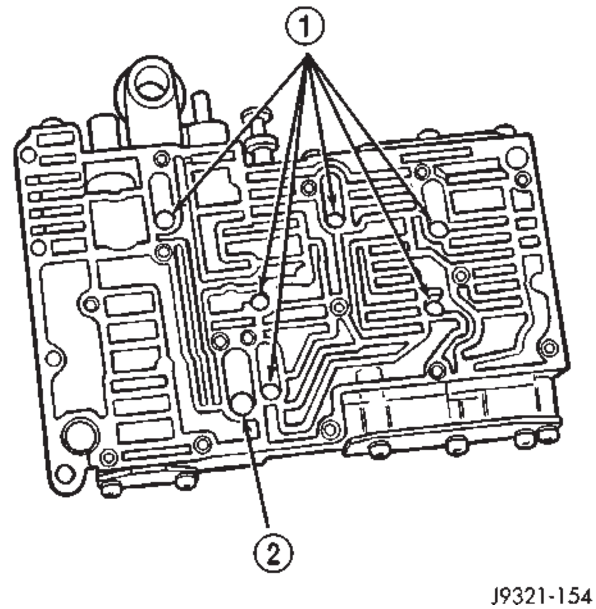

*Fig. 303 Check Ball Locations In Upper Housing*

1 - SMALL DIAMETER CHECK BALLS (6)
2 - LARGE DIAMETER CHECK BALL (1)

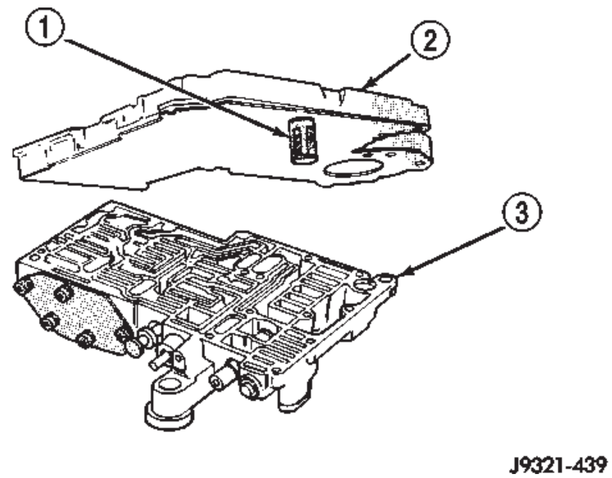

*Fig. 304 Installing Transfer Plate On Upper Housing*

1 - FILTER SCREEN
2 - TRANSFER PLATE/SEPARATOR PLATE ASSEMBLY
3 - UPPER HOUSING

VALVE BODY (Continued)

(3) Install the ECE check ball into the transfer plate (Fig. 290). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 305).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 306).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 306).

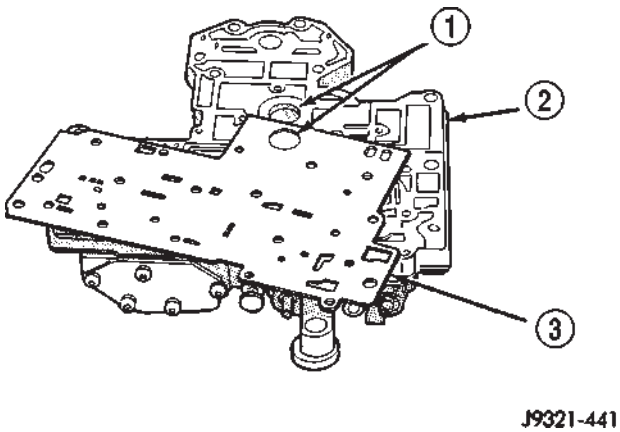

***Fig. 305 Lower Housing Separator Plate***

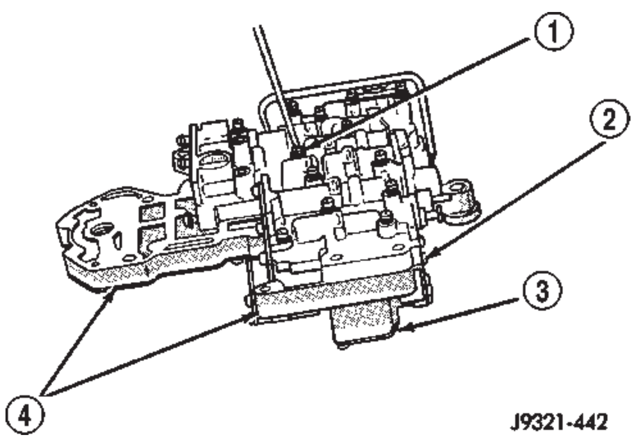

***Fig. 306 Installing Lower Housing On Transfer Plate And Upper Housing***

1 - VALVE BODY SCREWS (13)
2 - LOWER HOUSING
3 - UPPER HOUSING
4 - TRANSFER PLATE

## UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 307), (Fig. 308) and (Fig. 309) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

## BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 310).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 310).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 311).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 311).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 312).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

VALVE BODY (Continued)

### 3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 313).

(2) Loosely attach accumulator housing with right-side screw (Fig. 313). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 314). Tighten screws to 4 N·m (35 in. lbs.).

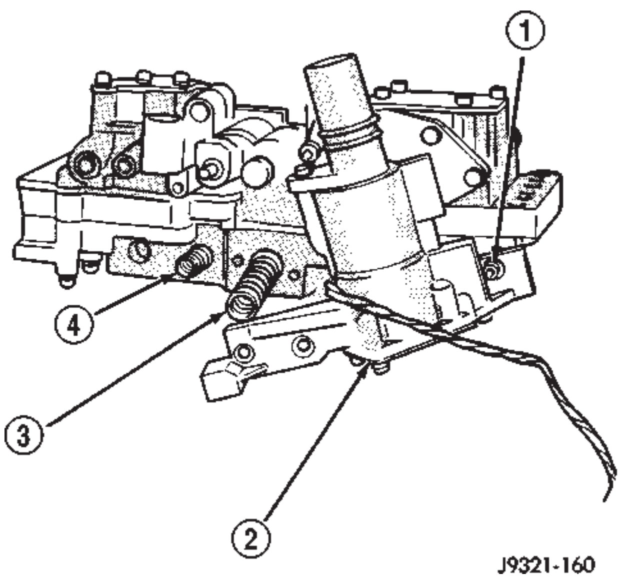

***Fig. 313 Converter Clutch And 3-4 Shift Valve Springs***

1 - RIGHT-SIDE SCREW
2 - 3-4 ACCUMULATOR
3 - 3-4 SHIFT VALVE SPRING
4 - CONVERTER CLUTCH VALVE SPRING

### VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 315).

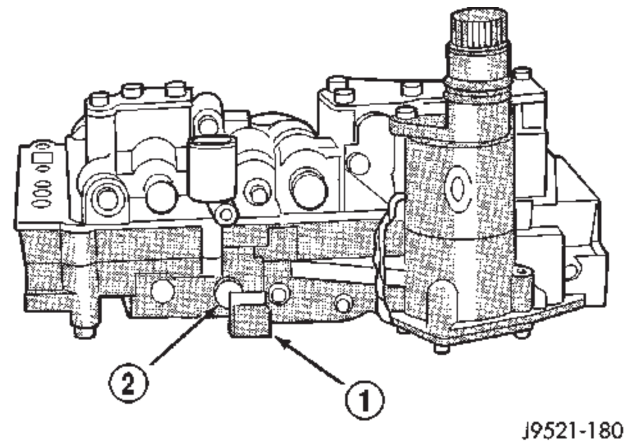

***Fig. 314 Seating 3-4 Accumulator On Lower Housing***

1 - ACCUMULATOR BOX
2 - CONVERTER CLUTCH VALVE PLUG

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 316).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

VALVE BODY (Continued)

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 317). Seat tang in dimple before tightening connector screw.

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(21) Verify that solenoid wire harness is properly routed (Fig. 318). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

## GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

VALVE BODY (Continued)

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

## INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 319). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 320).

(3) Check condition of seals on accumulator piston (Fig. 321). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

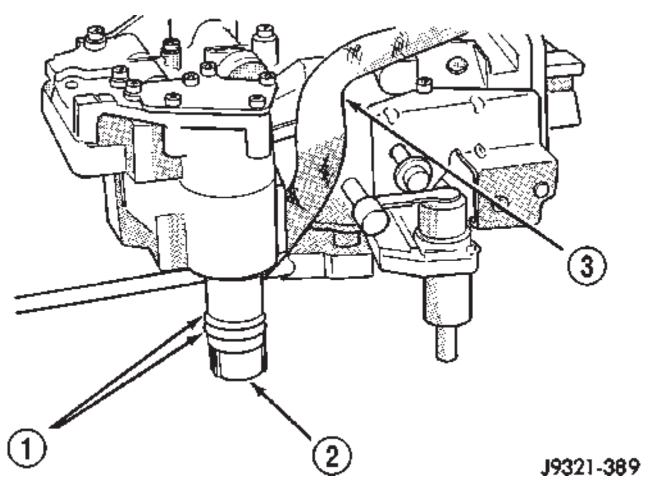

*Fig. 319 Valve Body Harness Connector O-Ring Seal*

1 - CONNECTOR O-RINGS
2 - VALVE BODY HARNESS CONNECTOR
3 - HARNESS

**CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.**

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

## ADJUSTMENTS - VALVE BODY

### CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

#### LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 322).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

**NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.**

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

#### THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 323).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

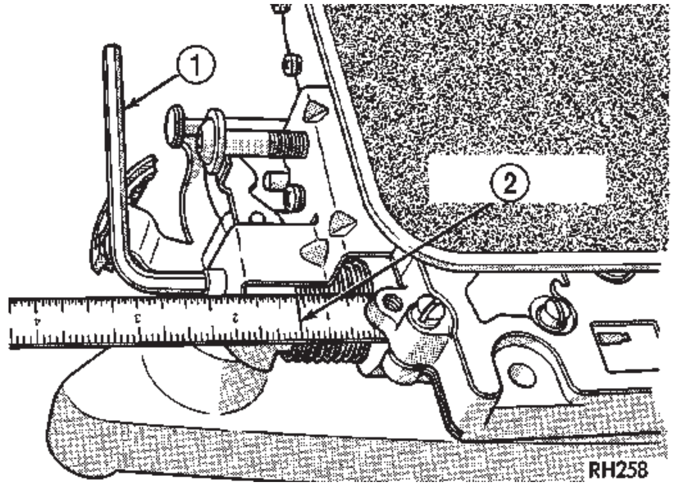

*Fig. 322 Line Pressure Adjustment*

1 - WRENCH
2 - 1–5/16 INCH

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

**NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.**

# AUTOMATIC TRANSMISSION - 44RE

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION - 44RE

## DESCRIPTION

The 44RE is a four speed fully automatic transmission (Fig. 1) with an electronic governor. The 44RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

## GEAR RATIOS The 44RE gear ratios are:

**1st** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.74:1
**2nd** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1.54:1
**3rd** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1.00:1
**4th** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 0.69:1
**Rev.** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.21:1

## OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 44RE (Continued)

## PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

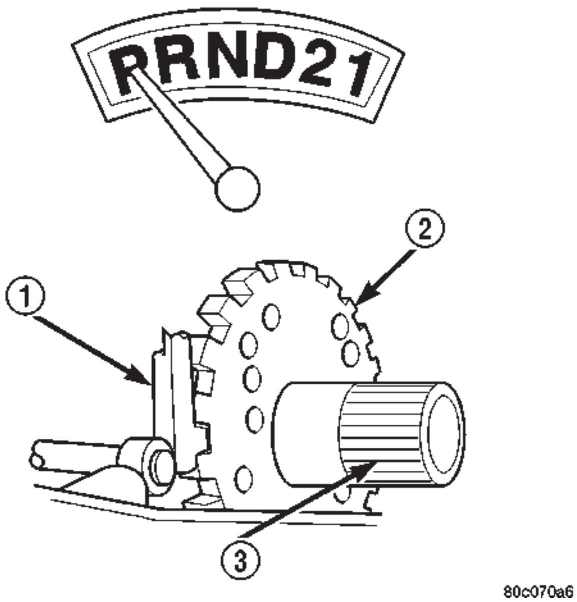

*Fig. 3 Park Powerflow*

1 - PAWL ENGAGED FOR PARK
2 - PARK SPRAG
3 - OUTPUT SHAFT

## NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

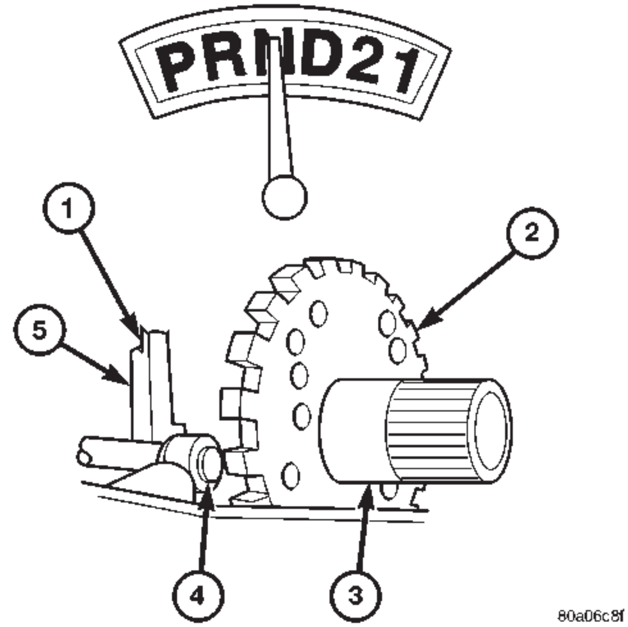

*Fig. 4 Neutral Powerflow*

1 - PAWL DISENGAGED FOR NEUTRAL
2 - PARK SPRAG
3 - OUTPUT SHAFT
4 - CAM
5 - PAWL

AUTOMATIC TRANSMISSION - 44RE (Continued)

### REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

8 - LOW/REVERSE BAND APPLIED

AUTOMATIC TRANSMISSION - 44RE (Continued)

## FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

3 - REAR CLUTCH APPLIED
4 - OUTPUT SHAFT
5 - OVER-RUNNING CLUTCH HOLDING
6 - INPUT SHAFT
7 - REAR CLUTCH APPLIED
8 - INPUT SHAFT

## SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed. Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

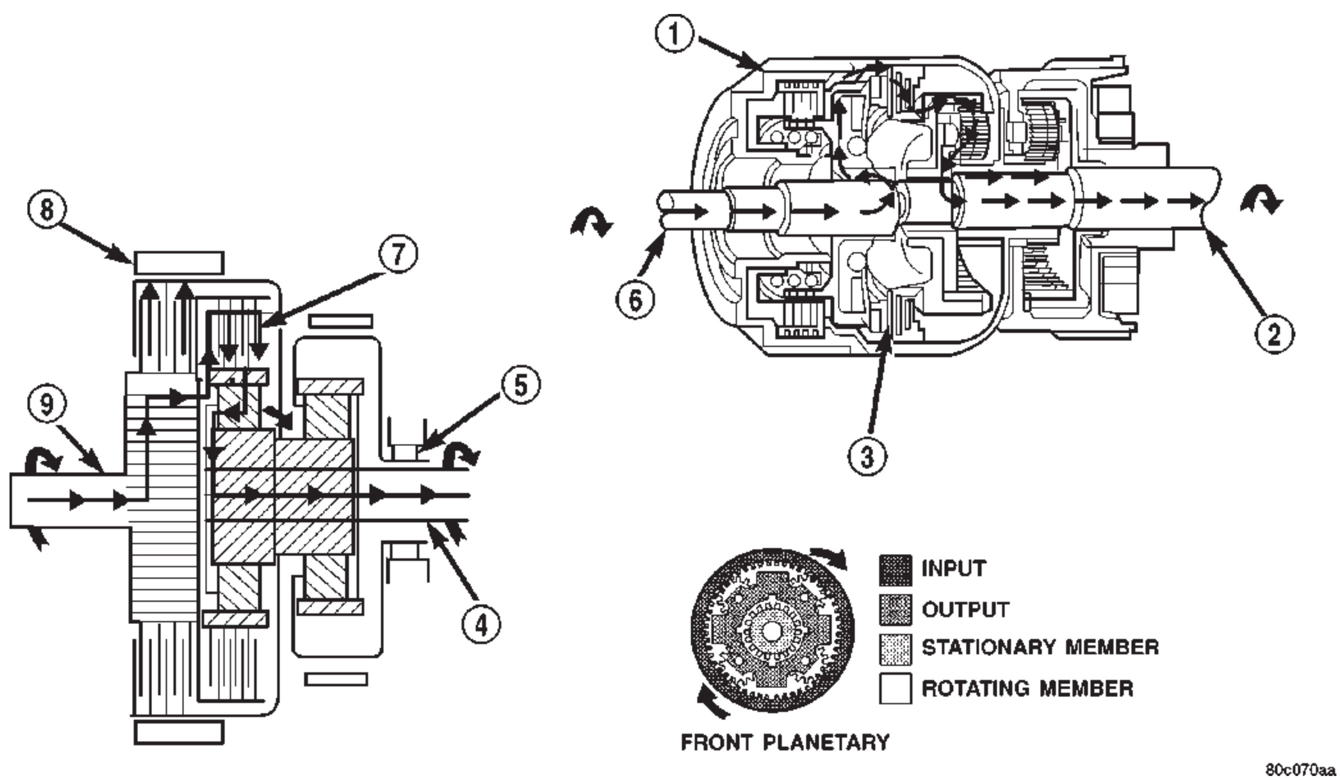

*Fig. 7 Second Gear Powerflow*

8 - KICKDOWN BAND APPLIED
9 - INPUT SHAFT

AUTOMATIC TRANSMISSION - 44RE (Continued)

### DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

AUTOMATIC TRANSMISSION - 44RE (Continued)

## FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

## DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

## DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

### VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB® scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform hydraulic pressure test if shift problems were noted during road test.

(6) Perform air-pressure test to check clutch-band operation.

### VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

## DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 44RE (Continued)

**CLUTCH AND BAND APPLICATION CHART**

| SHIFT LEVER POSITION | TRANSMISSION CLUTCHES AND BANDS | | | | | OVERDRIVE CLUTCHES | | |
|---|---|---|---|---|---|---|---|---|
| | FRONT CLUTCH | FRONT BAND | REAR CLUTCH | REAR BAND | OVER-RUNNING CLUTCH | OVER-DRIVE CLUTCH | DIRECT CLUTCH | OVER-RUNNING CLUTCH |
| Reverse | X | | | X | | | X | |
| Drive - First | | | X | | X | | X | X |
| Drive - Second | | X | X | | | | X | X |
| Drive - Third | X | | X | | | | X | X |
| Drive - Fourth | X | | X | | | X | | |
| Manual Second | | X | X | | X | | X | X |
| Manual First | | | X | X | X | | X | X |

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

## DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

### Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

AUTOMATIC TRANSMISSION - 44RE (Continued)

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

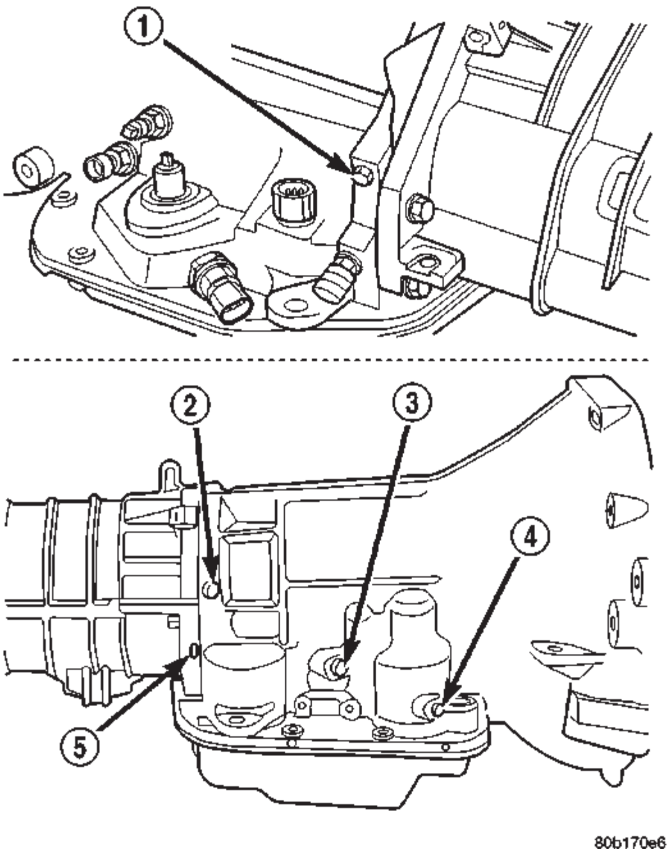

*Fig. 9 Pressure Test Port Locations*

1 - OVERDRIVE CLUTCH TEST PORT
2 - GOVERNOR TEST PORT
3 - ACCUMULATOR TEST PORT
4 - FRONT SERVO TEST PORT
5 - REAR SERVO TEST PORT

#### Test One - Transmission In Manual Low

**NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.**

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

#### Test Two - Transmission In 2 Range

**NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.**

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

#### Test Three - Transmission In D Range Third Gear

**NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.**

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

AUTOMATIC TRANSMISSION - 44RE (Continued)

#### Test Four - Transmission In Reverse

**NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.**

(1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.

(2) Move 300 psi Gauge C-3293-SP back to rear servo port.

(3) Have helper start and run engine at 1600 rpm for test.

(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.

(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.

(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

#### Test Five - Governor Pressure

**NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.**

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.
- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

#### Test Six - Transmission In Overdrive Fourth Gear

**NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.**

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

AUTOMATIC TRANSMISSION - 44RE (Continued)

*PRESSURE TEST ANALYSIS CHART*

| TEST CONDITION | INDICATION |
|---|---|
| Line pressure OK during any one test | Pump and regulator valve OK |
| Line pressure OK in R but low in D, 2, 1 | Leakage in rear clutch area (seal rings, clutch seals) |
| Pressure low in D Fourth Gear Range | Overdrive clutch piston seal, or check ball problem |
| Pressure OK in 1, 2 but low in D3 and R | Leakage in front clutch area |
| Pressure OK in 2 but low in R and 1 | Leakage in rear servo |
| Front servo pressure in 2 | Leakage in servo; broken servo ring or cracked servo piston |
| Pressure low in all positions | Clogged filter, stuck regulator valve, worn or faulty pump, low oil level |
| Governor pressure too high at idle speed | Governor pressure solenoid valve system fault. Refer to diagnostic book. |
| Governor pressure low at all mph figures | Faulty governor pressure solenoid, transmission control module, or governor pressure sensor |
| Lubrication pressure low at all throttle positions | Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter. |
| Line pressure high | Output shaft plugged, sticky regulator valve |
| Line pressure low | Sticky regulator valve, clogged filter, worn pump |

## DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

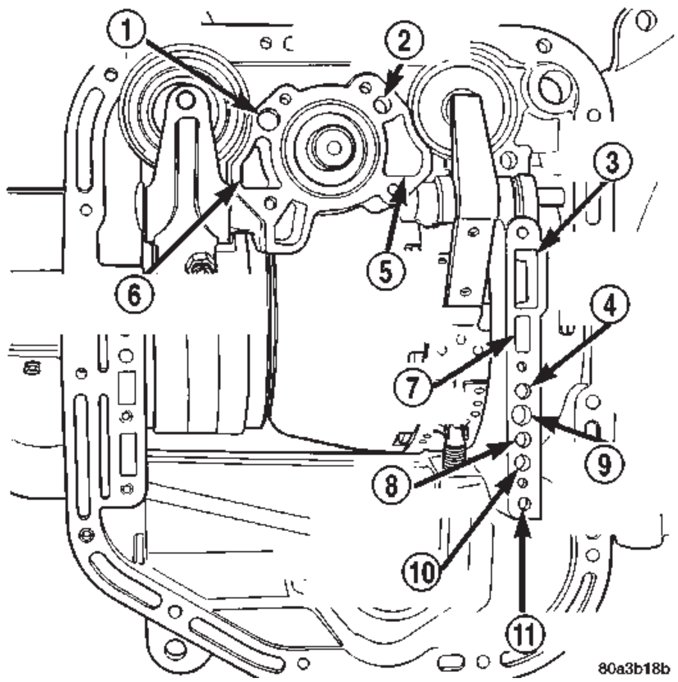

*Fig. 10 Air Pressure Test Passages*

1 - REAR SERVO APPLY
2 - FRONT SERVO APPLY
3 - PUMP SUCTION
4 - FRONT CLUTCH APPLY
5 - FRONT SERVO RELEASE
6 - LINE PRESSURE TO ACCUMULATOR
7 - PUMP PRESSURE
8 - TO CONVERTER
9 - REAR CLUTCH APPLY
10 - FROM CONVERTER
11 - TO COOLER

### Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage.

AUTOMATIC TRANSMISSION - 44RE (Continued)

Piston movement can be felt and a soft thump heard as the clutch applies.

### Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

### Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

## DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

(1) Verify that a leak condition actually exists.

(2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

## TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

(1) Leaks at the weld joint around the outside diameter weld (Fig. 12).

(2) Leaks at the converter hub weld (Fig. 12).

## CONVERTER HOUSING AREA LEAK CORRECTION

(1) Remove converter.

(2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.

(3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

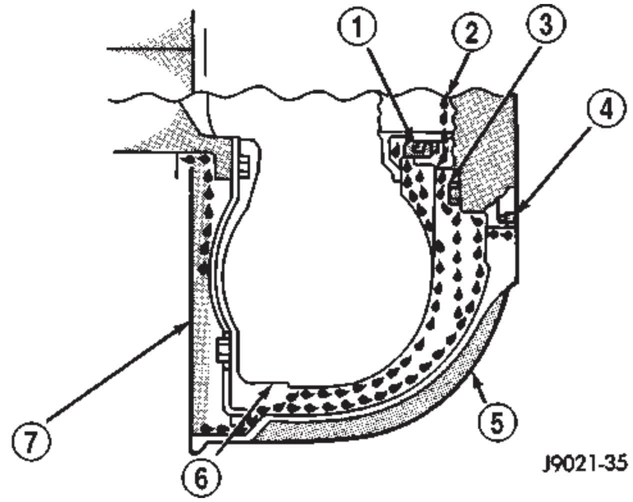

***Fig. 11 Converter Housing Leak Paths***

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

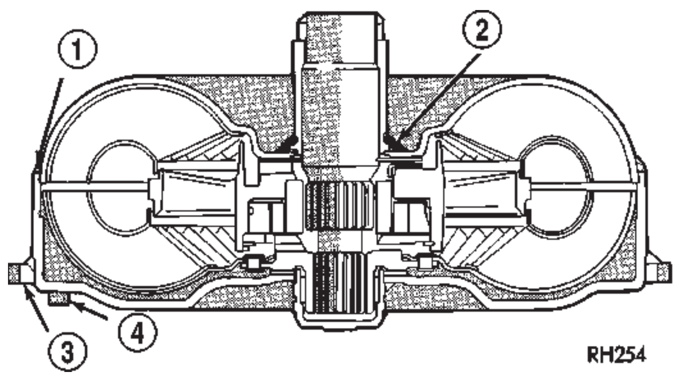

***Fig. 12 Converter Leak Points - Typical***

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to

AUTOMATIC TRANSMISSION - 44RE (Continued)

plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

## DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

**DIAGNOSIS CHARTS**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Add Fluid |
| | 2. Throttle Linkage Mis-adjusted. | 2. Adjust linkage - setting may be too long. |
| | 3. Mount and Driveline Bolts Loose. | 3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts. |
| | 4. U-Joint Worn/Broken. | 4. Remove propeller shaft and replace U-Joint. |
| | 5. Axle Backlash Incorrect. | 5. Check per Service Manual. Correct as needed. |
| | 6. Hydraulic Pressure Incorrect. | 6. Check pressure. Remove, overhaul or adjust valve body as needed. |
| | 7. Band Mis-adjusted. | 7. Adjust rear band. |
| | 8. Valve Body Check Balls Missing. | 8. Inspect valve body for proper check ball installation. |
| | 9. Axle Pinion Flange Loose. | 9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged. |
| | 10. Clutch, band or planetary component damaged. | 10. Remove, disassemble and repair transmission as necessary. |
| | 11. Converter Clutch Faulty. | 11. Replace converter and flush cooler and line before installing new converter. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Correct level and check for leaks. |
| | 2. Filter Clogged. | 2. Change filter. |
| | 3. Gearshift Linkage Mis-adjusted. | 3. Adjust linkage and repair linkage if worn or damaged. |
| | 4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump). | 4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house. |
| | 5. Rear Band Mis-adjusted. | 5. Adjust band. |
| | 6. Valve Body Filter Plugged. | 6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary. |
| | 7. Oil Pump Gears Worn/Damaged. | 7. Remove transmission and replace oil pump. |
| | 8. Governor Circuit and Solenoid Valve Electrical Fault. | 8. Test with DRB® scan tool and repair as required. |
| | 9. Hydraulic Pressure Incorrect. | 9. Perform pressure test, remove transmission and repair as needed. |
| | 10. Reaction Shaft Seal Rings Worn/Broken. | 10. Remove transmission, remove oil pump and replace seal rings. |
| | 11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged. | 11. Remove and disassemble transmission and repair as necessary. |
| | 12. Regulator Valve Stuck. | 12. Clean. |
| | 13. Cooler Plugged. | 13. Transfer case failure can plug cooler. |
| NO DRIVE RANGE (REVERSE OK) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Repair or replace linkage components. |
| | 3. Rear Clutch Burnt. | 3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed. |
| | 4. Valve Body Malfunction. | 4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged. |
| | 5. Transmission Overrunning Clutch Broken. | 5. Remove and disassemble transmission. Replace overrunning clutch. |
| | 6. Input Shaft Seal Rings Worn/ Damaged. | 6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts. |
| | 7. Front Planetary Failed Broken. | 7. Remove and repair. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts. |
| | 3. U-Joint/Axle/Transfer Case Broken. | 3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section. |
| | 4. Filter Plugged. | 4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary. |
| | 5. Oil Pump Damaged. | 5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary. |
| | 6. Valve Body Malfunctioned. | 6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition. |
| | 7. Transmission Internal Component Damaged. | 7. Remove and disassemble transmission. Repair or replace failed components as needed. |
| | 8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck. | 8. Remove, disassemble, repair. |
| | 9. Torque Converter Damage. | 9. Inspect and replace as required. |
| SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES) | 1. Fluid Level Low/High. | 1. Correct fluid level and check for leaks if low. |
| | 2. Fluid Filter Clogged. | 2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage as described in service section. |
| | 4. Throttle Linkage Binding. | 4. Check cable for binding. Check for return to closed throttle at transmission. |
| | 5. Gearshift Linkage/Cable Mis-adjusted. | 5. Adjust linkage/cable as described in service section. |
| | 6. Clutch or Servo Failure. | 6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed. |
| | 7. Governor Circuit Electrical Fault. | 7. Test using DRB® scan tool and repair as required. |
| | 8. Front Band Mis-adjusted. | 8. Adjust band. |
| | 9. Pump Suction Passage Leak. | 9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO REVERSE (D RANGES OK) | 1. Gearshift Linkage/Cable Mis-adjusted/Damaged. | 1. Repair or replace linkage parts as needed. |
| | 2. Park Sprag Sticking. | 2. Replace overdrive annulus gear. |
| | 3. Rear Band Mis-adjusted/Worn. | 3. Adjust band; replace. |
| | 4. Valve Body Malfunction. | 4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged. |
| | 5. Rear Servo Malfunction. | 5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary. |
| | 6. Direct Clutch in Overdrive Worn. | 6. Disassemble overdrive. Replace worn or damaged parts. |
| | 7. Front Clutch Burnt. | 7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required. |
| HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT) | 1. Governor Circuit Electrical Fault. | 1. Test using DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Repair stuck 1-2 shift valve or governor plug. |
| | 3. Front Servo/Kickdown Band Damaged/Burned. | 3. Repair/replace. |
| MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW | 1. Valve Body Malfunction. | 1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug. |
| NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY) | 1. Governor Circuit Electrical Fault. | 1. Test with DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs. |
| | 3. Front Servo Piston Cocked in Bore. | 3. Inspect servo and repair as required. |
| | 4. Front Band Linkage Malfunction | 4. Inspect linkage and look for bind in linkage. |
| NO KICKDOWN OR NORMAL DOWNSHIFT | 1. Throttle Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Accelerator Pedal Travel Restricted. | 2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets. |
| | 3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments. | 3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |
| | 4. Governor Circuit Electrical Fault. | 4. Test with DRB® scan tool and repair as required. |
| | 5. Valve Body Malfunction. | 5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 6. TPS Malfunction. | 6. Replace sensor, check with DRB® scan tool. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if required. |
| | 8. Valve Body Malfunction. | 8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve. |
| STUCK IN LOW GEAR (WILL NOT UPSHIFT) | 1. Throttle Linkage Mis-adjusted/ Stuck. | 1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage and repair linkage if worn or damaged. |
| | 3. Governor Component Electrical Fault. | 3. Check operating pressures and test with DRB® scan tool, repair faulty component. |
| | 4. Front Band Out of Adjustment. | 4. Adjust Band. |
| | 5. Clutch or Servo Malfunction. | 5. Air pressure check operation of clutches and bands. Repair faulty component. |
| CREEPS IN NEUTRAL | 1. Gearshift Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Rear Clutch Dragging/Warped. | 2. Disassemble and repair. |
| | 3. Valve Body Malfunction. | 3. Perform hydraulic pressure test to determine cause and repair as required. |
| BUZZING NOISE | 1. Fluid Level Low | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Mis-assembled. | 2. Route cable away from engine and bell housing. |
| | 3. Valve Body Mis-assembled. | 3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws. |
| | 4. Pump Passages Leaking. | 4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts. |
| | 5. Cooling System Cooler Plugged. | 5. Flow check cooler circuit. Repair as needed. |
| | 6. Overrunning Clutch Damaged. | 6. Replace clutch. |
| SLIPS IN REVERSE ONLY | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage. |
| | 3. Rear Band Mis-adjusted. | 3. Adjust band. |
| | 4. Rear Band Worn. | 4. Replace as required. |
| | 5. Overdrive Direct Clutch Worn. | 5. Disassemble overdrive. Repair as needed. |
| | 6. Hydraulic Pressure Too Low. | 6. Perform hydraulic pressure tests to determine cause. |
| | 7. Rear Servo Leaking. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Band Linkage Binding. | 8. Inspect and repair as required. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN FORWARD DRIVE RANGES | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Fluid Foaming. | 2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage. |
| | 4. Gearshift Linkage Mis-adjusted. | 4. Adjust linkage. |
| | 5. Rear Clutch Worn. | 5. Inspect and replace as needed. |
| | 6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines. | 6. Perform hydraulic and air pressure tests to determine cause. |
| | 7. Rear Clutch Malfunction, Leaking Seals or Worn Plates. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only). | 8. Replace Clutch. |
| SLIPS IN LOW GEAR ″D″ ONLY, BUT NOT IN MANUAL 1 POSITION | Overrunning Clutch Faulty. | Replace overrunning clutch. |
| GROWLING, GRATING OR SCRAPING NOISES | 1. Drive Plate Broken. | 1. Replace. |
| | 2. Torque Converter Bolts Hitting Dust Shield. | 2. Dust shield bent. Replace or repair. |
| | 3. Planetary Gear Set Broken/ Seized. | 3. Check for debris in oil pan and repair as required. |
| | 4. Overrunning Clutch Worn/Broken. | 4. Inspect and check for debris in oil pan. Repair as required. |
| | 5. Oil Pump Components Scored/ Binding. | 5. Remove, inspect and repair as required. |
| | 6. Output Shaft Bearing or Bushing Damaged. | 6. Remove, inspect and repair as required. |
| | 7. Clutch Operation Faulty. | 7. Perform air pressure check and repair as required. |
| | 8. Front and Rear Bands Mis-adjusted. | 8. Adjust bands. |
| DRAGS OR LOCKS UP | 1. Fluid Level Low. | 1. Check and adjust level. |
| | 2. Clutch Dragging/Failed | 2. Air pressure check clutch operation and repair as required. |
| | 3. Front or Rear Band Mis-adjusted. | 3. Adjust bands. |
| | 4. Case Leaks Internally. | 4. Check for leakage between passages in case. |
| | 5. Servo Band or Linkage Malfunction. | 5. Air pressure check servo operation and repair as required. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 6. Overrunning Clutch Worn. | 6. Remove and inspect clutch. Repair as required. |
| | 7. Planetary Gears Broken. | 7. Remove, inspect and repair as required (look for debris in oil pan). |
| | 8. Converter Clutch Dragging. | 8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required. |
| NO 4-3 DOWNSHIFT | 1. Circuit Wiring and/or Connectors Shorted. | 1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required. |
| | 2. PCM Malfunction. | 2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty. |
| | 3. TPS Malfunction | 3. Check TPS with DRB® scan tool at PCM. |
| | 4. Lockup Solenoid Not Venting. | 4. Remove valve body and replace solenoid assembly if plugged or shorted. |
| | 5. Overdrive Solenoid Not Venting. | 5. Remove valve body and replace solenoid if plugged or shorted. |
| | 6. Valve Body Valve Sticking. | 6. Repair stuck 3-4 shift valve or lockup timing valve. |
| NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF | 1. Control Switch Open/Shorted. | 1. Test and replace switch if faulty. |
| | 2. Overdrive Solenoid Connector Shorted. | 2. Test solenoids and replace if seized or shorted. |
| | 3. PCM Malfunction. | 3. Test with DRB® scan tool. Replace PCM if faulty. |
| | 4. Valve Body Stuck Valves. | 4. Repair stuck 3-4, lockup or lockup timing valve. |
| CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT | 1. Transmission Fluid Low. | 1. Add Fluid. |
| | 2. Throttle Cable Mis-adjusted. | 2. Adjust cable. |
| | 3. Overdrive Clutch Select Spacer Wrong Spacer. | 3. Replace overdrive piston thrust plate spacer. |
| 3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT | 1. Overdrive Solenoid Connector or Wiring Shorted. | 1. Test connector and wiring for loose connections, shorts or ground and repair as needed. |
| | 2. TPS Malfunction. | 2. Test TPS and replace as necessary. Check with DRB® scan tool. |
| | 3. PCM Malfunction. | 3. Test PCM with DRB® scan tool and replace controller if faulty. |
| | 4. Overdrive Solenoid Malfunction. | 4. Replace solenoid. |
| | 5. Valve Body Malfunction. | 5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed. |
| WHINE/NOISE RELATED TO ENGINE SPEED | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Incorrect Routing. | 2. Check shift cable for correct routing. Should not touch engine or bell housing. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO 3-4 UPSHIFT | 1. O/D Switch In OFF Position. | 1. Turn control switch to ON position. |
| | 2. Overdrive Circuit Fuse Blown. | 2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit). |
| | 3. O/D Switch Wire Shorted/Open Cut. | 3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary. |
| | 4. Distance or Coolant Sensor Malfunction. | 4. Check with DRB® scan tool and repair or replace as necessary. |
| | 5. TPS Malfunction. | 5. Check with DRB® scan tool and replace if necessary. |
| | 6. Neutral Sense to PCM Wire Shorted/Cut. | 6. Test switch/sensor as described in service section and replace if necessary. Engine no start. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if necessary. |
| | 8. Overdrive Solenoid Shorted/Open. | 8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool). |
| | 9. Solenoid Feed Orifice in Valve Body Blocked. | 9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice. |
| | 10. Overdrive Clutch Failed. | 10. Disassemble overdrive and repair as needed. |
| | 11. Hydraulic Pressure Low. | 11. Pressure test transmission to determine cause. |
| | 12. Valve Body Valve Stuck. | 12. Repair stuck 3-4 shift valve, 3-4 timing valve. |
| | 13. O/D Piston Incorrect Spacer. | 13. Remove unit, check end play and install correct spacer. |
| | 14. Overdrive Piston Seal Failure. | 14. Replace both seals. |
| | 15. O/D Check Valve/Orifice Failed. | 15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice. |
| SLIPS IN OVERDRIVE FOURTH GEAR | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Overdrive Clutch Pack Worn. | 2. Remove overdrive unit and rebuild clutch pack. |
| | 3. Overdrive Piston Retainer Bleed Orifice Blown Out. | 3. Disassemble transmission, remove retainer and replace orifice. |
| | 4. Overdrive Piston or Seal Malfunction. | 4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission. |
| | 5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction. | 5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 6. Overdrive Unit Thrust Bearing Failure. | 6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft). |
| | 7. O/D Check Valve/Bleed Orifice Failure. | 7. Check for function/secure orifice insert in O/D piston retainer. |
| DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Throttle Valve Cable Mis-adjusted. | 2. Adjust throttle valve cable. |
| | 3. Overdrive Clutch Pack Worn/ Burnt. | 3. Remove unit and rebuild clutch pack. |
| | 4. TPS Faulty. | 4. Test with DRB® scan tool and replace as necessary |
| | 5. Overdrive Clutch Bleed Orifice Plugged. | 5. Disassemble transmission and replace orifice. |
| | 6. Overdrive Solenoid or Wiring Shorted/Open. | 6. Test solenoid and check wiring for loose/corroded connections or shorts/ grounds. Replace solenoid if faulty and repair wiring if necessary. |
| | 7. Overdrive Excess Clearance. | 7. Remove unit. Measure end play and select proper spacer. |
| | 8. O/D Check Valve Missing or Stuck. | 8. Check for presence of check valve. Repair or replace as required. |
| TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR | Lockup Solenoid, Relay or Wiring Shorted/Open. | Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary. |
| HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS | Lockup Solenoid Malfunction. | Remove valve body and replace solenoid assembly. |
| NO START IN PARK OR NEUTRAL | 1. Gearshift Linkage/Cable Mis-adjusted. | 1. Adjust linkage/cable. |
| | 2. Neutral Sense Wire Open/Cut. | 2. Check continuity with test lamp. Repair as required. |
| | 3. Park/Neutral Switch, or Transmission Range Sensor Faulty. | 3. Refer to service section for test and replacement procedure. |
| | 4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty. | 4. Connectors spread open. Repair. |
| | 5. Valve Body Manual Lever Assembly Bent/Worn/Broken. | 5. Inspect lever assembly and replace if damaged. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO REVERSE (OR SLIPS IN REVERSE) | 1. Direct Clutch Pack (front clutch) Worn. | 1. Disassemble unit and rebuild clutch pack. |
| | 2. Rear Band Mis-adjusted. | 2. Adjust band. |
| | 3. Front Clutch Malfunctioned/ Burned. | 3. Air-pressure test clutch operation. Remove and rebuild if necessary. |
| | 4. Overdrive Thrust Bearing Failure. | 4. Disassemble geartrain and replace bearings. |
| | 5. Direct Clutch Spring Collapsed/ Broken. | 5. Remove and disassemble unit. Check clutch position and replace spring. |
| OIL LEAKS. | 1. Fluid Lines and Fittings Loose/ Leaks/Damaged. | 1. Tighten fittings. If leaks persist, replace fittings and lines if necessary. |
| | 2. Fill Tube (where tube enters case) Leaks/Damaged. | 2. Replace tube seal. Inspect tube for cracks in fill tube. |
| | 3. Pressure Port Plug Loose Loose/Damaged. | 3. Tighten to correct torque. Replace plug or reseal if leak persists. |
| | 4. Pan Gasket Leaks. | 4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket. |
| | 5. Valve Body Manual Lever Shaft Seal Leaks/Worn. | 5. Replace shaft seal. |
| | 6. Rear Bearing Access Plate Leaks. | 6. Replace gasket. Tighten screws. |
| | 7. Gasket Damaged or Bolts are Loose. | 7. Replace bolts or gasket or tighten both. |
| | 8. Adapter/Extension Gasket Damaged Leaks/Damaged. | 8. Replace gasket. |
| | 9. Park/Neutral Switch, or Transmission Range Sensor Leaks/ Damaged. | 9. Replace switch and gasket. |
| | 10. Converter Housing Area Leaks. | 10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug. |
| | 11. Pump Seal Leaks/Worn/Damaged. | 11. Replace seal. |
| | 12. Torque Converter Weld Leak/ Cracked Hub. | 12. Replace converter. |
| | 13. Case Porosity Leaks. | 13. Replace case. |
| NOISY OPERATION IN FOURTH GEAR ONLY | 1. Overdrive Clutch Discs, Plates or Snap Rings Damaged. | 1. Remove unit and rebuild clutch pack. |
| | 2. Overdrive Piston or Planetary Thrust Bearing Damaged. | 2. Remove and disassemble unit. Replace either thrust bearing if damaged. |
| | 3. Output Shaft Bearings Scored/ Damaged. | 3. Remove and disassemble unit. Replace either bearing if damaged. |
| | 4. Planetary Gears Worn/Chipped. | 4. Remove and overhaul overdrive unit. |
| | 5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored. | 5. Remove and overhaul overdrive unit. |

AUTOMATIC TRANSMISSION - 44RE (Continued)

## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

## REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

(1) Disconnect battery negative cable.

(2) Disconnect and lower or remove necessary exhaust components.

(3) Remove engine-to-transmission struts, if equipped (Fig. 13).

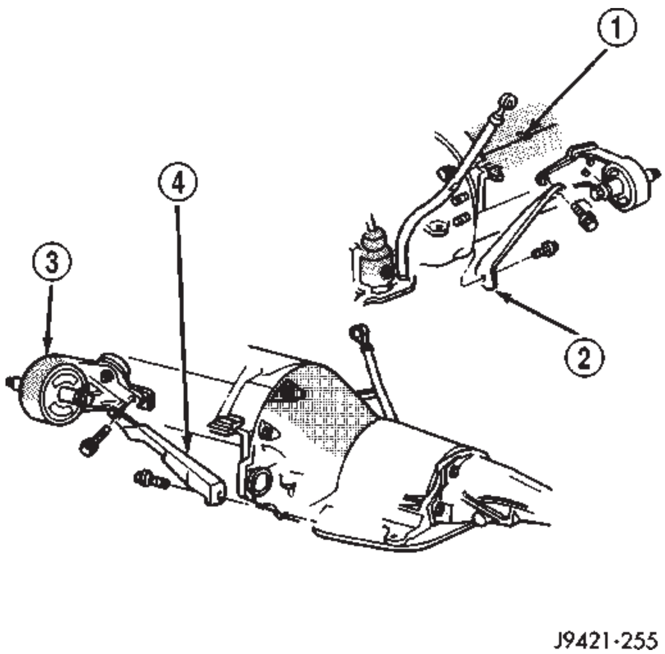

***Fig. 13 Transmission-To-Engine Strut Attachment***

1 - ENGINE BLOCK
2 - STRUT (PASSENGER SIDE)
3 - ENGINE MOUNT
4 - STRUT (DRIVER SIDE)

(4) Disconnect fluid cooler lines at transmission.

(5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)

(6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.

(7) Remove torque converter access cover.

(8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

(9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

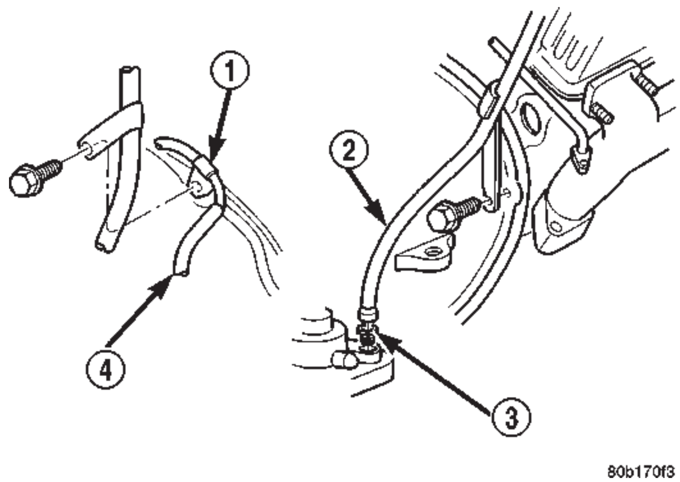

***Fig. 14 Fill Tube Attachment***

1 - TRANSFER CASE VENT TUBE
2 - FILL TUBE (V8)
3 - TUBE SEAL
4 - FILL TUBE (V6)

(10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(12) Disconnect wires from park/neutral position switch and transmission solenoid.

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

AUTOMATIC TRANSMISSION - 44RE (Continued)

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

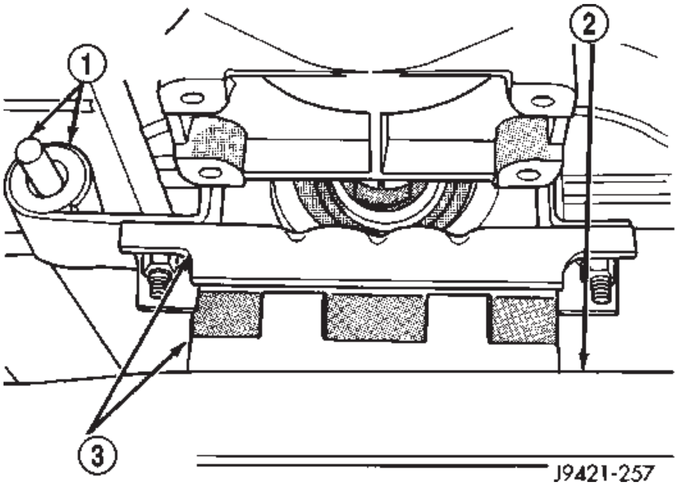

*Fig. 15 Rear Support Cushion*

1 - EXHAUST PIPE ARM AND BRACKET
2 - CROSSMEMBER
3 - REAR SUPPORT AND CUSHION

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

## DISASSEMBLY

(1) Clean transmission exterior with steam gun or with solvent. Wear eye protection during cleaning operations.

(2) Place transmission in a vertical position.

(3) Measure input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move the input shaft in and out. Record the maximum travel for assembly reference.

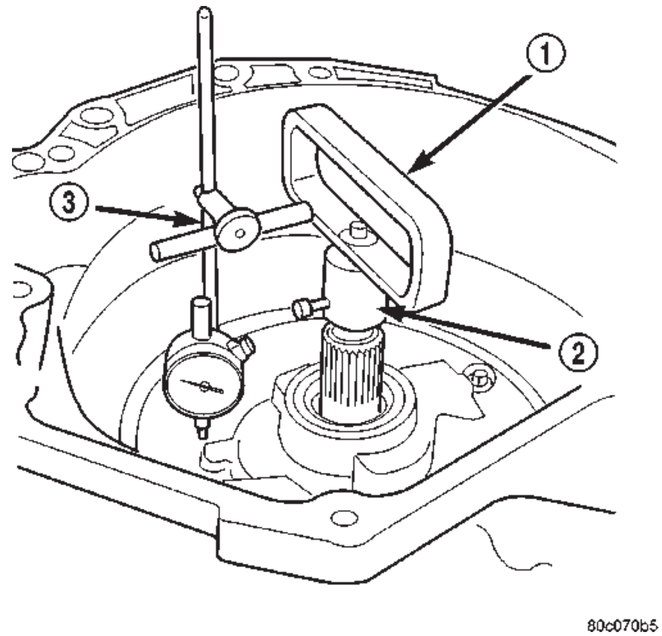

*Fig. 16 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-6
3 - TOOL C-3339

(4) Remove shift and throttle levers from valve body manual lever shaft.

(5) Place transmission in horizontal position.

(6) Remove transmission oil pan and gasket.

(7) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

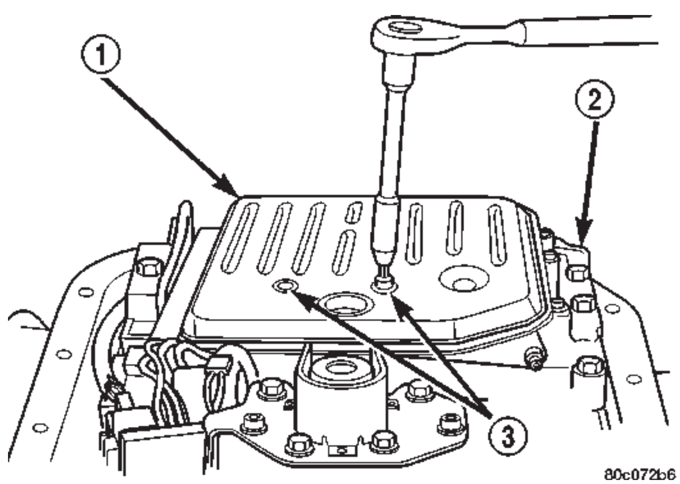

*Fig. 17 Oil Filter Removal*

1 - OIL FILTER
2 - VALVE BODY
3 - FILTER SCREWS (2)

AUTOMATIC TRANSMISSION - 44RE (Continued)

(8) Remove park/neutral position switch.

(9) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

(10) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

(11) Remove accumulator piston and inner and outer springs (Fig. 20).

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

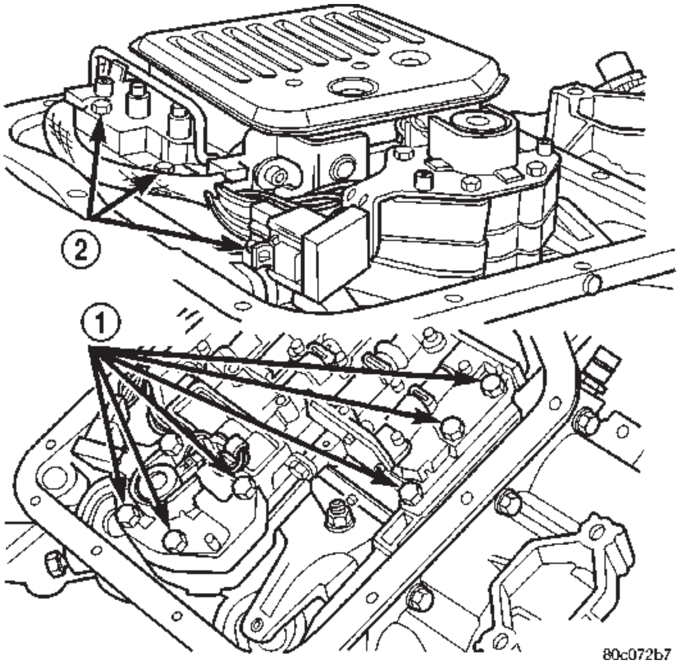

*Fig. 18 Valve Body Bolt Locations*

1 - VALVE BODY BOLTS
2 - VALVE BODY BOLTS

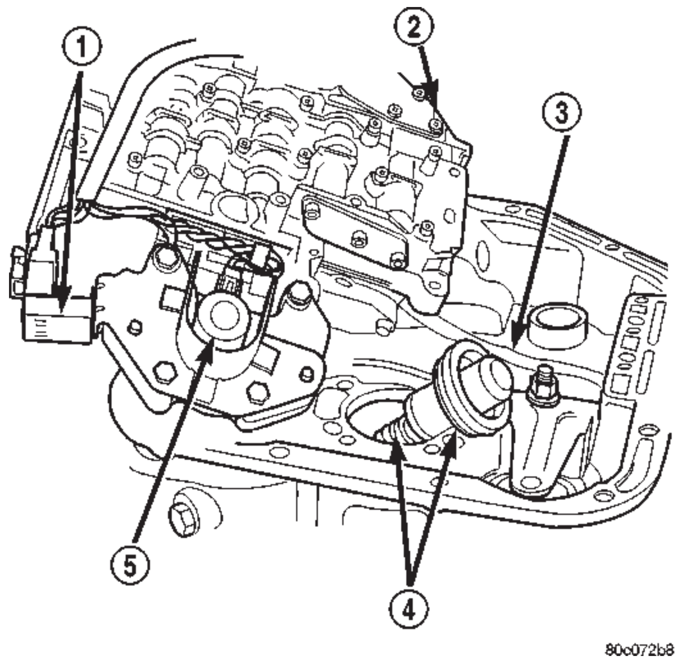

*Fig. 19 Valve Body Removal*

1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY

4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

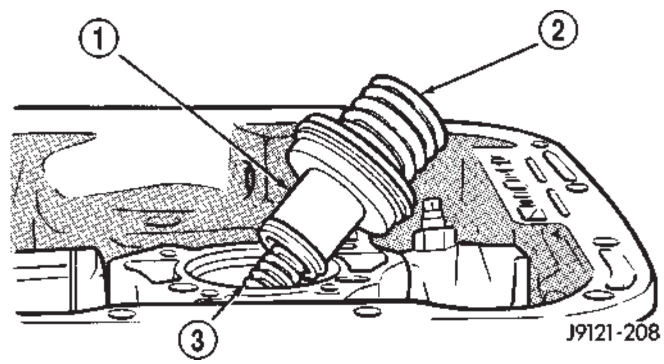

*Fig. 20 Accumulator Piston And Springs*

1 - ACCUMULATOR PISTON
2 - OUTER SPRING
3 - INNER SPRING

AUTOMATIC TRANSMISSION - 44RE (Continued)

(13) Loosen front band adjusting screw locknut 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 21).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 21).

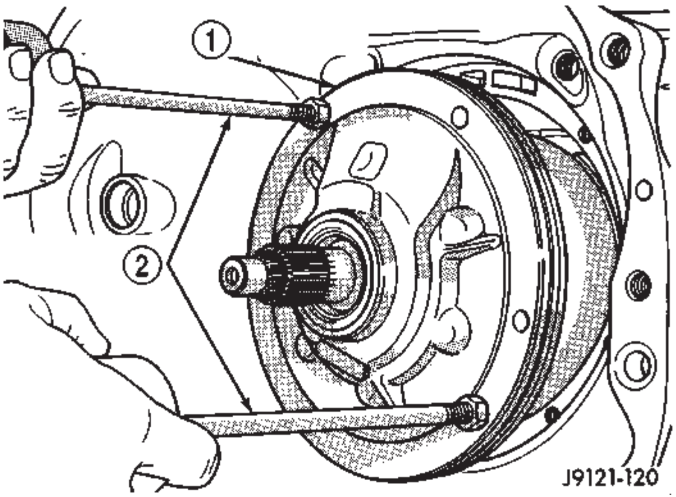

**Fig. 21 Removing Oil Pump And Reaction Shaft Support Assembly**

1 - OIL PUMP AND REACTION SHAFT SUPPORT ASSEMBLY
2 - SLIDE HAMMER TOOLS C-3752

(17) Loosen front band adjusting screw until band is completely loose.

(18) Squeeze front band together and remove band strut (Fig. 22).

(19) Remove front band lever (Fig. 23).

(20) Remove front band lever shaft plug, if necessary, from converter housing.

(21) Remove front band lever shaft.

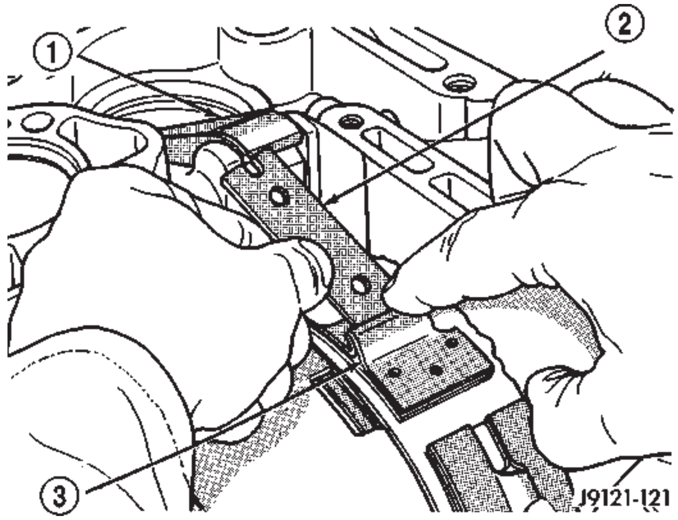

**Fig. 22 Removing Front Band Strut**

1 - BAND LEVER
2 - BAND STRUT
3 - FRONT BAND

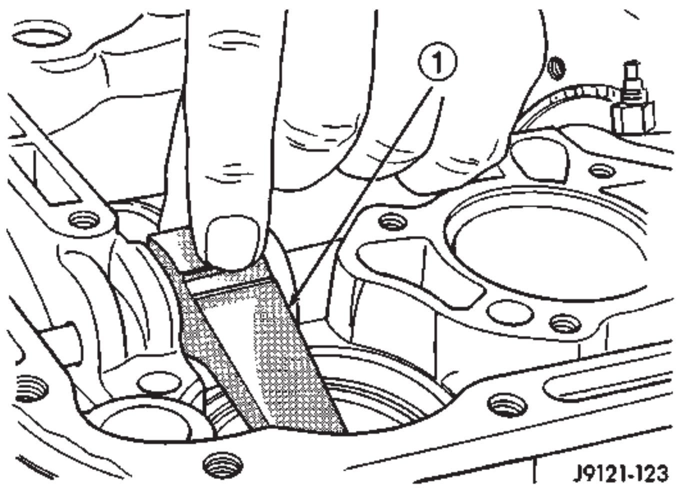

**Fig. 23 Removing Front Band Lever**

1 - FRONT BAND LEVER

AUTOMATIC TRANSMISSION - 44RE (Continued)

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 24).

(23) Lift front clutch off rear clutch (Fig. 25). Set clutch units aside for overhaul.

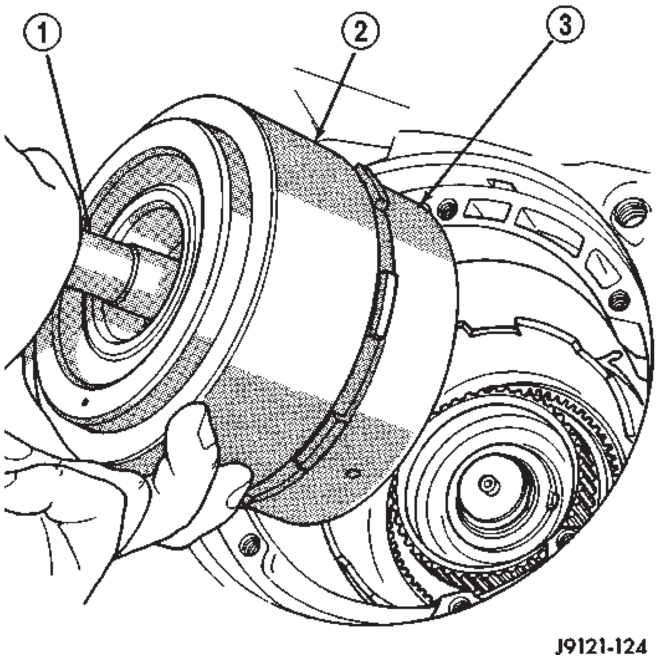

***Fig. 24 Removing Front/Rear Clutch Assemblies***

1 - INPUT SHAFT
2 - FRONT CLUTCH
3 - REAR CLUTCH

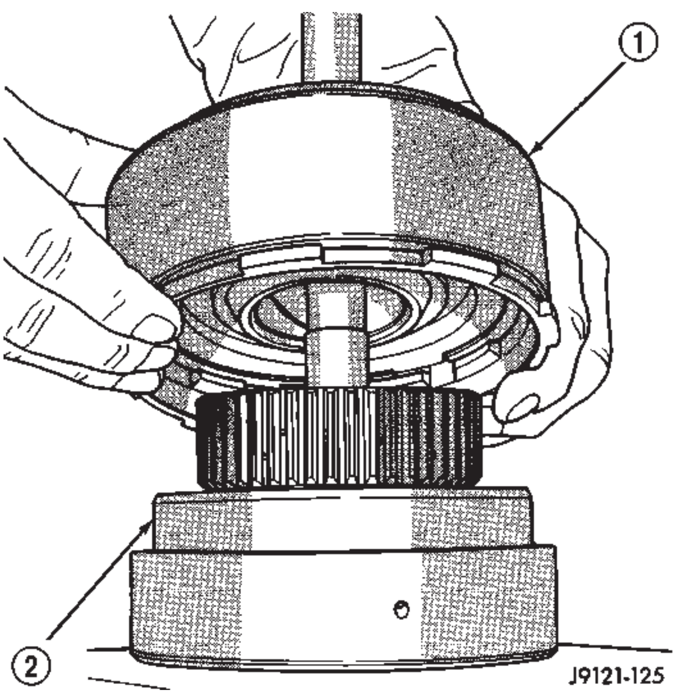

***Fig. 25 Separating Front/Rear Clutch Assemblies***

1 - FRONT CLUTCH
2 - REAR CLUTCH

(24) Remove intermediate shaft thrust washer from front end of shaft or from rear clutch hub (Fig. 26).

(25) Remove output shaft thrust plate from intermediate shaft hub (Fig. 27).

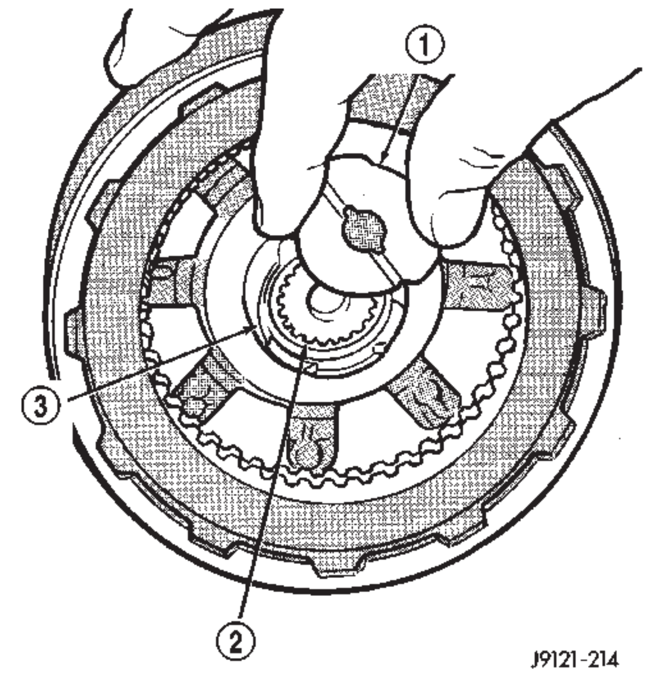

***Fig. 26 Removing Intermediate Shaft Thrust Washer***

1 - INTERMEDIATE SHAFT THRUST WASHER
2 - INPUT SHAFT
3 - REAR CLUTCH RETAINER HUB

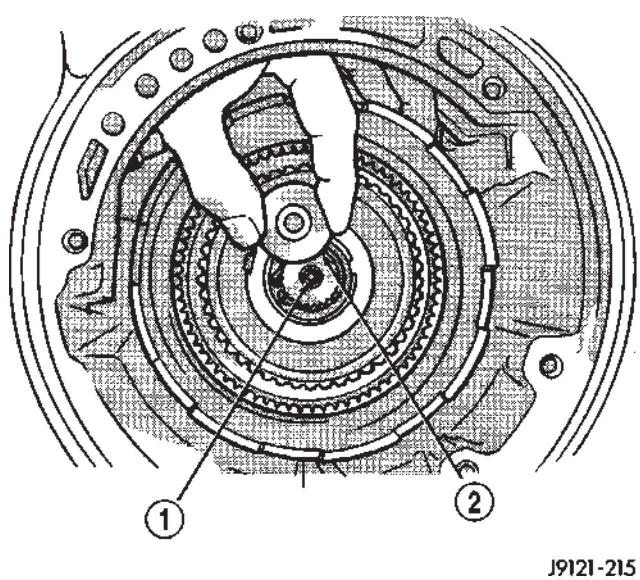

***Fig. 27 Removing Intermediate Shaft Thrust Plate***

1 - INTERMEDIATE SHAFT HUB
2 - INTERMEDIATE SHAFT THRUST PLATE

AUTOMATIC TRANSMISSION - 44RE (Continued)

(26) Slide front band off driving shell (Fig. 28) and remove band from case.

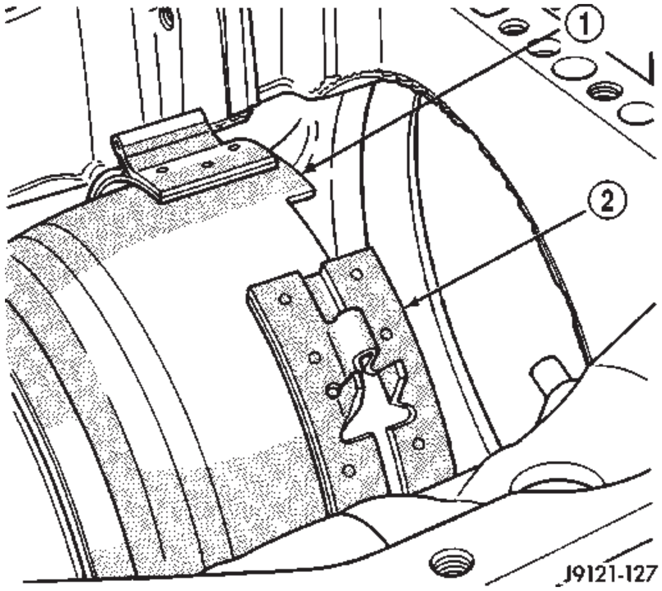

*Fig. 28 Front Band Removal*

1 - DRIVING SHELL
2 - FRONT BAND

(27) Remove planetary geartrain as assembly (Fig. 29). Support geartrain with both hands during removal. Do not allow machined surfaces on intermediate shaft or overdrive piston retainer to become nicked or scratched.

(28) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(29) Loosen rear band adjusting screw 4-5 turns.

(30) Remove low-reverse drum snap-ring (Fig. 30).

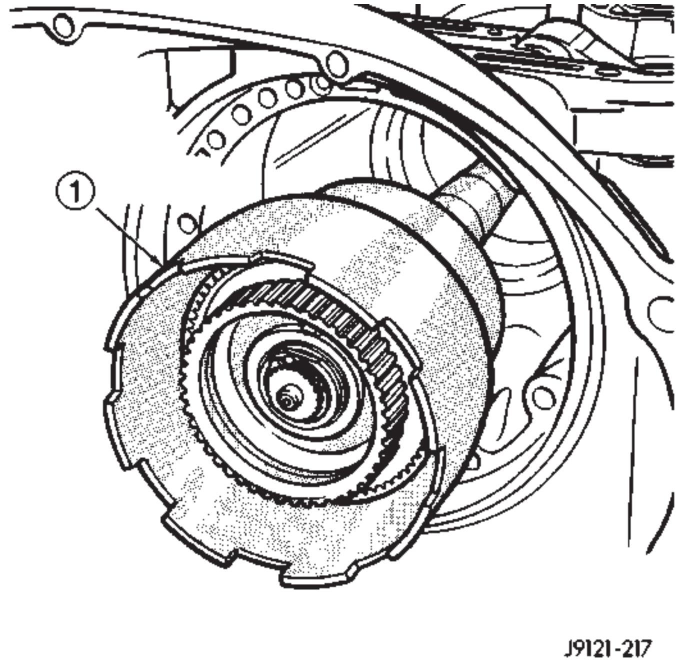

*Fig. 29 Removing Planetary Geartrain And Intermediate Shaft Assembly*

1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

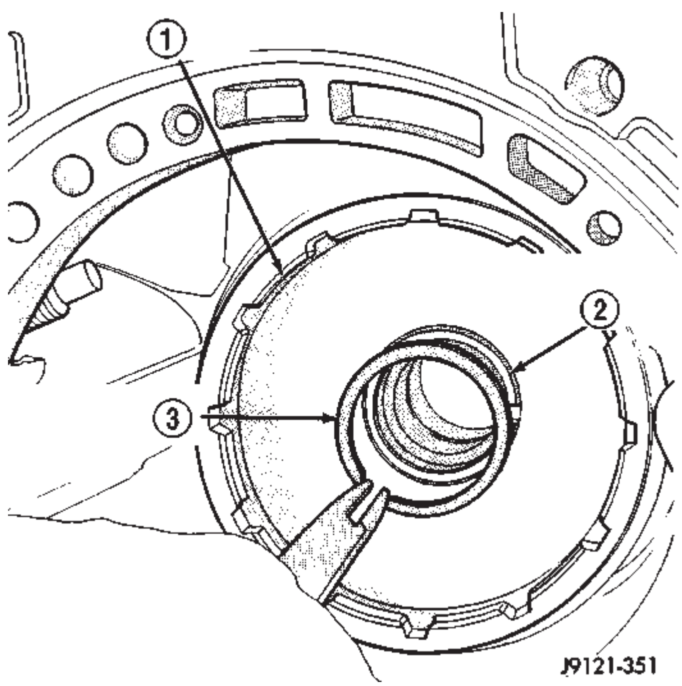

*Fig. 30 Removing Low-Reverse Drum Snap-Ring*

1 - LOW-REVERSE DRUM
2 - HUB OF OVERDRIVE PISTON RETAINER
3 - LOW-REVERSE DRUM SNAP-RING

AUTOMATIC TRANSMISSION - 44RE (Continued)

(31) Remove low-reverse drum and reverse band.

(32) Remove overrunning clutch roller and spring assembly as a unit (Fig. 31).

(33) Compress front servo rod guide about 1/8 inch with Valve Spring Compressor C-3422-B (Fig. 32).

(34) Remove front servo rod guide snap-ring. Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.

(35) Remove compressor tools and remove front servo rod guide, spring and servo piston.

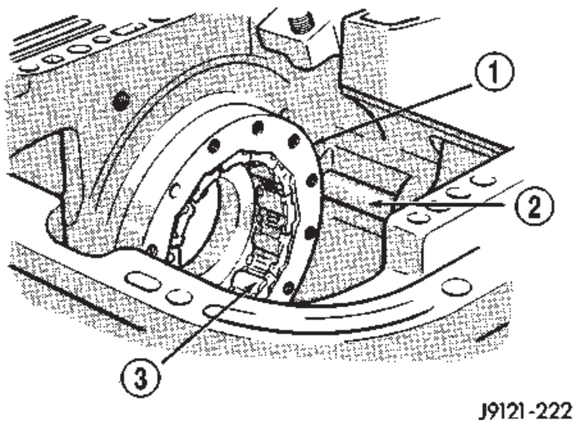

*Fig. 31 Overrunning Clutch Assembly Removal*

1 - OVERRUNNING CLUTCH CAM
2 - REAR BAND REACTION PIN
3 - OVERRUNNING CLUTCH ASSEMBLY

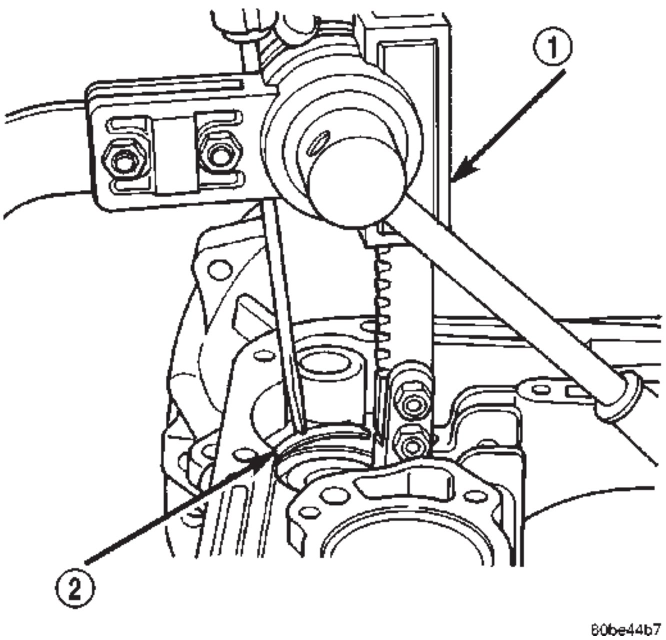

*Fig. 32 Compressing Front Servo Rod Guide*

1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP-RING

(36) Compress rear servo spring retainer about 1/16 inch with Valve Spring Compressor C-3422-B (Fig. 33).

(37) Remove rear servo spring retainer snap-ring. Then remove compressor tools and remove rear servo spring and piston.

(38) Inspect transmission components.

**NOTE: To Service the overrunning clutch cam or overdrive piston retainer, refer to the Overrunning Clutch Cam service procedure in this section.**

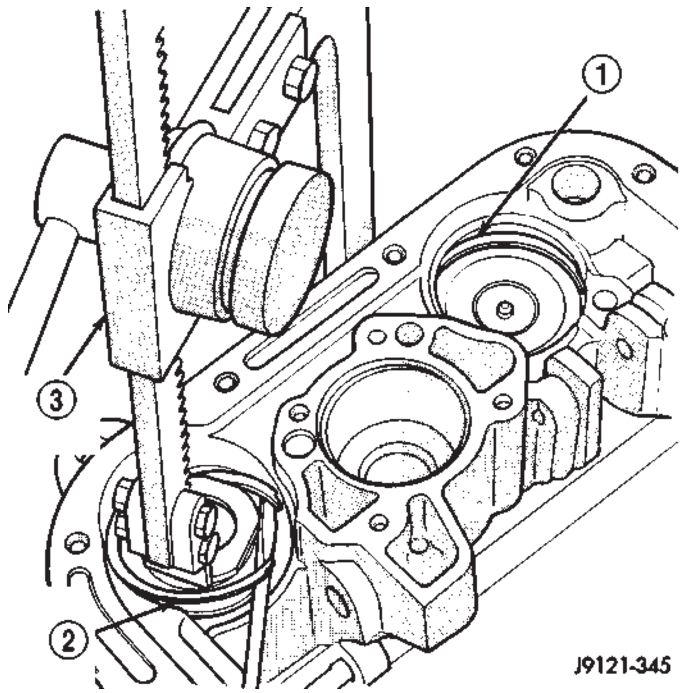

*Fig. 33 Compressing Rear Servo Spring*

1 - FRONT SERVO SNAP-RING
2 - REAR SERVO SNAP-RING
3 - SPECIAL TOOL

## CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and

AUTOMATIC TRANSMISSION - 44RE (Continued)

assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

## INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

## ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for assembly operations are equally clean.

Shop towels used for wiping off tools and hands must be made from **lint free** material. Lint will stick to transmission parts and could interfere with valve operation, or even restrict fluid passages.

Lubricate the transmission components with Mopar® transmission fluid during reassembly. Use Mopar® Door Ease, or Ru-Glyde™ on seals and O-rings to ease installation.

Petroleum jelly can also be used to hold thrust washers, thrust plates and gaskets in position during assembly. However, **do not** use chassis grease, bearing grease, white grease, or similar lubricants on any transmission part. These types of lubricants can eventually block or restrict fluid passages and interfere with valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and subassemblies are easily installed by hand when properly aligned.

If a part seems extremely difficult to install, it is either misaligned or incorrectly assembled. Also verify that thrust washers, thrust plates and seal rings are correctly positioned before assembly. These parts can interfere with proper assembly if mis-positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright.

(1) Install rear servo piston, spring and retainer (Fig. 34). Install spring on top of servo piston and install retainer on top of spring.

(2) Install front servo piston assembly, servo spring and rod guide (Fig. 35).

(3) Compress front/rear servo springs with Valve Spring Compressor C-3422-B and install each servo snap-ring (Fig. 36).

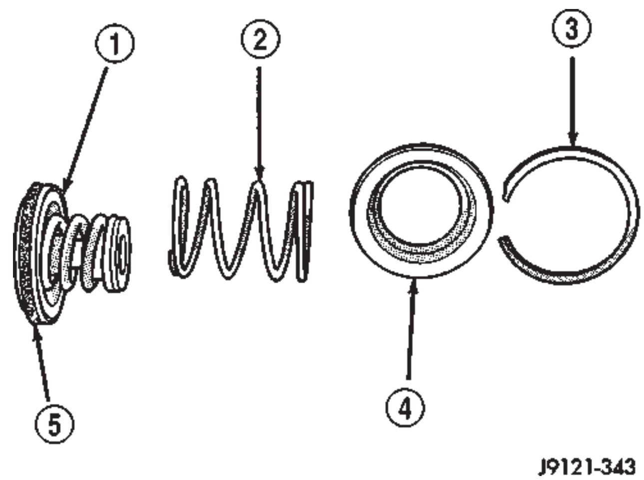

*Fig. 34 Rear Servo Components*

1 - SERVO PISTON
2 - PISTON SPRING
3 - SNAP-RING

5 - SPRING
6 - ROD

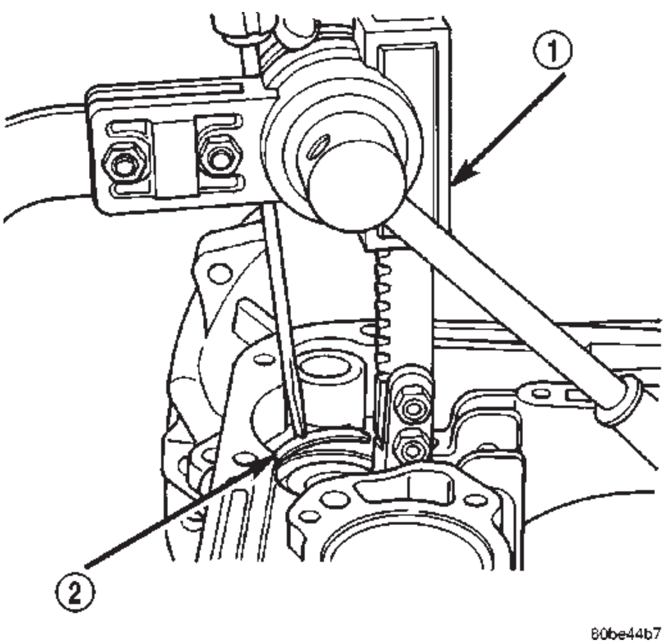

***Fig. 36 Compressing Front/Rear Servo Springs***

1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP-RING

(4) Lubricate clutch cam rollers with transmission fluid.

(5) Install rear band in case (Fig. 37). Be sure twin lugs on band are seated against reaction pin.

(6) Install low-reverse drum and check overrunning clutch operation as follows:

(a) Lubricate overrunning clutch race (on drum hub) with transmission fluid.

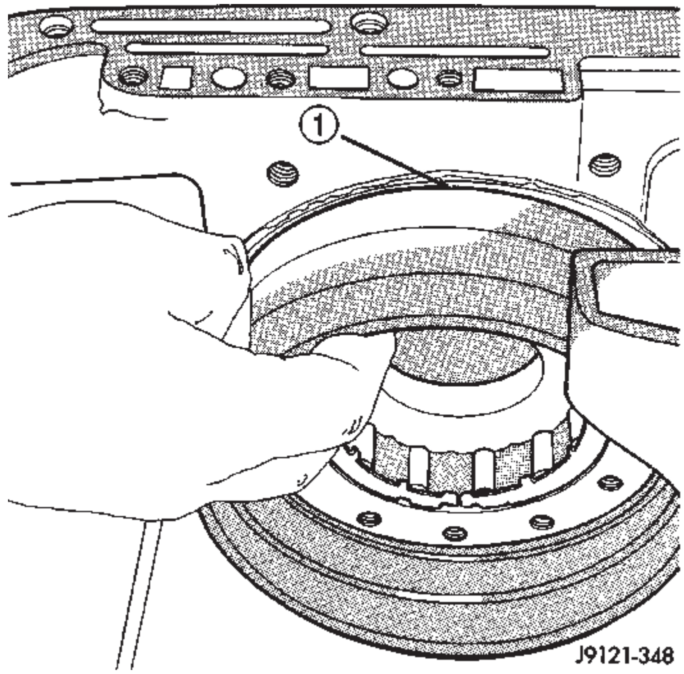

***Fig. 37 Rear Band Installation***

1 - REAR BAND

(b) Guide drum through rear band.

(c) Tilt drum slightly and start race (on drum hub) into overrunning clutch rollers.

(d) Press drum rearward and turn it in clockwise direction until drum seats in overrunning clutch (Fig. 38).

(e) Turn drum back and forth. Drum should rotate freely in clockwise direction and lock in counterclockwise direction (as viewed from front of case).

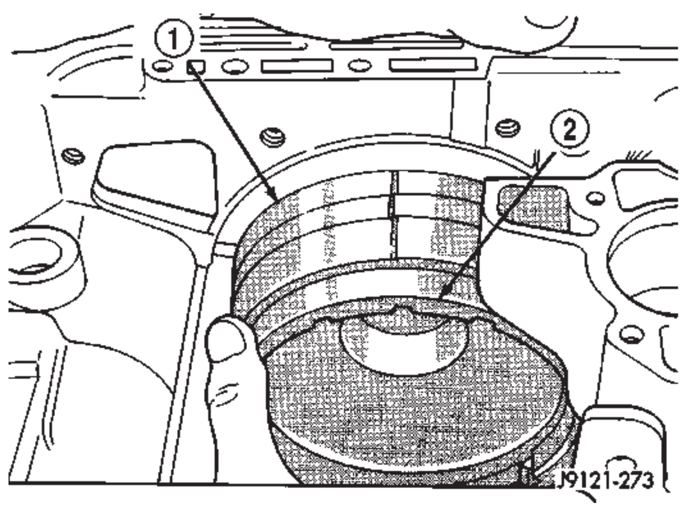

***Fig. 38 Installing Low-Reverse Drum***

1 - REAR BAND
2 - LOW-REVERSE DRUM

AUTOMATIC TRANSMISSION - 44RE (Continued)

(7) Install snap-ring that secures low-reverse drum to hub of overdrive piston retainer (Fig. 39).

(8) Install rear band lever and pivot pin (Fig. 40). Align lever with pin bores in case and push pivot pin into place.

(9) Install planetary geartrain assembly (Fig. 41).

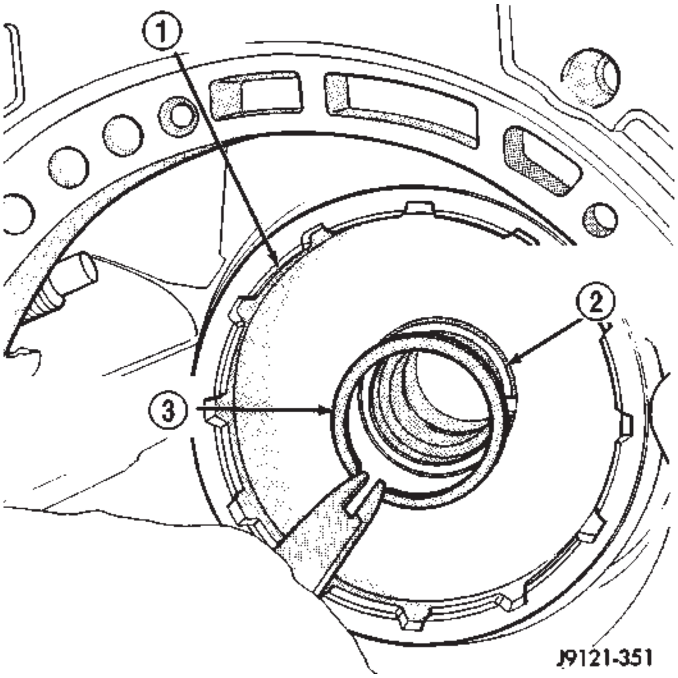

*Fig. 39 Installing Low-Reverse Drum Retaining Snap-Ring*

1 - LOW-REVERSE DRUM
2 - HUB OF OVERDRIVE PISTON RETAINER
3 - LOW-REVERSE DRUM SNAP-RING

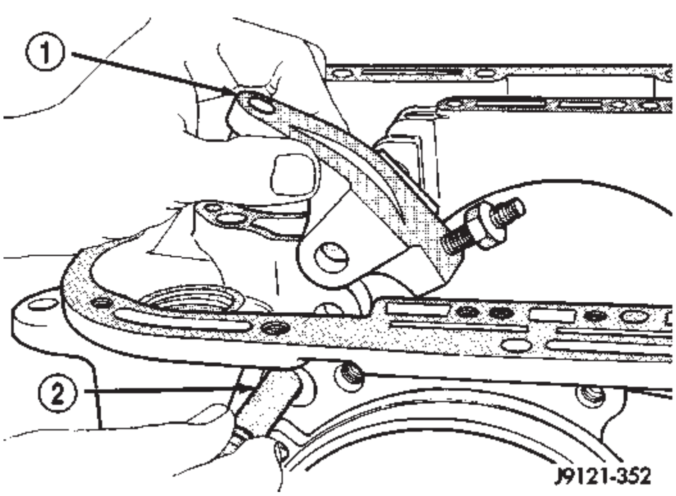

*Fig. 40 Rear Band Lever And Pivot Pin Installation*

1 - REAR BAND LEVER
2 - LEVER PIVOT PIN

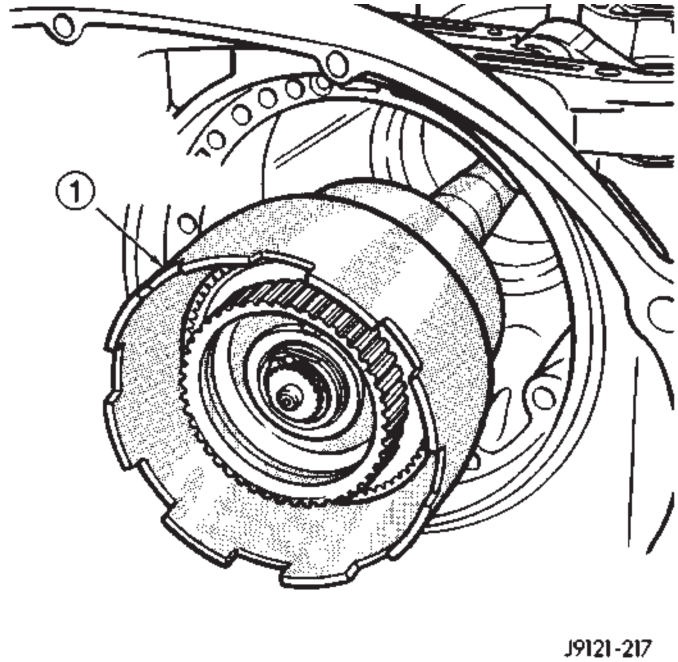

*Fig. 41 Installing Planetary Geartrain*

1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(10) Install thrust plate on intermediate shaft hub (Fig. 42). Use petroleum jelly to hold thrust plate in place.

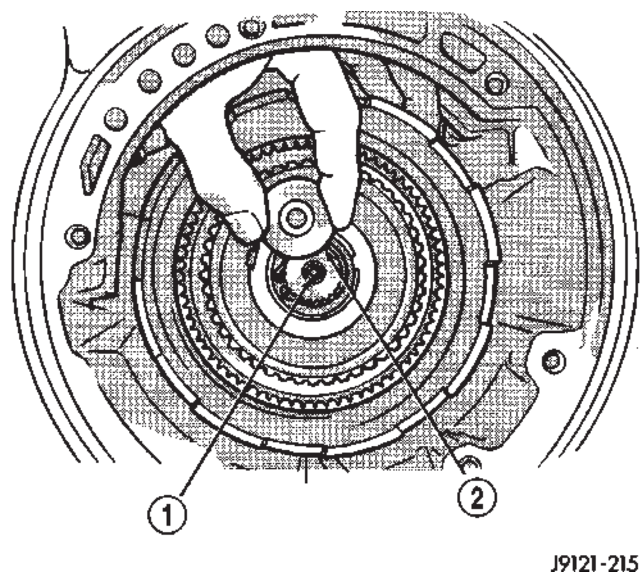

*Fig. 42 Installing Intermediate Shaft Thrust Plate*

1 - INTERMEDIATE SHAFT HUB
2 - INTERMEDIATE SHAFT THRUST PLATE

AUTOMATIC TRANSMISSION - 44RE (Continued)

(11) Check seal ring on rear clutch retainer hub and seal rings on input shaft (Fig. 43). Also verify that shaft seal rings are installed in sequence shown.

(12) Install rear clutch thrust washer (Fig. 44). Use additional petroleum jelly to hold washer in place if necessary.

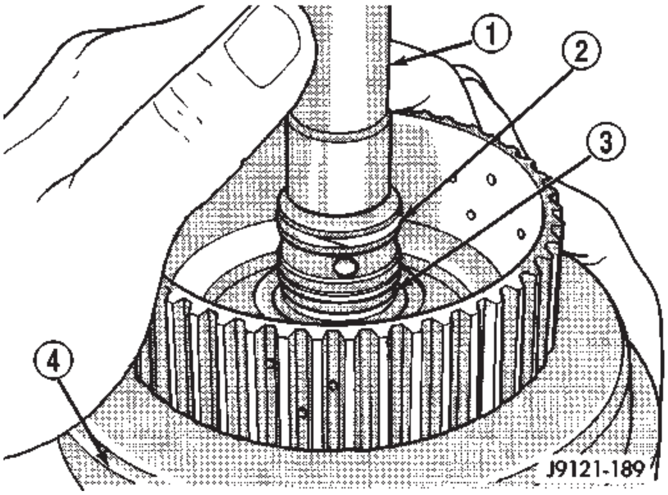

***Fig. 43 Input Shaft Seal Ring Location***

1 - INPUT SHAFT
2 - TEFLON SEAL RING
3 - PLASTIC SEAL RING
4 - REAR CLUTCH RETAINER

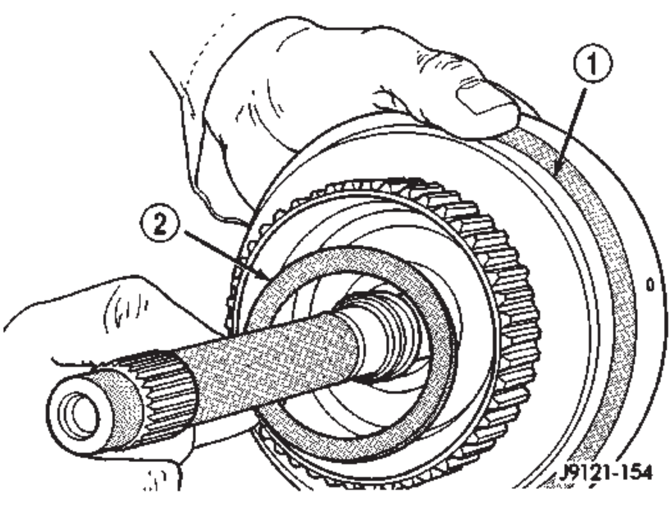

***Fig. 44 Installing Rear Clutch Thrust Washer***

1 - REAR CLUTCH RETAINER
2 - REAR CLUTCH THRUST WASHER (FIBER)

(13) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 45). Rotate front clutch retainer back and forth until completely seated on rear clutch retainer.

(14) Coat intermediate shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 46). Use enough petroleum jelly to hold washer in place. Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub. Note thickness of this washer. It is a select fit part and is used to control transmission end play.

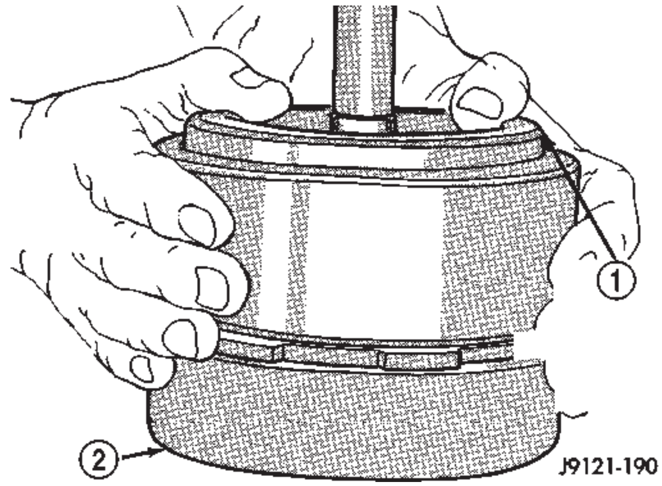

***Fig. 45 Assembling Front And Rear Clutch Units***

1 - TURN FRONT CLUTCH BACK & FORTH UNTIL SEATED
2 - REAR CLUTCH ASSEMBLY

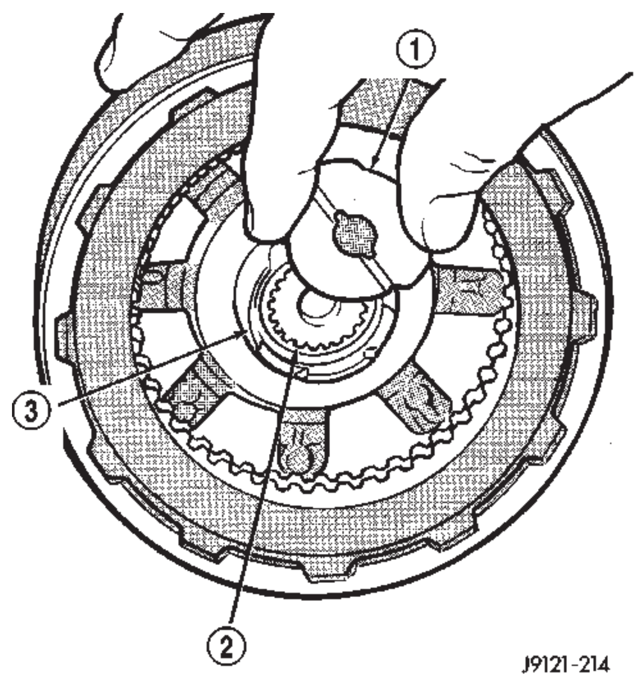

***Fig. 46 Installing Intermediate Shaft Thrust Plate***

1 - INTERMEDIATE SHAFT THRUST WASHER
2 - INPUT SHAFT
3 - REAR CLUTCH RETAINER HUB

AUTOMATIC TRANSMISSION - 44RE (Continued)

(15) Align drive teeth on rear clutch discs with small screwdriver (Fig. 47). This makes installation on front planetary easier.

(16) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(17) Slide front band into case.

(18) Install front and rear clutch units as assembly (Fig. 48). Align rear clutch with front annulus gear and install assembly in driving shell. Be sure output shaft thrust washer and thrust plate are not displaced during installation.

(19) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Also be sure front clutch drive lugs are fully engaged in slots of driving shell after installation.

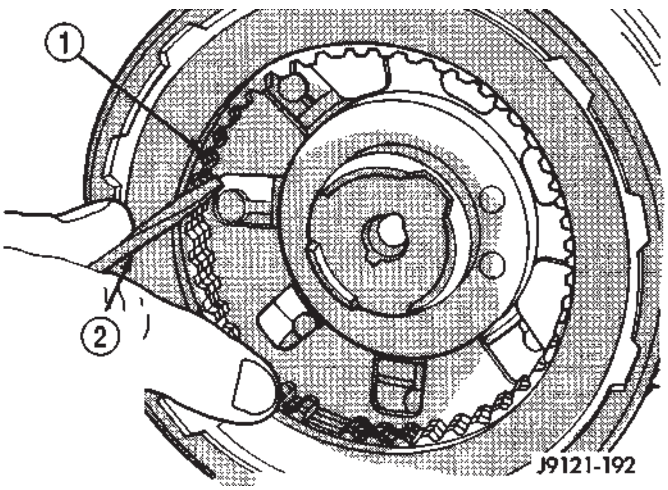

**Fig. 47 Aligning Rear Clutch Disc Lugs**

1 - REAR CLUTCH DISCS
2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

(20) Assemble front band strut.

(21) Install front band adjuster, strut and adjusting screw (Fig. 49).

(22) Tighten band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

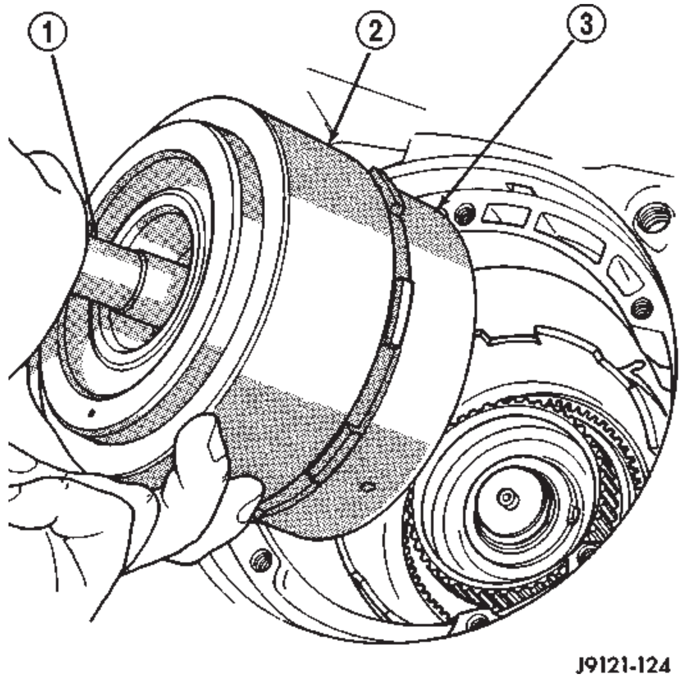

**Fig. 48 Installing Front/Rear Clutch Assemblies**

1 - INPUT SHAFT
2 - FRONT CLUTCH
3 - REAR CLUTCH

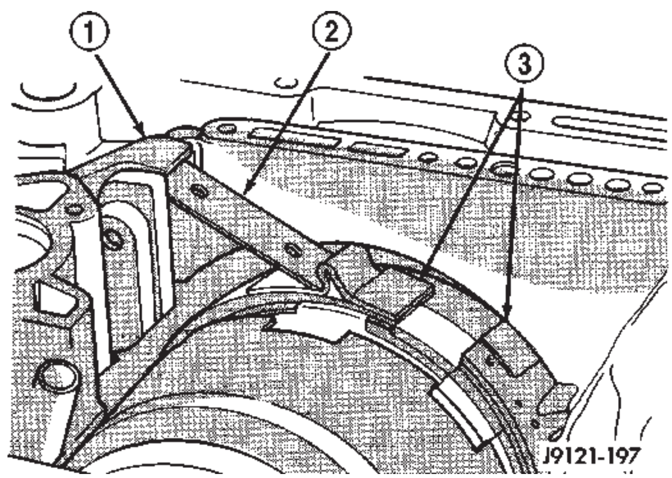

**Fig. 49 Front Band Linkage Installation**

1 - BAND LEVER
2 - BAND STRUT
3 - FRONT BAND

AUTOMATIC TRANSMISSION - 44RE (Continued)

(23) Check seal rings on reaction shaft support hub. Verify that seal rings are hooked together and that front clutch thrust washer is properly positioned (Fig. 50). Use petroleum jelly to hold thrust washer in place if necessary.

(24) Lubricate oil pump body seal with petroleum jelly. Lubricate pump shaft seal lip with petroleum jelly.

(25) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump bore flange (Fig. 51).

(26) Align and install oil pump gasket (Fig. 51).

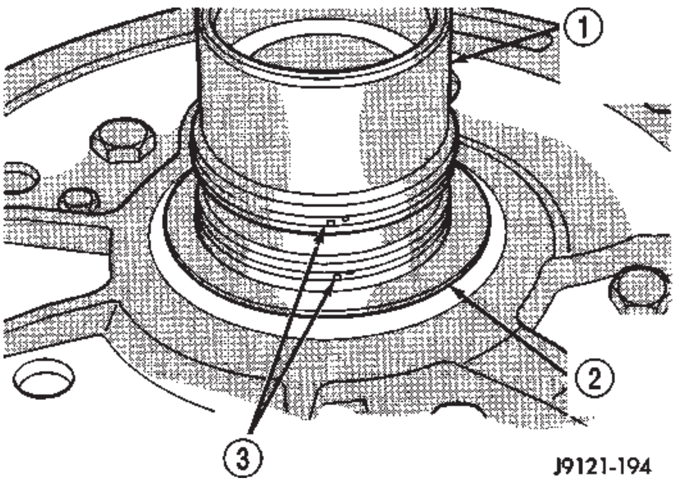

***Fig. 50 Reaction Shaft Support Seal Rings And Front Clutch Thrust Washer***

1 - REACTION SHAFT SUPPORT HUB
2 - FRONT CLUTCH THRUST WASHER
3 - SEAL RINGS

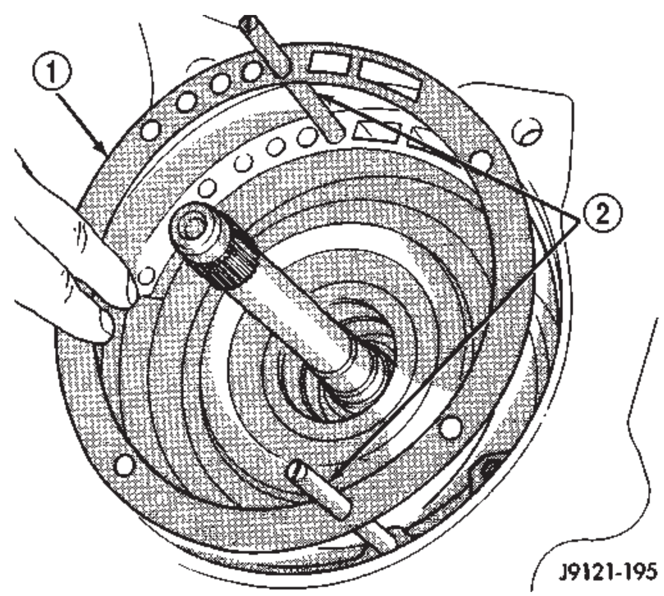

***Fig. 51 Installing Pilot Studs And Oil Pump Gasket***

1 - OIL PUMP GASKET
2 - PILOT STUD TOOLS C-3288-B

(27) Install oil pump (Fig. 52). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install 2 or 3 pump bolts to hold pump in place.

(28) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

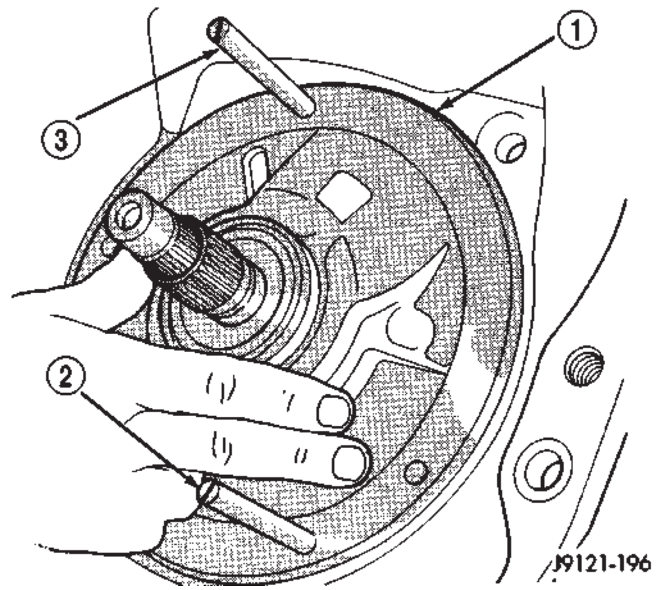

***Fig. 52 Installing Oil Pump***

1 - OIL PUMP
2 - PILOT STUD TOOL
3 - PILOT STUD TOOL

(29) Measure input shaft end play (Fig. 53).

**NOTE: If end play is incorrect, transmission is incorrectly assembled, or the intermediate shaft thrust washer is incorrect. The intermediate shaft thrust washer is selective.**

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. End play should be 0.56-2.31 mm (0.022-0.091 in.). Adjust as necessary.

(30) Install accumulator piston and inner and outer springs (Fig. 54).

(31) Verify that valve body solenoid harness is secured in 3-4 accumulator housing cover plate.

(32) Install valve body as follows:

AUTOMATIC TRANSMISSION - 44RE (Continued)

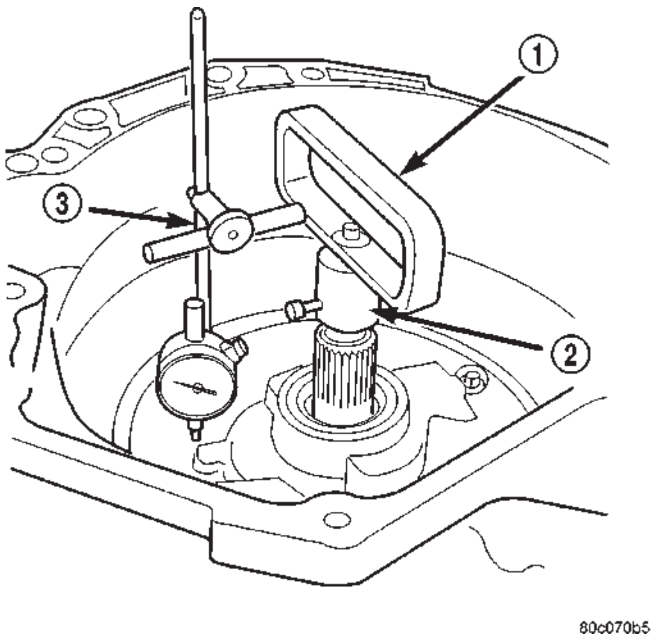

*Fig. 53 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-6
3 - TOOL C-3339

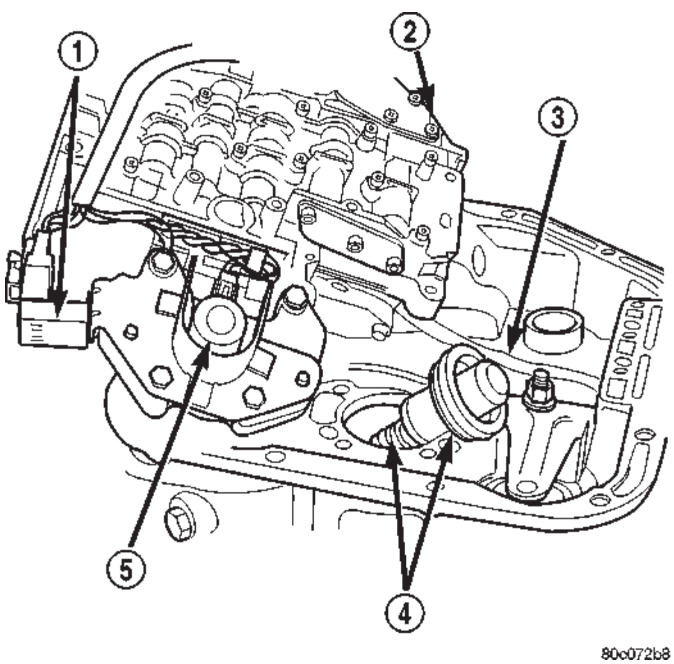

*Fig. 54 Accumulator Piston And Springs*

1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY
3 - PARK ROD
4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

(a) Align and carefully insert park rod into pawl. Rod will make click noise as it enters pawl. Move rod slightly to check engagement.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case. Also be sure valve body wiring is not pinched or kinked.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.

**CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into the cavity.**

(33) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(34) Adjust front and rear bands.

(35) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

(36) Install magnet in oil pan. Magnet goes on small protrusion at corner of pan.

(37) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(38) Install new valve body manual shaft seal in case (Fig. 55). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

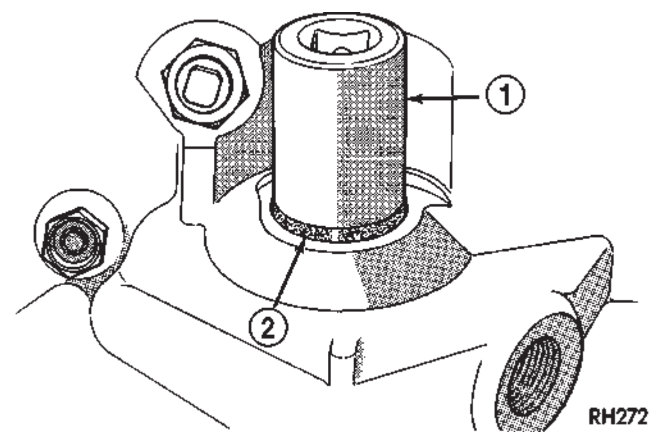

*Fig. 55 Installing Manual Lever Shaft Seal*

1 - 15/16" SOCKET
2 - SEAL

(39) Install throttle valve and shift selector levers on valve body manual lever shaft.

AUTOMATIC TRANSMISSION - 44RE (Continued)

## INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 56). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

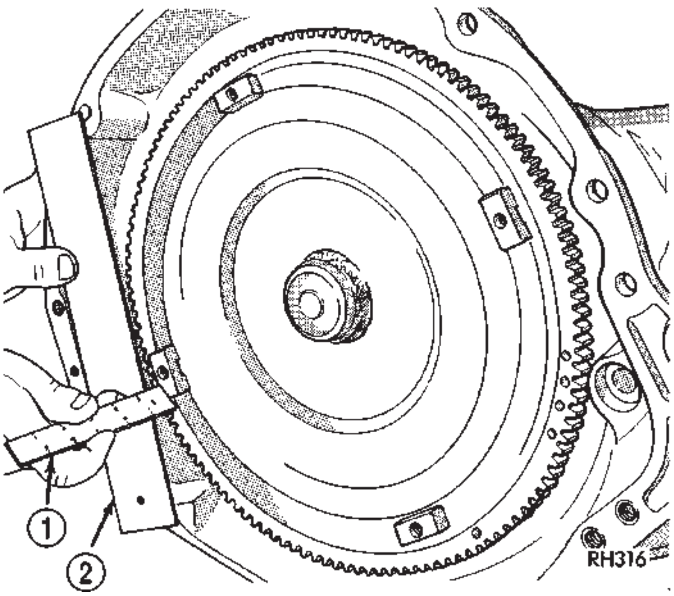

*Fig. 56 Checking Converter Seating - Typical*

1 - SCALE
2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

**CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.**

(20) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to 31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(27) Adjust gearshift linkage and throttle valve cable if necessary.

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

# ACCUMULATOR

## DESCRIPTION

The accumulator (Fig. 57) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 58).

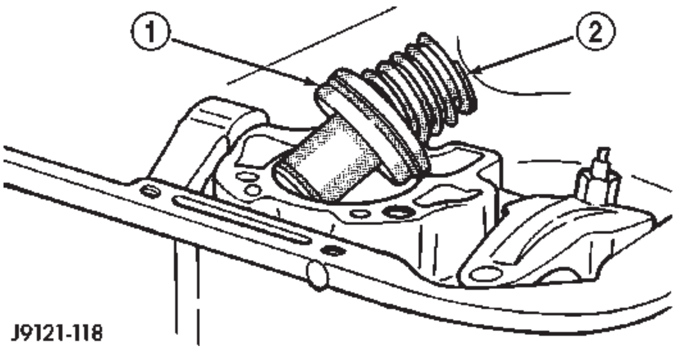

*Fig. 57 Accumulator*

1 - ACCUMULATOR PISTON
2 - PISTON SPRING

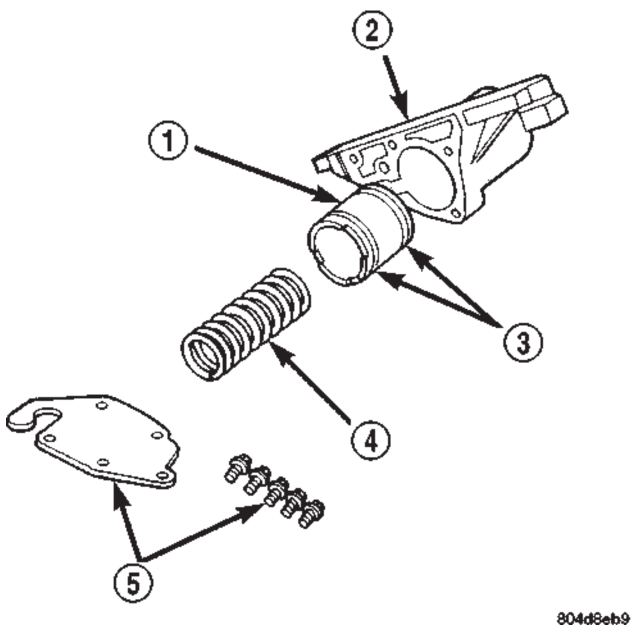

*Fig. 58 3-4 Accumulator and Housing*

1 - ACCUMULATOR PISTON
2 - 3-4 ACCUMULATOR HOUSING
3 - TEFLON SEALS
4 - PISTON SPRING
5 - COVER PLATE AND SCREWS

## OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 59), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 60), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

**NOTE: The accumulator is shown in the inverted position for illustrative purposes.**

## INSPECTION

Inspect the accumulator piston and seal rings (Fig. 61). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 61). Replace the springs if the coils are cracked, distorted or collapsed.

# BANDS

## DESCRIPTION

### KICKDOWN (FRONT) BAND

The kickdown, or “front”, band (Fig. 62) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/ wrap the drum that it holds).

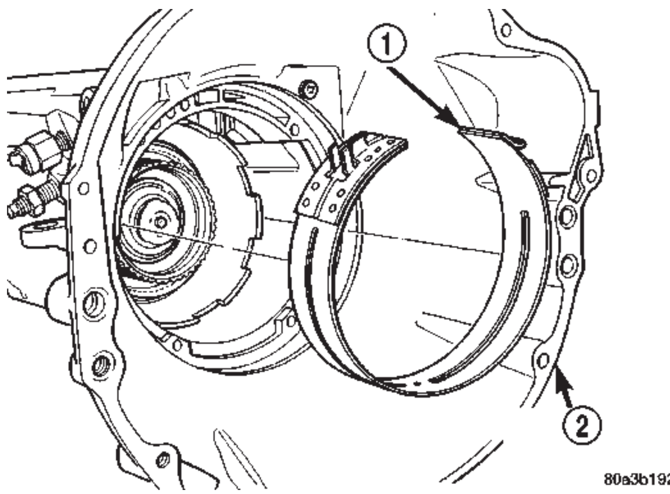

*Fig. 62 Front Band*

1 - FRONT BAND
2 - TRANSMISSION HOUSING

BANDS (Continued)

### LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 63) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/ wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

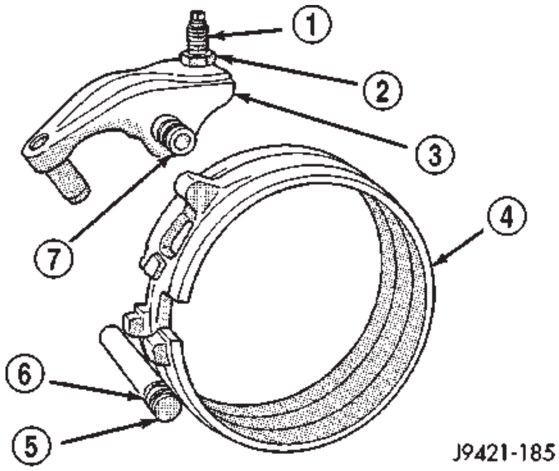

*Fig. 63 Rear Band*

1 - ADJUSTING SCREW
2 - LOCKNUT
3 - LEVER
4 - REAR BAND
5 - REACTION PIN
6 - O-RINGS
7 - PIVOT PIN

## OPERATION

### KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

### LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

## ADJUSTMENT - BANDS

### FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Raise vehicle.

(2) Loosen band adjusting screw locknut (Fig. 64). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.

(3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and appropriate Torx™ socket.

**CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.**

(4) Back off front band adjusting screw 1 7/8 turns.

(5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

(6) Lower vehicle.

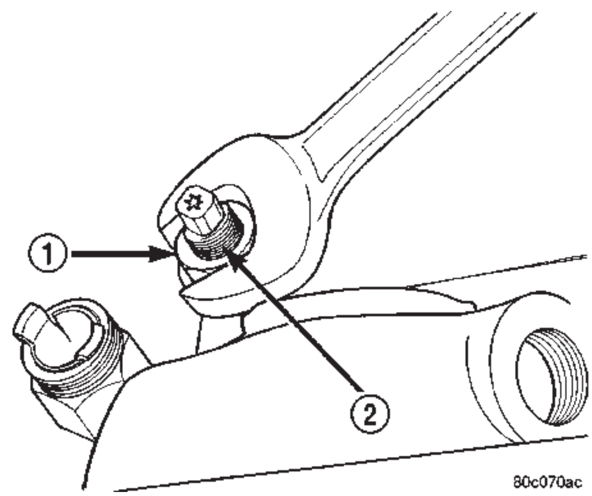

*Fig. 64 Front Band Adjustment Screw Location*

1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

### REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

(1) Raise vehicle.

(2) Remove transmission oil pan and drain fluid.

(3) Loosen band adjusting screw locknut 5-6 turns (Fig. 65). Be sure adjusting screw turns freely in lever.

(4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque.

(5) Back off adjusting screw 4 turns.

(6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

BANDS (Continued)

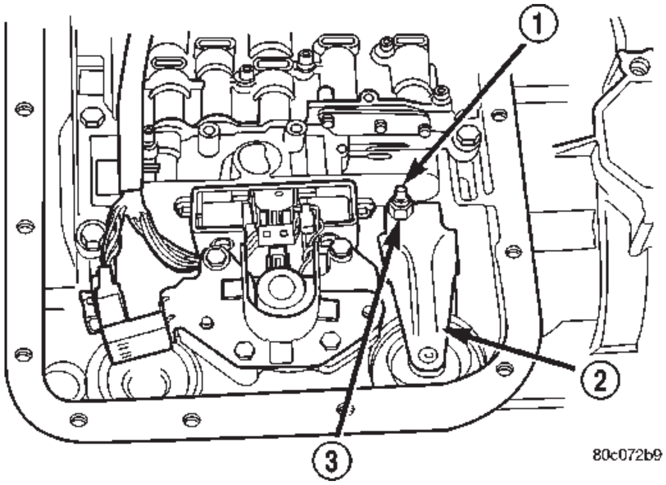

*Fig. 65 Rear Band Adjusting Screw Location*

1 - ADJUSTING SCREW
2 - REAR BAND LEVER
3 - LOCKNUT

(8) Lower vehicle and refill transmission with Mopar® ATF Plus 4, Type 9602 fluid.

# ELECTRONIC GOVERNOR

## DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

### GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 66).

### GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 67).

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

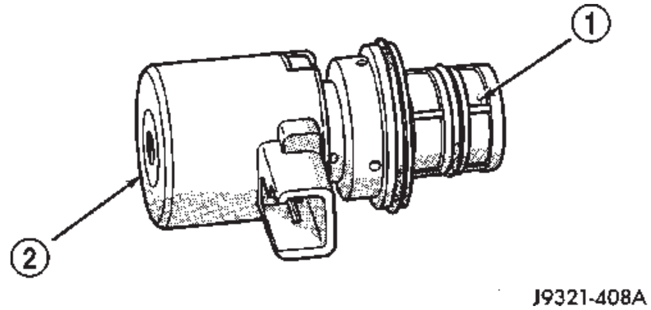

*Fig. 66 Governor Pressure Solenoid Valve*

1 - SOLENOID FILTER
2 - GOVERNOR PRESSURE SOLENOID

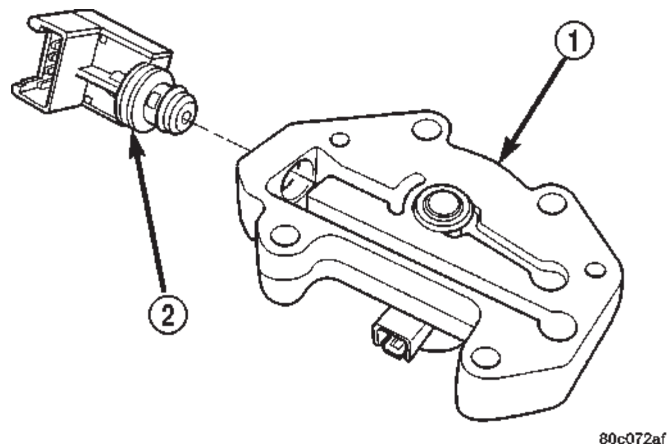

*Fig. 67 Governor Pressure Sensor*

1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 67).

### GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, –1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

## OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output valves are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the ″cold″ period of operation.

## GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

## GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

## GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

## GOVERNOR PRESSURE CURVES

### LOW TRANSMISSION FLUID TEMPERATURE

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

### NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade ″hunting″ prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

### WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

### TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine ″flare.″ The low range governor pressure curve is also higher than normal

ELECTRONIC GOVERNOR (Continued)

to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

## REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Remove transmission fluid pan and filter.

(3) Disengage wire connectors from pressure sensor and solenoid (Fig. 68).

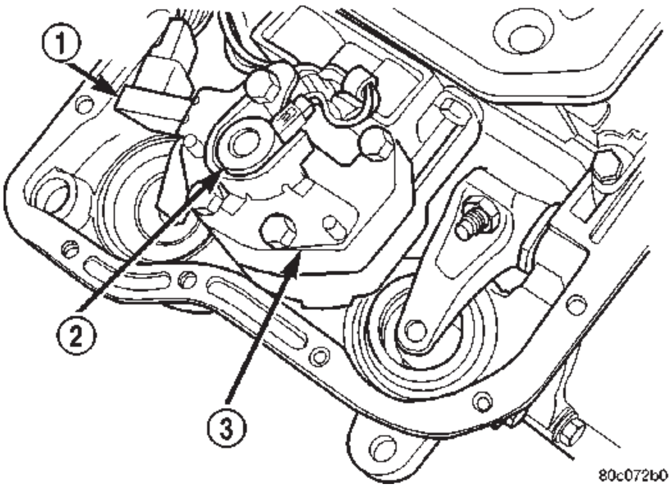

***Fig. 68 Governor Solenoid And Pressure Sensor***

1 - PRESSURE SENSOR
2 - PRESSURE SOLENOID
3 - GOVERNOR

(4) Remove screws holding pressure solenoid retainer to governor body.

(5) Separate solenoid retainer from governor (Fig. 69).

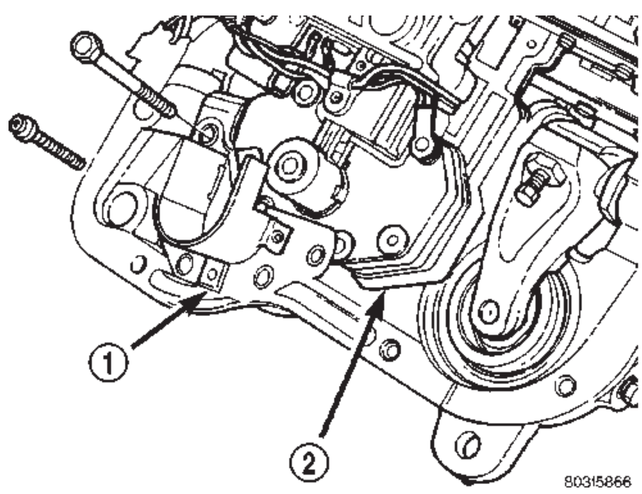

***Fig. 69 Pressure Solenoid Retainer***

1 - PRESSURE SOLENOID RETAINER
2 - GOVERNOR

(6) Pull solenoid from governor body (Fig. 70).

(7) Pull pressure sensor from governor body.

(8) Remove bolts holding governor body to valve body.

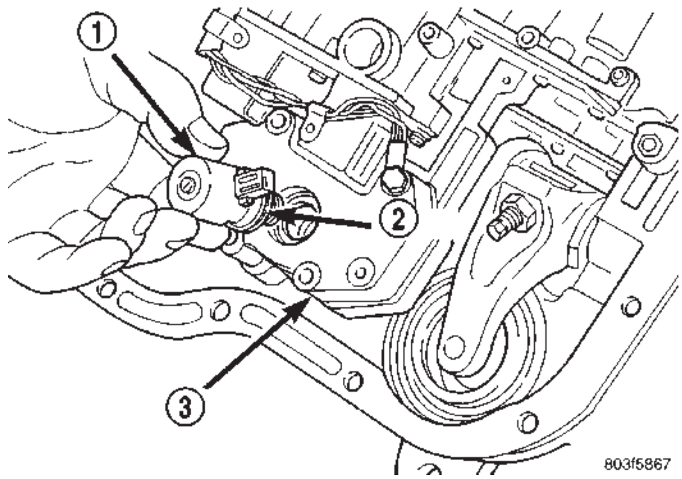

***Fig. 70 Pressure Solenoid and O-ring***

1 - PRESSURE SOLENOID
2 - O-RING
3 - GOVERNOR

(9) Separate governor body from valve body (Fig. 71).

(10) Remove governor body gasket.

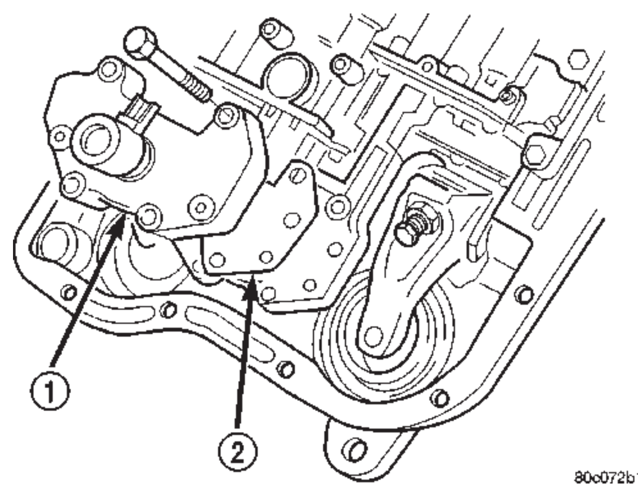

***Fig. 71 Governor Body and Gasket***

1 - GOVERNOR BODY
2 - GASKET

## INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace o-ring seals, clean the gasket surfaces and replace gasket.

(1) Place gasket in position on back of governor body (Fig. 72).

(2) Place governor body in position on valve body.

ELECTRONIC GOVERNOR (Continued)

(3) Install bolts to hold governor body to valve body.

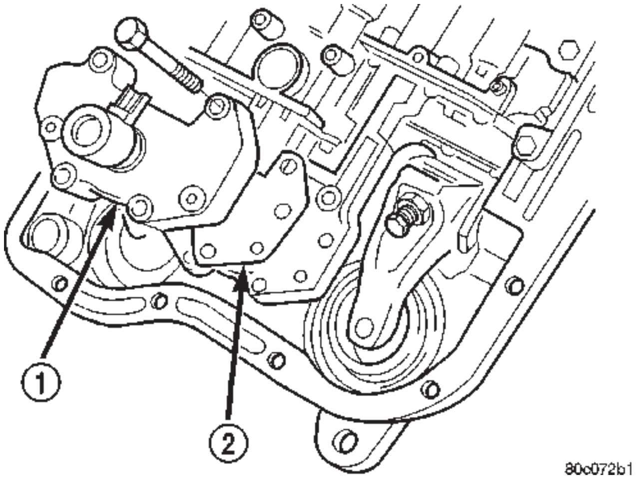

*Fig. 72 Governor Body and Gasket*

1 - GOVERNOR BODY
2 - GASKET

(4) Lubricate o-ring on pressure sensor with transmission fluid.

(5) Align pressure sensor to bore in governor body.

(6) Push pressure sensor into governor body.

(7) Lubricate o-ring, on pressure solenoid, with transmission fluid.

(8) Align pressure solenoid to bore in governor body (Fig. 73).

(9) Push solenoid into governor body.

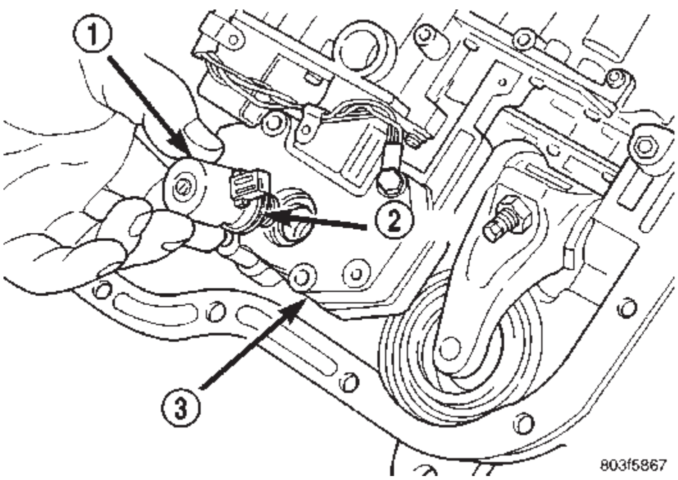

*Fig. 73 Pressure Solenoid and O-ring*

1 - PRESSURE SOLENOID
2 - O-RING
3 - GOVERNOR

(10) Place solenoid retainer in position on governor (Fig. 74).

(11) Install screws to hold pressure solenoid retainer to governor body.

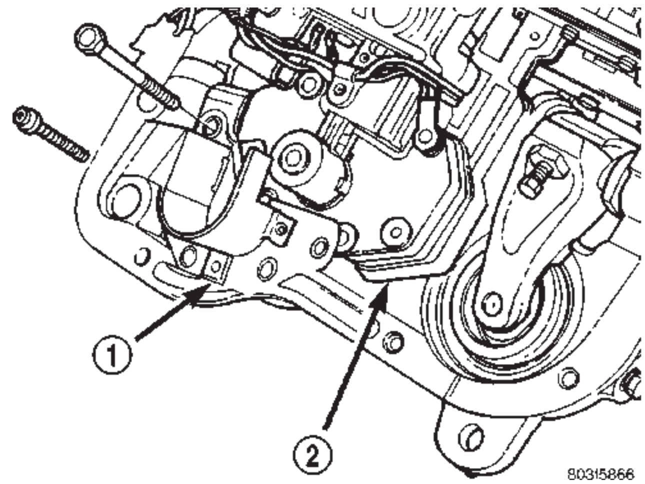

*Fig. 74 Pressure Solenoid Retainer*

1 - PRESSURE SOLENOID RETAINER
2 - GOVERNOR

(12) Engage wire connectors into pressure sensor and solenoid (Fig. 75).

(13) Install transmission fluid pan and (new) filter.

(14) Lower vehicle and road test to verify repair.

# EXTENSION HOUSING BUSHING

## REMOVAL

(1) Remove extension housing yoke seal.

(2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 76).

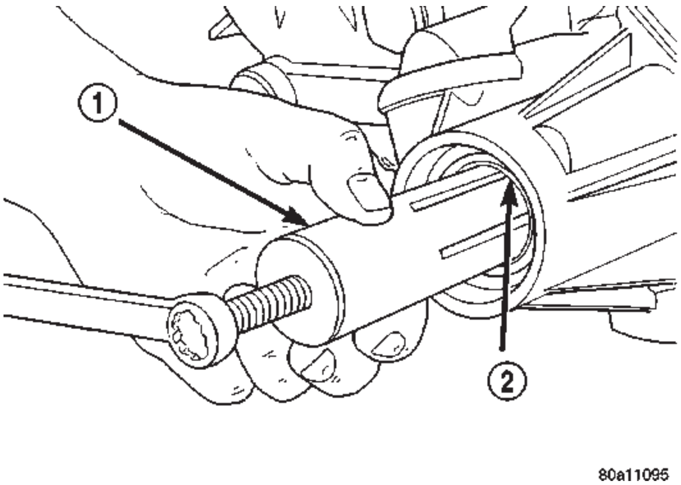

*Fig. 76 Bushing Removal - Typical*

1 - REMOVER
2 - EXTENSION HOUSING BUSHING

## INSTALLATION

(1) Align bushing oil hole with oil slot in extension housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 77).

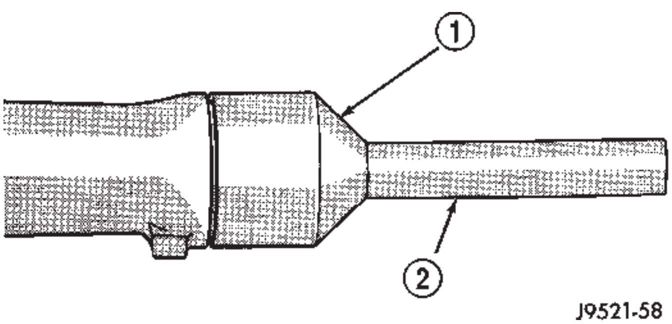

*Fig. 77 Extension Housing Seal Installation*

1 - SPECIAL TOOL C-3995-A OR C-3972-A
2 - SPECIAL TOOL C-4471

# EXTENSION HOUSING SEAL

## REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 78) from overdrive housing.

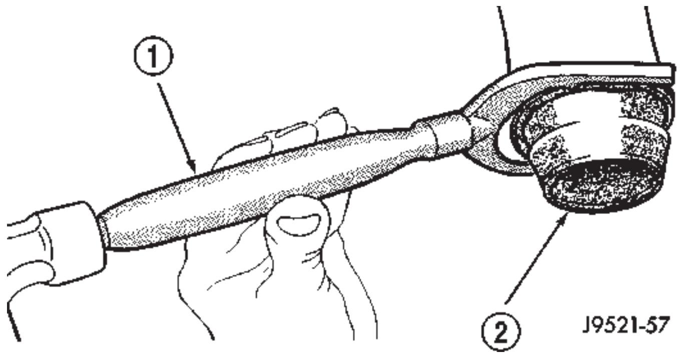

*Fig. 78 Removing Overdrive Housing Yoke Seal*

1 - SPECIAL TOOL C-3985-B
2 - SEAL

## INSTALLATION

(1) Place seal in position on overdrive housing.

(2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 79).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

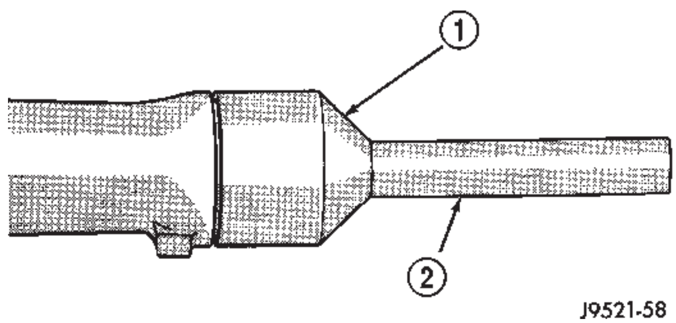

*Fig. 79 Installing Overdrive Housing Seal*

1 - SPECIAL TOOL C-3995-A OR C-3972-A
2 - SPECIAL TOOL C-4471

# FLUID AND FILTER

## DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

## DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

## DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmssion has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

FLUID AND FILTER (Continued)

### PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 80) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not overfill.

### PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

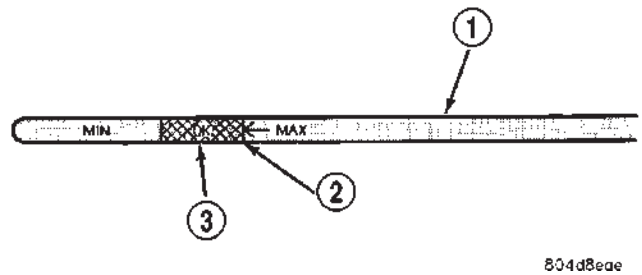

***Fig. 80 Dipstick Fluid Level Marks - Typical***

1 - DIPSTICK
2 - MAXIMUM CORRECT FLUID LEVEL
3 - ACCEPTABLE FLUID LEVEL

(5) Hook up DRB® scan tool and select engine.

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the figure. (Fig. 81)

(9) Adjust transmission fluid level shown on the dipstick according to the figure.

**NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

(10) Check transmission for leaks.

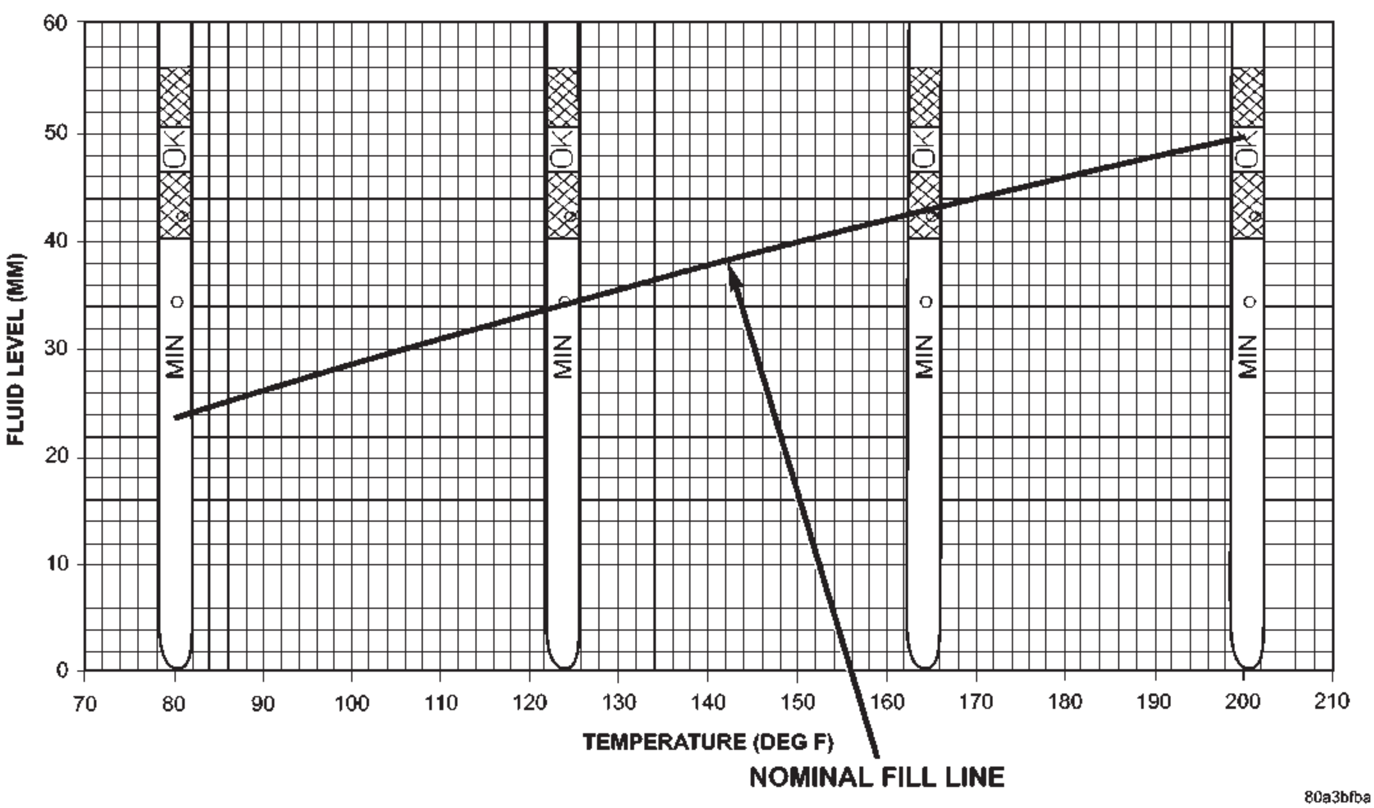

***Fig. 81 42/44RE Fluid Fill Graph***

FLUID AND FILTER (Continued)

## STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 82).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 83).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

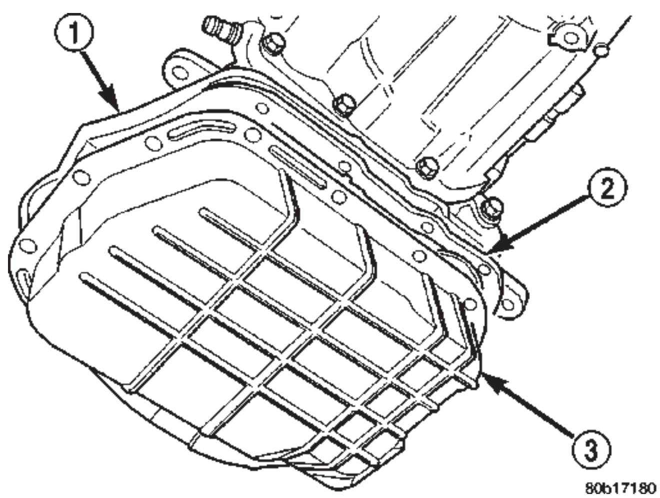

*Fig. 82 Transmission Pan*

1 - TRANSMISSION
2 - GASKET
3 - PAN

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

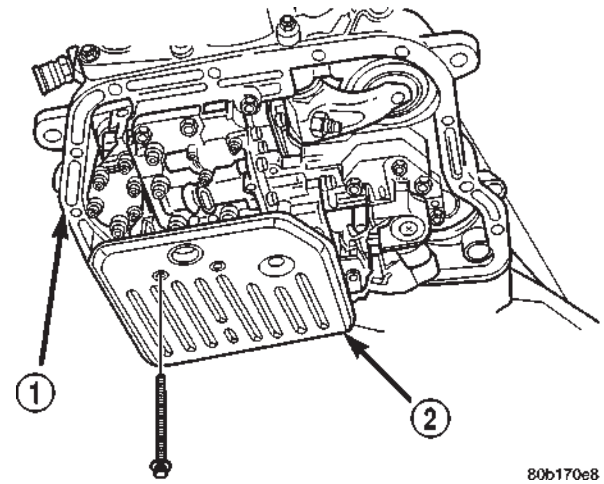

*Fig. 83 Transmission Filter*

1 - TRANSMISSION
2 - FILTER

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.**

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

# FRONT CLUTCH

## DESCRIPTION

The front clutch assembly (Fig. 84) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## DISASSEMBLY

(1) Remove waved snap-ring and remove pressure plate, clutch plates and clutch discs (Fig. 85).

FRONT CLUTCH (Continued)

FRONT CLUTCH (Continued)

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 86). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

(6) Remove seals from clutch retainer piston bore and clutch retainer hub. Discard both seals as they are not reusable.

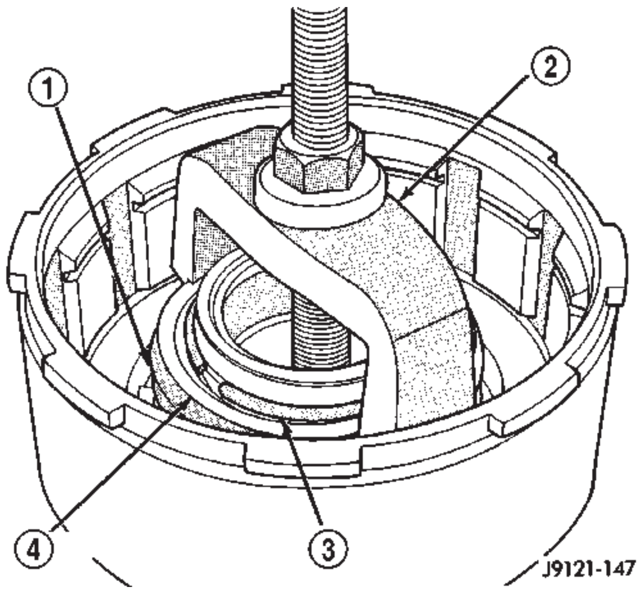

***Fig. 86 Compressing Front Clutch Piston Spring***

1 - FRONT CLUTCH SPRING
2 - COMPRESSOR TOOL C-3575-A
3 - RETAINER SNAP-RING
4 - SPRING RETAINER

## INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, or if the facing is flaking off. Replace the steel plates if heavily scored, warped, or broken. Be sure the driving lugs on the plates are in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the clutch spring and spring retainer if either is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged.

Check action of the check ball in the retainer (Fig. 87). The ball must move freely and not stick.

**NOTE: Inspect the clutch retainer bushings carefully (Fig. 88). The retainer bushings are NOT serviceable. It will be necessary to replace the retainer if either bushing is scored, or worn.**

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

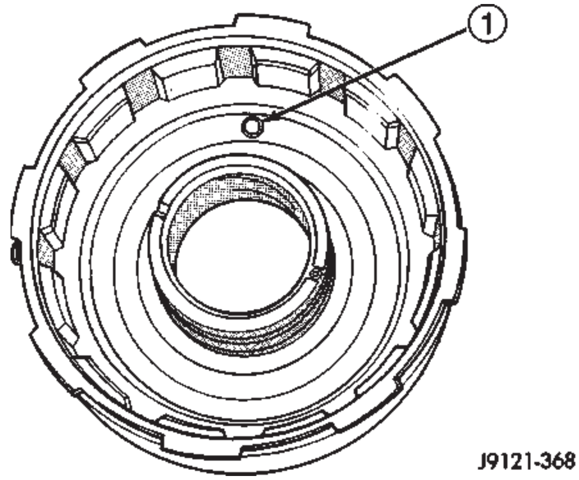

***Fig. 87 Front Clutch Piston Retainer Check Ball Location***

1 - RETAINER CHECK BALL

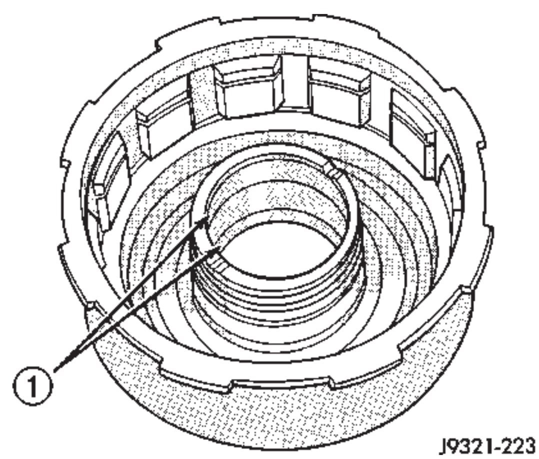

***Fig. 88 Retainer Bushing Location/Inspection***

1 - FRONT CLUTCH RETAINER BUSHINGS (NON-SERVICEABLE)

## ASSEMBLY

**NOTE: The 44RE transmission uses five (5) plates and discs for the front clutch.**

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

FRONT CLUTCH (Continued)

(2) Install new seals in the clutch retainer lower groove and on the outer diameter of the retainer hub. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of the retainer seals with liberal quantity of Mopar® Door Ease. Then lubricate retainer hub, bore, and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 89). Use twisting motion to seat piston in bottom of retainer.

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip.**

(5) Position spring in clutch piston (Fig. 90).

(6) Position spring retainer on top of piston spring. Make sure retainer is properly installed (Fig. 85).

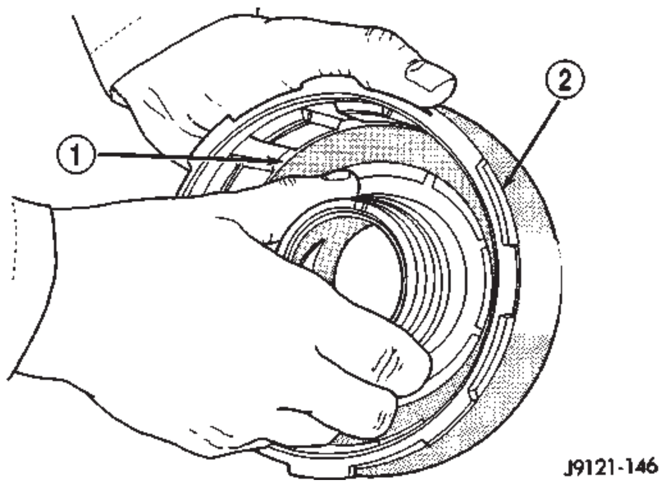

***Fig. 89 Front Clutch Piston Installation***

1 - CLUTCH PISTON
2 - FRONT CLUTCH RETAINER

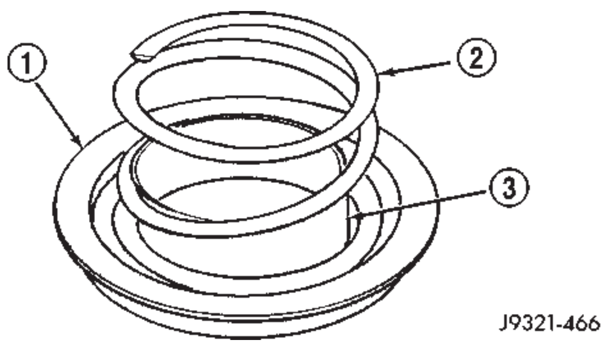

***Fig. 90 Clutch Piston Spring Installation***

1 - RETAINER
2 - CLUTCH SPRING
3 - PISTON

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 86). Then install new snap ring to secure spring retainer and spring.

(8) Install clutch plates and discs. Install steel plate then disc until all plates and discs are installed. The front clutch uses 5 clutch discs and plates in a 44RE transmission.

(9) Install pressure plate and waved snap-ring.

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs, plates, pressure plates and snap ring may have to be changed.

# FRONT SERVO

## DESCRIPTION

The kickdown servo (Fig. 91) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

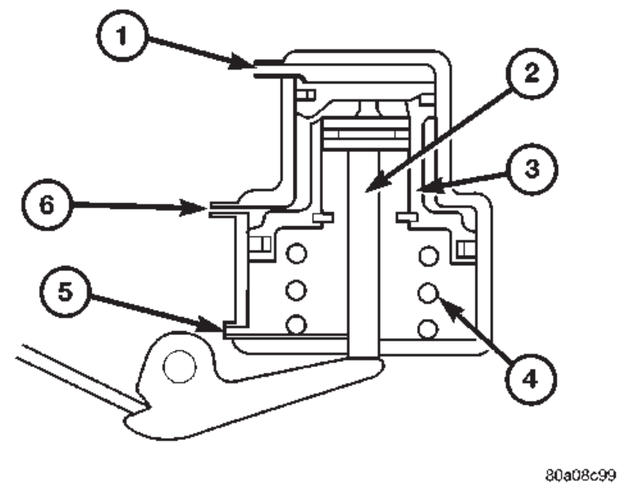

***Fig. 91 Front Servo***

1 - VENT
2 -PISTON ROD
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE

## OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend though its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston.

FRONT SERVO (Continued)

The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

## DISASSEMBLY

(1) Remove seal ring from rod guide (Fig. 92).

(2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.

(3) Remove and discard servo component o-ring and seal rings.

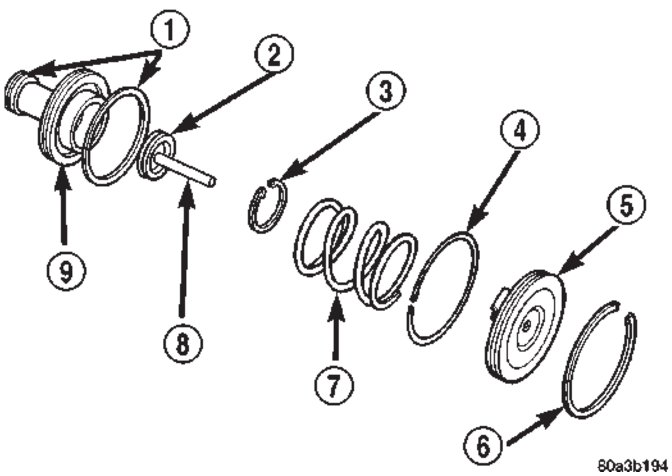

*Fig. 92 Front Servo*

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

FRONT SERVO (Continued)

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

## ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 95).

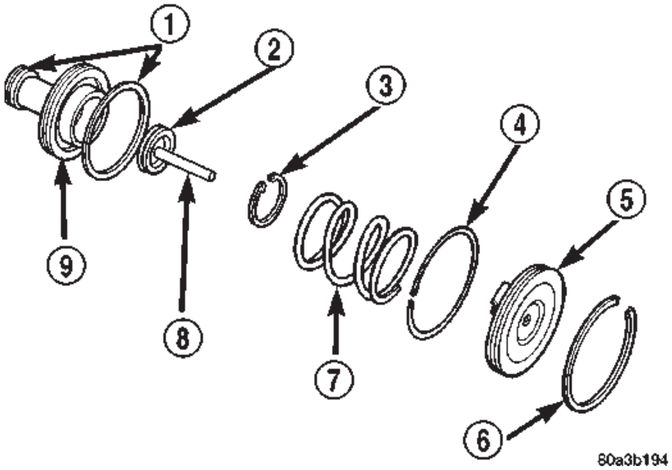

*Fig. 95 Front Servo*

3 - OUTER GEAR

# OIL PUMP

## DESCRIPTION

The oil pump (Fig. 96) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear (Fig. 97), a housing, and a cover that also serves as the reaction shaft support.

## OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

## STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

OIL PUMP (Continued)

**CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.**

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

## DISASSEMBLY

(1) Remove seal ring from housing and reaction shaft support (Fig. 98).

(2) Mark pump housing and support assembly for alignment reference.

(3) Remove bolts attaching pump body to support (Fig. 99).

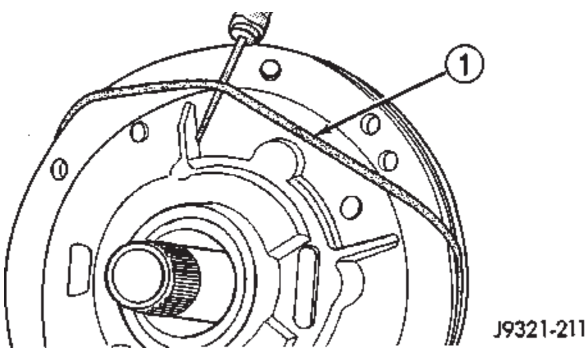

***Fig. 98 Removing Pump Seal Ring***

1 - PUMP HOUSING SEAL RING

(4) Separate support from pump housing (Fig. 100).

(5) Remove inner and outer gears from reaction shaft support (Fig. 101).

(6) If pump seal was not removed during transmission disassembly, remove seal with punch and hammer.

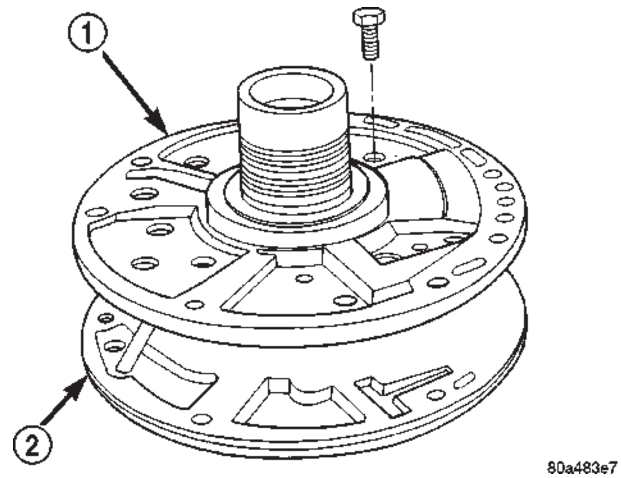

***Fig. 99 Pump Support Bolts***

OIL PUMP (Continued)

(7) Remove front clutch thrust washer from support hub (Fig. 102).

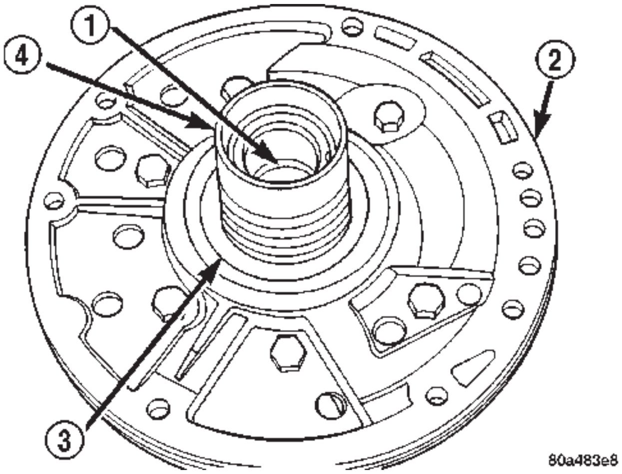

*Fig. 102 Support Hub Thrust Washer*

1 - BUSHING
2 - REACTION SHAFT SUPPORT
3 - THRUST WASHER
4 - HUB

## OIL PUMP BUSHING REPLACEMENT

(1) Remove pump bushing with Tool Handle C-4171 and Bushing Remover SP-3551 from Tool Set C-3887-J (Fig. 103).

(2) Install new pump bushing with Tool Handle C-4171 and Bushing Installer SP-5117 (Fig. 103). Bushing should be flush with pump housing bore.

(3) Stake new pump bushing in two places with blunt punch (Fig. 104). Remove burrs from stake points with knife blade afterward.

## REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Bushing Remover Tools SP-1191, 3633 and 5324 (Fig. 105). Do not clamp any part of reaction shaft or support in vise.

(2) Hold Cup Tool SP-3633 firmly against reaction shaft and thread remover SP-5324 into bushing as far as possible by hand. Then thread remover tool 3-4 additional turns into bushing with a wrench.

(3) Turn remover tool hex nut down against remover cup to pull bushing from shaft. Clean all chips from shaft after bushing removal.

(4) Lightly grip old bushing in vise or with pliers and back remover tool out of bushing.

(5) Assemble Bushing Installer Tools C-4171 and SP-5325 (Fig. 105).

(6) Slide new bushing onto Installer Tool SP-5325.

(7) Position reaction shaft support upright on a clean smooth surface.

(8) Align bushing in bore. Then tap bushing into place until Bushing Installer SP-5325 bottoms.

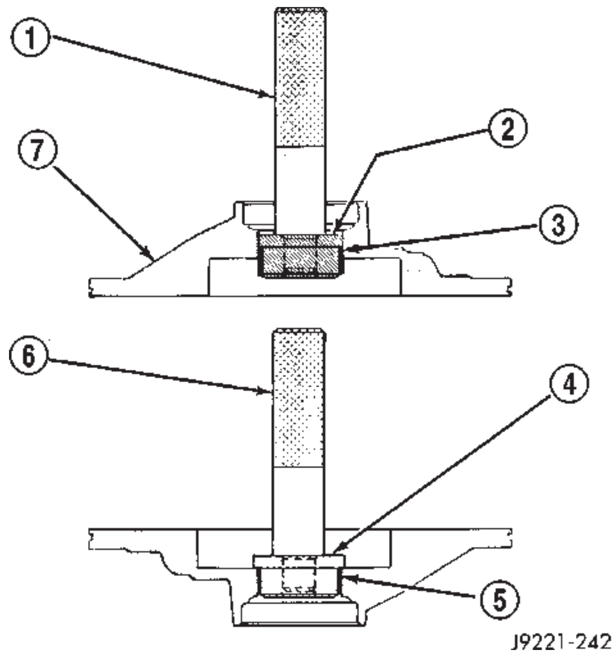

*Fig. 103 Removing Oil Pump Bushing*

(9) Clean reaction shaft support thoroughly after installing bushing.

## CLEANING

Clean pump and support components with solvent and dry them with compressed air.

OIL PUMP (Continued)

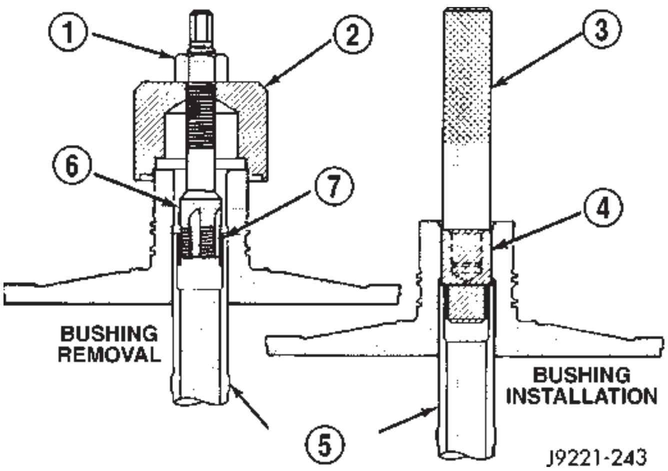

*Fig. 105 Replacing Reaction Shaft Support Bushing*

1 - SPECIAL TOOL SP-1191
2 - SPECIAL TOOL SP-3633
3 - SPECIAL TOOL C-4171
4 - SPECIAL TOOL SP-5325
5 - REACTION SHAFT
6 - SPECIAL TOOL SP-5324
7 - BUSHING

## INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

## ASSEMBLY

(1) Lubricate gear bore in pump housing with transmission fluid.

(2) Lubricate pump gears with transmission fluid.

(3) Support pump housing on wood blocks (Fig. 106).

(4) Install outer gear in pump housing (Fig. 106). Gear can be installed either way (it is not a one-way fit).

(5) Install pump inner gear (Fig. 107).

**CAUTION: The pump inner gear is a one way fit. The bore on one side of the gear inside diameter (I.D.) is chamfered. Be sure the chamfered side faces forward (to front of pump).**

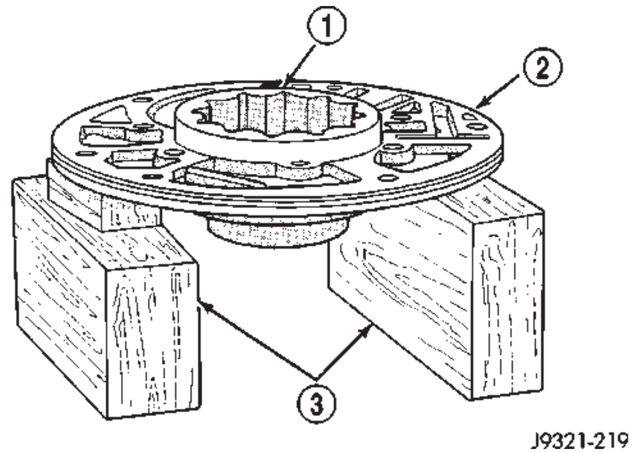

*Fig. 106 Supporting Pump And Installing Outer Gear*

1 - OUTER GEAR
2 - PUMP HOUSING
3 - WOOD BLOCKS

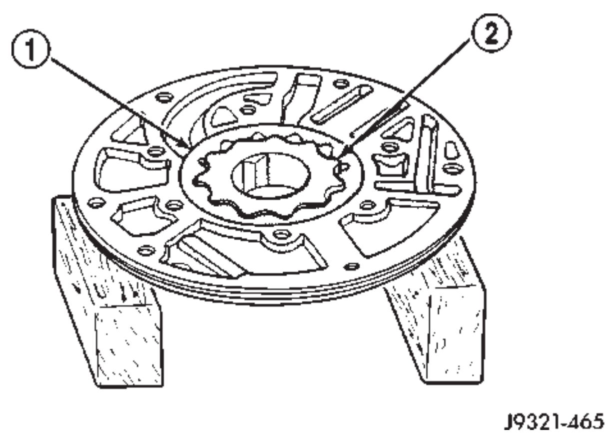

*Fig. 107 Pump Inner Gear Installation*

1 - OUTER GEAR
2 - INNER GEAR

OIL PUMP (Continued)

(6) Install new thrust washer on hub of reaction shaft support. Lubricate washer with transmission fluid or petroleum jelly.

(7) If reaction shaft seal rings are being replaced, install new seal rings on support hub (Fig. 108). Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

**CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.**

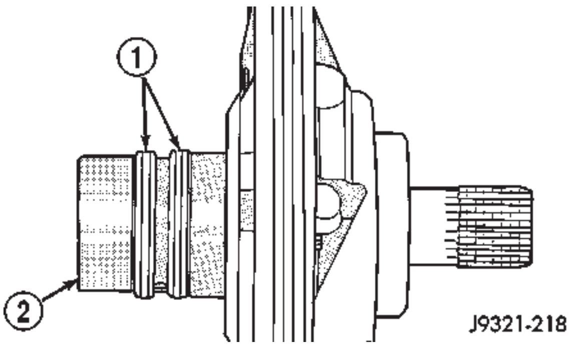

*Fig. 108 Hub Seal Ring Position*

1 - SEAL RINGS
2 - SUPPORT HUB

(8) Install reaction shaft support on pump housing (Fig. 109).

(9) Align reaction support on pump housing. Use alignment marks made at disassembly. Or, rotate support until bolt holes in support and pump housing are all aligned (holes are offset for one-way fit).

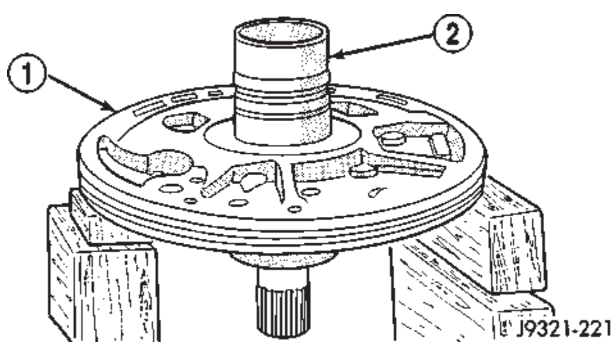

*Fig. 109 Assembling Reaction Shaft Support And Pump Housing*

1 - PUMP HOUSING
2 - REACTION SHAFT SUPPORT

(10) Install all bolts that attach support to pump housing. Then tighten bolts finger tight.

(11) Tighten support-to-pump bolts to required torque as follows:

(a) Reverse pump assembly and install it in transmission case. Position pump so bolts are facing out and are accessible.

(b) Secure pump assembly in case with 2 or 3 bolts, or with pilot studs.

(c) Tighten support-to-pump bolts to 20 N·m (15 ft. lbs.).

(d) Remove pump assembly from transmission case.

(12) Install new oil seal in pump with Special Tool C-4193 and Tool Handle C-4171 (Fig. 110). Be sure seal lip faces inward.

(13) Install new seal ring around pump housing. Be sure seal is properly seated in groove.

(14) Lubricate lip of pump oil seal and O-ring seal with transmission fluid.

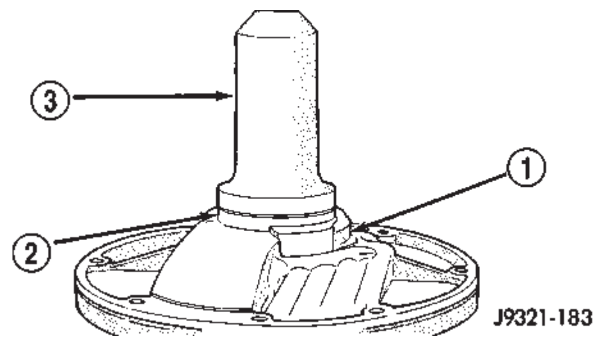

*Fig. 110 Pump Oil Seal Installation*

1 - PUMP BODY
2 - PUMP SEAL

# OUTPUT SHAFT FRONT BEARING

## REMOVAL

(1) Remove overdrive unit from the vehicle.
(2) Remove overdrive geartrain from housing.
(3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 111).
(4) Pull bearing from output shaft.

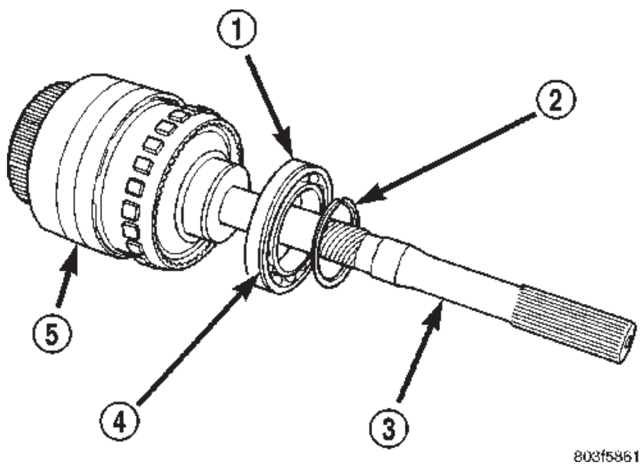

*Fig. 111 Output Shaft Front Bearing*

1 - OUTPUT SHAFT FRONT BEARING
2 - SNAP-RING
3 - OUTPUT SHAFT
4 - GROOVE TO REAR
5 - OVERDRIVE GEARTRAIN

## INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.
(2) Push bearing onto shaft until the snap-ring groove is visible.
(3) Install snap-ring to hold bearing onto output shaft.
(4) Install overdrive geartrain into housing.
(5) Install overdrive unit in vehicle.

# OUTPUT SHAFT REAR BEARING

## REMOVAL

(1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/ OVERDRIVE - REMOVAL)
(2) Remove overdrive geartrain from housing.
(3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 112).
(4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

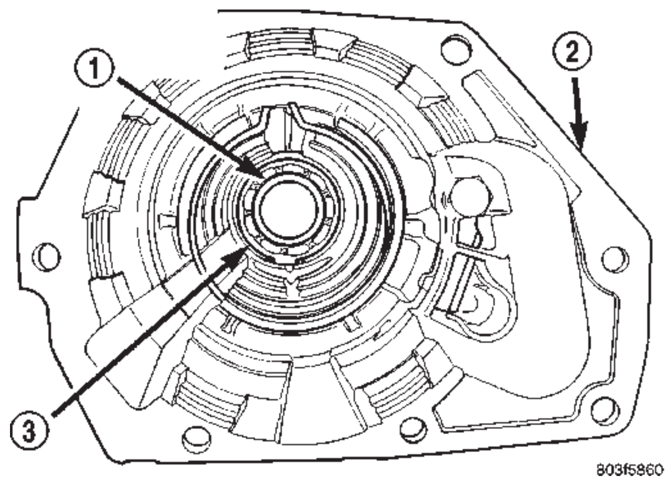

*Fig. 112 Output Shaft Rear Bearing*

1 - OUTPUT SHAFT REAR BEARING
2 - OVERDRIVE HOUSING
3 - SNAP-RING

## INSTALLATION

(1) Place replacement bearing in position in housing.
(2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.
(3) Install snap-ring to hold bearing into housing (Fig. 112).
(4) Install overdrive geartrain into housing.
(5) Install overdrive unit in vehicle.

# OVERDRIVE CLUTCH

## DESCRIPTION

The overdrive clutch (Fig. 113) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

# OVERDRIVE SWITCH

## DESCRIPTION

The overdrive OFF (control) switch is located in the shift lever arm (Fig. 114). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

## OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

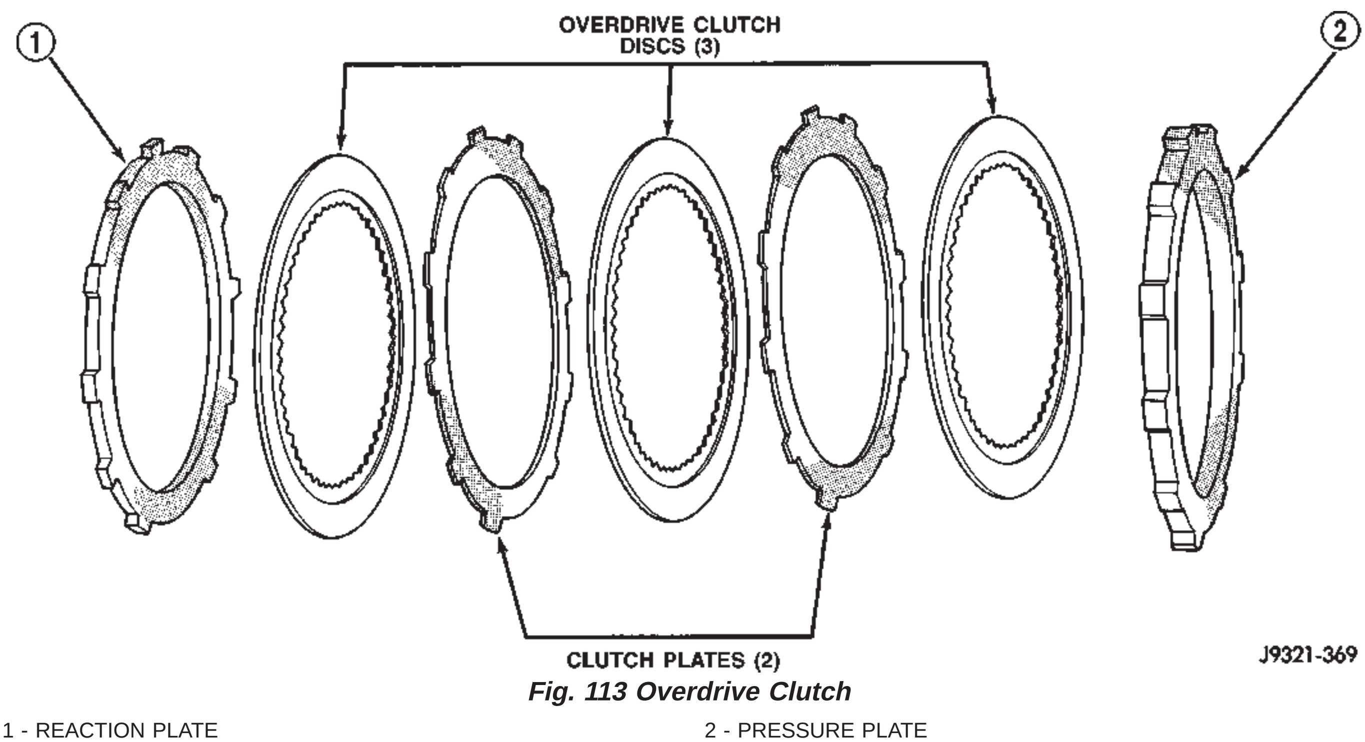

*Fig. 113 Overdrive Clutch*

1 - REACTION PLATE
2 - PRESSURE PLATE

OVERDRIVE SWITCH (Continued)

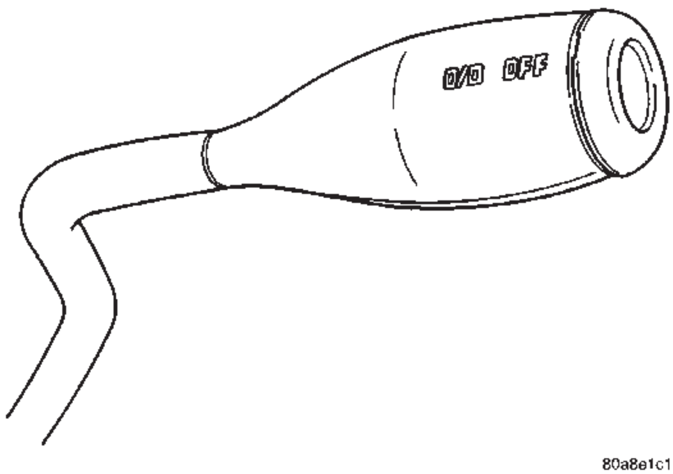

*Fig. 114 Overdrive Off Switch*

## DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

## REMOVAL

(1) Using a plastic trim tool, remove the overdrive off switch retainer from the shift lever (Fig. 115).

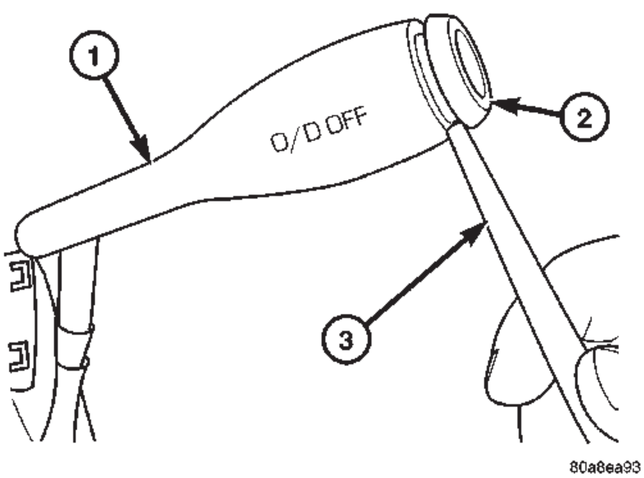

*Fig. 115 Overdrive Off Switch Retainer*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH RETAINER
3 - PLASTIC TRIM TOOL

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 116)

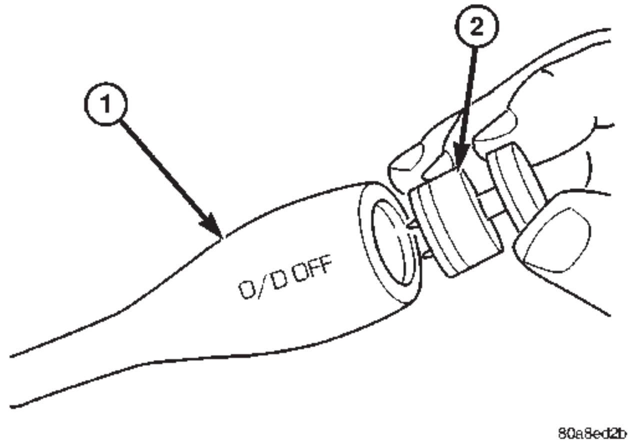

*Fig. 116 Remove the Overdrive Off Switch*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH

## INSTALLATION

**NOTE: There is enough slack in the wire to pull out the connector from the lever.**

(1) Pull the connector out of the lever just enough to grasp it.

**CAUTION: Be careful not to bend the pins on the overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.**

(2) Install the overdrive off switch into the connector (Fig. 117)

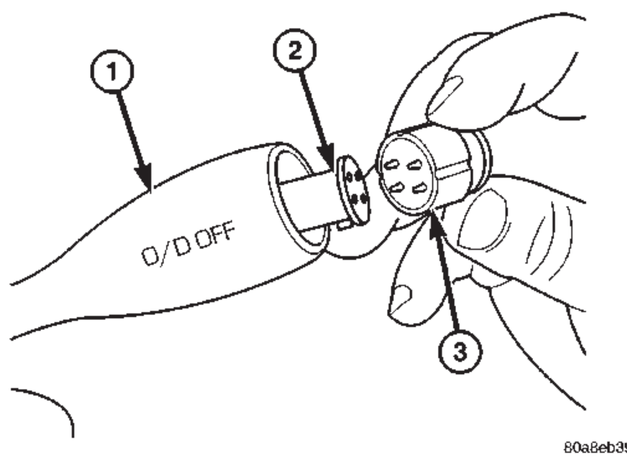

*Fig. 117 Install the Overdrive Off Switch*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH WIRING CONNECTOR
3 - OVERDRIVE OFF SWITCH

(3) Push the overdrive off switch and wiring into the shift lever.

(4) Install the overdrive off switch retainer onto the shift lever.

# OVERDRIVE UNIT

## REMOVAL

(1) Shift transmission into PARK.
(2) Raise vehicle.
(3) Remove transfer case, if equipped.
(4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if neccesary.
(5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
(6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.
(7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.
(8) Support transmission with transmission jack.
(9) Remove bolts attaching overdrive unit to transmission (Fig. 118).

**CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.**

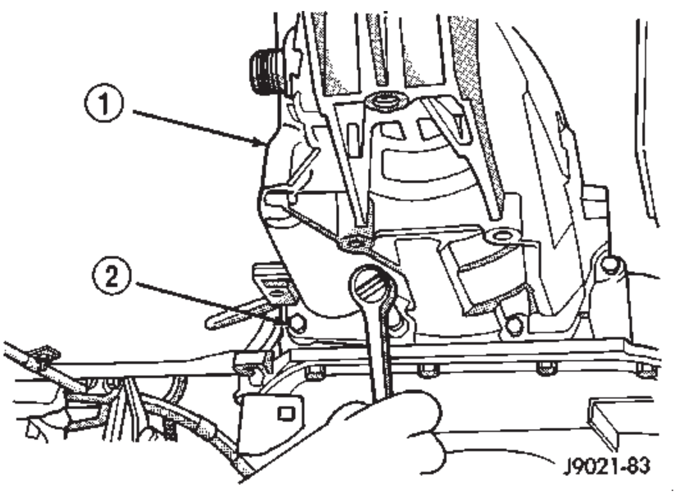

***Fig. 118 Overdrive Unit Bolts***

1 - OVERDRIVE UNIT
2 - ATTACHING BOLTS (7)

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.
(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.
(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.
(13) Position drain pan on workbench.
(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.
(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.
(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

## DISASSEMBLY

(1) Remove transmission speed sensor and O-ring seal from overdrive case (Fig. 119).
(2) Remove overdrive piston thrust bearing (Fig. 120).

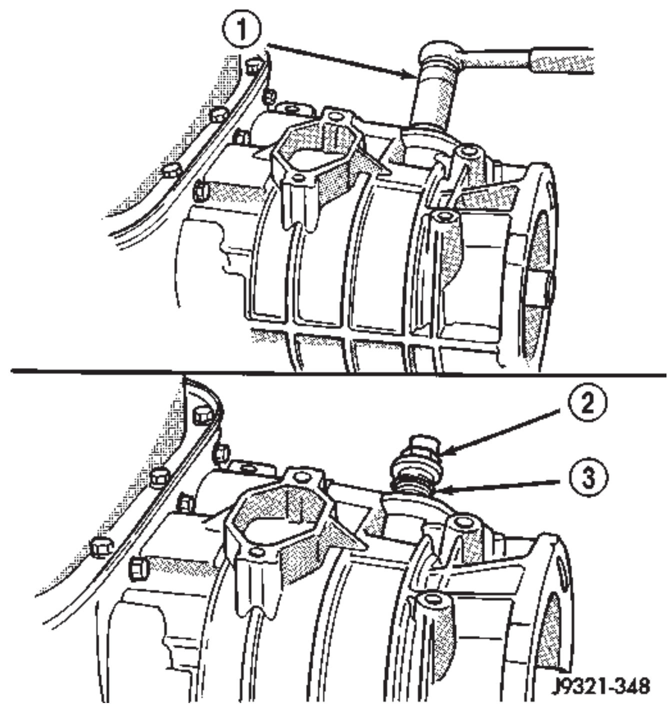

***Fig. 119 Transmission Speed Sensor Removal***

1 - SOCKET AND WRENCH
2 - SPEED SENSOR
3 - O-RING

OVERDRIVE UNIT (Continued)

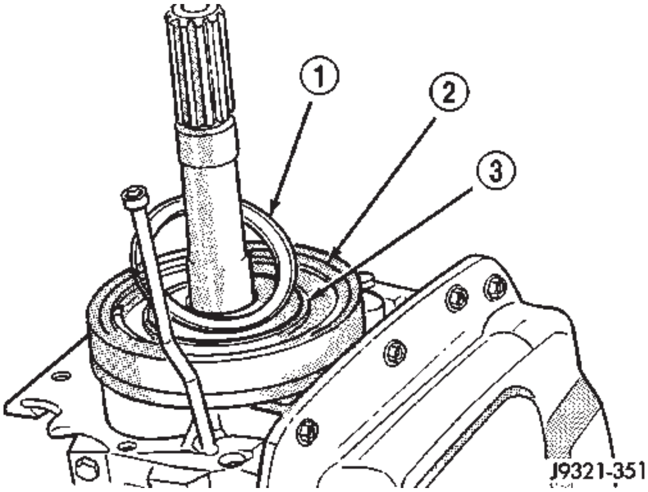

***Fig. 120 Overdrive Piston Thrust Bearing Removal***

1 - THRUST BEARING
2 - OVERDRIVE PISTON
3 - THRUST PLATE

## OVERDRIVE PISTON

(1) Remove overdrive piston thrust plate (Fig. 121). Retain thrust plate. It is a select fit part and may possibly be reused.

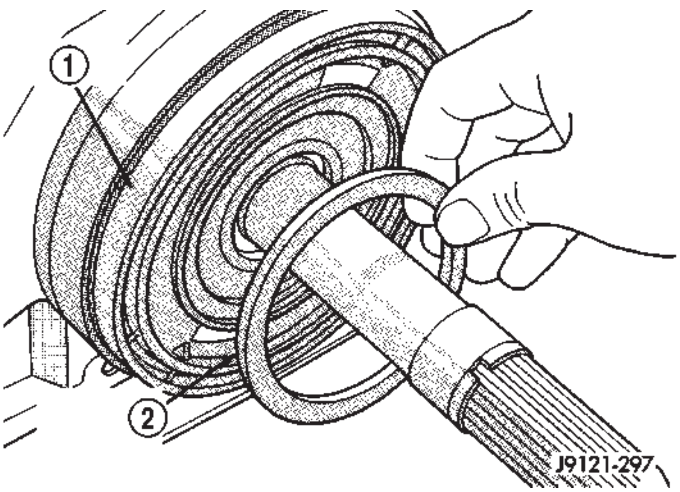

***Fig. 121 Overdrive Piston Thrust Plate Removal***

1 - OVERDRIVE PISTON
2 - OVERDRIVE PISTON SPACER (SELECT FIT)

(2) Remove intermediate shaft spacer (Fig. 122). Retain spacer. It is a select fit part and may possibly be reused.

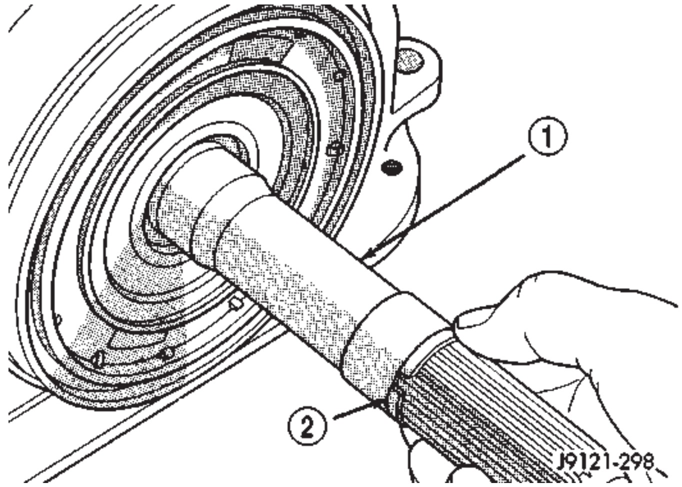

***Fig. 122 Intermediate Shaft Spacer Location***

1 - INTERMEDIATE SHAFT
2 - INTERMEDIATE SHAFT SPACER (SELECT FIT)

(3) Remove overdrive piston from retainer (Fig. 123).

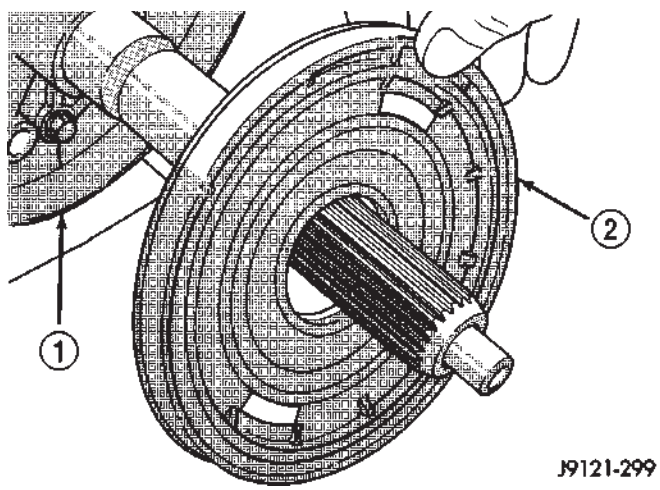

***Fig. 123 Overdrive Piston Removal***

1 - PISTON RETAINER
2 - OVERDRIVE PISTON

OVERDRIVE UNIT (Continued)

### OVERDRIVE CLUTCH PACK

(1) Remove overdrive clutch pack wire retaining ring (Fig. 124).

(2) Remove overdrive clutch pack (Fig. 125).

**NOTE: The 44RE transmission has four(4) clutch discs and three(3) clutch plates.**

(3) Note position of clutch pack components for assembly reference.

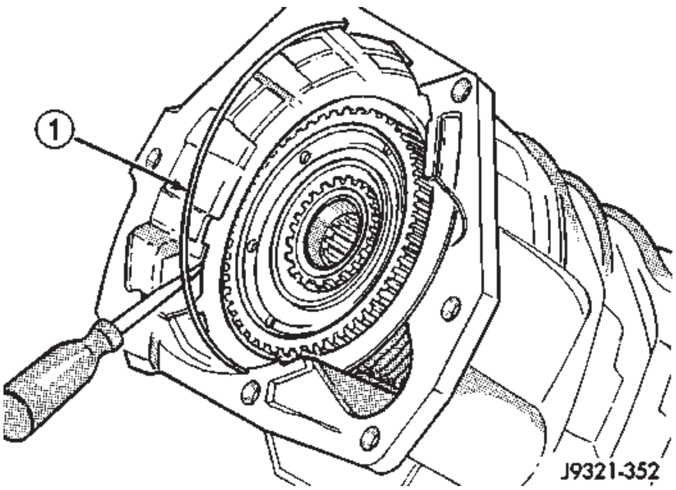

***Fig. 124 Removing Overdrive Clutch Pack Retaining Ring***

1 - OVERDRIVE CLUTCH PACK RETAINING RING

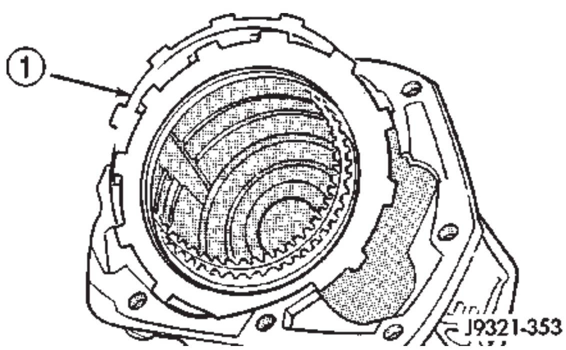

***Fig. 125 Overdrive Clutch Pack Removal***

1 - OVERDRIVE CLUTCH PACK

### OVERDRIVE GEARTRAIN

(1) Remove overdrive clutch wave spring (Fig. 126).

(2) Remove overdrive clutch reaction snap-ring (Fig. 127). Note that snap-ring is located in same groove as wave spring.

(3) Remove Torx™ head screws that attach access cover and gasket to overdrive case (Fig. 128).

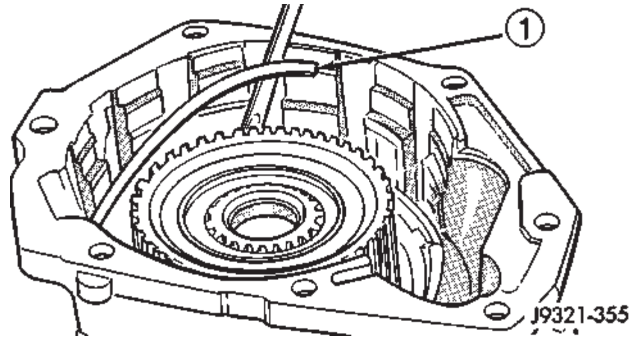

***Fig. 126 Overdrive Clutch Wave***

1 - WAVE SPRING

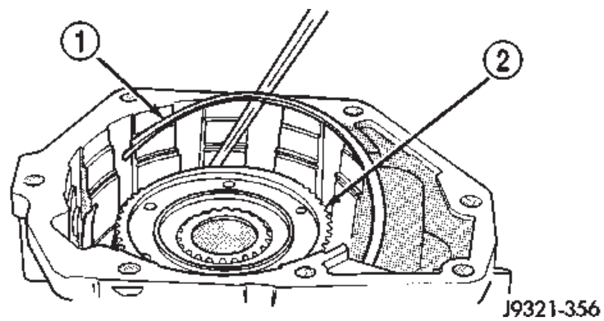

***Fig. 127 Overdrive Clutch Reaction Snap-Ring Removal***

1 - REACTION RING
2 - CLUTCH HUB

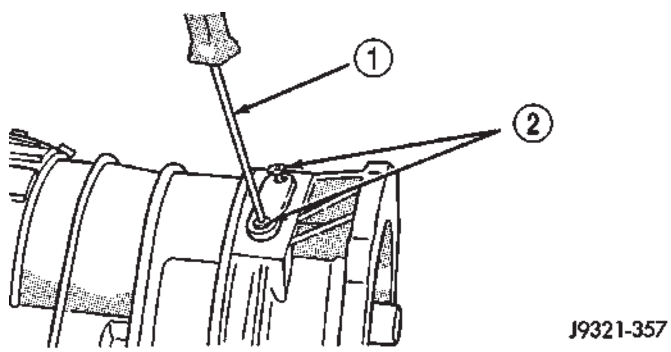

***Fig. 128 Access Cover Screw Removal***

1 - TORX™ SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

OVERDRIVE UNIT (Continued)

(4) Remove access cover and gasket (Fig. 129).

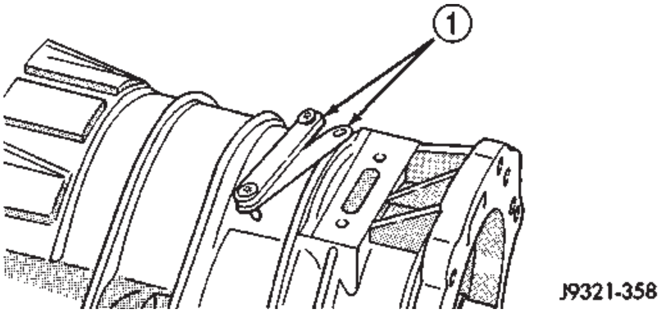

*Fig. 129 Access Cover And Gasket Removal*

1 - ACCESS COVER AND GASKET

(5) Expand output shaft bearing snap-ring with expanding-type snap-ring pliers. Then push output shaft forward to release shaft bearing from locating ring (Fig. 130).

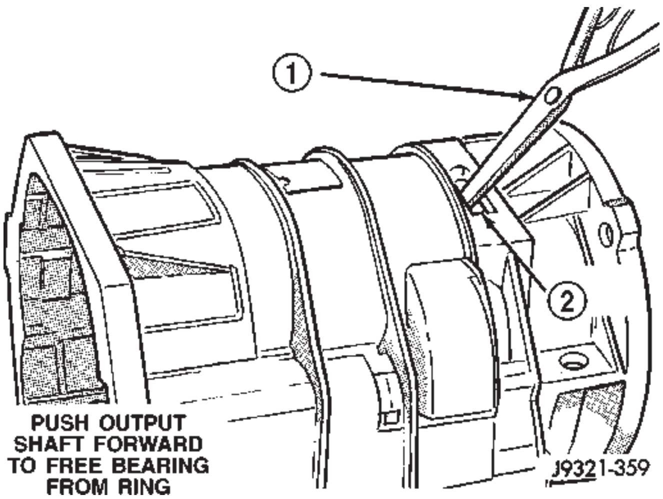

*Fig. 130 Releasing Bearing From Locating Ring*

1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS

2 - ACCESS HOLE

(6) Lift gear case up and off geartrain assembly (Fig. 131).

(7) Remove snap-ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 132).

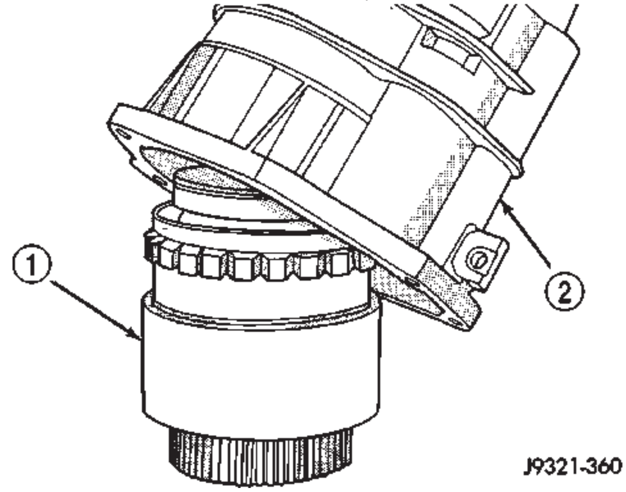

*Fig. 131 Removing Gear Case From Geartrain Assembly*

1 - GEARTRAIN ASSEMBLY

2 - GEAR CASE

OVERDRIVE UNIT (Continued)

### DIRECT CLUTCH, HUB AND SPRING

**WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(1) Mount geartrain assembly in shop press (Fig. 133).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 133). Support output shaft flange with steel press plates as shown and center assembly under press ram.

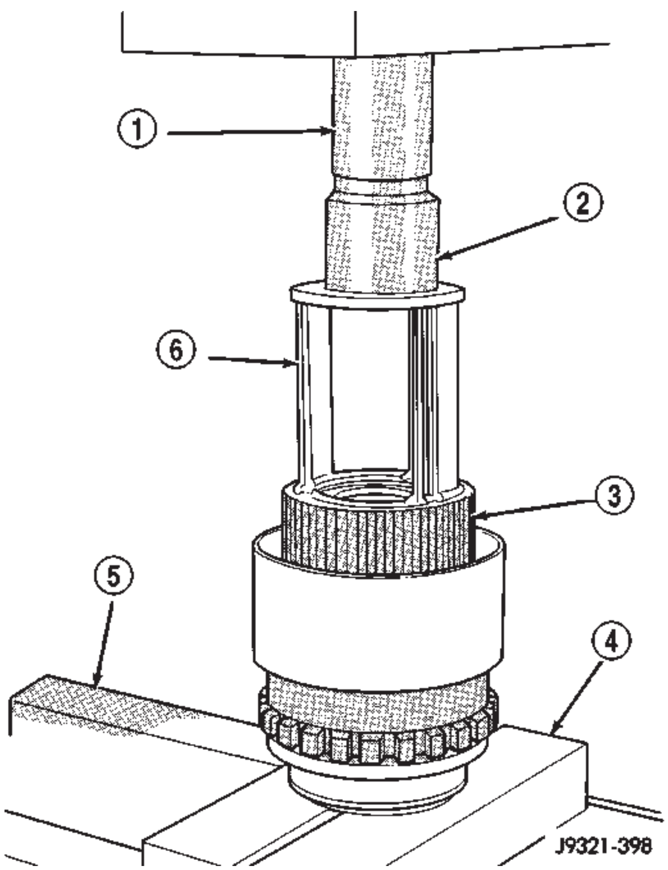

*Fig. 133 Geartrain Mounted In Shop Press*

1 - PRESS RAM
2 - SPECIAL TOOL C-3995-A (OR SIMILAR TOOL)
3 - CLUTCH HUB
4 - PLATES
5 - PRESS BED
6 - SPECIAL TOOL 6227-1

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 133).

(4) Remove direct clutch pack snap-ring (Fig. 134).

(5) Remove direct clutch hub retaining ring (Fig. 135).

(6) Release press load slowly and completely (Fig. 136).

(7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 136).

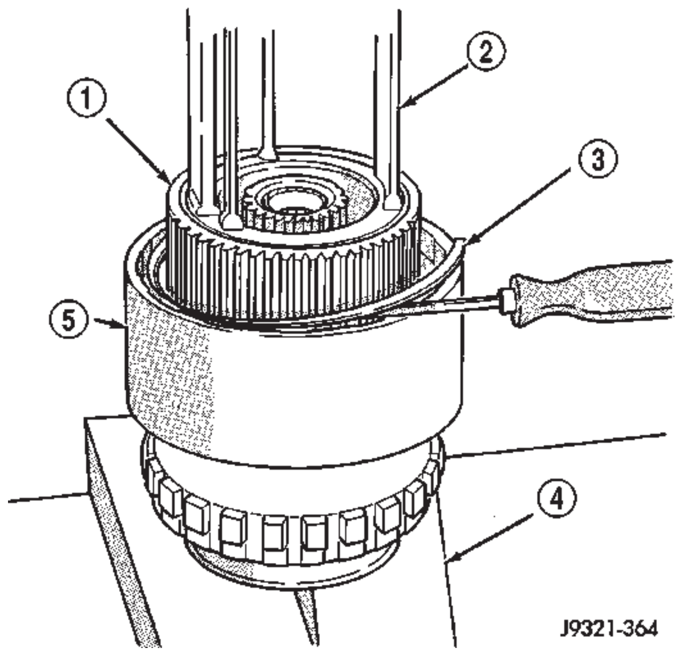

*Fig. 134 Direct Clutch Pack Snap-Ring Removal*

1 - CLUTCH HUB
2 - SPECIAL TOOL 6227-1
3 - DIRECT CLUTCH PACK SNAP-RING
4 - PRESS PLATES
5 - CLUTCH DRUM

3 - DIRECT CLUTCH PACK

## GEARTRAIN

(1) Remove direct clutch hub and spring (Fig. 137).

(2) Remove sun gear and spring plate. Then remove planetary thrust bearing and planetary gear (Fig. 138).

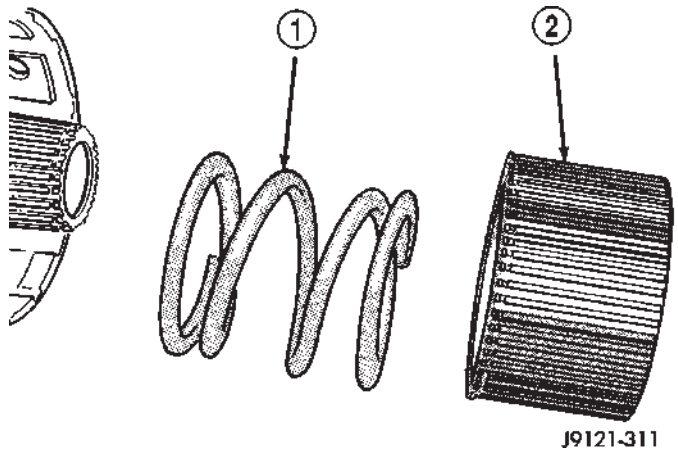

***Fig. 137 Direct Clutch Hub And Spring Removal***

1 - DIRECT CLUTCH SPRING
2 - DIRECT CLUTCH HUB

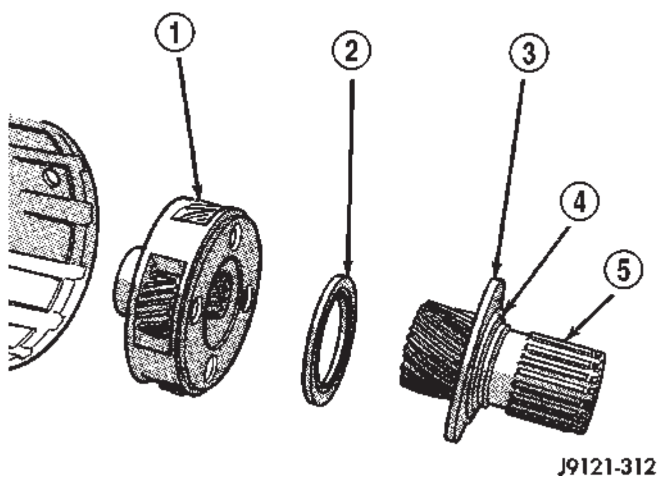

***Fig. 138 Removing Sun Gear, Thrust Bearing And Planetary Gear***

1 - PLANETARY GEAR
2 - PLANETARY THRUST BEARING
3 - CLUTCH SPRING PLATE
4 - SPRING PLATE SNAP-RING
5 - SUN GEAR

OVERDRIVE UNIT (Continued)

(3) Remove overrunning clutch assembly with expanding type snap-ring pliers (Fig. 139). Insert pliers into clutch hub. Expand pliers to grip hub splines and remove clutch with counterclockwise, twisting motion.

(4) Remove thrust bearing from overrunning clutch hub.

(5) Remove overrunning clutch from hub.

(6) Mark position of annulus gear and direct clutch drum for assembly alignment reference (Fig. 140). Use small center punch or scriber to make alignment marks.

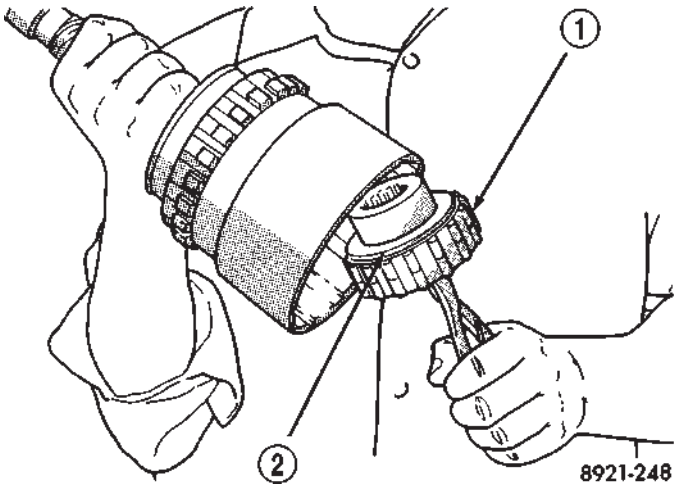

***Fig. 139 Overrunning Clutch***

1 - OVERRUNNING CLUTCH
2 - NEEDLE BEARING

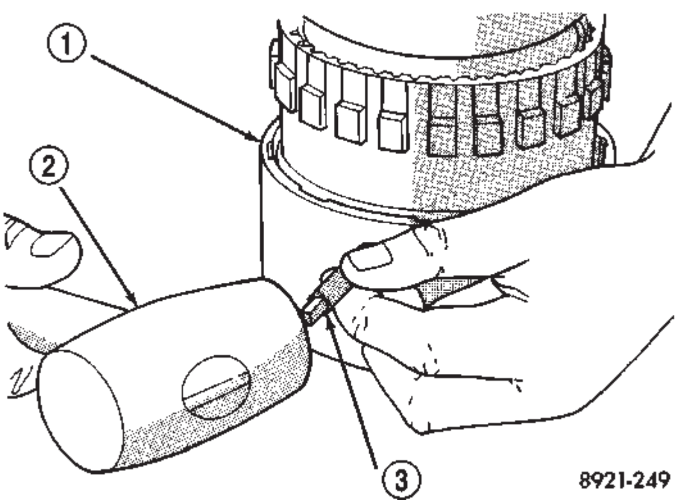

***Fig. 140 Marking Direct Clutch Drum And Annulus Gear For Assembly Alignment***

1 - DIRECT CLUTCH DRUM
2 - HAMMER
3 - PUNCH

(7) Remove direct clutch drum rear retaining ring (Fig. 141).

(8) Remove direct clutch drum outer retaining ring (Fig. 142).

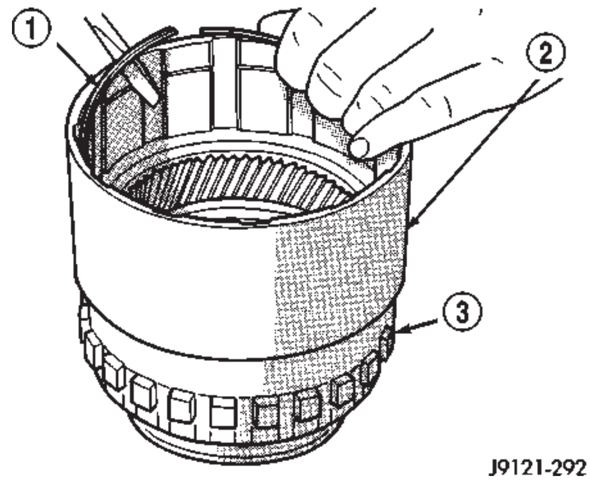

***Fig. 141 Clutch Drum Inner Retaining Ring Removal***

1 - INNER RETAINING RING
2 - DIRECT CLUTCH DRUM
3 - ANNULUS GEAR

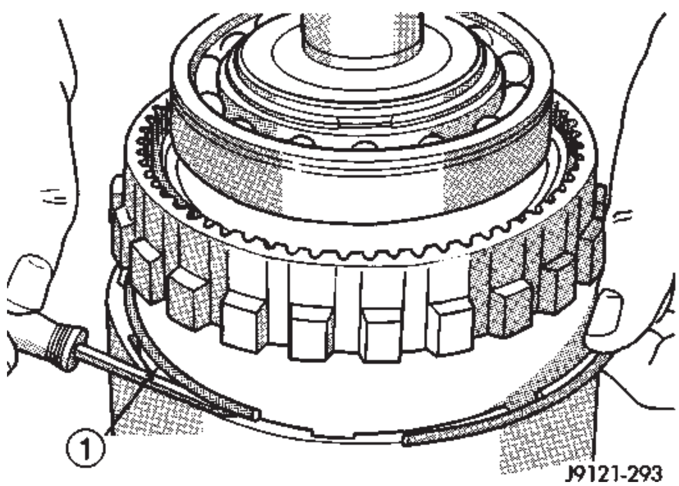

***Fig. 142 Clutch Drum Outer Retaining Ring Removal***

1 - OUTER RETAINING RING

OVERDRIVE UNIT (Continued)

(9) Mark annulus gear and output shaft for assembly alignment reference (Fig. 143). Use punch or scriber to mark gear and shaft.

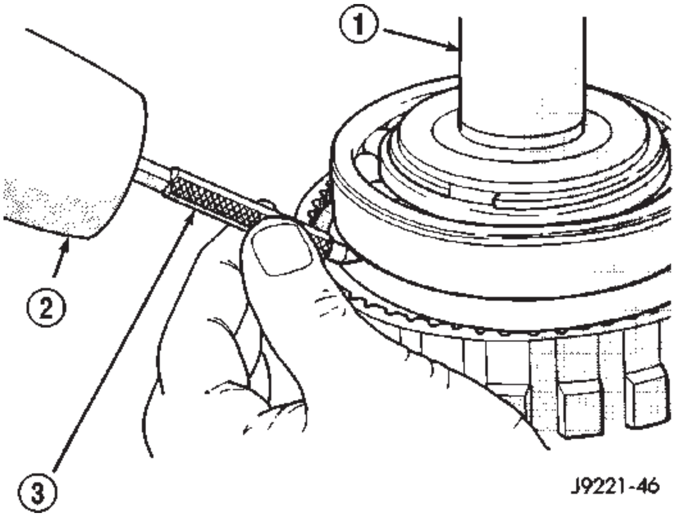

*Fig. 143 Marking Annulus Gear And Output Shaft For Assembly Alignment*

1 - OUTPUT SHAFT
2 - HAMMER
3 - PUNCH

(10) Remove snap-ring that secures annulus gear on output shaft (Fig. 144). Use two screwdrivers to unseat and work snap-ring out of groove as shown.

(11) Remove annulus gear from output shaft (Fig. 145). Use rawhide or plastic mallet to tap gear off shaft.

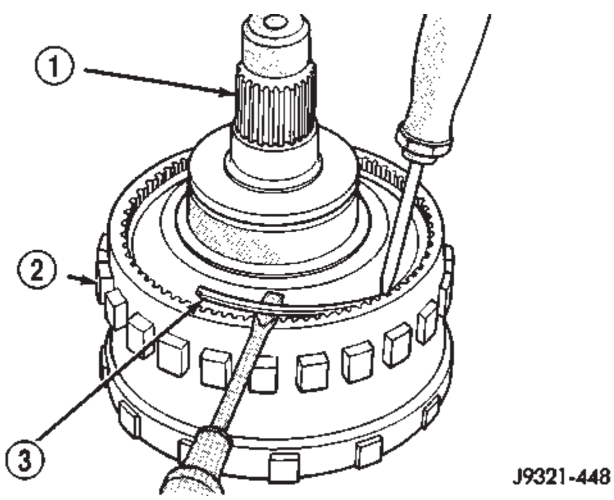

*Fig. 144 Annulus Gear Snap-Ring Removal*

1 - OUTPUT SHAFT
2 - ANNULUS GEAR
3 - SNAP-RING

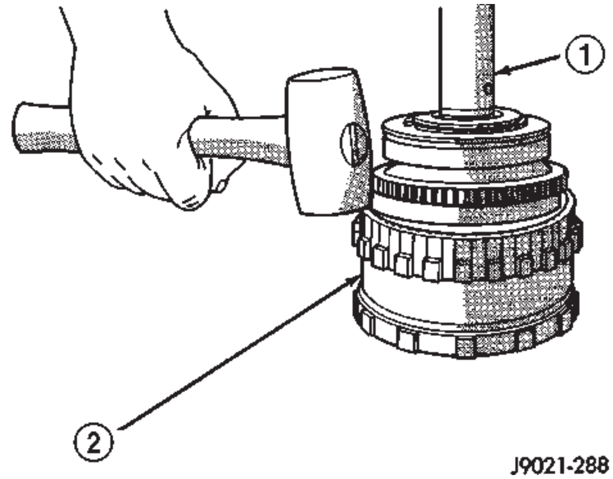

*Fig. 145 Annulus Gear Removal*

1 - OUTPUT SHAFT
2 - ANNULUS GEAR

## GEAR CASE AND PARK LOCK

(1) Remove locating ring from gear case.

(2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.

(3) Remove reaction plug snap-ring and remove reaction plug.

(4) Remove output shaft seal.

## CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

## INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace

OVERDRIVE UNIT (Continued)

the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

## ASSEMBLY

### GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 146). Lubricate bushings with petroleum jelly, or transmission fluid.

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 147).

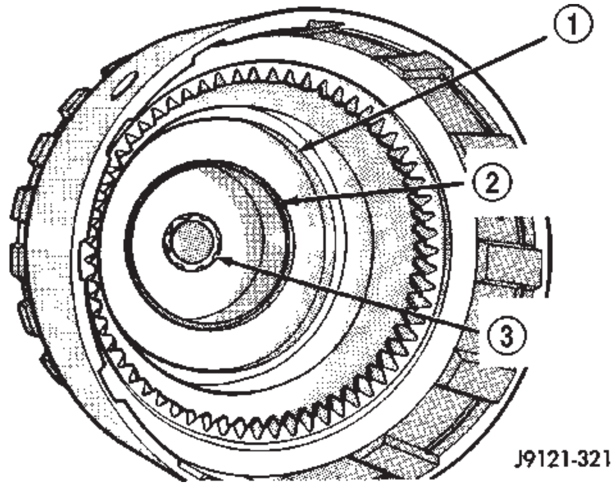

***Fig. 146 Output Shaft Pilot Bushing***

1 - OUTPUT SHAFT HUB
2 - OVERRUNNING CLUTCH HUB BUSHING
3 - INTERMEDIATE SHAFT PILOT BUSHING

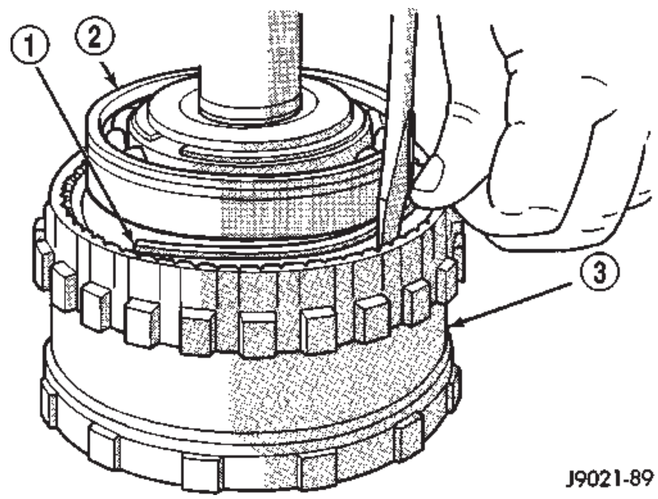

***Fig. 147 Annulus Gear Installation***

1 - SNAP-RING
2 - OUTPUT SHAFT FRONT BEARING
3 - ANNULUS GEAR

OVERDRIVE UNIT (Continued)

(4) Align and install clutch drum on annulus gear (Fig. 148). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 148).

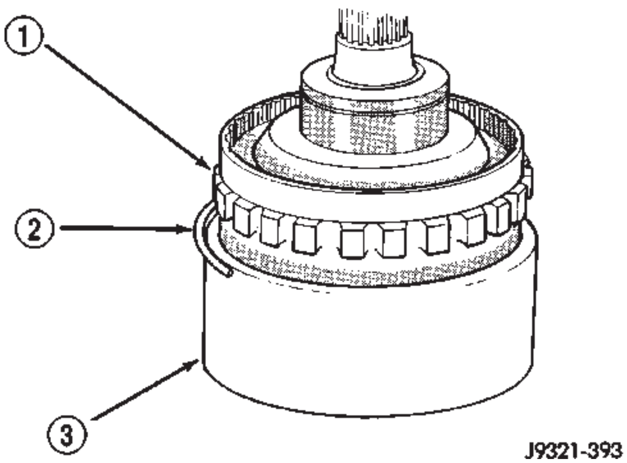

***Fig. 148 Clutch Drum And Outer Retaining Ring Installation***

1 - ANNULUS GEAR
2 - OUTER SNAP-RING
3 - CLUTCH DRUM

(6) Slide clutch drum forward and install inner retaining ring (Fig. 149).

(7) Install rear bearing and snap-ring on output shaft (Fig. 150). Be sure locating ring groove in bearing is toward rear.

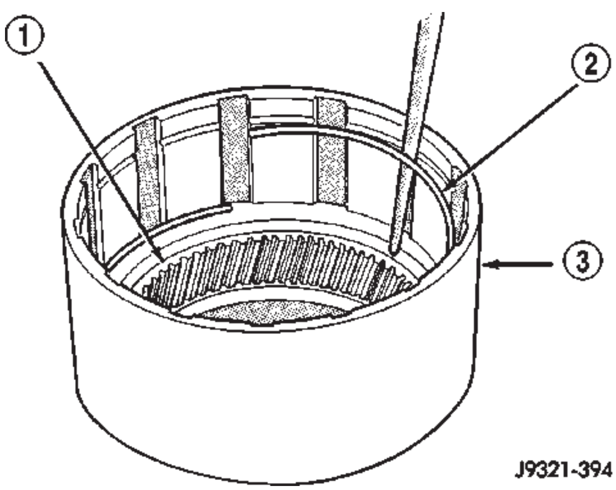

***Fig. 149 Clutch Drum Inner Retaining Ring Installation***

1 - ANNULUS GEAR
2 - INNER SNAP-RING
3 - CLUTCH DRUM

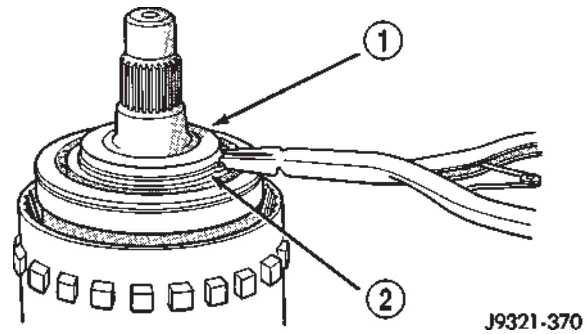

***Fig. 150 Rear Bearing And Snap-Ring Installation***

1 - REAR BEARING
2 - SNAP-RING

(8) Install overrunning clutch on hub (Fig. 151). Note that clutch only fits one-way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one-way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

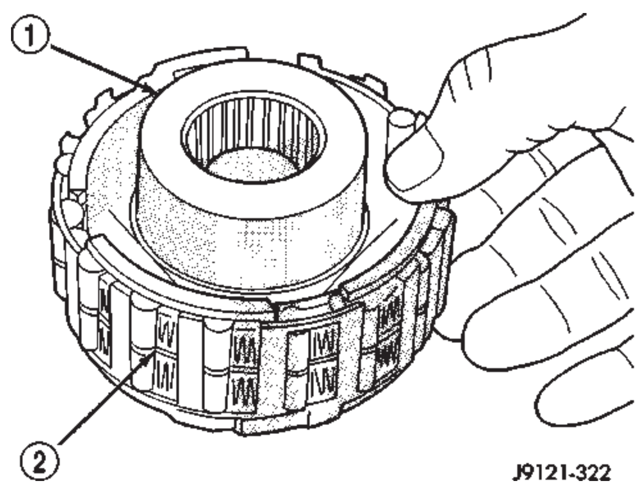

***Fig. 151 Assembling Overrunning Clutch And Hub***

1 - CLUTCH HUB
2 - OVERRUNNING CLUTCH

OVERDRIVE UNIT (Continued)

(10) Install overrunning clutch in output shaft (Fig. 152). Insert snap-ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 153). Be sure planetary pinions are fully seated in annulus gear before proceeding.

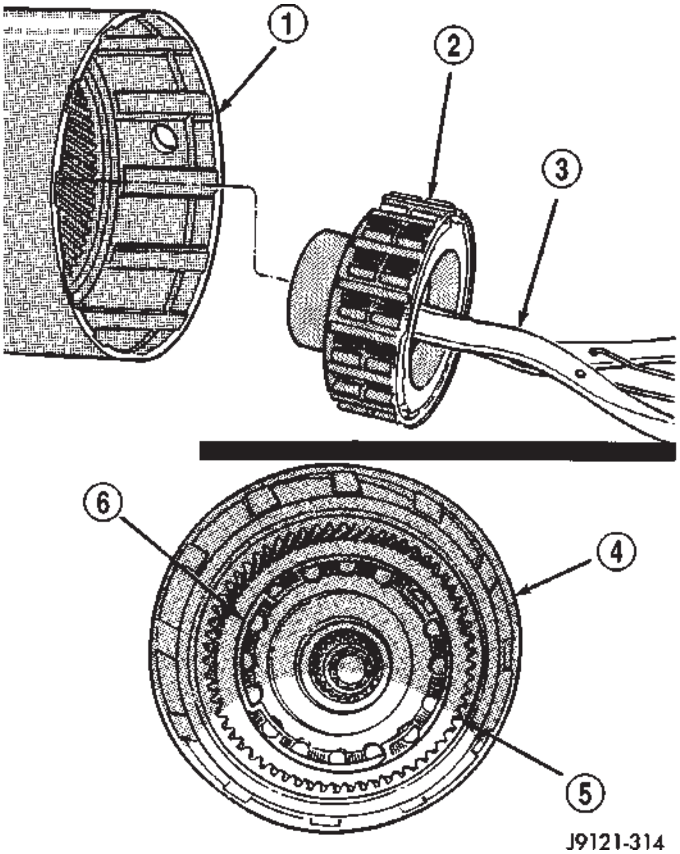

***Fig. 152 Overrunning Clutch Installation***

1 - CLUTCH DRUM
2 - OVERRUNNING CLUTCH ASSEMBLY
3 - EXPANDING-TYPE SNAP-RING PLIERS
4 - CLUTCH DRUM
5 - ANNULUS GEAR
6 - OVERRUNNING CLUTCH ASSEMBLY SEATED IN OUTPUT SHAFT

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

(13) Install planetary thrust bearing on sun gear (Fig. 154). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one-way only. If it does not seat squarely against spring plate, remove and reposition bearing.

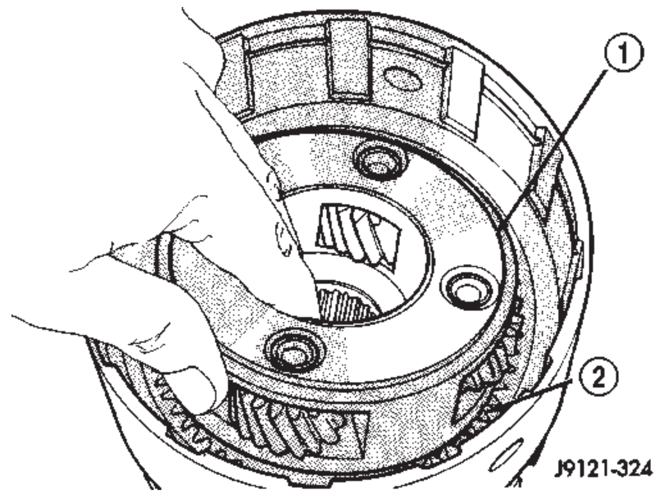

***Fig. 153 Planetary Gear Installation***

1 - PLANETARY GEAR
2 - ANNULUS GEAR

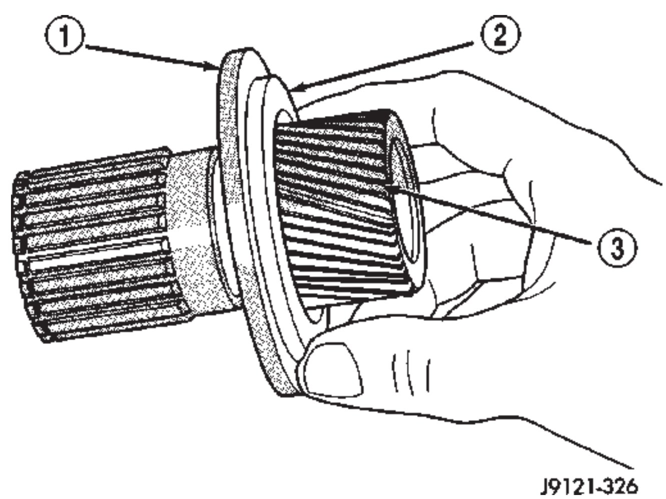

***Fig. 154 Planetary Thrust Bearing Installation***

1 - SPRING PLATE
2 - PLANETARY THRUST BEARING
3 - SUN GEAR

OVERDRIVE UNIT (Continued)

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 155). Be sure sun gear and thrust bearing are fully seated before proceeding.

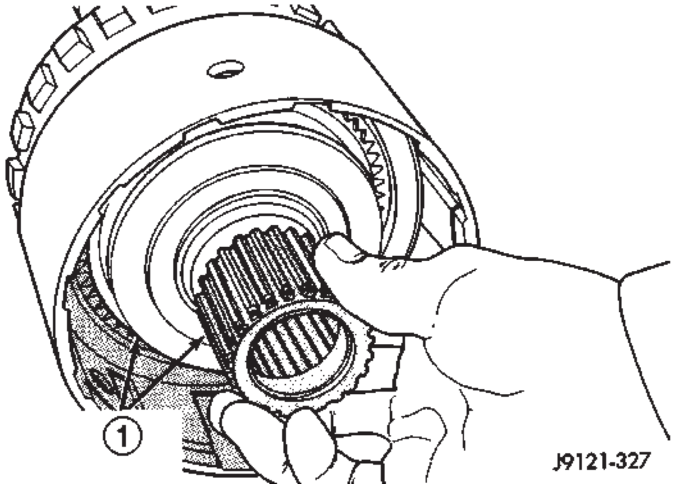

***Fig. 155 Sun Gear Installation***

1 - SUN GEAR AND SPRING PLATE ASSEMBLY

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 156). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 157). Be sure spring is properly seated on spring plate.

**NOTE: The 44RE transmission has 8 direct clutch discs and 7 clutch plates.**

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 158).

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 159).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 160).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 161). Be sure hub is started on sun gear splines before proceeding.

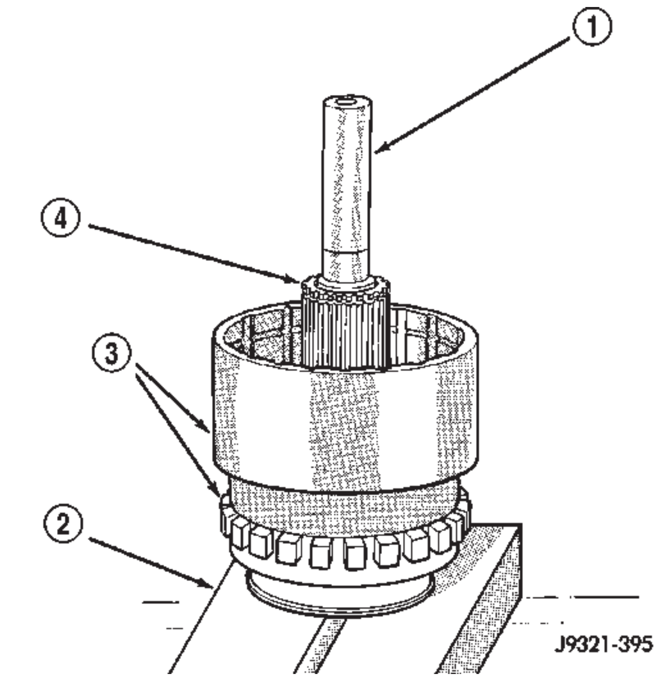

***Fig. 156 Alignment Tool Installation***

1 - SPECIAL TOOL 6227-2

2 - CLUTCH PACK
3 - BE SURE SHOULDER SIDE OF PLATE FACES UPWARD

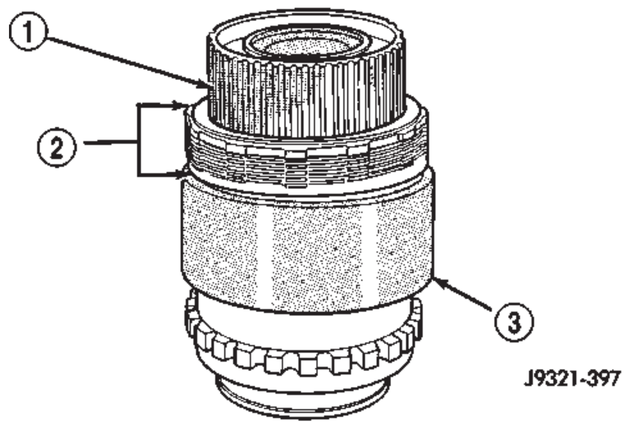

*Fig. 161 Direct Clutch*

1 - CLUTCH HUB
2 - DIRECT CLUTCH PACK
3 - CLUTCH DRUM

**WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap-ring (Fig. 162). Be very sure snap-ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 163). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

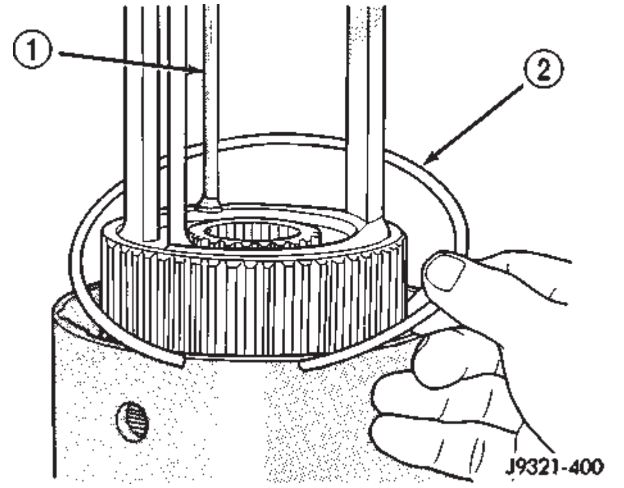

*Fig. 162 Direct Clutch Pack Snap-Ring Installation*

1 - SPECIAL TOOL 6227-1
2 - DIRECT CLUTCH PACK SNAP-RING

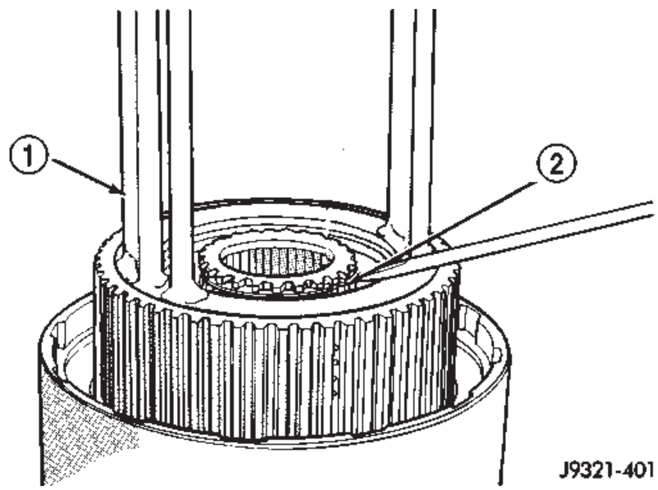

*Fig. 163 Clutch Hub Retaining Ring Installation*

1 - SPECIAL TOOL 6227-1

OVERDRIVE UNIT (Continued)

## GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 164). Be sure pin is seated in hole in case before installing snap-ring.

(4) Install reaction plug snap-ring (Fig. 165). Compress snap ring only enough for installation; do not distort it.

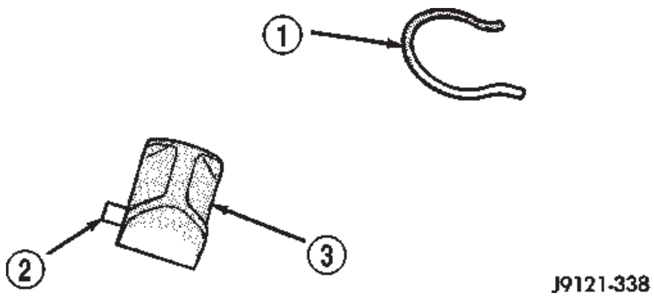

***Fig. 164 Reaction Plug Locating Pin And Snap-Ring***

1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)
2 - LOCATING PIN
3 - PARK LOCK REACTION PLUG

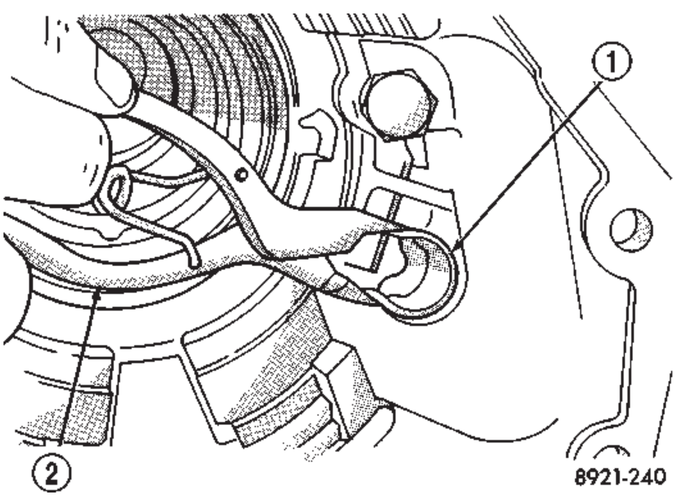

***Fig. 165 Reaction Plug And Snap-Ring Installation***

1 - REACTION PLUG SNAP-RING
2 - SNAP-RING PLIERS

(5) Install new seal in gear case. On 4x4 gear case, use Tool Handle C-4171 and Installer C-3860-A to seat seal in case. On 4 x 2 gear case, use same Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 166).

(7) Support geartrain on Tool 6227-1 (Fig. 167). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 167).

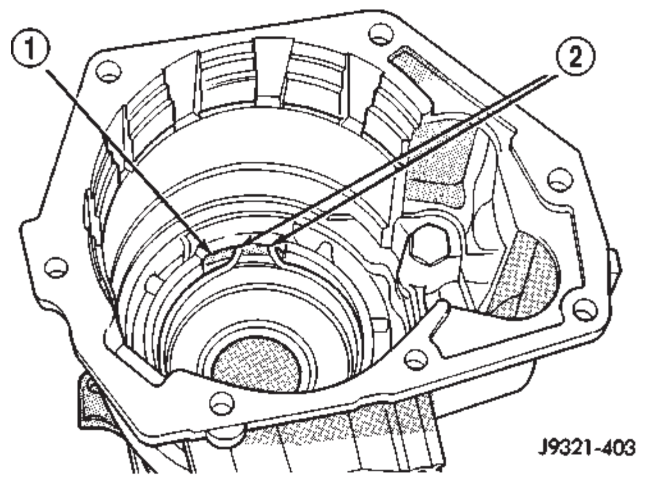

***Fig. 166 Correct Rear Bearing Locating Ring Position***

1 - CASE ACCESS HOLE
2 - TAB ENDS OF LOCATING RING

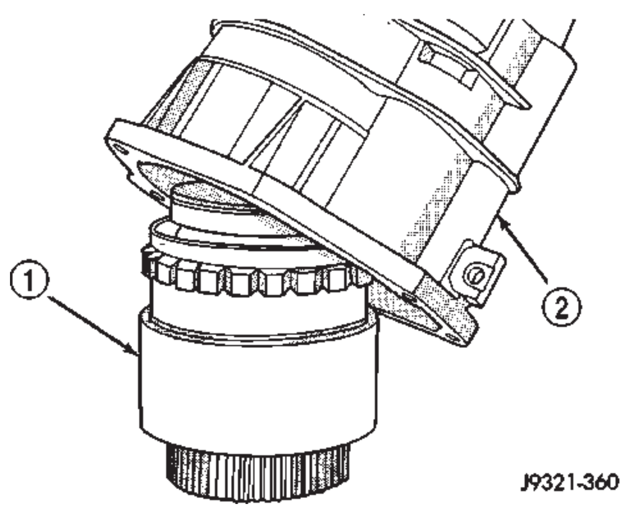

***Fig. 167 Overdrive Gear Case Installation***

1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

OVERDRIVE UNIT (Continued)

(9) Expand front bearing locating ring with snap-ring pliers (Fig. 168). Then slide case downward until locating ring locks in bearing groove and release snap-ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 169).

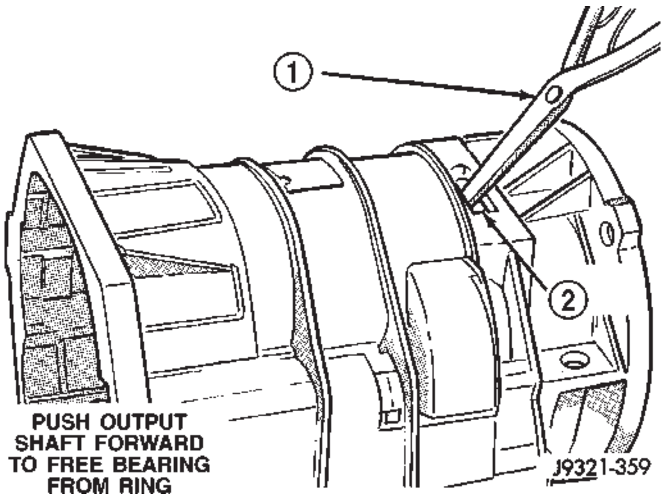

***Fig. 168 Seating Locating Ring In Rear Bearing***

1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

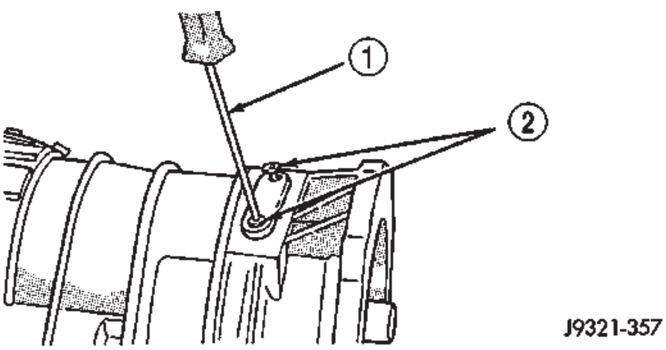

***Fig. 169 Locating Ring Access Cover And Gasket Installation***

1 - TORX™ SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

## OVERDRIVE CLUTCH

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 170).

(2) Install wave spring on top of reaction ring (Fig. 171). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

**NOTE: The 44RE transmission has 4 overdrive clutch discs and 3 plates.**

(3) Assemble overdrive clutch pack.

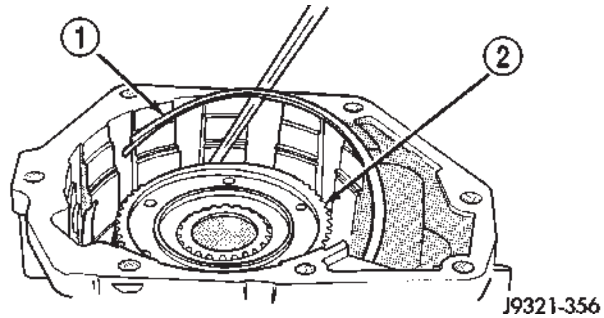

***Fig. 170 Overdrive Clutch Reaction Ring Installation***

1 - REACTION RING
2 - CLUTCH HUB

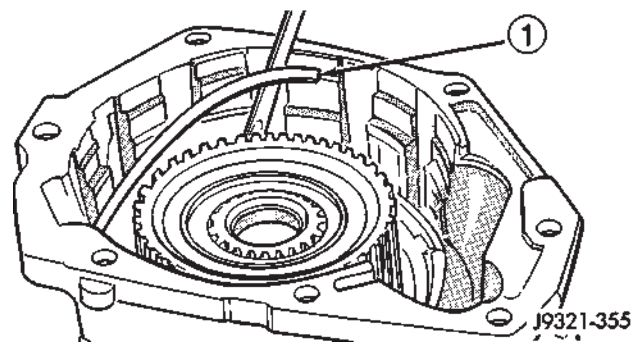

***Fig. 171 Overdrive Clutch Wave Spring Installation***

1 - WAVE SPRING

(4) Install overdrive clutch reaction plate first.

**NOTE: The reaction plate is the same thickness as the pressure plate in a 44RE transmission.**

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 172).

## INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

OVERDRIVE UNIT (Continued)

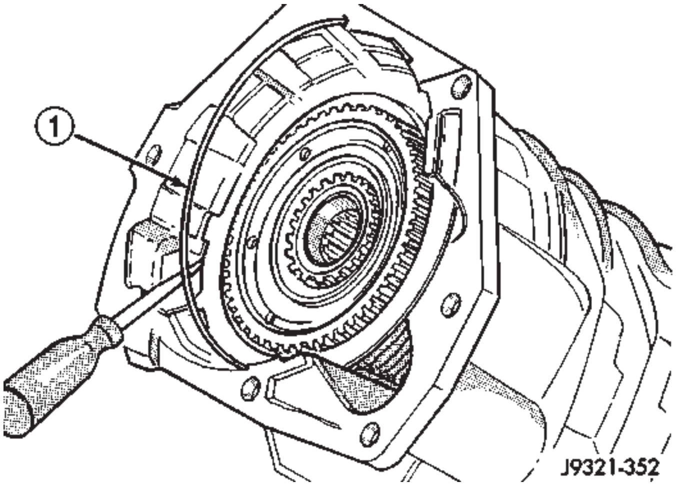

*Fig. 172 Overdrive Clutch Pack Retaining Ring Installation*

1 - OVERDRIVE CLUTCH PACK RETAINING RING

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 173). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 173).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 174).

(e) Remove Gauge Alignment Tool 6312.

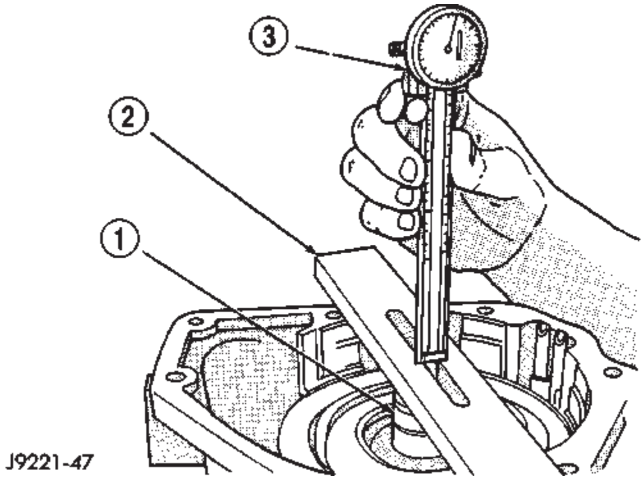

*Fig. 173 Shaft End Play Measurement*

1 - SPECIAL TOOL 6312
2 - SPECIAL TOOL 6311
3 - SPECIAL TOOL C-4962

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| .7336 - .7505 | .158 - .159 |
| .7506 - .7675 | .175 - .176 |
| .7676 - .7855 | .193 - .194 |
| .7856 - .8011 | .211 - .212 |

J9121-341

*Fig. 174 Intermediate Shaft End Play Spacer Selection*

## OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 175).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 176).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

## OVERDRIVE PISTON

(1) Install new seals on over drive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

OVERDRIVE UNIT (Continued)

J9121-342

*Fig. 176 Overdrive Piston Thrust Plate Selection*

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case (Fig. 119).

## INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 177).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

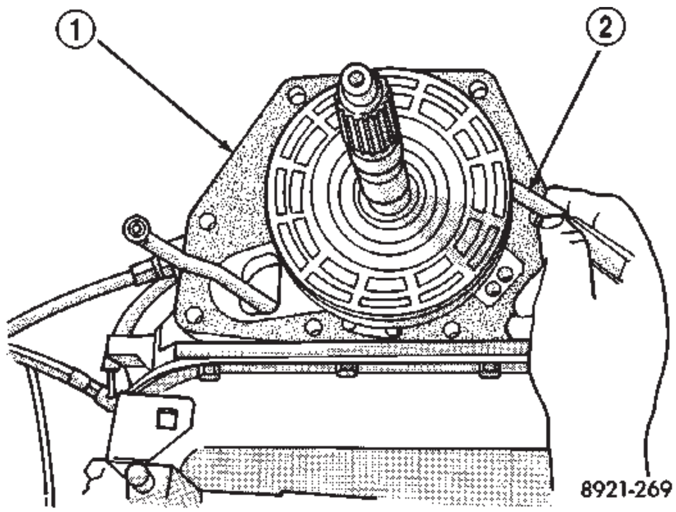

*Fig. 177 Trimming Overdrive Case Gasket*

1 - GASKET
2 - SHARP KNIFE

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 178).

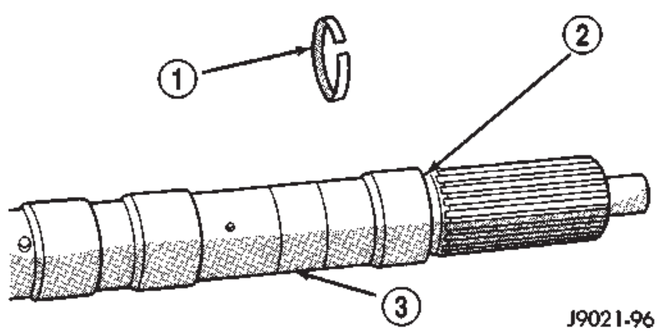

*Fig. 178 Intermediate Shaft Selective Spacer Location*

1 - SELECTIVE SPACER
2 - SPACER GROOVE
3 - INTERMEDIATE SHAFT

OVERDRIVE UNIT (Continued)

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

**CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.**

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

# OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

## DESCRIPTION

The overrunning clutch (Fig. 179) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

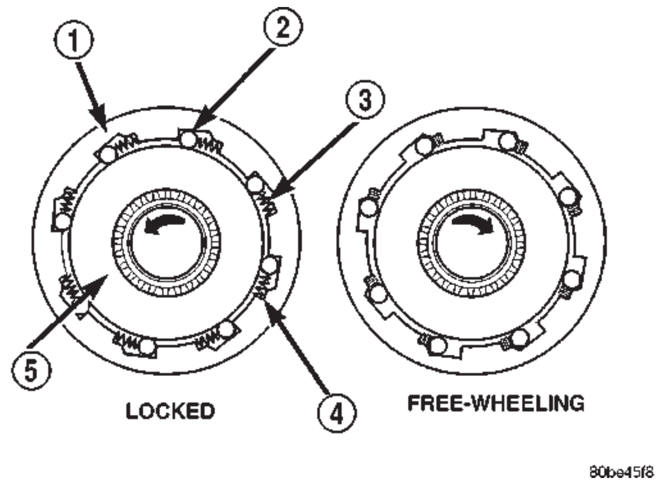

*Fig. 179 Overrunning Clutch*

1 - OUTER RACE (CAM)
2 - ROLLER
3 - SPRING
4 - SPRING RETAINER
5 - INNER RACE (HUB)

## OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a free-wheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

## DISASSEMBLY

**NOTE: To service the overrunning clutch cam and the overdrive piston retainer, the transmission geartrain and the overdrive unit must be removed from the transmission.**

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

(1) Remove the overdrive piston (Fig. 180).
(2) Remove the overdrive piston retainer bolts.
(3) Remove overdrive piston retainer.
(4) Remove case gasket.
(5) Mark the position of the overrunning clutch cam in the case (Fig. 181).
(6) Remove the overrunning clutch cam bolts.
(7) Remove the overrunning clutch cam.

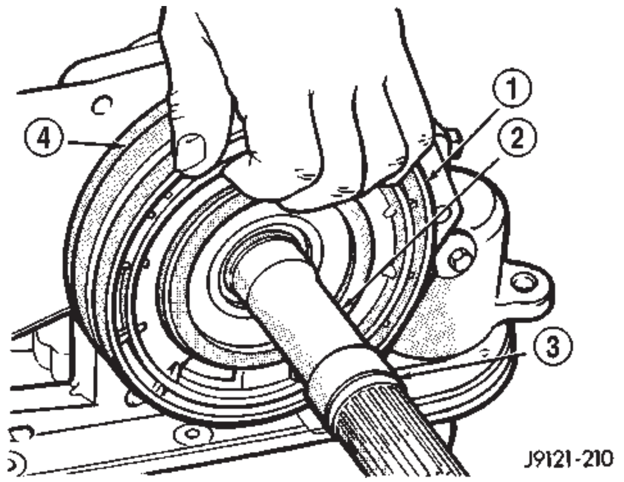

*Fig. 180 Overdrive Piston Removal*

1 - OVERDRIVE CLUTCH PISTON
2 - INTERMEDIATE SHAFT
3 - SELECTIVE SPACER
4 - PISTON RETAINER

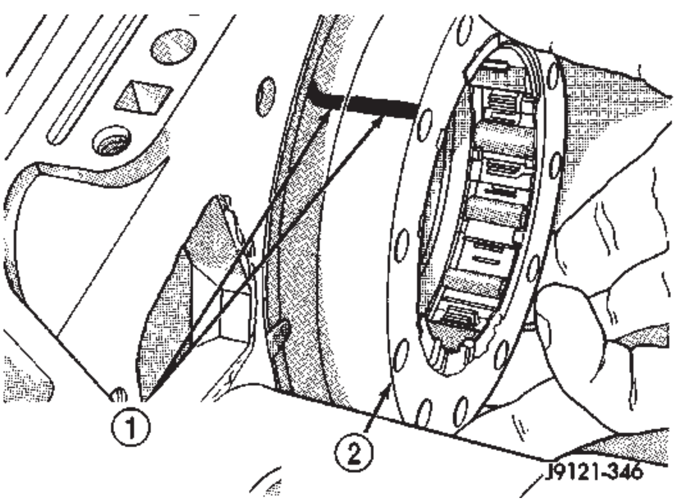

*Fig. 181 Overrunning Clutch Cam Removal*

1 - ALIGN MARKS IDENTIFYING NON-THREADED HOLE IN CAM AND CASE
2 - OVERRUNNING CLUTCH ASSEMBLY

## CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

## ASSEMBLY

(1) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 182). This hole must align with blank area in clutch cam bolt circle (Fig. 183). Mark hole location on clutch cam and blank area in case with grease pencil, paint stripe, or scribe mark for assembly reference.
(2) Mark location of non-threaded hole in clutch cam and blank area in bolt circle with grease pencil.
(3) Align and install overrunning clutch and cam in case (Fig. 184). Be sure cam is correctly installed. Bolt holes in cam are slightly countersunk on one side. Be sure this side of cam faces rearward (toward piston retainer).

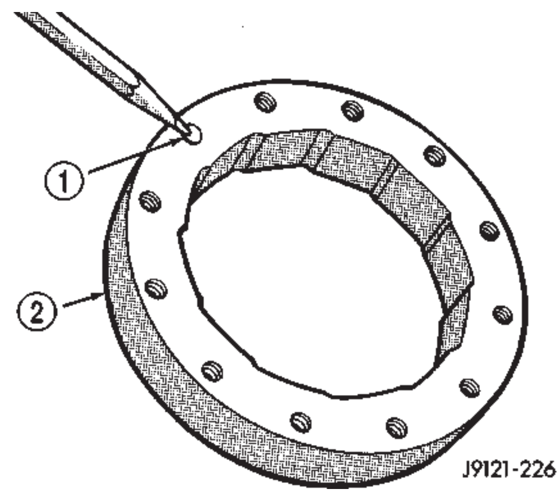

*Fig. 182 Location Of Non-Threaded Hole In Clutch Cam*

1 - NON-THREADED HOLE
2 - OVERRUNNING CLUTCH CAM

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

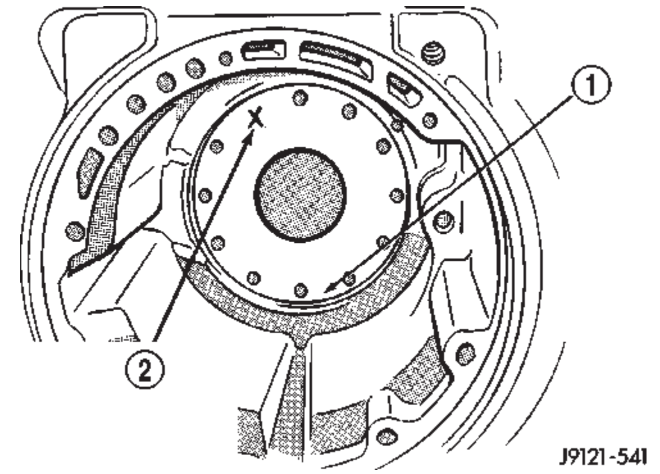

*Fig. 183 Location Of Blank Area In Clutch Cam Bolt Circle*

1 - OVERRUNNING CLUTCH CAM SEAT IN CASE

2 - NON-THREADED HOLE IN CLUTCH CAM ALIGNS HERE (BLANK AREA) OF SEAT

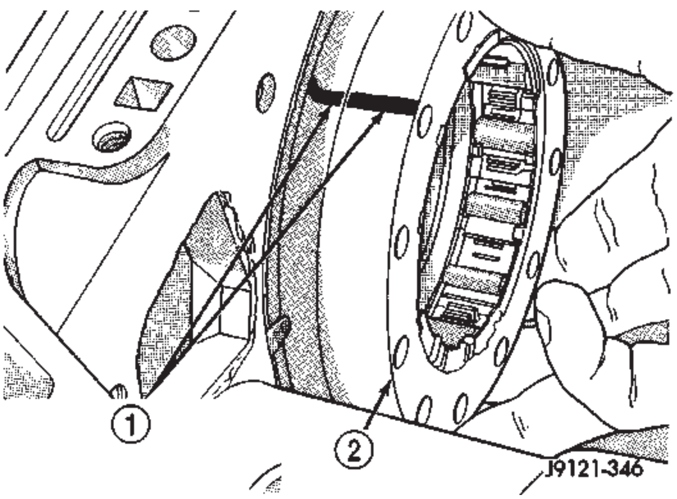

*Fig. 184 Overrunning Clutch Installation*

1 - ALIGN MARKS IDENTIFYING NON-THREADED HOLE IN CAM AND CASE

2 - OVERRUNNING CLUTCH ASSEMBLY

(4) Verify that non-threaded hole in clutch cam is properly aligned. Check alignment by threading a bolt into each bolt hole. Adjust clutch cam position if necessary.

(5) Install and tighten overrunning clutch cam bolts to 17 N·m (13 ft. lbs.) torque. Note that clutch cam bolts are shorter than piston retainer bolts.

(6) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 185). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

(7) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 186). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

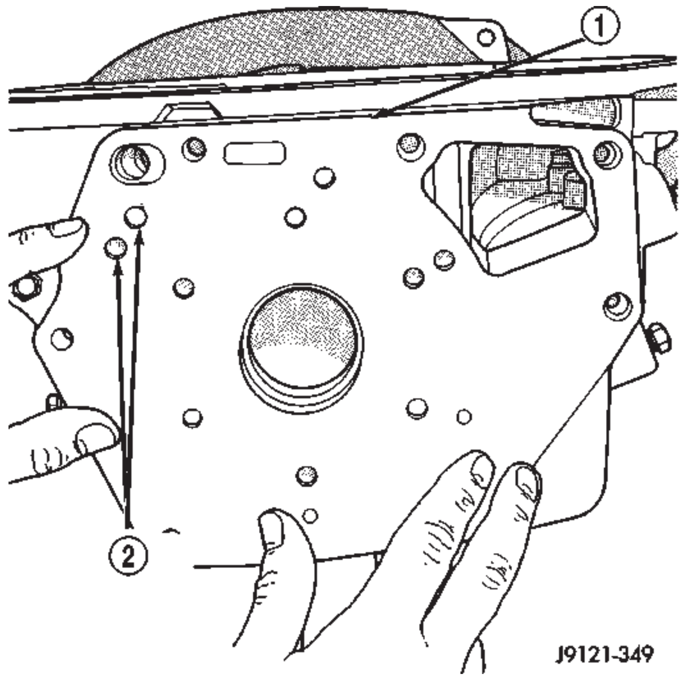

*Fig. 185 Installing/Aligning Case Gasket*

1 - CASE GASKET

2 - BE SURE GOVERNOR TUBE FEED HOLES IN CASE AND GASKET ARE ALIGNED

(8) Install new seals on over drive piston.

(9) Stand transmission case upright on bellhousing.

(10) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(11) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(12) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

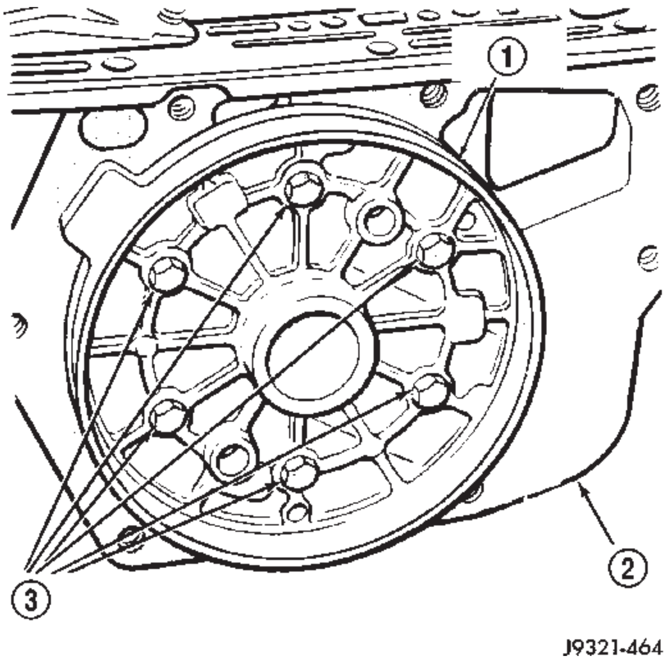

*Fig. 186 Aligning Overdrive Piston Retainer*

1 - PISTON RETAINER
2 - GASKET
3 - RETAINER BOLTS

**NOTE: Install the remaining transmission components and the overdrive unit.**

# PARK/NEUTRAL POSITION SWITCH

## DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

### SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

## REMOVAL

(1) Raise vehicle and position drain pan under switch.
(2) Disconnect switch wires.
(3) Remove switch from case.

## INSTALLATION

(1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 187).

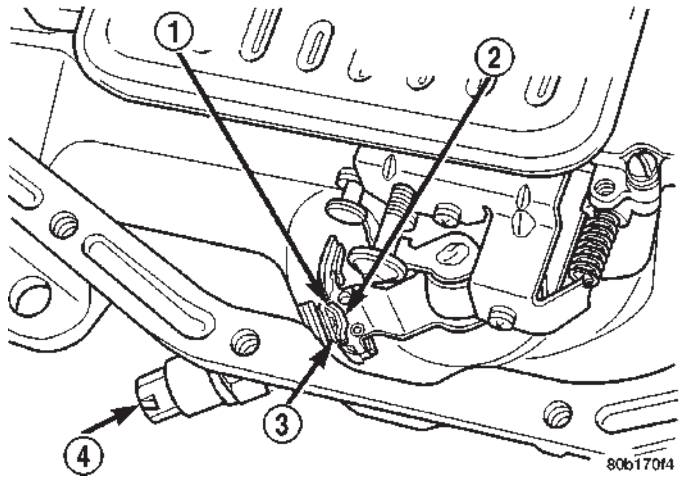

*Fig. 187 Park/Neutral Position Switch*

1 - NEUTRAL CONTACT
2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
3 - PARK CONTACT
4 - SWITCH

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.
(3) Test continuity of new switch with 12V test lamp.
(4) Connect switch wires and lower vehicle.
(5) Top off transmission fluid level.

# PISTONS

## DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

PISTONS (Continued)

## OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

## PRESSURE

Pressure (Fig. 188) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

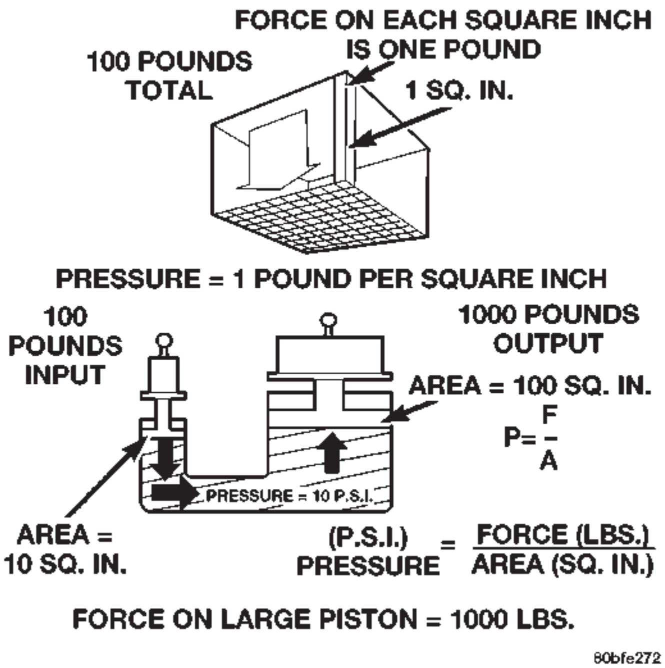

*Fig. 188 Force and Pressure Relationship*

## PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 189) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

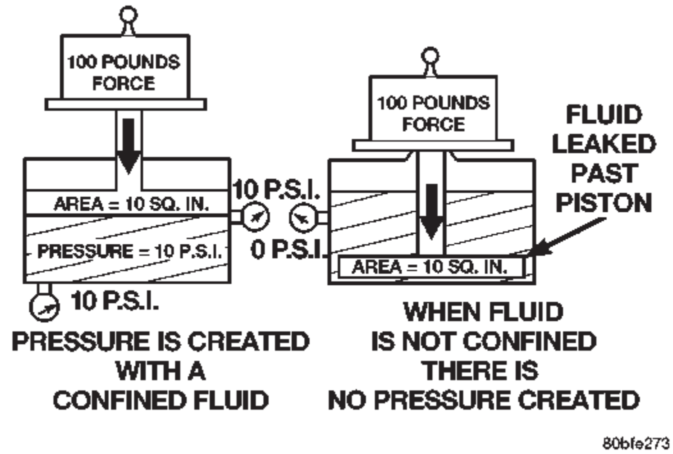

*Fig. 189 Pressure on a Confined Fluid*

## FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 190), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 190), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

PISTONS (Continued)

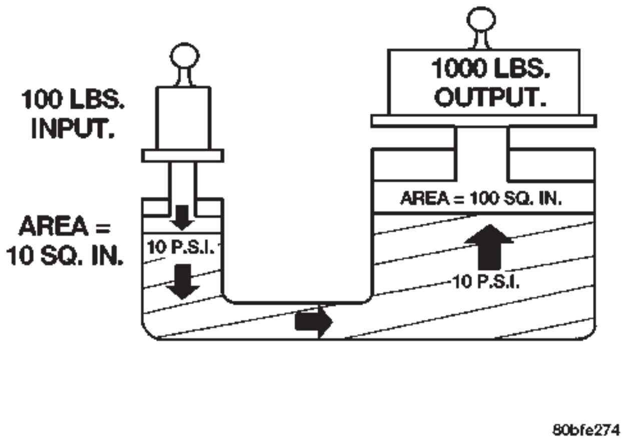

*Fig. 190 Force Multiplication*

### PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 191) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

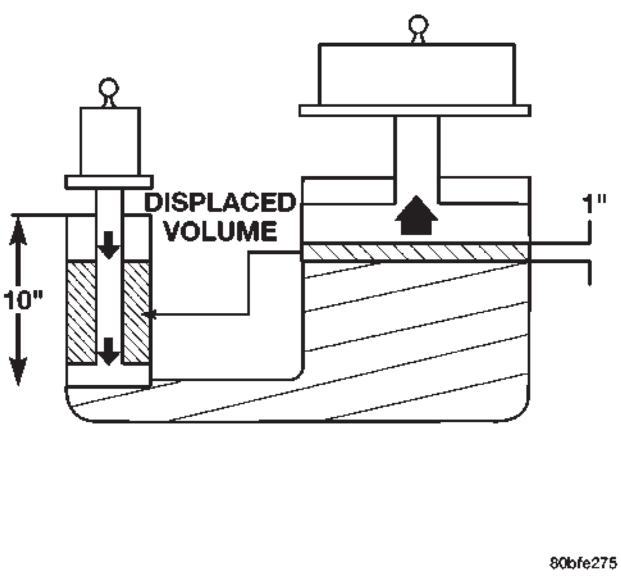

*Fig. 191 Piston Travel*

## PLANETARY GEARTRAIN/ OUTPUT SHAFT

### DESCRIPTION

The planetary gearsets (Fig. 192) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

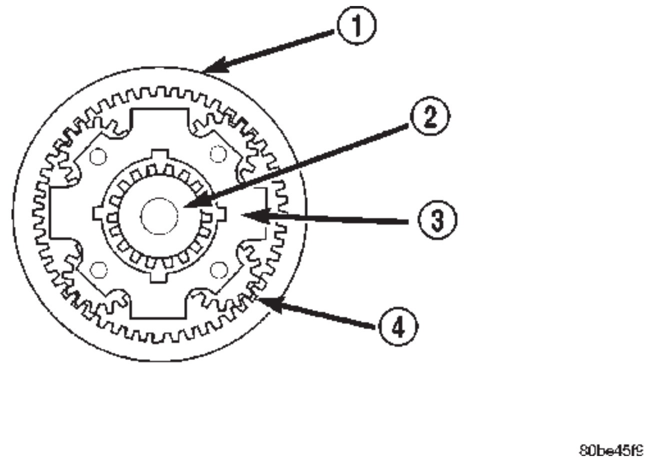

*Fig. 192 Planetary Gearset*

1 - ANNULUS GEAR
2 - SUN GEAR
3 - PLANET CARRIER
4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

**NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.**

### OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

**NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.**

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

## DISASSEMBLY

(1) Remove planetary snap-ring (Fig. 193).

(2) Remove front annulus and planetary assembly from driving shell (Fig. 193).

(3) Remove snap-ring that retains front planetary gear in annulus gear (Fig. 194).

(4) Remove tabbed thrust washer and tabbed thrust plate from hub of front annulus (Fig. 195).

(5) Separate front annulus and planetary gears (Fig. 195).

(6) Remove front planetary gear front thrust washer from annulus gear hub.

(7) Separate and remove driving shell, rear planetary and rear annulus from output shaft (Fig. 196).

(8) Remove front planetary rear thrust washer from driving shell.

(9) Remove tabbed thrust washers from rear planetary gear.

(10) Remove lock ring that retains sun gear in driving shell. Then remove sun gear, spacer and thrust plates.

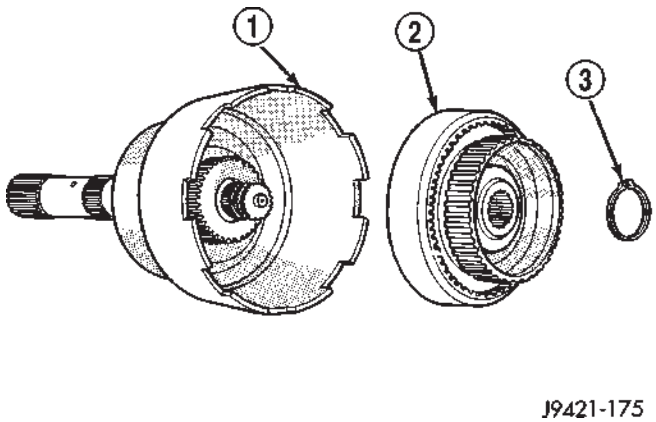

*Fig. 193 Front Annulus And Planetary Assembly Removal*

5 - FRONT PLANETARY

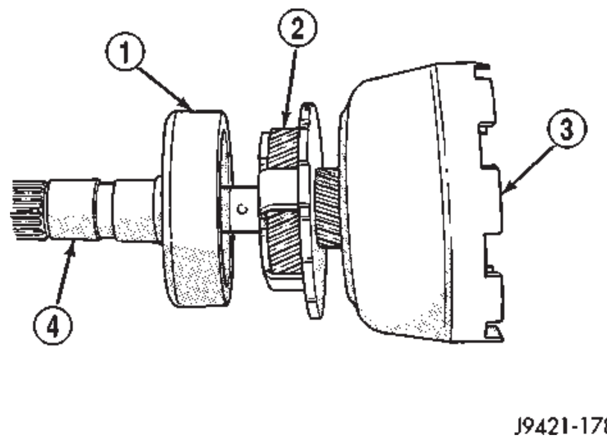

*Fig. 196 Removing Driving Shell, Rear Planetary And Rear Annulus*

1 - REAR ANNULUS
2 - REAR PLANETARY
3 - DRIVING SHELL
4 - OUTPUT SHAFT

## INSPECTION

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

Inspect the geartrain spacers, thrust plates, snap-rings, and thrust washers. Replace any of these parts that are worn, distorted or damaged. Do not attempt to reuse these parts.

The planetary gear thrust washers are different sizes. The large diameter washers go on the front planetary and the smaller washers go on the rear planetary. All the washers have four locating tabs on them. These tabs fit in the holes or slots provided in each planetary gear.

Inspect the output shaft carefully. Pay particular attention to the machined bushing/bearing surfaces on the shaft and the governor valve shaft bore at the shaft rear.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location (especially at the governor valve shaft bore).

The annulus gears can be removed from their supports if necessary. Just remove the snap-rings and separate the two parts when replacement is necessary. In addition, the annulus gear bushings can be replaced if severely worn, or scored. However it is not necessary to replace the bushings if they only exhibit normal wear. Check bushing fit on the output shaft to be sure.

## ASSEMBLY

(1) Lubricate output shaft and planetary components with transmission fluid. Use petroleum jelly to lubricate and hold thrust washers and plates in position.

(2) Assemble rear annulus gear and support if disassembled. Be sure support snap-ring is seated and that shoulder-side of support faces rearward (Fig. 197).

(3) Install rear thrust washer on rear planetary gear. Use enough petroleum jelly to hold washer in place. Also be sure all four washer tabs are properly engaged in gear slots.

(4) Install rear annulus over and onto rear planetary gear (Fig. 197).

(5) Install assembled rear planetary and annulus gear on output shaft (Fig. 198). Verify that assembly is fully seated on shaft.

(6) Install front thrust washer on rear planetary gear (Fig. 199). Use enough petroleum jelly to hold washer on gear. Be sure all four washer tabs are seated in slots.

(7) Install spacer on sun gear (Fig. 200).

(8) Install thrust plate on sun gear (Fig. 201). Note that driving shell thrust plates are interchangeable. Use either plate on sun gear and at front/rear of shell.

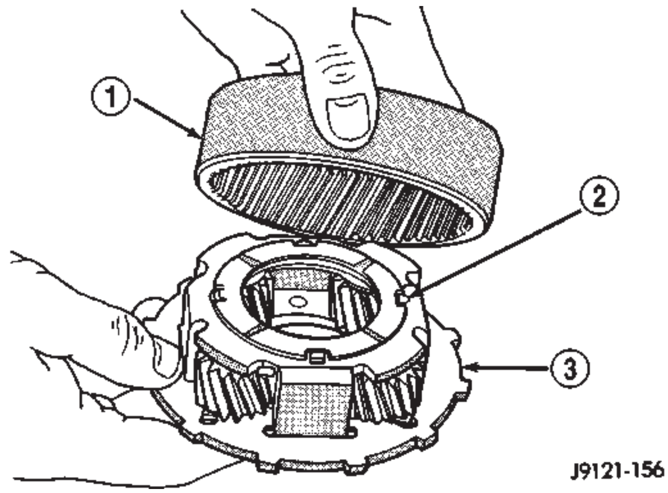

*Fig. 197 Assembling Rear Annulus And Planetary Gear*

1 - REAR ANNULUS GEAR
2 - TABBED THRUST WASHER

2 - SUN GEAR SPACER

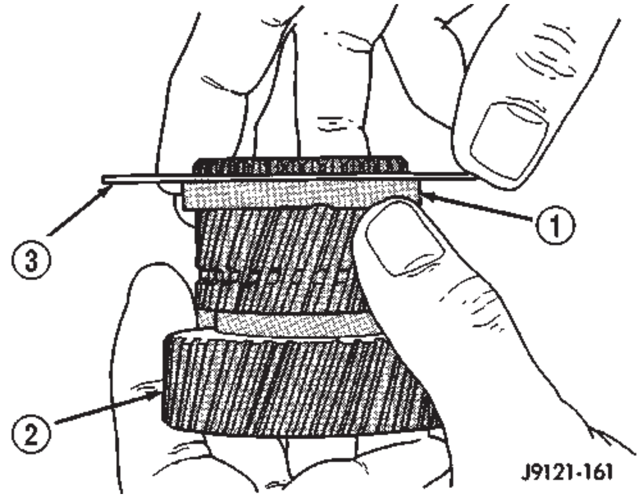

*Fig. 201 Installing Driving Shell Front Thrust Plate On Sun Gear*

1 - SPACER
2 - SUN GEAR
3 - THRUST PLATE

(9) Hold sun gear in place and install thrust plate over sun gear at rear of driving shell (Fig. 202).

(10) Position wood block on bench and support sun gear on block (Fig. 203). This makes it easier to align and install sun gear lock ring. Keep wood block handy as it will also be used for geartrain end play check.

(11) Align rear thrust plate on driving shell and install sun gear lock ring. Be sure ring is fully seated in sun gear ring groove (Fig. 204).

(12) Install assembled driving shell and sun gear on output shaft (Fig. 205).

(13) Install rear thrust washer on front planetary gear (Fig. 206). Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

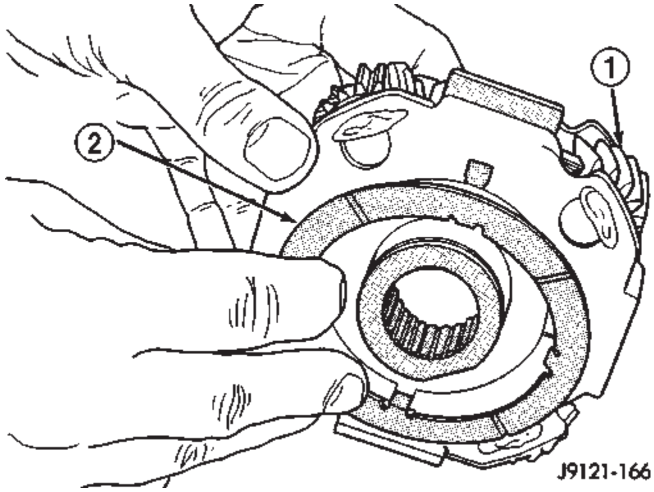

*Fig. 206 Installing Rear Thrust Washer On Front Planetary Gear*

1 - FRONT PLANETARY GEAR
2 - REAR TABBED THRUST WASHER

(14) Install front planetary gear on output shaft and in driving shell (Fig. 207).

(15) Install front thrust washer on front planetary gear. Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

(16) Assemble front annulus gear and support, if necessary. Be sure support snap-ring is seated.

(17) Install front annulus on front planetary (Fig. 207).

(18) Position thrust plate on front annulus gear support (Fig. 208). Note that plate has two tabs on it. These tabs fit in notches of annulus hub.

(19) Install thrust washer in front annulus (Fig. 209). Align flat on washer with flat on planetary hub. Also be sure washer tab is facing up.

(20) Install front annulus snap-ring (Fig. 210). Use snap-ring pliers to avoid distorting ring during installation. Also be sure ring is fully seated.

(21) Install planetary selective snap-ring with snap-ring pliers (Fig. 211). Be sure ring is fully seated.

(22) Turn planetary geartrain assembly over so driving shell is facing workbench. Then support geartrain on wood block positioned under forward end of output shaft. This allows geartrain components to move forward for accurate end play check.

(23) Check planetary geartrain end play with feeler gauge (Fig. 212). Gauge goes between shoulder on output shaft and end of rear annulus support.

(24) Geartrain end play should be 0.12 to 1.22 mm (0.005 to 0.048 in.). If end play is incorrect, snap-ring (or thrust washers) may have to be replaced. Snap-rings are available in three different thicknesses for adjustment purposes.

# REAR CLUTCH

## DESCRIPTION

The rear clutch assembly (Fig. 213) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

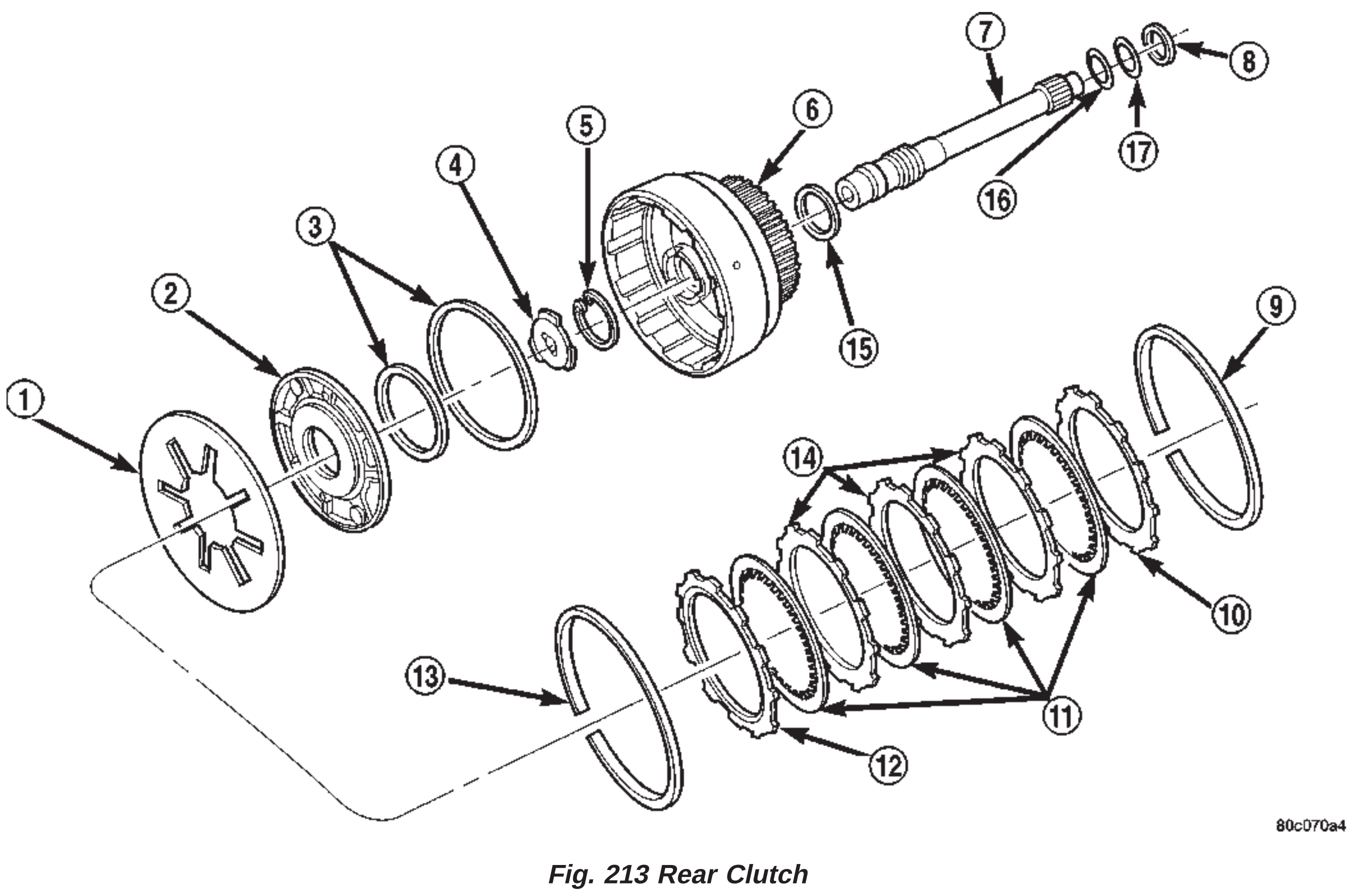

*Fig. 213 Rear Clutch*

13 - WAVE SPRING
14 - CLUTCH PLATES (3)
15 - RETAINER SEAL RING
16 - SHAFT REAR SEAL RING (PLASTIC)
17 - SHAFT FRONT SEAL RING (TEFLON)

REAR CLUTCH (Continued)

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front/rear seal rings.

(3) Remove selective clutch pack snap-ring (Fig. 214).

(4) Remove top pressure plate, clutch discs, steel plates, bottom pressure plate and wave snap-ring and wave spring (Fig. 214).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft snap-ring (Fig. 215). It may be necessary to press the input shaft in slightly to relieve tension on the snap-ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

## CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

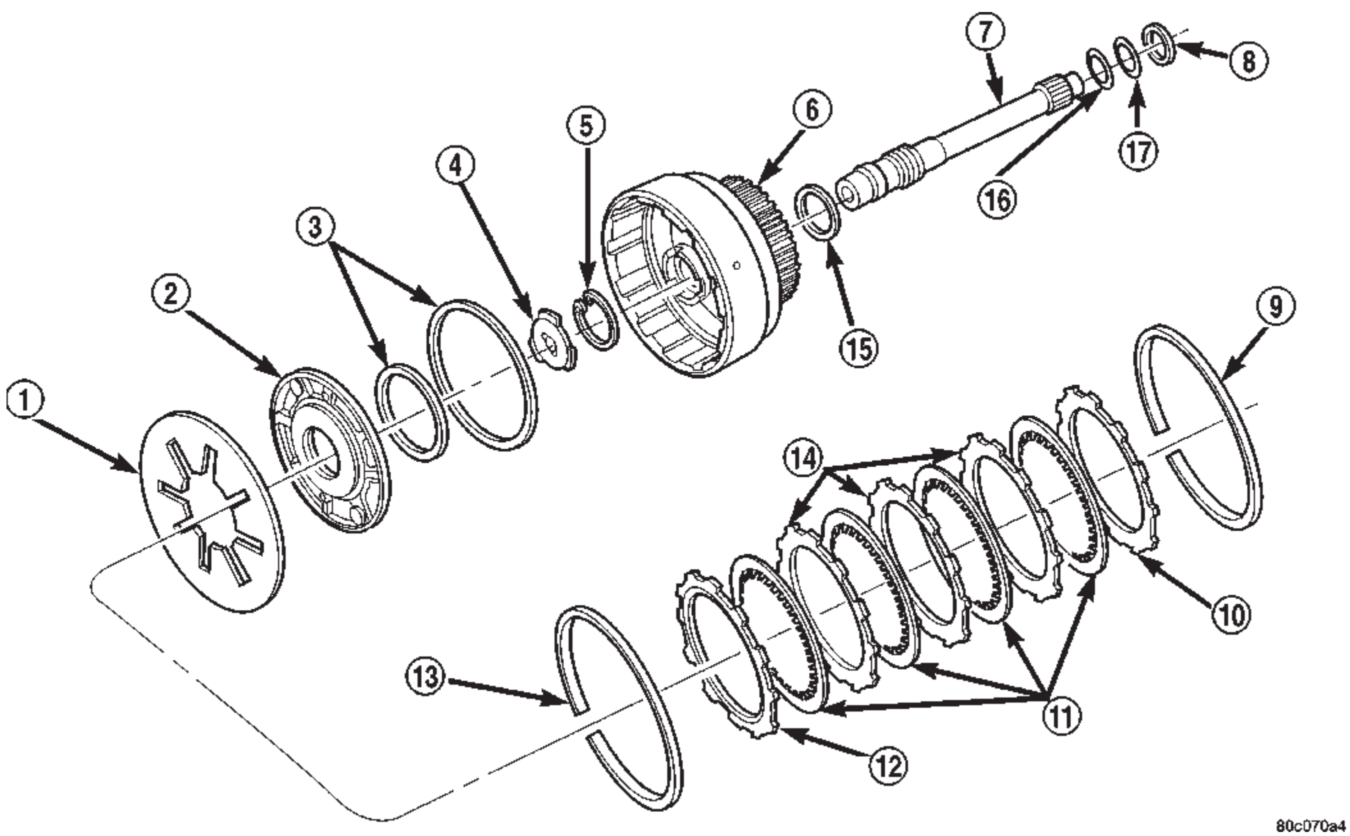

*Fig. 214 Rear Clutch Components*

## INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

## ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft, if necessary, (Fig. 216) and (Fig. 217).

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then press input shaft into retainer (Fig. 218). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft snap-ring (Fig. 217).

(5) Invert retainer and press input shaft in opposite direction until snap-ring is seated.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020″ thick), can be used to guide seals into place if necessary.

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.**

(9) Install piston spring in retainer and on top of piston (Fig. 219). Concave side of spring faces downward (toward piston).

(10) Install wave spring in retainer (Fig. 219). Be sure spring is completely seated in retainer groove.

(11) Install bottom pressure plate (Fig. 216). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of bottom pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 216).

(13) Install top pressure plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

REAR CLUTCH (Continued)

REAR CLUTCH (Continued)

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 220).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 220).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.559 - 0.914 mm (0.022 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap-ring thicknesses are:

- 0.107-0.109 in.
- 0.098-0.100 in.
- 0.095-0.097 in.
- 0.083-0.085 in.
- 0.076-0.078 in.
- 0.071-0.073 in.
- 0.060-0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 221). Use enough petroleum jelly to hold washer in place.

# REAR SERVO

## DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

## OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

## DISASSEMBLY

(1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 222).

(2) Remove and discard servo piston seal ring.

2 - PISTON SEAL
3 - PISTON PLUG
4 - SPRING RETAINER
5 - SNAP-RING
6 - PISTON SPRING
7 - CUSHION SPRING
8 - PISTON

## CLEANING

Remove and discard the servo piston seal ring (Fig. 223). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap-rings and use new ones at assembly.

5 - SNAP-RING
6 - PISTON SPRING
7 - CUSHION SPRING
8 - PISTON

## ASSEMBLY

(1) Lubricate piston and guide seals (Fig. 224) with petroleum jelly. Lubricate other servo parts with Mopar® ATF +4, type 9602, transmission fluid.

(2) Install new seal ring on servo piston.

(3) Assemble piston, plug, spring and new snap-ring.

(4) Lubricate piston seal lip with petroleum jelly.

# SHIFT MECHANISM

## DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

## OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

SHIFT MECHANISM (Continued)

### ADJUSTMENT

Check linkage adjustment by starting engine in PARK and NEUTRAL. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

### LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 225). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

(1) Shift transmission into PARK.

(2) Raise and support vehicle.

(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 225).

(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.

(5) Move transmission shift lever fully rearward to the Park detent.

(6) Center adjusting swivel on shift rod.

(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).

(8) Lower vehicle and verify proper adjustment.

## SOLENOID

### DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position some-

SOLENOID (Continued)

where between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

### OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## SPEED SENSOR

### DESCRIPTION

The speed sensor (Fig. 226) is located in the overdrive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

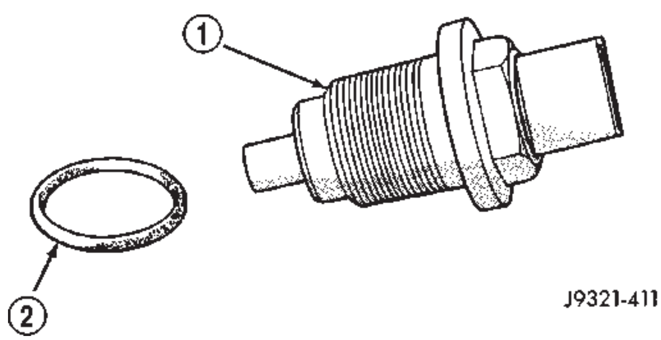

***Fig. 226 Transmission Output Speed Sensor***

1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
2 - SEAL

### OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

## THROTTLE VALVE CABLE

### DESCRIPTION

Transmission throttle valve cable (Fig. 227) adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

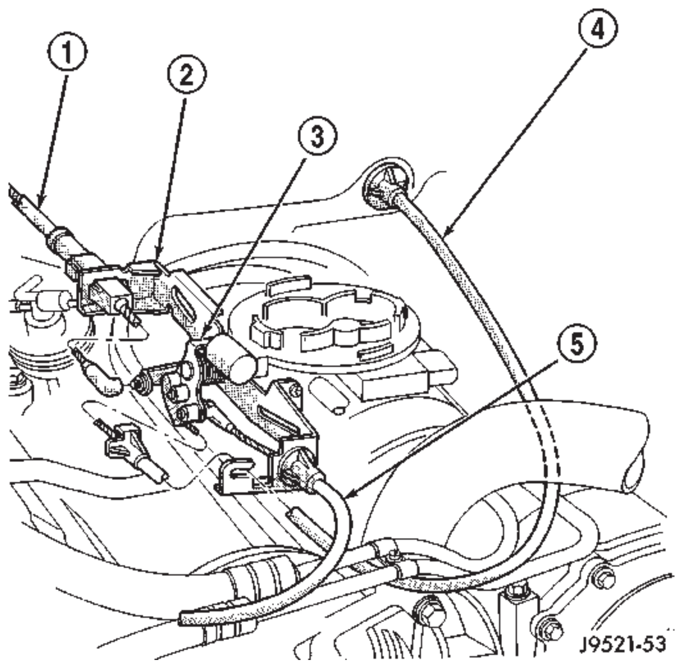

***Fig. 227 Throttle Valve Cable Attachment - At Engine***

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 228). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

5 - SPEED CONTROL CABLE

## ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

### ADJUSTMENT VERIFICATION

(1) Turn ignition key to OFF position.

(2) Remove air cleaner.

(3) Verify that lever on throttle body is at curb idle position (Fig. 229). Then verify that the transmission throttle lever (Fig. 230) is also at idle (fully forward) position.

(4) Slide cable off attachment stud on throttle body lever.

(5) Compare position of cable end to attachment stud on throttle body lever:

- Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 231).
- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.
- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

7 - TRANSMISSION FLUID LINES

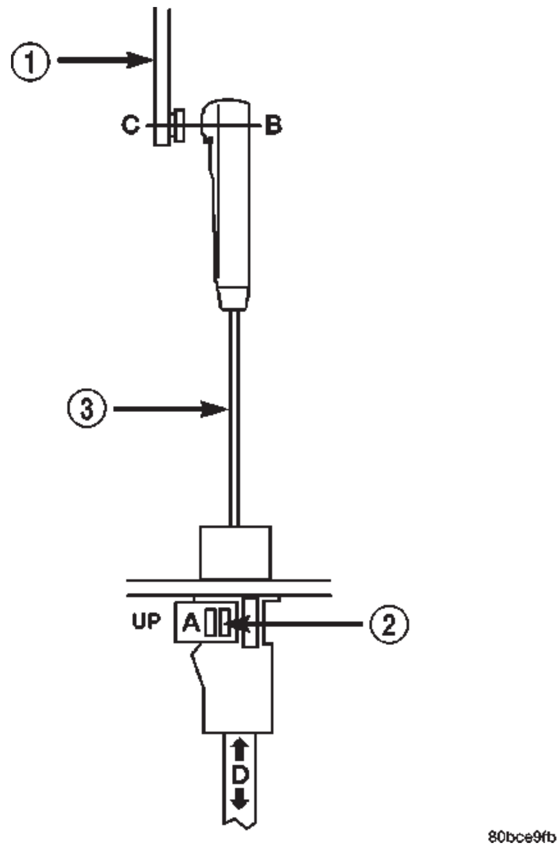

*Fig. 231 Throttle Valve Cable at Throttle Linkage*

1 - THROTTLE LINKAGE
2 - THROTTLE VALVE CABLE LOCKING CLIP
3 - THROTTLE VALVE CABLE

## ADJUSTMENT PROCEDURE

(1) Turn ignition switch to OFF position.

(2) Remove air cleaner if necessary.

(3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Pry the T.V. cable lock (A) into the UP position (Fig. 231). This will unlock the cable and allow for readjustment.

(6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable.**Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 231).

(7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 231). This will lock the present T.V. cable adjustment.

**NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.**

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

# TORQUE CONVERTER

## DESCRIPTION

The torque converter (Fig. 232) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.**

1 - ENGINE FLEXPLATE
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

## IMPELLER

The impeller (Fig. 233) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

## TURBINE

The turbine (Fig. 234) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

1 - TURBINE VANE
2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

## STATOR

The stator assembly (Fig. 235) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 236). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

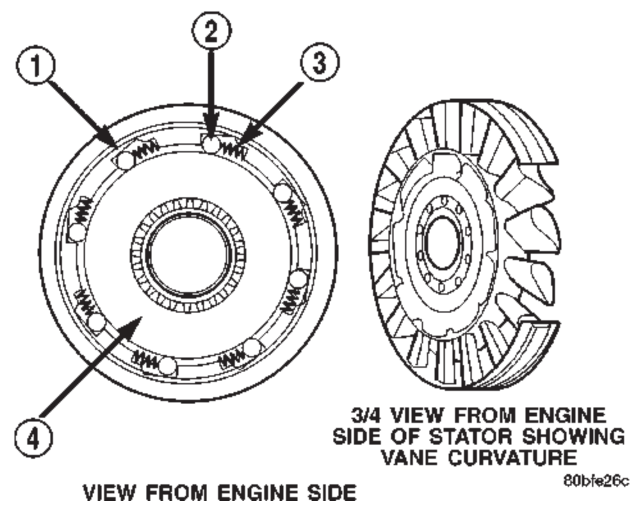

*Fig. 235 Stator Components*

2 - ROLLER
3 - SPRING
4 - INNER RACE

TORQUE CONVERTER (Continued)

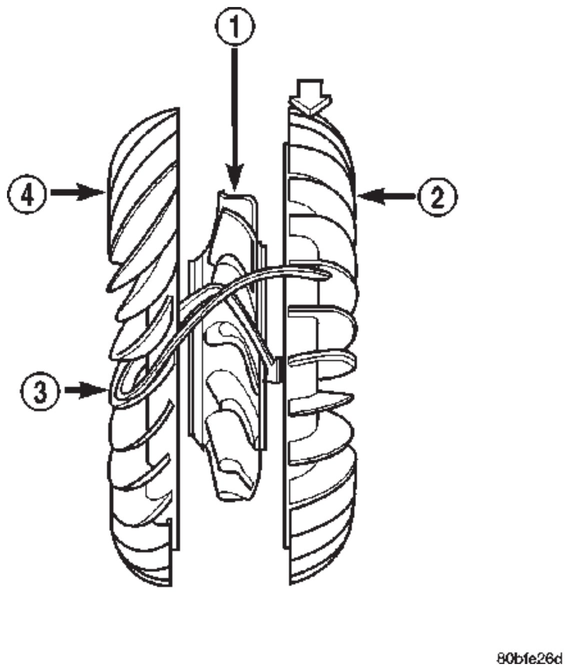

*Fig. 236 Stator Location*

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 237) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

## OPERATION

The converter impeller (Fig. 238) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

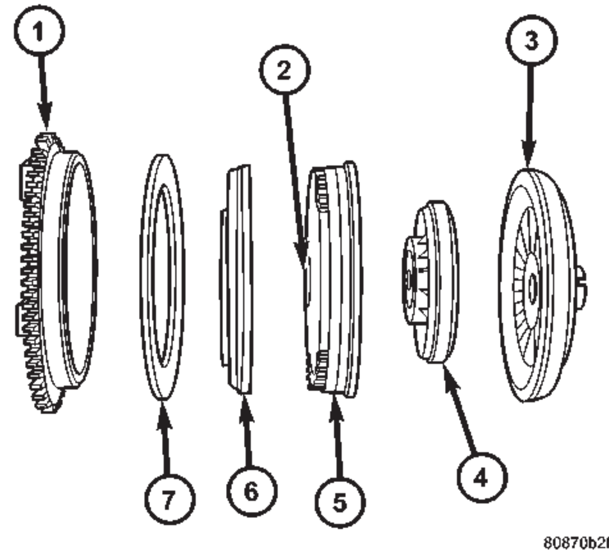

*Fig. 237 Torque Converter Clutch (TCC)*

1 - IMPELLER FRONT COVER
2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a “hindering” direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

TORQUE CONVERTER (Continued)

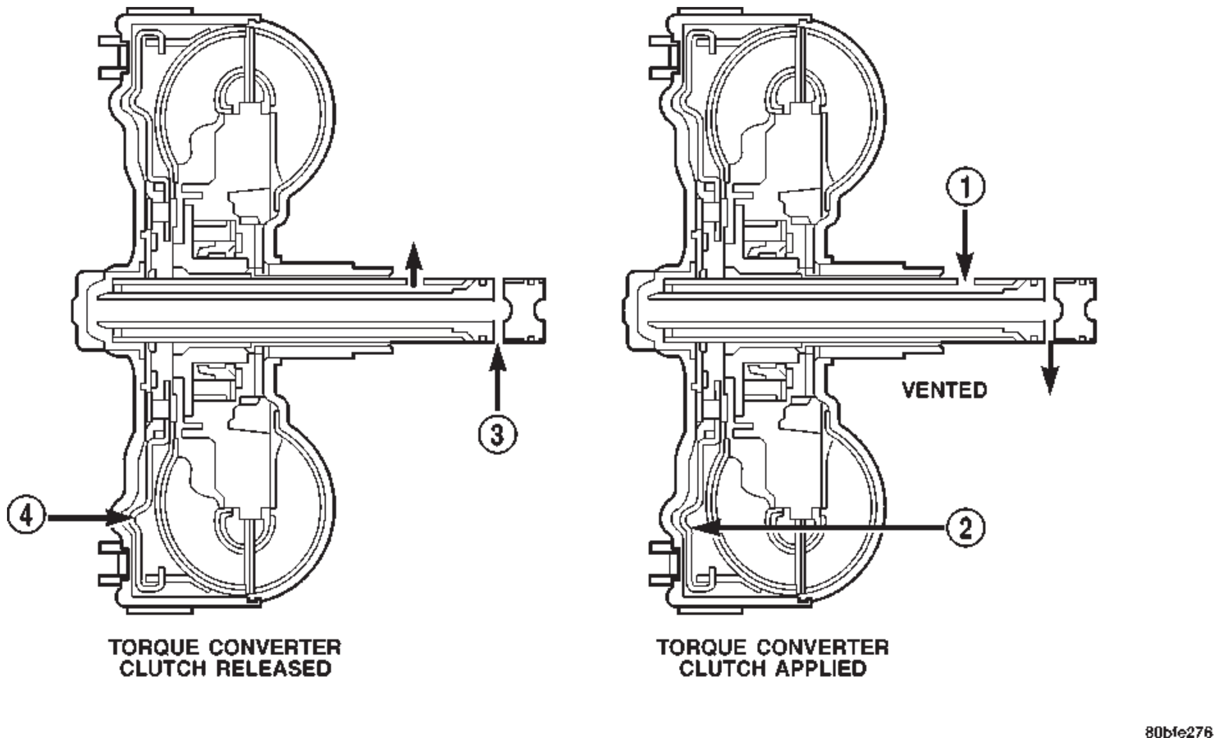

*Fig. 238 Torque Converter Fluid Operation*

1 - APPLY PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD
3 - RELEASE PRESSURE
4 - THE PISTON MOVES SLIGHTLY REARWARD

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 239). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

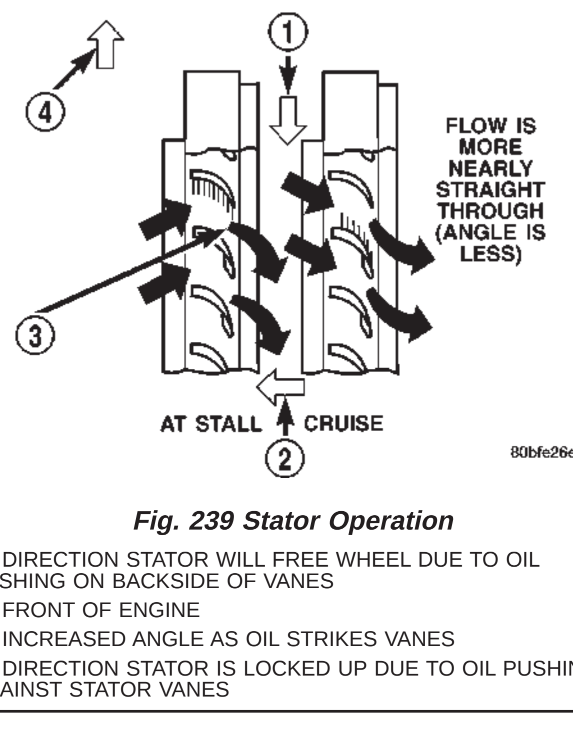

*Fig. 239 Stator Operation*

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

### TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.

### REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.**

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

### INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

**CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.**

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 240). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

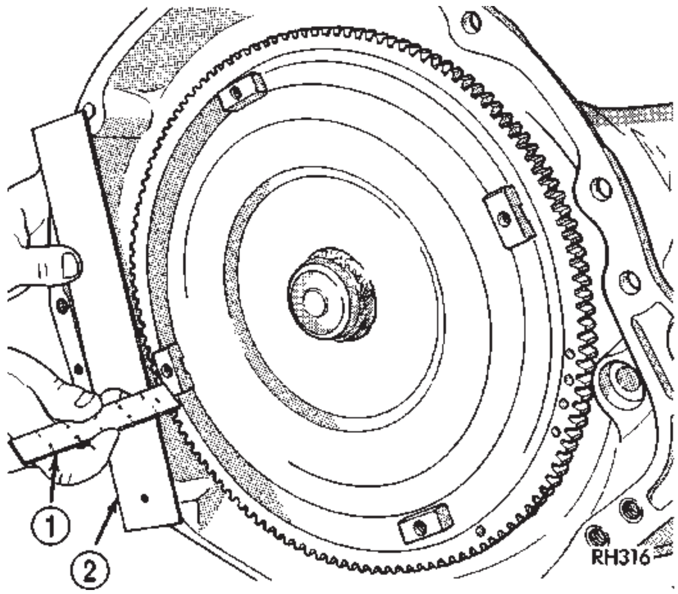

***Fig. 240 Checking Torque Converter Seating - Typical***

1 - SCALE
2 - STRAIGHTEDGE

## TORQUE CONVERTER DRAINBACK VALVE

### DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

### OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

### STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the

TORQUE CONVERTER DRAINBACK VALVE (Continued)

vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

**CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.**

# TRANSMISSION TEMPERATURE SENSOR

## DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 241). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

## OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

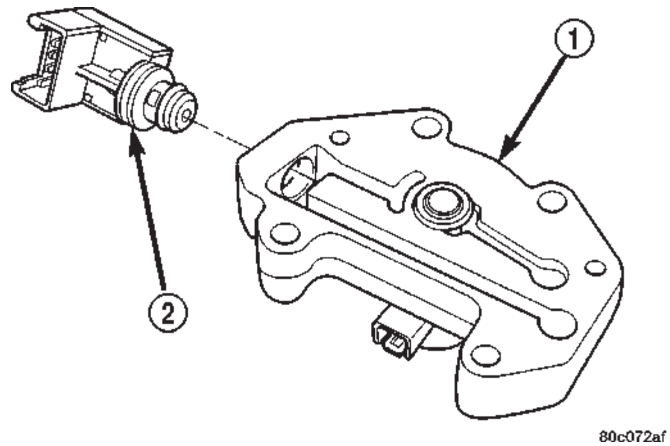

***Fig. 241 Governor Pressure Sensor***

1 - GOVERNOR BODY

2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

# VALVE BODY

## DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 242), (Fig. 243), (Fig. 244), and (Fig. 245):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

## OPERATION

**NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.**

### CHECK BALLS

| CHECK BALL NUMBER | DESCRIPTION |
|---|---|
| 1 | Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug. |
| 2 | Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug. |
| 3 | Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch. |
| 4 | Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo. |
| 5 | Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure. |
| 6 | Provides a by-pass around the front servo orifice so that the servo can release quickly. |
| 7 | Provides a by-pass around the rear clutch orifice so that the clutch can release quickly. |
| 8 | Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient. |
| 9 | Provides a by-pass around the rear servo orifice so that the servo can release quickly. |
| ECE (10) | Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown. |

### REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as “line pressure.”

The regulator valve (Fig. 246) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

VALVE BODY (Continued)

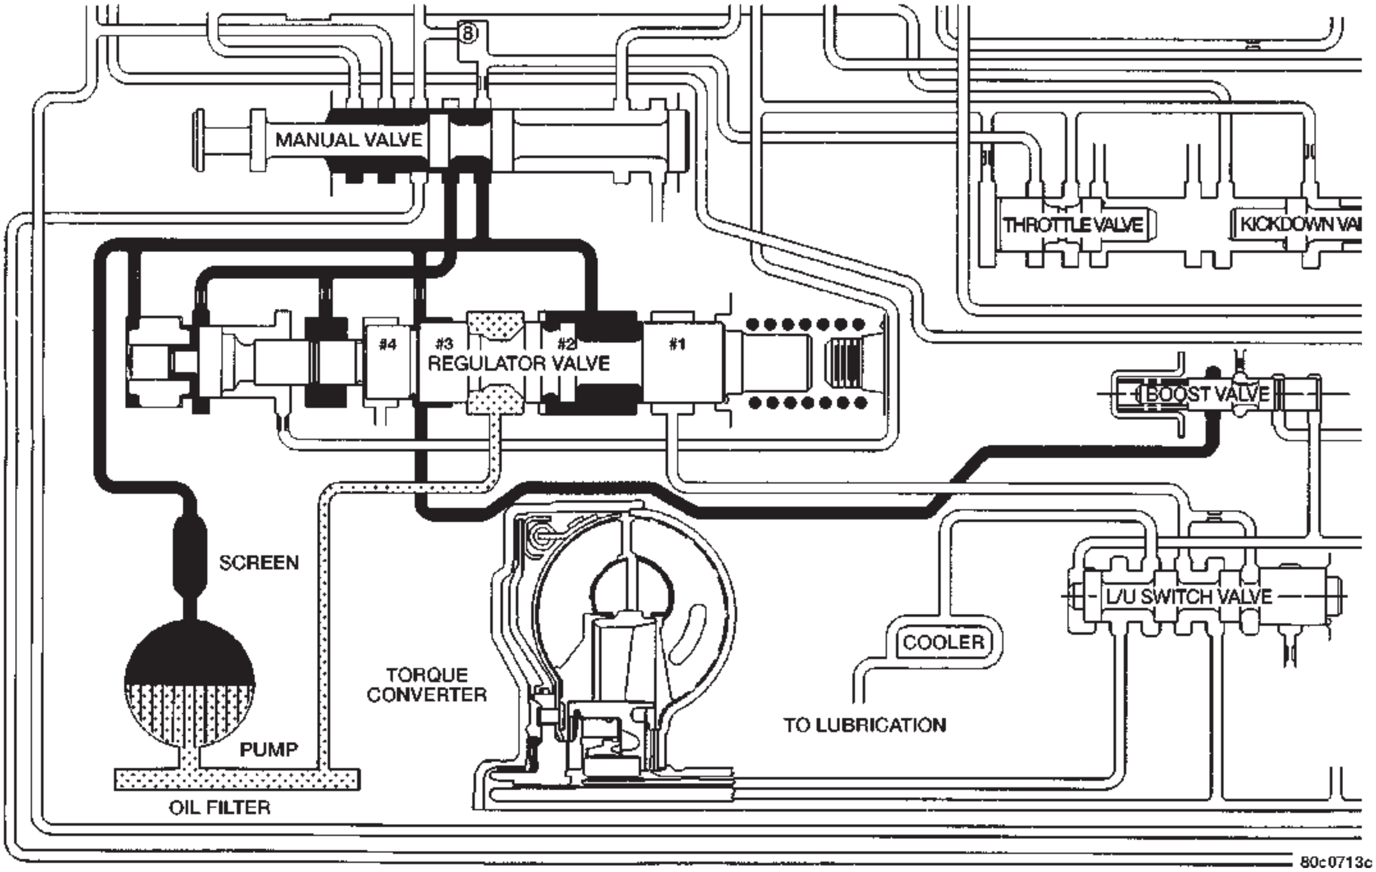

*Fig. 246 Regulator Valve in PARK Position*

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 247), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

VALVE BODY (Continued)

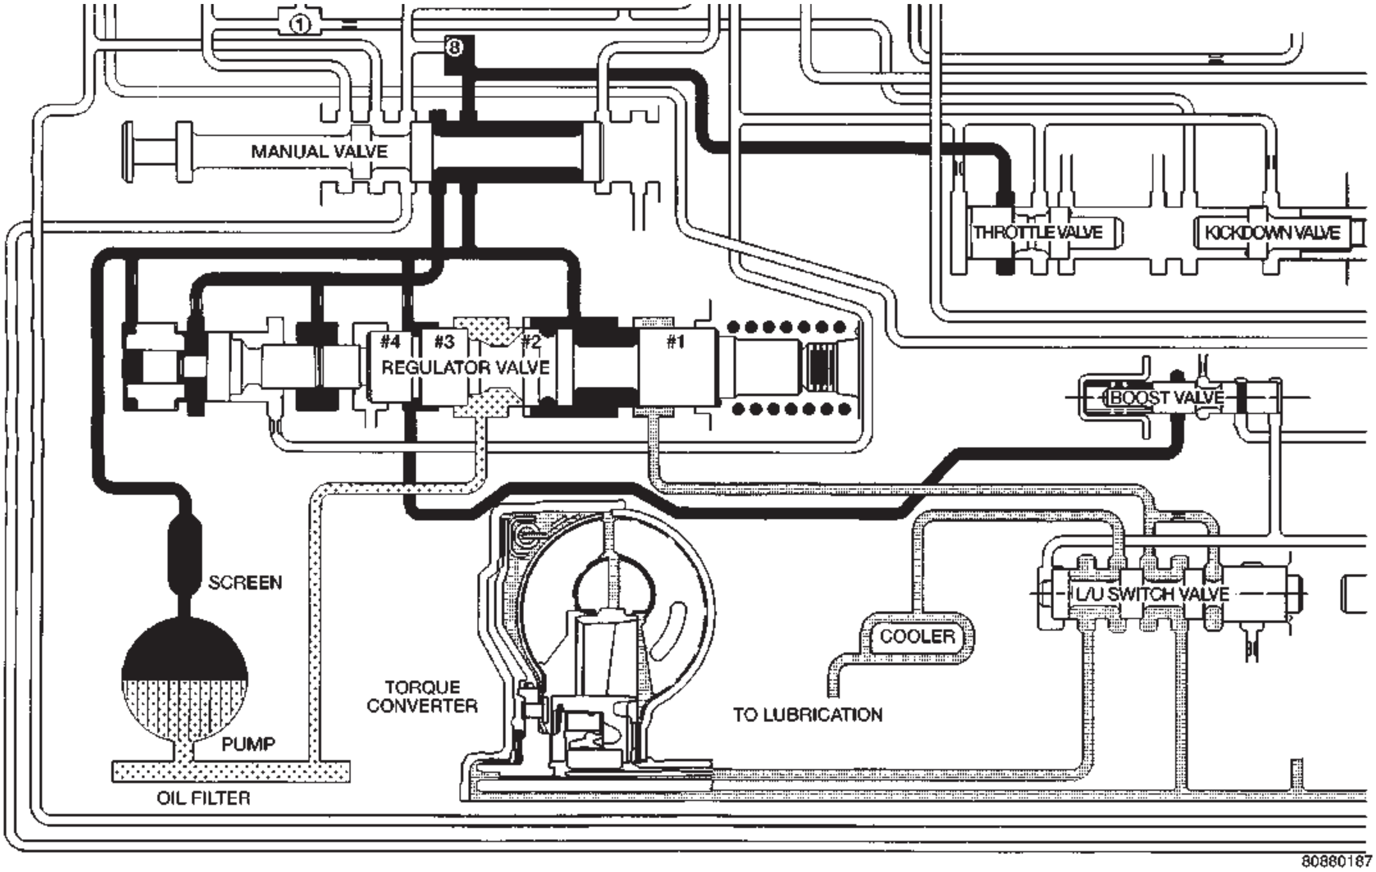

*Fig. 247 Regulator Valve in NEUTRAL Position*

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 248). The regulated line pressure in REVERSE (Fig. 249) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

VALVE BODY (Continued)

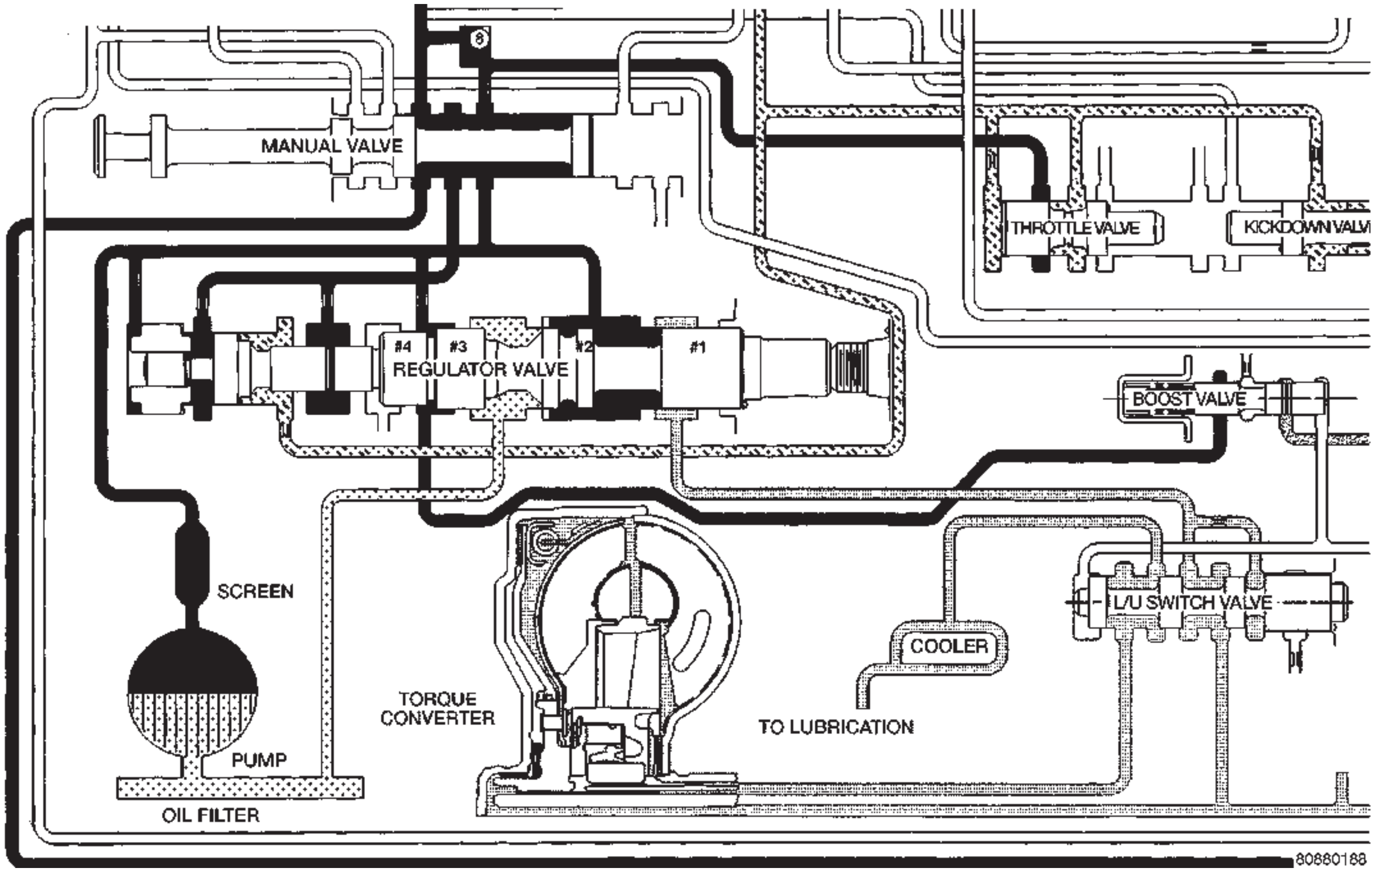

*Fig. 248 Regulator Valve in DRIVE Position*

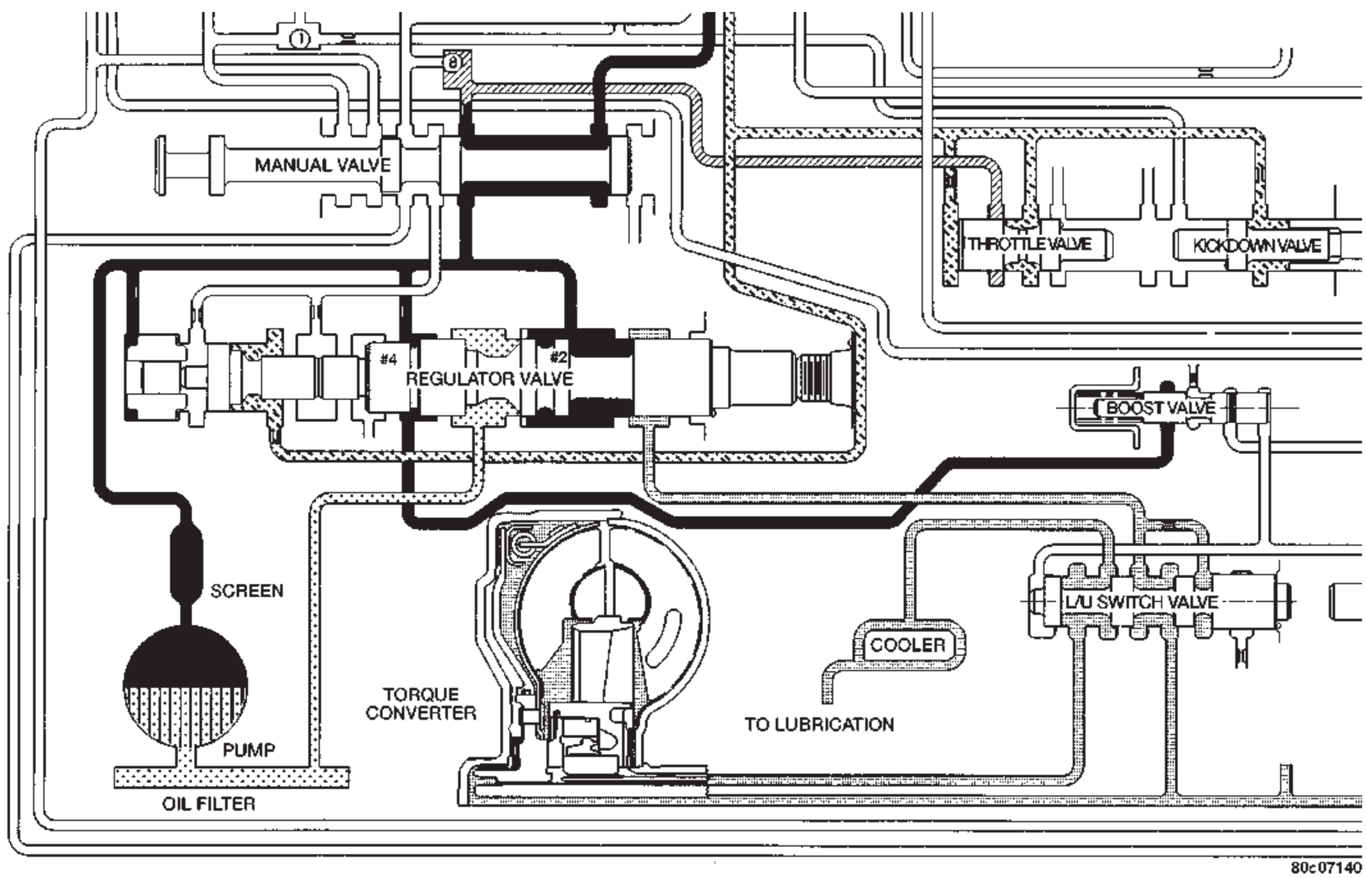

*Fig. 249 Regulator Valve in REVERSE Position*

VALVE BODY (Continued)

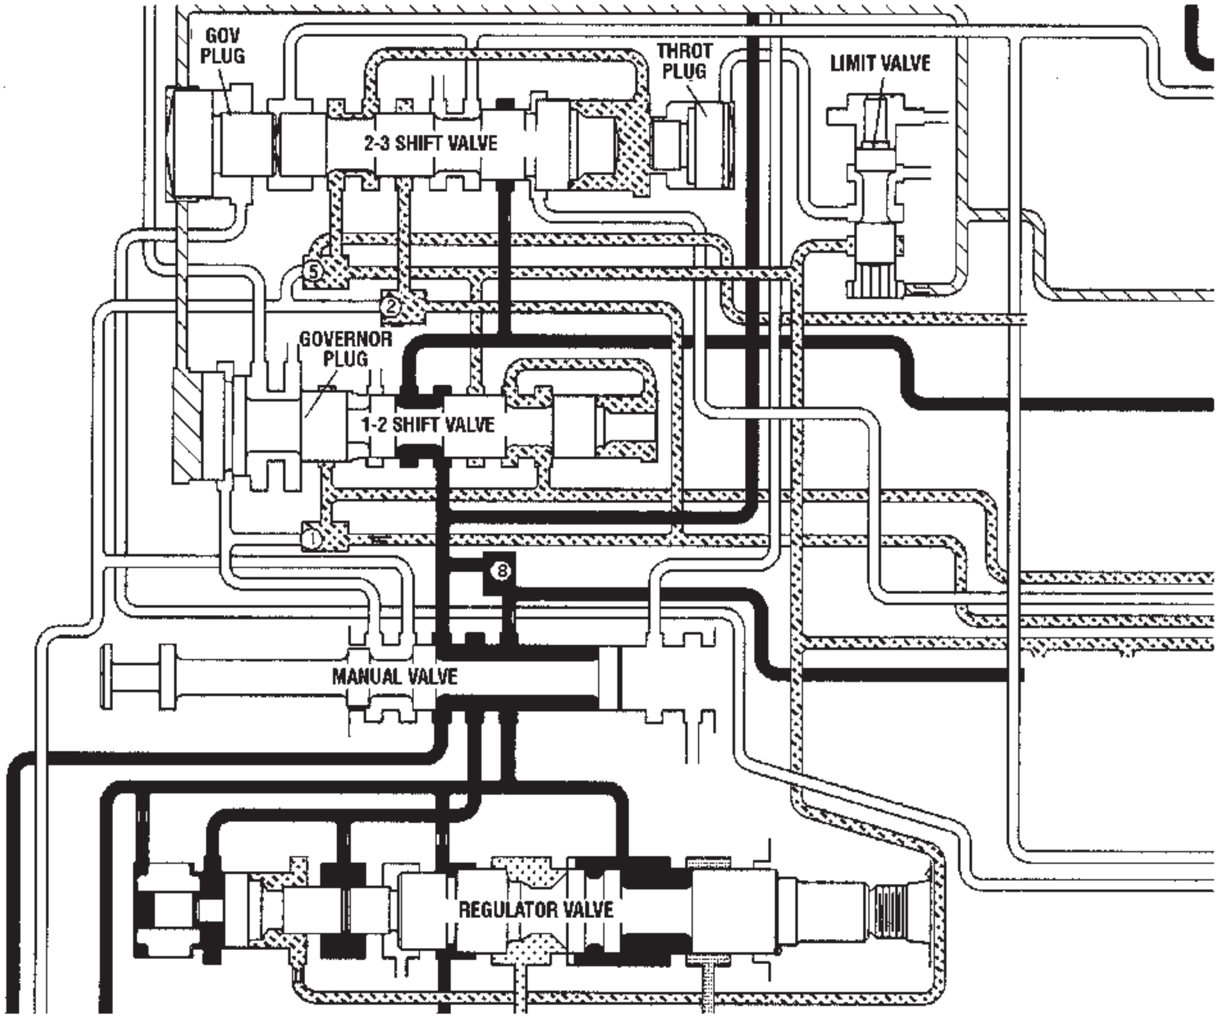

*Fig. 250 Kickdown Valve-Wide Open Throttle*

## KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 250) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

## KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 251) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 252), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

VALVE BODY (Continued)

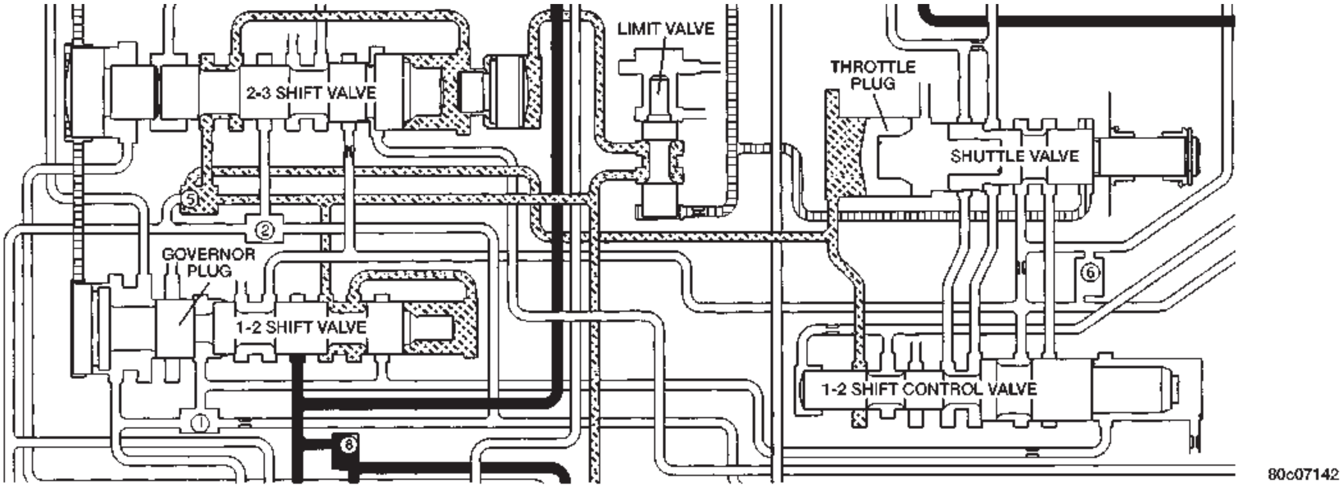

*Fig. 251 Kickdown Limit Valve-Low Speeds*

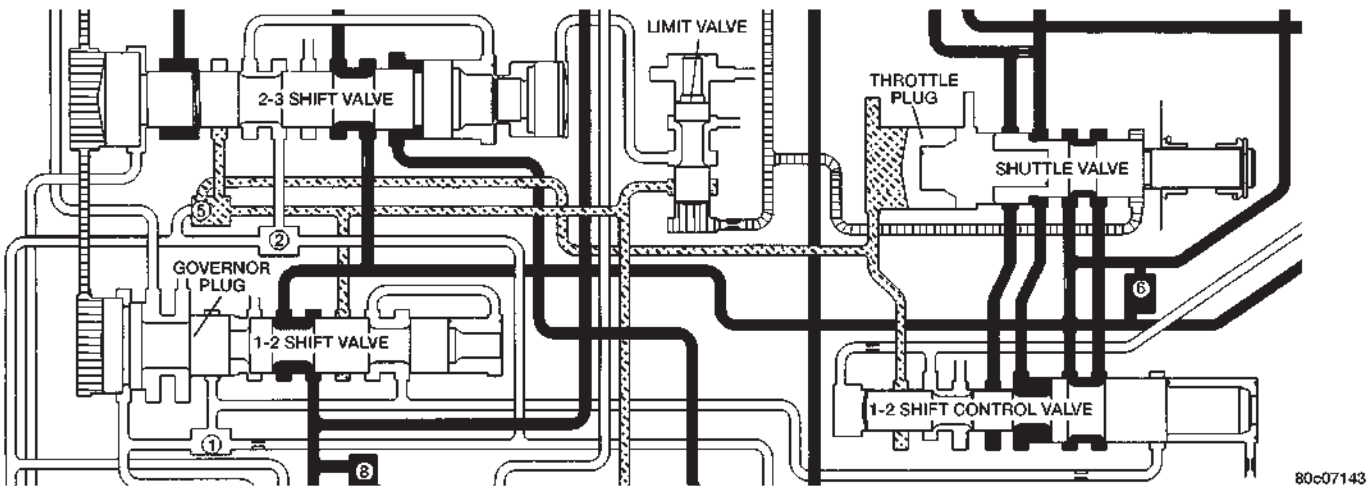

*Fig. 252 Kickdown Limit Valve-High Speeds*

## 1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 253), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 254).

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically “blocked” into position so no upshift can occur.

The physical blocking of the upshift while in the manual “1” position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

VALVE BODY (Continued)

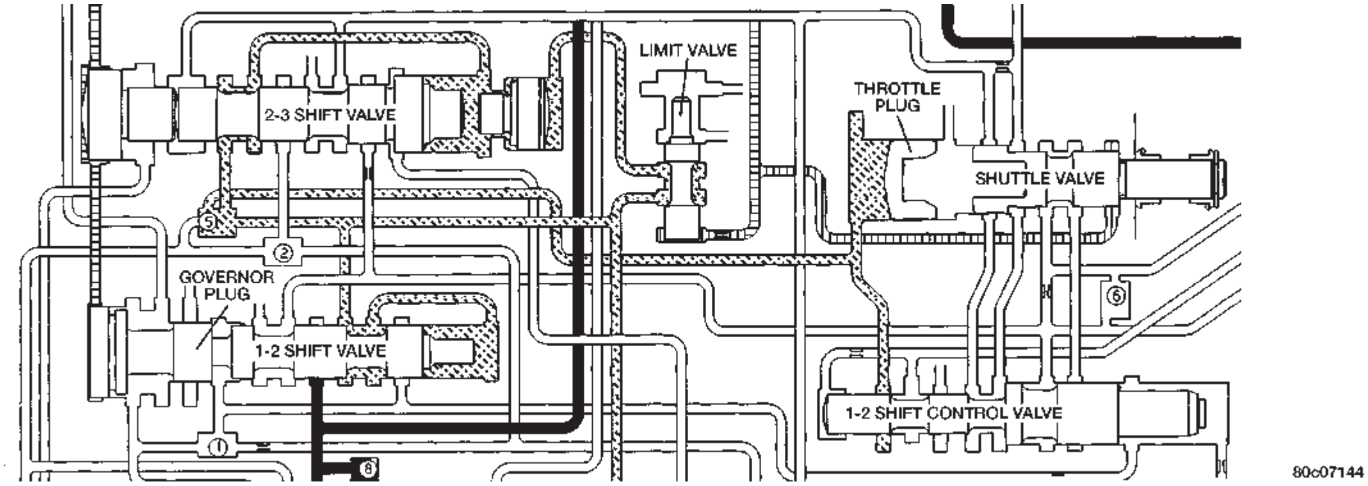

*Fig. 253 1-2 Shift Valve-Before Shift*

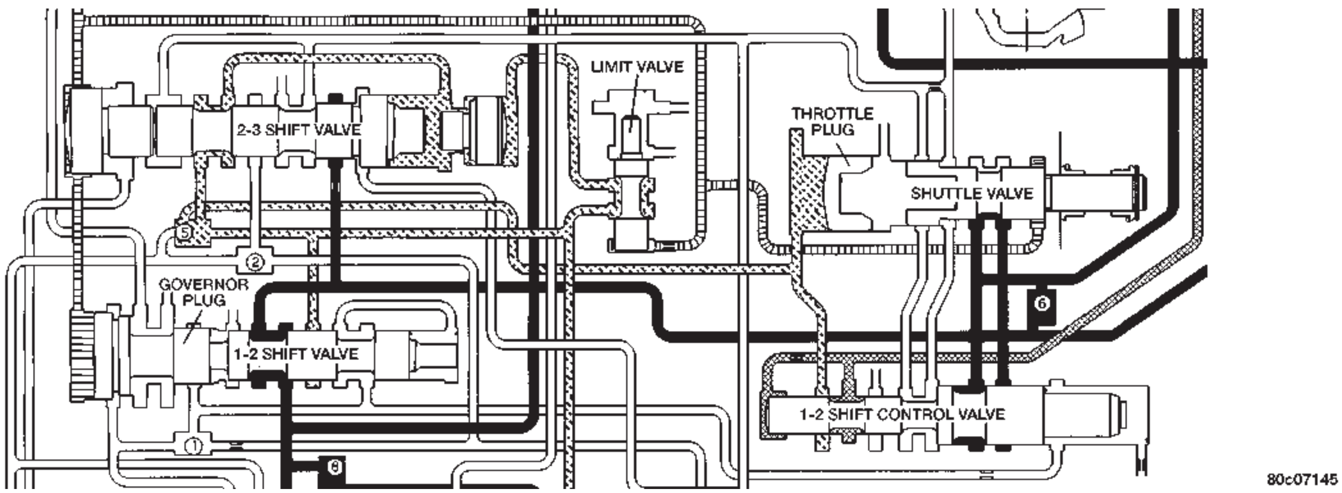

*Fig. 254 1-2 Shift Valve-After Shift*

## 1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a “relay” and “balanced” valve.

The valve has two specific operations (Fig. 255):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kickdown ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or “modulated throttle pressure” is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is “cushioned” and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control’s spring cavity, adding to the spring load on the valve. The result of this increased “modulated” throttle pressure is a firmer WOT upshift.

## 2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 256) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead–end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift.

VALVE BODY (Continued)

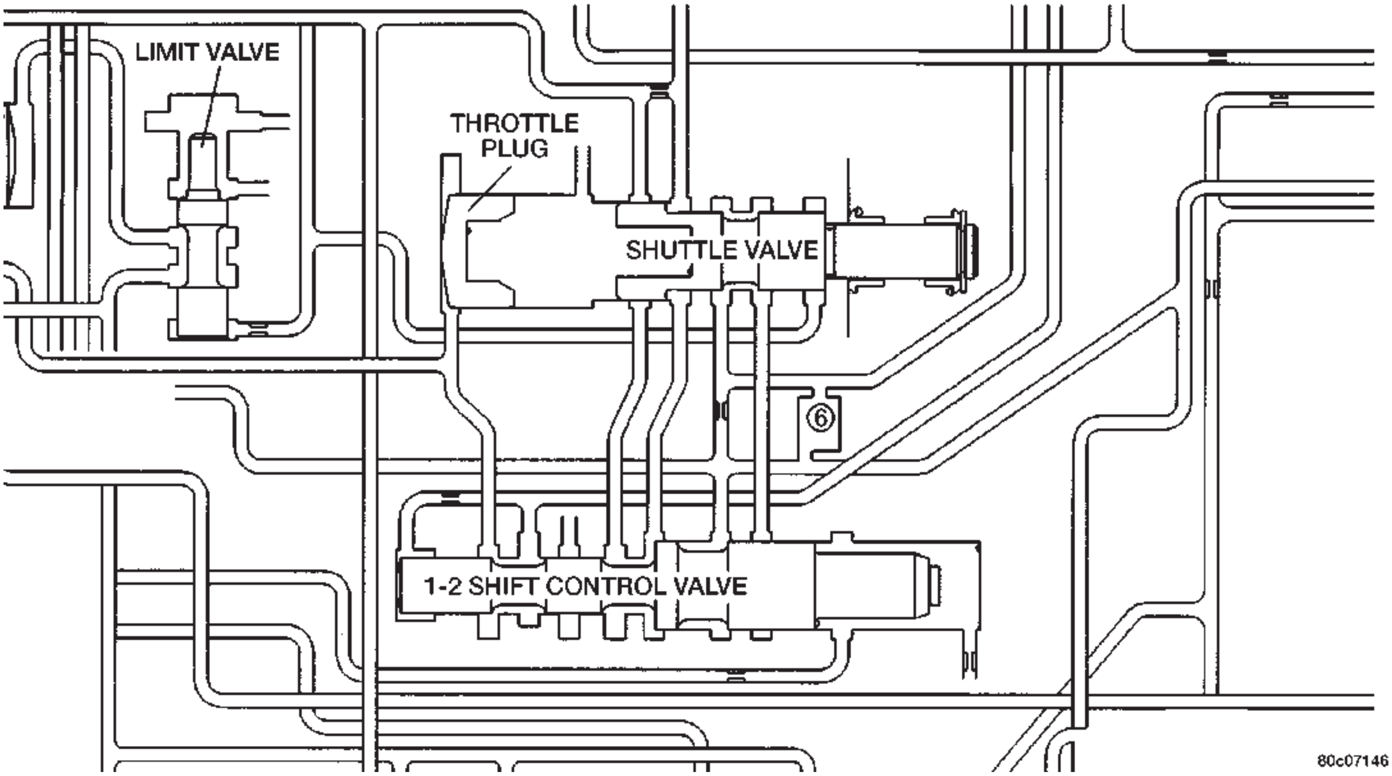

***Fig. 255 1-2 Shift Control Valve***

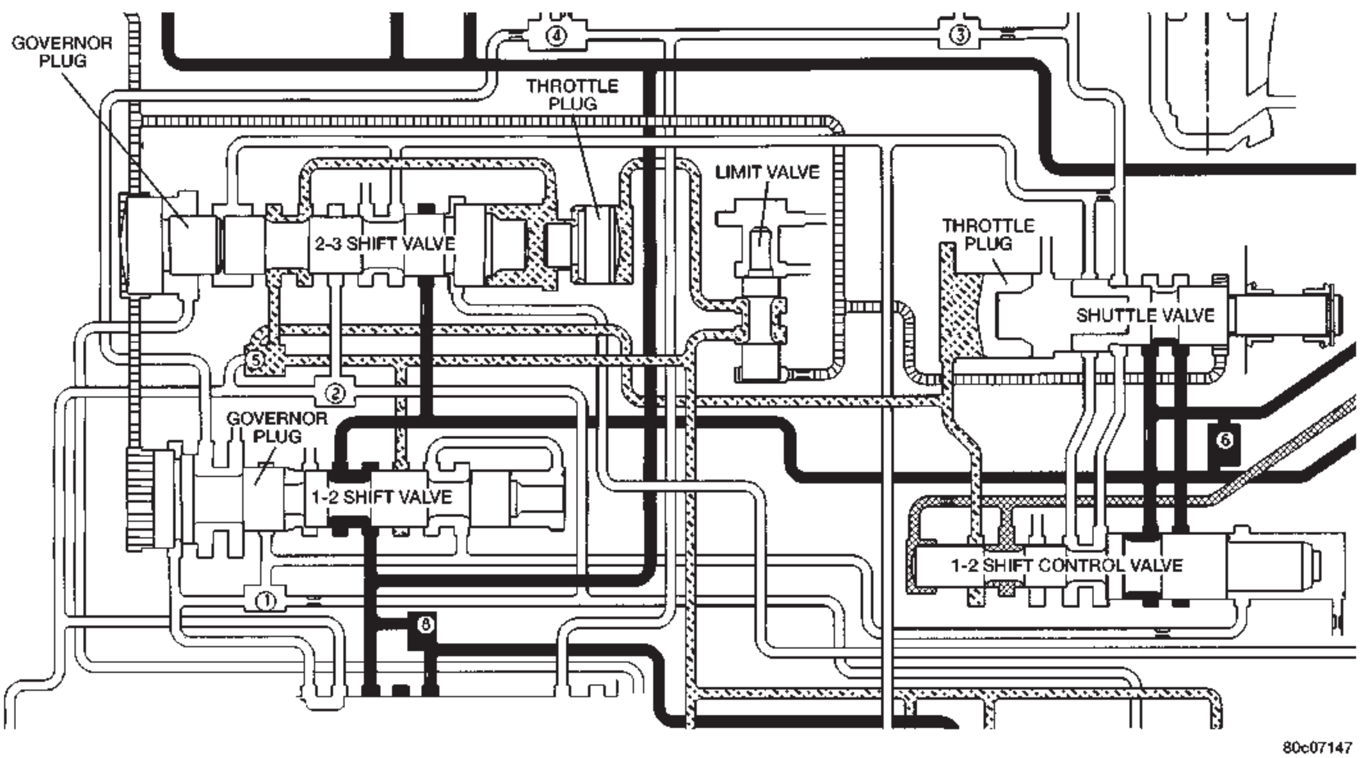

***Fig. 256 2-3 Shift Valve-Before Shift***

When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

VALVE BODY (Continued)

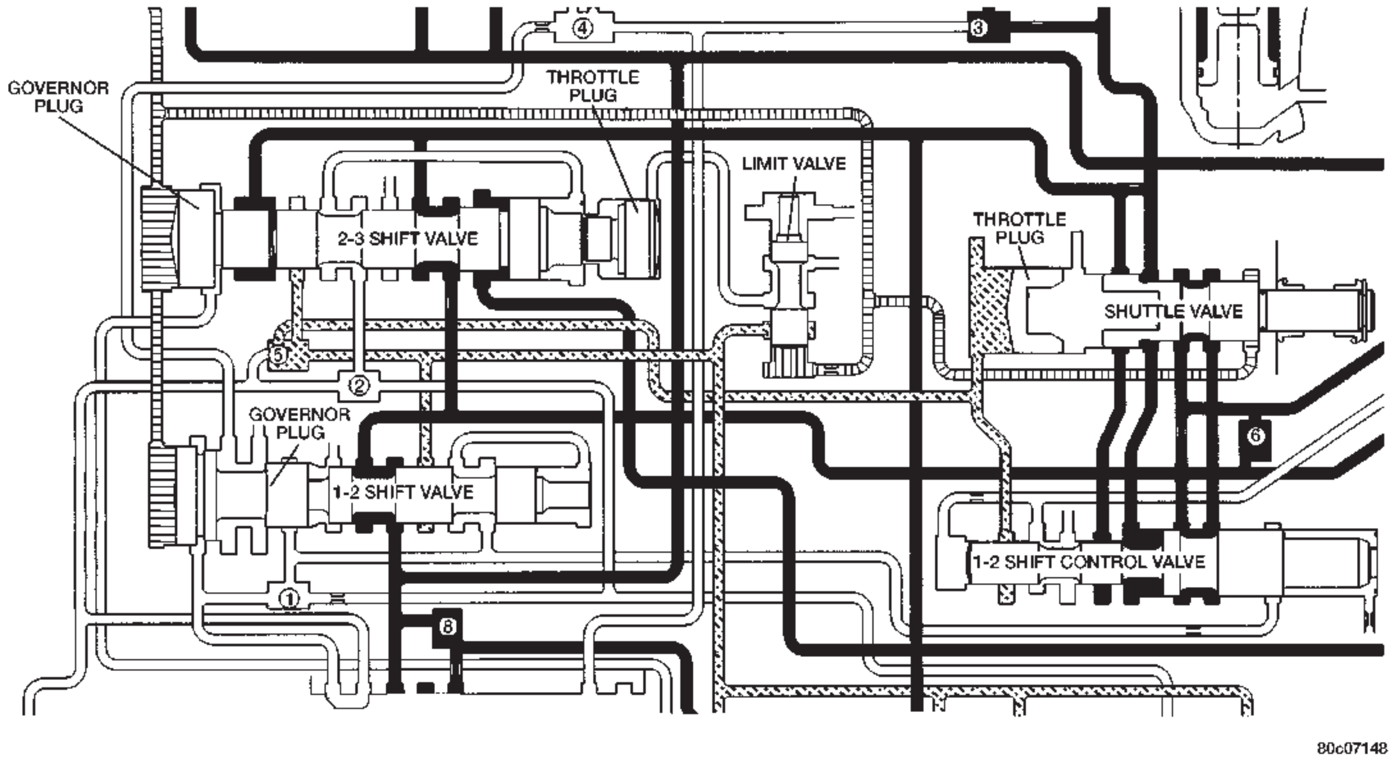

*Fig. 257 2-3 Shift Valve-After Shift*

After the shift (Fig. 257), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual “1” or manual “2” gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

## 3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 258). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 259). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

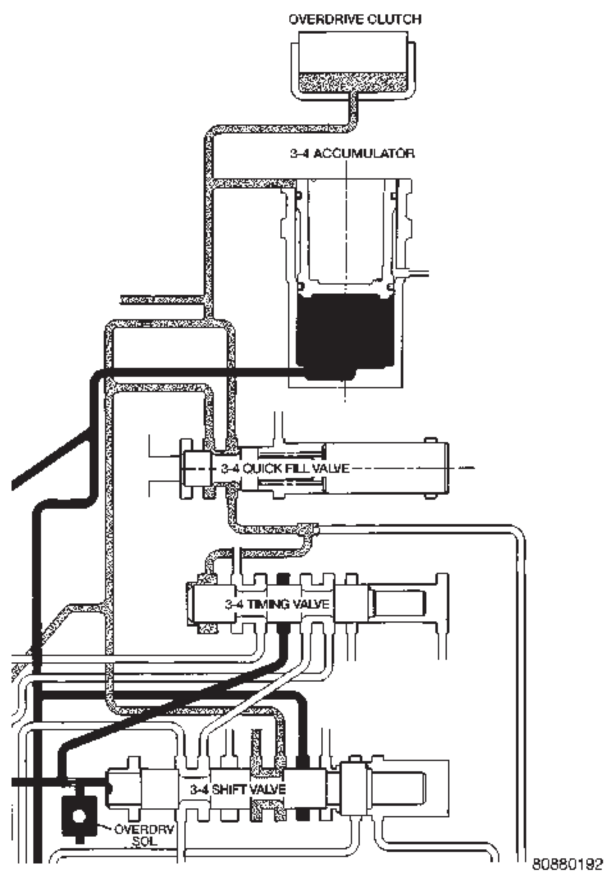

*Fig. 258 3-4 Shift Valve Before Shift*

VALVE BODY (Continued)

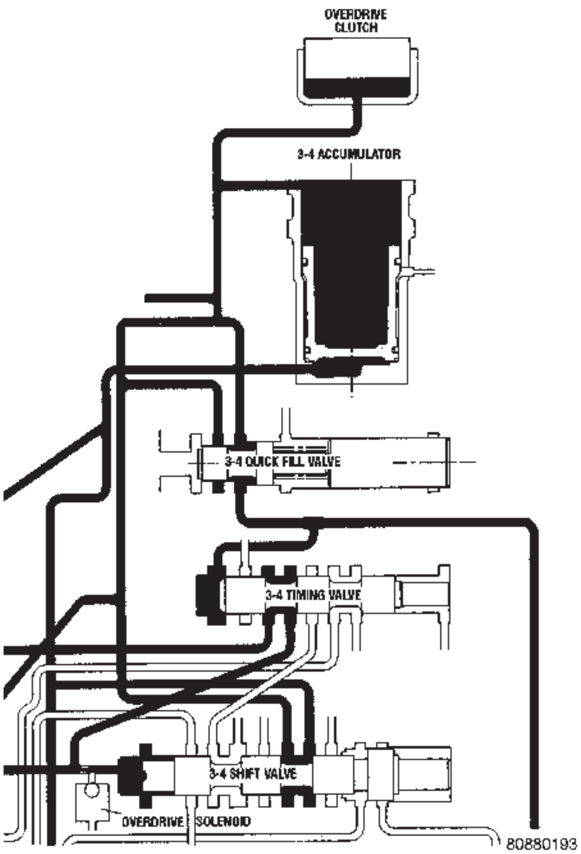

*Fig. 259 3-4 Shift Valve After Shift*

## 3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 259). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 258).

## 3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 258). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 259). Clutch fill is then completed through the regular feed orifice.

## THROTTLE VALVE

In all gear positions the throttle valve (Fig. 260) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is “metered” out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

VALVE BODY (Continued)

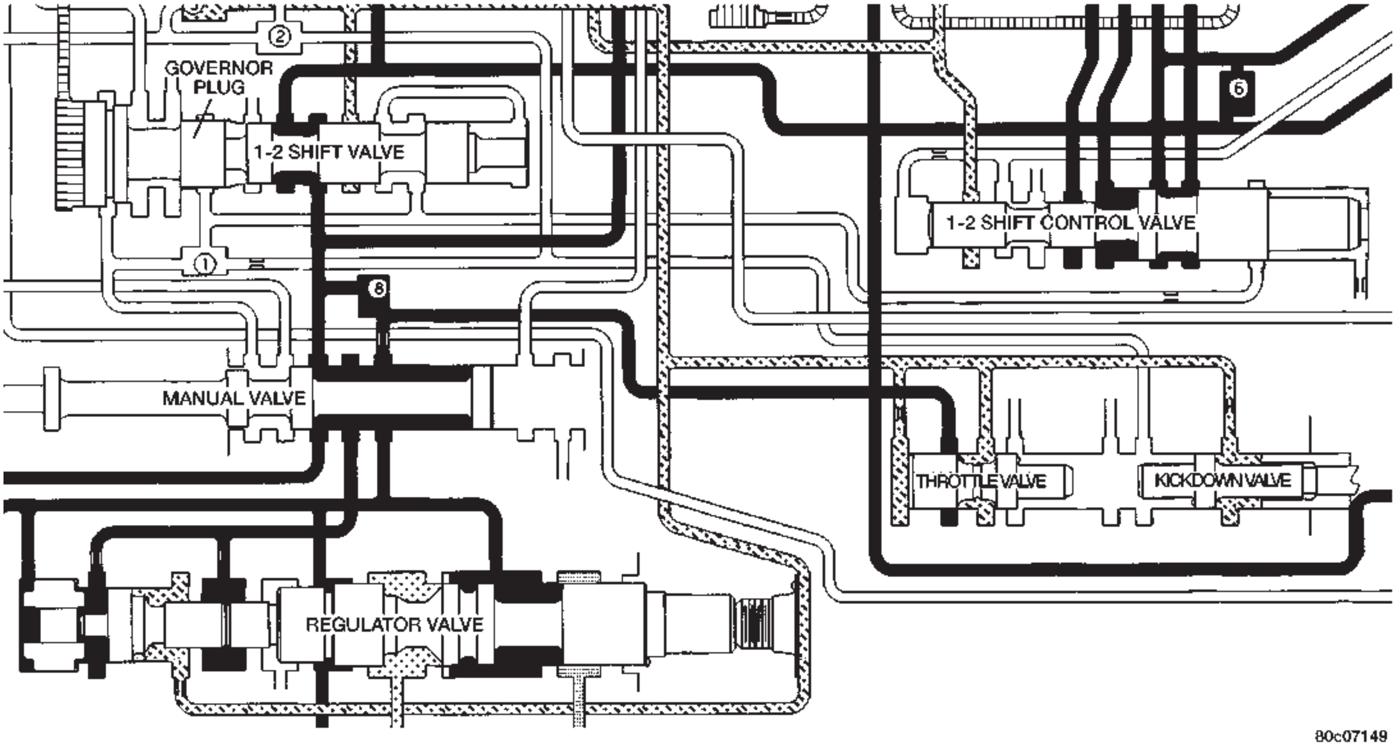

*Fig. 260 Throttle Valve*

## SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 261), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

Once the TCC control valve has moved to the right (Fig. 262), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

VALVE BODY (Continued)

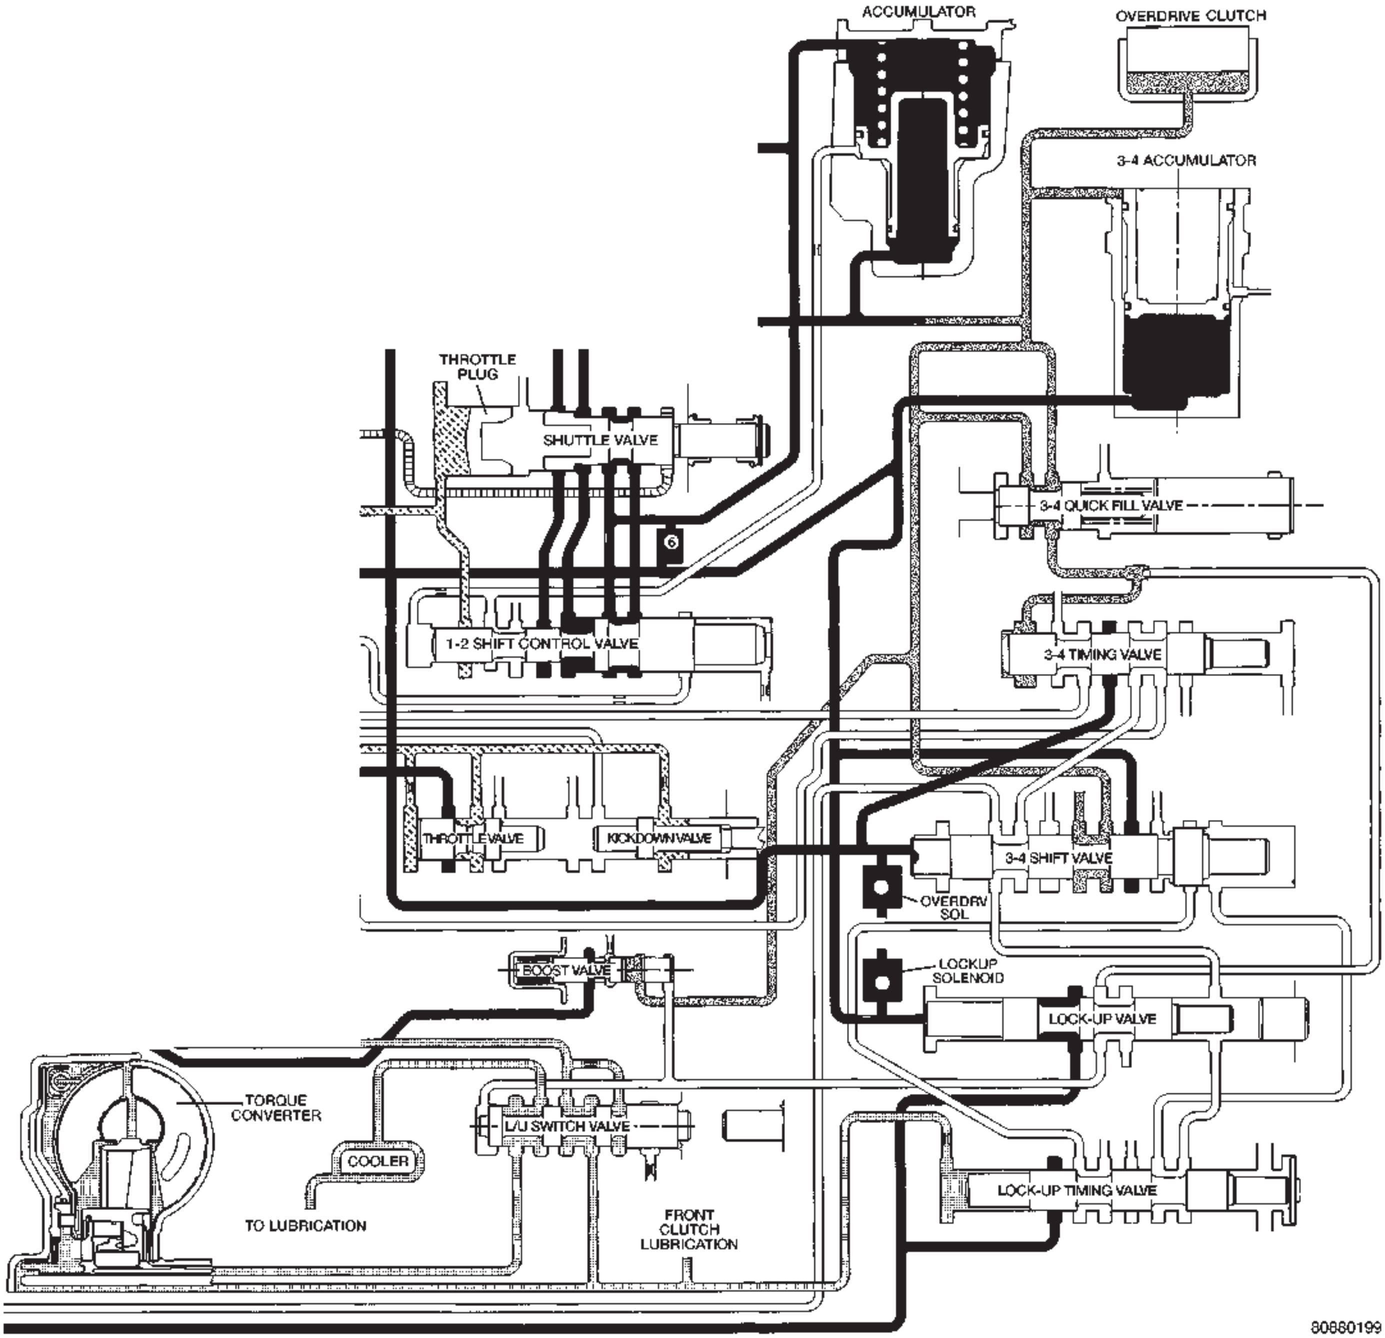

*Fig. 261 Switch Valve-Torque Converter Unlocked*

VALVE BODY (Continued)

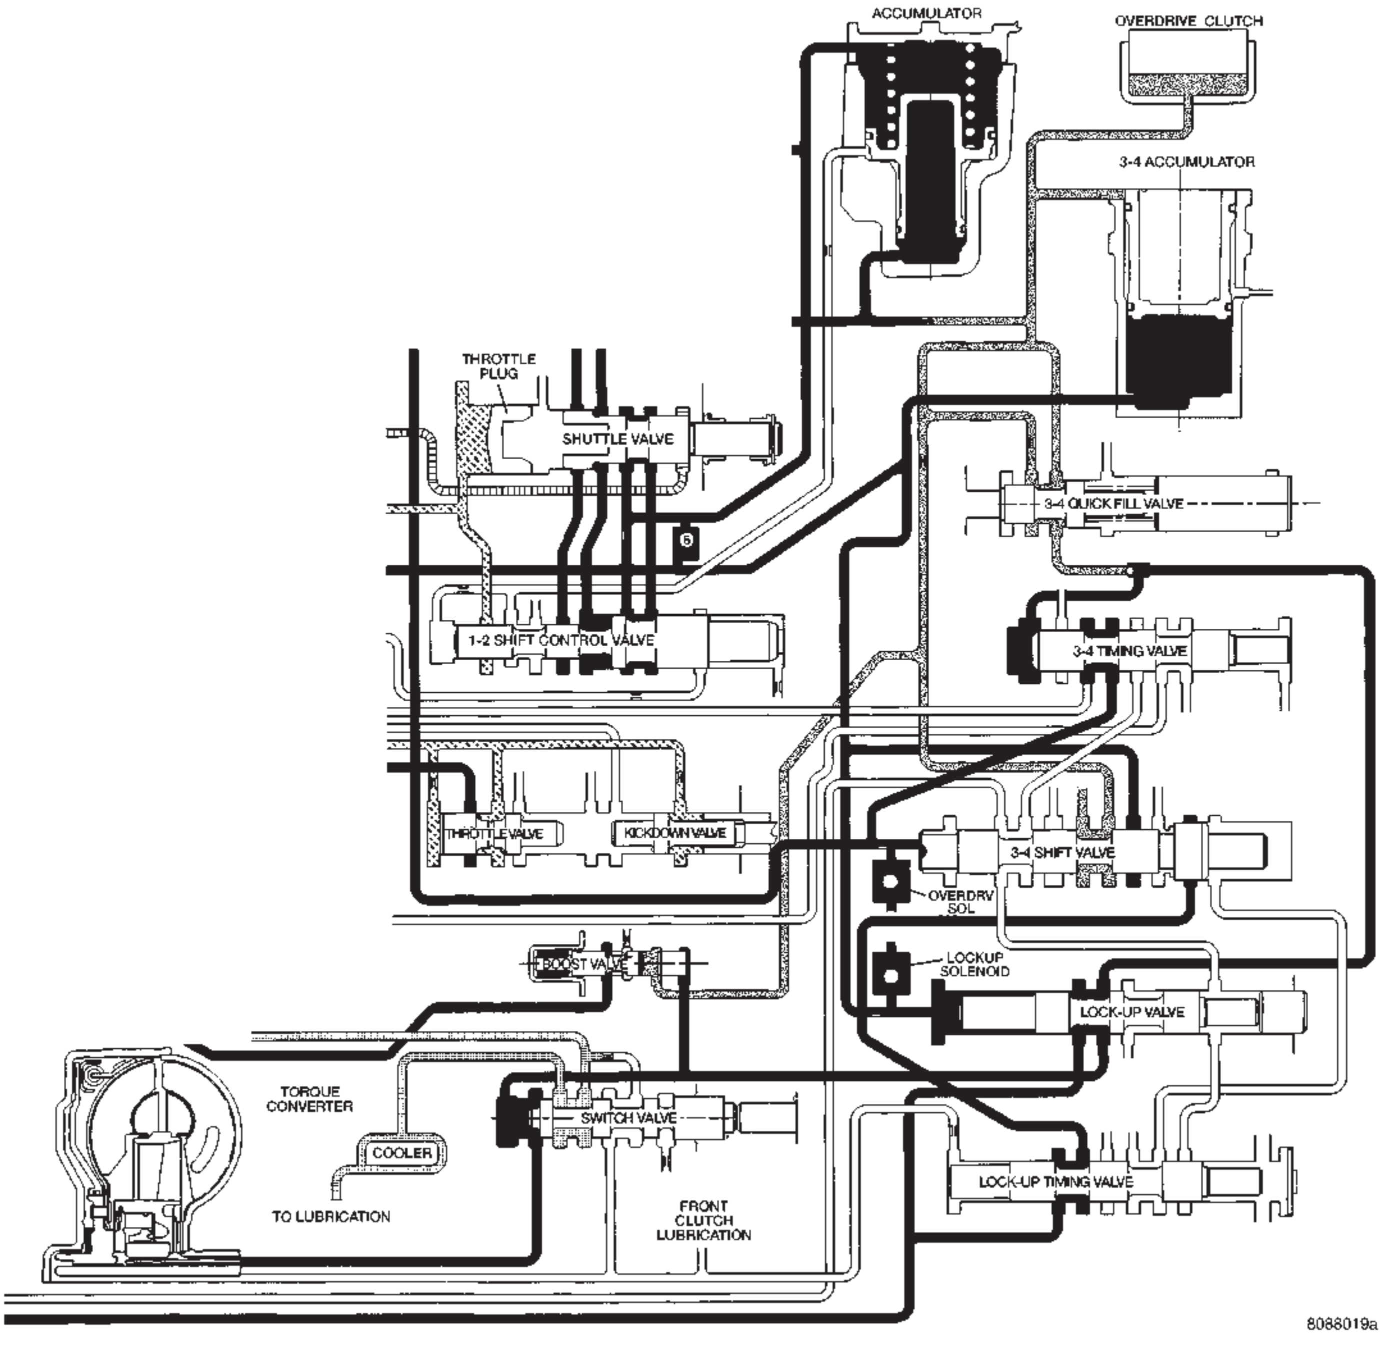

*Fig. 262 Switch Valve-Torque Converter Locked*

## MANUAL VALVE

The manual valve (Fig. 263) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

## CONVERTER CLUTCH LOCK-UP VALVE

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

VALVE BODY (Continued)

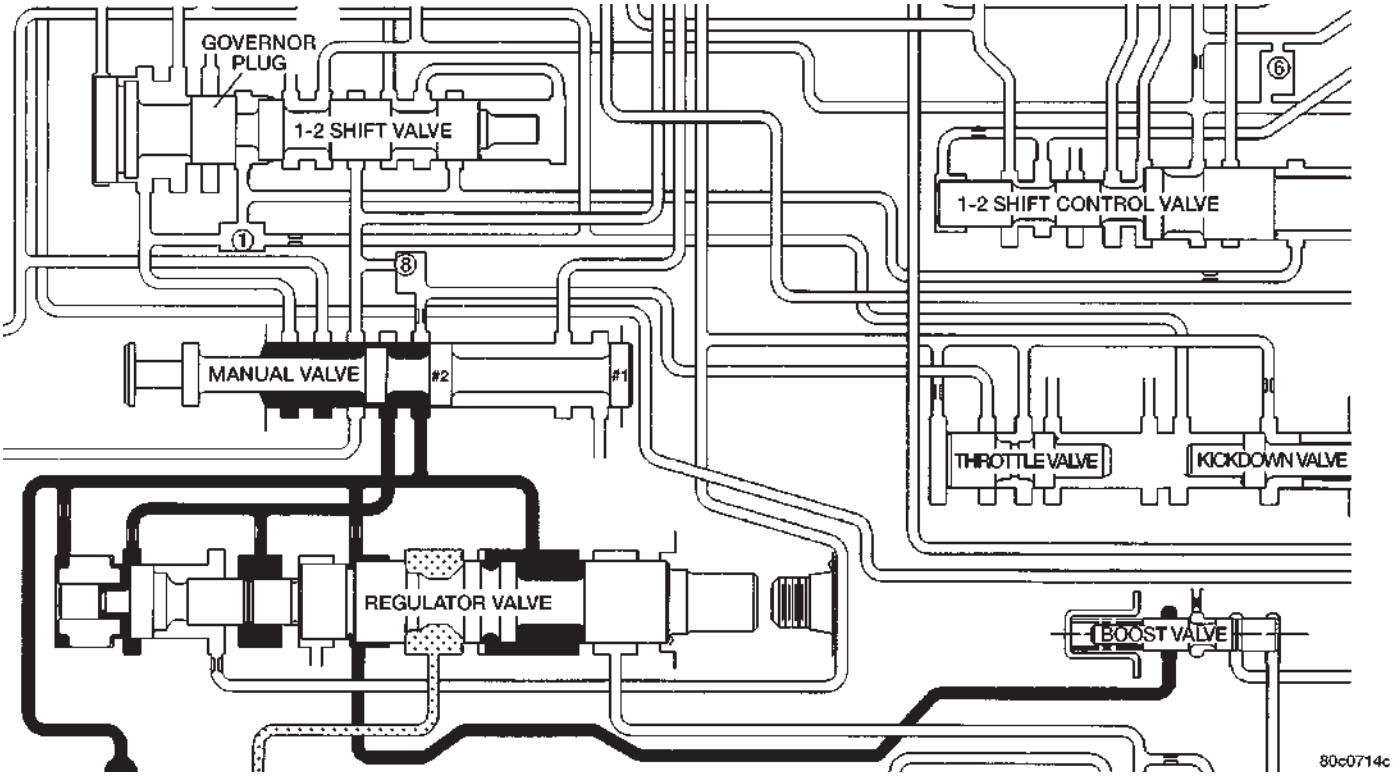

*Fig. 263 Manual Valve*

## CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

## SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 255) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by–pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 “lift foot” upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

## BOOST VALVE

The boost valve (Fig. 264) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 265), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

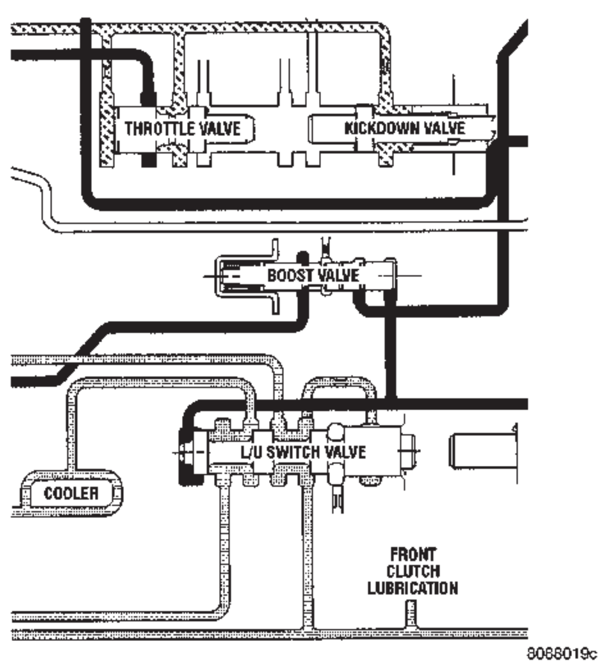

*Fig. 264 Boost Valve Before Lock-up*

VALVE BODY (Continued)

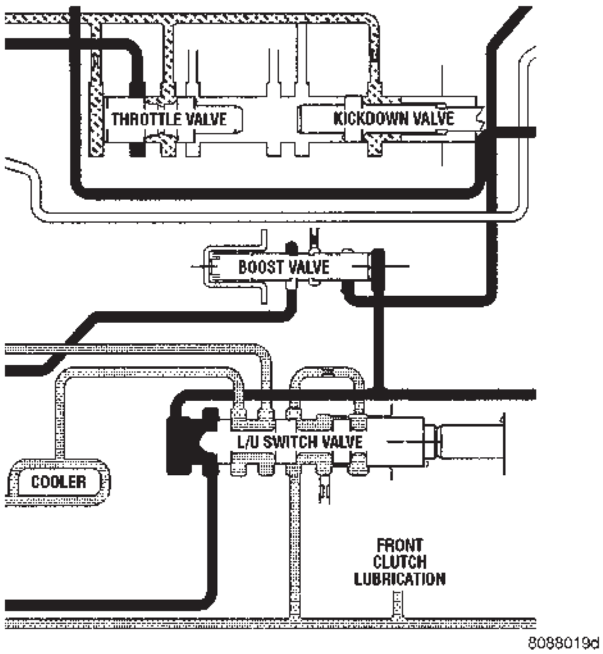

*Fig. 265 Boost Valve After Lock-up*

## REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).
- Converter clutch/overdrive solenoid assembly and harness .
- Governor housing gasket.
- Solenoid case connector O-rings.

(1) Shift transmission into NEUTRAL.

(2) Raise vehicle.

(3) Remove gearshift and throttle levers from shaft of valve body manual lever.

(4) Disconnect wires at solenoid case connector (Fig. 266).

(5) Position drain pan under transmission oil pan.

(6) Remove transmission oil pan and gasket.

(7) Remove fluid filter from valve body.

(8) Remove bolts attaching valve body to transmission case.

(9) Lower valve body enough to remove accumulator piston and springs.

(10) Work manual lever shaft and electrical connector out of transmission case.

(11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 267).

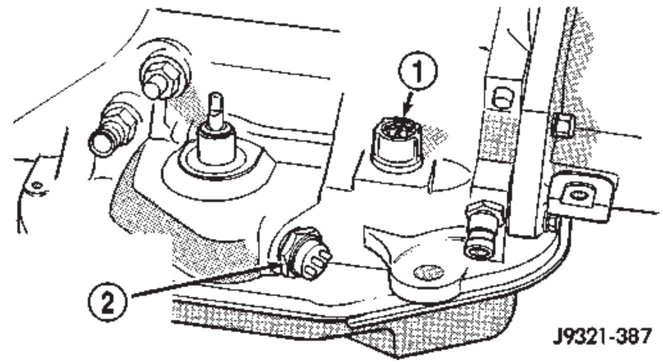

*Fig. 266 Transmission Case Connector*

## DISASSEMBLY

**CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.**

(1) Disconnect wires from governor pressure sensor and solenoid.

(2) Remove screws attaching governor body and retainer plate to transfer plate.

(3) Remove retainer plate, governor body and gasket from transfer plate.

(4) Remove governor pressure sensor from governor body.

(5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 268). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

(7) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 269).

(8) Turn valve body over and remove screws that attach overdrive/converter solenoid assembly to valve body (Fig. 270).

(9) Remove solenoid and harness assembly from valve body (Fig. 271).

(10) Remove boost valve cover (Fig. 272).

(11) Remove boost valve retainer, valve spring and boost valve (Fig. 273).

VALVE BODY (Continued)

(12) Secure detent ball and spring with Retainer Tool 6583 (Fig. 274).

(13) Remove park rod E-clip and separate rod from manual lever (Fig. 275).

(14) Remove E-clip and washer that retains throttle lever shaft in manual lever (Fig. 276).

(15) Remove manual lever and throttle lever (Fig. 277). Rotate and lift manual lever off valve body and throttle lever shaft. Then slide throttle lever out of valve body.

(16) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 278).

(17) Remove screws attaching pressure adjusting screw bracket to valve body and transfer plate (Fig. 279). Hold bracket firmly against spring tension while removing last screw.

(18) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 280). Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.

(19) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 281).

(20) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 281).

VALVE BODY (Continued)

(21) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 282).

(22) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 283).

(23) Remove left-side screw and remove 3-4 accumulator housing from valve body (Fig. 284).

(24) Bend back tabs on boost valve tube brace (Fig. 285).

VALVE BODY (Continued)

(25) Remove boost valve connecting tube (Fig. 286). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

**CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.**

(26) Turn valve body over so lower housing is facing upward (Fig. 287). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(27) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 287). Note position of boost valve tube brace for assembly reference.

(28) Remove lower housing and overdrive separator plate from transfer plate (Fig. 287).

(29) Remove the ECE check ball from the transfer plate (Fig. 288). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(30) Remove transfer plate from upper housing (Fig. 289).

(31) Turn transfer plate over so upper housing separator plate is facing upward.

(32) Remove upper housing separator plate from transfer plate (Fig. 290). Note position of filter in separator plate for assembly reference.

(33) Remove rear clutch and rear servo check balls from transfer plate. Note check ball location for assembly reference (Fig. 291).

## VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 292). Then remove the one large diameter and the six smaller diameter check balls.

(2) Remove governor plug and shuttle valve covers (Fig. 294).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 293).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 294).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 281).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 295).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 295).

(9) Remove 1-2 shift control valve and spring (Fig. 295).

(10) Remove 1-2 shift valve and spring (Fig. 295).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 295).

(12) Remove pressure plug cover (Fig. 295).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 295).

## CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either part has sustained physical damage (dented, deformed, broken, etc.)

.

**CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.**

## INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

**CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.**

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

VALVE BODY (Continued)

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

## ASSEMBLY

**CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Over-tightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.**

### LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 298).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

### 3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 299).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

### TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 298).

(2) Install filter screen in upper housing separator plate (Fig. 299).

(3) Align and position upper housing separator plate on transfer plate (Fig. 300).

(4) Install brace plate (Fig. 300). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

3 - SEPARATOR PLATE

## UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 301). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 302). Be sure filter screen is seated in proper housing recess.

(3) Install the ECE check ball into the transfer plate (Fig. 290). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 303).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 304).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 304).

## UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 305), (Fig. 306) and (Fig. 307) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

## BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 308).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 308).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 309).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 309).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 310).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

## 3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 311).

(2) Loosely attach accumulator housing with right-side screw (Fig. 311). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 312). Tighten screws to 4 N·m (35 in. lbs.).

2 - CONVERTER CLUTCH VALVE PLUG

## VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 313).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 314).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 315). Seat tang in dimple before tightening connector screw.

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(21) Verify that solenoid wire harness is properly routed (Fig. 316). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

2 - 3-4 ACCUMULATOR COVER PLATE

## GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

VALVE BODY (Continued)

## INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 317). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 318).

(3) Check condition of seals on accumulator piston (Fig. 319). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

**CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.**

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

## ADJUSTMENTS - VALVE BODY

### CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

#### LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 320).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

**NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.**

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

#### THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 321).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

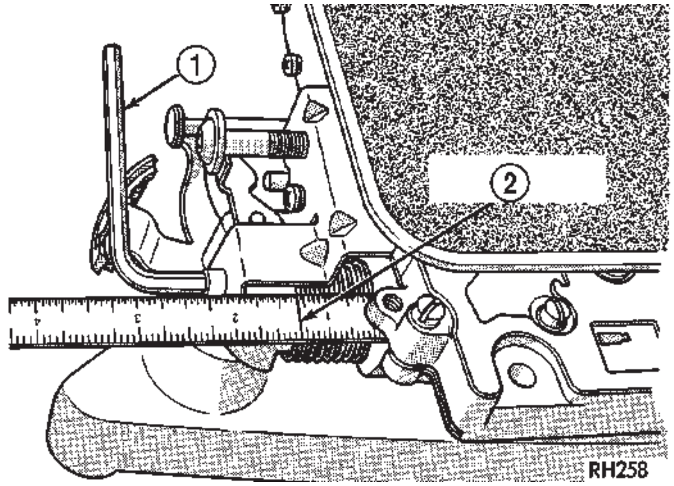

*Fig. 320 Line Pressure Adjustment*

1 - WRENCH
2 - 1–5/16 INCH

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

**NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.**

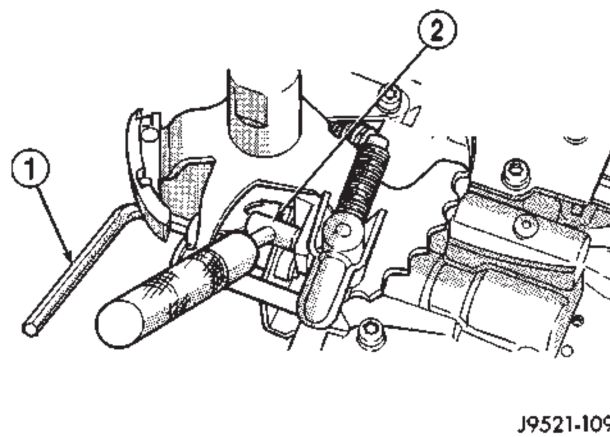

*Fig. 321 Throttle Pressure Adjustment*

2 - SPECIAL TOOL C-3763 (POSITIONED BETWEEN THROTTLE LEVER AND KICKDOWN VALVE)

# AUTOMATIC TRANSMISSION - 46RE

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION - 46RE

## DESCRIPTION

The 46RE (Fig. 1) is a four speed fully automatic transmissions with an electronic governor. The 46RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

## IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan gasket surface (Fig. 2). Refer to this information when ordering replacement parts.

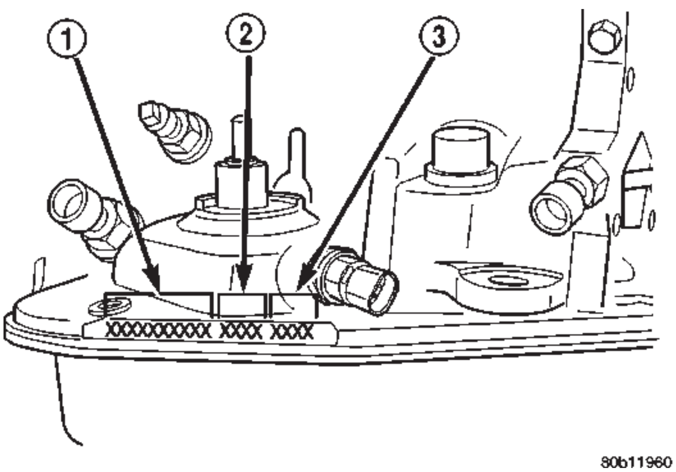

*Fig. 2 Transmission Part And Serial Number Location*

1 - PART NUMBER
2 - BUILD DATE
3 - SERIAL NUMBER

## GEAR RATIOS The 46RE gear ratios are:

**1st** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.45:1
**2nd** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1.45:1
**3rd** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1.00:1
**4th** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 0.69:1
**1st** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.45:1
**Rev.** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.21

## OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 46RE (Continued)

## PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

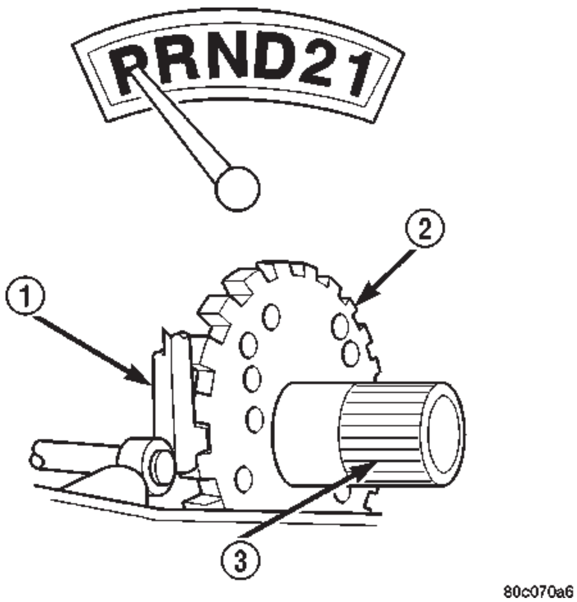

***Fig. 3 Park Powerflow***

1 - PAWL ENGAGED FOR PARK
2 - PARK SPRAG
3 - OUTPUT SHAFT

## NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

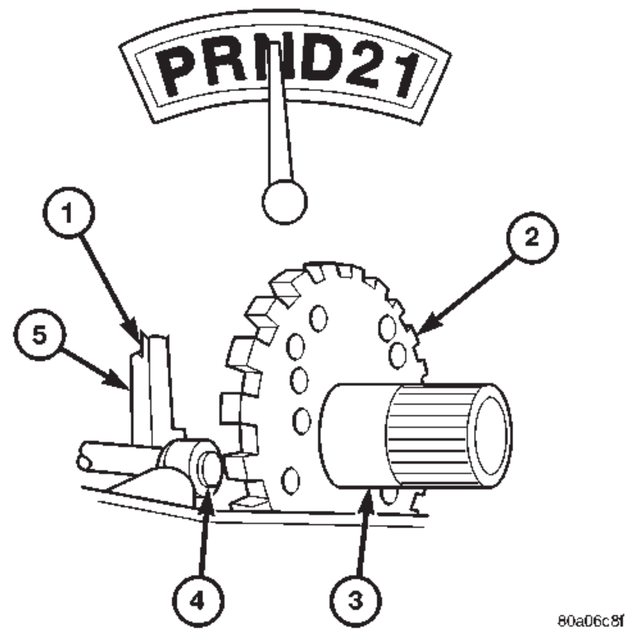

***Fig. 4 Neutral Powerflow***

AUTOMATIC TRANSMISSION - 46RE (Continued)

## REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

AUTOMATIC TRANSMISSION - 46RE (Continued)

## FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

### SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed. Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

8 - KICKDOWN BAND APPLIED
9 - INPUT SHAFT

## DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

## FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

## DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

## DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

### VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB® scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform hydraulic pressure test if shift problems were noted during road test.

(6) Perform air-pressure test to check clutch-band operation.

### VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

## DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 46RE (Continued)

**CLUTCH AND BAND APPLICATION CHART**

| SHIFT LEVER POSITION | TRANSMISSION CLUTCHES AND BANDS | | | | | OVERDRIVE CLUTCHES | | |
|---|---|---|---|---|---|---|---|---|
| | FRONT CLUTCH | FRONT BAND | REAR CLUTCH | REAR BAND | OVER-RUNNING CLUTCH | OVER-DRIVE CLUTCH | DIRECT CLUTCH | OVER-RUNNING CLUTCH |
| Reverse | X | | | X | | | X | |
| Drive - First | | | X | | X | | X | X |
| Drive - Second | | X | X | | | | X | X |
| Drive - Third | X | | X | | | | X | X |
| Drive - Fourth | X | | X | | | X | | |
| Manual Second | | X | X | | X | | X | X |
| Manual First | | | X | X | X | | X | X |

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

## DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

### Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

AUTOMATIC TRANSMISSION - 46RE (Continued)

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

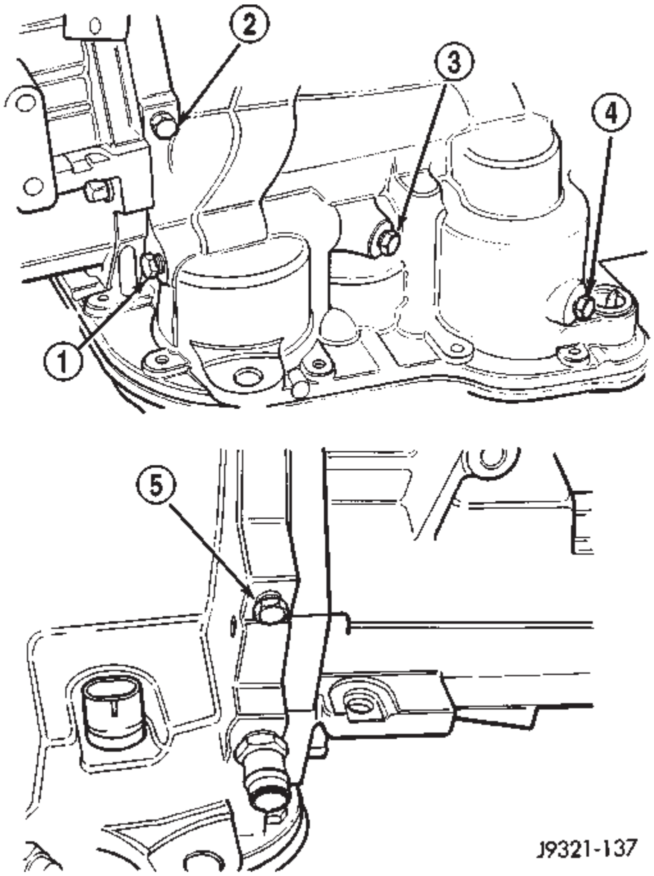

*Fig. 9 Pressure Test Port Locations*

1 - REAR SERVO TEST PORT
2 - GOVERNOR TEST PORT
3 - ACCUMULATOR TEST PORT
4 - FRONT SERVO TEST PORT
5 - OVERDRIVE CLUTCH TEST PORT

#### Test One - Transmission In Manual Low

**NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.**

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

#### Test Two - Transmission In 2 Range

**NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.**

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

#### Test Three - Transmission In D Range Third Gear

**NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.**

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

AUTOMATIC TRANSMISSION - 46RE (Continued)

### Test Four - Transmission In Reverse

**NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.**

(1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.

(2) Move 300 psi Gauge C-3293-SP back to rear servo port.

(3) Have helper start and run engine at 1600 rpm for test.

(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.

(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.

(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

### Test Five - Governor Pressure

**NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.**

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.
- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

### Test Six - Transmission In Overdrive Fourth Gear

**NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.**

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

AUTOMATIC TRANSMISSION - 46RE (Continued)

*PRESSURE TEST ANALYSIS CHART*

| TEST CONDITION | INDICATION |
|---|---|
| Line pressure OK during any one test | Pump and regulator valve OK |
| Line pressure OK in R but low in D, 2, 1 | Leakage in rear clutch area (seal rings, clutch seals) |
| Pressure low in D Fourth Gear Range | Overdrive clutch piston seal, or check ball problem |
| Pressure OK in 1, 2 but low in D3 and R | Leakage in front clutch area |
| Pressure OK in 2 but low in R and 1 | Leakage in rear servo |
| Front servo pressure in 2 | Leakage in servo; broken servo ring or cracked servo piston |
| Pressure low in all positions | Clogged filter, stuck regulator valve, worn or faulty pump, low oil level |
| Governor pressure too high at idle speed | Governor pressure solenoid valve system fault. Refer to diagnostic book. |
| Governor pressure low at all mph figures | Faulty governor pressure solenoid, transmission control module, or governor pressure sensor |
| Lubrication pressure low at all throttle positions | Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter. |
| Line pressure high | Output shaft plugged, sticky regulator valve |
| Line pressure low | Sticky regulator valve, clogged filter, worn pump |

## DIAGNOSIS AND TESTING - AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

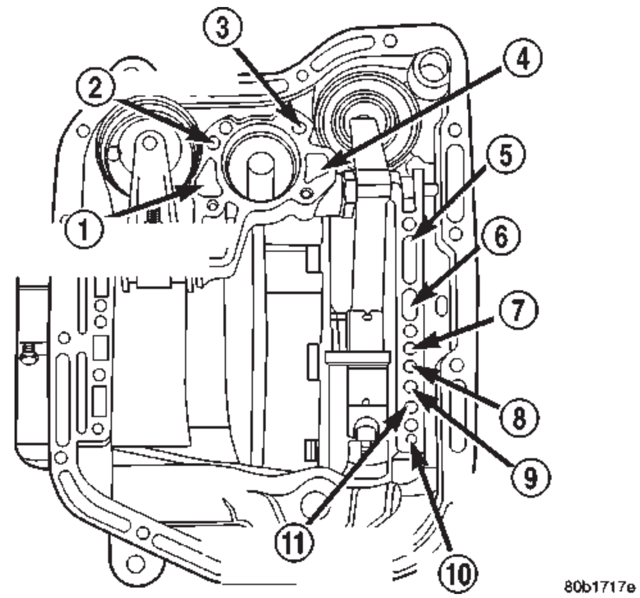

***Fig. 10 Air Pressure Test Passages***

1 - LINE PRESSURE TO ACCUMULATOR
2 - REAR SERVO APPLY
3 - FRONT SERVO APPLY
4 - FRONT SERVO RELEASE
5 - PUMP SUCTION
6 - PUMP PRESSURE
7 - FRONT CLUTCH APPLY
8 - REAR CLUTCH APPLY
9 - TO TORQUE CONVERTOR
10 - TO COOLER
11 - FROM TORQUE CONVERTER

### Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Front Servo Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

### Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

AUTOMATIC TRANSMISSION - 46RE (Continued)

## DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

(1) Verify that a leak condition actually exists.

(2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

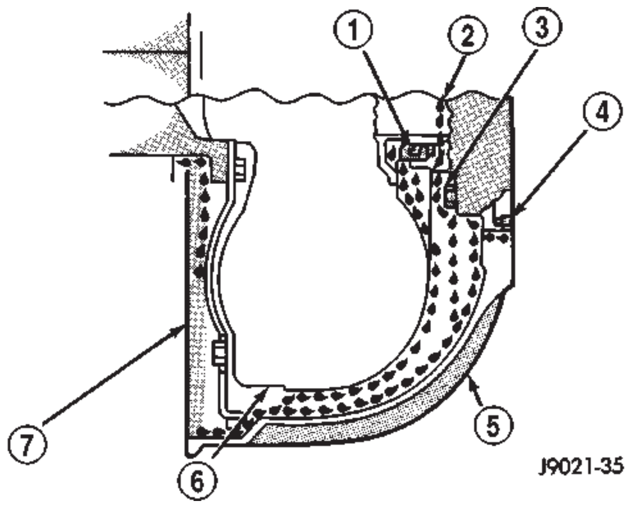

*Fig. 11 Converter Housing Leak Paths*

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

## TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

(1) Leaks at the weld joint around the outside diameter weld (Fig. 12).

(2) Leaks at the converter hub weld (Fig. 12).

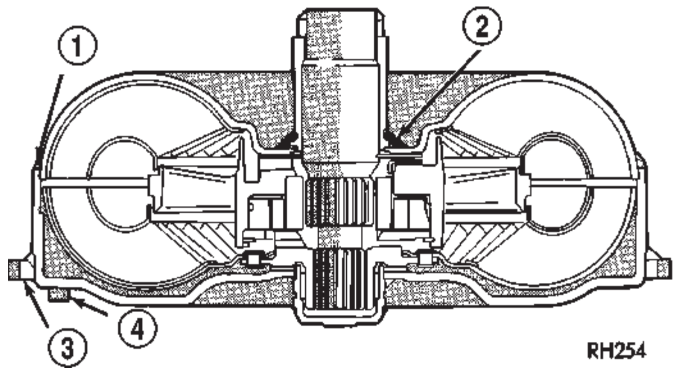

*Fig. 12 Converter Leak Points - Typical*

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

## CONVERTER HOUSING AREA LEAK CORRECTION

(1) Remove converter.

(2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.

(3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

AUTOMATIC TRANSMISSION - 46RE (Continued)

## DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

**DIAGNOSIS CHARTS**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Add Fluid |
| | 2. Throttle Linkage Mis-adjusted. | 2. Adjust linkage - setting may be too long. |
| | 3. Mount and Driveline Bolts Loose. | 3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts. |
| | 4. U-Joint Worn/Broken. | 4. Remove propeller shaft and replace U-Joint. |
| | 5. Axle Backlash Incorrect. | 5. Check per Service Manual. Correct as needed. |
| | 6. Hydraulic Pressure Incorrect. | 6. Check pressure. Remove, overhaul or adjust valve body as needed. |
| | 7. Band Mis-adjusted. | 7. Adjust rear band. |
| | 8. Valve Body Check Balls Missing. | 8. Inspect valve body for proper check ball installation. |
| | 9. Axle Pinion Flange Loose. | 9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged. |
| | 10. Clutch, band or planetary component damaged. | 10. Remove, disassemble and repair transmission as necessary. |
| | 11. Converter Clutch Faulty. | 11. Replace converter and flush cooler and line before installing new converter. |
| DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Correct level and check for leaks. |
| | 2. Filter Clogged. | 2. Change filter. |
| | 3. Gearshift Linkage Mis-adjusted. | 3. Adjust linkage and repair linkage if worn or damaged. |
| | 4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump). | 4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house. |
| | 5. Rear Band Mis-adjusted. | 5. Adjust band. |
| | 6. Valve Body Filter Plugged. | 6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary. |
| | 7. Oil Pump Gears Worn/Damaged. | 7. Remove transmission and replace oil pump. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 8. Governor Circuit and Solenoid Valve Electrical Fault. | 8. Test with DRB® scan tool and repair as required. |
| | 9. Hydraulic Pressure Incorrect. | 9. Perform pressure test, remove transmission and repair as needed. |
| | 10. Reaction Shaft Seal Rings Worn/Broken. | 10. Remove transmission, remove oil pump and replace seal rings. |
| | 11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged. | 11. Remove and disassemble transmission and repair as necessary. |
| | 12. Regulator Valve Stuck. | 12. Clean. |
| | 13. Cooler Plugged. | 13. Transfer case failure can plug cooler. |
| NO DRIVE RANGE (REVERSE OK) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Repair or replace linkage components. |
| | 3. Rear Clutch Burnt. | 3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed. |
| | 4. Valve Body Malfunction. | 4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged. |
| | 5. Transmission Overrunning Clutch Broken. | 5. Remove and disassemble transmission. Replace overrunning clutch. |
| | 6. Input Shaft Seal Rings Worn/ Damaged. | 6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts. |
| | 7. Front Planetary Failed Broken. | 7. Remove and repair. |
| NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts. |
| | 3. U-Joint/Axle/Transfer Case Broken. | 3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section. |
| | 4. Filter Plugged. | 4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary. |
| | 5. Oil Pump Damaged. | 5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 6. Valve Body Malfunctioned. | 6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition. |
| | 7. Transmission Internal Component Damaged. | 7. Remove and disassemble transmission. Repair or replace failed components as needed. |
| | 8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck. | 8. Remove, disassemble, repair. |
| | 9. Torque Converter Damage. | 9. Inspect and replace as required. |
| SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES) | 1. Fluid Level Low/High. | 1. Correct fluid level and check for leaks if low. |
| | 2. Fluid Filter Clogged. | 2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage as described in service section. |
| | 4. Throttle Linkage Binding. | 4. Check cable for binding. Check for return to closed throttle at transmission. |
| | 5. Gearshift Linkage/Cable Mis-adjusted. | 5. Adjust linkage/cable as described in service section. |
| | 6. Clutch or Servo Failure. | 6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed. |
| | 7. Governor Circuit Electrical Fault. | 7. Test using DRB® scan tool and repair as required. |
| | 8. Front Band Mis-adjusted. | 8. Adjust band. |
| | 9. Pump Suction Passage Leak. | 9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed. |
| NO REVERSE (D RANGES OK) | 1. Gearshift Linkage/Cable Mis-adjusted/Damaged. | 1. Repair or replace linkage parts as needed. |
| | 2. Park Sprag Sticking. | 2. Replace overdrive annulus gear. |
| | 3. Rear Band Mis-adjusted/Worn. | 3. Adjust band; replace. |
| | 4. Valve Body Malfunction. | 4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged. |
| | 5. Rear Servo Malfunction. | 5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary. |
| | 6. Direct Clutch in Overdrive Worn. | 6. Disassemble overdrive. Replace worn or damaged parts. |
| | 7. Front Clutch Burnt. | 7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT) | 1. Governor Circuit Electrical Fault. | 1. Test using DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Repair stuck 1-2 shift valve or governor plug. |
| | 3. Front Servo/Kickdown Band Damaged/Burned. | 3. Repair/replace. |
| MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW | 1. Valve Body Malfunction. | 1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug. |
| NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY) | 1. Governor Circuit Electrical Fault. | 1. Test with DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs. |
| | 3. Front Servo Piston Cocked in Bore. | 3. Inspect servo and repair as required. |
| | 4. Front Band Linkage Malfunction | 4. Inspect linkage and look for bind in linkage. |
| NO KICKDOWN OR NORMAL DOWNSHIFT | 1. Throttle Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Accelerator Pedal Travel Restricted. | 2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets. |
| | 3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments. | 3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |
| | 4. Governor Circuit Electrical Fault. | 4. Test with DRB® scan tool and repair as required. |
| | 5. Valve Body Malfunction. | 5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |
| | 6. TPS Malfunction. | 6. Replace sensor, check with DRB® scan tool. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if required. |
| | 8. Valve Body Malfunction. | 8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| STUCK IN LOW GEAR (WILL NOT UPSHIFT) | 1. Throttle Linkage Mis-adjusted/ Stuck. | 1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage and repair linkage if worn or damaged. |
| | 3. Governor Component Electrical Fault. | 3. Check operating pressures and test with DRB® scan tool, repair faulty component. |
| | 4. Front Band Out of Adjustment. | 4. Adjust Band. |
| | 5. Clutch or Servo Malfunction. | 5. Air pressure check operation of clutches and bands. Repair faulty component. |
| CREEPS IN NEUTRAL | 1. Gearshift Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Rear Clutch Dragging/Warped. | 2. Disassemble and repair. |
| | 3. Valve Body Malfunction. | 3. Perform hydraulic pressure test to determine cause and repair as required. |
| BUZZING NOISE | 1. Fluid Level Low | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Mis-assembled. | 2. Route cable away from engine and bell housing. |
| | 3. Valve Body Mis-assembled. | 3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws. |
| | 4. Pump Passages Leaking. | 4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts. |
| | 5. Cooling System Cooler Plugged. | 5. Flow check cooler circuit. Repair as needed. |
| | 6. Overrunning Clutch Damaged. | 6. Replace clutch. |
| SLIPS IN REVERSE ONLY | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage. |
| | 3. Rear Band Mis-adjusted. | 3. Adjust band. |
| | 4. Rear Band Worn. | 4. Replace as required. |
| | 5. Overdrive Direct Clutch Worn. | 5. Disassemble overdrive. Repair as needed. |
| | 6. Hydraulic Pressure Too Low. | 6. Perform hydraulic pressure tests to determine cause. |
| | 7. Rear Servo Leaking. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Band Linkage Binding. | 8. Inspect and repair as required. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN FORWARD DRIVE RANGES | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Fluid Foaming. | 2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage. |
| | 4. Gearshift Linkage Mis-adjusted. | 4. Adjust linkage. |
| | 5. Rear Clutch Worn. | 5. Inspect and replace as needed. |
| | 6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines. | 6. Perform hydraulic and air pressure tests to determine cause. |
| | 7. Rear Clutch Malfunction, Leaking Seals or Worn Plates. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only). | 8. Replace Clutch. |
| SLIPS IN LOW GEAR ″D″ ONLY, BUT NOT IN MANUAL 1 POSITION | Overrunning Clutch Faulty. | Replace overrunning clutch. |
| GROWLING, GRATING OR SCRAPING NOISES | 1. Drive Plate Broken. | 1. Replace. |
| | 2. Torque Converter Bolts Hitting Dust Shield. | 2. Dust shield bent. Replace or repair. |
| | 3. Planetary Gear Set Broken/ Seized. | 3. Check for debris in oil pan and repair as required. |
| | 4. Overrunning Clutch Worn/Broken. | 4. Inspect and check for debris in oil pan. Repair as required. |
| | 5. Oil Pump Components Scored/ Binding. | 5. Remove, inspect and repair as required. |
| | 6. Output Shaft Bearing or Bushing Damaged. | 6. Remove, inspect and repair as required. |
| | 7. Clutch Operation Faulty. | 7. Perform air pressure check and repair as required. |
| | 8. Front and Rear Bands Mis-adjusted. | 8. Adjust bands. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| DRAGS OR LOCKS UP | 1. Fluid Level Low. | 1. Check and adjust level. |
| | 2. Clutch Dragging/Failed | 2. Air pressure check clutch operation and repair as required. |
| | 3. Front or Rear Band Mis-adjusted. | 3. Adjust bands. |
| | 4. Case Leaks Internally. | 4. Check for leakage between passages in case. |
| | 5. Servo Band or Linkage Malfunction. | 5. Air pressure check servo operation and repair as required. |
| | 6. Overrunning Clutch Worn. | 6. Remove and inspect clutch. Repair as required. |
| | 7. Planetary Gears Broken. | 7. Remove, inspect and repair as required (look for debris in oil pan). |
| | 8. Converter Clutch Dragging. | 8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required. |
| NO 4-3 DOWNSHIFT | 1. Circuit Wiring and/or Connectors Shorted. | 1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required. |
| | 2. PCM Malfunction. | 2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty. |
| | 3. TPS Malfunction | 3. Check TPS with DRB® scan tool at PCM. |
| | 4. Lockup Solenoid Not Venting. | 4. Remove valve body and replace solenoid assembly if plugged or shorted. |
| | 5. Overdrive Solenoid Not Venting. | 5. Remove valve body and replace solenoid if plugged or shorted. |
| | 6. Valve Body Valve Sticking. | 6. Repair stuck 3-4 shift valve or lockup timing valve. |
| NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF | 1. Control Switch Open/Shorted. | 1. Test and replace switch if faulty. |
| | 2. Overdrive Solenoid Connector Shorted. | 2. Test solenoids and replace if seized or shorted. |
| | 3. PCM Malfunction. | 3. Test with DRB® scan tool. Replace PCM if faulty. |
| | 4. Valve Body Stuck Valves. | 4. Repair stuck 3-4, lockup or lockup timing valve. |
| CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT | 1. Transmission Fluid Low. | 1. Add Fluid. |
| | 2. Throttle Cable Mis-adjusted. | 2. Adjust cable. |
| | 3. Overdrive Clutch Select Spacer Wrong Spacer. | 3. Replace overdrive piston thrust plate spacer. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| 3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT | 1. Overdrive Solenoid Connector or Wiring Shorted. | 1. Test connector and wiring for loose connections, shorts or ground and repair as needed. |
| | 2. TPS Malfunction. | 2. Test TPS and replace as necessary. Check with DRB® scan tool. |
| | 3. PCM Malfunction. | 3. Test PCM with DRB® scan tool and replace controller if faulty. |
| | 4. Overdrive Solenoid Malfunction. | 4. Replace solenoid. |
| | 5. Valve Body Malfunction. | 5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed. |
| WHINE/NOISE RELATED TO ENGINE SPEED | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Incorrect Routing. | 2. Check shift cable for correct routing. Should not touch engine or bell housing. |
| NO 3-4 UPSHIFT | 1. O/D Switch In OFF Position. | 1. Turn control switch to ON position. |
| | 2. Overdrive Circuit Fuse Blown. | 2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit). |
| | 3. O/D Switch Wire Shorted/Open Cut. | 3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary. |
| | 4. Distance or Coolant Sensor Malfunction. | 4. Check with DRB® scan tool and repair or replace as necessary. |
| | 5. TPS Malfunction. | 5. Check with DRB® scan tool and replace if necessary. |
| | 6. Neutral Sense to PCM Wire Shorted/Cut. | 6. Test switch/sensor as described in service section and replace if necessary. Engine no start. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if necessary. |
| | 8. Overdrive Solenoid Shorted/Open. | 8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool). |
| | 9. Solenoid Feed Orifice in Valve Body Blocked. | 9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice. |
| | 10. Overdrive Clutch Failed. | 10. Disassemble overdrive and repair as needed. |
| | 11. Hydraulic Pressure Low. | 11. Pressure test transmission to determine cause. |
| | 12. Valve Body Valve Stuck. | 12. Repair stuck 3-4 shift valve, 3-4 timing valve. |
| | 13. O/D Piston Incorrect Spacer. | 13. Remove unit, check end play and install correct spacer. |
| | 14. Overdrive Piston Seal Failure. | 14. Replace both seals. |
| | 15. O/D Check Valve/Orifice Failed. | 15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN OVERDRIVE FOURTH GEAR | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Overdrive Clutch Pack Worn. | 2. Remove overdrive unit and rebuild clutch pack. |
| | 3. Overdrive Piston Retainer Bleed Orifice Blown Out. | 3. Disassemble transmission, remove retainer and replace orifice. |
| | 4. Overdrive Piston or Seal Malfunction. | 4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission. |
| | 5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction. | 5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned. |
| | 6. Overdrive Unit Thrust Bearing Failure. | 6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft). |
| | 7. O/D Check Valve/Bleed Orifice Failure. | 7. Check for function/secure orifice insert in O/D piston retainer. |
| DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Throttle Valve Cable Mis-adjusted. | 2. Adjust throttle valve cable. |
| | 3. Overdrive Clutch Pack Worn/ Burnt. | 3. Remove unit and rebuild clutch pack. |
| | 4. TPS Faulty. | 4. Test with DRB® scan tool and replace as necessary |
| | 5. Overdrive Clutch Bleed Orifice Plugged. | 5. Disassemble transmission and replace orifice. |
| | 6. Overdrive Solenoid or Wiring Shorted/Open. | 6. Test solenoid and check wiring for loose/corroded connections or shorts/ grounds. Replace solenoid if faulty and repair wiring if necessary. |
| | 7. Overdrive Excess Clearance. | 7. Remove unit. Measure end play and select proper spacer. |
| | 8. O/D Check Valve Missing or Stuck. | 8. Check for presence of check valve. Repair or replace as required. |
| TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR | Lockup Solenoid, Relay or Wiring Shorted/Open. | Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary. |
| HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS | Lockup Solenoid Malfunction. | Remove valve body and replace solenoid assembly. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO START IN PARK OR NEUTRAL | 1. Gearshift Linkage/Cable Mis-adjusted. | 1. Adjust linkage/cable. |
| | 2. Neutral Sense Wire Open/Cut. | 2. Check continuity with test lamp. Repair as required. |
| | 3. Park/Neutral Switch, or Transmission Range Sensor Faulty. | 3. Refer to service section for test and replacement procedure. |
| | 4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty. | 4. Connectors spread open. Repair. |
| | 5. Valve Body Manual Lever Assembly Bent/Worn/Broken. | 5. Inspect lever assembly and replace if damaged. |
| NO REVERSE (OR SLIPS IN REVERSE) | 1. Direct Clutch Pack (front clutch) Worn. | 1. Disassemble unit and rebuild clutch pack. |
| | 2. Rear Band Mis-adjusted. | 2. Adjust band. |
| | 3. Front Clutch Malfunctioned/ Burned. | 3. Air-pressure test clutch operation. Remove and rebuild if necessary. |
| | 4. Overdrive Thrust Bearing Failure. | 4. Disassemble geartrain and replace bearings. |
| | 5. Direct Clutch Spring Collapsed/ Broken. | 5. Remove and disassemble unit. Check clutch position and replace spring. |
| OIL LEAKS. | 1. Fluid Lines and Fittings Loose/ Leaks/Damaged. | 1. Tighten fittings. If leaks persist, replace fittings and lines if necessary. |
| | 2. Fill Tube (where tube enters case) Leaks/Damaged. | 2. Replace tube seal. Inspect tube for cracks in fill tube. |
| | 3. Pressure Port Plug Loose Loose/Damaged. | 3. Tighten to correct torque. Replace plug or reseal if leak persists. |
| | 4. Pan Gasket Leaks. | 4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket. |
| | 5. Valve Body Manual Lever Shaft Seal Leaks/Worn. | 5. Replace shaft seal. |
| | 6. Rear Bearing Access Plate Leaks. | 6. Replace gasket. Tighten screws. |
| | 7. Gasket Damaged or Bolts are Loose. | 7. Replace bolts or gasket or tighten both. |
| | 8. Adapter/Extension Gasket Damaged Leaks/Damaged. | 8. Replace gasket. |
| | 9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged. | 9. Replace switch and gasket. |
| | 10. Converter Housing Area Leaks. | 10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug. |

AUTOMATIC TRANSMISSION - 46RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 11. Pump Seal Leaks/Worn/ Damaged. | 11. Replace seal. |
| | 12. Torque Converter Weld Leak/Cracked Hub. | 12. Replace converter. |
| | 13. Case Porosity Leaks. | 13. Replace case. |
| NOISY OPERATION IN FOURTH GEAR ONLY | 1. Overdrive Clutch Discs, Plates or Snap Rings Damaged. | 1. Remove unit and rebuild clutch pack. |
| | 2. Overdrive Piston or Planetary Thrust Bearing Damaged. | 2. Remove and disassemble unit. Replace either thrust bearing if damaged. |
| | 3. Output Shaft Bearings Scored/ Damaged. | 3. Remove and disassemble unit. Replace either bearing if damaged. |
| | 4. Planetary Gears Worn/Chipped. | 4. Remove and overhaul overdrive unit. |
| | 5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored. | 5. Remove and overhaul overdrive unit. |

## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

## REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

(1) Disconnect battery negative cable.

(2) Disconnect and lower or remove necessary exhaust components.

(3) Remove engine-to-transmission struts, if equipped (Fig. 13).

(4) Disconnect fluid cooler lines at transmission.

(5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)

(6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.

(7) Remove torque converter access cover.

(8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

(9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

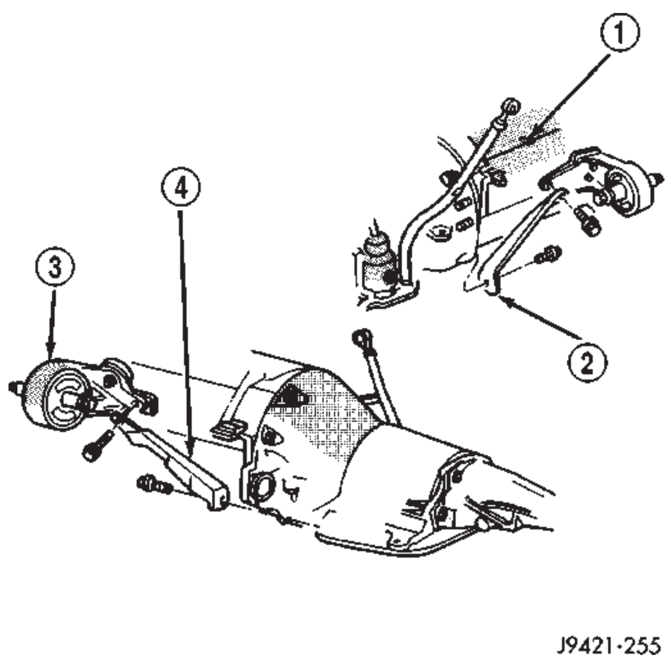

*Fig. 13 Transmission-To-Engine Strut Attachment*

1 - ENGINE BLOCK
2 - STRUT (PASSENGER SIDE)
3 - ENGINE MOUNT
4 - STRUT (DRIVER SIDE)

(10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

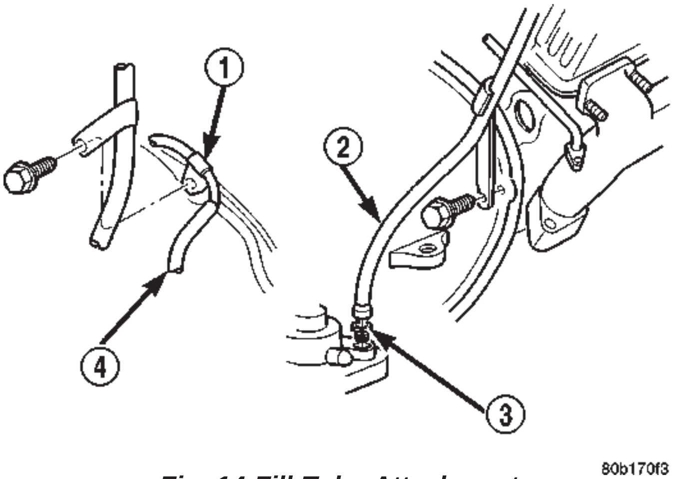

*Fig. 14 Fill Tube Attachment*

1 - TRANSFER CASE VENT TUBE
2 - FILL TUBE (V8)
3 - TUBE SEAL
4 - FILL TUBE (V6)

(12) Disconnect wires from park/neutral position switch and transmission solenoid.

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

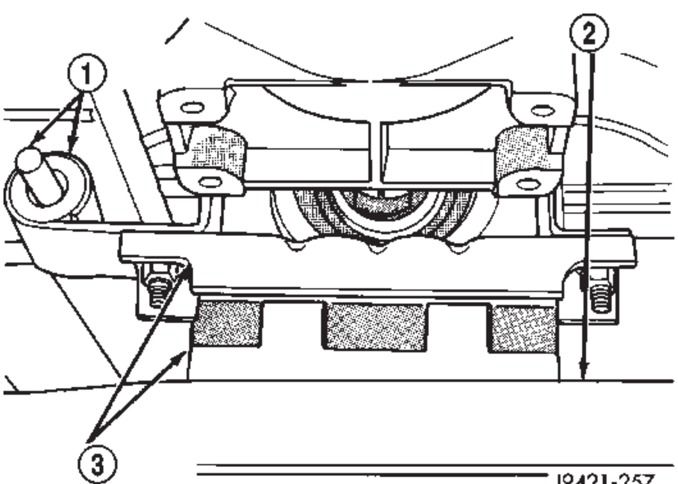

*Fig. 15 Rear Support Cushion*

1 - EXHAUST PIPE ARM AND BRACKET
2 - CROSSMEMBER
3 - REAR SUPPORT AND CUSHION

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

## DISASSEMBLY

(1) Clean exterior of transmission with suitable solvent or pressure washer.

(2) Place transmission in vertical position.

(3) Measure the input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-5 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. Record the maximum travel for assembly reference

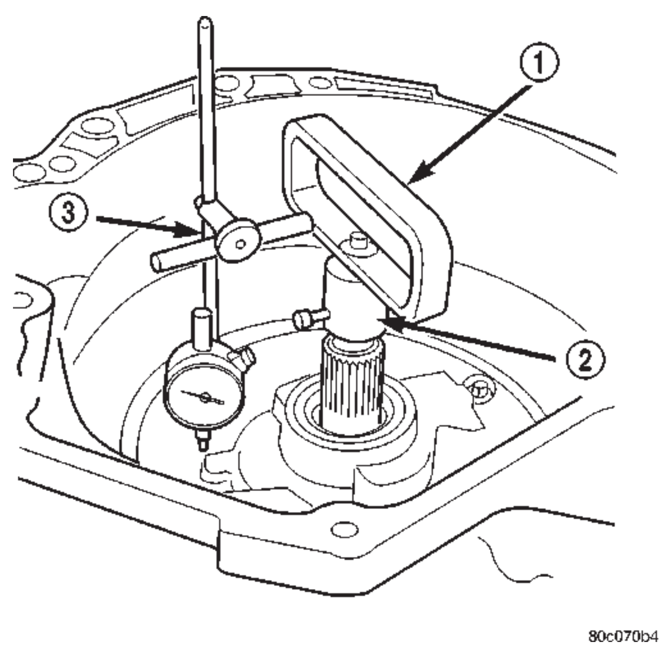

*Fig. 16 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-5
3 - TOOL C-3339

AUTOMATIC TRANSMISSION - 46RE (Continued)

(4) Remove throttle and shift levers from valve body manual shaft and throttle lever shaft.

(5) Remove transmission oil pan and gasket.

(6) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

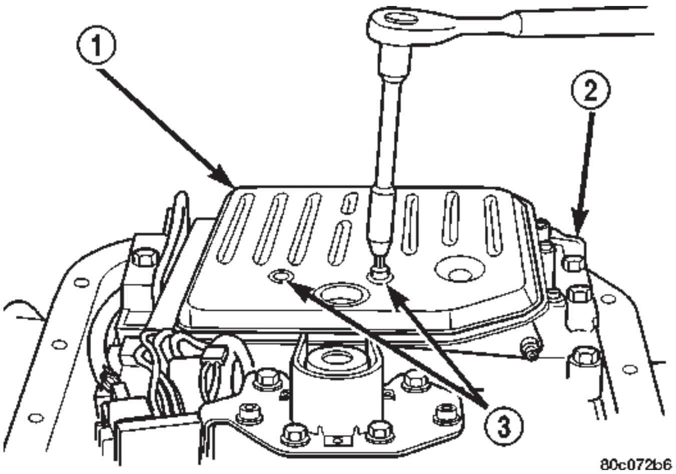

*Fig. 17 Oil Filter Removal*

1 - OIL FILTER
2 - VALVE BODY
3 - FILTER SCREWS (2)

(7) Remove park/neutral position switch and seal.

(8) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

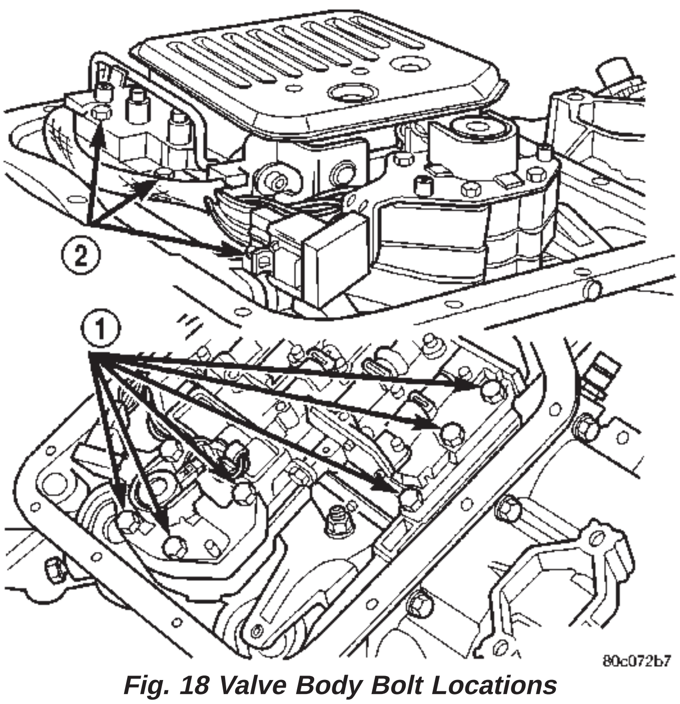

*Fig. 18 Valve Body Bolt Locations*

1 - VALVE BODY BOLTS
2 - VALVE BODY BOLTS

(9) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

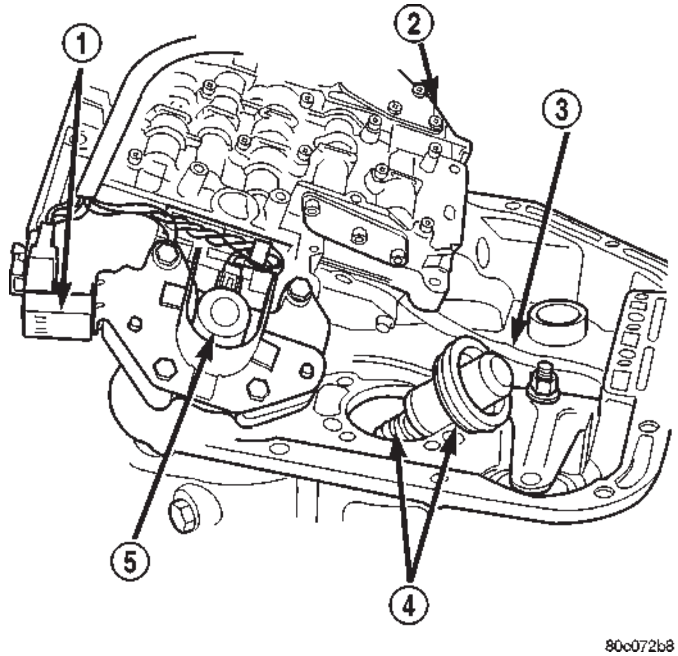

*Fig. 19 Valve Body Removal*

1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY
3 - PARK ROD
4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

(10) Remove accumulator outer spring, piston and inner spring (Fig. 20). Note position of piston and springs for assembly reference. Remove and discard piston seals if worn or cut.

(11) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

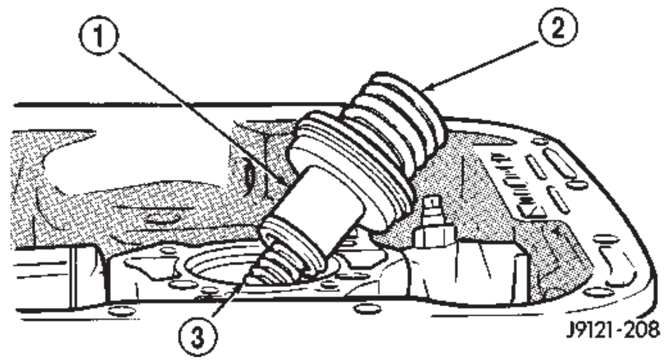

*Fig. 20 Accumulator Component Removal*

1 - ACCUMULATOR PISTON
2 - OUTER SPRING
3 - INNER SPRING

AUTOMATIC TRANSMISSION - 46RE (Continued)

(12) Remove front band lever pin access plug (Fig. 21). Use square end of 1/4 in. drive extension to remove plug as shown.

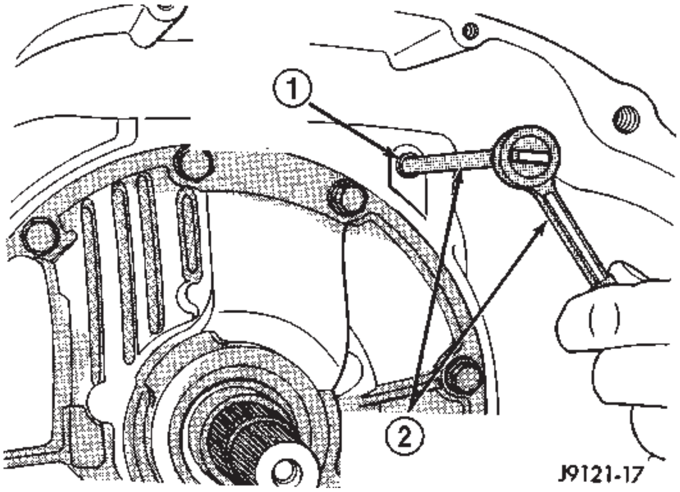

***Fig. 21 Front Band Lever Pin Access Plug***

1 - FRONT BAND REACTION PIN ACCESS PLUG
2 - 1/4 DRIVE EXTENSION AND RATCHET

(13) Remove oil pump and reaction shaft support assembly as follows:

(a) Tighten front band adjusting screw until band is tight around front clutch retainer (Fig. 22). This will prevent retainer from coming out with pump and possibly damaging clutch or pump components.

(b) Remove oil pump bolts.

(c) Thread Slide Hammer Tools C-3752 into threaded holes in flange of oil pump housing (Fig. 23).

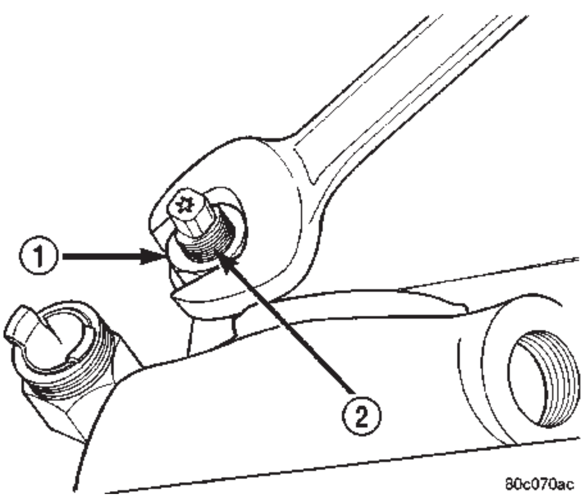

***Fig. 22 Tightening Front Band To Hold Front Clutch In Place***

1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

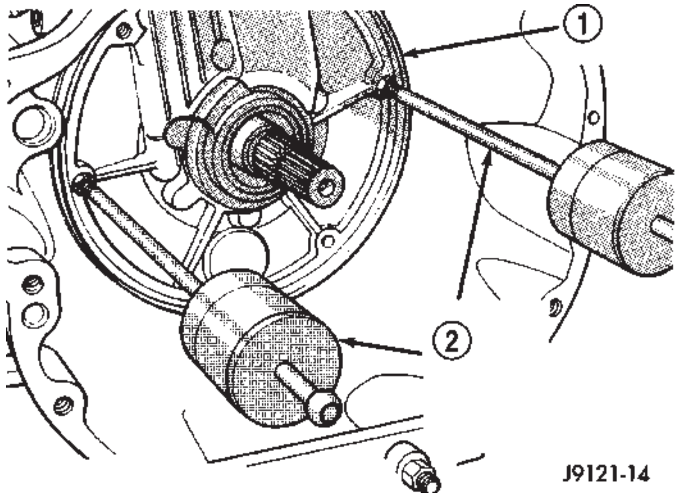

***Fig. 23 Oil Pump Removal Tools***

1 - PUMP HOUSING
2 - SLIDE HAMMER TOOLS (THREAD INTO PUMP HOUSING)

(d) Remove oil pump and reaction shaft support by bumping slide hammers outward alternately to pull pump from case (Fig. 24).

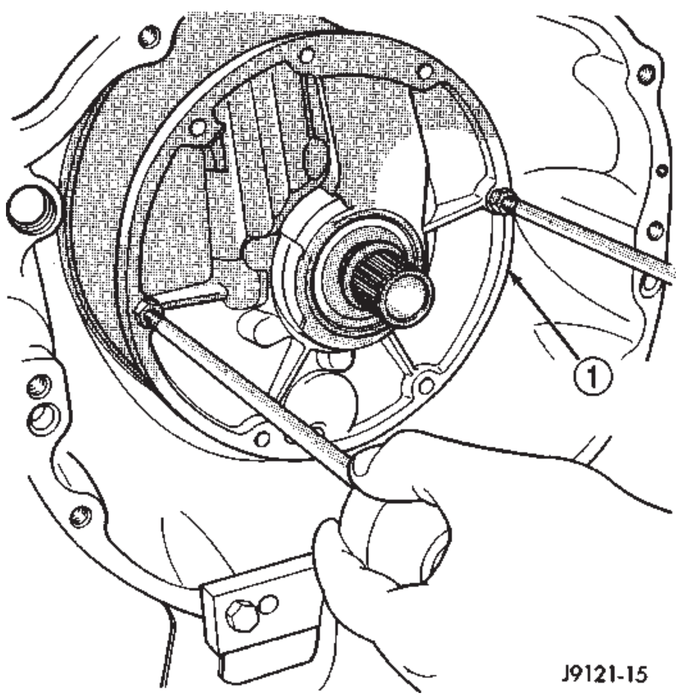

***Fig. 24 Oil Pump Removal***

1 - OIL PUMP AND REACTION SHAFT SUPPORT

AUTOMATIC TRANSMISSION - 46RE (Continued)

(14) Remove oil pump gasket (Fig. 25). Note gasket position in case for assembly reference.

(15) Loosen front band adjusting screw until band is completely loose.

(16) Remove front band strut and anchor (Fig. 26).

(17) Squeeze front band together slightly and slide band over front clutch retainer and out of case (Fig. 27).

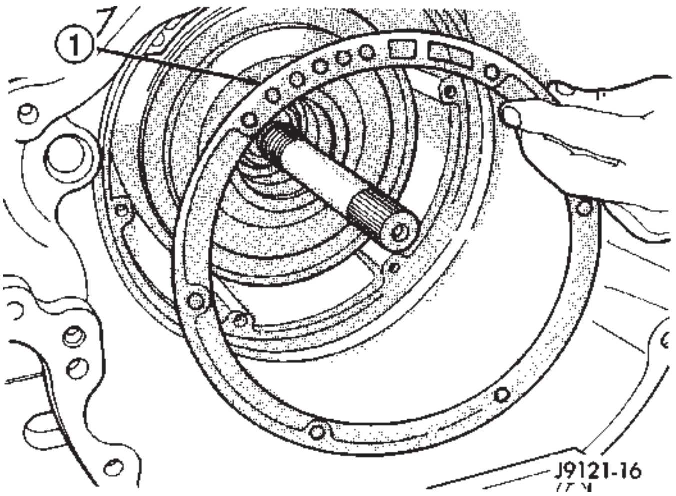

***Fig. 25 Oil Pump Gasket***

1 - OIL PUMP GASKET

1 - LEVER
2 - STRUT
3 - ANCHOR
4 - FRONT BAND

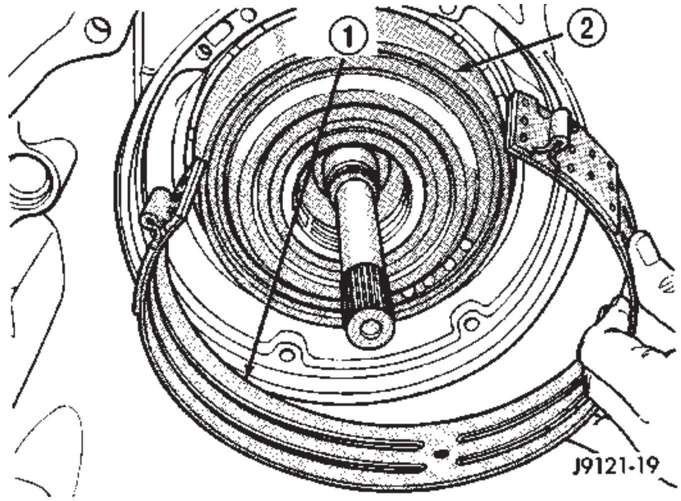

***Fig. 27 Front Band Removal***

1 - FRONT BAND
2 - FRONT CLUTCH RETAINER

(18) Remove front and rear clutch assemblies as a unit (Fig. 28).

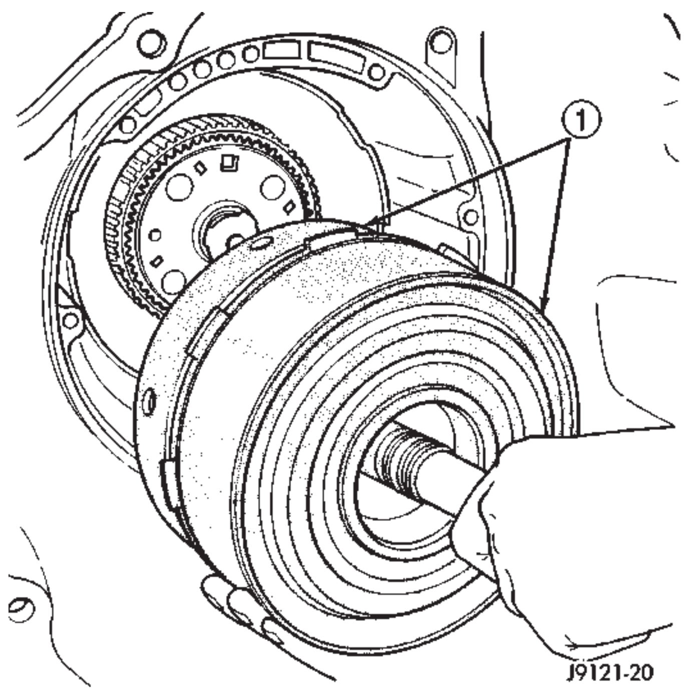

***Fig. 28 Removing Front/Rear Clutch Assemblies***

1 - FRONT AND REAR CLUTCH ASSEMBLIES

AUTOMATIC TRANSMISSION - 46RE (Continued)

(19) Remove front band reaction pin and lever. Start pin through lever and out of case bore with drift or punch. Then use pencil magnet to withdraw pin completely (Fig. 29).

(20) Remove intermediate shaft thrust washer. Triangular shaped washer will either be on shaft pilot hub or in rear clutch retainer (Fig. 30).

(21) Remove thrust plate from intermediate shaft hub (Fig. 31).

(22) Remove intermediate shaft-planetary geartrain assembly (Fig. 32).

(23) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

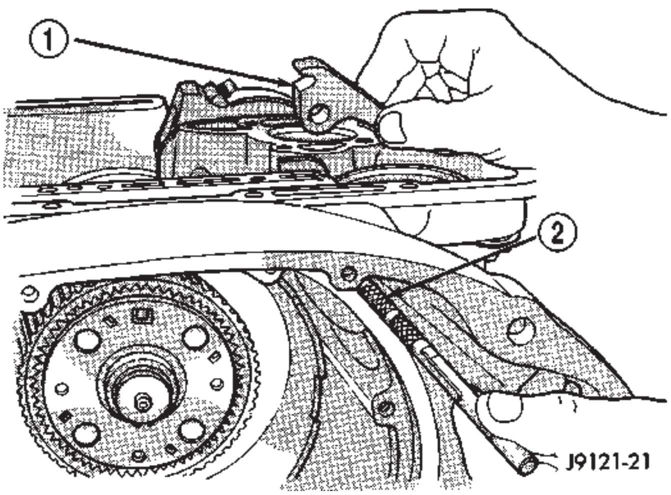

***Fig. 29 Front Band Lever And Pin***

1 - BAND LEVER
2 - USE PENCIL MAGNET TO REMOVE REACTION PIN

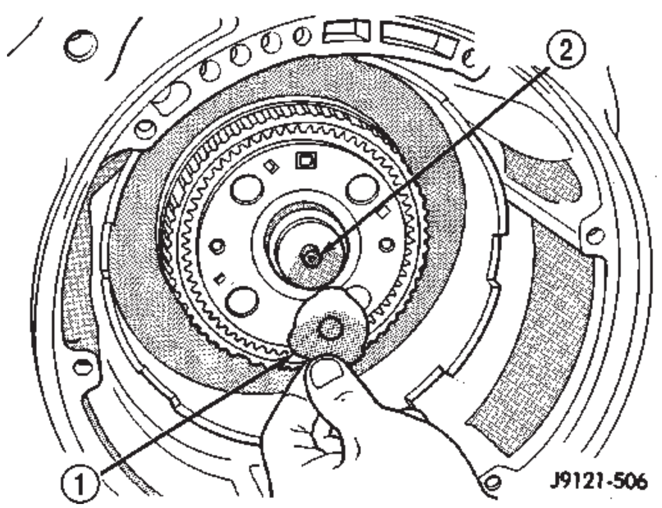

***Fig. 30 Intermediate Shaft Thrust Washer***

1 - THRUST WASHER
2 - INTERMEDIATE SHAFT PILOT HUB

(24) Loosen rear band locknut and loosen adjusting screw 3-4 turns.

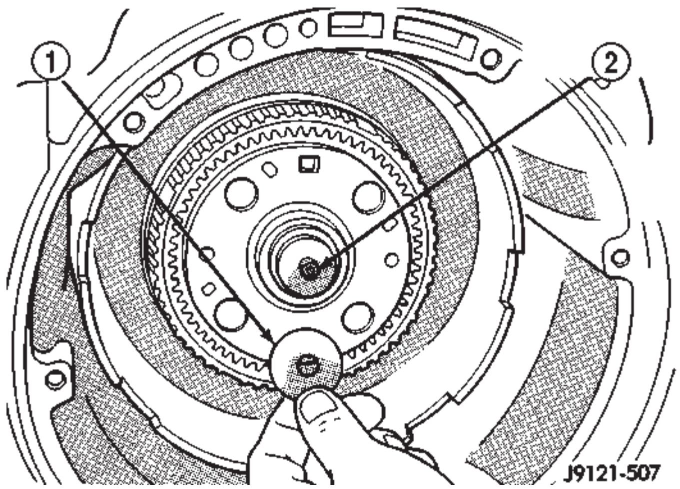

***Fig. 31 Intermediate Shaft Thrust Plate***

1 - SHAFT THRUST PLATE
2 - INTERMEDIATE SHAFT PILOT HUB

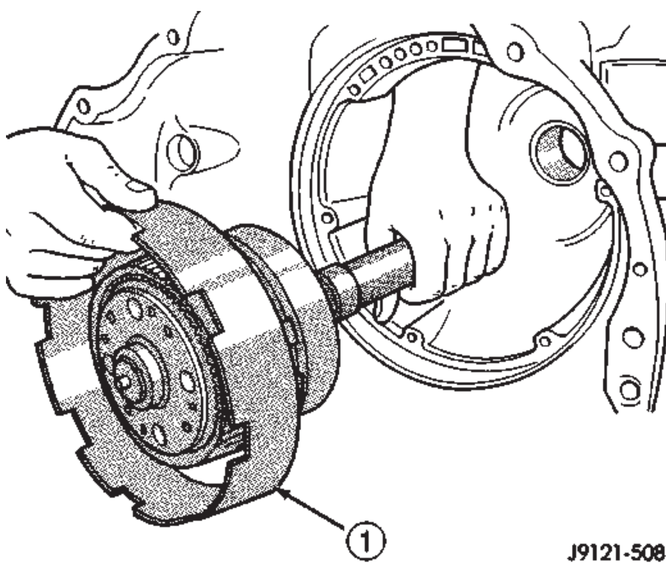

***Fig. 32 Intermediate Shaft And Planetary Geartrain***

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

AUTOMATIC TRANSMISSION - 46RE (Continued)

(25) Remove snap-ring that retains low-reverse drum on overdrive piston retainer hub (Fig. 33).

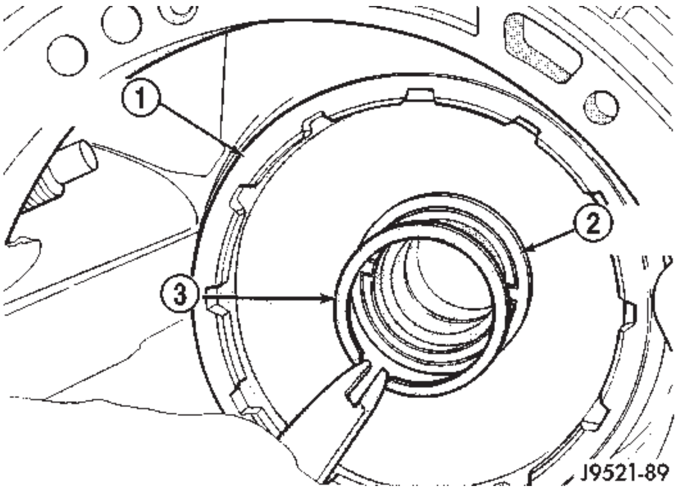

*Fig. 33 Low-Reverse Drum Snap-Ring*

1 - LOW-REVERSE DRUM
2 - TABBED WASHER
3 - SNAP-RING

(26) Slide low-reverse drum and thrust washer off piston retainer hub and out of rear band (Fig. 34).

(27) Note that overrunning clutch race will remain on splines of low-reverse drum after removal (Fig. 35). **The race is a permanent press fit on the hub splines. Do not attempt to remove the race.**

(28) Remove overrunning clutch assembly (Fig. 36). Assembly can be removed without displacing rollers and springs if care is exercised. Note position of rollers and springs for assembly reference.

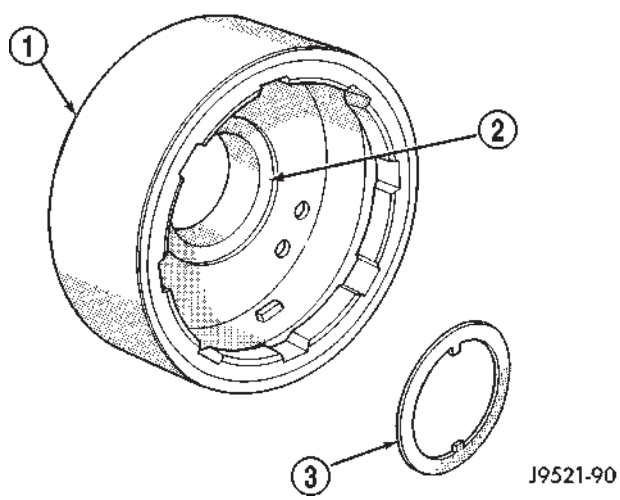

*Fig. 34 Low-Reverse Drum And Thrust Washer*

1 - LOW-REVERSE DRUM
2 - SPOTFACE FOR WASHER
3 - THRUST WASHER

(29) Remove rear band adjusting lever, reaction lever and pin (Fig. 37).

(30) Remove strut from rear band. Keep strut with levers and pin for cleaning, inspection and assembly reference.

(31) Remove rear band and link (Fig. 38).

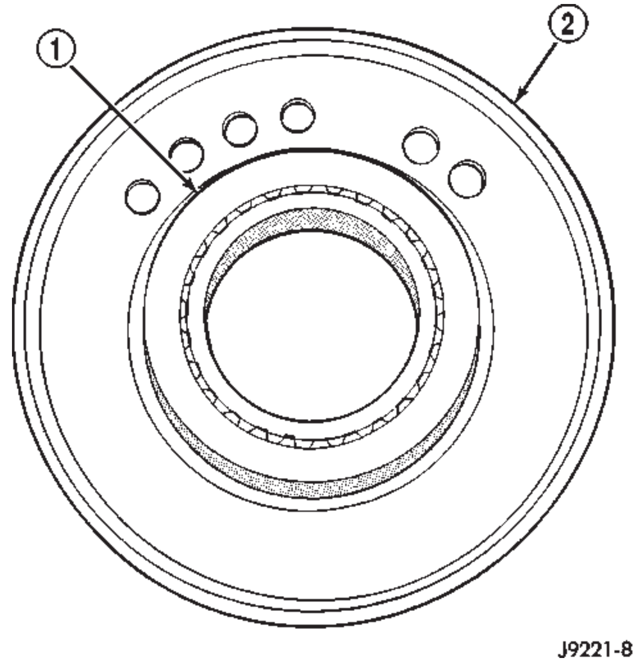

*Fig. 35 Overrunning Clutch Race Position On Low-Reverse Drum*

1 - BAND LINK
2 - REAR BAND

(32) Compress front servo rod guide with large C-clamp and Tool C-4470, or Compressor Tool C-3422-B (Fig. 39). Compress guide only enough to permit snap-ring removal (about 1/8 in.).

(33) Remove servo piston snap-ring (Fig. 39). Unseat one end of ring. Then carefully work removal tool around back of ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(34) Remove tools and remove servo piston and spring.

(35) Compress rear servo piston with C-clamp and Tool C-4470, or Valve Spring Compressor C-3422-B (Fig. 40). Compress servo spring retainer only enough to permit snap-ring removal.

(36) Remove servo piston snap-ring (Fig. 40). Start one end of ring out of bore. Then carefully work removal tool around back of snap-ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(37) Remove tools and remove rear servo retainer, spring and piston assembly.

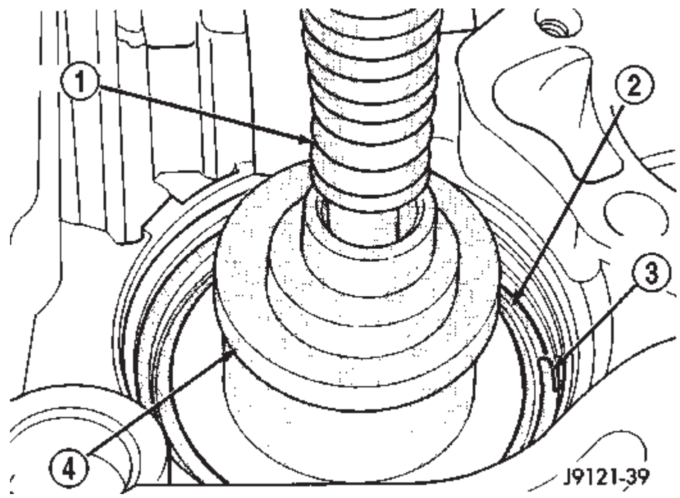

*Fig. 39 Front Servo Retaining Snap-Ring*

1 - C-CLAMP
2 - FRONT SERVO ROD GUIDE
3 - SNAP-RING
4 - TOOL C-4470

## CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

AUTOMATIC TRANSMISSION - 46RE (Continued)

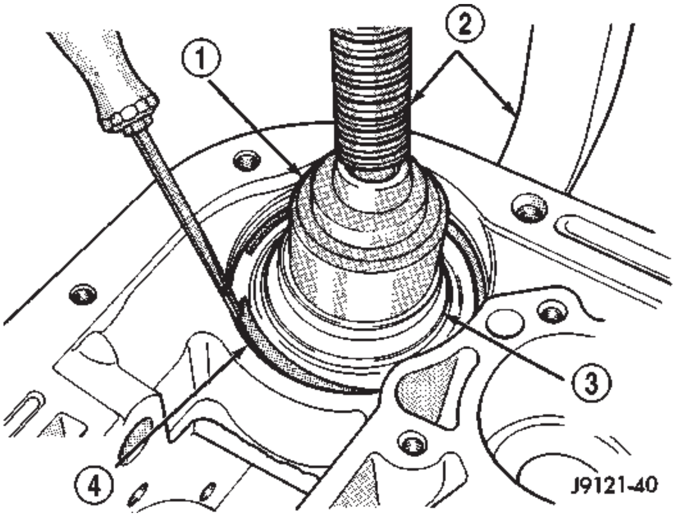

*Fig. 40 Rear Servo Retaining Snap-Ring*

1 - TOOL C-4470
2 - C-CLAMP
3 - REAR SERVO SPRING RETAINER
4 - RETAINER SNAP-RING

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

## INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

## ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for reassembly operations are equally clean.

Shop towels used for wiping off tools and your hands must be made from **lint free** materials. Lint will stick to transmission parts and could interfere with valve operation or even restrict fluid passages.

Lubricate transmission clutch and gear components with Mopar® ATF +4, type 9602, during reassembly. Soak clutch discs in transmission fluid before installation.

Use Mopar® Door Ease, or Ru-Glyde™ on piston seals and O-rings to ease installation. Petroleum jelly can also be used to lubricate and hold thrust washers and plates in position during assembly.

**Do not use chassis grease, bearing grease, white grease, or similar lubricants on any part.** These types of lubricants can eventually block or restrict fluid passages and valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and sub-assemblies are easily installed by hand when properly aligned. If a part seems difficult to install, it is either misaligned or incorrectly assembled. Verify that thrust washers, thrust plates and seal rings are correctly positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright. Either tilt the case upward with wood blocks, or cut a hole in the bench large enough for the intermediate shaft and rear support. Then lower the shaft and support into the hole and support the rear of the case directly on the bench.

## FRONT/REAR SERVO

(1) Lubricate rear servo piston seal with Mopar® Door Ease or ATF +4. Lubricate servo bore in case with ATF +4.

(2) Install rear servo piston in case. Position piston at slight angle to bore and insert piston with twisting motion (Fig. 41).

AUTOMATIC TRANSMISSION - 46RE (Continued)

(3) Install rear servo spring and retainer in case bore (Fig. 42). Be sure spring is seated on piston.

(4) Compress rear servo piston with C-clamp or Valve Spring Compressor C-3422-B and install servo piston snap-ring (Fig. 43).

(5) Lubricate front servo piston components and servo bore in case with transmission fluid.

(6) Install front servo piston in bore. Carefully "run" small, suitable tool around piston ring to press it back into groove and ease installation (Fig. 44). Rotate piston into bore at same time. Rock piston slightly to ease piston ring past snap-ring groove and into bore.

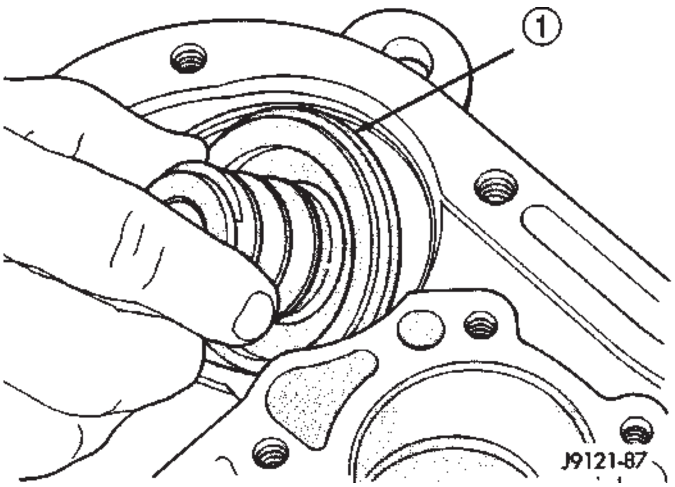

***Fig. 41 Rear Servo Piston***

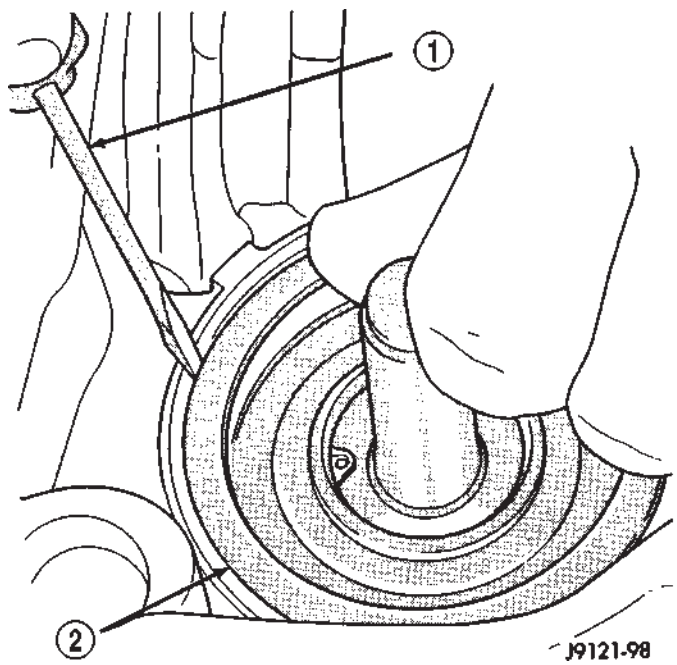

***Fig. 44 Front Servo Piston***

1 - USE SUITABLE TOOL TO HELP SEAT PISTON RING
2 - FRONT SERVO PISTON

AUTOMATIC TRANSMISSION - 46RE (Continued)

(7) Bottom front servo piston in bore and install servo spring.

(8) Install front servo piston rod guide as follows:

(a) Place Tool SP-5560 (or similar size tool) on guide and position C-clamp on tool and case (Fig. 45).

(b) Slowly compress rod guide while simultaneously easing seal ring into bore with suitable tool.

(9) Install rod guide snap-ring (Fig. 45).

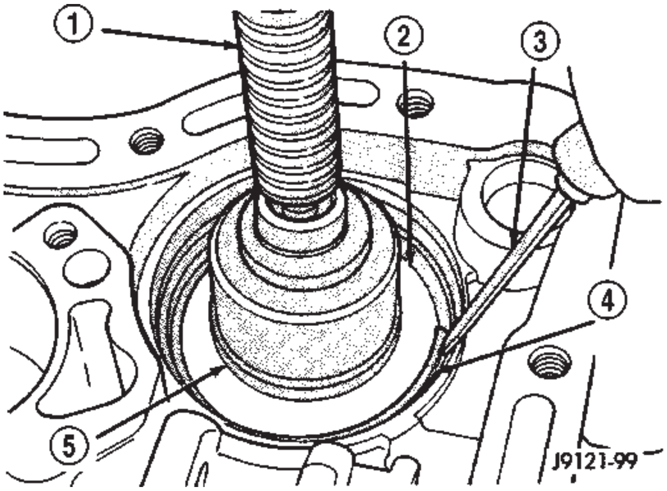

*Fig. 45 Front Servo Rod Guide And Snap-Ring*

1 - C-CLAMP
2 - ROD GUIDE
3 - SMALL SCREWDRIVER
4 - ROD GUIDE SNAP-RING
5 - TOOL SP-5560

## OVERRUNNING CLUTCH, REAR BAND, AND LOW-REVERSE DRUM

(1) Install overrunning clutch components if not yet installed.

(2) Position rear band and link in case (Fig. 46).

(3) Install low-reverse drum (Fig. 47). Slide drum through rear band, onto piston retainer hub and into engagement with overrunning clutch and race.

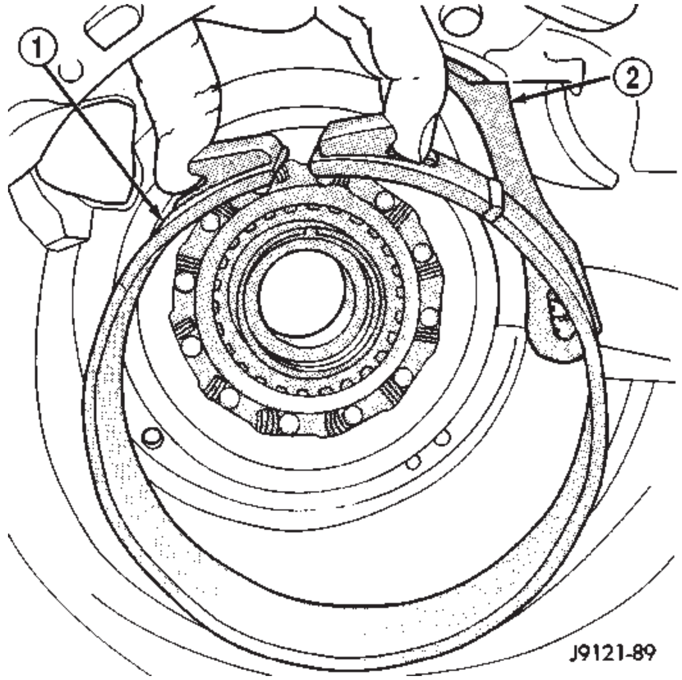

*Fig. 46 Rear Band And Link*

1 - REAR BAND
2 - BAND LINK

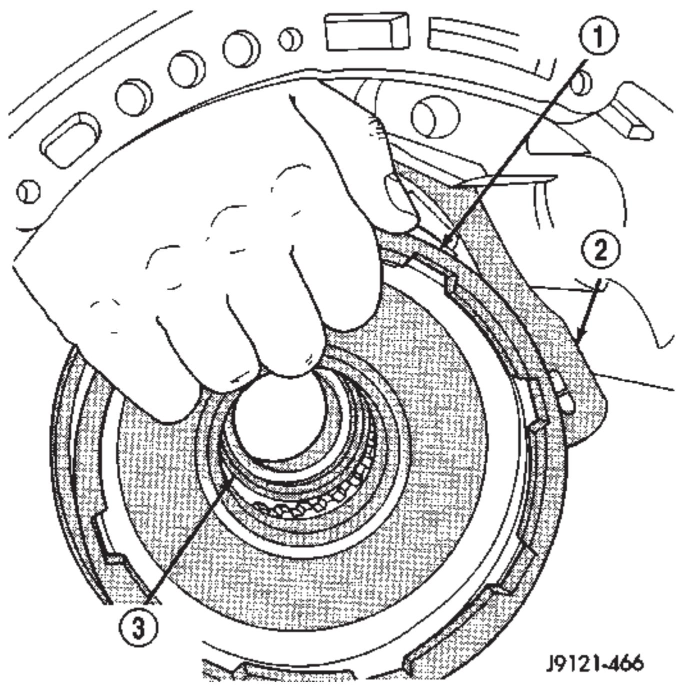

*Fig. 47 Low-Reverse Drum*

1 - LOW-REVERSE DRUM
2 - REAR BAND LINK
3 - HUB OF OVERDRIVE PISTON RETAINER

AUTOMATIC TRANSMISSION - 46RE (Continued)

(4) Install thrust washer in low-reverse drum spot-face (Fig. 48). Use petroleum jelly to hold washer in place.

(5) Install snap-ring that secures low-reverse drum to piston retainer hub (Fig. 48).

(6) Insert band reaction pin part way into case and band link (Fig. 49).

(7) Install rear band adjusting lever, reaction lever, and strut (Fig. 50). Be sure levers and strut are aligned and engaged before seating band reaction pin in case.

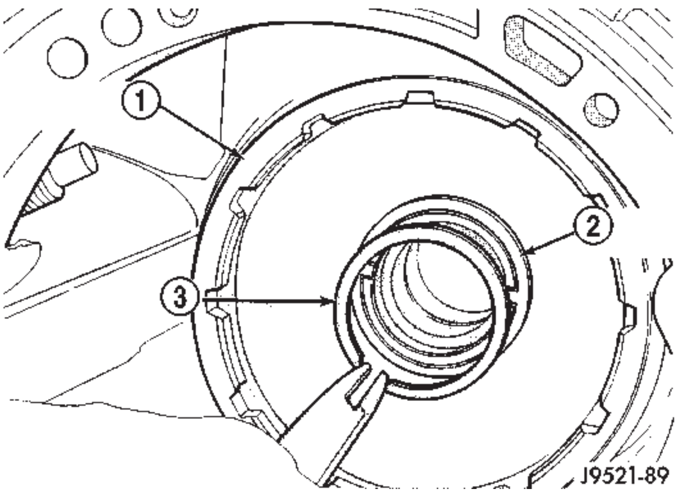

*Fig. 48 Low-Reverse Drum Snap-Ring*

4 - STRUT

## PLANETARY GEARTRAIN, FRONT/REAR CLUTCH, AND FRONT BAND

(1) Remove Alignment Shaft 6227-2, if installed previously.

(2) Install assembled intermediate shaft and planetary geartrain (Fig. 51). **Support shaft carefully during installation. Do not allow shaft bearing/bushing surfaces to become nicked or scratched.**

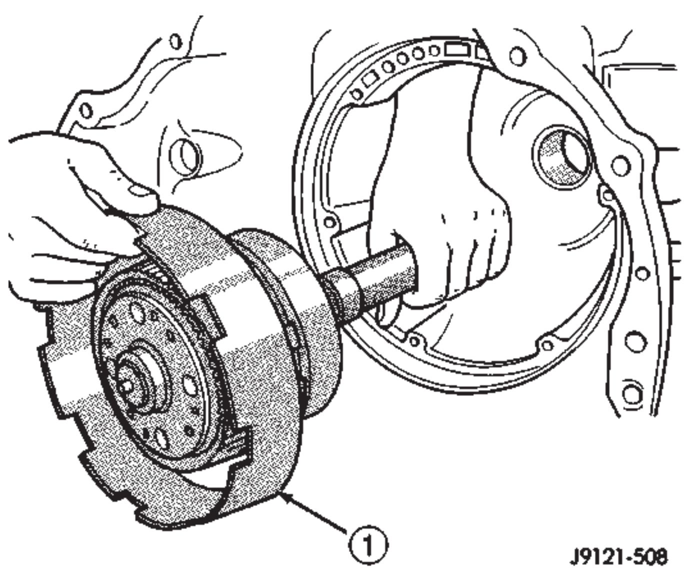

*Fig. 51 Intermediate Shaft And Planetary Geartrain*

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

AUTOMATIC TRANSMISSION - 46RE (Continued)

(3) Lubricate intermediate shaft thrust plate with petroleum jelly and install plate on shaft pilot hub (Fig. 52).

(4) Check input shaft front seal rings, fiber thrust washer and rear seal ring (Fig. 53). Be ends of rear seal ring are hooked together and diagonal cut ends of front seal rings are firmly seated against each other as shown. Lubricate seal rings with petroleum jelly after checking them.

(5) Assemble front and rear clutches (Fig. 54). Align lugs on front clutch discs. Mount front clutch on rear clutch. Turn front clutch retainer back and forth until front clutch discs are fully seated on rear clutch splined hub.

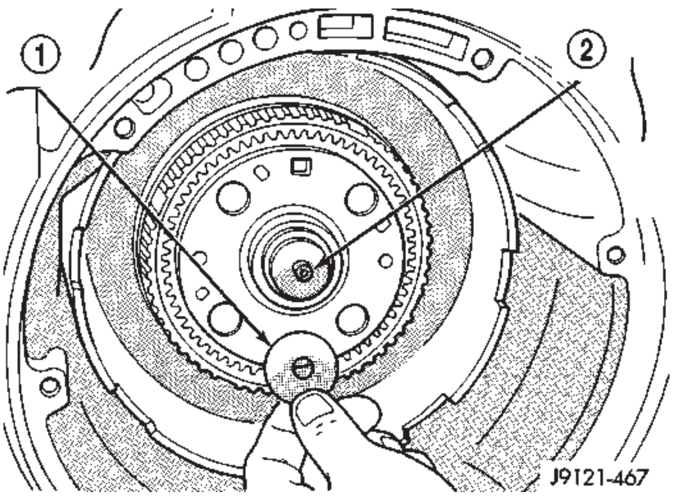

**Fig. 52 Intermediate Shaft Thrust Plate**

1 - SHAFT THRUST PLATE

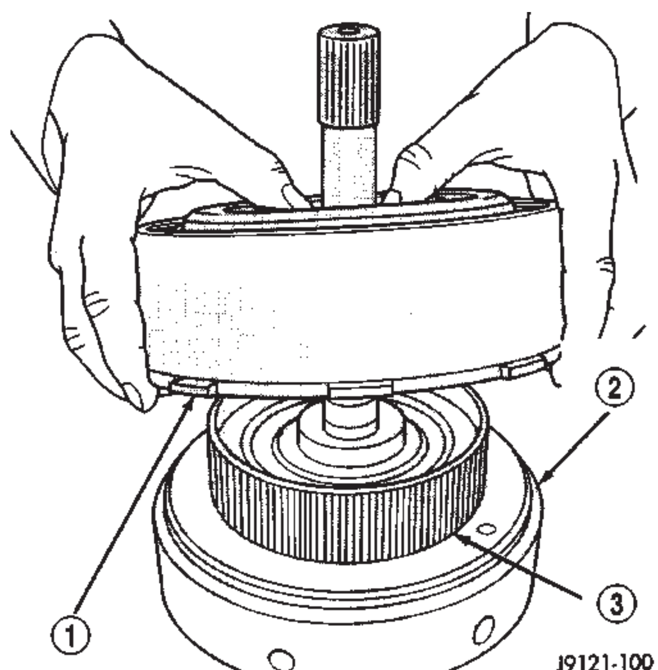

**Fig. 54 Assembling Front And Rear Clutches**

1 - FRONT CLUTCH ASSEMBLY
2 - REAR CLUTCH ASSEMBLY
3 - REAR CLUTCH SPLINED HUB

AUTOMATIC TRANSMISSION - 46RE (Continued)

(6) Install intermediate shaft thrust washer in hub of rear clutch retainer (Fig. 55). Use petroleum jelly to hold washer in place. Position washer so grooves are facing outward. **Washer only fits one way in clutch retainer hub.**

(7) Place transmission case in upright position, or place blocks under front end of transmission repair stand to tilt case rearward. This makes it easier to install front/rear clutch assembly.

(8) Align discs in rear clutch. Then install and engage assembly in front planetary and driving shell (Fig. 56). Turn clutch retainers back and forth until both clutches are seated.

(9) Position front band lever in case and over servo rod guide. Then install front band lever pin in case and slide it through lever.

(10) Coat threads of front band pin access plug with sealer and install it in case. Tighten plug to 17 N·m (13 ft. lbs.) torque.

(11) Slide front band over front clutch retainer and install front band strut and anchor (Fig. 57).

(12) Tighten front band adjusting screw until band is tight on clutch retainer. This will hold clutches in place while oil pump is being installed. **Verify that front/rear clutch assembly is still properly seated before tightening band.**

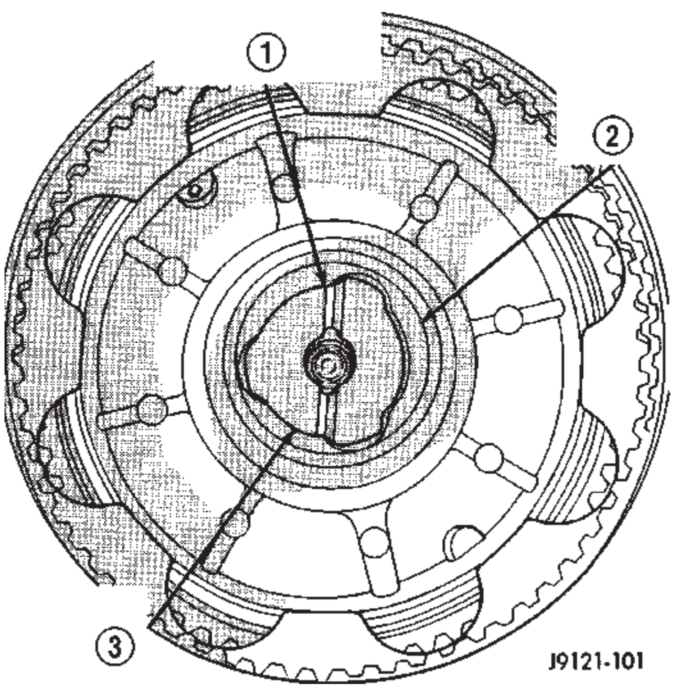

***Fig. 55 Intermediate Shaft Thrust Washer***

AUTOMATIC TRANSMISSION - 46RE (Continued)

## OIL PUMP

(1) Install oil pump Pilot Studs C-3288-B in case (Fig. 58).

(2) Install new oil pump gasket on pilot studs and seat it in case. Be sure gasket is properly aligned with fluid passages in case (Fig. 58).

(3) Coat front clutch thrust washer with petroleum jelly to hold it in place. Then install washer over reaction shaft hub and seat it on pump (Fig. 59).

**CAUTION: The thrust washer bore (I.D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.**

(4) Check seal rings on reaction shaft support. Be sure rings are hooked together correctly. Also be sure fiber thrust washer is in position (Fig. 60). Use extra petroleum jelly to hold washer in place if necessary.

(5) Lubricate oil pump seals with petroleum Mopar® ATF +4, type 9602.

(6) Mount oil pump on pilot studs and slide pump into case opening (Fig. 61). **Work pump into case by hand. Do not use a mallet or similar tools to seat pump.**

(7) Remove pilot studs and install oil pump bolts. Tighten pump bolts alternately and evenly to fully seat pump in case. Then final-tighten pump bolts to 20 N·m (15 ft. lbs.) torque.

(8) Verify correct installation. Rotate input and intermediate shafts and check for bind. If bind exists, components are either mis-assembled, or not seated. Disassemble and correct as necessary before proceeding.

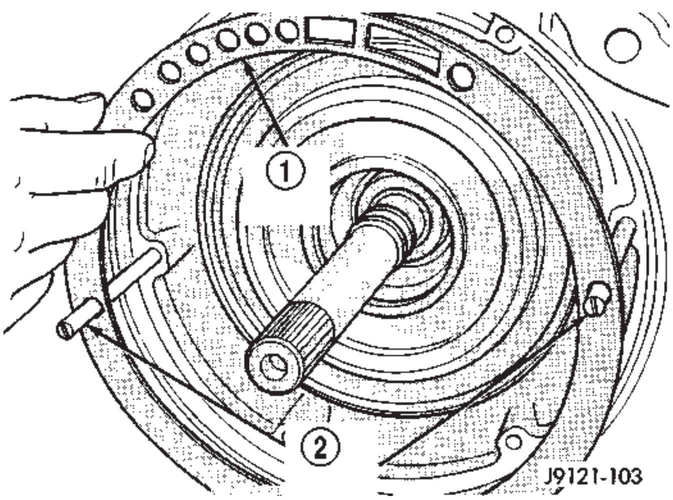

*Fig. 58 Oil Pump Gasket And Pilot Studs*

AUTOMATIC TRANSMISSION - 46RE (Continued)

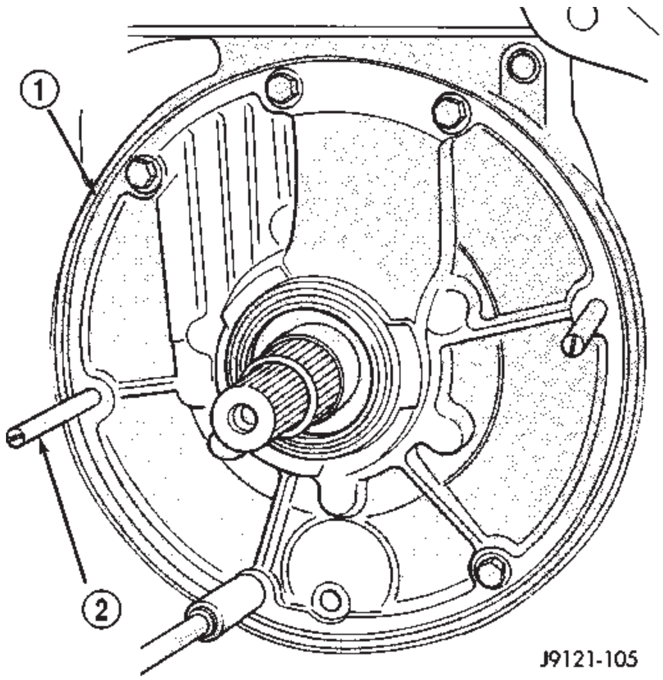

*Fig. 61 Oil Pump*

1 - SEAT OIL PUMP IN CASE BY HAND
2 - REMOVE PILOT STUDS WHEN PUMP IS SEATED

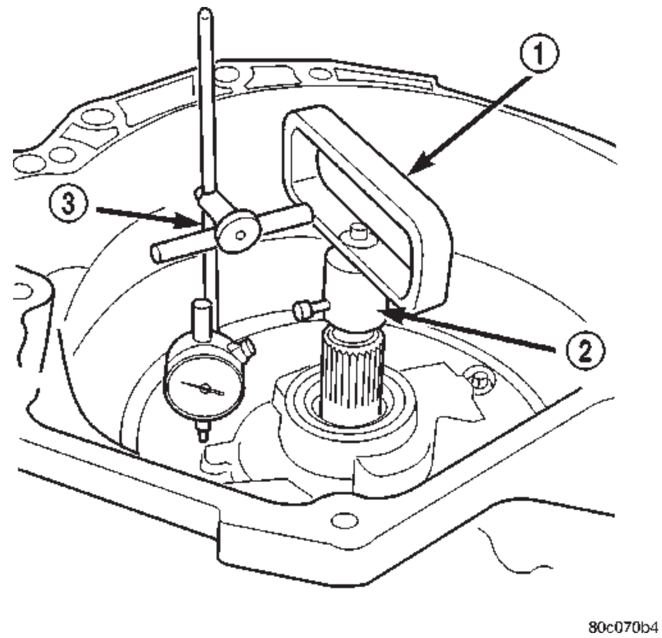

*Fig. 62 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-5
3 - TOOL C-3339

## INPUT SHAFT END PLAY CHECK

**NOTE: Overdrive unit must be installed in order to correctly measure the input shaft end-play.**

(1) Measure input shaft end play (Fig. 62).

**NOTE: If end play is incorrect, transmission is incorrectly assembled, or reaction shaft thrust washer is incorrect. The reaction shaft thrust washer is selective.**

(a) Attach Adapter 8266-5 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. End play should be 0.86-2.13 mm (0.034-0.084 in.). Adjust as necessary.

## ACCUMULATOR, VALVE BODY, OIL PAN, AND TORQUE CONVERTER

(1) Install accumulator inner spring, piston and outer spring (Fig. 63).

(2) Verify that park/neutral position switch has **not** been installed in case. Valve body can not be installed if switch is in position.

(3) Install new valve body manual shaft seal in case (Fig. 64). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

(4) Install valve body as follows:

(a) Start park rod into park pawl. If rod will not slide past park pawl, pawl is engaged in park gear. Rotate overdrive output shaft with suitable size 12 point socket; this will free pawl and allow rod to engage.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.**.

(5) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(6) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

AUTOMATIC TRANSMISSION - 46RE (Continued)

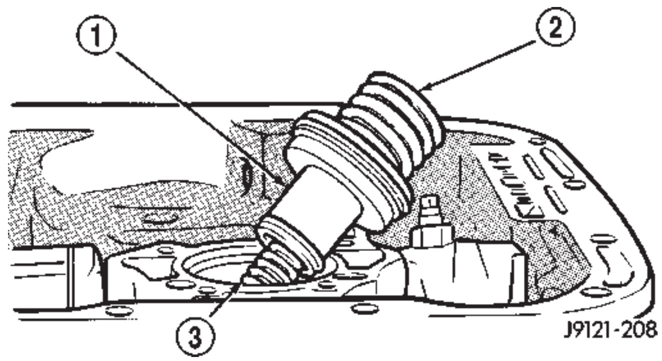

*Fig. 63 Accumulator Piston And Springs*

1 - ACCUMULATOR PISTON
2 - OUTER SPRING
3 - INNER SPRING

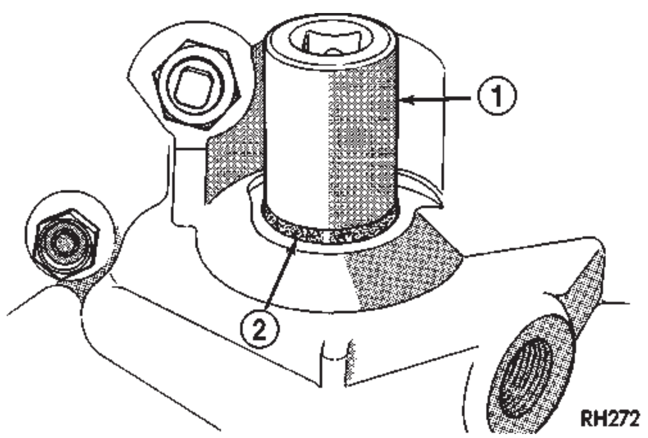

*Fig. 64 Manual Lever Shaft Seal*

1 - 15/16" SOCKET
2 - SEAL

**CAUTION: If the condition of the transmission before the overhaul procedure caused excessive metallic or fiber contamination in the fluid, replace the torque converter and reverse flush the cooler(s) and cooler lines. Fluid contamination and transmission failure can result if not done.**

(7) Install torque converter. Use C-clamp or metal strap to hold converter in place for installation.

## BAND ADJUSTMENT AND FINAL

(1) Adjust front and rear bands as follows:

(a) Loosen locknut on each band adjusting screw 4-5 turns.

(b) Tighten both adjusting screws to 8 N·m (72 in. lbs.).

(c) Back off front band adjusting screw 2-7/8 turns.

(d) Back off rear band adjusting screw 2 turns.

(e) Hold each adjusting screw in position and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(2) Install magnet in oil pan. Magnet seats on small protrusion at corner of pan.

(3) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(4) Install throttle valve and shift selector levers on valve body manual lever shaft.

(5) Apply small quantity of dielectric grease to terminal pins of solenoid case connector and neutral switch.

(6) Fill transmission with recommended fluid. Refer to Service Procedures section of this group.

## INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 65). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

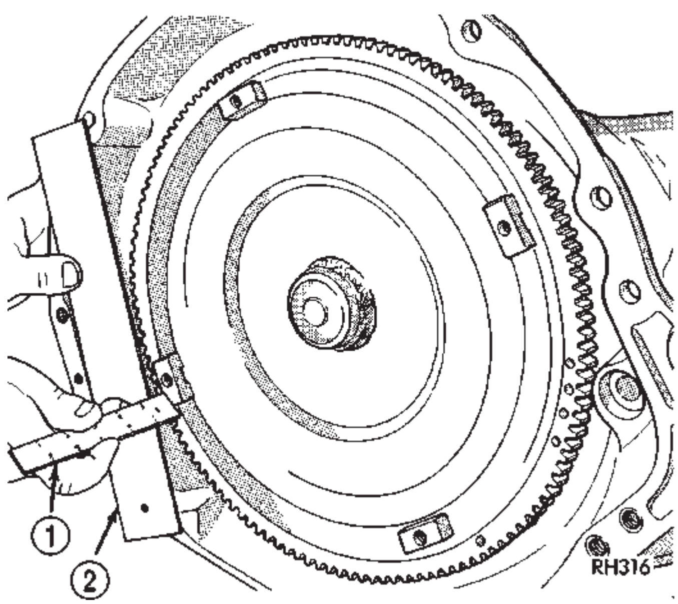

*Fig. 65 Checking Converter Seating - Typical*

1 - SCALE
2 - STRAIGHTEDGE

AUTOMATIC TRANSMISSION - 46RE (Continued)

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

**CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.**

(20) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to 31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(27) Adjust gearshift linkage and throttle valve cable if necessary.

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

# ACCUMULATOR

## DESCRIPTION

The accumulator (Fig. 66) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 67).

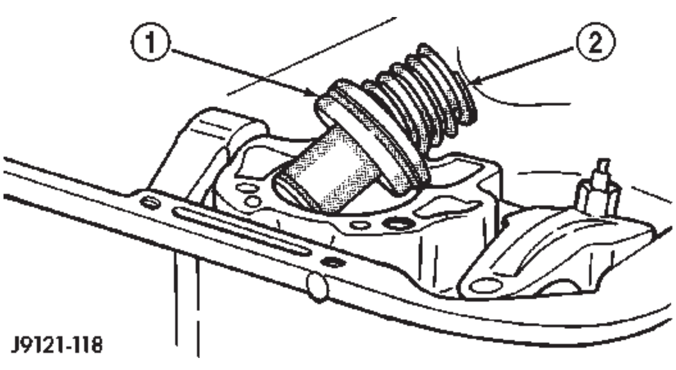

*Fig. 66 Accumulator*

1 - ACCUMULATOR PISTON
2 - PISTON SPRING

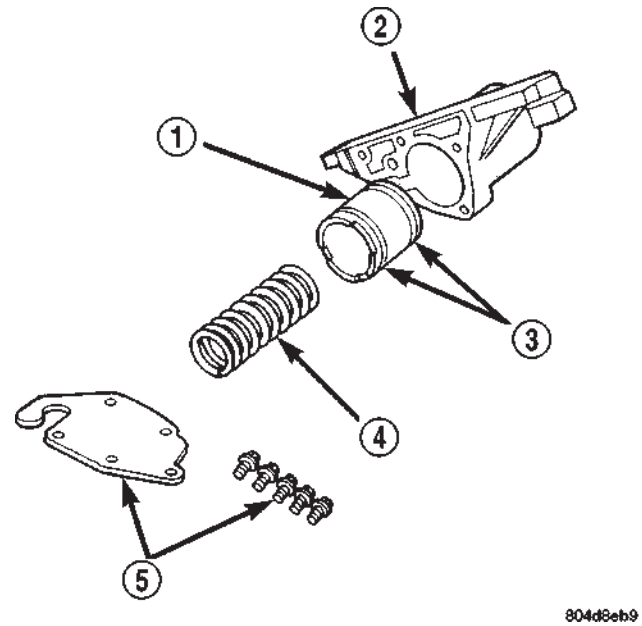

*Fig. 67 3-4 Accumulator and Housing*

1 - ACCUMULATOR PISTON
2 - 3-4 ACCUMULATOR HOUSING
3 - TEFLON SEALS
4 - PISTON SPRING
5 - COVER PLATE AND SCREWS

## OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 68), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 69), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

**NOTE: The accumulator is shown in the inverted position for illustrative purposes.**

## INSPECTION

Inspect the accumulator piston and seal rings (Fig. 70). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 70). Replace the springs if the coils are cracked, distorted or collapsed.

# BANDS

## DESCRIPTION

### KICKDOWN (FRONT) BAND

The kickdown, or “front”, band (Fig. 71) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

### LOW/REVERSE (REAR) BAND

The low/reverse band, or “rear”, band (Fig. 72) is similar in appearance and operation to the front band. The rear band is also a single-wrap design ( the band does not completely encompass/wrap the drum that it holds).

BANDS (Continued)

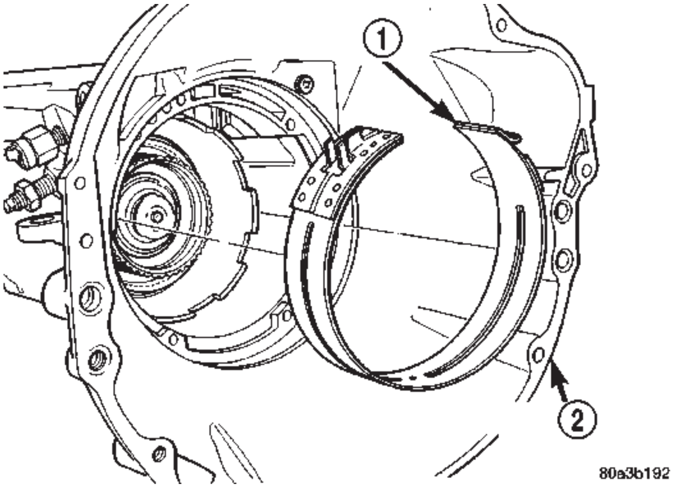

*Fig. 71 Front Band*

1 - FRONT BAND
2 - TRANSMISSION HOUSING

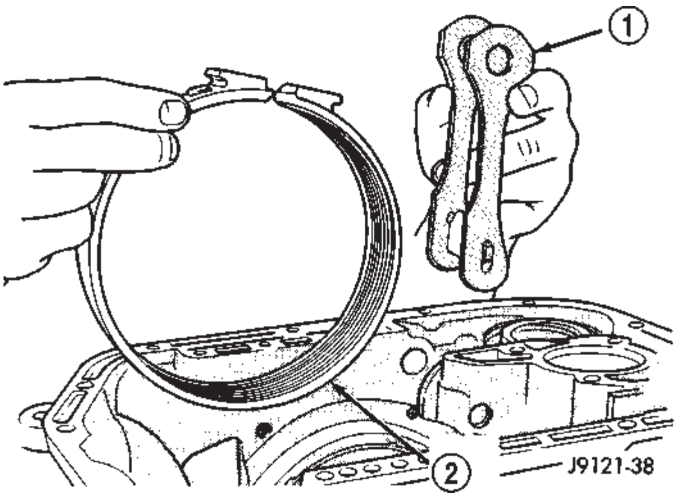

*Fig. 72 Rear Band And Link*

1 - BAND LINK
2 - REAR BAND

## OPERATION

### KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

### LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

## ADJUSTMENT - BANDS

### FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Raise vehicle.

(2) Loosen band adjusting screw locknut (Fig. 73). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.

(3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and an appropriate Torx™ socket.

**CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.**

(4) Back off front band adjusting screw 2-7/8 turns.

(5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

(6) Lower vehicle.

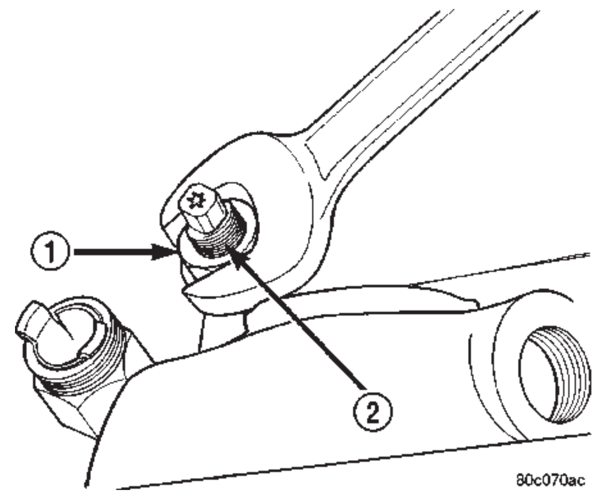

*Fig. 73 Front Band Adjustment Screw Location*

1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

BANDS (Continued)

### REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

(1) Raise vehicle.

(2) Remove transmission oil pan and drain fluid.

(3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.

(4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque (Fig. 74).

(5) Back off adjusting screw 2 turns.

(6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(8) Lower vehicle and refill transmission with Mopar® ATF +4, Type 9602 fluid.

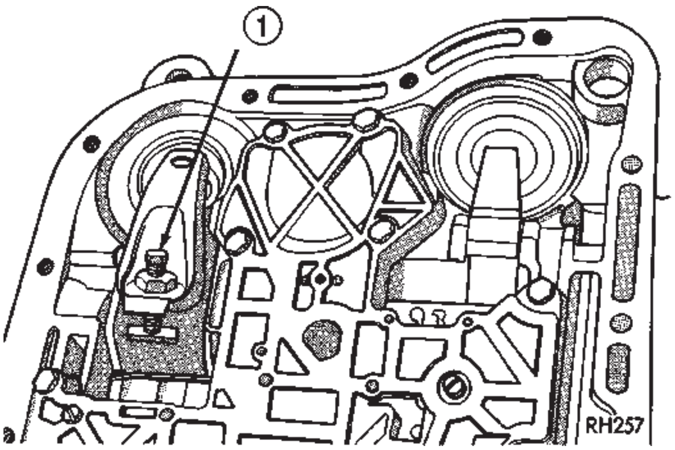

*Fig. 74 Rear Band Adjustment Screw Location*

1 - LOW-REVERSE BAND ADJUSTMENT

## ELECTRONIC GOVERNOR

### DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

### GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 75).

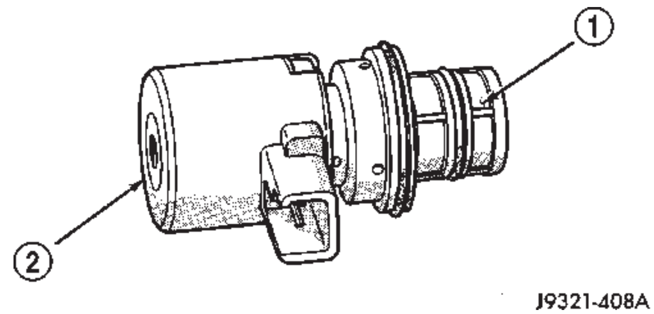

*Fig. 75 Governor Pressure Solenoid Valve*

1 - SOLENOID FILTER

2 - GOVERNOR PRESSURE SOLENOID

### GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 76).

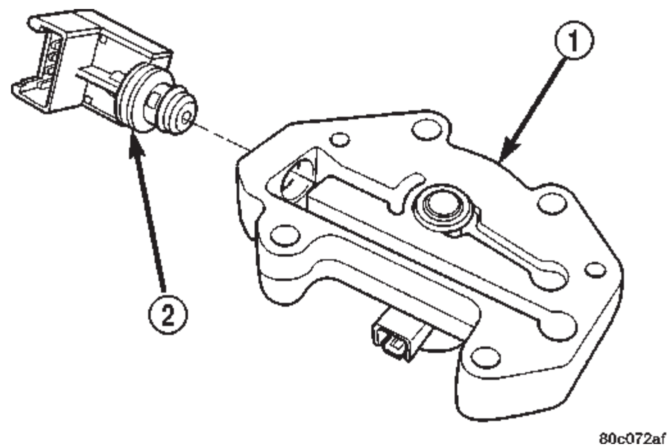

*Fig. 76 Governor Pressure Sensor*

1 - GOVERNOR BODY

2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 76).

### GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, –1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used

ELECTRONIC GOVERNOR (Continued)

during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

## OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output valves are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the ″cold″ period of operation.

### GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

### GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

### GOVERNOR PRESSURE CURVES

#### LOW TRANSMISSION FLUID TEMPERATURE

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

#### NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade ″hunting″ prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

#### WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is

ELECTRONIC GOVERNOR (Continued)

reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

### TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine ″flare.″ The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

## REMOVAL

(1) Hoist and support vehicle on safety stands.
(2) Remove transmission fluid pan and filter.
(3) Disengage wire connectors from pressure sensor and solenoid (Fig. 77).

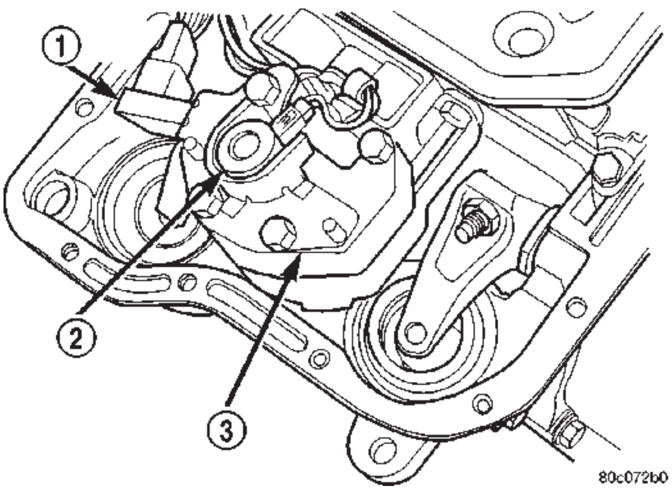

*Fig. 77 Governor Solenoid And Pressure Sensor*

1 - PRESSURE SENSOR
2 - PRESSURE SOLENOID
3 - GOVERNOR

(4) Remove screws holding pressure solenoid retainer to governor body.
(5) Separate solenoid retainer from governor (Fig. 78).
(6) Pull solenoid from governor body (Fig. 79).
(7) Pull pressure sensor from governor body.
(8) Remove bolts holding governor body to valve body.
(9) Separate governor body from valve body (Fig. 80).
(10) Remove governor body gasket.

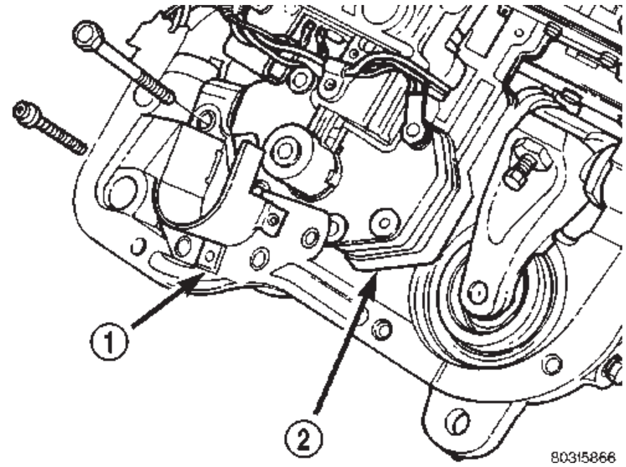

*Fig. 78 Pressure Solenoid Retainer*

2 - GASKET

ELECTRONIC GOVERNOR (Continued)

## INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace o-ring seals, clean the gasket surfaces and replace gasket.

(1) Place gasket in position on back of governor body (Fig. 81).

(2) Place governor body in position on valve body.

(3) Install bolts to hold governor body to valve body.

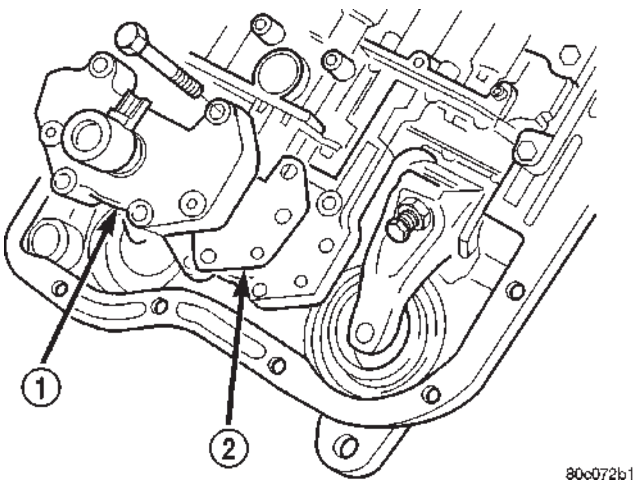

*Fig. 81 Governor Body and Gasket*

1 - GOVERNOR BODY
2 - GASKET

(4) Lubricate o-ring on pressure sensor with transmission fluid.

(5) Align pressure sensor to bore in governor body.

(6) Push pressure sensor into governor body.

(7) Lubricate o-ring, on pressure solenoid, with transmission fluid.

(8) Align pressure solenoid to bore in governor body (Fig. 82).

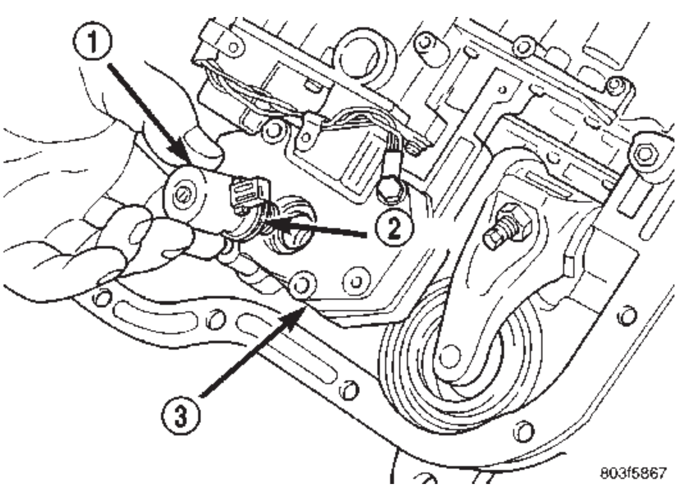

*Fig. 82 Pressure Solenoid and O-ring*

1 - PRESSURE SOLENOID
2 - O-RING
3 - GOVERNOR

(9) Push solenoid into governor body.

(10) Place solenoid retainer in position on governor (Fig. 83).

(11) Install screws to hold pressure solenoid retainer to governor body.

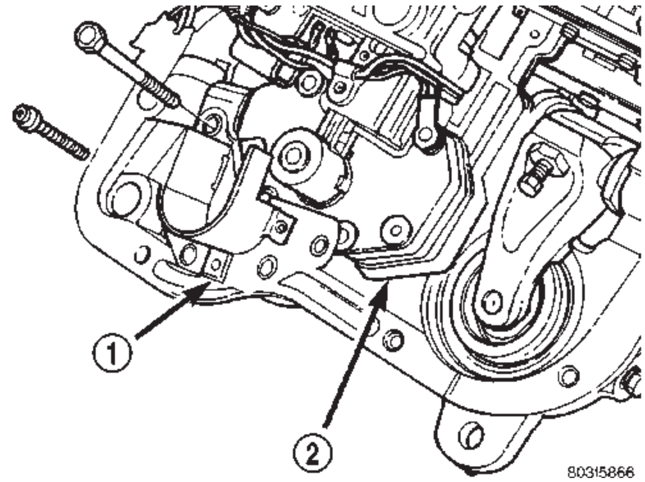

*Fig. 83 Pressure Solenoid Retainer*

1 - PRESSURE SOLENOID RETAINER
2 - GOVERNOR

(12) Engage wire connectors into pressure sensor and solenoid (Fig. 84).

(13) Install transmission fluid pan and (new) filter.

(14) Lower vehicle and road test to verify repair.

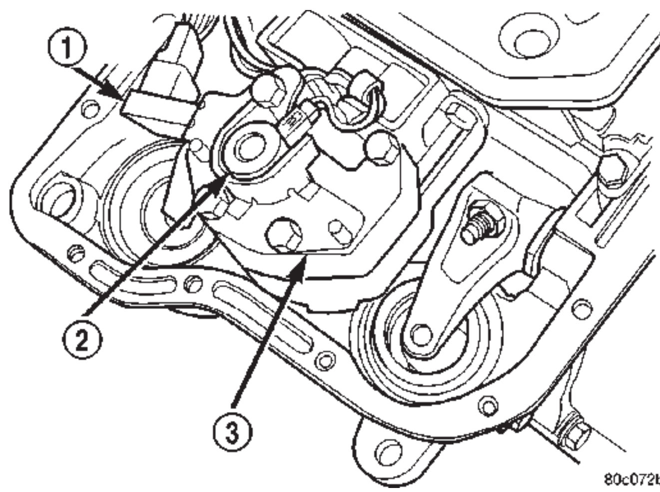

*Fig. 84 Governor Solenoid And Pressure Sensor*

1 - PRESSURE SENSOR
2 - PRESSURE SOLENOID
3 - GOVERNOR

# EXTENSION HOUSING BUSHING

## REMOVAL

(1) Remove extension housing yoke seal.

(2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 85).

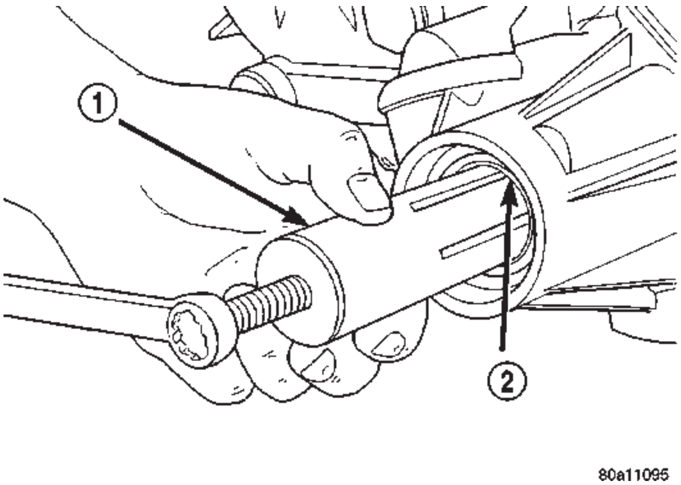

*Fig. 85 Bushing Removal - Typical*

1 - REMOVER
2 - EXTENSION HOUSING BUSHING

## INSTALLATION

(1) Align bushing oil hole with oil slot in extension housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 86).

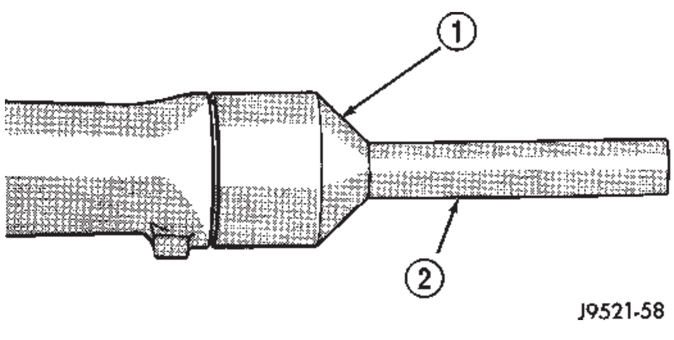

*Fig. 86 Extension Housing Seal Installation*

1 - SPECIAL TOOL C-3995-A OR C-3972-A
2 - SPECIAL TOOL C-4471

# EXTENSION HOUSING SEAL

## REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 87) from overdrive housing.

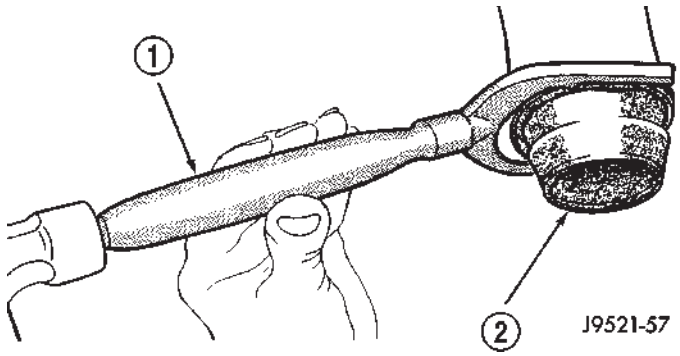

*Fig. 87 Removing Overdrive Housing Yoke Seal*

1 - SPECIAL TOOL C-3985-B
2 - SEAL

## INSTALLATION

(1) Place seal in position on overdrive housing.

(2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 88).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

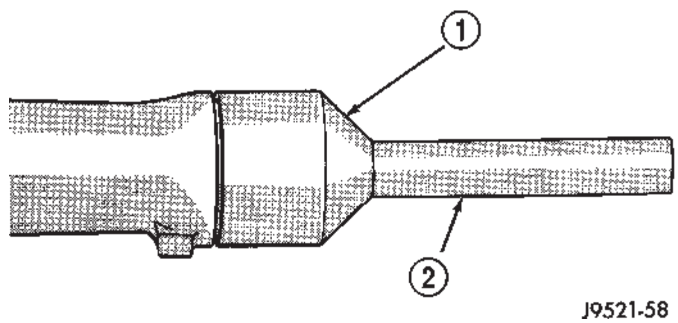

*Fig. 88 Installing Overdrive Housing Seal*

1 - SPECIAL TOOL C-3995-A OR C-3972-A

# FLUID AND FILTER

## DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

## DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

## DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmssion has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

FLUID AND FILTER (Continued)

## PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 89) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not overfill.

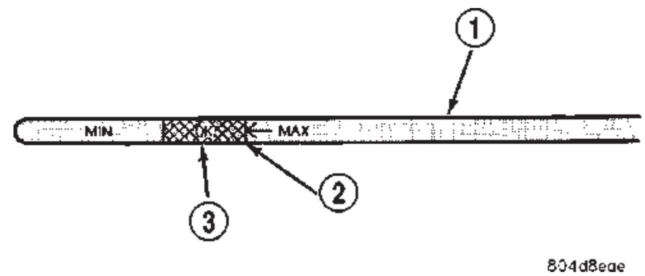

*Fig. 89 Dipstick Fluid Level Marks - Typical*

1 - DIPSTICK
2 - MAXIMUM CORRECT FLUID LEVEL
3 - ACCEPTABLE FLUID LEVEL

## PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

(5) Hook up DRB® scan tool and select engine.

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the chart.

(9) Adjust transmission fluid level shown on the dipstick according to the chart (Fig. 90).

**NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

(10) Check transmission for leaks.

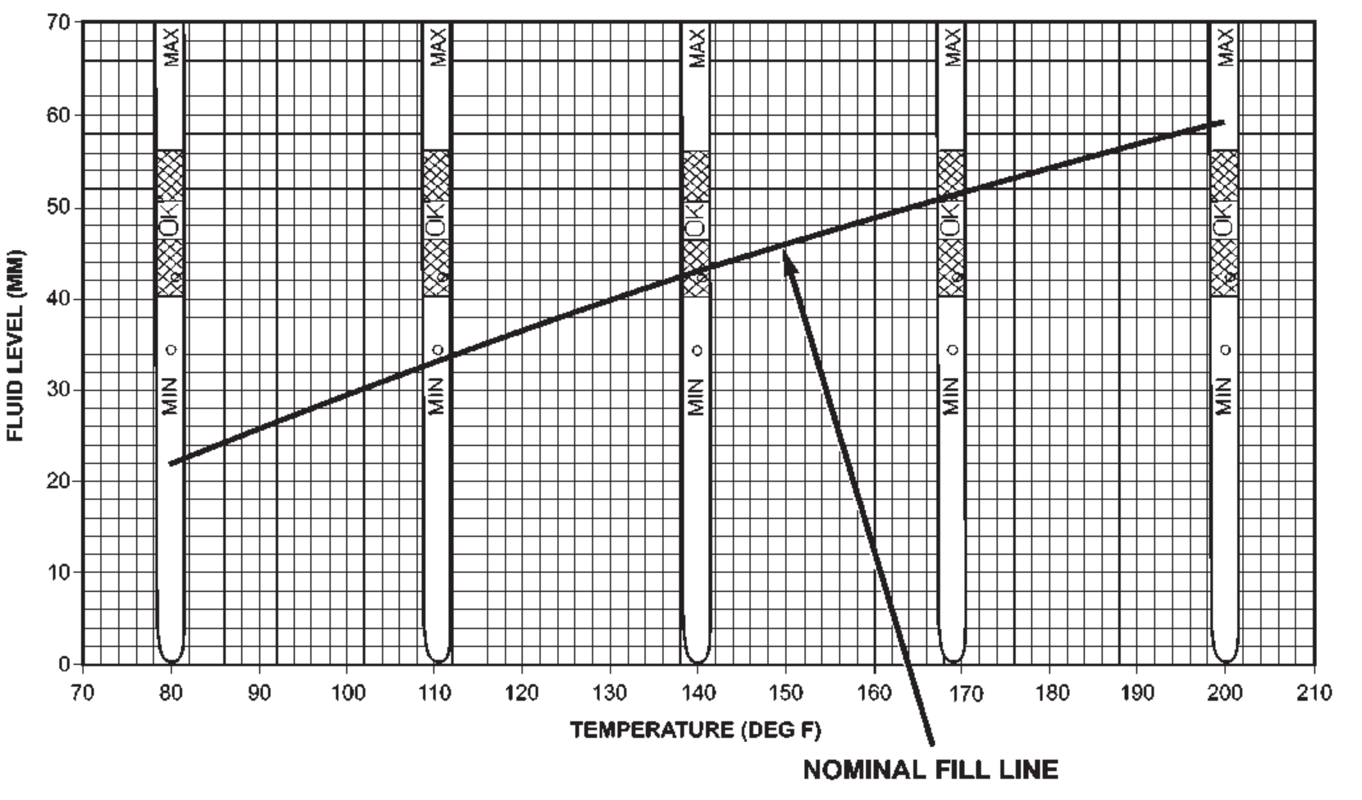

*Fig. 90 46RE Fluid Fill Graph*

FLUID AND FILTER (Continued)

## STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 91).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 92).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

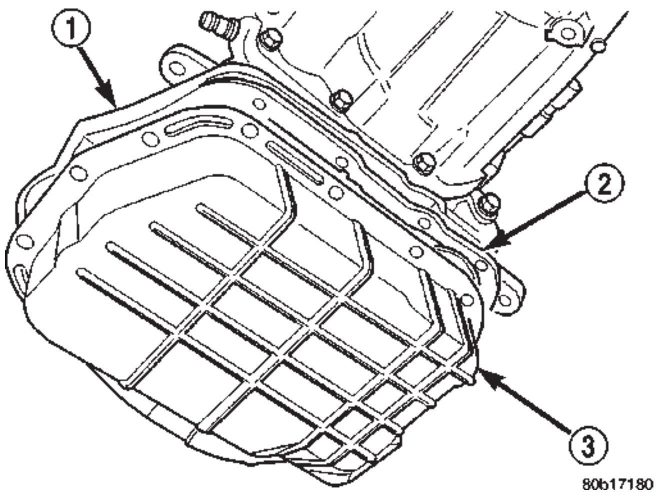

*Fig. 91 Transmission Pan*

1 - TRANSMISSION
2 - GASKET
3 - PAN

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

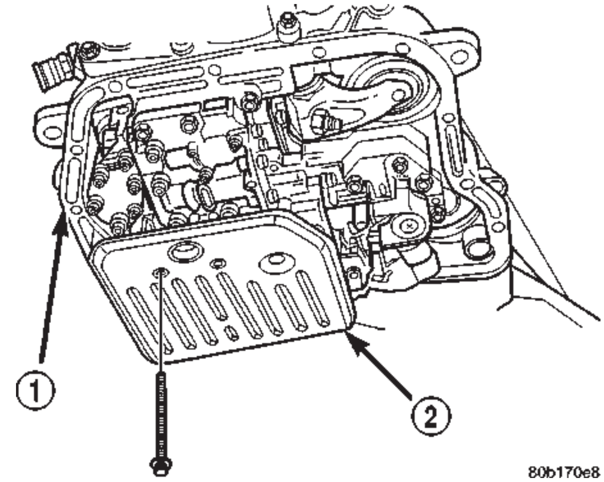

*Fig. 92 Transmission Filter*

1 - TRANSMISSION
2 - FILTER

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.**

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

# FRONT CLUTCH

## DESCRIPTION

The front clutch assembly (Fig. 93) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

10 - OUTER PISTON SEAL
11 - FRONT CLUTCH RETAINER

FRONT CLUTCH (Continued)

## DISASSEMBLY

(1) Remove the waved snap-ring, reaction plate, clutch plates, and clutch discs.

(2) Compress clutch piston retainer and piston springs with Compressor Tool C-3863-A (Fig. 94).

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove clutch piston springs (Fig. 95). Note position of piston springs for assembly reference.

(5) Remove clutch piston from retainer with a twisting motion.

(6) Remove and discard clutch piston inner and outer seals.

(7) Assemble Tool Handle C-4171 and Bushing Remover SP-3629 (Fig. 96).

(8) Insert remover tool in bushing and drive bushing straight out of clutch retainer.

## INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, the lugs are damaged, or if the facing is flaking off. Replace the steel plates and reaction plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plate are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston springs and spring retainer if either are distorted, warped or broken.

Check the lug grooves in the clutch piston retainer. The steel plates should slide freely in the slots. Replace the piston retainer if the grooves are worn or damaged. Also check action of the check ball in the piston retainer. The ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or there is any doubt about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check the clutch piston check ball. The ball should be securely in place. Replace the piston if the ball is missing, or seized in place.

## ASSEMBLY

**NOTE: The 46RE transmission uses three plates and discs for the front clutch.**

(1) Mount Bushing Installer SP-5511 on tool handle (Fig. 97).

(2) Slide new bushing onto installer tool and start bushing into retainer.

(3) Tap new bushing into place until installer tool bottoms against clutch retainer.

(4) Remove installer tools and clean retainer thoroughly.

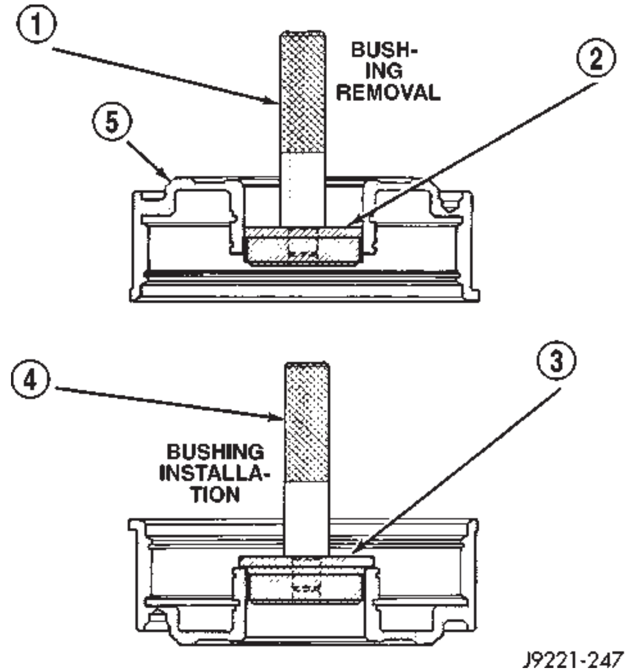

***Fig. 97 Front Clutch Retainer Bushing Replacement Tools***

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL SP-3629
3 - SPECIAL TOOL SP-5511
4 - SPECIAL TOOL C-4171
5 - FRONT CLUTCH RETAINER

(5) Soak clutch discs in transmission fluid.

(6) Install new inner piston seal onto the outer diameter of the clutch retainer inner hub.

(7) Install new outer seal onto the clutch piston. Be sure seal lips of both seals face the interior of the retainer.

(8) Lubricate new inner and outer piston seals with Ru-Glyde™, or Mopar® Door Ease.

(9) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.015 - 0.020 in. thick), can be used to guide seals into place if necessary.

FRONT CLUTCH (Continued)

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.**

(10) Install and position nine clutch piston springs (Fig. 98).

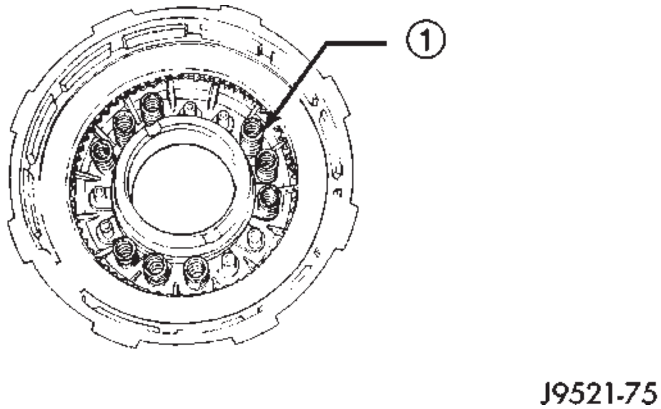

*Fig. 98 Front Clutch Spring Position*

1 - 9 SPRING CLUTCH

(11) Install spring retainer on top of piston springs.
(12) Compress spring retainer and piston springs with Tool C-3863-A.
(13) Install spring retainer snap-ring and remove compressor tool.
(14) Install clutch plates and discs (Fig. 95). Three clutch discs, three steel plates and one reaction plate are required.
(15) Install reaction plate followed by waved snap-ring.
(16) Check clutch pack clearance with feeler gauge (Fig. 99). Clearance between waved spring and pressure plate should 1.78 - 3.28 mm (0.070 - 0.129 in.). If clearance is incorrect, clutch plates, clutch discs, snap-ring, or pressure plate may have to be changed.

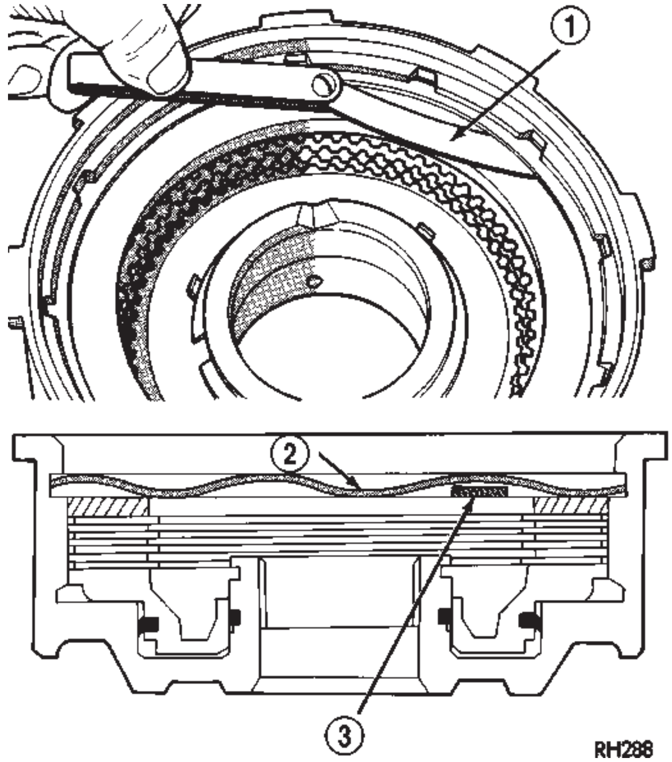

*Fig. 99 Typical Method Of Measuring Front Clutch Pack Clearance*

2 - WAVED SNAP-RING
3 - FEELER GAUGE

# FRONT SERVO

## DESCRIPTION

The kickdown servo (Fig. 100) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

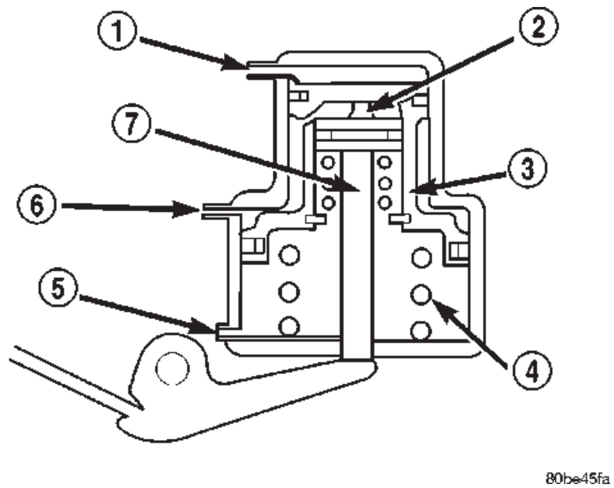

*Fig. 100 Front Servo*

1 - VENT
2 - INNER PISTON
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE
7 - PISTON ROD

FRONT SERVO (Continued)

## OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend though its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

## DISASSEMBLY

(1) Remove seal ring from rod guide (Fig. 101).

(2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.

(3) Remove and discard servo component O-ring and seal rings.

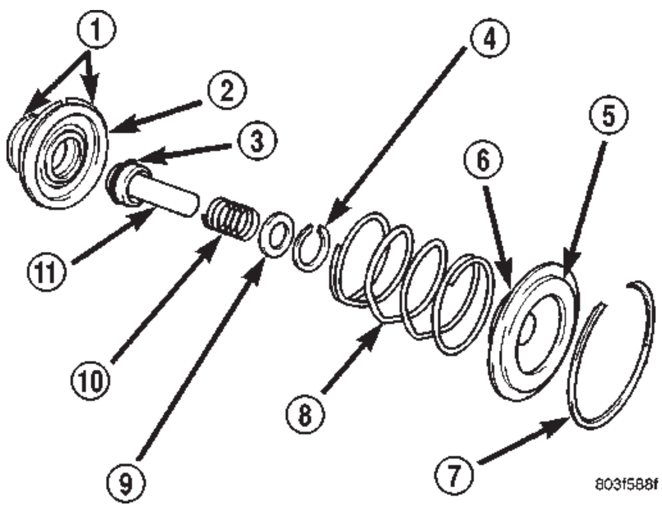

***Fig. 101 Front Servo***

10 - SPRING
11 - PISTON ROD

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

## ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 104).

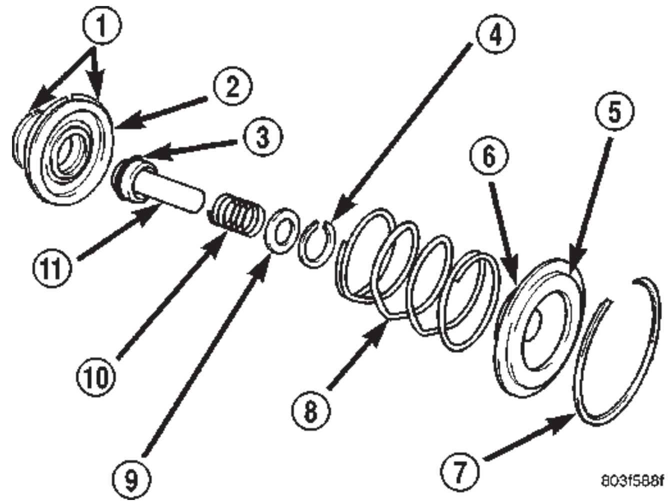

*Fig. 104 Front Servo*

# OIL PUMP

## DESCRIPTION

The oil pump (Fig. 105) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a reaction shaft support.

## OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

## STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

**CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.**

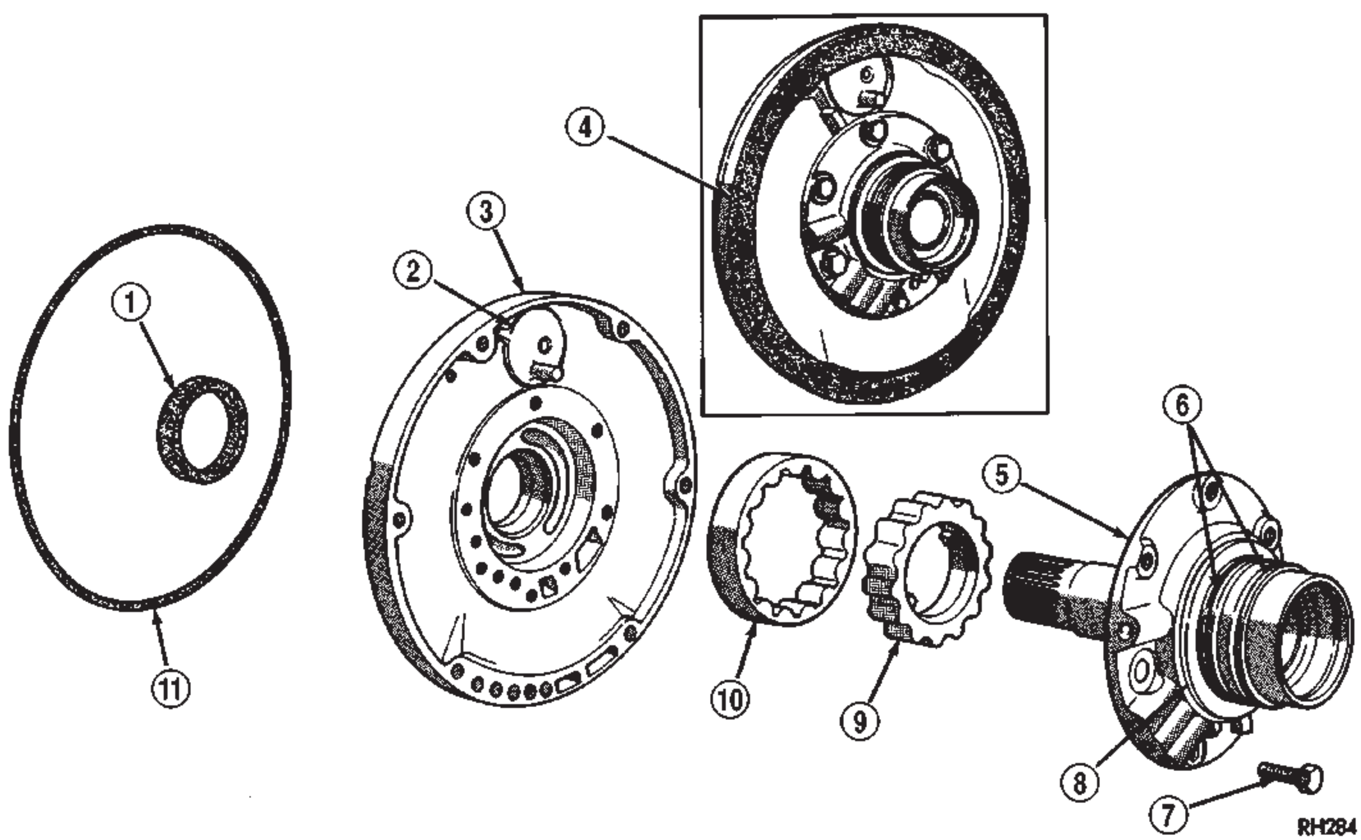

*Fig. 105 Oil Pump Assembly*

6 - SEAL RINGS
7 - BOLTS (6)
8 - #1 THRUST WASHER (SELECTIVE)
9 - INNER GEAR
10 - OUTER GEAR
11 - “O” RING

OIL PUMP (Continued)

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

## DISASSEMBLY

(1) Mark position of support in oil pump body for assembly alignment reference. Use scriber or paint to make alignment marks.

(2) Place pump body on two wood blocks.

(3) Remove reaction shaft support bolts and separate support from pump body (Fig. 106).

(4) Remove pump inner and outer gears (Fig. 107).

(5) Remove o-ring seal from pump body (Fig. 108). Discard seal after removal.

(6) Remove oil pump seal with Remover Tool C-3981. Discard seal after removal.

## OIL PUMP BUSHING REMOVAL

(1) Position pump housing on clean, smooth surface with gear cavity facing down.

(2) Remove bushing with Tool Handle C-4171 and Bushing Remover SP-3550 (Fig. 109).

## REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Cup Tool SP-3633, Nut SP-1191 and Bushing Remover SP-5301 (Fig. 110).

(2) Hold cup tool firmly against reaction shaft. Thread remover tool into bushing as far as possible by hand.

(3) Using wrench, thread remover tool an additional 3-4 turns into bushing to firmly engage tool.

(4) Tighten tool hex nut against cup tool to pull bushing from shaft. Clean all chips from shaft and support after bushing removal.

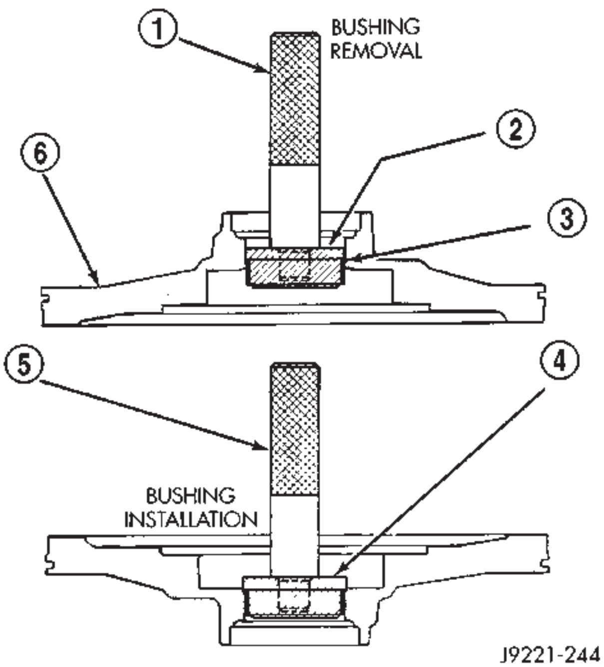

*Fig. 109 Oil Pump Bushing*

5 - SPECIAL TOOL SP-5302
6 - BUSHING
7 - REACTION SHAFT
8 - BUSHING

## CLEANING

Clean pump and support components with solvent and dry them with compressed air.

## INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

OIL PUMP (Continued)

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge (Fig. 111).

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

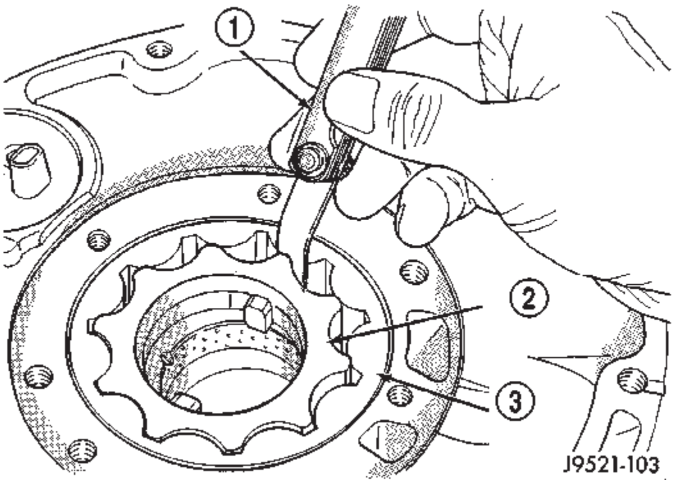

*Fig. 111 Checking Pump Gear Tip Clearance*

1 - FEELER GAUGE
2 - INNER GEAR
3 - OUTER GEAR

## ASSEMBLY

### OIL PUMP BUSHING

(1) Assemble Tool Handle C-4171 and Bushing Installer SP-5118 (Fig. 112).

(2) Place bushing on installer tool and start bushing into shaft.

(3) Tap bushing into place until Installer Tool SP-5118 bottoms in pump cavity. Keep tool and bushing square with bore. Do not allow bushing to become cocked during installation.

(4) Stake pump bushing in two places with blunt punch. Remove burrs from stake points with knife blade (Fig. 113).

### REACTION SHAFT SUPPORT BUSHING

(1) Place reaction shaft support upright on a clean, smooth surface.

(2) Assemble Bushing Installer Tools C-4171 and SP-5302. Then slide new bushing onto installer tool (Fig. 114).

(3) Start bushing in shaft. Tap bushing into shaft until installer tool bottoms against support flange.

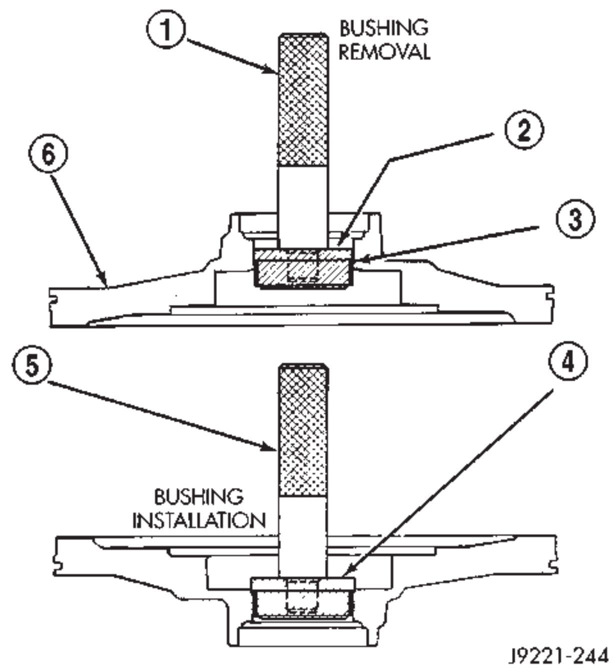

*Fig. 112 Oil Pump Bushing*

8 - BUSHING

### OIL PUMP BODY

(1) Lubricate pump gears with transmission fluid and install them in pump body.

(2) Install thrust washer on reaction shaft support hub. Lubricate washer with petroleum jelly or transmission fluid before installation.

(3) If reaction shaft seal rings are being replaced, install new seal rings on support hub. Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

**CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.**

(4) Align and install reaction shaft support on pump body.

(5) Install bolts attaching reaction shaft support to pump. Tighten bolts to 20 N·m (175 in. lbs.) torque.

(6) Install new pump seal with Installer Tool C-3860-A (Fig. 115). Use hammer or mallet to tap seal into place.

(7) Install new o-ring on pump body. Lubricate oil seal and o-ring with petroleum jelly.

(8) Cover pump assembly to prevent dust entry and set aside for assembly installation.

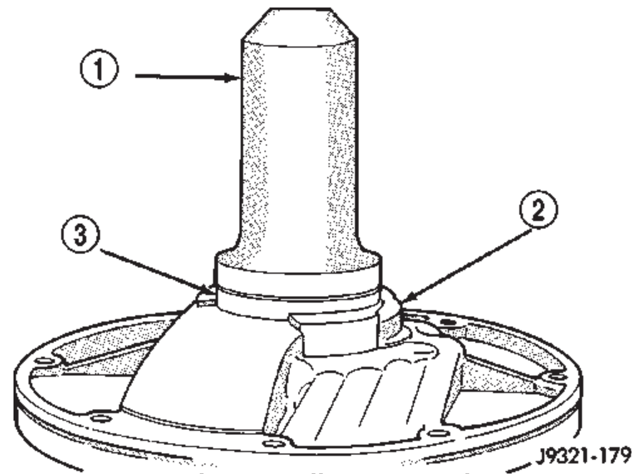

*Fig. 115 Oil Pump Seal*

1 - SPECIAL TOOL C-3860-A
2 - PUMP BODY
3 - PUMP SEAL

## OUTPUT SHAFT FRONT BEARING

### REMOVAL

(1) Remove overdrive unit from the vehicle.

(2) Remove overdrive geartrain from housing.

(3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 116).

(4) Pull bearing from output shaft.

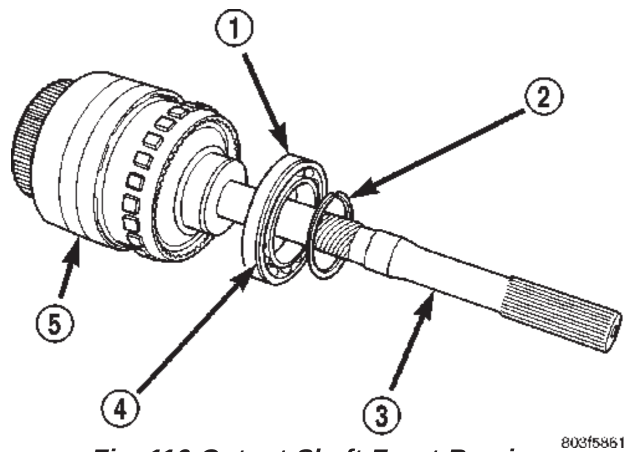

*Fig. 116 Output Shaft Front Bearing*

1 - OUTPUT SHAFT FRONT BEARING
2 - SNAP-RING
3 - OUTPUT SHAFT
4 - GROOVE TO REAR
5 - OVERDRIVE GEARTRAIN

### INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.

(2) Push bearing onto shaft until the snap-ring groove is visible.

(3) Install snap-ring to hold bearing onto output shaft.

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

## OUTPUT SHAFT REAR BEARING

### REMOVAL

(1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/ OVERDRIVE - REMOVAL)

(2) Remove overdrive geartrain from housing.

(3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 117).

(4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

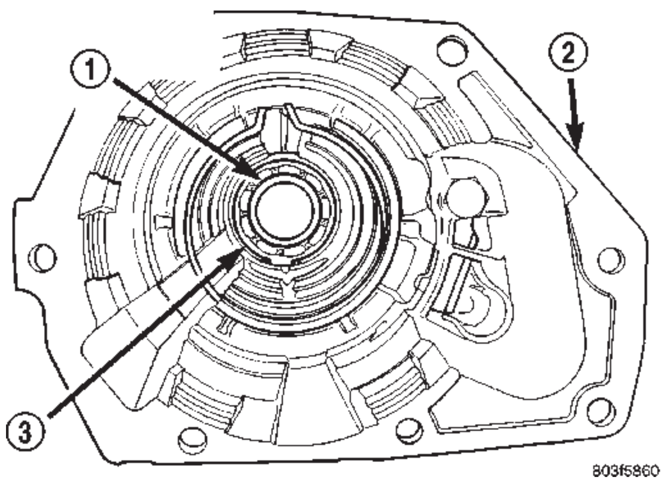

***Fig. 117 Output Shaft Rear Bearing***

1 - OUTPUT SHAFT REAR BEARING
2 - OVERDRIVE HOUSING
3 - SNAP-RING

### INSTALLATION

(1) Place replacement bearing in position in housing.

(2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.

(3) Install snap-ring to hold bearing into housing (Fig. 112).

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

## OVERDRIVE CLUTCH

### DESCRIPTION

The overdrive clutch (Fig. 118) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

### OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

## OVERDRIVE UNIT

### REMOVAL

(1) Shift transmission into PARK.

(2) Raise vehicle.

(3) Remove transfer case, if equipped.

(4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if neccesary.

(5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIV-

OVERDRIVE UNIT (Continued)

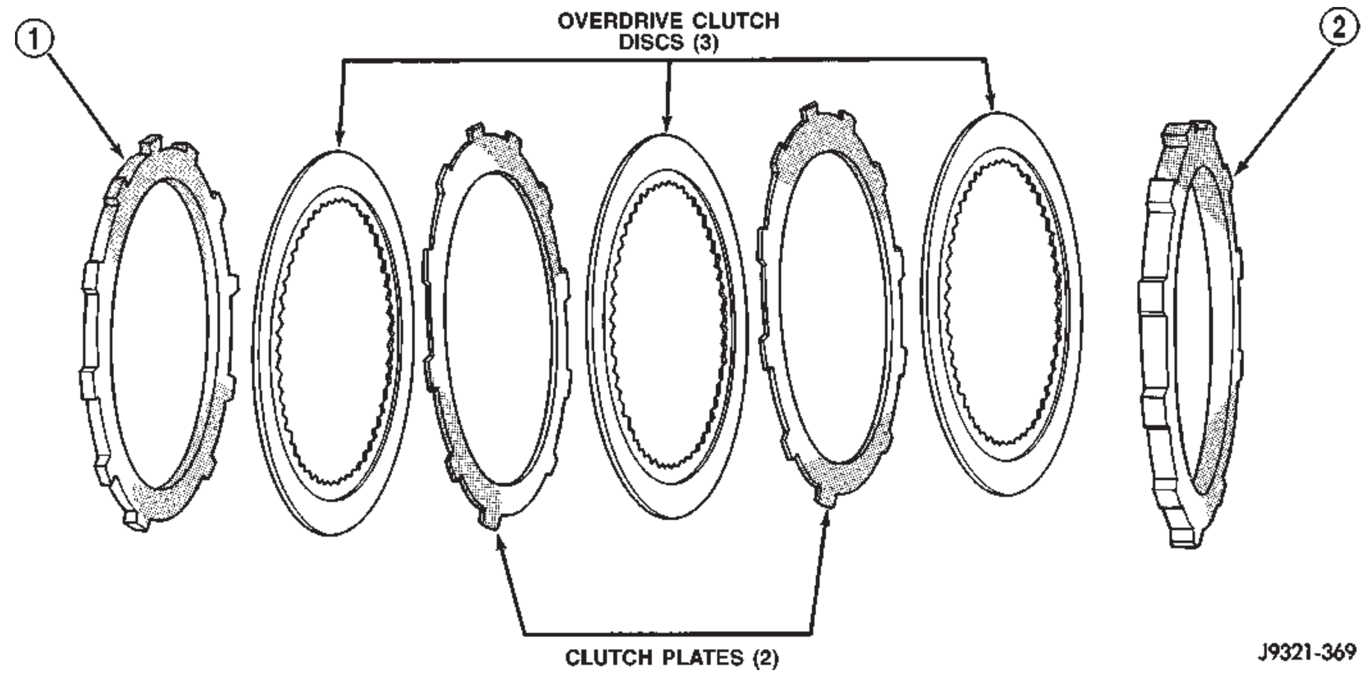

*Fig. 118 Overdrive Clutch*

1 - REACTION PLATE
2 - PRESSURE PLATE

ELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.

(7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.

(8) Support transmission with transmission jack.

(9) Remove bolts attaching overdrive unit to transmission (Fig. 119).

**CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.**

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

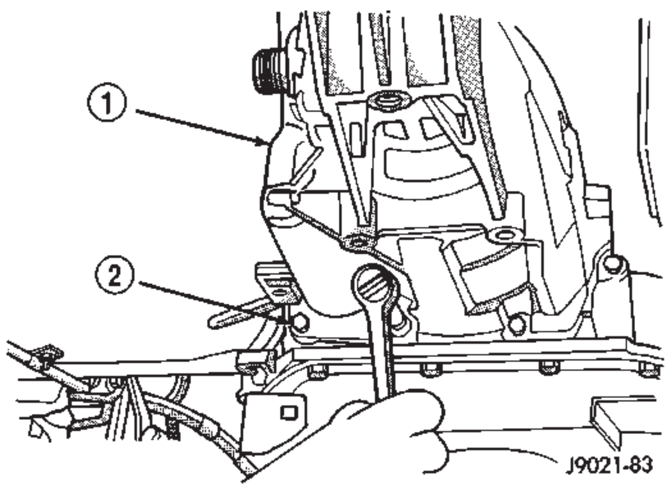

*Fig. 119 Overdrive Unit Bolts*

1 - OVERDRIVE UNIT
2 - ATTACHING BOLTS (7)

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

OVERDRIVE UNIT (Continued)

## DISASSEMBLY

(1) Remove transmission speed sensor and o-ring seal from overdrive case (Fig. 120).

(2) Remove overdrive piston thrust bearing (Fig. 121).

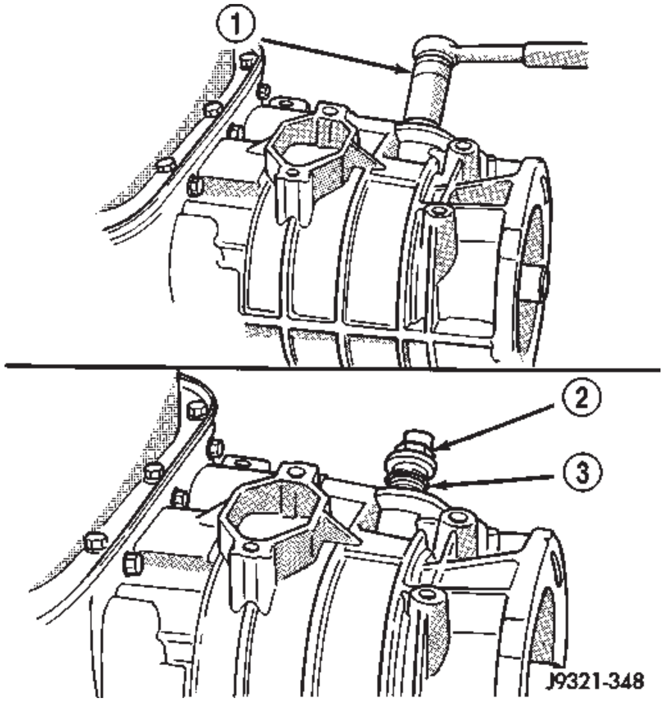

*Fig. 120 Transmission Speed Sensor*

1 - SOCKET AND WRENCH
2 - SPEED SENSOR
3 - O-RING

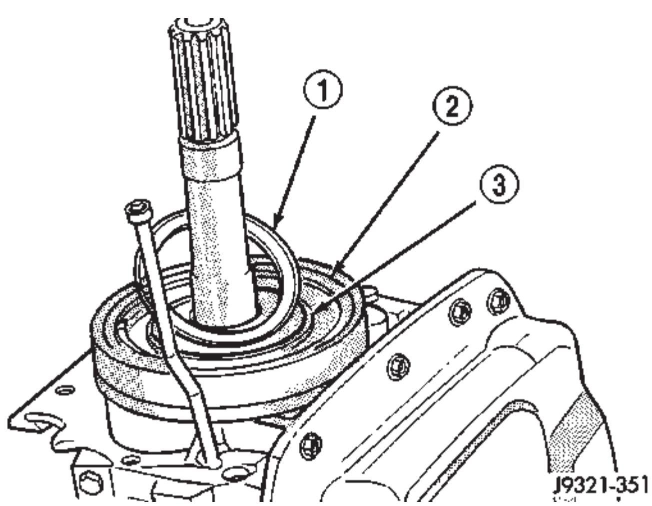

*Fig. 121 Overdrive Piston Thrust Bearing Removal/ Installation*

OVERDRIVE UNIT (Continued)

(7) Remove snap-ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 134).

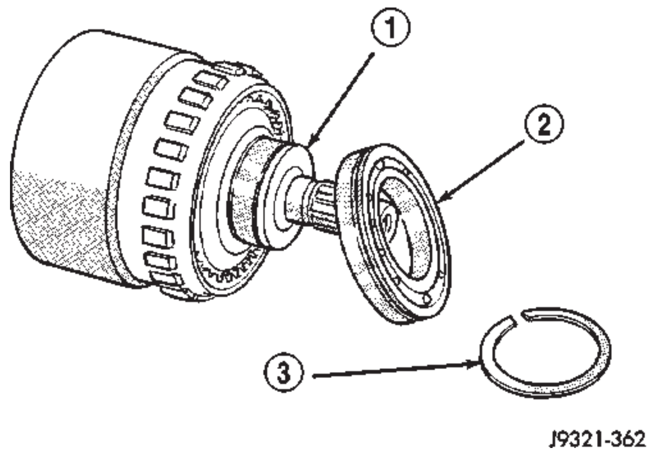

***Fig. 134 Rear Bearing Removal***

1 - OUTPUT SHAFT
2 - REAR BEARING
3 - SNAP-RING

## DIRECT CLUTCH, HUB AND SPRING

**WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(1) Mount geartrain assembly in shop press (Fig. 135).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 135). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 135).

(4) Remove direct clutch pack snap-ring (Fig. 136).

(5) Remove direct clutch hub retaining ring (Fig. 137).

(6) Release press load slowly and completely (Fig. 138).

(7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 138).

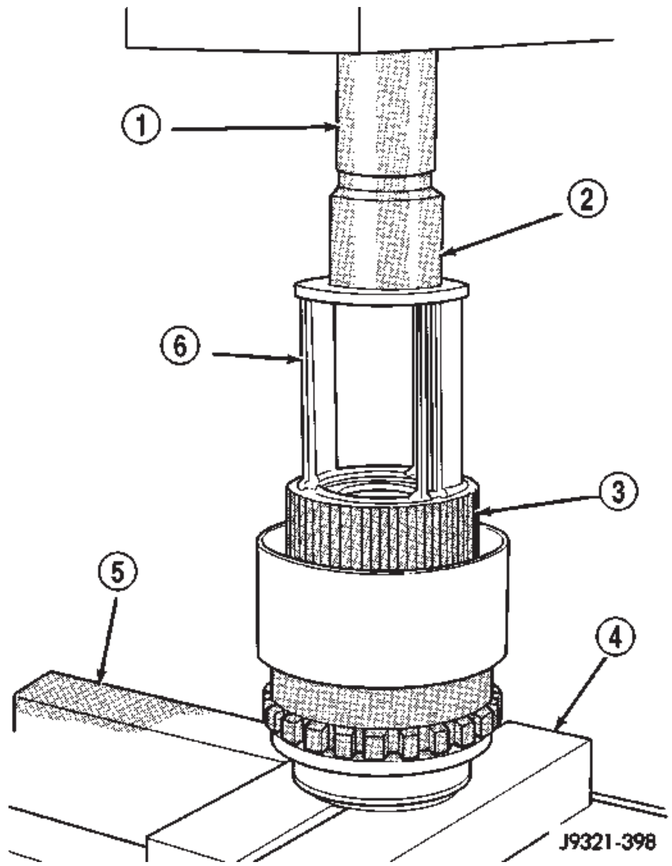

***Fig. 135 Geartrain Mounted In Shop Press***

(10) Remove snap-ring that secures annulus gear on output shaft (Fig. 146). Use two screwdrivers to unseat and work snap-ring out of groove as shown.

(11) Remove annulus gear from output shaft (Fig. 147). Use rawhide or plastic mallet to tap gear off shaft.

## GEAR CASE AND PARK LOCK

(1) Remove locating ring from gear case.

(2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.

(3) Remove reaction plug snap-ring and remove reaction plug.

(4) Remove output shaft seal.

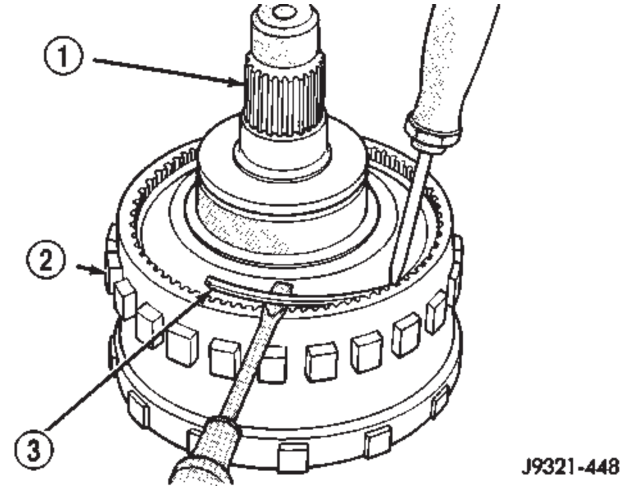

*Fig. 146 Annulus Gear Snap-Ring Removal*

1 - OUTPUT SHAFT

## CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

OVERDRIVE UNIT (Continued)

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

## INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

## ASSEMBLY

### GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 148). Lubricate bushings with petroleum jelly, or transmission fluid.

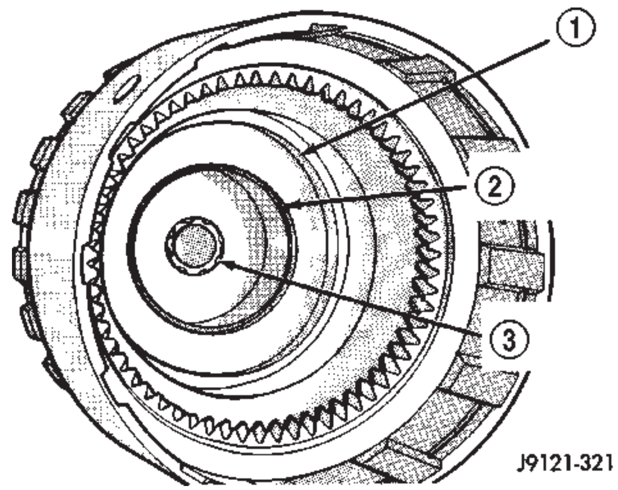

***Fig. 148 Output Shaft Pilot Bushing***

1 - OUTPUT SHAFT HUB
2 - OVERRUNNING CLUTCH HUB BUSHING
3 - INTERMEDIATE SHAFT PILOT BUSHING

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 149).

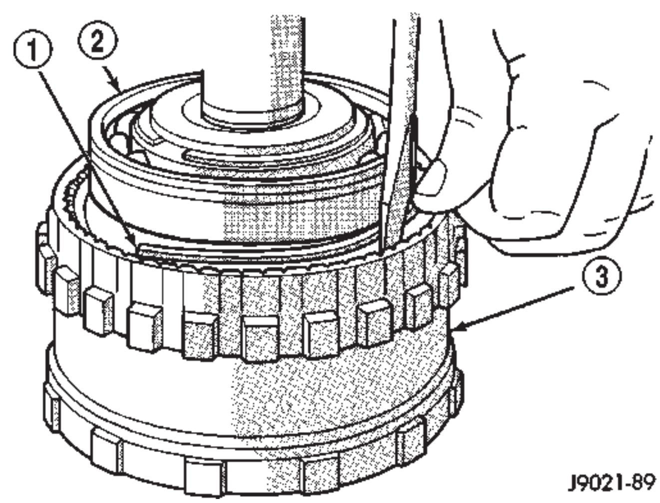

***Fig. 149 Annulus Gear Installation***

1 - SNAP-RING
2 - OUTPUT SHAFT FRONT BEARING
3 - ANNULUS GEAR

OVERDRIVE UNIT (Continued)

(4) Align and install clutch drum on annulus gear (Fig. 150). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 150).

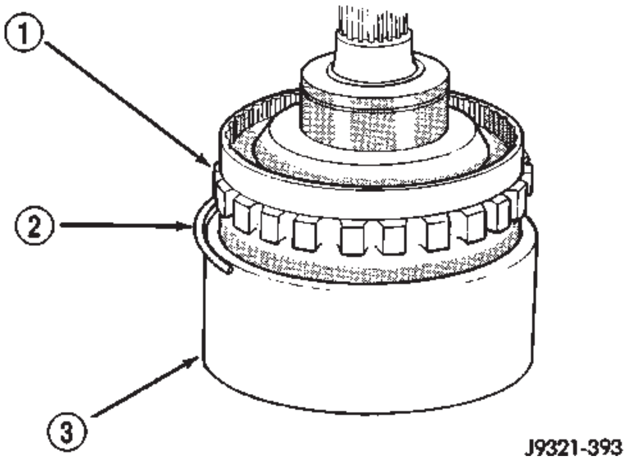

**Fig. 150 Clutch Drum And Outer Retaining Ring Installation**

1 - ANNULUS GEAR
2 - OUTER SNAP-RING
3 - CLUTCH DRUM

(6) Slide clutch drum forward and install inner retaining ring (Fig. 151).

(7) Install rear bearing and snap ring on output shaft (Fig. 152). Be sure locating ring groove in bearing is toward rear.

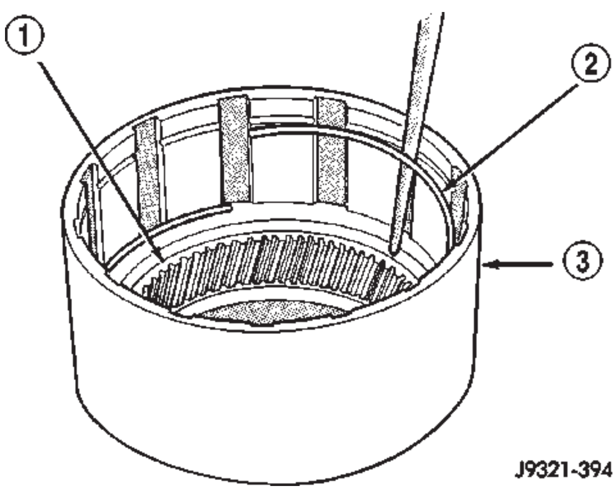

**Fig. 151 Clutch Drum Inner Retaining Ring Installation**

1 - ANNULUS GEAR
2 - INNER SNAP-RING
3 - CLUTCH DRUM

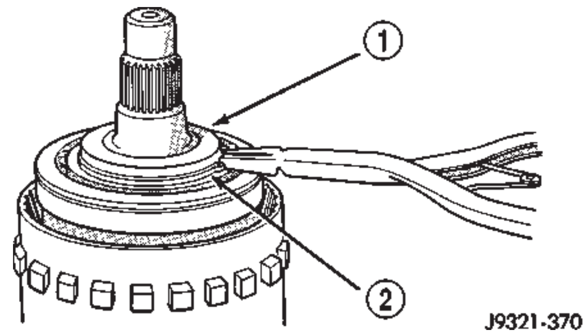

**Fig. 152 Rear Bearing And Snap-Ring Installation**

1 - REAR BEARING
2 - SNAP-RING

(8) Install overrunning clutch on hub (Fig. 153). Note that clutch only fits one way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

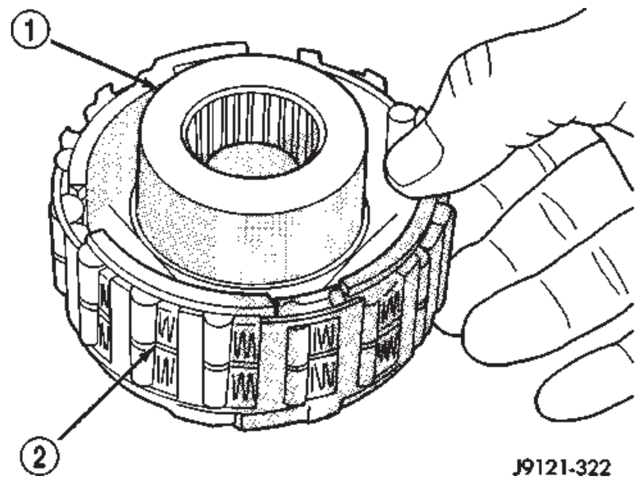

**Fig. 153 Assembling Overrunning Clutch And Hub**

1 - CLUTCH HUB
2 - OVERRUNNING CLUTCH

(10) Install overrunning clutch in output shaft (Fig. 154). Insert snap ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 155). Be sure planetary pinions are fully seated in annulus gear before proceeding.

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

OVERDRIVE UNIT (Continued)

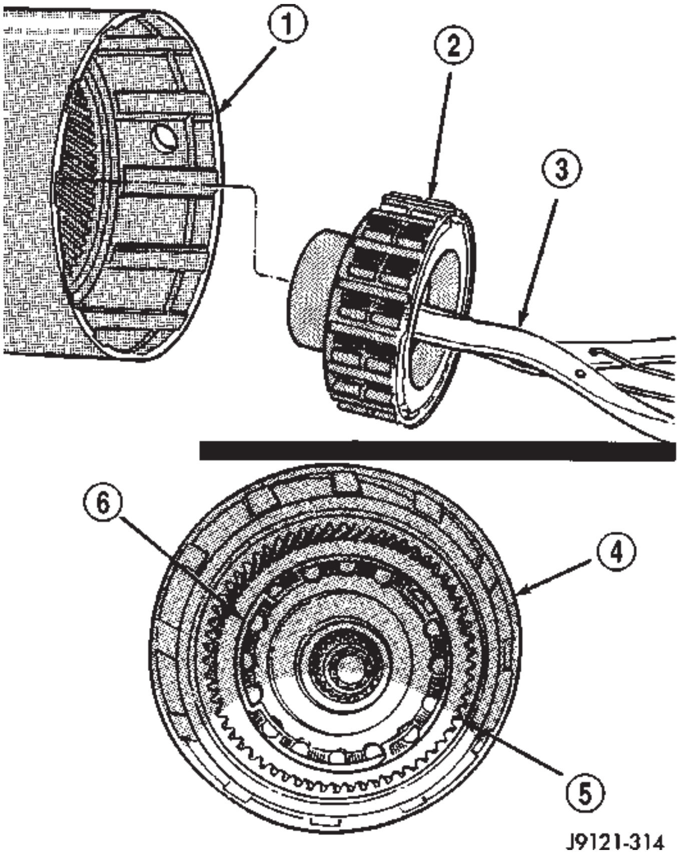

*Fig. 154 Overrunning Clutch Installation*

1 - CLUTCH DRUM
2 - OVERRUNNING CLUTCH ASSEMBLY
3 - EXPANDING-TYPE SNAP-RING PLIERS
4 - CLUTCH DRUM
5 - ANNULUS GEAR
6 - OVERRUNNING CLUTCH ASSEMBLY SEATED IN OUTPUT SHAFT

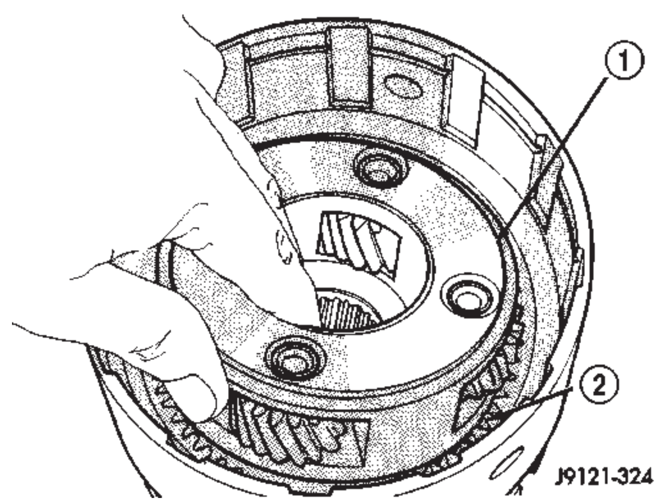

*Fig. 155 Planetary Gear Installation*

1 - PLANETARY GEAR
2 - ANNULUS GEAR

(13) Install planetary thrust bearing on sun gear (Fig. 156). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 157). Be sure sun gear and thrust bearing are fully seated before proceeding.

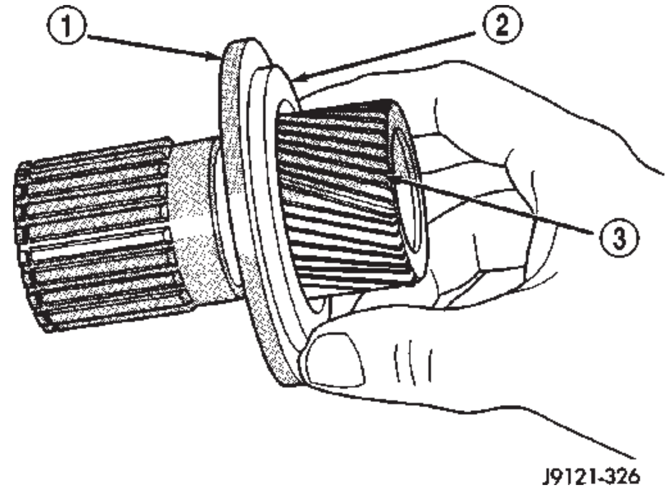

*Fig. 156 Planetary Thrust Bearing Installation*

1 - SPRING PLATE
2 - PLANETARY THRUST BEARING
3 - SUN GEAR

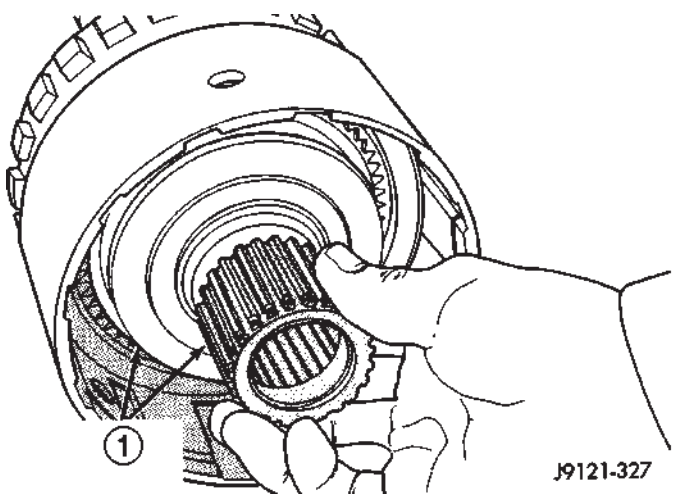

*Fig. 157 Sun Gear Installation*

1 - SUN GEAR AND SPRING PLATE ASSEMBLY

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 158). Insert tool through sun gear and into splines of

OVERDRIVE UNIT (Continued)

both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 159). Be sure spring is properly seated on spring plate.

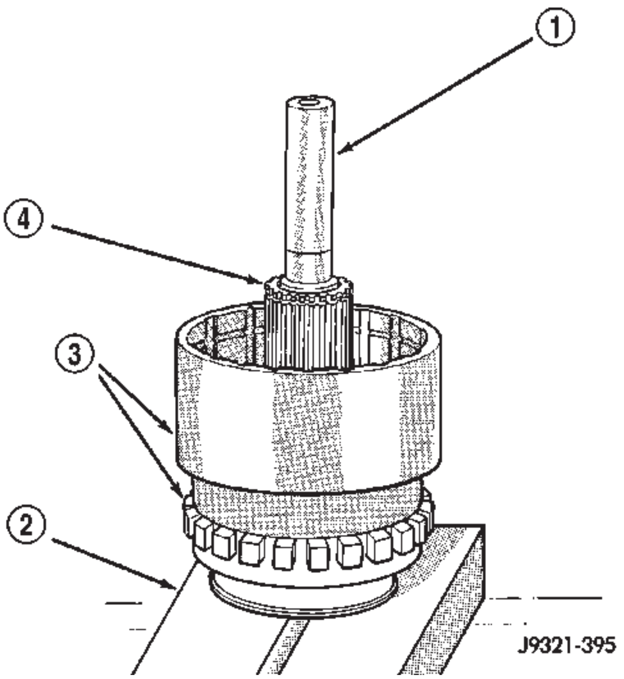

*Fig. 158 Alignment Tool Installation*

1 - SPECIAL TOOL 6227-2
2 - PRESS PLATES
3 - ASSEMBLED DRUM AND ANNULUS GEAR
4 - SUN GEAR

**NOTE: The direct clutch in a 46RE transmission uses 8 clutch discs.**

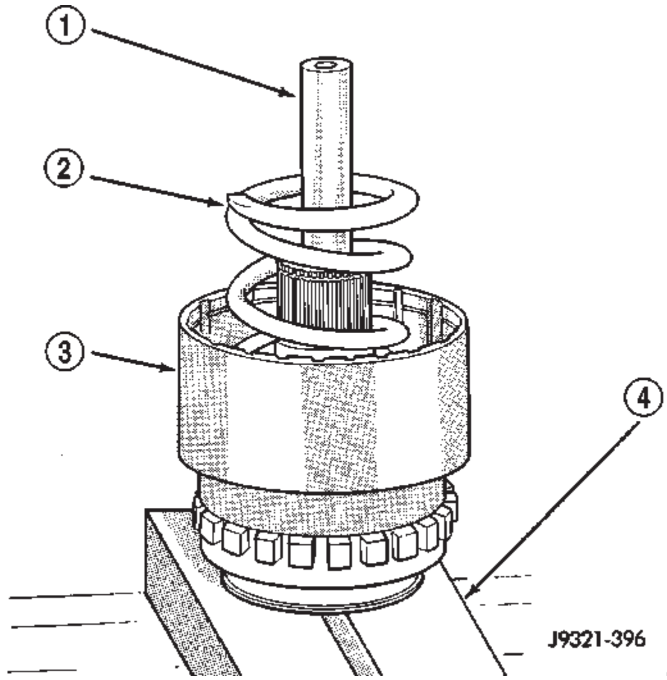

*Fig. 159 Direct Clutch Spring Installation*

1 - SPECIAL TOOL 6227-2
2 - DIRECT CLUTCH SPRING
3 - CLUTCH HUB
4 - PRESS PLATES

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 160).

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 161).

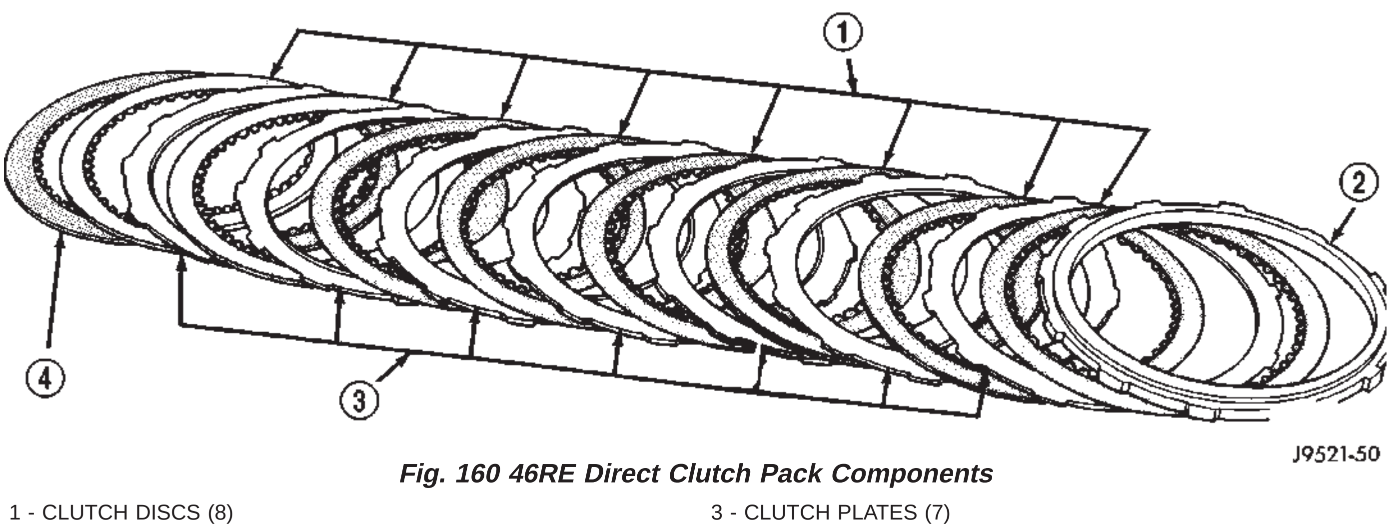

*Fig. 160 46RE Direct Clutch Pack Components*

1 - CLUTCH DISCS (8)
2 - PRESSURE PLATE
3 - CLUTCH PLATES (7)
4 - REACTION PLATE

OVERDRIVE UNIT (Continued)

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 162).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 163). Be sure hub is started on sun gear splines before proceeding.

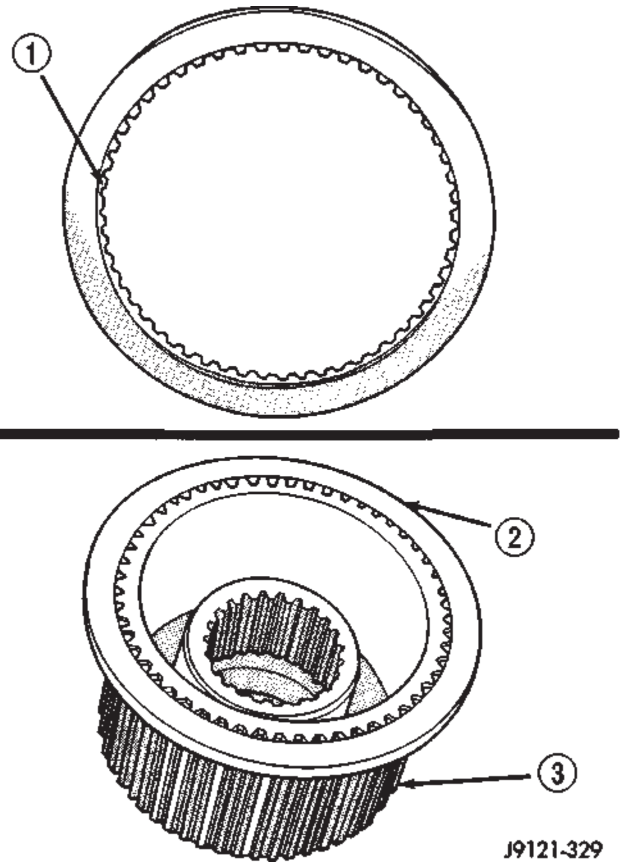

***Fig. 161 Correct Position Of Direct Clutch Reaction Plate***

1 - REACTION PLATE COUNTERBORE

2 - DIRECT CLUTCH REACTION PLATE (FLUSH WITH END OF HUB)

3 - CLUTCH HUB

**WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

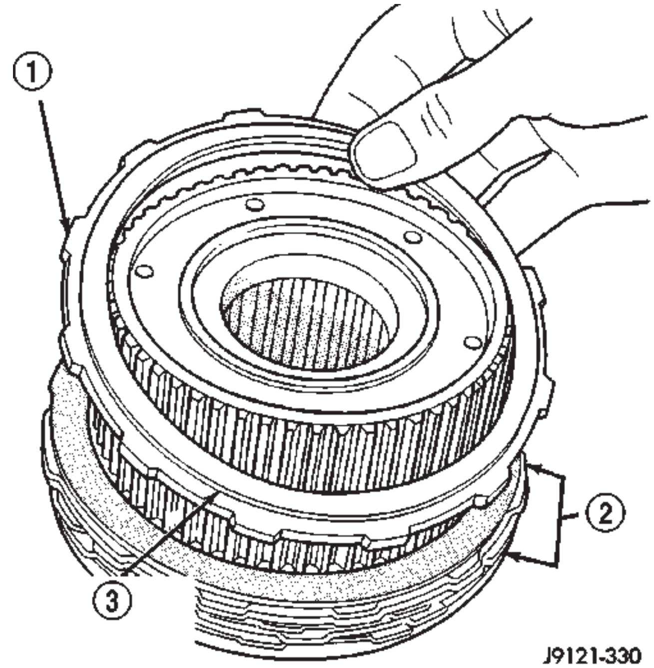

***Fig. 162 Correct Position Of Direct Clutch***

1 - DIRECT CLUTCH PRESSURE PLATE

2 - CLUTCH PACK

3 - BE SURE SHOULDER SIDE OF PLATE FACES UPWARD

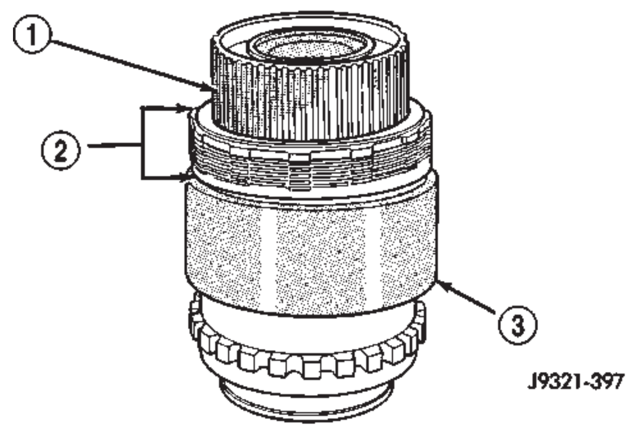

***Fig. 163 Direct Clutch Pack And Clutch Hub Installation***

1 - CLUTCH HUB

2 - DIRECT CLUTCH PACK

3 - CLUTCH DRUM

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring

OVERDRIVE UNIT (Continued)

grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap ring (Fig. 164). Be very sure snap ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 165). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

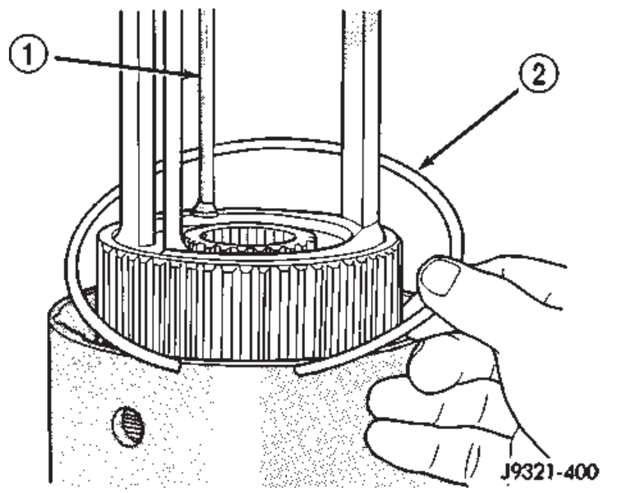

*Fig. 164 Direct Clutch Pack Snap-Ring Installation*

1 - SPECIAL TOOL 6227-1
2 - DIRECT CLUTCH PACK SNAP-RING

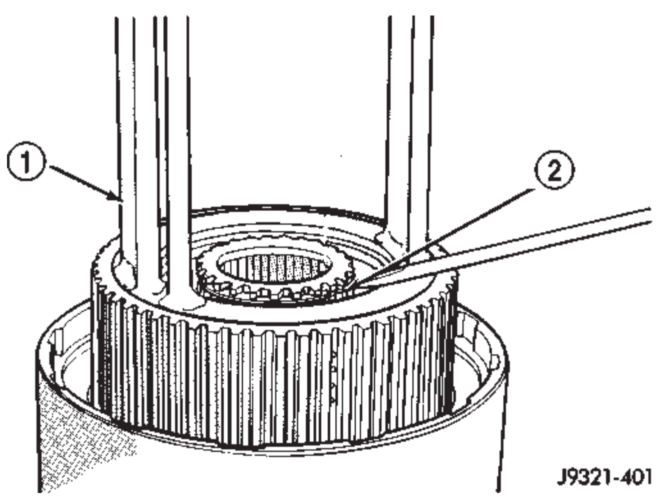

*Fig. 165 Clutch Hub Retaining Ring Installation*

1 - SPECIAL TOOL 6227-1
2 - CLUTCH HUB RETAINING RING

## GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 166). Be sure pin is seated in hole in case before installing snap ring.

(4) Install reaction plug snap-ring (Fig. 167). Compress snap ring only enough for installation; do not distort it.

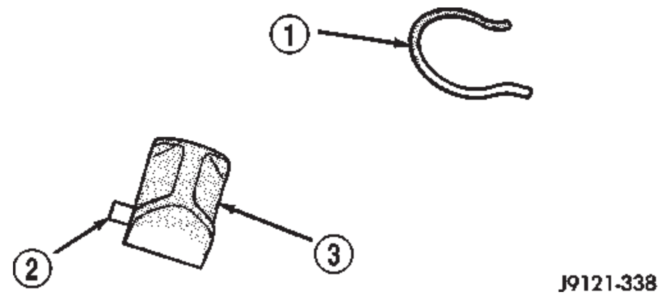

*Fig. 166 Reaction Plug Locating Pin And Snap-Ring*

1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)
2 - LOCATING PIN
3 - PARK LOCK REACTION PLUG

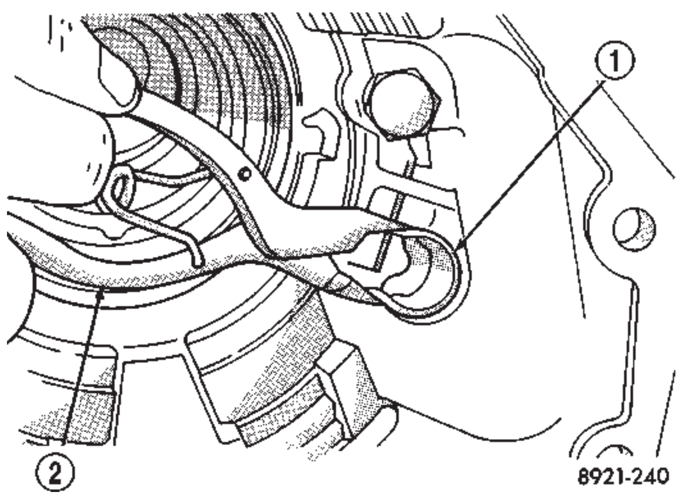

*Fig. 167 Reaction Plug And Snap-Ring Installation*

1 - REACTION PLUG SNAP-RING
2 - SNAP-RING PLIERS

(5) Install new seal in gear case. Use Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 168).

(7) Support geartrain on Tool 6227-1 (Fig. 169). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 169).

(9) Expand front bearing locating ring with snap ring pliers (Fig. 170). Then slide case downward until

OVERDRIVE UNIT (Continued)

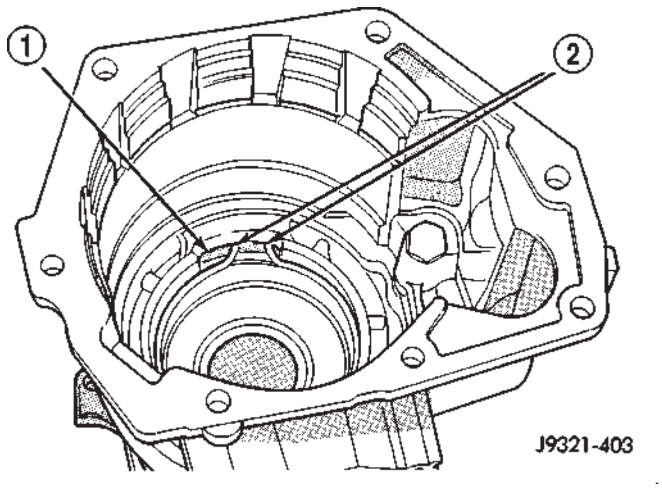

*Fig. 168 Correct Rear Bearing Locating Ring Position*

1 - CASE ACCESS HOLE
2 - TAB ENDS OF LOCATING RING

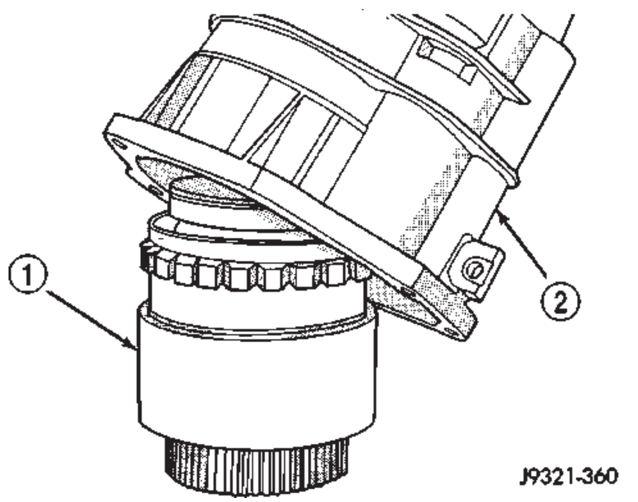

*Fig. 169 Overdrive Gear Case Installation*

1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

locating ring locks in bearing groove and release snap ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 171).

## OVERDRIVE CLUTCH

**NOTE: The overdrive clutch in a 46RE transmission uses 4 clutch discs.**

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 172).

(2) Install wave spring on top of reaction ring (Fig. 173). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring

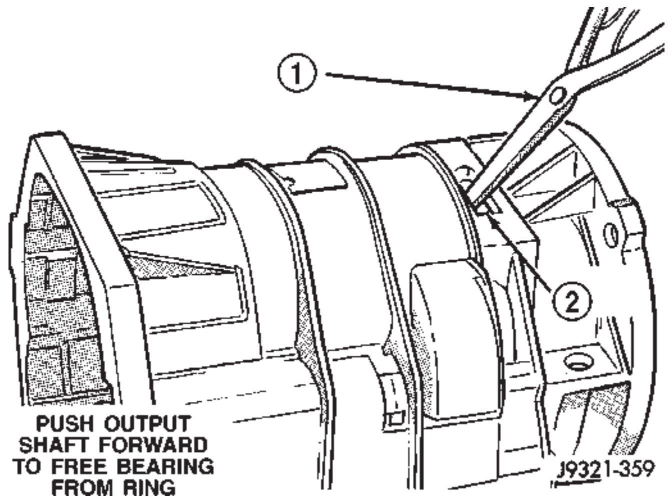

*Fig. 170 Seating Locating Ring In Rear Bearing*

1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

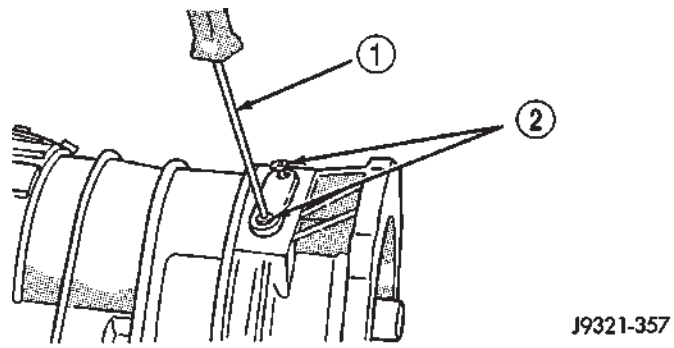

*Fig. 171 Locating Ring Access Cover And Gasket Installation*

1 - TORX SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

securely in groove. Also ensure that the ends of the two rings are offset from each other.

(3) Assemble overdrive clutch pack (Fig. 174).

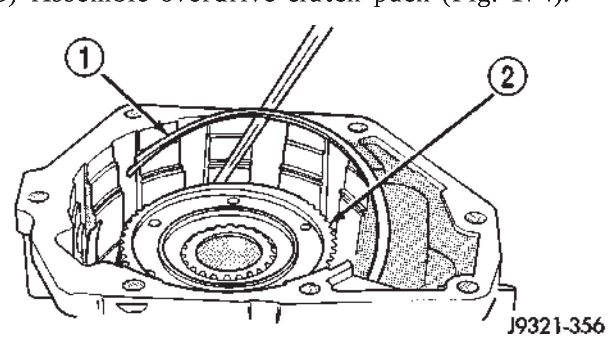

*Fig. 172 Overdrive Clutch Reaction Ring Installation*

1 - REACTION RING
2 - CLUTCH HUB

OVERDRIVE UNIT (Continued)

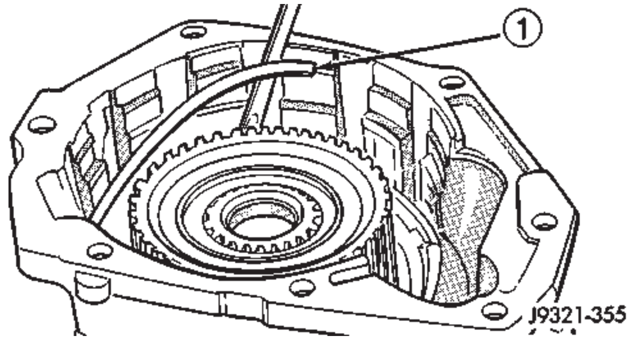

***Fig. 173 Overdrive Clutch Wave Spring Installation***

1 - WAVE SPRING

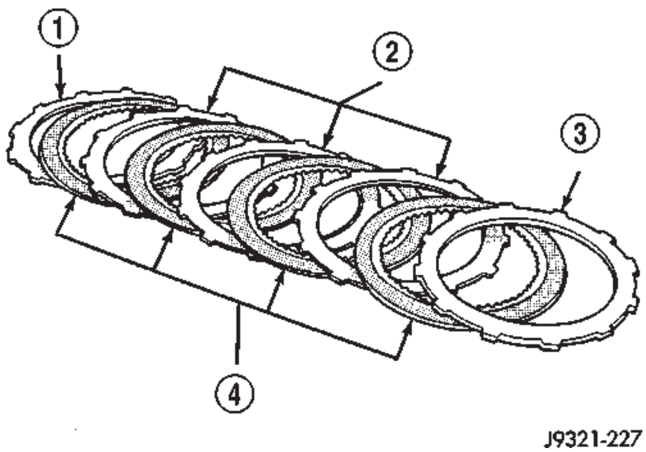

***Fig. 174 46RE Overdrive Clutch Components***

1 - REACTION PLATE
2 - CLUTCH PLATES (3)
3 - PRESSURE PLATE
4 - CLUTCH DISCS (4)

(4) Install overdrive clutch reaction plate first.

**NOTE: The reaction plate is the same thickness as the pressure plate in a 46RE transmission.**

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 175).

## INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

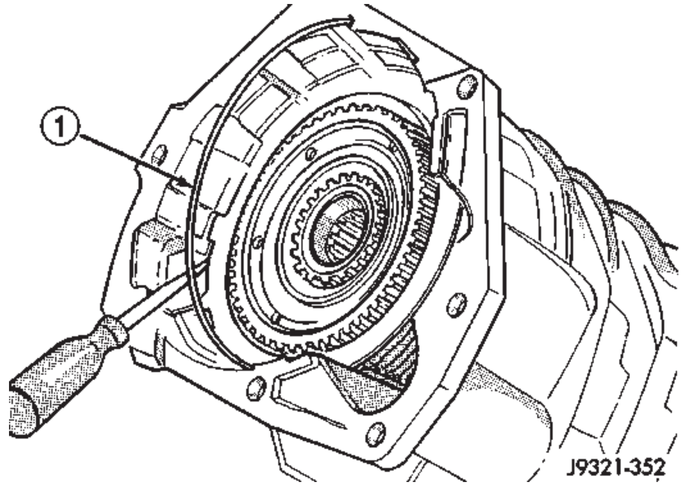

***Fig. 175 Overdrive Clutch Pack Retaining Ring Installation***

1 - OVERDRIVE CLUTCH PACK RETAINING RING

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 176). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 176).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 177).

(e) Remove Gauge Alignment Tool 6312.

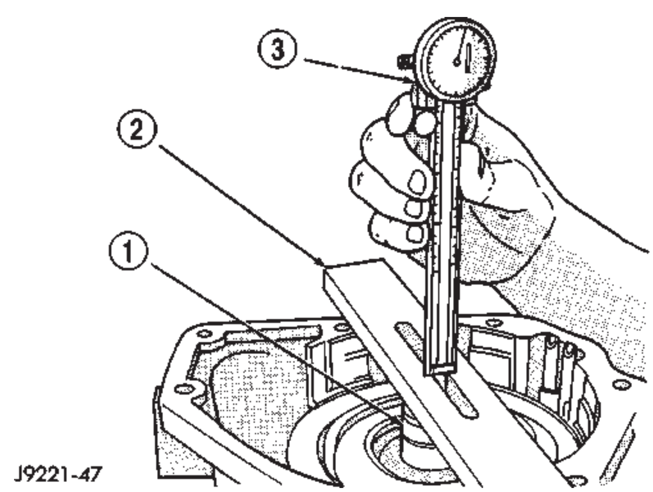

***Fig. 176 Shaft End Play Measurement***

1 - SPECIAL TOOL 6312
2 - SPECIAL TOOL 6311
3 - SPECIAL TOOL C-4962

OVERDRIVE UNIT (Continued)

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| .7336 - .7505 | .158 - .159 |
| .7506 - .7675 | .175 - .176 |
| .7676 - .7855 | .193 - .194 |
| .7856 - .8011 | .211 - .212 |

J9121-341

*Fig. 177 Intermediate Shaft End Play Spacer Selection*

## OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 178).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 179).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

## OVERDRIVE PISTON

(1) Install new seals on overdrive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by:

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114–3 and inside Guide Ring 8114–1.

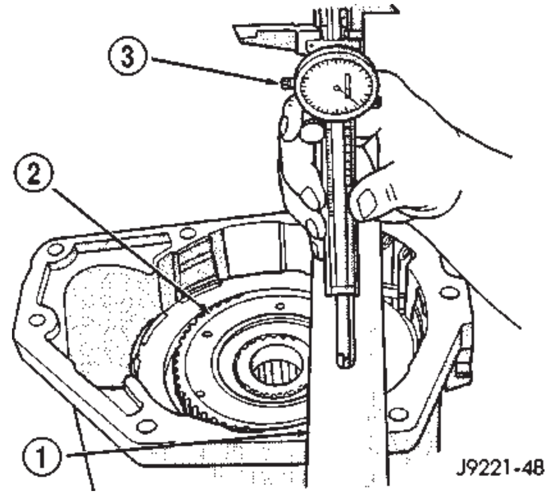

*Fig. 178 Overdrive Piston Thrust Plate Measurement*

1 - SPECIAL TOOL 6311
2 - DIRECT CLUTCH HUB THRUST BEARING SEAT
3 - SPECIAL TOOL C-4962

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| 1.7500 - 1.7649 | .108 - .110 |
| 1.7650 - 1.7799 | .123 - .125 |
| 1.7800 - 1.7949 | .138 - .140 |
| 1.7950 - 1.8099 | .153 - .155 |
| 1.8100 - 1.8249 | .168 - .170 |
| 1.8250 - 1.8399 | .183 - .185 |
| 1.8400 - 1.8549 | .198 - .200 |
| 1.8550 - 1.8699 | .213 - .215 |
| 1.8700 - 1.8849 | .228 - .230 |
| 1.8850 - 1.8999 | .243 - .245 |

J9121-342

*Fig. 179 Overdrive Piston Thrust Plate Selection*

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case.

## INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not

OVERDRIVE UNIT (Continued)

seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 180).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

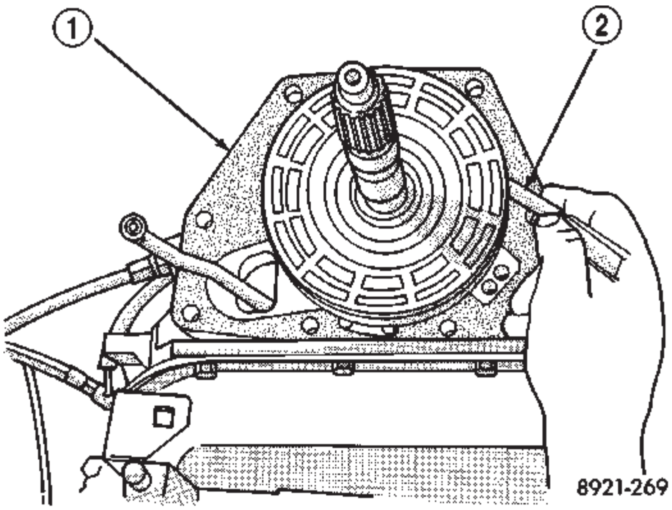

**Fig. 180 Trimming Overdrive Case Gasket**

1 - GASKET
2 - SHARP KNIFE

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 181).

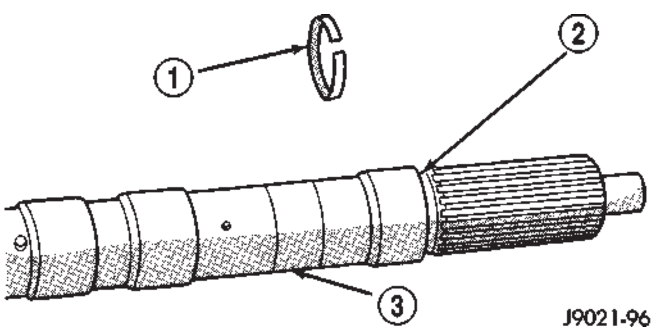

**Fig. 181 Intermediate Shaft Selective Spacer Location**

1 - SELECTIVE SPACER
2 - SPACER GROOVE
3 - INTERMEDIATE SHAFT

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

**CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.**

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

# OVERDRIVE SWITCH

## DESCRIPTION

The overdrive OFF (control) switch is located in the shift lever arm (Fig. 182). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

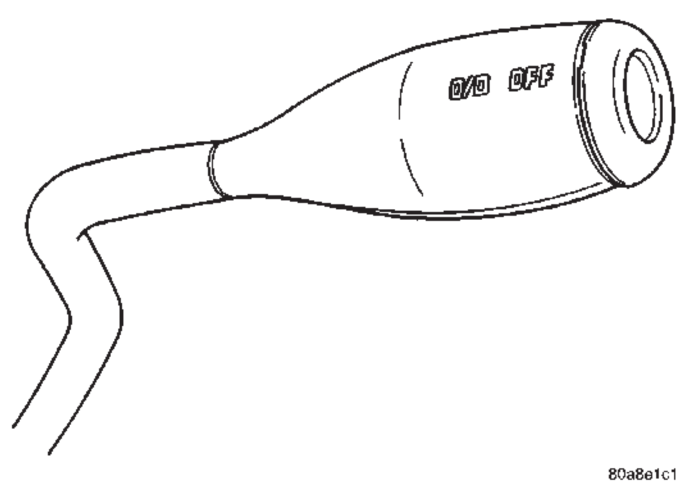

**Fig. 182 Overdrive Off Switch**

OVERDRIVE SWITCH (Continued)

## OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

## DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

## REMOVAL

(1) Using a plastic trim tool, remove the overdrive off switch retainer from the shift lever (Fig. 183).

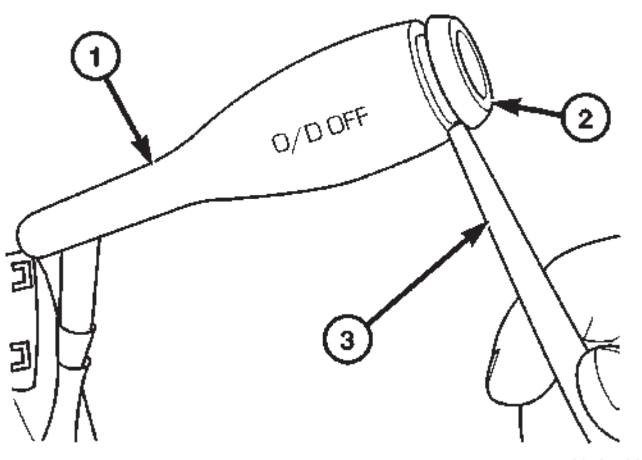

***Fig. 183 Overdrive Off Switch Retainer***

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH RETAINER
3 - PLASTIC TRIM TOOL

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 184)

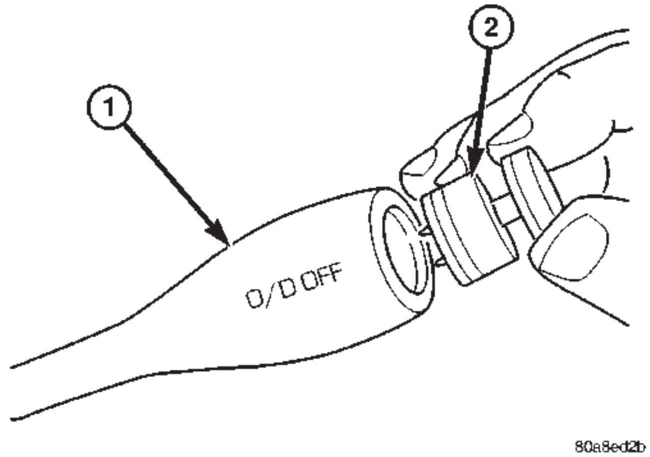

***Fig. 184 Remove the Overdrive Off Switch***

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH

## INSTALLATION

**NOTE: There is enough slack in the wire to pull out the connector from the lever.**

(1) Pull the connector out of the lever just enough to grasp it.

**CAUTION: Be careful not to bend the pins on the overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.**

(2) Install the overdrive off switch into the connector (Fig. 185)

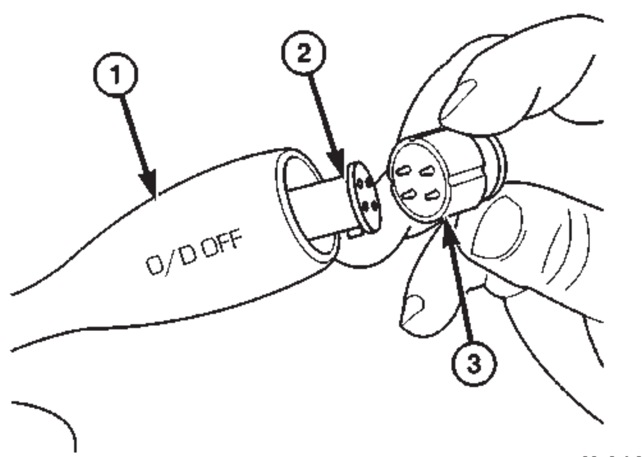

***Fig. 185 Install the Overdrive Off Switch***

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH WIRING CONNECTOR
3 - OVERDRIVE OFF SWITCH

OVERDRIVE SWITCH (Continued)

(3) Push the overdrive off switch and wiring into the shift lever.

(4) Install the overdrive off switch retainer onto the shift lever.

# OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

## DESCRIPTION

The overrunning clutch (Fig. 186) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

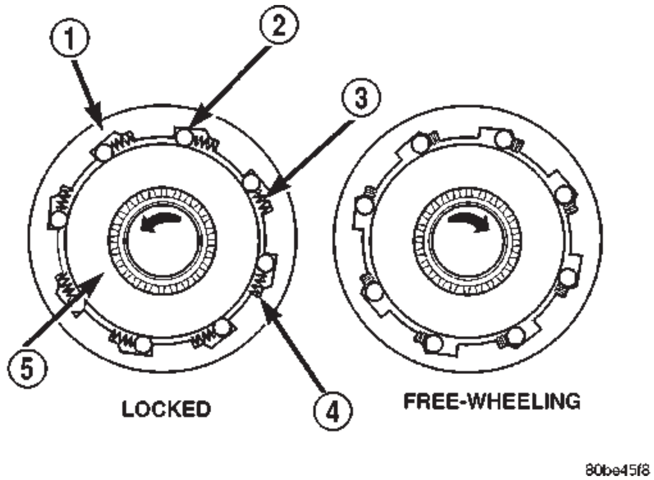

*Fig. 186 Overrunning Clutch*

1 - OUTER RACE (CAM)
2 - ROLLER
3 - SPRING
4 - SPRING RETAINER
5 - INNER RACE (HUB)

## OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a freewheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

## DISASSEMBLY

(1) Remove the overdrive piston (Fig. 187).

(2) Remove the overdrive piston retainer bolts.

(3) Remove overdrive piston retainer.

(4) Remove case gasket.

(5) Tap old cam out of case with pin punch. Insert punch through bolt holes at rear of case (Fig. 188). Alternate position of punch to avoid cocking cam during removal.

(6) Clean clutch cam bore and case. Be sure to remove all chips/shavings generated during cam removal.

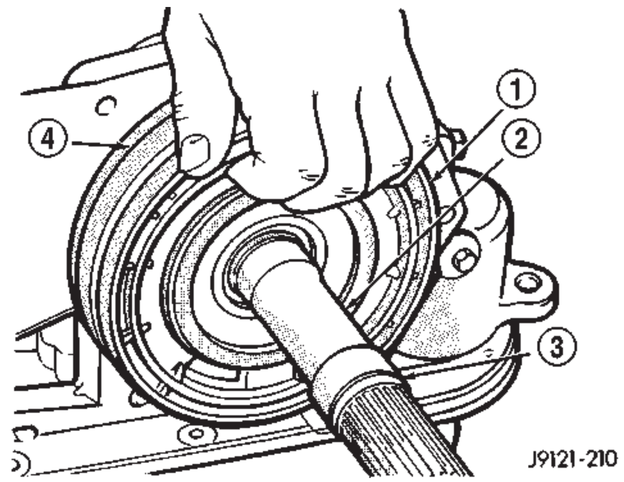

*Fig. 187 Overdrive Piston Removal*

1 - OVERDRIVE CLUTCH PISTON
2 - INTERMEDIATE SHAFT
3 - SELECTIVE SPACER
4 - PISTON RETAINER

## CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances.**

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

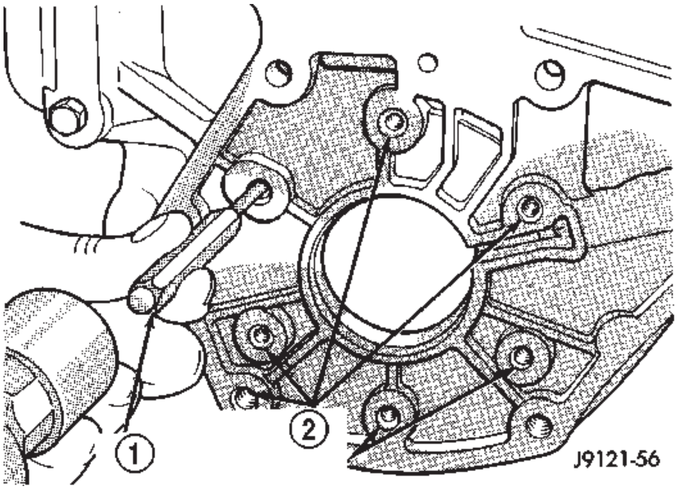

***Fig. 188 Overrunning Clutch Cam***

1 - PIN PUNCH
2 - REAR SUPPORT BOLT HOLES

**Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

## ASSEMBLY

(1) Temporarily install overdrive piston retainer in case. Use 3-4 bolts to secure retainer.

(2) Align and start new clutch cam in the transmission case. Be sure serrations on cam and in case are aligned (Fig. 189). Then tap cam into case just enough to hold it in place.

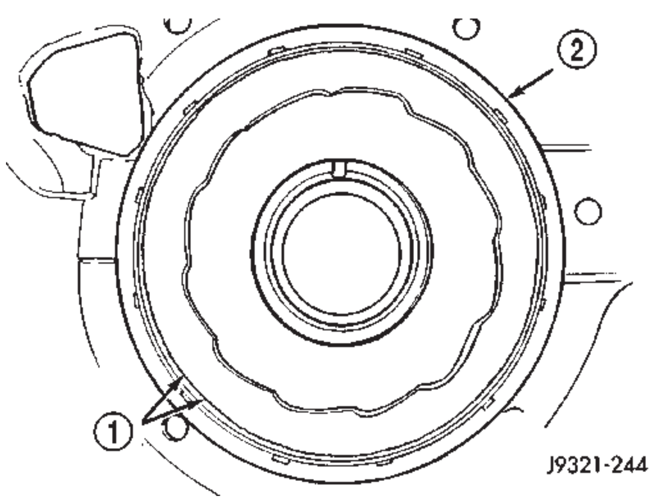

***Fig. 189 Positioning Replacement Clutch Cam In Case***

1 - ALIGN SERRATIONS ON CAM AND IN CASE
2 - CLUTCH CAM

(3) Verify that cam is correctly positioned before proceeding any further. Narrow ends of cam ramps should be to left when cam is viewed from front end of case (Fig. 189).

(4) Insert Adapter Tool SP-5124 into piston retainer (Fig. 190).

(5) Assemble Puller Bolt SP-3701 and Press Plate SP-3583-A (Fig. 191).

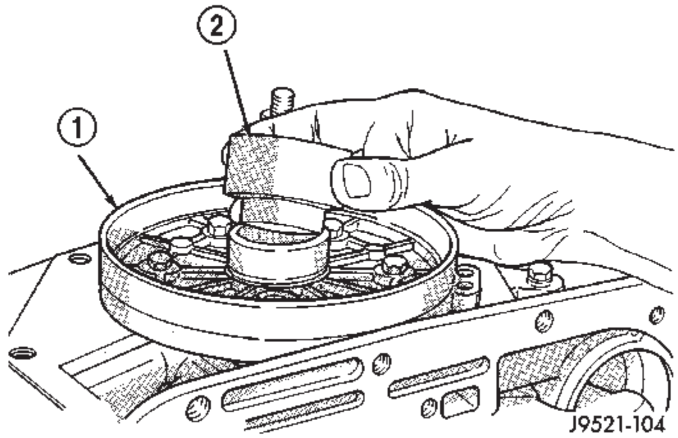

***Fig. 190 Positioning Adapter Tool In Overdrive Piston Retainer***

1 - PISTON RETAINER
2 - SPECIAL TOOL SP-5124

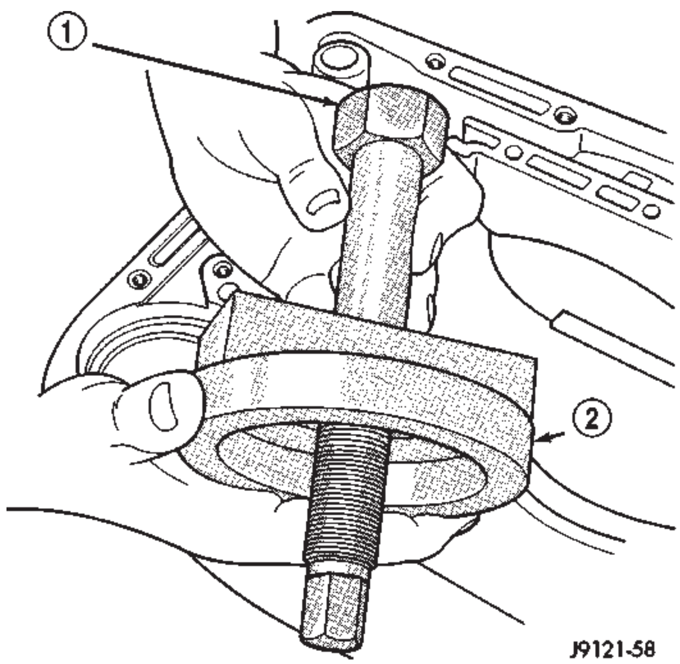

***Fig. 191 Assembling Clutch Cam Puller Bolt And Press Plate***

1 - PULLER BOLT SP-3701
2 - PRESS PLATE SP-3583-A

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

(6) Install assembled puller plate and bolt (Fig. 192). Insert bolt through cam, case and adapter tool. Be sure plate is seated squarely on cam.

(7) Hold puller plate and bolt in place and install puller nut SP-3701 on puller bolt (Fig. 193).

(8) Tighten puller nut to press clutch cam into case (Fig. 193). Be sure cam is pressed into case evenly and does not become cocked.

(9) Remove clutch cam installer tools.

(10) Stake case in 14 places around clutch cam to help secure cam in case. Use blunt punch or chisel to stake case.

(11) Remove piston retainer from case. Cover retainer with plastic sheeting, or paper to keep it dust free.

(12) Clean case and cam thoroughly. Be sure any chips/shavings generated during cam installation are removed from case.

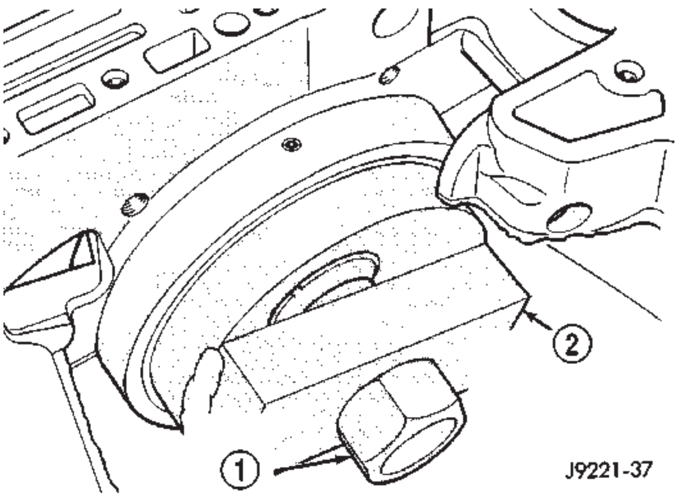

***Fig. 192 Positioning Puller Plate On Clutch Cam***

1 - SPECIAL TOOL SP-3701
2 - BE SURE PLATE SP-3583-A IS SEATED SQUARELY ON CAM

(13) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 194). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

(14) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 195). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

(15) Install new seals on overdrive piston.

(16) Stand transmission case upright on bellhousing.

(17) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

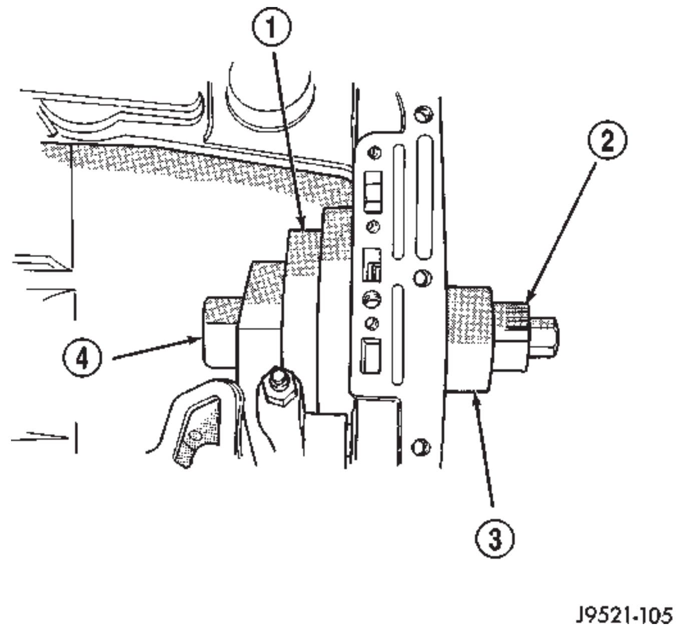

***Fig. 193 Pressing Overrunning Clutch Cam Into Case***

1 - SPECIAL TOOL SP-3583-A
2 - TIGHTEN NUT TO DRAW CAM INTO CASE (NUT IS PART OF BOLT SP-3701)
3 - SPECIAL TOOL SP-5124
4 - SPECIAL TOOL SP-3701

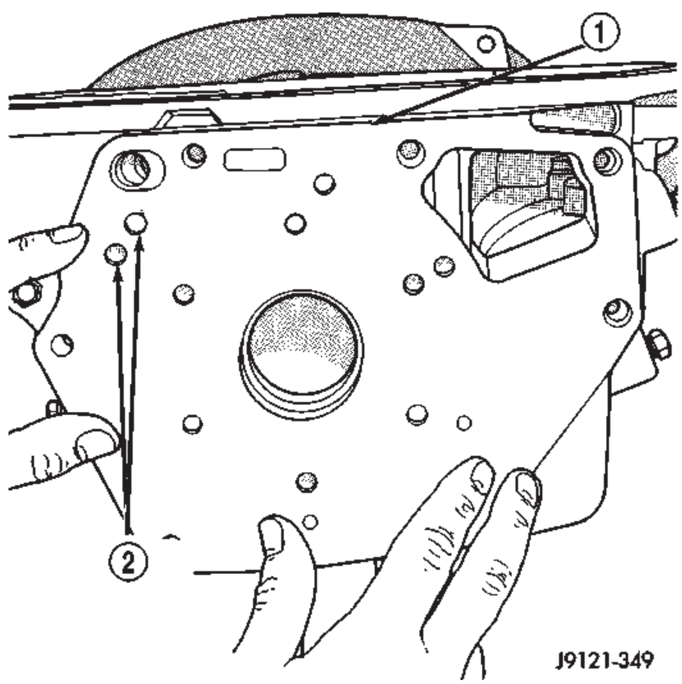

***Fig. 194 Installing/Aligning Case Gasket***

1 - CASE GASKET
2 - BE SURE GOVERNOR TUBE FEED HOLES IN CASE AND GASKET ARE ALIGNED

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

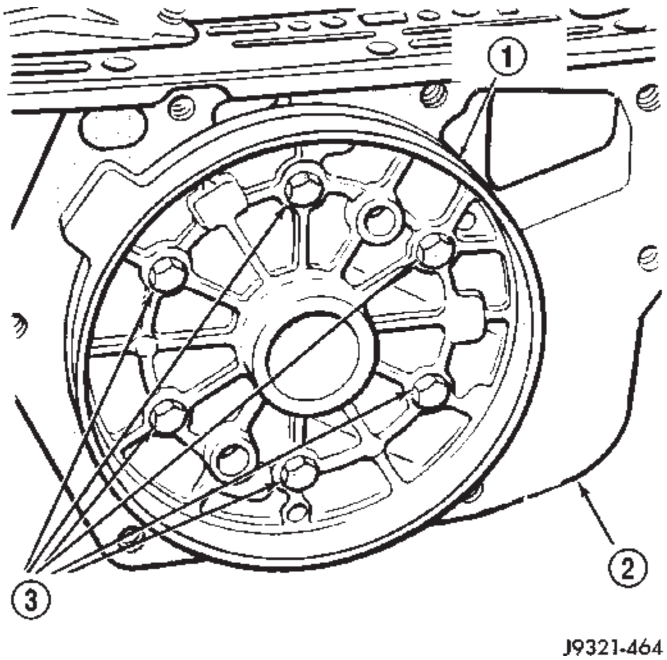

*Fig. 195 Aligning Overdrive Piston Retainer*

1 - PISTON RETAINER
2 - GASKET
3 - RETAINER BOLTS

(18) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(19) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

# PARK/NEUTRAL POSITION SWITCH

## DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

### SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

## REMOVAL

(1) Raise vehicle and position drain pan under switch.

(2) Disconnect switch wires.

(3) Remove switch from case.

## INSTALLATION

(1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 196).

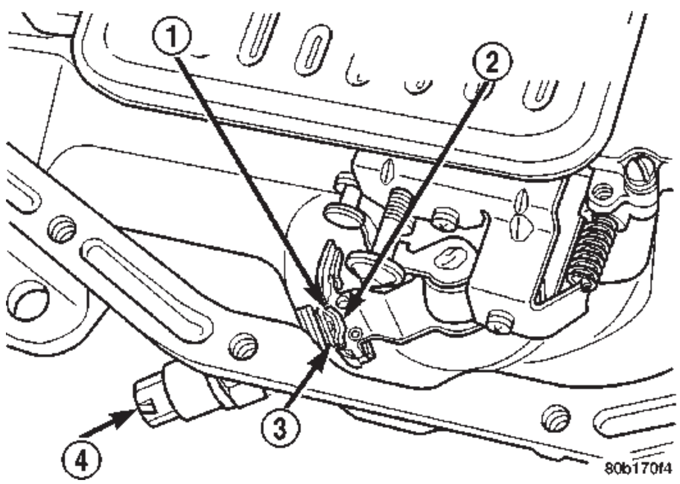

*Fig. 196 Park/Neutral Position Switch*

1 - NEUTRAL CONTACT
2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
3 - PARK CONTACT
4 - SWITCH

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

(3) Test continuity of new switch with 12V test lamp.

(4) Connect switch wires and lower vehicle.

(5) Top off transmission fluid level.

# PISTONS

## DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

## OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

### PRESSURE

Pressure (Fig. 197) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

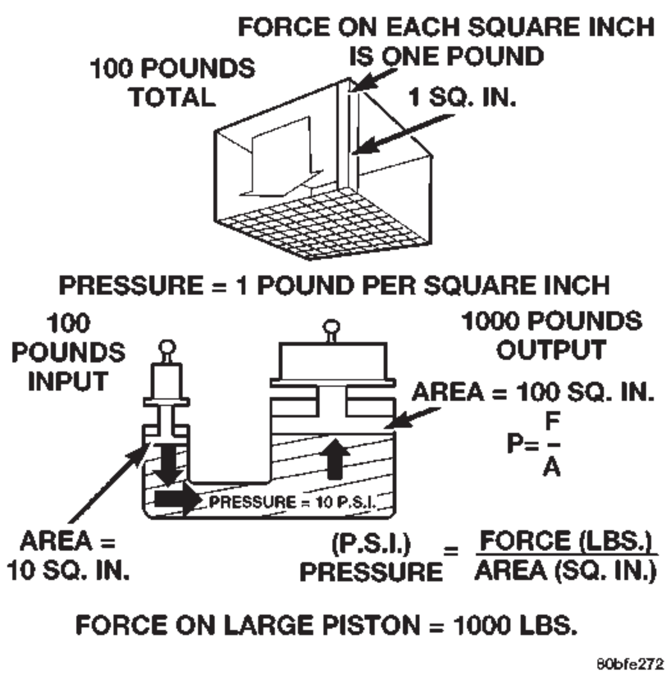

*Fig. 197 Force and Pressure Relationship*

### PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 198) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

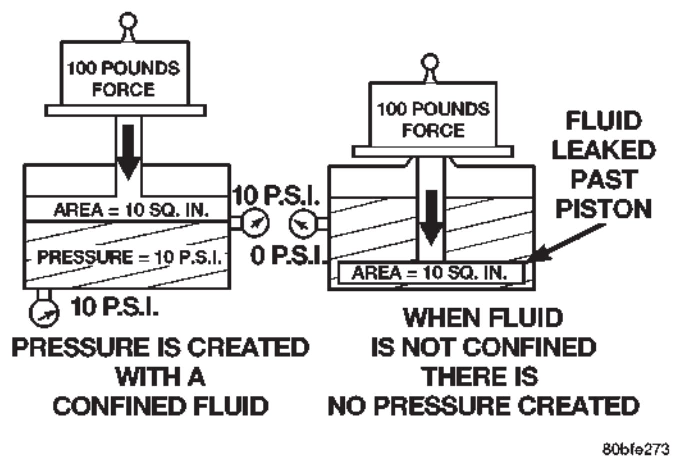

*Fig. 198 Pressure on a Confined Fluid*

### FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 199), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 199), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift

PISTONS (Continued)

valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

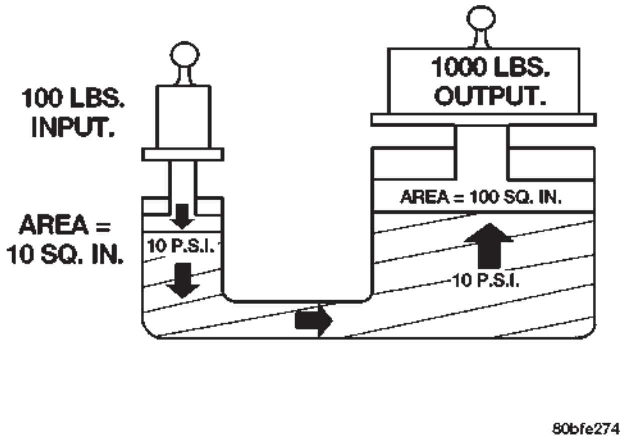

*Fig. 199 Force Multiplication*

### PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 200) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

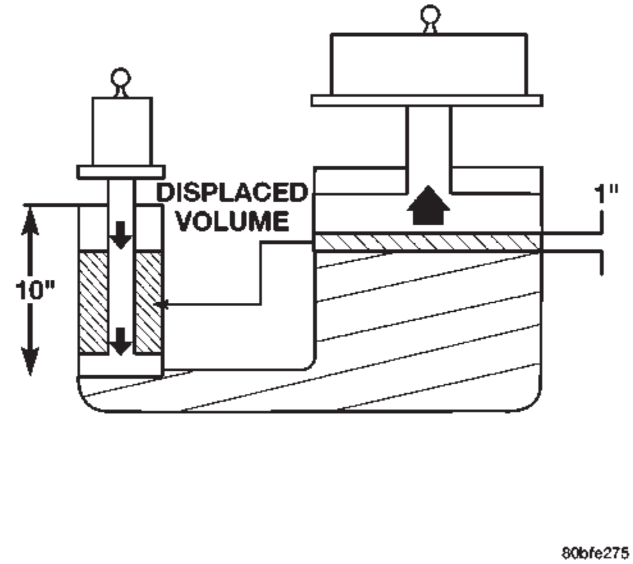

*Fig. 200 Piston Travel*

## PLANETARY GEARTRAIN/ OUTPUT SHAFT

### DESCRIPTION

The planetary gearsets (Fig. 201) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

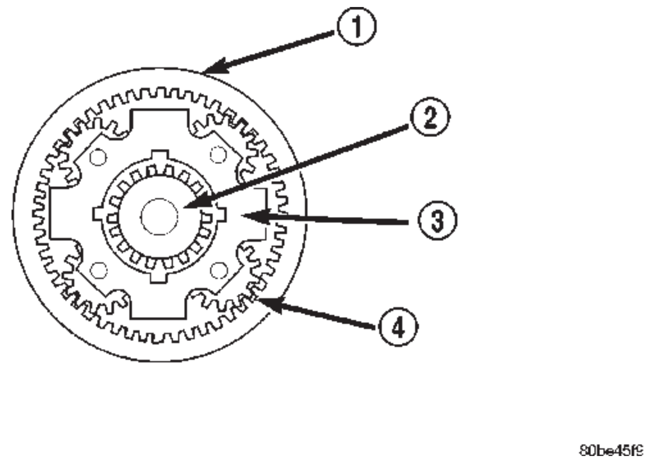

*Fig. 201 Planetary Gearset*

1 - ANNULUS GEAR
2 - SUN GEAR
3 - PLANET CARRIER
4 - PLANET PINIONS (4)

**NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.**

### OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

• For direct drive to occur, two gear members in the front planetary gearset must be driven.

**NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.**

## DISASSEMBLY

(1) Remove planetary snap-ring from intermediate shaft (Fig. 202). Discard snap-ring as it is not reusable.

(2) Remove front planetary gear and front annulus gear as assembly (Fig. 203).

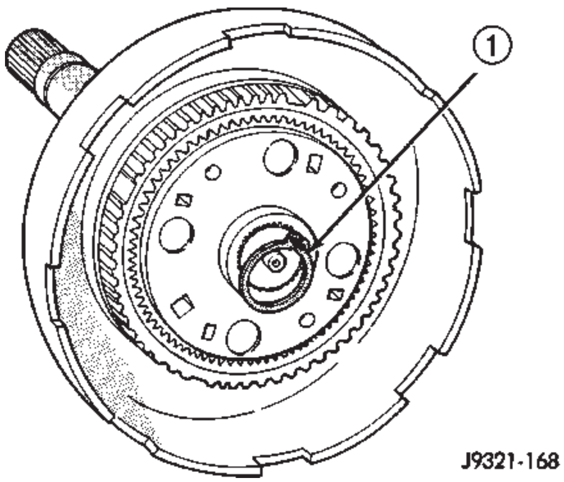

*Fig. 202 Removing Planetary Snap-Ring*

1 - PLANETARY SNAP-RING

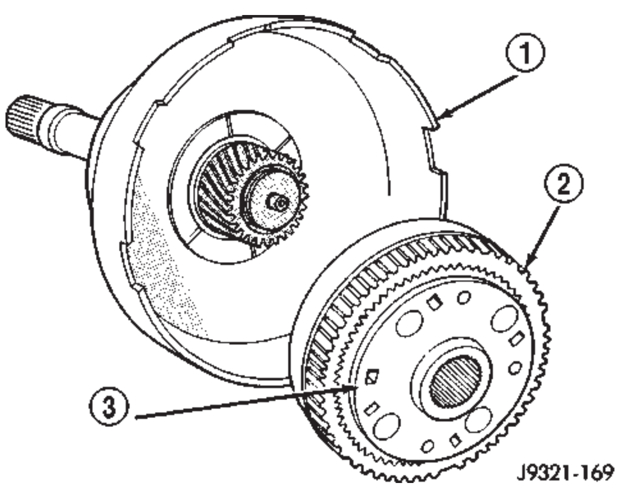

*Fig. 203 Removing Front Planetary And Annulus Gears*

1 - DRIVING SHELL
2 - FRONT ANNULUS GEAR
3 - FRONT PLANETARY GEAR

(3) Remove front planetary gear and thrust washer from front annulus gear (Fig. 204). Note thrust washer position for assembly reference.

(4) Remove tabbed thrust washer from driving shell (Fig. 205). Note washer position for assembly reference.

(5) Remove sun gear and driving shell as assembly (Fig. 206).

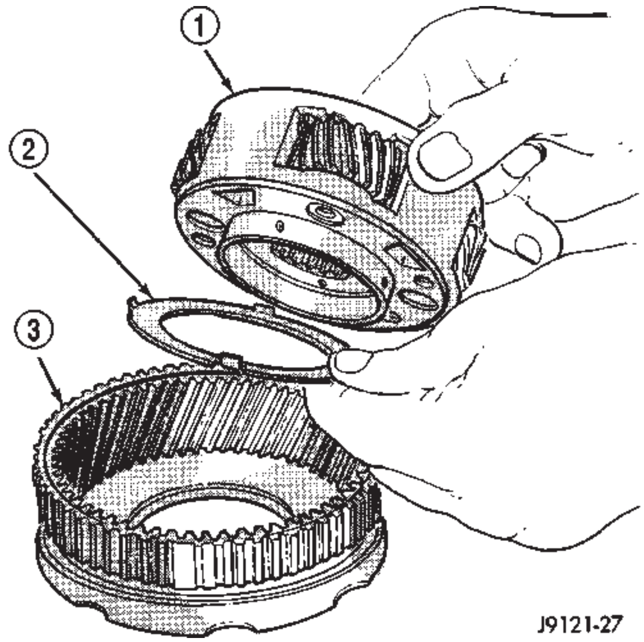

*Fig. 204 Disassembling Front Planetary And Annulus Gears*

3 - SUN GEAR

(6) Remove tabbed thrust washer from rear planetary gear (Fig. 207). Note washer position on gear for assembly reference.

(7) Remove rear planetary gear and rear annulus gear from intermediate shaft (Fig. 208).

(8) Remove thrust plate from rear annulus gear (Fig. 209).

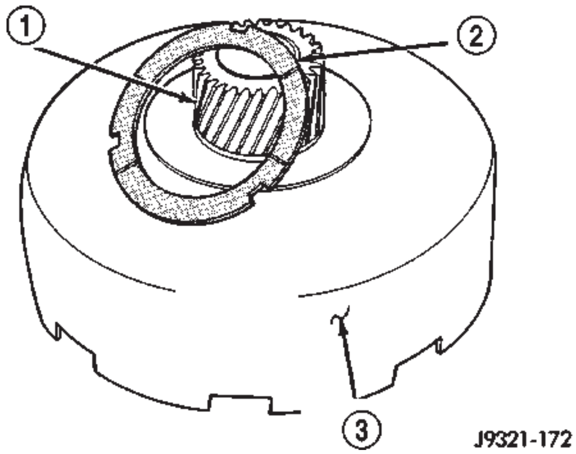

***Fig. 207 Rear Planetary Thrust Washer Removal***

1 - SUN GEAR
2 - REAR PLANETARY THRUST WASHER
3 - DRIVING SHELL

## INSPECTION

Inspect the planetary gear sets and annulus gears. The planetary pinions, shafts, washers, and retaining pins are serviceable. However, if a pinion carrier is damaged, the entire planetary gear set must be replaced as an assembly.

Replace the annulus gears if the teeth are chipped, broken, or worn, or the gear is cracked. Replace the planetary thrust plates and the tabbed thrust washers if cracked, scored or worn.

Inspect the machined surfaces of the intermediate shaft. Be sure the oil passages are open and clear. Replace the shaft if scored, pitted, or damaged.

Inspect the sun gear and driving shell. If either component is worn or damaged, remove the sun gear rear retaining ring and separate the sun gear and thrust plate from the driving shell. Then replace the necessary component.

Replace the sun gear as an assembly if the gear teeth are chipped or worn. Also replace the gear as an assembly if the bushings are scored or worn. The sun gear bushings are not serviceable. Replace the thrust plate if worn, or severely scored. Replace the driving shell if distorted, cracked, or damaged in any way.

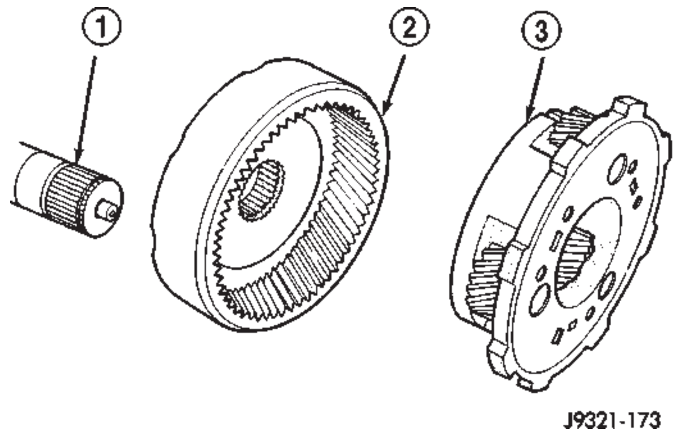

***Fig. 208 Rear Planetary And Annulus Gear Removal***

1 - INTERMEDIATE SHAFT
2 - REAR ANNULUS GEAR
3 - REAR PLANETARY GEAR

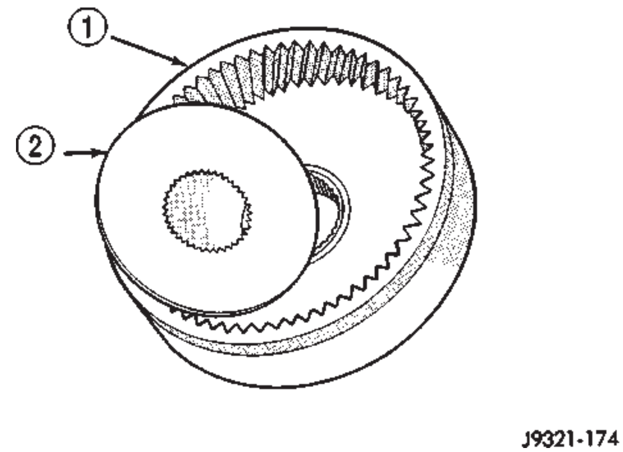

***Fig. 209 Rear Annulus Thrust Plate Removal***

1 - REAR ANNULUS GEAR
2 - THRUST PLATE

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

Replace all snap-rings during geartrain assembly. Reusing snap-rings is not recommended.

## ASSEMBLY

(1) Lubricate sun gear and planetary gears with transmission fluid during assembly. Use petroleum jelly to lubricate intermediate shaft bushing surfaces, thrust washers and thrust plates and to hold these parts in place during assembly.

(2) Install front snap-ring on sun gear and install gear in driving shell. Then install thrust plate over sun gear and against rear side of driving shell (Fig. 210). Install rear snap-ring to secure sun gear and thrust plate in driving shell.

(3) Install rear annulus gear on intermediate shaft (Fig. 211).

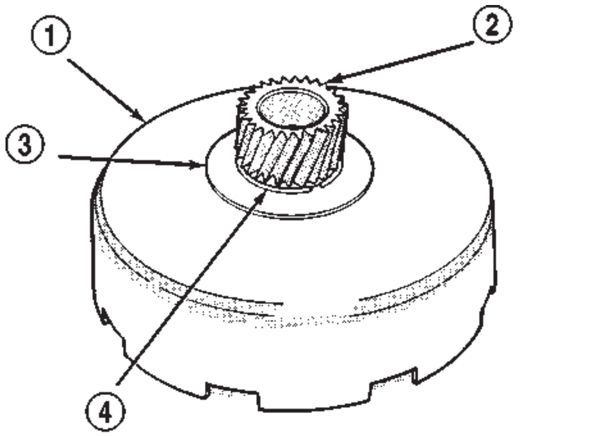

*Fig. 210 Sun Gear Installation*

1 - DRIVING SHELL
2 - SUN GEAR
3 - THRUST PLATE
4 - SUN GEAR REAR RETAINING RING

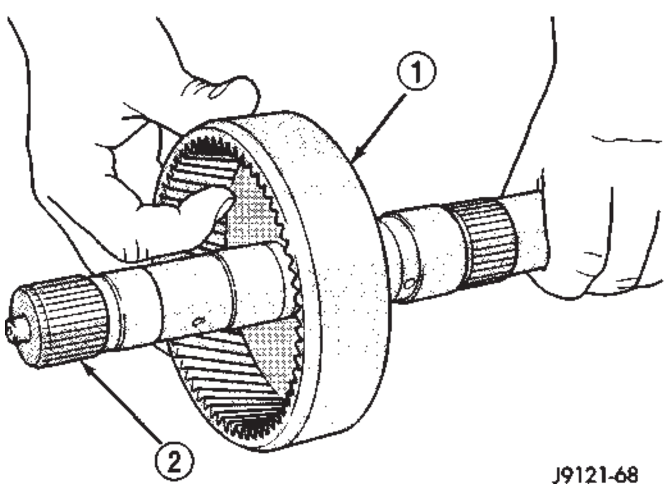

*Fig. 211 Installing Rear Annulus Gear On Intermediate Shaft*

1 - REAR ANNULUS GEAR
2 - OUTPUT SHAFT

(4) Install thrust plate in annulus gear (Fig. 212). Be sure plate is seated on shaft splines and against gear.

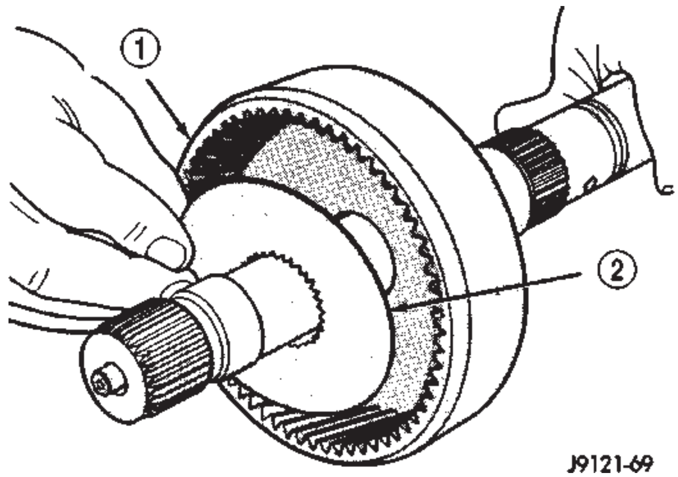

*Fig. 212 Installing Rear Annulus Thrust Plate*

1 - REAR ANNULUS GEAR
2 - THRUST PLATE

(5) Install rear planetary gear in rear annulus gear (Fig. 213). Be sure planetary carrier is seated against annulus gear.

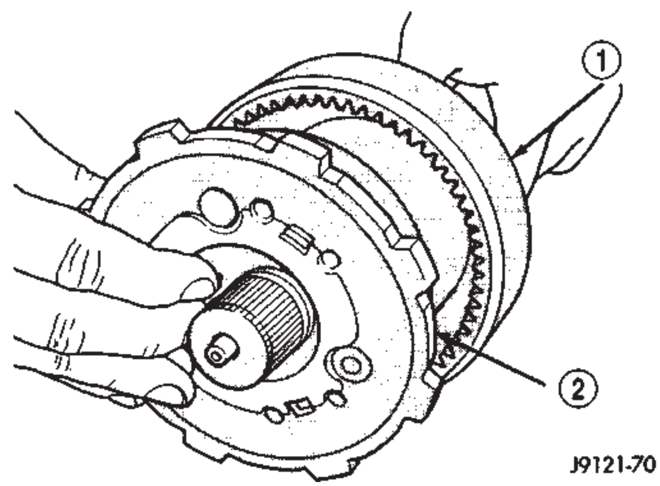

*Fig. 213 Installing Rear Planetary Gear*

1 - REAR ANNULUS GEAR
2 - REAR PLANETARY GEAR

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(6) Install tabbed thrust washer on front face of rear planetary gear (Fig. 214). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

(7) Lubricate sun gear bushings with petroleum jelly or transmission fluid.

(8) Install sun gear and driving shell on intermediate shaft (Fig. 215). Seat shell against rear planetary gear. Verify that thrust washer on planetary gear was not displaced during installation.

(9) Install tabbed thrust washer in driving shell (Fig. 216), be sure washer tabs are seated in tab slots of driving shell. Use extra petroleum jelly to hold washer in place if desired.

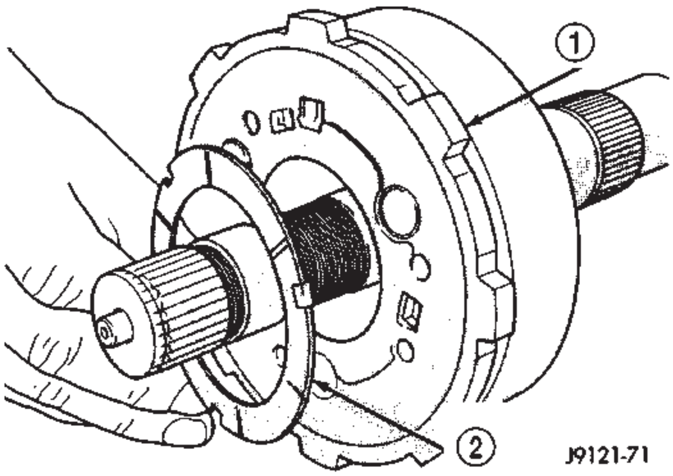

*Fig. 214 Installing Rear Planetary Thrust Washer*

1 - REAR PLANETARY GEAR
2 - TABBED THRUST WASHER

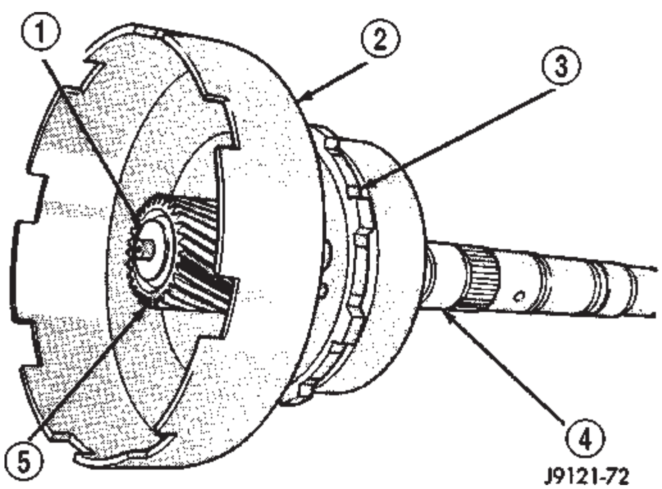

*Fig. 215 Installing Sun Gear And Driving Shell*

1 - OUTPUT SHAFT
2 - DRIVING SHELL
3 - REAR PLANETARY GEAR
4 - OUTPUT SHAFT
5 - SUN GEAR

(10) Install tabbed thrust washer on front planetary gear (Fig. 217). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

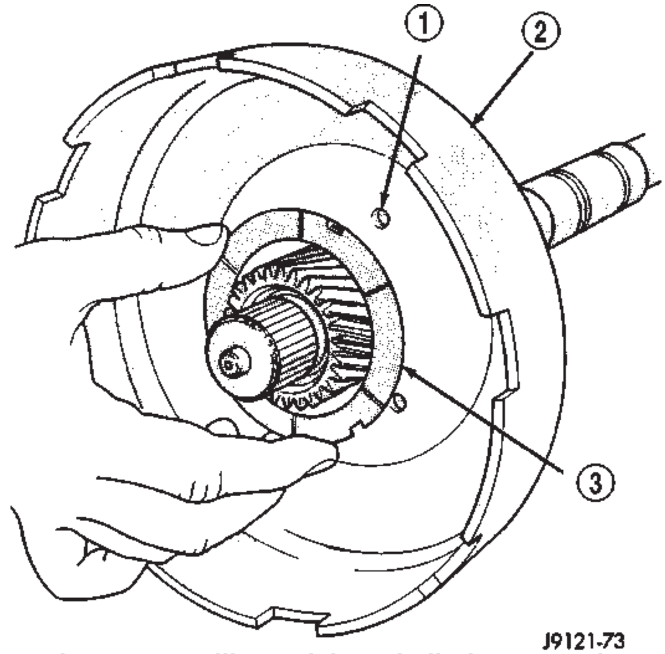

*Fig. 216 Installing Driving Shell Thrust Washer*

1 - TAB SLOTS (3)
2 - DRIVING SHELL
3 - TABBED THRUST WASHER

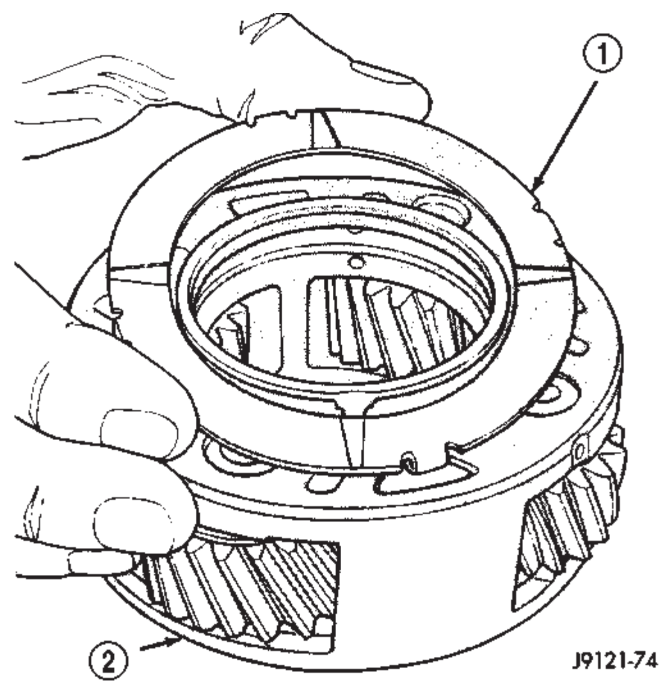

*Fig. 217 Installing Thrust Washer On Front Planetary Gear*

1 - TABBED THRUST WASHER
2 - FRONT PLANETARY GEAR

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(11) Install front annulus gear over and onto front planetary gear (Fig. 218). Be sure gears are fully meshed and seated.

(12) Install front planetary and annulus gear assembly (Fig. 219). Hold gears together and slide them onto shaft. Be sure planetary pinions are seated on sun gear and that planetary carrier is seated on intermediate shaft.

(13) Place geartrain in upright position. Rotate gears to be sure all components are seated and properly assembled. Snap-ring groove at forward end of intermediate shaft will be completely exposed when components are assembled correctly.

(14) Install new planetary snap-ring in groove at end of intermediate shaft (Fig. 220).

(15) Turn planetary geartrain over. Position wood block under front end of intermediate shaft and support geartrain on shaft. Be sure all geartrain parts have moved forward against planetary snap-ring. This is important for accurate end play check.

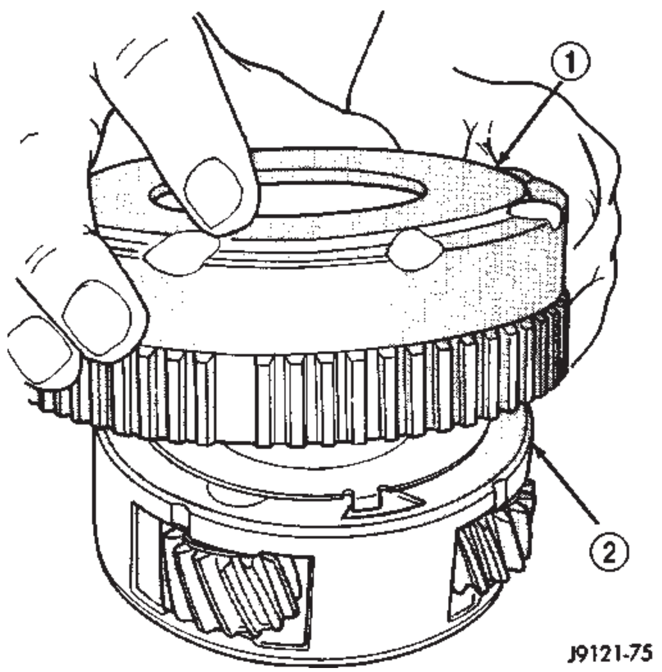

***Fig. 218 Assembling Front Planetary And Annulus Gears***

2 - PLANETARY SNAP-RING

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(16) Check planetary geartrain end play with feeler gauge (Fig. 221). Insert gauge between rear annulus gear and shoulder on intermediate shaft as shown. End play should be 0.15 to 1.22 mm (0.006 to 0.048 in.).

(17) If end play is incorrect, install thinner/thicker planetary snap-ring as needed.

# REAR CLUTCH

## DESCRIPTION

The rear clutch assembly (Fig. 222) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

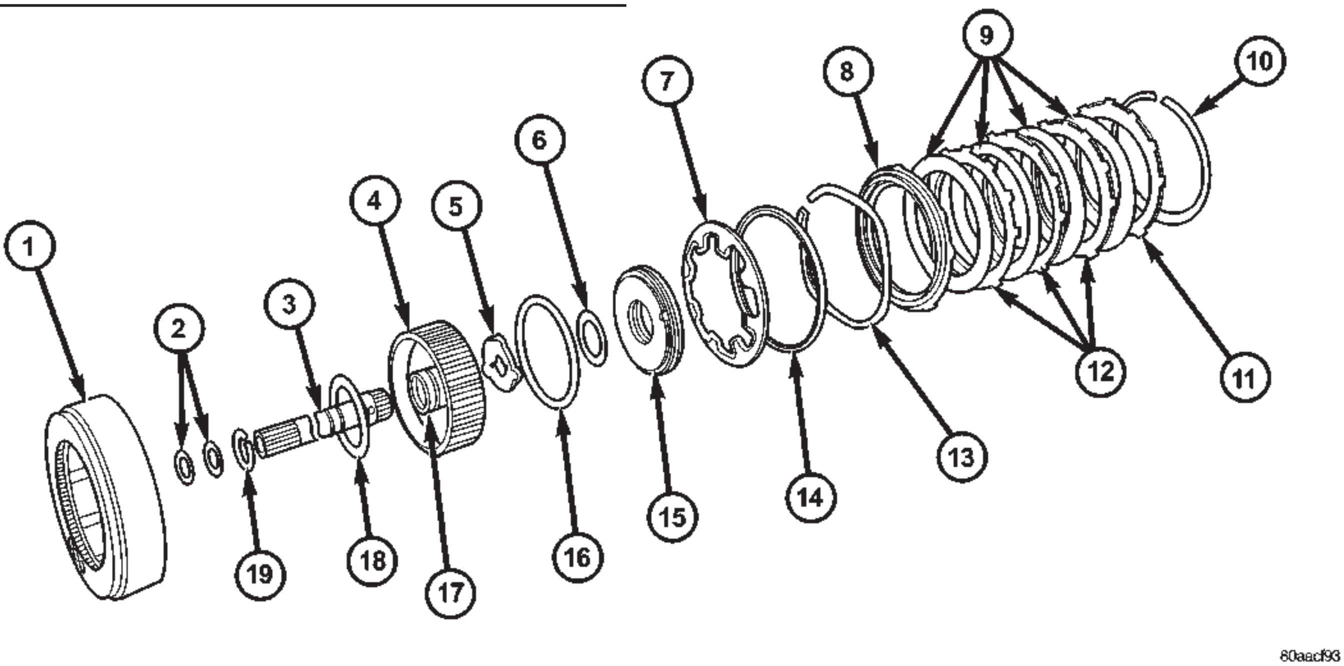

*Fig. 222 Rear Clutch Components*

17 - REAR SEAL RING
18 - FIBER THRUST WASHER
19 - RETAINING RING

REAR CLUTCH (Continued)

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

## DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front and rear seal rings.

(3) Remove selective clutch pack snap-ring (Fig. 223).

(4) Remove the reaction plate, clutch discs, steel plates, pressure plate, wave spring, spacer ring, and piston spring (Fig. 223).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft retaining ring. It may be necessary to press the input shaft in slightly to relieve tension on the retaining ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

## CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

## INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

## ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary.

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then partially press input shaft into retainer (Fig. 224). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft retaining ring.

(5) Press the input shaft the remainder of the way into the clutch retainer.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020″ thick), can be used to guide seals into place if necessary.

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.**

(9) Install piston spring in retainer and on top of piston. Concave side of spring faces downward (toward piston).

(10) Install the spacer ring and wave spring into the retainer. Be sure spring is completely seated in retainer groove.

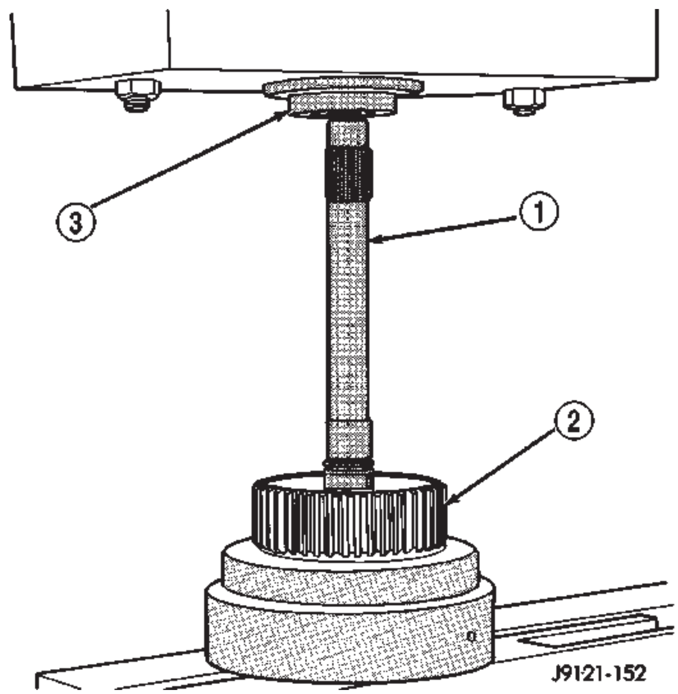

***Fig. 224 Pressing Input Shaft Into Rear Clutch Retainer***

1 - INPUT SHAFT
2 - REAR CLUTCH RETAINER
3 - PRESS RAM

(11) Install pressure plate (Fig. 223). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of pressure plate. Then install a clutch plate followed

REAR CLUTCH (Continued)

by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 223).

(13) Install the reaction plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 225).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 225).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.635 - 0.914 mm (0.025 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap ring thicknesses are:

- 0.107 - 0.109 in.
- 0.098 - 0.100 in.
- 0.095 - 0.097 in.
- 0.083 - 0.085 in.
- 0.076 - 0.078 in.
- 0.071 - 0.073 in.
- 0.060 - 0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 226). Use enough petroleum jelly to hold washer in place.

(17) Set rear clutch aside for installation during final assembly.

# REAR SERVO

## DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

## OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

## DISASSEMBLY

(1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 227).

(2) Remove and discard servo piston seal ring.

## CLEANING

Remove and discard the servo piston seal ring (Fig. 228). Then clean the servo components with solvent and dry with compressed air. Replace either spring if

## SHIFT MECHANISM

### DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

### OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

SHIFT MECHANISM (Continued)

## ADJUSTMENT

Check linkage adjustment by starting engine in PARK and NEUTRAL. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

### LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 230). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

(1) Shift transmission into PARK.
(2) Raise and support vehicle.
(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 230).
(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.
(5) Move transmission shift lever fully rearward to the Park detent.
(6) Center adjusting swivel on shift rod.
(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).
(8) Lower vehicle and verify proper adjustment.

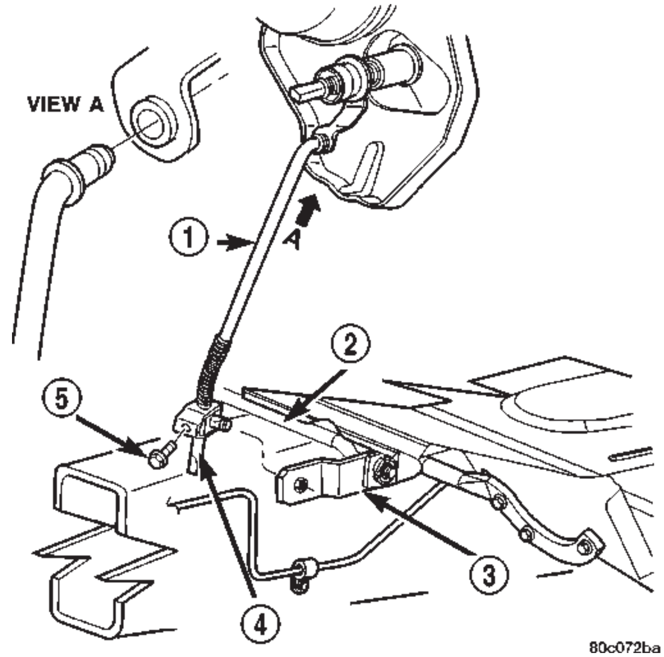

*Fig. 230 Linkage Adjustment Components*

# SOLENOID

## DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position some-

SOLENOID (Continued)

where between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

### OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## SPEED SENSOR

### DESCRIPTION

The speed sensor (Fig. 231) is located in the overdrive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

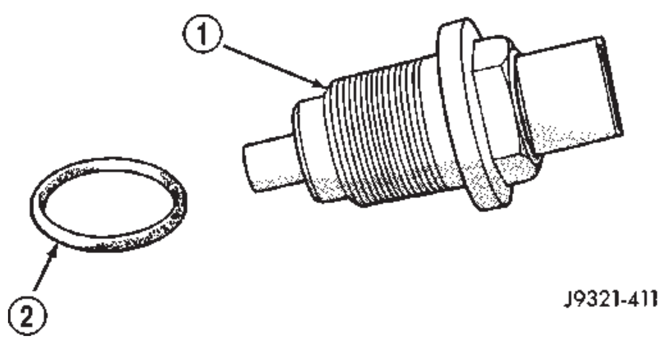

***Fig. 231 Transmission Output Speed Sensor***

1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
2 - SEAL

### OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

## THROTTLE VALVE CABLE

### DESCRIPTION

Transmission throttle valve cable (Fig. 232) adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

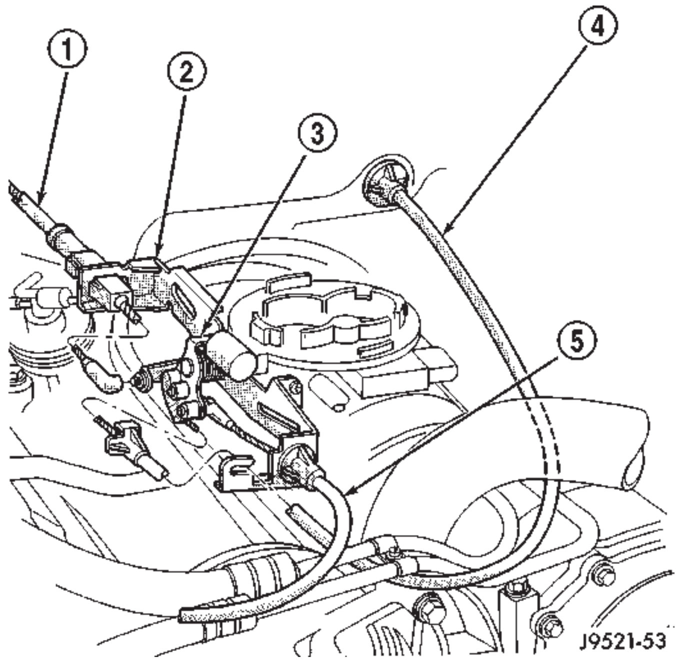

***Fig. 232 Throttle Valve Cable Attachment - At Engine***

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

THROTTLE VALVE CABLE (Continued)

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 233). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

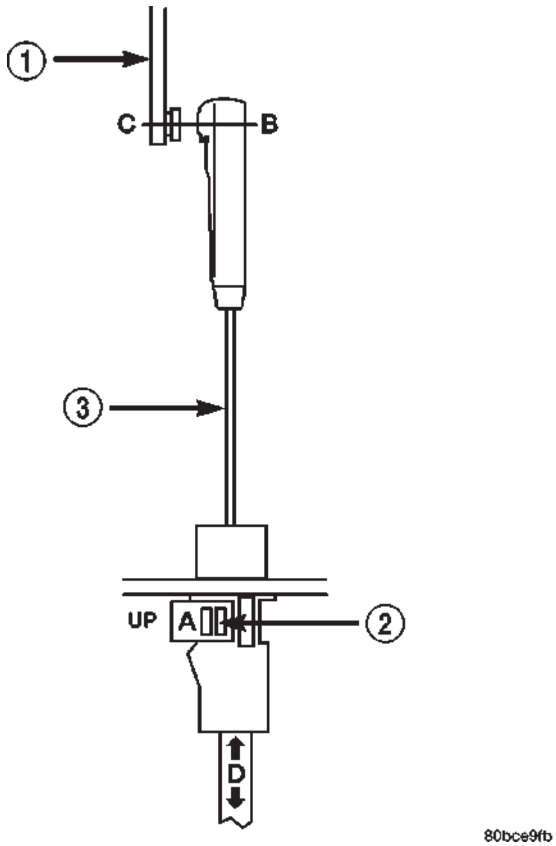

*Fig. 233 Throttle Valve Cable at Throttle Linkage*

3 - THROTTLE VALVE CABLE

## ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

### ADJUSTMENT VERIFICATION

(1) Turn ignition key to OFF position.
(2) Remove air cleaner.

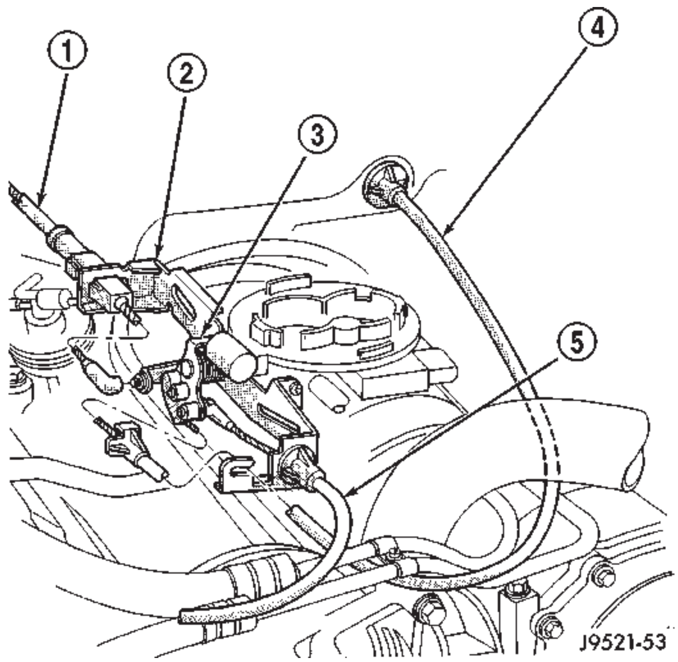

*Fig. 234 Throttle Valve Cable Attachment - At Engine*

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

(3) Verify that lever on throttle body is at curb idle position (Fig. 234). Then verify that the transmission throttle lever (Fig. 235) is also at idle (fully forward) position.

(4) Slide cable off attachment stud on throttle body lever.

(5) Compare position of cable end to attachment stud on throttle body lever:

- Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 236).
- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.
- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

THROTTLE VALVE CABLE (Continued)

4 - TRANSFER CASE SHIFTER CABLE BRACKET RETAINING BOLT (1 OR 2)
5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
6 - ELECTRICAL CONNECTORS
7 - TRANSMISSION FLUID LINES

## ADJUSTMENT PROCEDURE

(1) Turn ignition switch to OFF position.

(2) Remove air cleaner if necessary.

(3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Pry the T.V. cable lock (A) into the UP position (Fig. 236). This will unlock the cable and allow for readjustment.

(6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable.**Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 236).

(7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 236). This will lock the present T.V. cable adjustment.

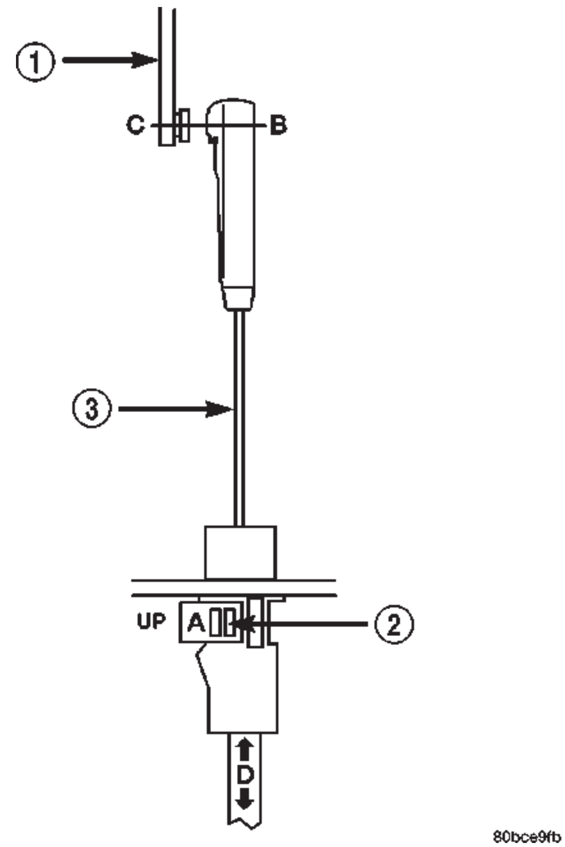

*Fig. 236 Throttle Valve Cable at Throttle Linkage*

1 - THROTTLE LINKAGE
2 - THROTTLE VALVE CABLE LOCKING CLIP
3 - THROTTLE VALVE CABLE

**NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.**

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

# TORQUE CONVERTER

## DESCRIPTION

The torque converter (Fig. 237) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.**

TORQUE CONVERTER (Continued)

### IMPELLER

The impeller (Fig. 238) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TORQUE CONVERTER (Continued)

### TURBINE

The turbine (Fig. 239) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

## STATOR

The stator assembly (Fig. 240) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 241). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

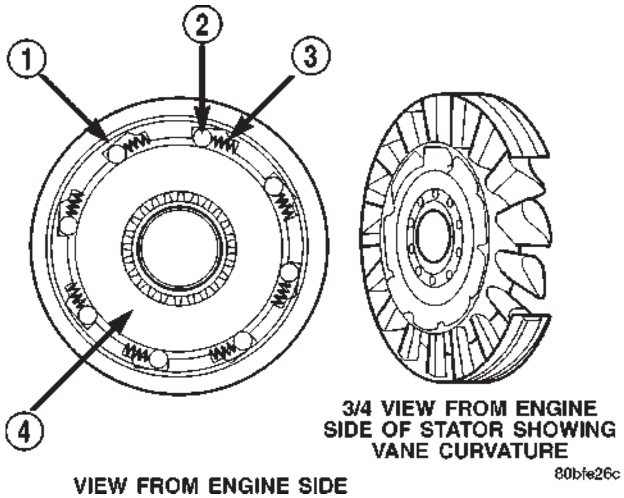

*Fig. 240 Stator Components*

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 242) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

TORQUE CONVERTER (Continued)

## OPERATION

The converter impeller (Fig. 243) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 244). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

## TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.

## REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.**

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

## INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

**CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.**

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 245). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

# TORQUE CONVERTER DRAINBACK VALVE

## DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

## OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

### STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

**CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.**

## TRANSMISSION TEMPERATURE SENSOR

### DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 246). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

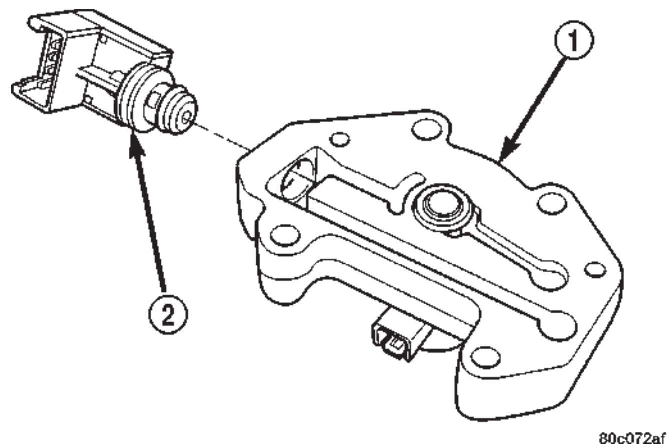

***Fig. 246 Governor Pressure Sensor***

1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

### OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

# VALVE BODY

## DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 247), (Fig. 248), (Fig. 249), and (Fig. 250):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

## OPERATION

**NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.**

### CHECK BALLS

| CHECK BALL NUMBER | DESCRIPTION |
|---|---|
| 1 | Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug. |
| 2 | Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug. |
| 3 | Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch. |
| 4 | Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo. |
| 5 | Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure. |
| 6 | Provides a by-pass around the front servo orifice so that the servo can release quickly. |
| 7 | Provides a by-pass around the rear clutch orifice so that the clutch can release quickly. |
| 8 | Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient. |
| 9 | Provides a by-pass around the rear servo orifice so that the servo can release quickly. |
| ECE (10) | Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown. |

VALVE BODY (Continued)

## REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 251) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

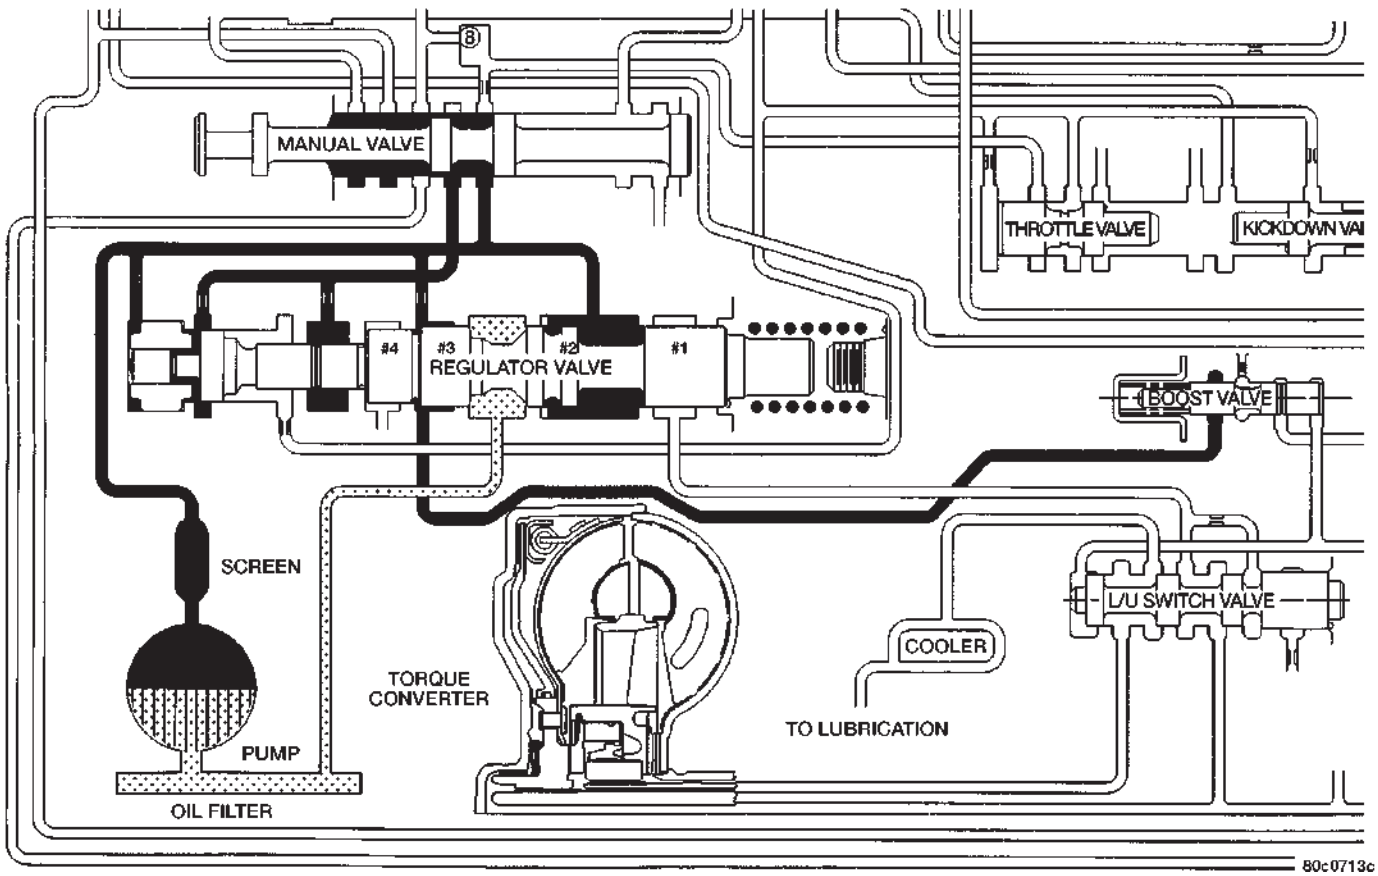

*Fig. 251 Regulator Valve in PARK Position*

VALVE BODY (Continued)

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 252), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 253). The regulated line pressure in REVERSE (Fig. 254) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

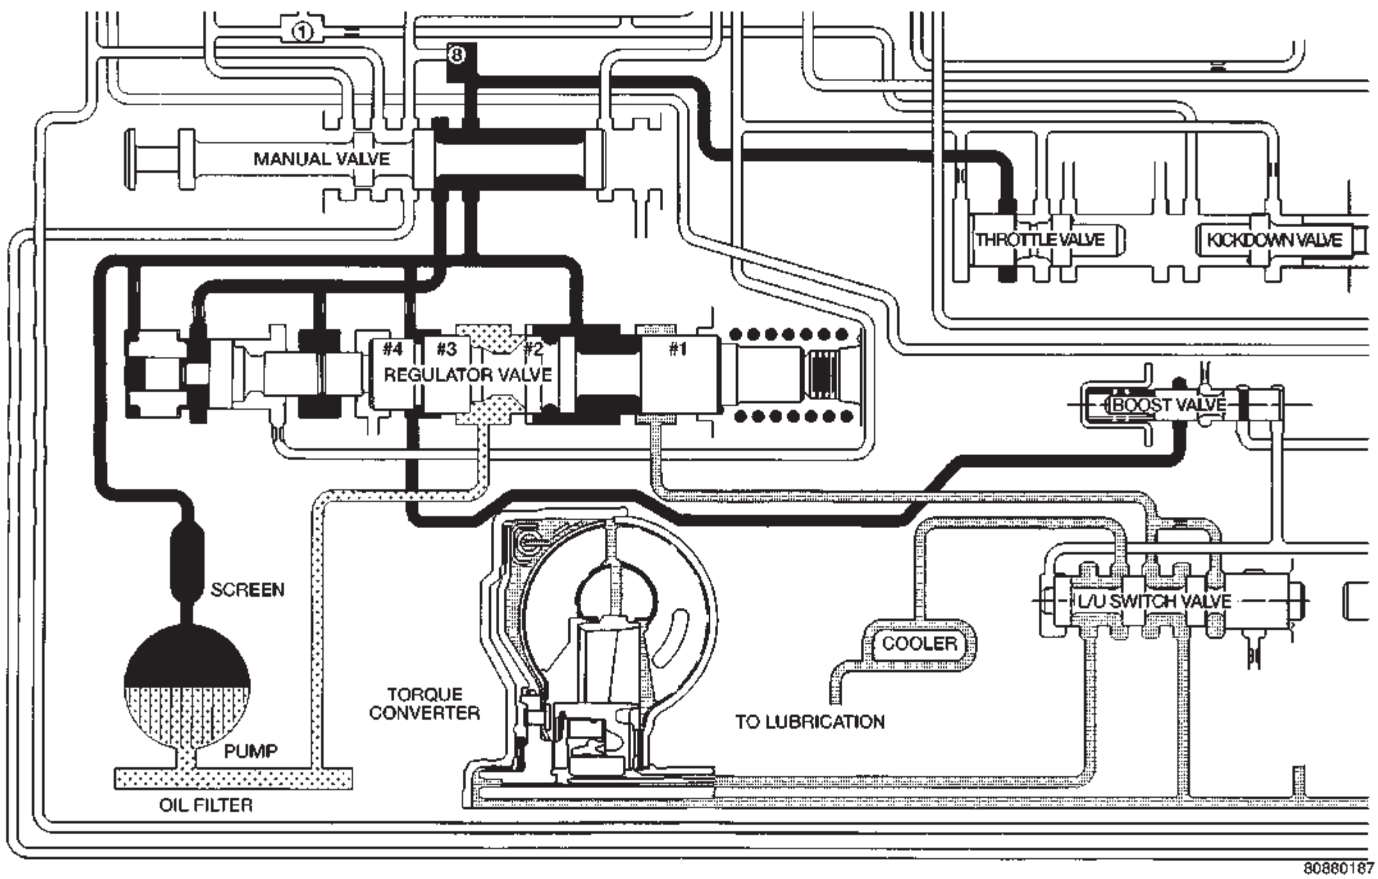

*Fig. 252 Regulator Valve in NEUTRAL Position*

VALVE BODY (Continued)

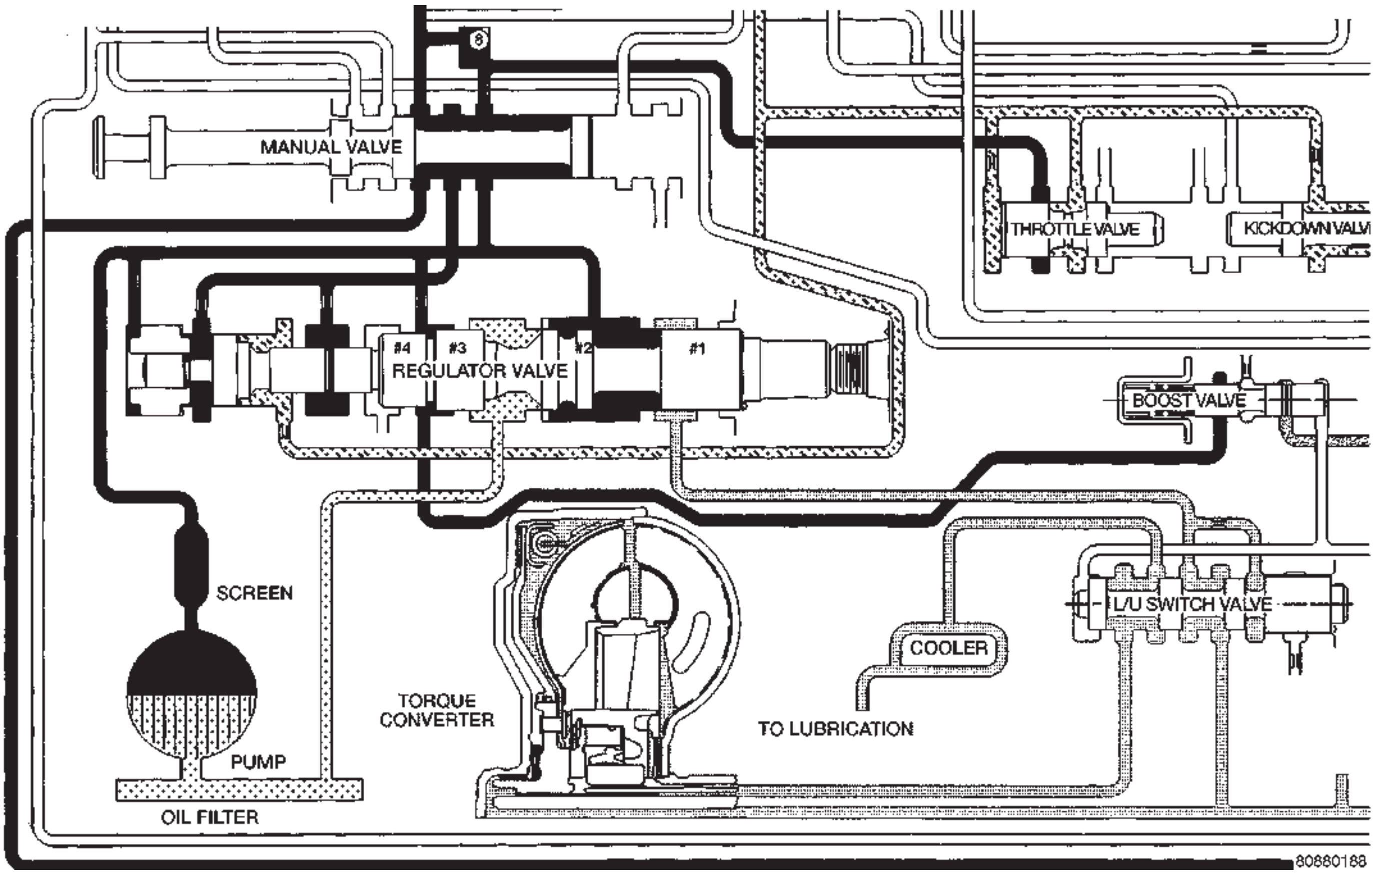

Fig. 253 Regulator Valve in DRIVE Position

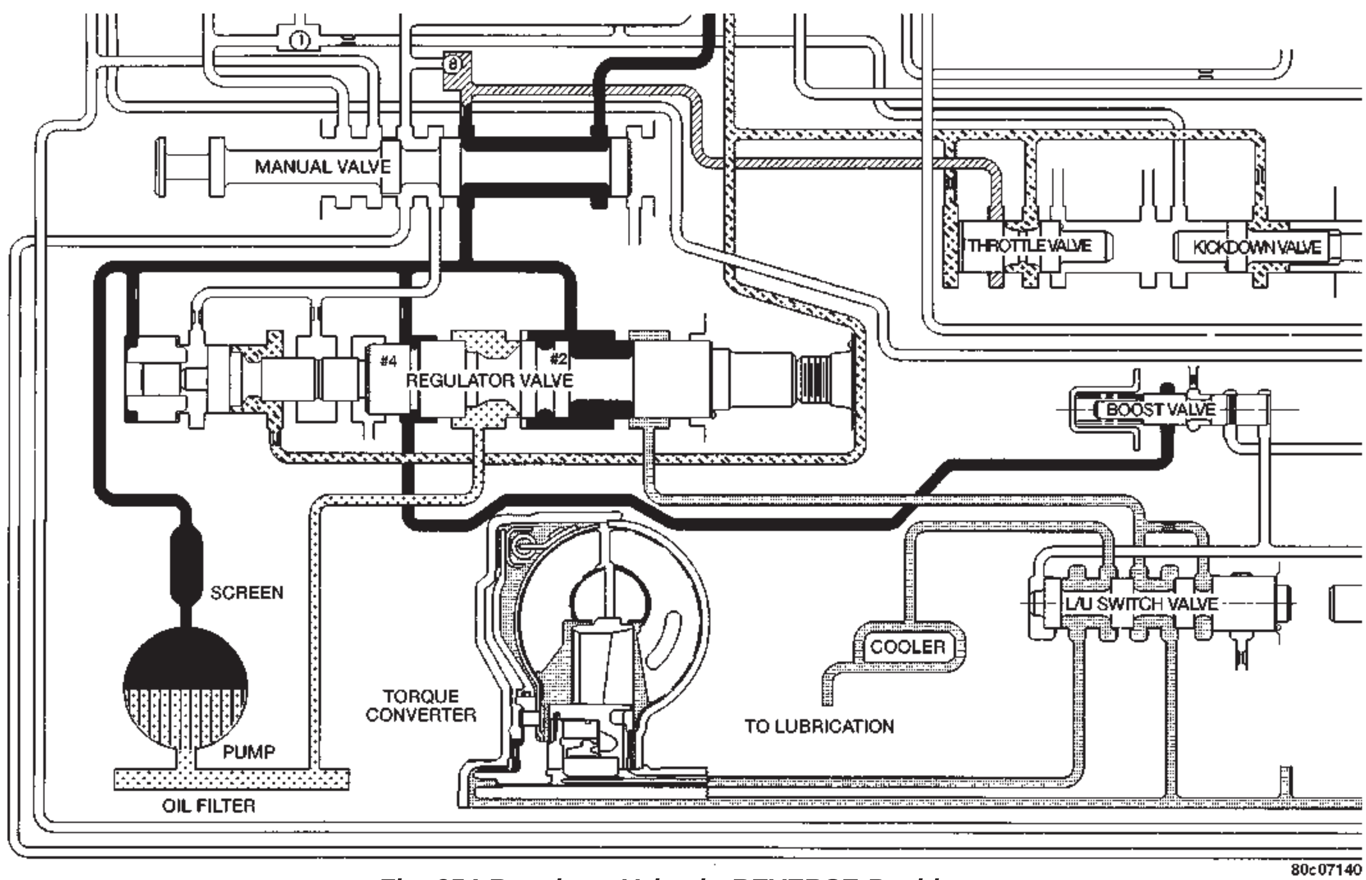

Fig. 254 Regulator Valve in REVERSE Position

VALVE BODY (Continued)

## KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 255) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

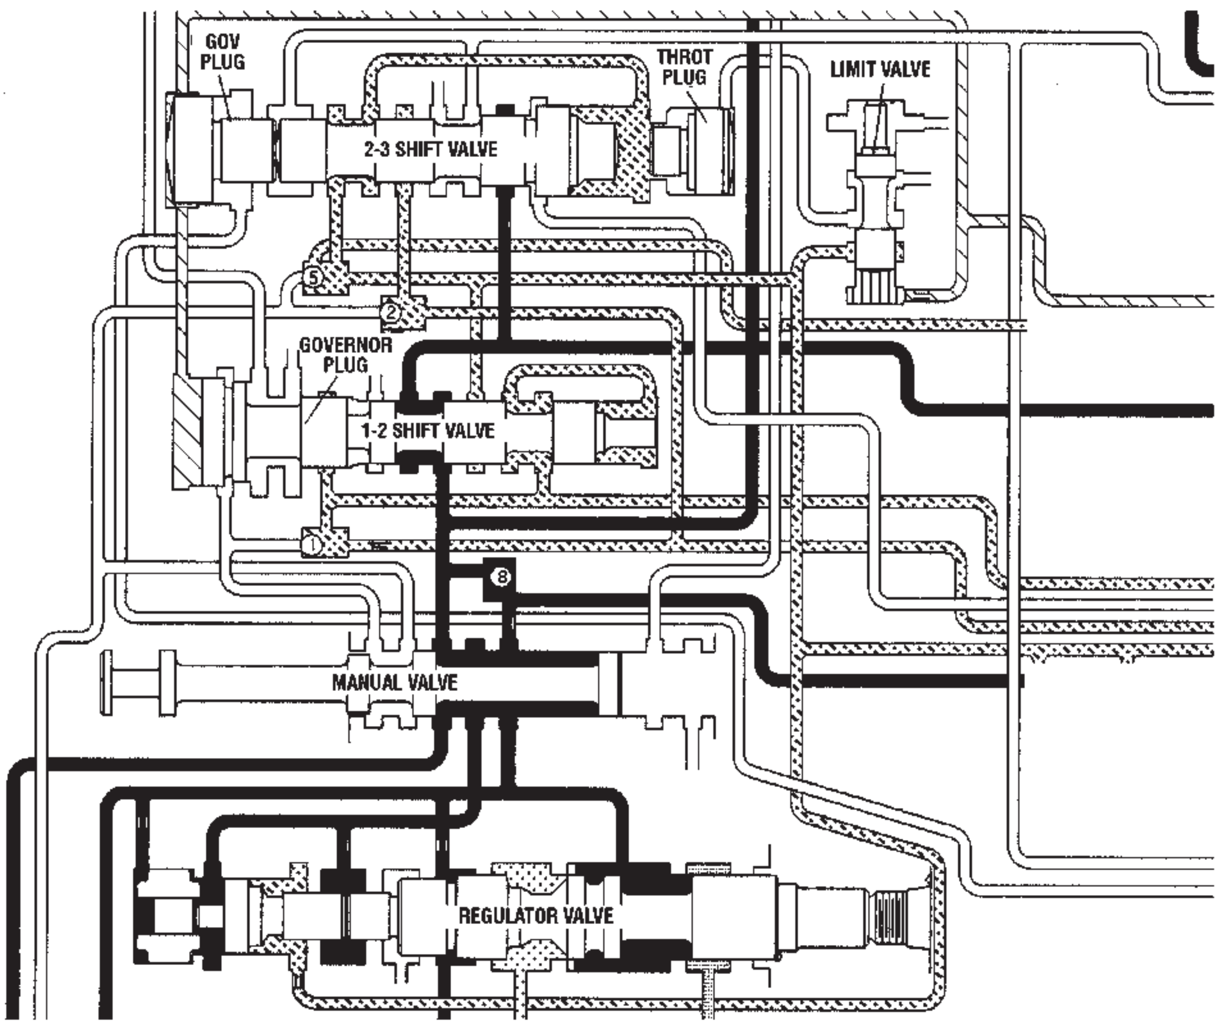

*Fig. 255 Kickdown Valve-Wide Open Throttle*

VALVE BODY (Continued)

## KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 256) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 257), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

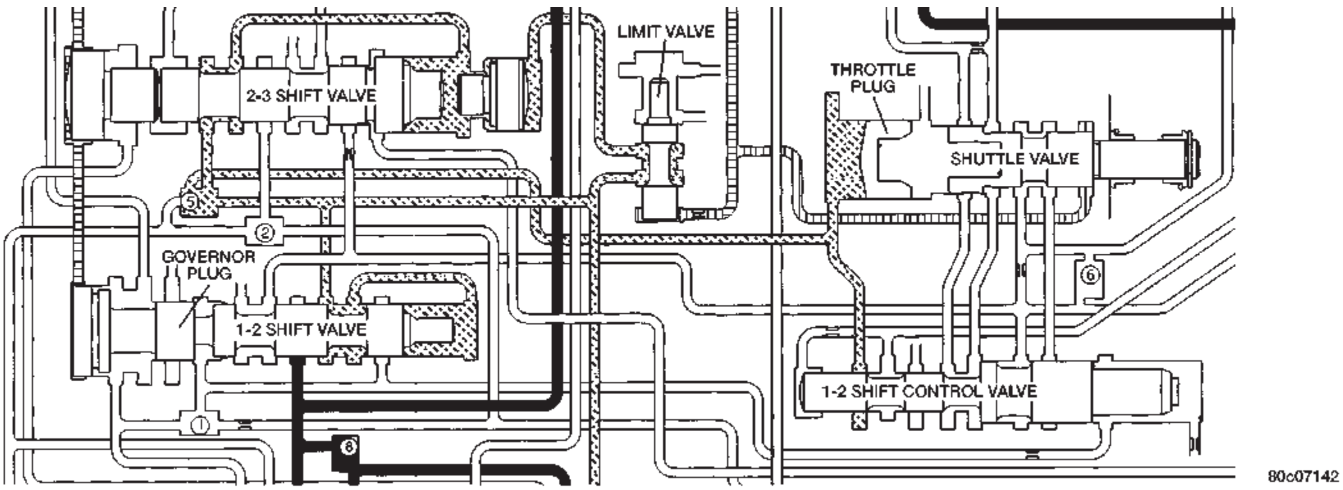

*Fig. 256 Kickdown Limit Valve-Low Speeds*

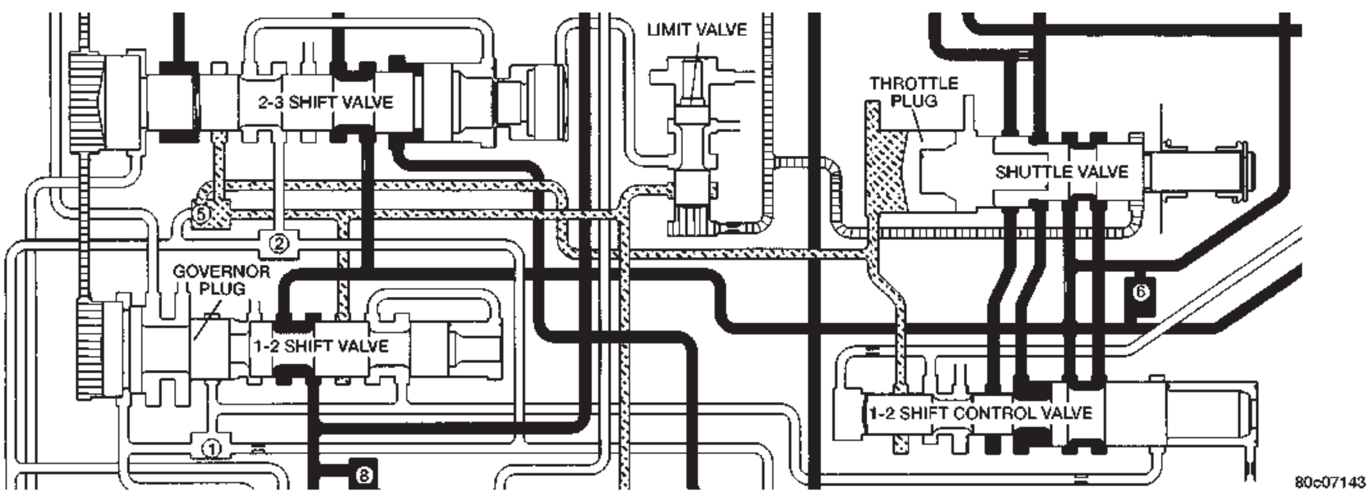

*Fig. 257 Kickdown Limit Valve-High Speeds*

VALVE BODY (Continued)

### 1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 258), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 259).

The governor plug serves a dual purpose:

• It allows the shift valves to move either left or right, allowing both upshifts and downshifts.

• When in a manual selection position, it will be hydraulically "blocked" into position so no upshift can occur.

The physical blocking of the upshift while in the manual "1" position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

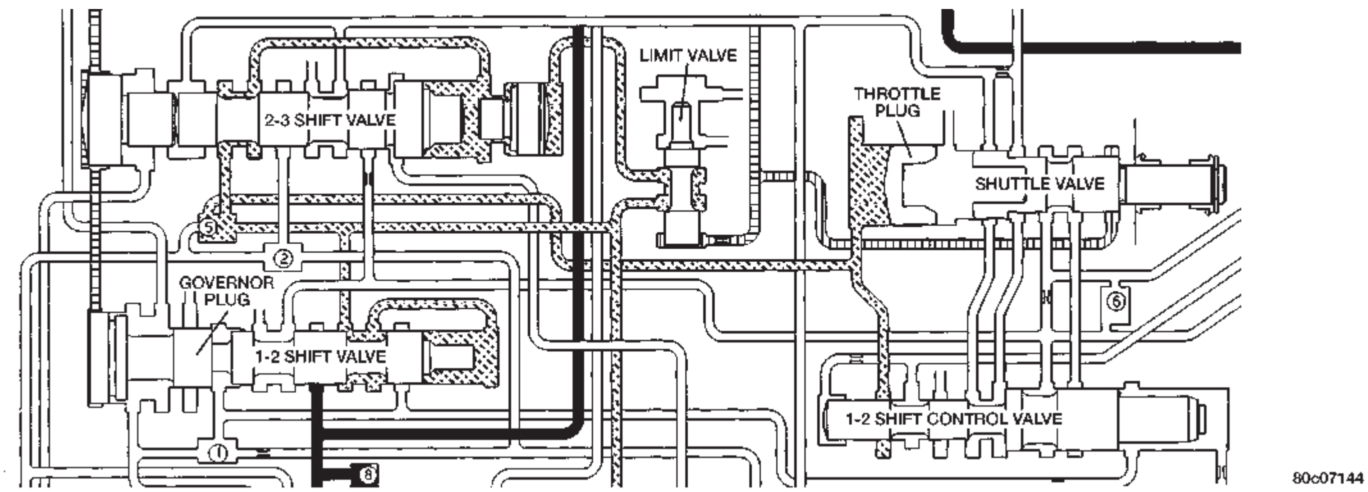

**Fig. 258 1-2 Shift Valve-Before Shift**

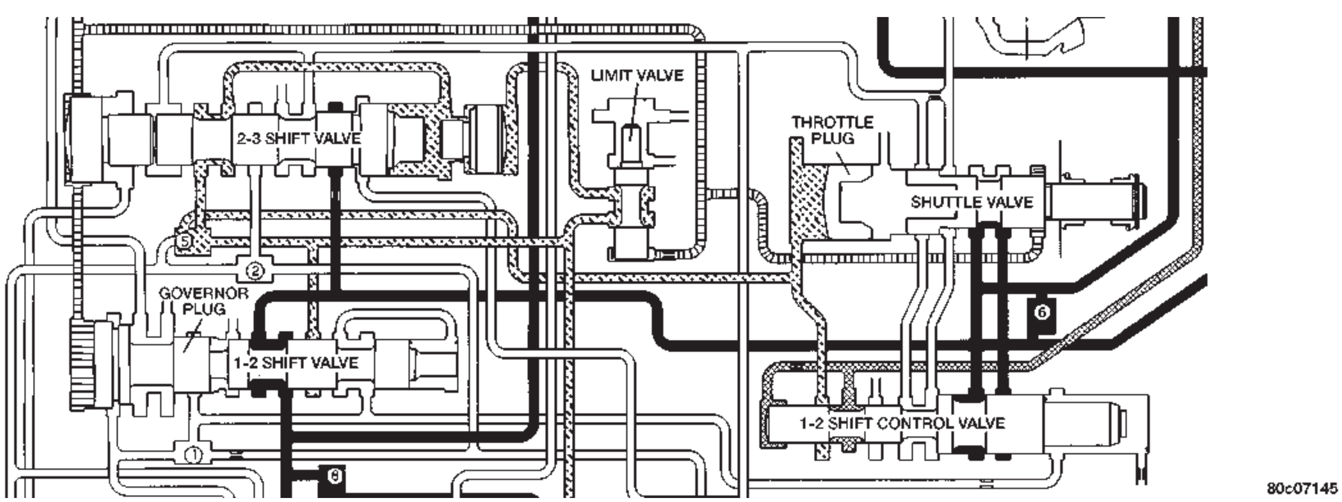

**Fig. 259 1-2 Shift Valve-After Shift**

VALVE BODY (Continued)

## 1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

The valve has two specific operations (Fig. 260):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kickdown ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

## 2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 261) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead–end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 262), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the

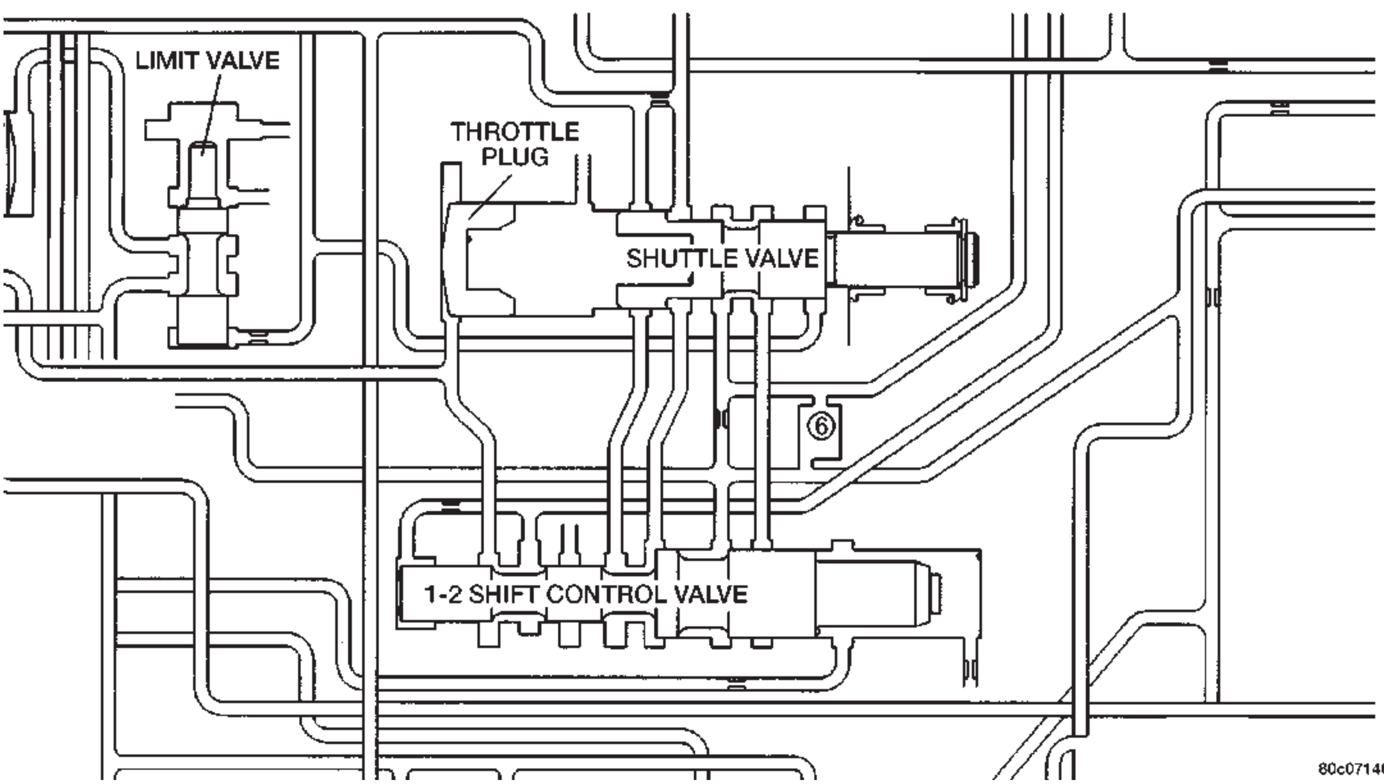

*Fig. 260 1-2 Shift Control Valve*

VALVE BODY (Continued)

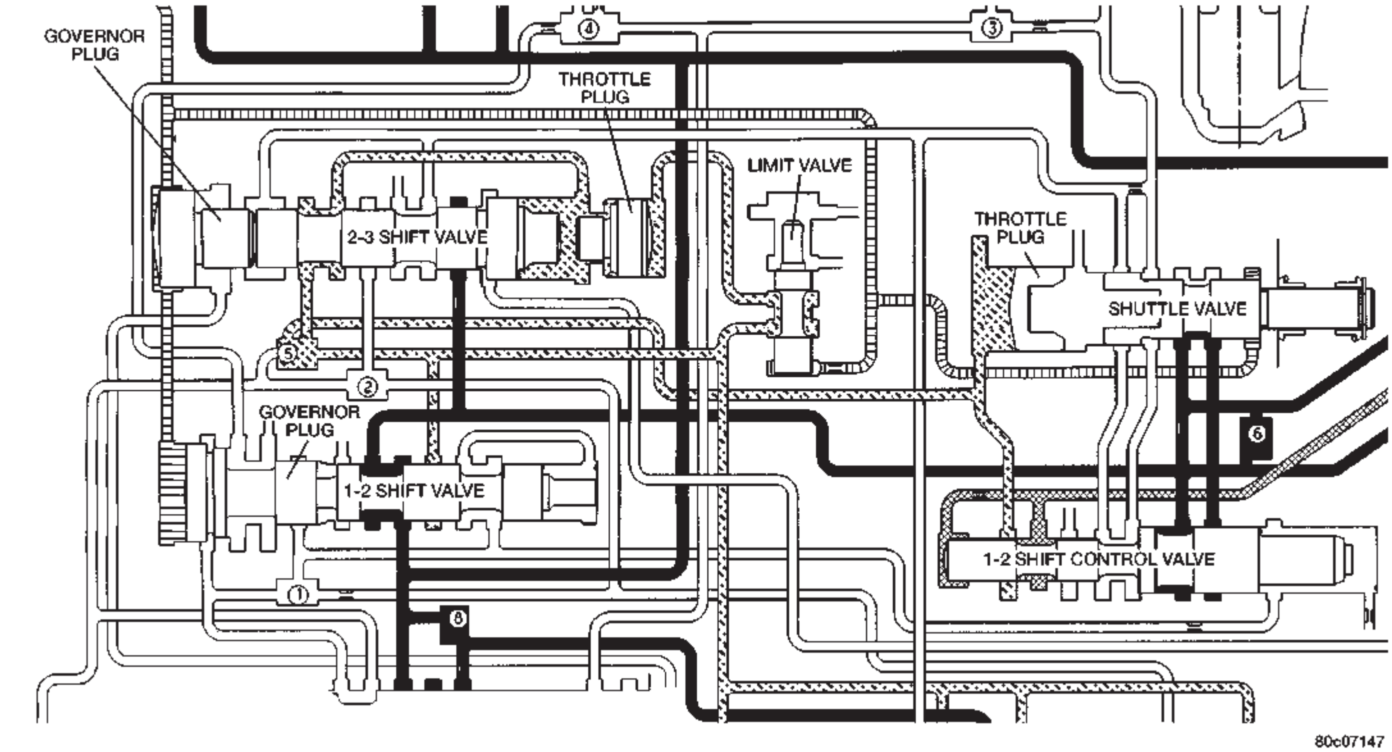

*Fig. 261 2-3 Shift Valve-Before Shift*

governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

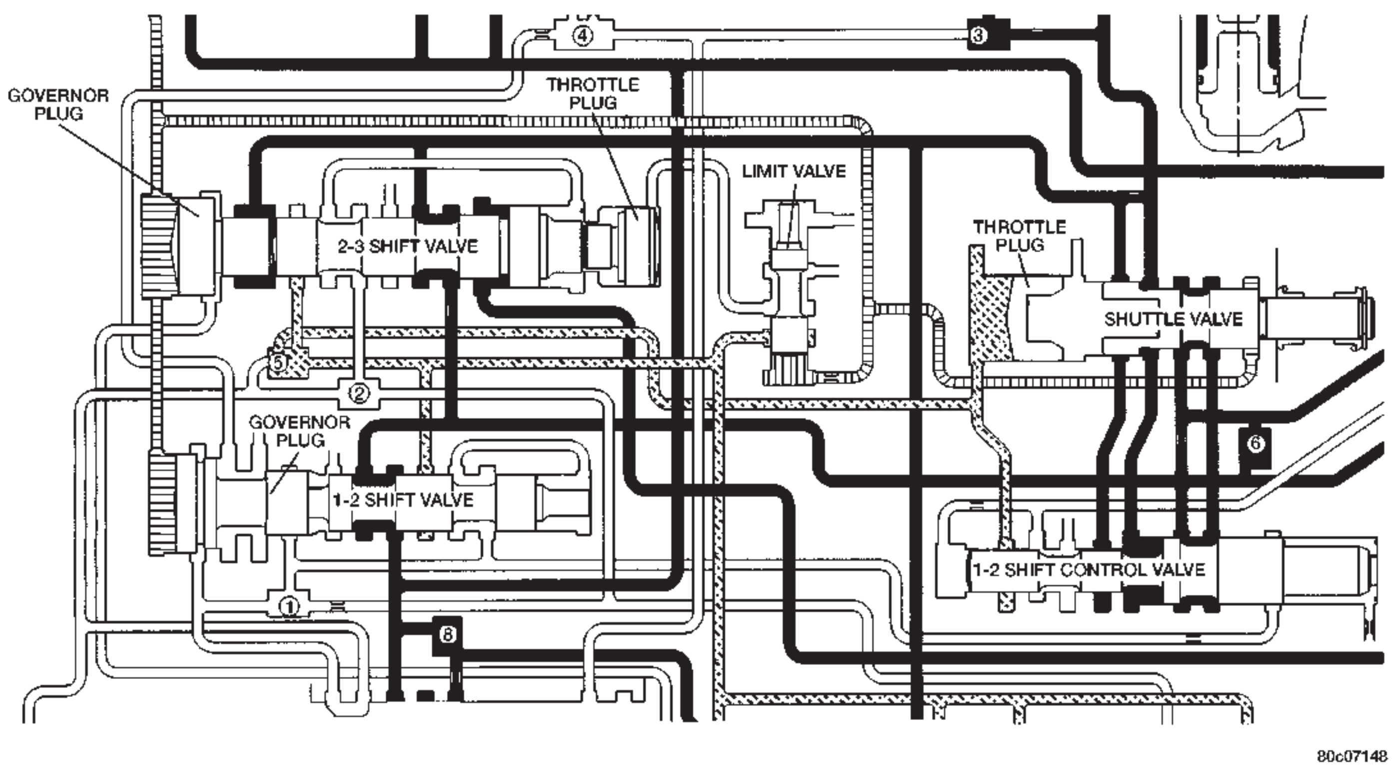

*Fig. 262 2-3 Shift Valve-After Shift*

VALVE BODY (Continued)

### 3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 263). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 264). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

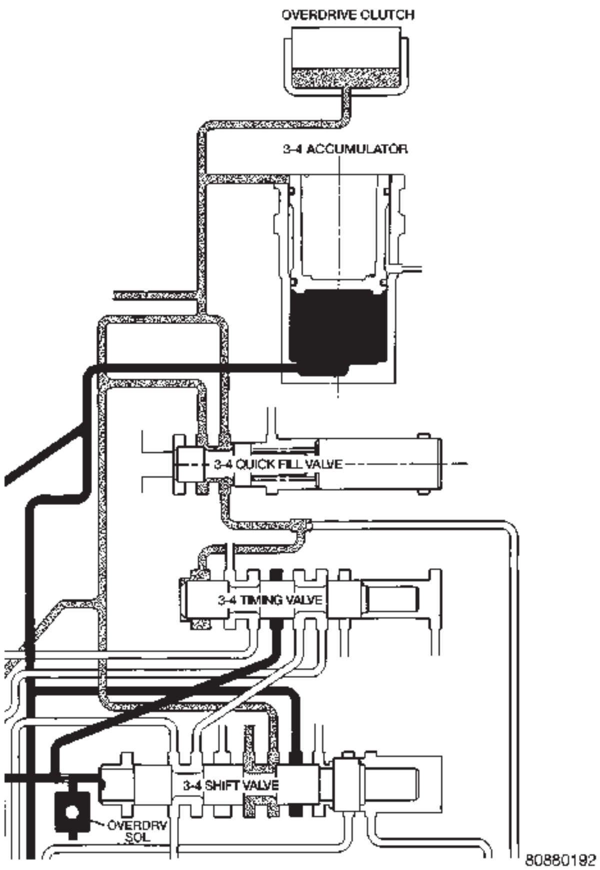

*Fig. 263 3-4 Shift Valve Before Shift*

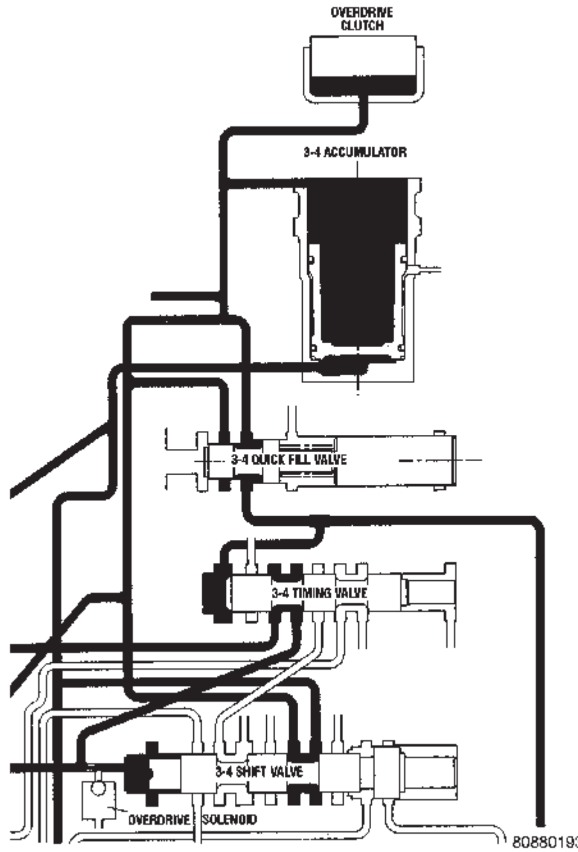

*Fig. 264 3-4 Shift Valve After Shift*

### 3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 264). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 263).

### 3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 263). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 264). Clutch fill is then completed through the regular feed orifice.

VALVE BODY (Continued)

## THROTTLE VALVE

In all gear positions the throttle valve (Fig. 265) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is “metered” out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

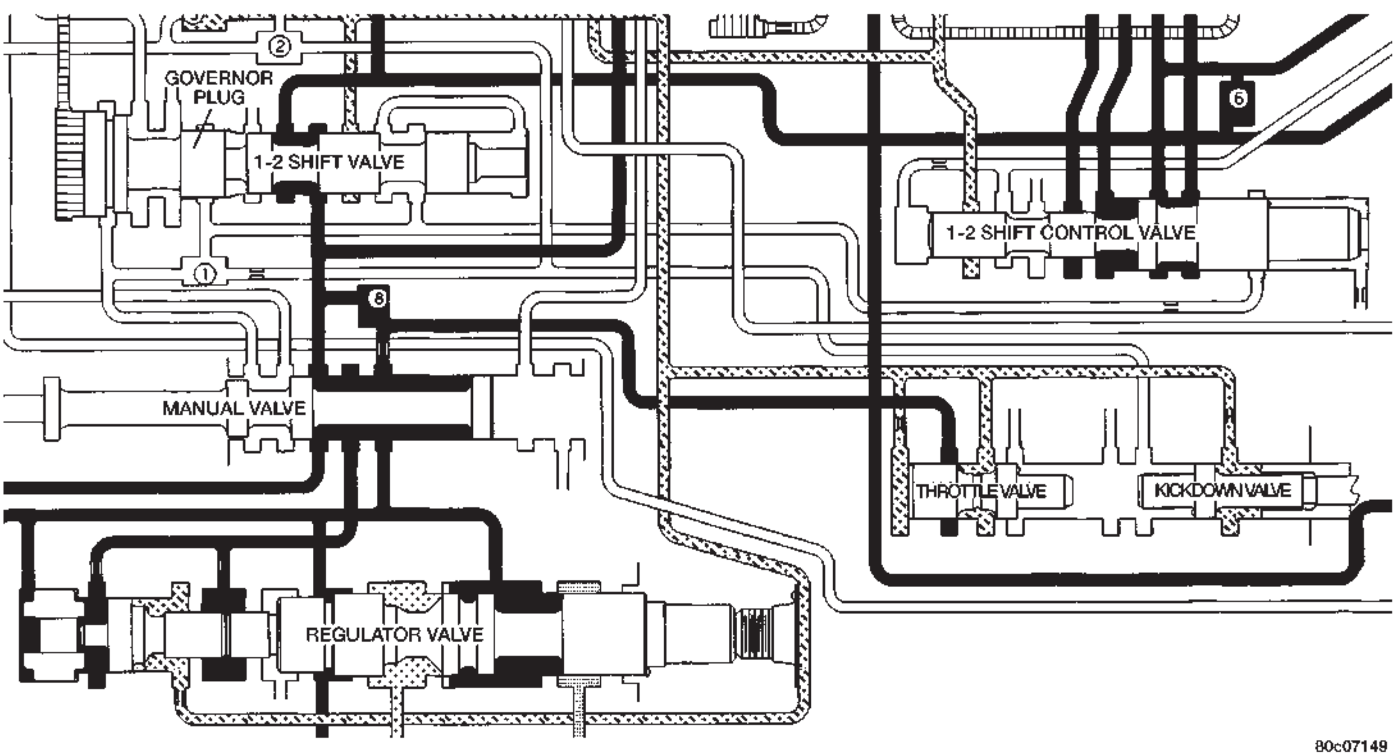

*Fig. 265 Throttle Valve*

VALVE BODY (Continued)

## SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 266), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

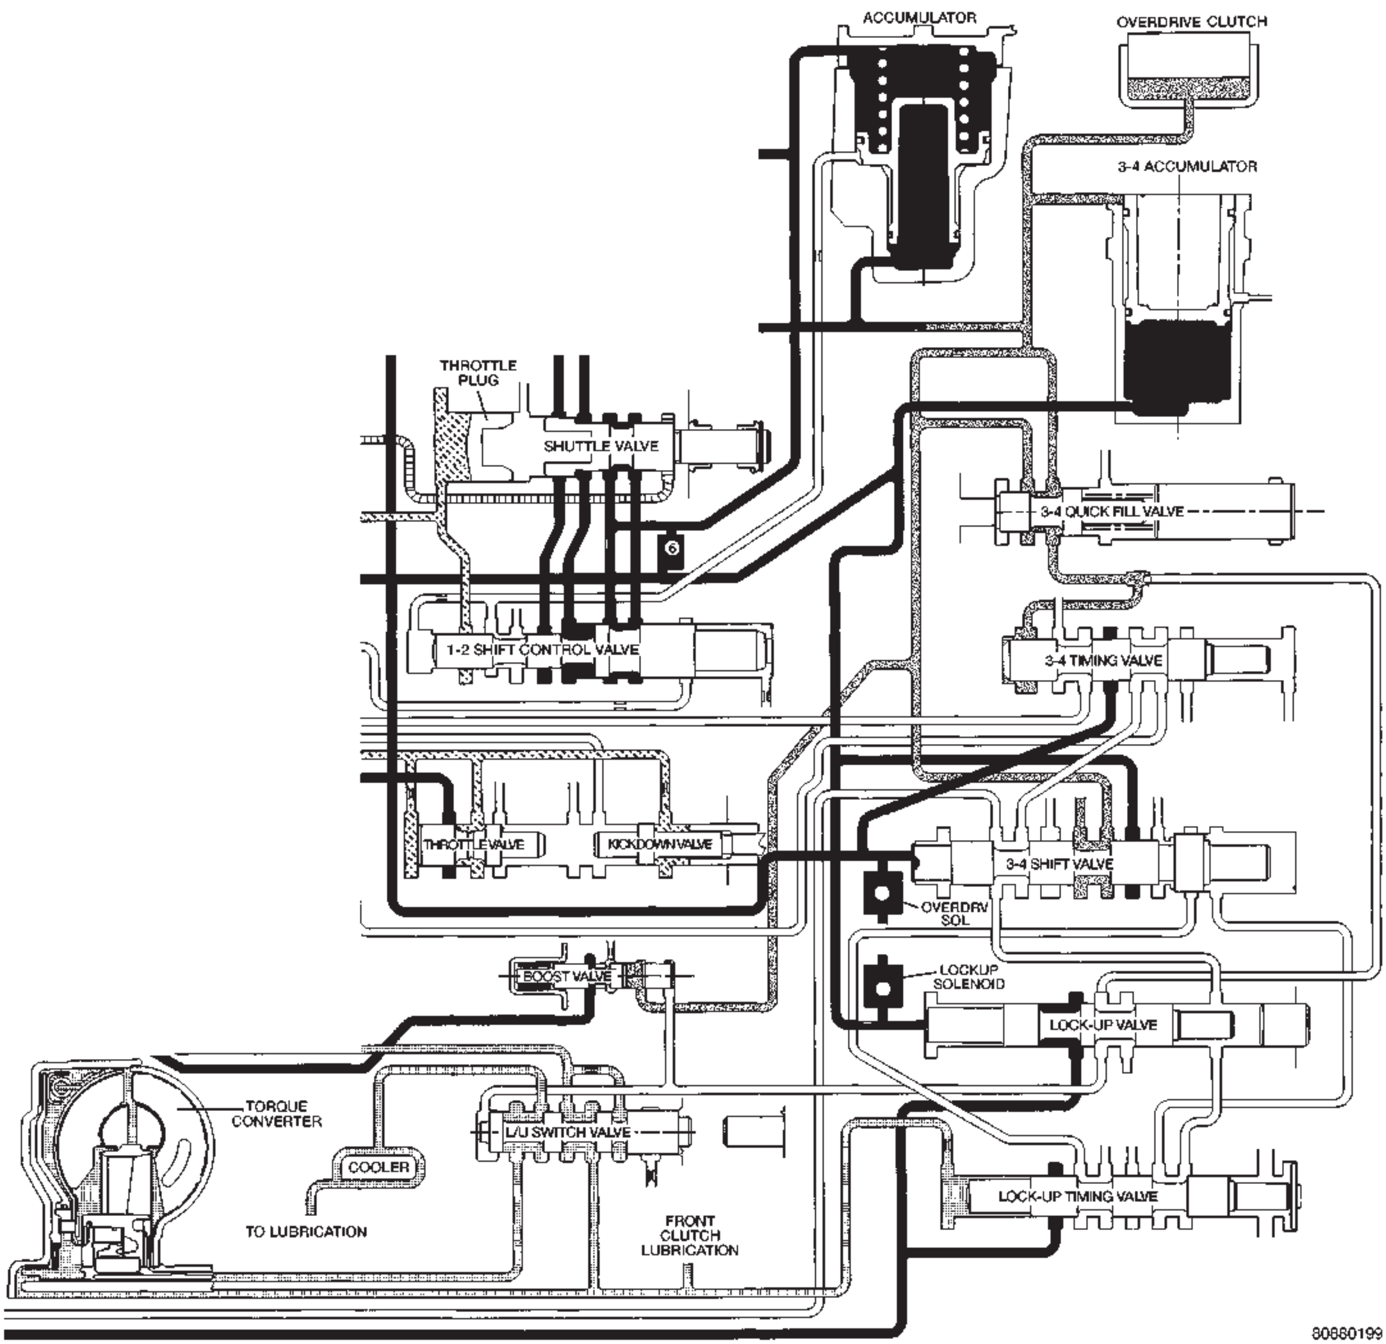

*Fig. 266 Switch Valve-Torque Converter Unlocked*

VALVE BODY (Continued)

Once the TCC control valve has moved to the right (Fig. 267), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

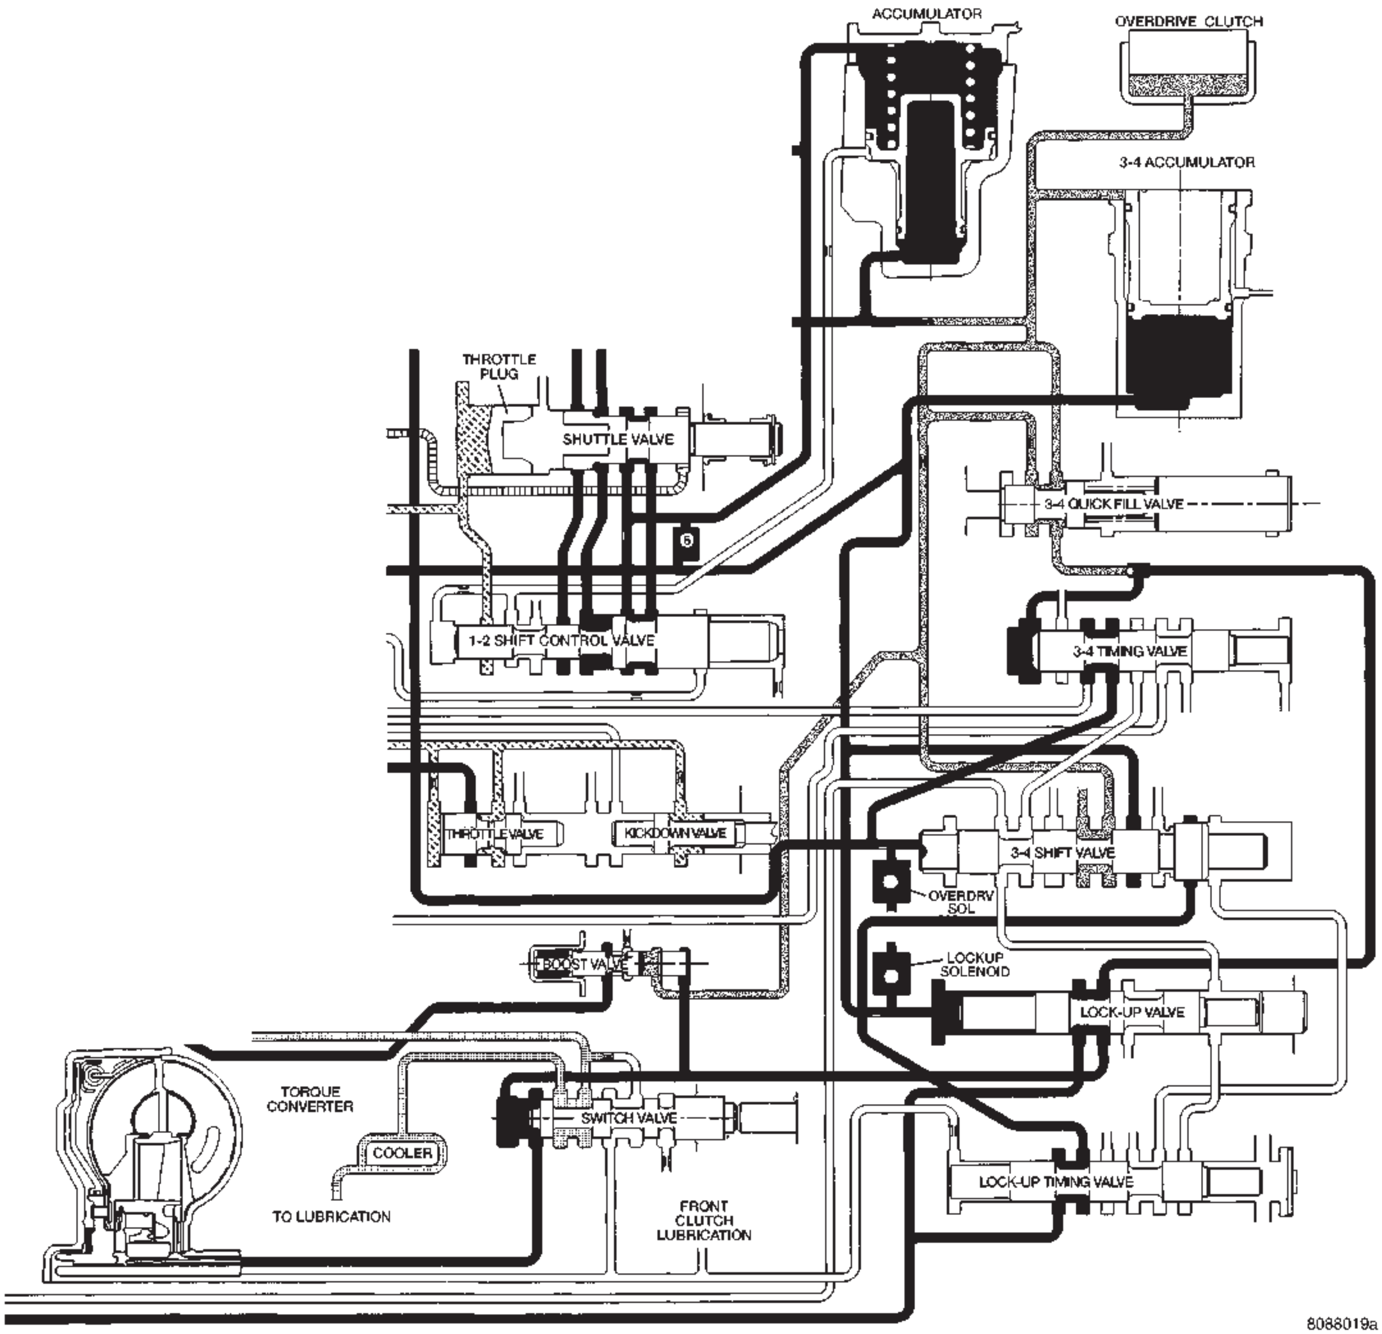

*Fig. 267 Switch Valve-Torque Converter Locked*

VALVE BODY (Continued)

## MANUAL VALVE

The manual valve (Fig. 268) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the “roostercomb” of the manual valve lever.

## CONVERTER CLUTCH LOCK-UP VALVE

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

## CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

## SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 260) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by–pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 “lift foot” upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

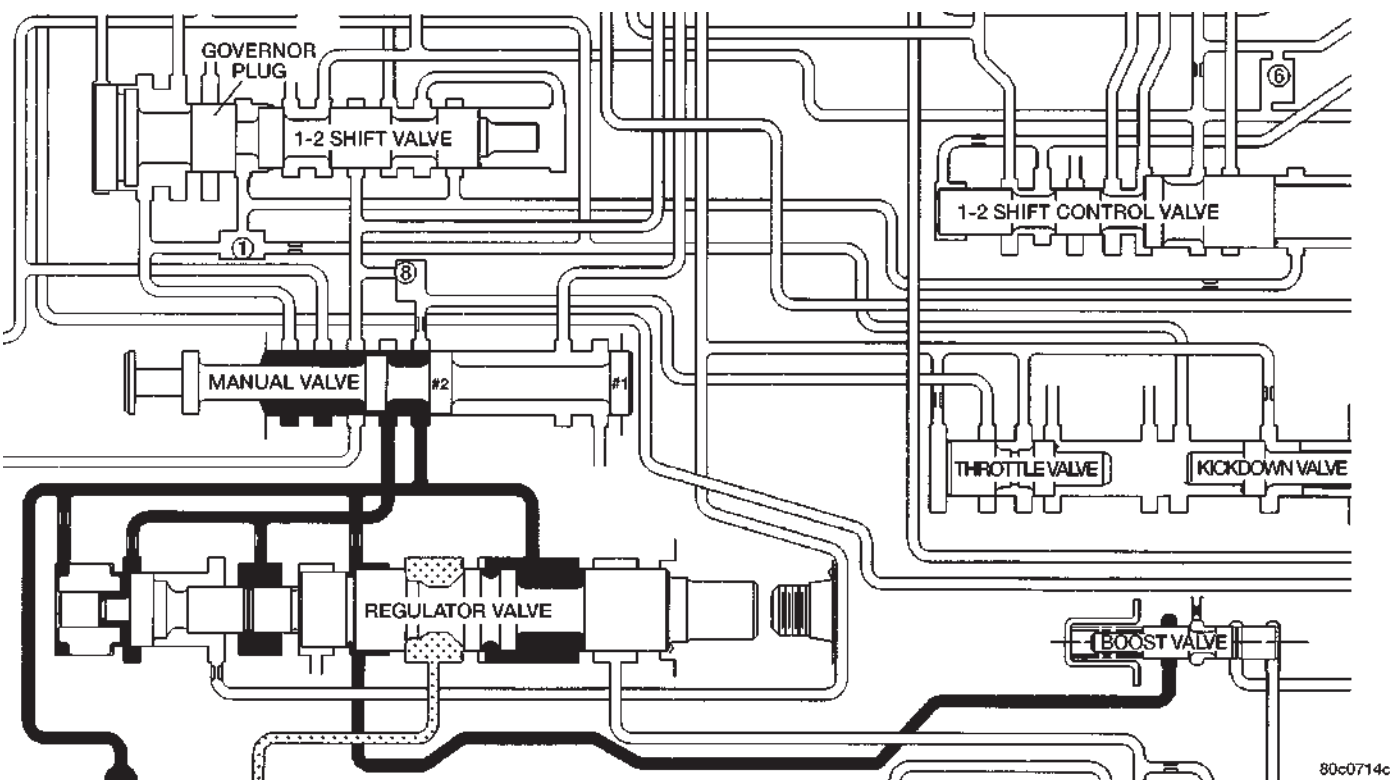

*Fig. 268 Manual Valve*

VALVE BODY (Continued)

### BOOST VALVE

The boost valve (Fig. 269) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 270), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

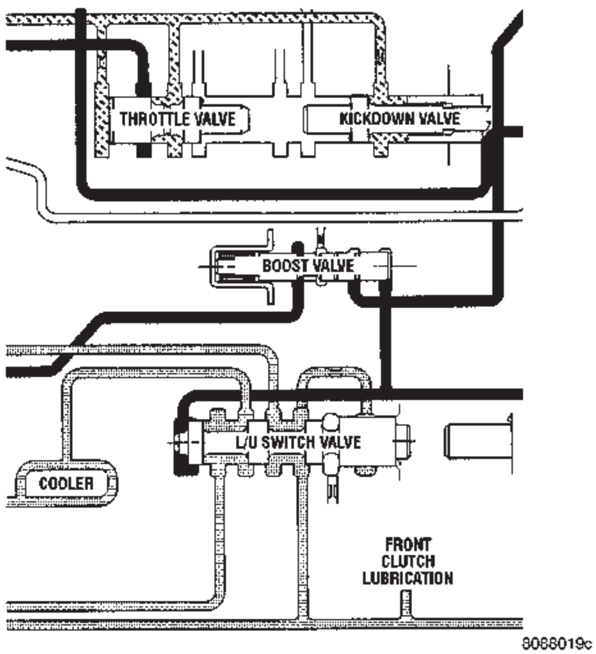

***Fig. 269 Boost Valve Before Lock-up***

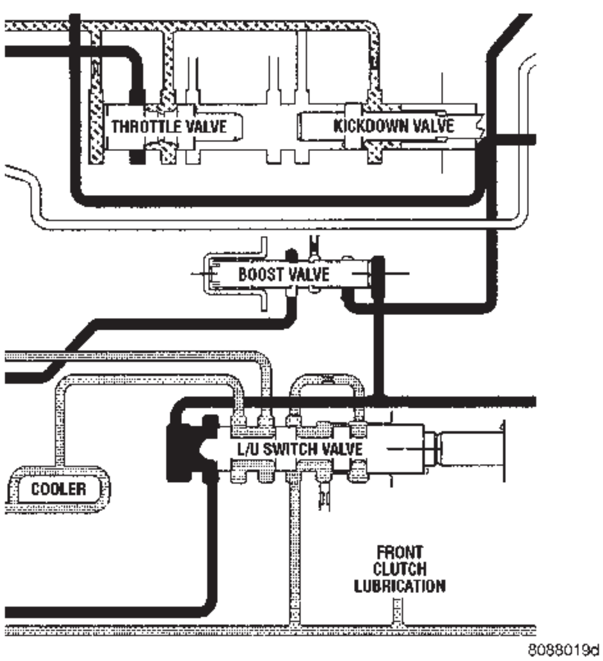

***Fig. 270 Boost Valve After Lock-up***

### REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).
- Converter clutch/overdrive solenoid assembly and harness .
- Governor housing gasket.
- Solenoid case connector O-rings.

(1) Shift transmission into NEUTRAL.

(2) Raise vehicle.

(3) Remove gearshift and throttle levers from shaft of valve body manual lever.

(4) Disconnect wires at solenoid case connector (Fig. 271).

(5) Position drain pan under transmission oil pan.

(6) Remove transmission oil pan and gasket.

(7) Remove fluid filter from valve body.

(8) Remove bolts attaching valve body to transmission case.

(9) Lower valve body enough to remove accumulator piston and springs.

(10) Work manual lever shaft and electrical connector out of transmission case.

(11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 272).

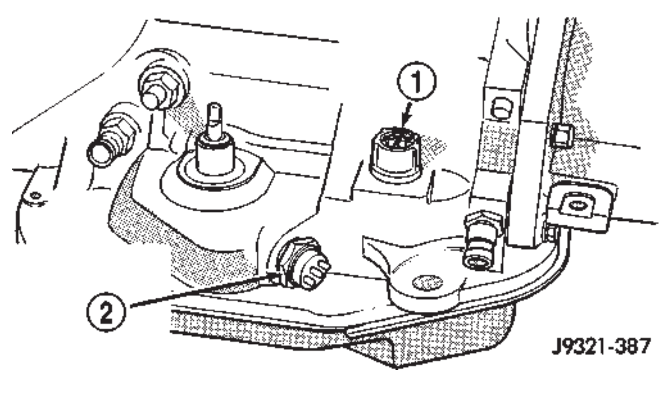

***Fig. 271 Transmission Case Connector***

1 - SOLENOID CASE CONNECTOR
2 - PARK/NEUTRAL POSITION SWITCH

VALVE BODY (Continued)

## DISASSEMBLY

**CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.**

(1) Disconnect wires from governor pressure sensor and solenoid.

(2) Remove screws attaching governor body and retainer plate to transfer plate.

(3) Remove retainer plate, governor body and gasket from transfer plate.

(4) Remove governor pressure sensor from governor body.

(5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 273). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

(7) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 274).

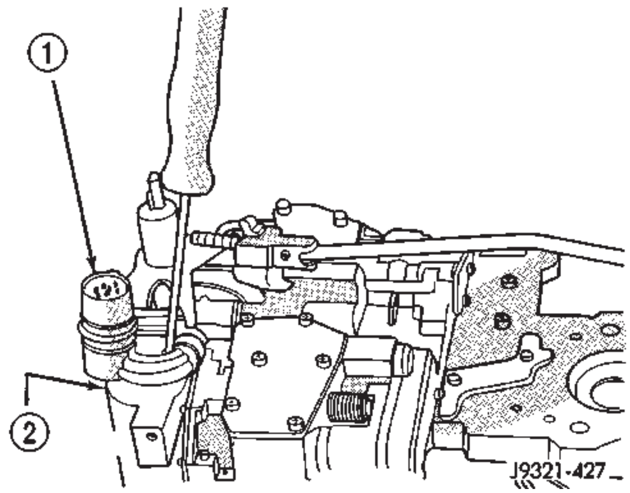

*Fig. 273 Solenoid Harness Case Connector Shoulder Bolt*

VALVE BODY (Continued)

(16) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 283).

(17) Remove screws attaching pressure adjusting screw bracket to valve body and transfer plate (Fig. 284). Hold bracket firmly against spring tension while removing last screw.

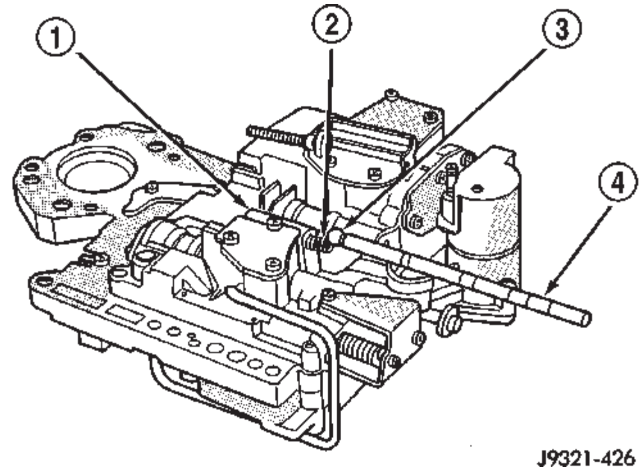

***Fig. 283 Detent Ball And Spring***

1 - DETENT HOUSING
2 - DETENT SPRING
3 - DETENT BALL
4 - PENCIL MAGNET

(18) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 285). Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.

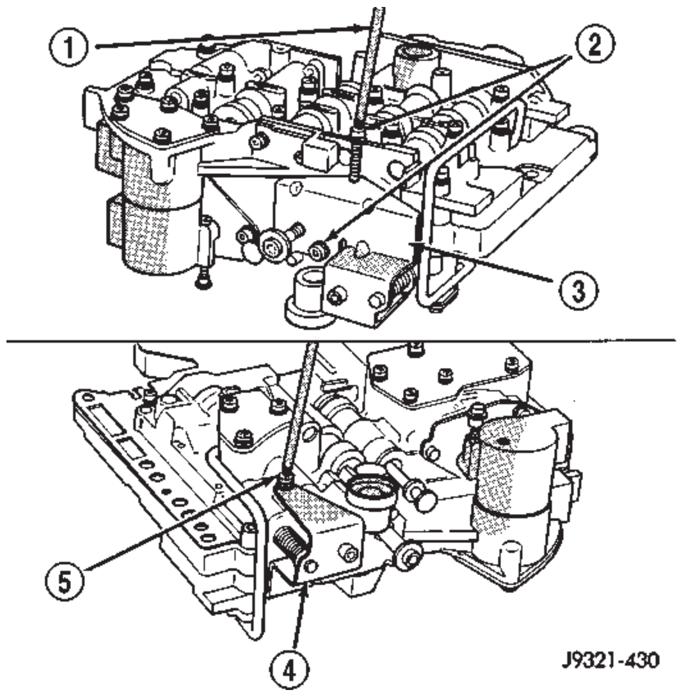

***Fig. 284 Adjusting Screw Bracket Fastener***

VALVE BODY (Continued)

(19) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 286).

(20) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 286).

(21) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 287).

(22) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 288).

(23) Remove left-side screw and remove 3-4 accumulator housing from valve body (Fig. 289).

(24) Bend back tabs on boost valve tube brace (Fig. 290).

(25) Remove boost valve connecting tube (Fig. 291). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

**CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.**

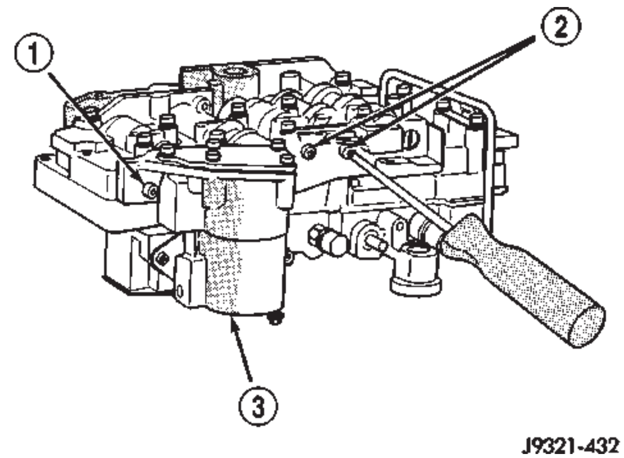

***Fig. 287 Accumulator Housing Screw Locations***

1 - LOOSEN THIS SCREW
2 - REMOVE THESE SCREWS
3 - 3-4 ACCUMULATOR HOUSING

(26) Turn valve body over so lower housing is facing upward (Fig. 292). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

1 - E-CLIP
2 - SECONDARY SPRING AND GUIDES
3 - SHUTTLE VALVE

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 299).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 286).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 300).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 300).

(9) Remove 1-2 shift control valve and spring (Fig. 300).

(10) Remove 1-2 shift valve and spring (Fig. 300).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 300).

(12) Remove pressure plug cover (Fig. 300).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 300).

## CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either part has sustained physical damage (dented, deformed, broken, etc.).

**CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.**

## INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

**CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.**

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.**Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer

VALVE BODY (Continued)

plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

## ASSEMBLY

**CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.**

### LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 298).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

### 3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 299).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

### TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 303).

(2) Install filter screen in upper housing separator plate (Fig. 304).

(3) Align and position upper housing separator plate on transfer plate (Fig. 305).

(4) Install brace plate (Fig. 305). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

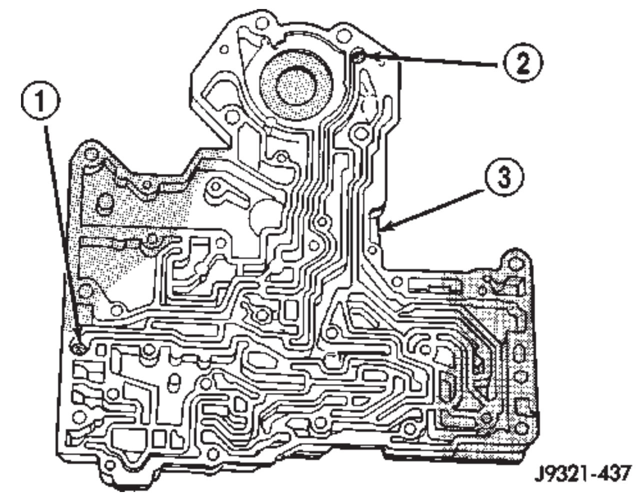

*Fig. 303 Rear Clutch And Rear Servo Check Ball Locations*

VALVE BODY (Continued)

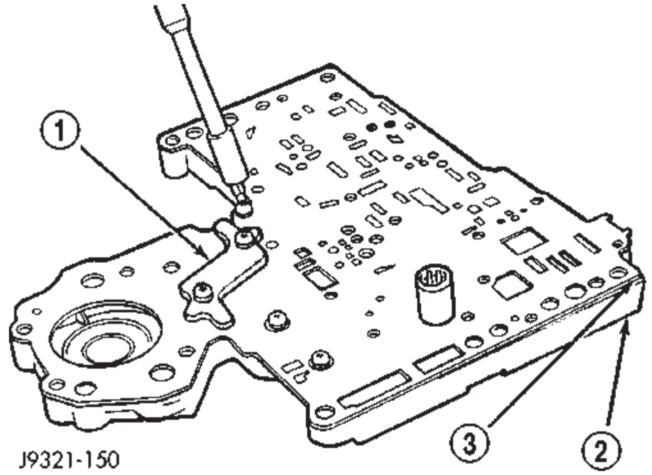

*Fig. 305 Brace Plate*

1 - BRACE
2 - TRANSFER PLATE
3 - SEPARATOR PLATE

## UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 306). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 307).

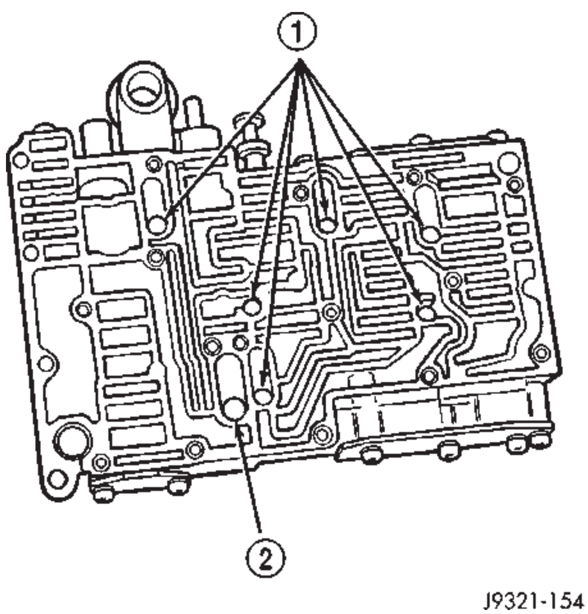

*Fig. 306 Check Ball Locations In Upper Housing*

1 - SMALL DIAMETER CHECK BALLS (6)
2 - LARGE DIAMETER CHECK BALL (1)

Be sure filter screen is seated in proper housing recess.

(3) Install the ECE check ball into the transfer plate (Fig. 290). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 308).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 309).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 309).

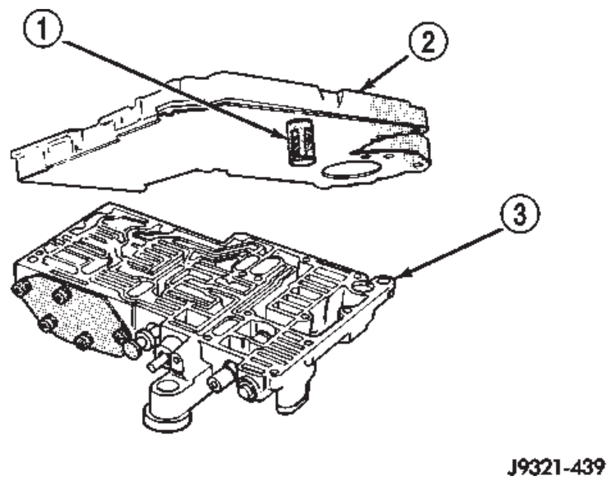

*Fig. 307 Installing Transfer Plate On Upper Housing*

4 - TRANSFER PLATE

## UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 310), (Fig. 311) and (Fig. 312) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

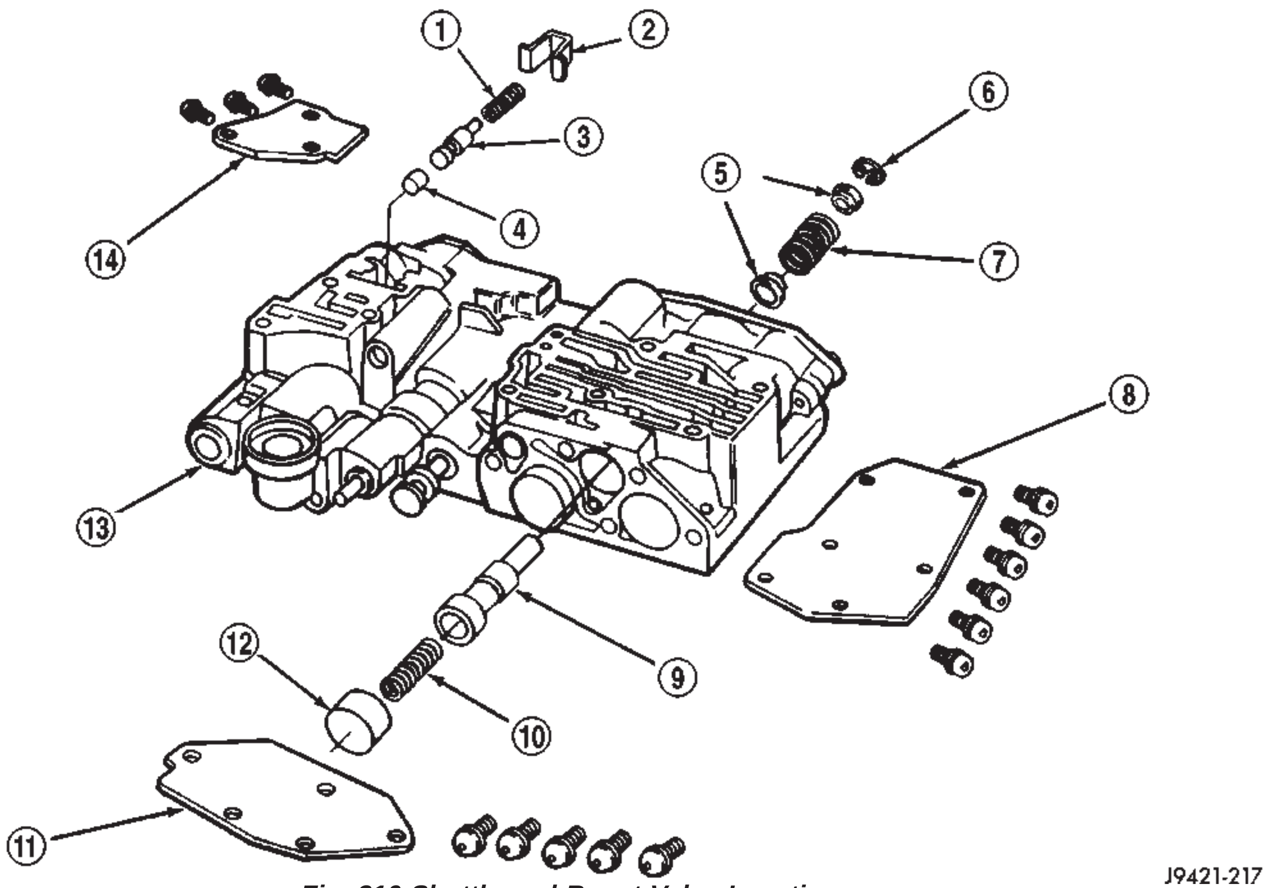

*Fig. 310 Shuttle and Boost Valve Locations*

1 - SPRING
2 - RETAINER
3 - BOOST VALVE
4 - BOOST VALVE PLUG
5 - SPRING GUIDES
6 - E-CLIP
7 - SHUTTLE VALVE SECONDARY SPRING

9 - SHUTTLE VALVE
10 - SHUTTLE VALVE PRIMARY SPRING
11 - GOVERNOR PLUG COVER
12 - THROTTLE PLUG
13 - UPPER HOUSING
14 - BOOST VALVE COVER

VALVE BODY (Continued)

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

## BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 313).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 313).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 314).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 314).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 315).

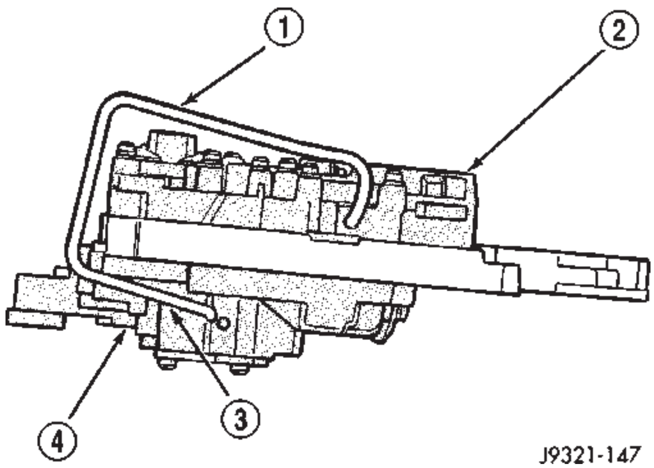

*Fig. 313 Boost Valve Tube*

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

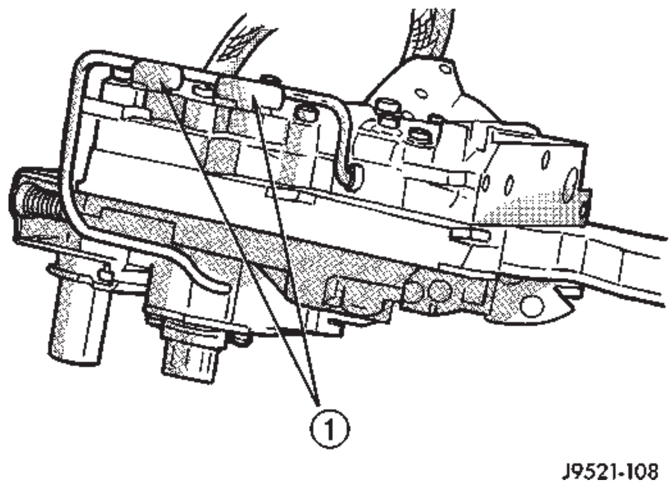

*Fig. 315 Securing Boost Valve Tube With Brace Tabs*

1 - BEND TABS UP AGAINST TUBE AS SHOWN

## 3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 316).

(2) Loosely attach accumulator housing with right-side screw (Fig. 316). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

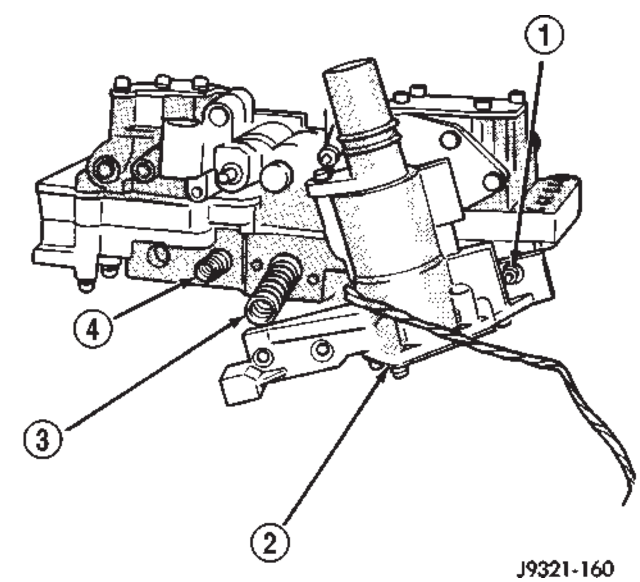

*Fig. 316 Converter Clutch And 3-4 Shift Valve Springs*

1 - RIGHT-SIDE SCREW
2 - 3-4 ACCUMULATOR
3 - 3-4 SHIFT VALVE SPRING
4 - CONVERTER CLUTCH VALVE SPRING

VALVE BODY (Continued)

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 317). Tighten screws to 4 N·m (35 in. lbs.).

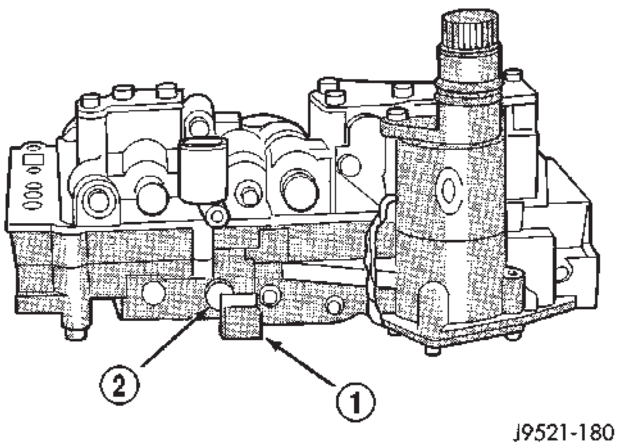

***Fig. 317 Seating 3-4 Accumulator On Lower Housing***

1 - ACCUMULATOR BOX
2 - CONVERTER CLUTCH VALVE PLUG

## VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 318).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 319).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 320). Seat tang in dimple before tightening connector screw.

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(21) Verify that solenoid wire harness is properly routed (Fig. 321). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

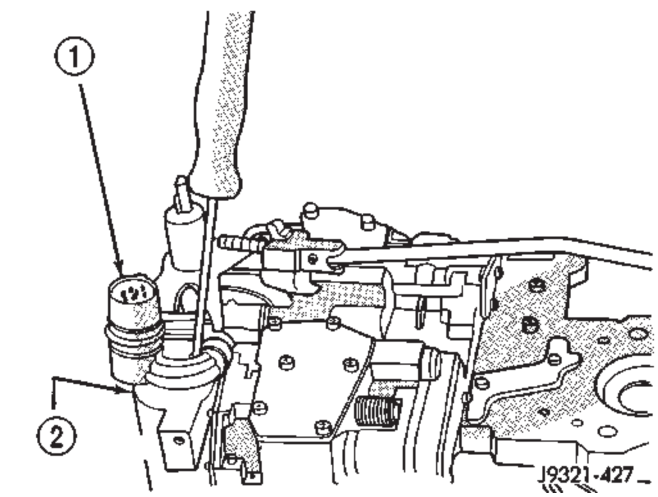

***Fig. 320 Solenoid Harness Case Connector Shoulder Bolt***

1 - SOLENOID HARNESS CASE CONNECTOR
2 - 3-4 ACCUMULATOR HOUSING

## GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

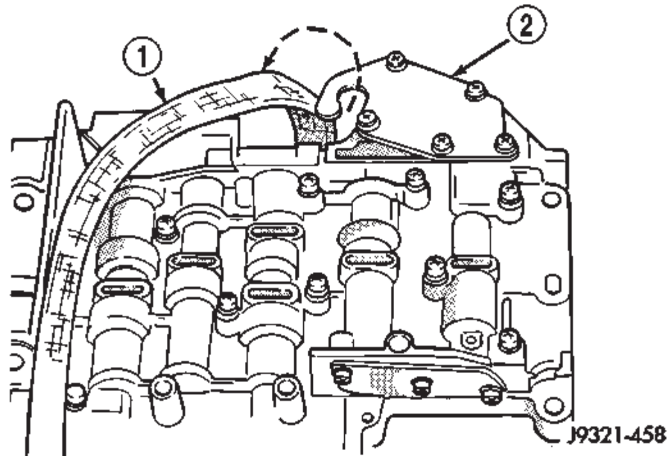

***Fig. 321 Solenoid Harness Routing***

1 - OVERDRIVE/CONVERTER SOLENOID WIRE HARNESS
2 - 3-4 ACCUMULATOR COVER PLATE

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

## INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 322). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 323).

(3) Check condition of seals on accumulator piston (Fig. 324). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

VALVE BODY (Continued)

**CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.**

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

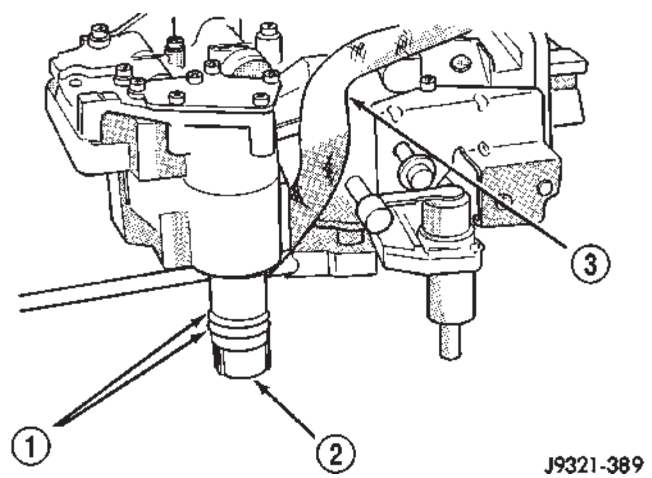

*Fig. 322 Valve Body Harness Connector O-Ring Seal*

## ADJUSTMENTS - VALVE BODY

### CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

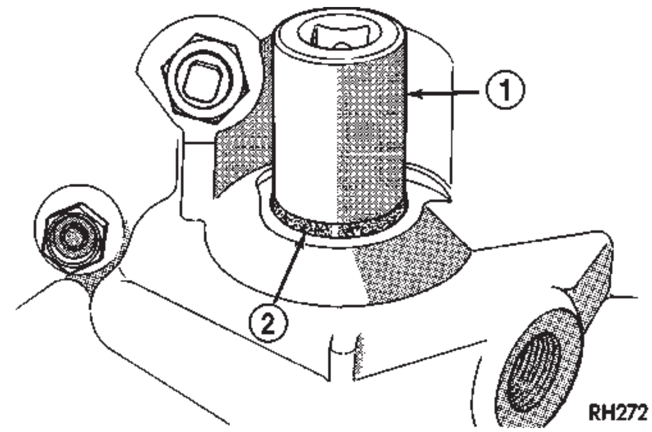

*Fig. 323 Manual Lever Shaft Seal*

1 - 15/16" SOCKET
2 - SEAL

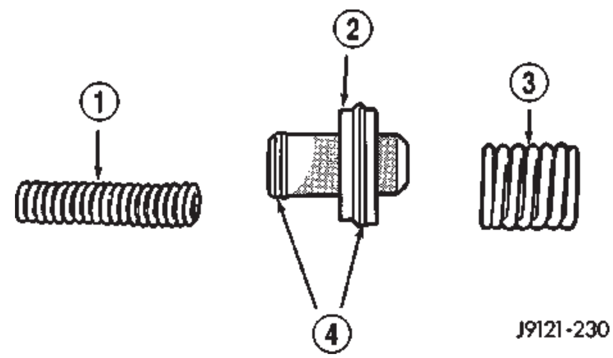

*Fig. 324 Accumulator Piston Components*

1 - INNER SPRING
2 - ACCUMULATOR PISTON
3 - OUTER SPRING
4 - SEAL RINGS

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

### LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 325).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

**NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.**

VALVE BODY (Continued)

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

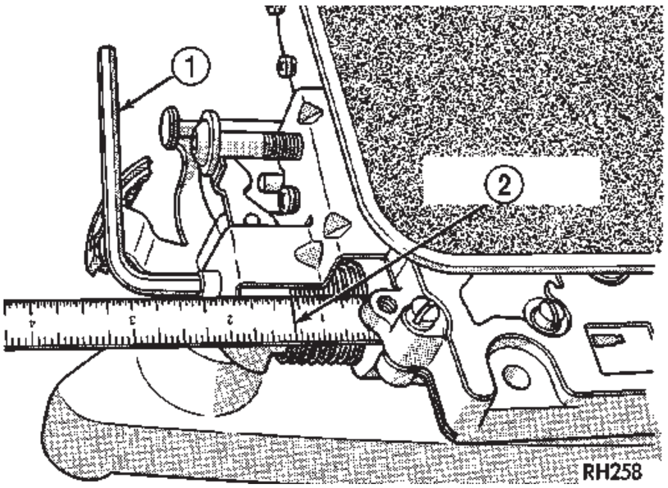

*Fig. 325 Line Pressure Adjustment*

1 - WRENCH
2 - 1–5/16 INCH

#### THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 326).

Push the gauge tool inward to compress the kick-down valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

**NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.**

# AUTOMATIC TRANSMISSION - 47RE

## TABLE OF CONTENTS

# AUTOMATIC TRANSMISSION - 47RE

## DESCRIPTION

The 47RE (Fig. 1) is a four speed fully automatic transmissions with an electronic governor. The 47RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

## GEAR RATIOS The 47RE gear ratios are:

**1st** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.45:1
**2nd** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1.45:1
**3rd** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1.00:1
**4th** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 0.69:1
**Rev.** . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 2.21

## OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 47RE (Continued)

## PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

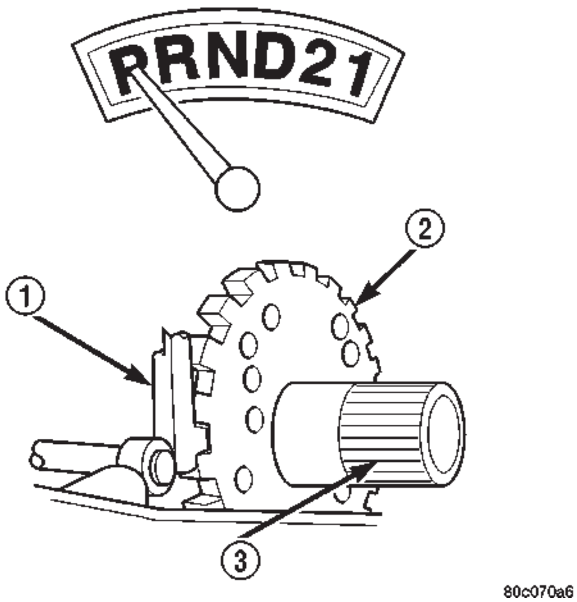

***Fig. 3 Park Powerflow***

1 - PAWL ENGAGED FOR PARK
2 - PARK SPRAG
3 - OUTPUT SHAFT

## NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

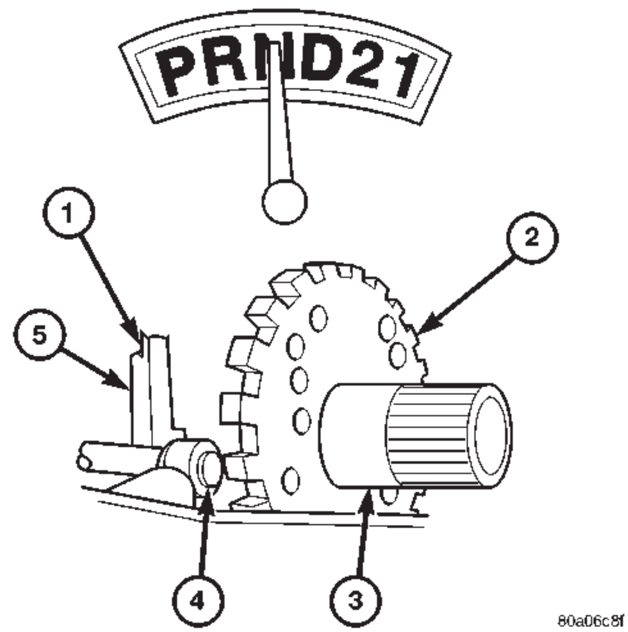

***Fig. 4 Neutral Powerflow***

1 - PAWL DISENGAGED FOR NEUTRAL
2 - PARK SPRAG
3 - OUTPUT SHAFT
4 - CAM
5 - PAWL

AUTOMATIC TRANSMISSION - 47RE (Continued)

## REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

8 - LOW/REVERSE BAND APPLIED

AUTOMATIC TRANSMISSION - 47RE (Continued)

### FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

AUTOMATIC TRANSMISSION - 47RE (Continued)

## SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed. Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

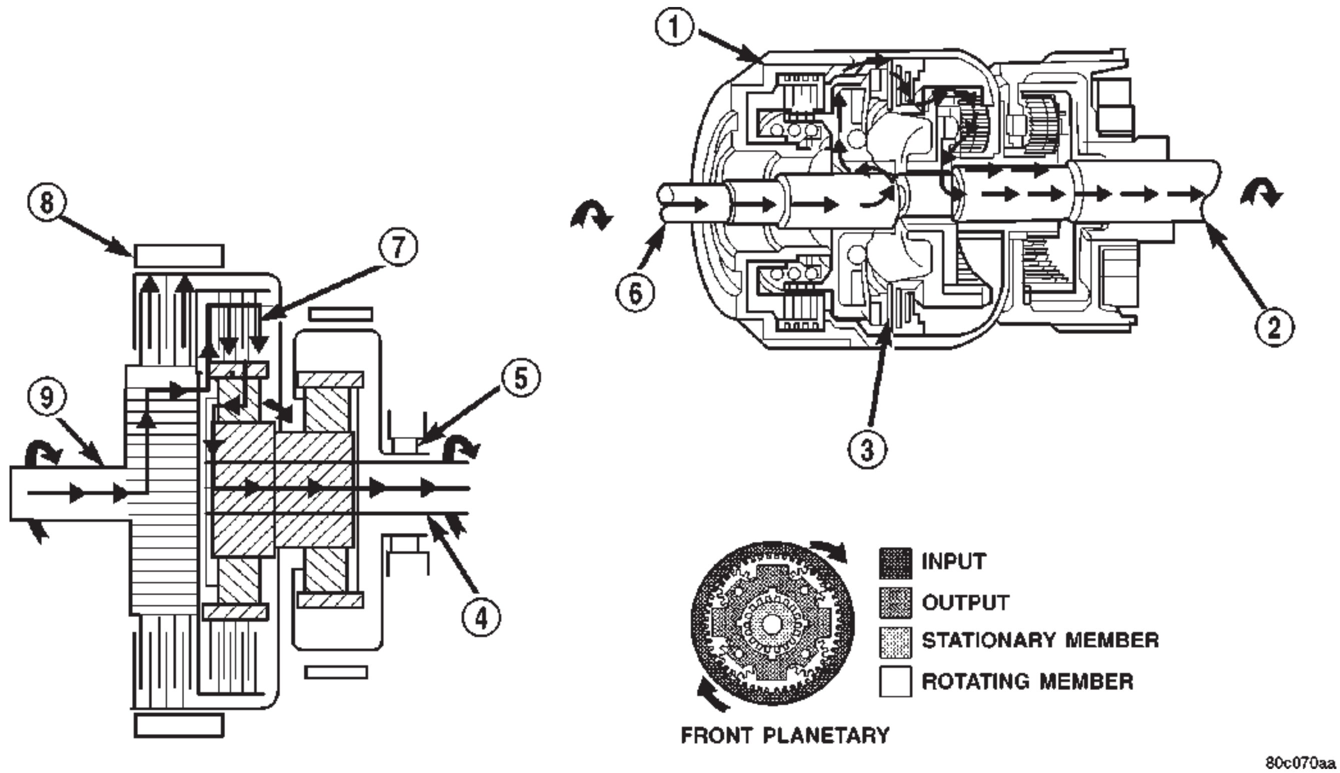

*Fig. 7 Second Gear Powerflow*

7 - REAR CLUTCH APPLIED
8 - KICKDOWN BAND APPLIED
9 - INPUT SHAFT

AUTOMATIC TRANSMISSION - 47RE (Continued)

### DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

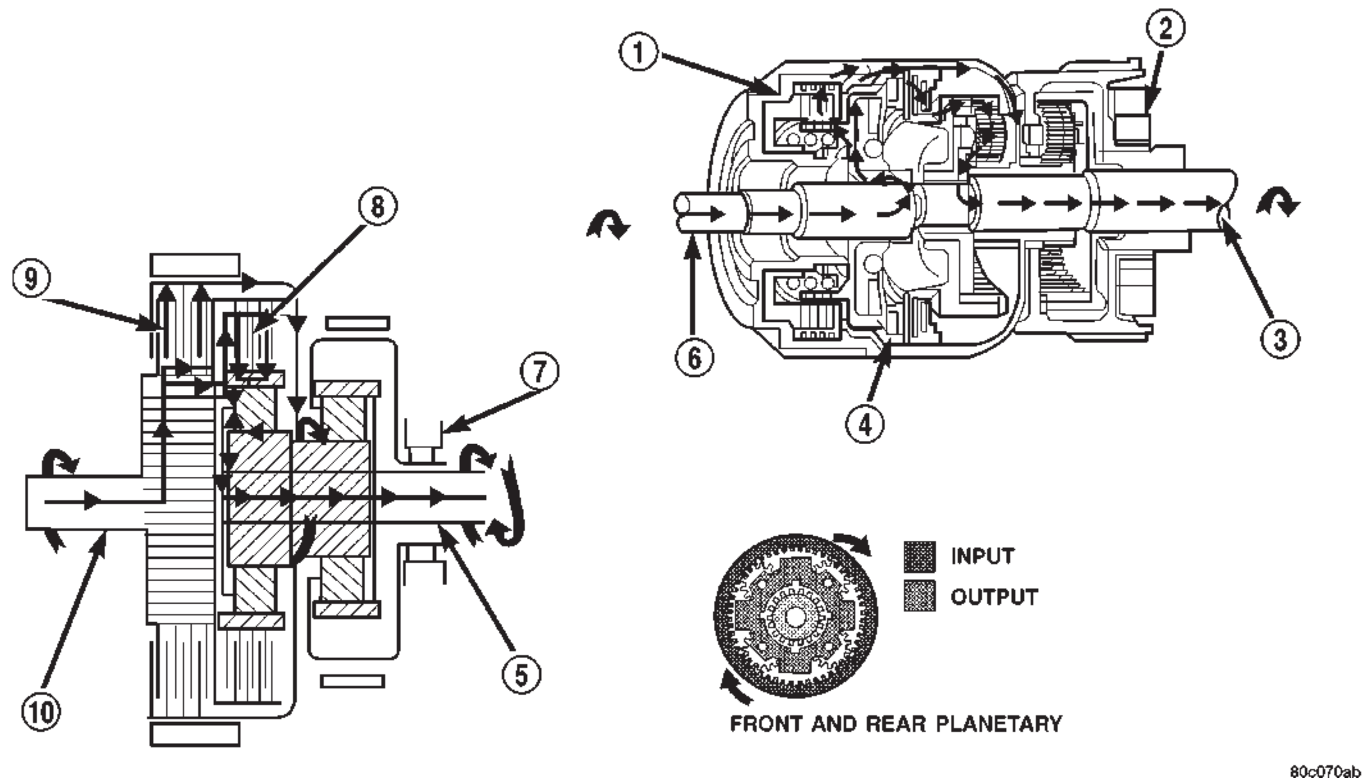

*Fig. 8 Direct Drive Powerflow*

10 - INPUT SHAFT

## FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

## DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

## DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

### VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB® scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform hydraulic pressure test if shift problems were noted during road test.

(6) Perform air-pressure test to check clutch-band operation.

### VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

 (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

 (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

 (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

## DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 47RE (Continued)

**CLUTCH AND BAND APPLICATION CHART**

| SHIFT LEVER POSITION | TRANSMISSION CLUTCHES AND BANDS | | | | | OVERDRIVE CLUTCHES | | |
|---|---|---|---|---|---|---|---|---|
| | FRONT CLUTCH | FRONT BAND | REAR CLUTCH | REAR BAND | OVER-RUNNING CLUTCH | OVER-DRIVE CLUTCH | DIRECT CLUTCH | OVER-RUNNING CLUTCH |
| Reverse | X | | | X | | | X | |
| Drive - First | | | X | | X | | X | X |
| Drive - Second | | X | X | | | | X | X |
| Drive - Third | X | | X | | | | X | X |
| Drive - Fourth | X | | X | | | X | | |
| Manual Second | | X | X | | X | | X | X |
| Manual First | | | X | X | X | | X | X |

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

## DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

### Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

AUTOMATIC TRANSMISSION - 47RE (Continued)

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

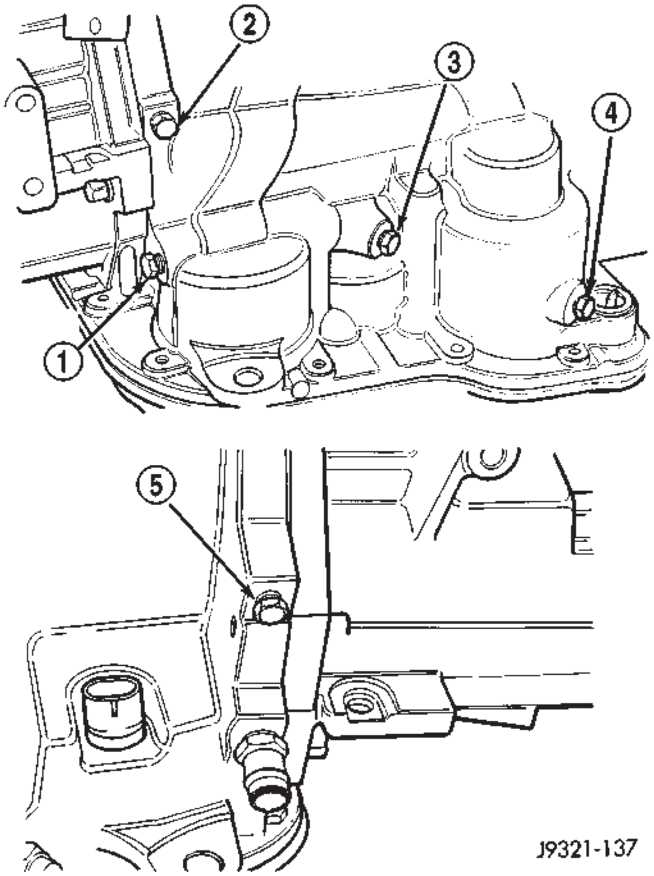

*Fig. 9 Pressure Test Port Locations*

1 - REAR SERVO TEST PORT
2 - GOVERNOR TEST PORT
3 - ACCUMULATOR TEST PORT
4 - FRONT SERVO TEST PORT
5 - OVERDRIVE CLUTCH TEST PORT

#### Test One - Transmission In Manual Low

**NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.**

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

#### Test Two - Transmission In 2 Range

**NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.**

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

#### Test Three - Transmission In D Range Third Gear

**NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.**

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

AUTOMATIC TRANSMISSION - 47RE (Continued)

#### Test Four - Transmission In Reverse

**NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.**

(1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.

(2) Move 300 psi Gauge C-3293-SP back to rear servo port.

(3) Have helper start and run engine at 1600 rpm for test.

(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.

(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.

(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

#### Test Five - Governor Pressure

**NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.**

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.
- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

#### Test Six - Transmission In Overdrive Fourth Gear

**NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.**

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

AUTOMATIC TRANSMISSION - 47RE (Continued)

*PRESSURE TEST ANALYSIS CHART*

| TEST CONDITION | INDICATION |
|---|---|
| Line pressure OK during any one test | Pump and regulator valve OK |
| Line pressure OK in R but low in D, 2, 1 | Leakage in rear clutch area (seal rings, clutch seals) |
| Pressure low in D Fourth Gear Range | Overdrive clutch piston seal, or check ball problem |
| Pressure OK in 1, 2 but low in D3 and R | Leakage in front clutch area |
| Pressure OK in 2 but low in R and 1 | Leakage in rear servo |
| Front servo pressure in 2 | Leakage in servo; broken servo ring or cracked servo piston |
| Pressure low in all positions | Clogged filter, stuck regulator valve, worn or faulty pump, low oil level |
| Governor pressure too high at idle speed | Governor pressure solenoid valve system fault. Refer to diagnostic book. |
| Governor pressure low at all mph figures | Faulty governor pressure solenoid, transmission control module, or governor pressure sensor |
| Lubrication pressure low at all throttle positions | Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter. |
| Line pressure high | Output shaft plugged, sticky regulator valve |
| Line pressure low | Sticky regulator valve, clogged filter, worn pump |

## DIAGNOSIS AND TESTING - AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

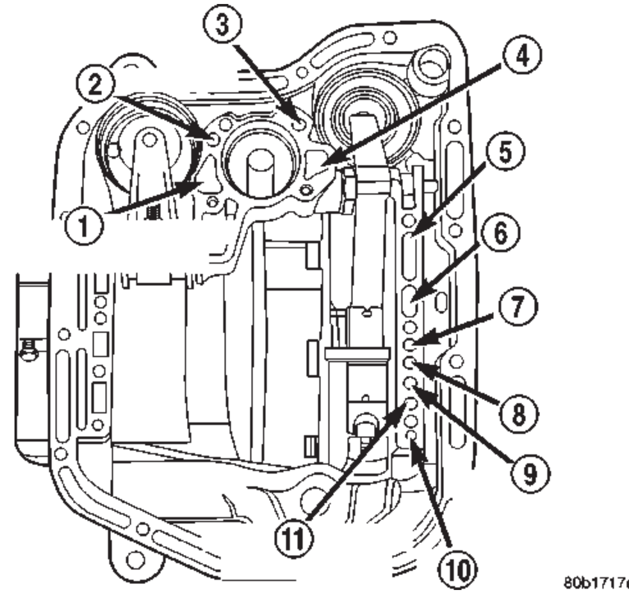

***Fig. 10 Air Pressure Test Passages***

1 - LINE PRESSURE TO ACCUMULATOR
2 - REAR SERVO APPLY
3 - FRONT SERVO APPLY
4 - FRONT SERVO RELEASE
5 - PUMP SUCTION
6 - PUMP PRESSURE
7 - FRONT CLUTCH APPLY
8 - REAR CLUTCH APPLY
9 - TO TORQUE CONVERTOR
10 - TO COOLER
11 - FROM TORQUE CONVERTER

### Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

### Front Servo Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

### Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

## DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

(1) Verify that a leak condition actually exists.

(2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

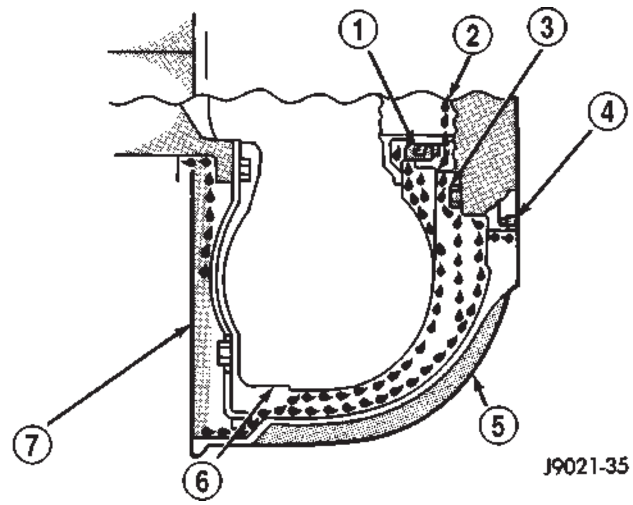

*Fig. 11 Converter Housing Leak Paths*

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

## TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

(1) Leaks at the weld joint around the outside diameter weld (Fig. 12).

(2) Leaks at the converter hub weld (Fig. 12).

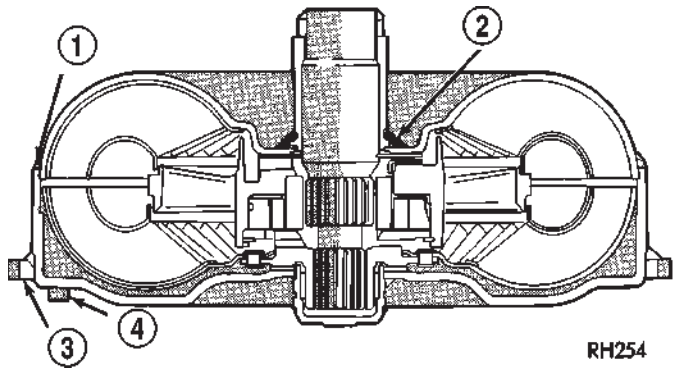

*Fig. 12 Converter Leak Points - Typical*

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

## CONVERTER HOUSING AREA LEAK CORRECTION

(1) Remove converter.

(2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.

(3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

AUTOMATIC TRANSMISSION - 47RE (Continued)

## DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

**DIAGNOSIS CHARTS**

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Add Fluid |
| | 2. Throttle Linkage Mis-adjusted. | 2. Adjust linkage - setting may be too long. |
| | 3. Mount and Driveline Bolts Loose. | 3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts. |
| | 4. U-Joint Worn/Broken. | 4. Remove propeller shaft and replace U-Joint. |
| | 5. Axle Backlash Incorrect. | 5. Check per Service Manual. Correct as needed. |
| | 6. Hydraulic Pressure Incorrect. | 6. Check pressure. Remove, overhaul or adjust valve body as needed. |
| | 7. Band Mis-adjusted. | 7. Adjust rear band. |
| | 8. Valve Body Check Balls Missing. | 8. Inspect valve body for proper check ball installation. |
| | 9. Axle Pinion Flange Loose. | 9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged. |
| | 10. Clutch, band or planetary component damaged. | 10. Remove, disassemble and repair transmission as necessary. |
| | 11. Converter Clutch Faulty. | 11. Replace converter and flush cooler and line before installing new converter. |
| DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE) | 1. Fluid Level Low. | 1. Correct level and check for leaks. |
| | 2. Filter Clogged. | 2. Change filter. |
| | 3. Gearshift Linkage Mis-adjusted. | 3. Adjust linkage and repair linkage if worn or damaged. |
| | 4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump). | 4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house. |
| | 5. Rear Band Mis-adjusted. | 5. Adjust band. |
| | 6. Valve Body Filter Plugged. | 6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 7. Oil Pump Gears Worn/Damaged. | 7. Remove transmission and replace oil pump. |
| | 8. Governor Circuit and Solenoid Valve Electrical Fault. | 8. Test with DRB® scan tool and repair as required. |
| | 9. Hydraulic Pressure Incorrect. | 9. Perform pressure test, remove transmission and repair as needed. |
| | 10. Reaction Shaft Seal Rings Worn/Broken. | 10. Remove transmission, remove oil pump and replace seal rings. |
| | 11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged. | 11. Remove and disassemble transmission and repair as necessary. |
| | 12. Regulator Valve Stuck. | 12. Clean. |
| | 13. Cooler Plugged. | 13. Transfer case failure can plug cooler. |
| NO DRIVE RANGE (REVERSE OK) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Repair or replace linkage components. |
| | 3. Rear Clutch Burnt. | 3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed. |
| | 4. Valve Body Malfunction. | 4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged. |
| | 5. Transmission Overrunning Clutch Broken. | 5. Remove and disassemble transmission. Replace overrunning clutch. |
| | 6. Input Shaft Seal Rings Worn/ Damaged. | 6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts. |
| | 7. Front Planetary Failed Broken. | 7. Remove and repair. |
| NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks if drive is restored. |
| | 2. Gearshift Linkage/Cable Loose/Misadjusted. | 2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts. |
| | 3. U-Joint/Axle/Transfer Case Broken. | 3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section. |
| | 4. Filter Plugged. | 4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary. |
| | 5. Oil Pump Damaged. | 5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary. |
| | 6. Valve Body Malfunctioned. | 6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 7. Transmission Internal Component Damaged. | 7. Remove and disassemble transmission. Repair or replace failed components as needed. |
| | 8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck. | 8. Remove, disassemble, repair. |
| | 9. Torque Converter Damage. | 9. Inspect and replace as required. |
| SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES) | 1. Fluid Level Low/High. | 1. Correct fluid level and check for leaks if low. |
| | 2. Fluid Filter Clogged. | 2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage as described in service section. |
| | 4. Throttle Linkage Binding. | 4. Check cable for binding. Check for return to closed throttle at transmission. |
| | 5. Gearshift Linkage/Cable Mis-adjusted. | 5. Adjust linkage/cable as described in service section. |
| | 6. Clutch or Servo Failure. | 6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed. |
| | 7. Governor Circuit Electrical Fault. | 7. Test using DRB® scan tool and repair as required. |
| | 8. Front Band Mis-adjusted. | 8. Adjust band. |
| | 9. Pump Suction Passage Leak. | 9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed. |
| NO REVERSE (D RANGES OK) | 1. Gearshift Linkage/Cable Mis-adjusted/Damaged. | 1. Repair or replace linkage parts as needed. |
| | 2. Park Sprag Sticking. | 2. Replace overdrive annulus gear. |
| | 3. Rear Band Mis-adjusted/Worn. | 3. Adjust band; replace. |
| | 4. Valve Body Malfunction. | 4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged. |
| | 5. Rear Servo Malfunction. | 5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary. |
| | 6. Direct Clutch in Overdrive Worn. | 6. Disassemble overdrive. Replace worn or damaged parts. |
| | 7. Front Clutch Burnt. | 7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT) | 1. Governor Circuit Electrical Fault. | 1. Test using DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Repair stuck 1-2 shift valve or governor plug. |
| | 3. Front Servo/Kickdown Band Damaged/Burned. | 3. Repair/replace. |
| MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW | 1. Valve Body Malfunction. | 1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug. |
| NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY) | 1. Governor Circuit Electrical Fault. | 1. Test with DRB® scan tool and repair as required. |
| | 2. Valve Body Malfunction. | 2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs. |
| | 3. Front Servo Piston Cocked in Bore. | 3. Inspect servo and repair as required. |
| | 4. Front Band Linkage Malfunction | 4. Inspect linkage and look for bind in linkage. |
| NO KICKDOWN OR NORMAL DOWNSHIFT | 1. Throttle Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Accelerator Pedal Travel Restricted. | 2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets. |
| | 3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments. | 3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |
| | 4. Governor Circuit Electrical Fault. | 4. Test with DRB® scan tool and repair as required. |
| | 5. Valve Body Malfunction. | 5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required. |
| | 6. TPS Malfunction. | 6. Replace sensor, check with DRB® scan tool. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if required. |
| | 8. Valve Body Malfunction. | 8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| STUCK IN LOW GEAR (WILL NOT UPSHIFT) | 1. Throttle Linkage Mis-adjusted/ Stuck. | 1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage and repair linkage if worn or damaged. |
| | 3. Governor Component Electrical Fault. | 3. Check operating pressures and test with DRB® scan tool, repair faulty component. |
| | 4. Front Band Out of Adjustment. | 4. Adjust Band. |
| | 5. Clutch or Servo Malfunction. | 5. Air pressure check operation of clutches and bands. Repair faulty component. |
| CREEPS IN NEUTRAL | 1. Gearshift Linkage Mis-adjusted. | 1. Adjust linkage. |
| | 2. Rear Clutch Dragging/Warped. | 2. Disassemble and repair. |
| | 3. Valve Body Malfunction. | 3. Perform hydraulic pressure test to determine cause and repair as required. |
| BUZZING NOISE | 1. Fluid Level Low | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Mis-assembled. | 2. Route cable away from engine and bell housing. |
| | 3. Valve Body Mis-assembled. | 3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws. |
| | 4. Pump Passages Leaking. | 4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts. |
| | 5. Cooling System Cooler Plugged. | 5. Flow check cooler circuit. Repair as needed. |
| | 6. Overrunning Clutch Damaged. | 6. Replace clutch. |
| SLIPS IN REVERSE ONLY | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Gearshift Linkage Mis-adjusted. | 2. Adjust linkage. |
| | 3. Rear Band Mis-adjusted. | 3. Adjust band. |
| | 4. Rear Band Worn. | 4. Replace as required. |
| | 5. Overdrive Direct Clutch Worn. | 5. Disassemble overdrive. Repair as needed. |
| | 6. Hydraulic Pressure Too Low. | 6. Perform hydraulic pressure tests to determine cause. |
| | 7. Rear Servo Leaking. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Band Linkage Binding. | 8. Inspect and repair as required. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN FORWARD DRIVE RANGES | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Fluid Foaming. | 2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary. |
| | 3. Throttle Linkage Mis-adjusted. | 3. Adjust linkage. |
| | 4. Gearshift Linkage Mis-adjusted. | 4. Adjust linkage. |
| | 5. Rear Clutch Worn. | 5. Inspect and replace as needed. |
| | 6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines. | 6. Perform hydraulic and air pressure tests to determine cause. |
| | 7. Rear Clutch Malfunction, Leaking Seals or Worn Plates. | 7. Air pressure check clutch-servo operation and repair as required. |
| | 8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only). | 8. Replace Clutch. |
| SLIPS IN LOW GEAR ″D″ ONLY, BUT NOT IN MANUAL 1 POSITION | Overrunning Clutch Faulty. | Replace overrunning clutch. |
| GROWLING, GRATING OR SCRAPING NOISES | 1. Drive Plate Broken. | 1. Replace. |
| | 2. Torque Converter Bolts Hitting Dust Shield. | 2. Dust shield bent. Replace or repair. |
| | 3. Planetary Gear Set Broken/ Seized. | 3. Check for debris in oil pan and repair as required. |
| | 4. Overrunning Clutch Worn/Broken. | 4. Inspect and check for debris in oil pan. Repair as required. |
| | 5. Oil Pump Components Scored/ Binding. | 5. Remove, inspect and repair as required. |
| | 6. Output Shaft Bearing or Bushing Damaged. | 6. Remove, inspect and repair as required. |
| | 7. Clutch Operation Faulty. | 7. Perform air pressure check and repair as required. |
| | 8. Front and Rear Bands Mis-adjusted. | 8. Adjust bands. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| DRAGS OR LOCKS UP | 1. Fluid Level Low. | 1. Check and adjust level. |
| | 2. Clutch Dragging/Failed | 2. Air pressure check clutch operation and repair as required. |
| | 3. Front or Rear Band Mis-adjusted. | 3. Adjust bands. |
| | 4. Case Leaks Internally. | 4. Check for leakage between passages in case. |
| | 5. Servo Band or Linkage Malfunction. | 5. Air pressure check servo operation and repair as required. |
| | 6. Overrunning Clutch Worn. | 6. Remove and inspect clutch. Repair as required. |
| | 7. Planetary Gears Broken. | 7. Remove, inspect and repair as required (look for debris in oil pan). |
| | 8. Converter Clutch Dragging. | 8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required. |
| NO 4-3 DOWNSHIFT | 1. Circuit Wiring and/or Connectors Shorted. | 1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required. |
| | 2. PCM Malfunction. | 2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty. |
| | 3. TPS Malfunction | 3. Check TPS with DRB® scan tool at PCM. |
| | 4. Lockup Solenoid Not Venting. | 4. Remove valve body and replace solenoid assembly if plugged or shorted. |
| | 5. Overdrive Solenoid Not Venting. | 5. Remove valve body and replace solenoid if plugged or shorted. |
| | 6. Valve Body Valve Sticking. | 6. Repair stuck 3-4 shift valve or lockup timing valve. |
| NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF | 1. Control Switch Open/Shorted. | 1. Test and replace switch if faulty. |
| | 2. Overdrive Solenoid Connector Shorted. | 2. Test solenoids and replace if seized or shorted. |
| | 3. PCM Malfunction. | 3. Test with DRB® scan tool. Replace PCM if faulty. |
| | 4. Valve Body Stuck Valves. | 4. Repair stuck 3-4, lockup or lockup timing valve. |
| CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT | 1. Transmission Fluid Low. | 1. Add Fluid. |
| | 2. Throttle Cable Mis-adjusted. | 2. Adjust cable. |
| | 3. Overdrive Clutch Select Spacer Wrong Spacer. | 3. Replace overdrive piston thrust plate spacer. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| 3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT | 1. Overdrive Solenoid Connector or Wiring Shorted. | 1. Test connector and wiring for loose connections, shorts or ground and repair as needed. |
| | 2. TPS Malfunction. | 2. Test TPS and replace as necessary. Check with DRB® scan tool. |
| | 3. PCM Malfunction. | 3. Test PCM with DRB® scan tool and replace controller if faulty. |
| | 4. Overdrive Solenoid Malfunction. | 4. Replace solenoid. |
| | 5. Valve Body Malfunction. | 5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed. |
| WHINE/NOISE RELATED TO ENGINE SPEED | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Shift Cable Incorrect Routing. | 2. Check shift cable for correct routing. Should not touch engine or bell housing. |
| NO 3-4 UPSHIFT | 1. O/D Switch In OFF Position. | 1. Turn control switch to ON position. |
| | 2. Overdrive Circuit Fuse Blown. | 2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit). |
| | 3. O/D Switch Wire Shorted/Open Cut. | 3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary. |
| | 4. Distance or Coolant Sensor Malfunction. | 4. Check with DRB® scan tool and repair or replace as necessary. |
| | 5. TPS Malfunction. | 5. Check with DRB® scan tool and replace if necessary. |
| | 6. Neutral Sense to PCM Wire Shorted/Cut. | 6. Test switch/sensor as described in service section and replace if necessary. Engine no start. |
| | 7. PCM Malfunction. | 7. Check with DRB® scan tool and replace if necessary. |
| | 8. Overdrive Solenoid Shorted/Open. | 8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool). |
| | 9. Solenoid Feed Orifice in Valve Body Blocked. | 9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice. |
| | 10. Overdrive Clutch Failed. | 10. Disassemble overdrive and repair as needed. |
| | 11. Hydraulic Pressure Low. | 11. Pressure test transmission to determine cause. |
| | 12. Valve Body Valve Stuck. | 12. Repair stuck 3-4 shift valve, 3-4 timing valve. |
| | 13. O/D Piston Incorrect Spacer. | 13. Remove unit, check end play and install correct spacer. |
| | 14. Overdrive Piston Seal Failure. | 14. Replace both seals. |
| | 15. O/D Check Valve/Orifice Failed. | 15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| SLIPS IN OVERDRIVE FOURTH GEAR | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Overdrive Clutch Pack Worn. | 2. Remove overdrive unit and rebuild clutch pack. |
| | 3. Overdrive Piston Retainer Bleed Orifice Blown Out. | 3. Disassemble transmission, remove retainer and replace orifice. |
| | 4. Overdrive Piston or Seal Malfunction. | 4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission. |
| | 5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction. | 5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned. |
| | 6. Overdrive Unit Thrust Bearing Failure. | 6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft). |
| | 7. O/D Check Valve/Bleed Orifice Failure. | 7. Check for function/secure orifice insert in O/D piston retainer. |
| DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE) | 1. Fluid Level Low. | 1. Add fluid and check for leaks. |
| | 2. Throttle Valve Cable Mis-adjusted. | 2. Adjust throttle valve cable. |
| | 3. Overdrive Clutch Pack Worn/ Burnt. | 3. Remove unit and rebuild clutch pack. |
| | 4. TPS Faulty. | 4. Test with DRB® scan tool and replace as necessary |
| | 5. Overdrive Clutch Bleed Orifice Plugged. | 5. Disassemble transmission and replace orifice. |
| | 6. Overdrive Solenoid or Wiring Shorted/Open. | 6. Test solenoid and check wiring for loose/corroded connections or shorts/ grounds. Replace solenoid if faulty and repair wiring if necessary. |
| | 7. Overdrive Excess Clearance. | 7. Remove unit. Measure end play and select proper spacer. |
| | 8. O/D Check Valve Missing or Stuck. | 8. Check for presence of check valve. Repair or replace as required. |
| TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR | Lockup Solenoid, Relay or Wiring Shorted/Open. | Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary. |
| HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS | Lockup Solenoid Malfunction. | Remove valve body and replace solenoid assembly. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| NO START IN PARK OR NEUTRAL | 1. Gearshift Linkage/Cable Mis-adjusted. | 1. Adjust linkage/cable. |
| | 2. Neutral Sense Wire Open/Cut. | 2. Check continuity with test lamp. Repair as required. |
| | 3. Park/Neutral Switch, or Transmission Range Sensor Faulty. | 3. Refer to service section for test and replacement procedure. |
| | 4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty. | 4. Connectors spread open. Repair. |
| | 5. Valve Body Manual Lever Assembly Bent/Worn/Broken. | 5. Inspect lever assembly and replace if damaged. |
| NO REVERSE (OR SLIPS IN REVERSE) | 1. Direct Clutch Pack (front clutch) Worn. | 1. Disassemble unit and rebuild clutch pack. |
| | 2. Rear Band Mis-adjusted. | 2. Adjust band. |
| | 3. Front Clutch Malfunctioned/ Burned. | 3. Air-pressure test clutch operation. Remove and rebuild if necessary. |
| | 4. Overdrive Thrust Bearing Failure. | 4. Disassemble geartrain and replace bearings. |
| | 5. Direct Clutch Spring Collapsed/ Broken. | 5. Remove and disassemble unit. Check clutch position and replace spring. |
| OIL LEAKS. | 1. Fluid Lines and Fittings Loose/ Leaks/Damaged. | 1. Tighten fittings. If leaks persist, replace fittings and lines if necessary. |
| | 2. Fill Tube (where tube enters case) Leaks/Damaged. | 2. Replace tube seal. Inspect tube for cracks in fill tube. |
| | 3. Pressure Port Plug Loose Loose/Damaged. | 3. Tighten to correct torque. Replace plug or reseal if leak persists. |
| | 4. Pan Gasket Leaks. | 4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket. |
| | 5. Valve Body Manual Lever Shaft Seal Leaks/Worn. | 5. Replace shaft seal. |
| | 6. Rear Bearing Access Plate Leaks. | 6. Replace gasket. Tighten screws. |
| | 7. Gasket Damaged or Bolts are Loose. | 7. Replace bolts or gasket or tighten both. |
| | 8. Adapter/Extension Gasket Damaged Leaks/Damaged. | 8. Replace gasket. |
| | 9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged. | 9. Replace switch and gasket. |
| | 10. Converter Housing Area Leaks. | 10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug. |

AUTOMATIC TRANSMISSION - 47RE (Continued)

| CONDITION | POSSIBLE CAUSES | CORRECTION |
|---|---|---|
| | 11. Pump Seal Leaks/Worn/ Damaged. | 11. Replace seal. |
| | 12. Torque Converter Weld Leak/Cracked Hub. | 12. Replace converter. |
| | 13. Case Porosity Leaks. | 13. Replace case. |
| NOISY OPERATION IN FOURTH GEAR ONLY | 1. Overdrive Clutch Discs, Plates or Snap Rings Damaged. | 1. Remove unit and rebuild clutch pack. |
| | 2. Overdrive Piston or Planetary Thrust Bearing Damaged. | 2. Remove and disassemble unit. Replace either thrust bearing if damaged. |
| | 3. Output Shaft Bearings Scored/ Damaged. | 3. Remove and disassemble unit. Replace either bearing if damaged. |
| | 4. Planetary Gears Worn/Chipped. | 4. Remove and overhaul overdrive unit. |
| | 5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored. | 5. Remove and overhaul overdrive unit. |

## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

## REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

(1) Disconnect battery negative cable.

(2) Disconnect and lower or remove necessary exhaust components.

(3) Remove engine-to-transmission struts, if equipped (Fig. 13).

(4) Disconnect fluid cooler lines at transmission.

(5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)

(6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.

(7) Remove torque converter access cover.

(8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

(9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

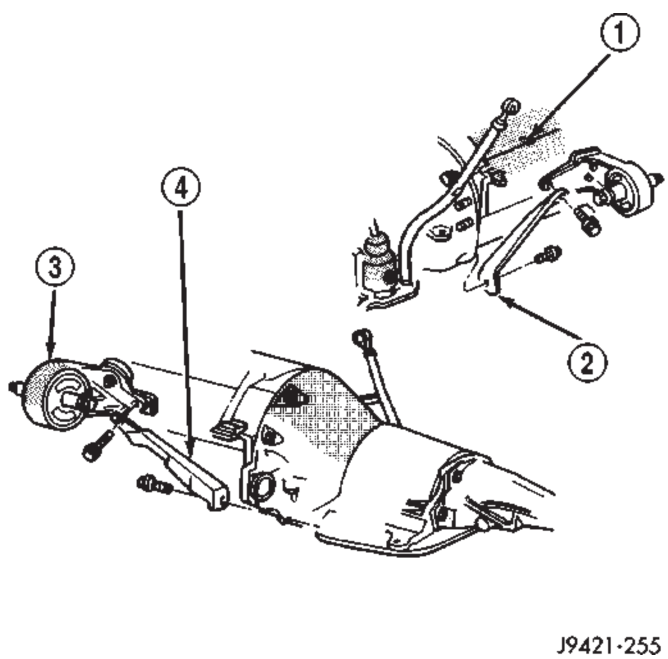

*Fig. 13 Transmission-To-Engine Strut Attachment*

1 - ENGINE BLOCK
2 - STRUT (PASSENGER SIDE)
3 - ENGINE MOUNT
4 - STRUT (DRIVER SIDE)

(10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

AUTOMATIC TRANSMISSION - 47RE (Continued)

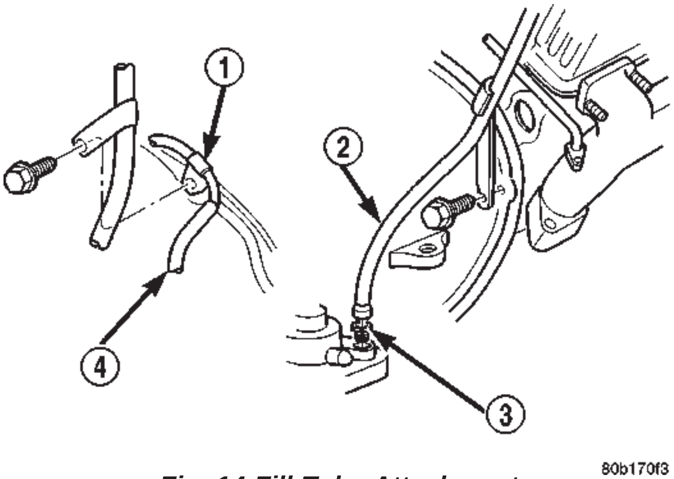

*Fig. 14 Fill Tube Attachment*

1 - TRANSFER CASE VENT TUBE
2 - FILL TUBE (V8)
3 - TUBE SEAL
4 - FILL TUBE (V6)

(12) Disconnect wires from park/neutral position switch and transmission solenoid.

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

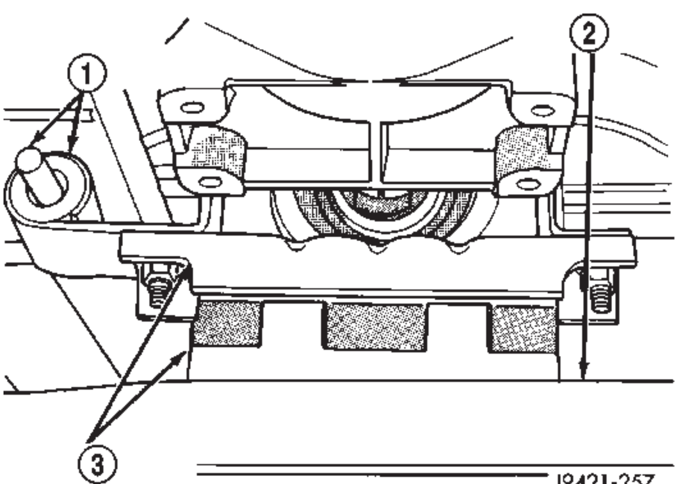

*Fig. 15 Rear Support Cushion*

1 - EXHAUST PIPE ARM AND BRACKET
2 - CROSSMEMBER
3 - REAR SUPPORT AND CUSHION

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

## DISASSEMBLY

(1) Clean exterior of transmission with suitable solvent or pressure washer.

(2) Place transmission in vertical position.

(3) Measure the input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-5 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. Record the maximum travel for assembly reference

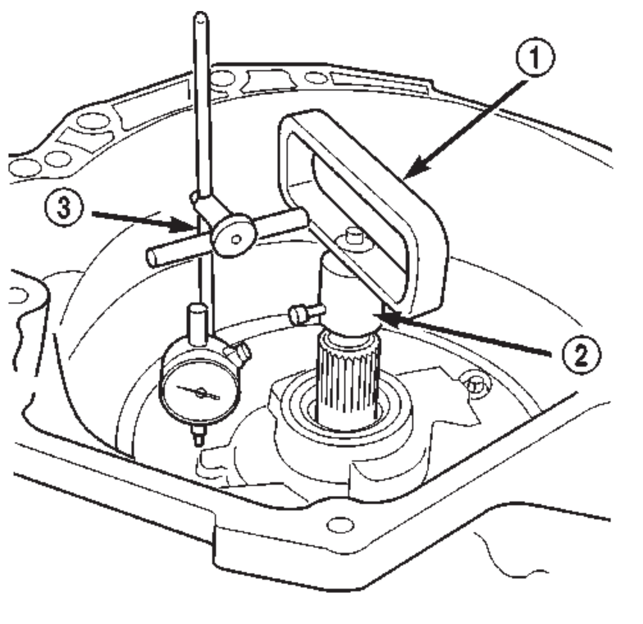

*Fig. 16 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-5
3 - TOOL C-3339

AUTOMATIC TRANSMISSION - 47RE (Continued)

(4) Remove throttle and shift levers from valve body manual shaft and throttle lever shaft.

(5) Remove transmission oil pan and gasket.

(6) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

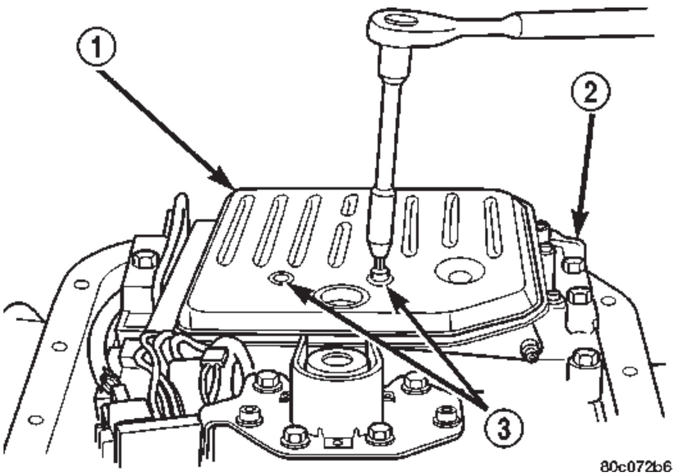

*Fig. 17 Oil Filter Removal*

1 - OIL FILTER
2 - VALVE BODY
3 - FILTER SCREWS (2)

(7) Remove park/neutral position switch and seal.

(8) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

(9) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

(10) Remove accumulator outer spring, piston and inner spring (Fig. 20). Note position of piston and springs for assembly reference. Remove and discard piston seals if worn or cut.

(11) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

(12) Remove front band lever pin access plug (Fig. 21). Use square end of 1/4 in. drive extension to remove plug as shown.

(13) Remove oil pump and reaction shaft support assembly as follows:

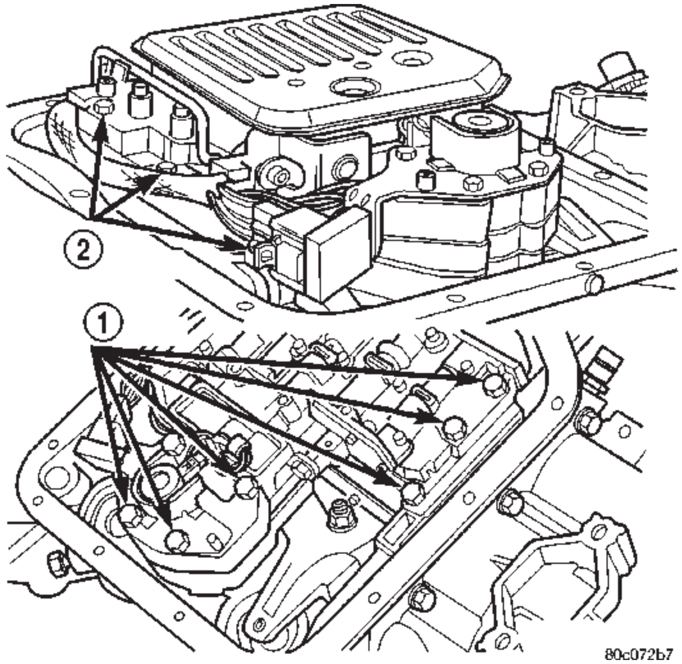

*Fig. 18 Valve Body Bolt Locations*

1 - VALVE BODY BOLTS
2 - VALVE BODY BOLTS

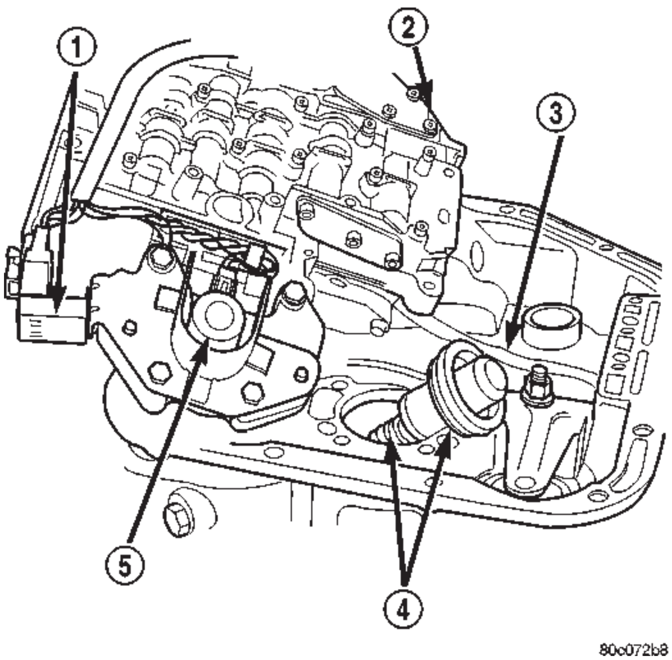

*Fig. 19 Valve Body Removal*

1 - GOVERNOR PRESSURE SENSOR
2 - VALVE BODY
3 - PARK ROD
4 - ACCUMULATOR PISTON
5 - GOVERNOR PRESSURE SOLENOID

AUTOMATIC TRANSMISSION - 47RE (Continued)

2 - OUTER SPRING
3 - INNER SPRING

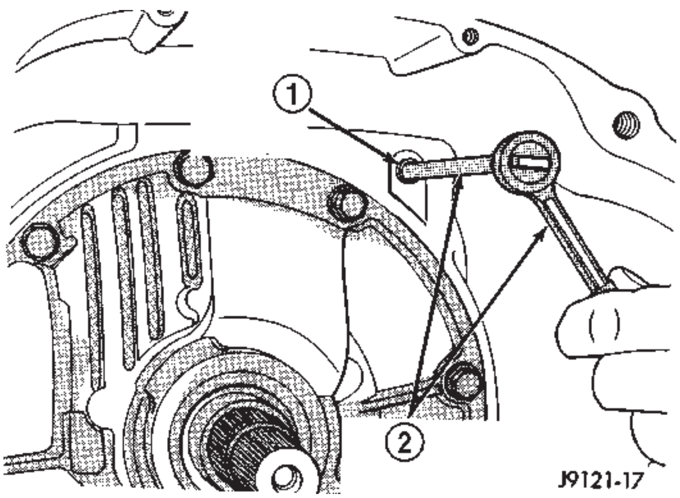

***Fig. 21 Front Band Lever Pin Access Plug***

1 - FRONT BAND REACTION PIN ACCESS PLUG
2 - 1/4 DRIVE EXTENSION AND RATCHET

(a) Tighten front band adjusting screw until band is tight around front clutch retainer (Fig. 22). This will prevent retainer from coming out with pump and possibly damaging clutch or pump components.

(b) Remove oil pump bolts.

(c) Thread Slide Hammer Tools C-3752 into threaded holes in flange of oil pump housing (Fig. 23).

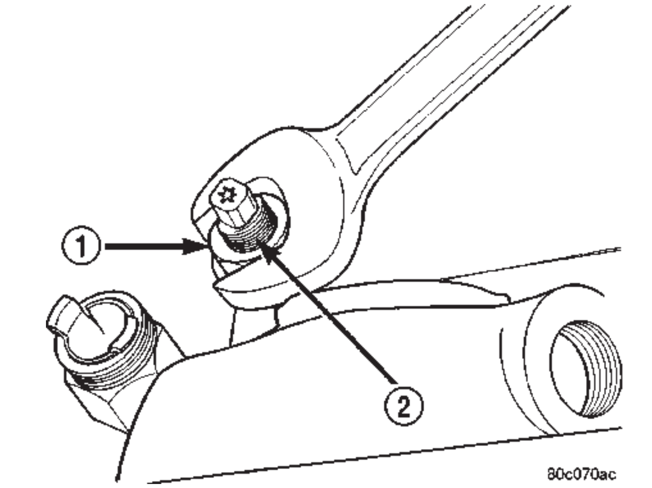

***Fig. 22 Tightening Front Band To Hold Front Clutch In Place***

1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

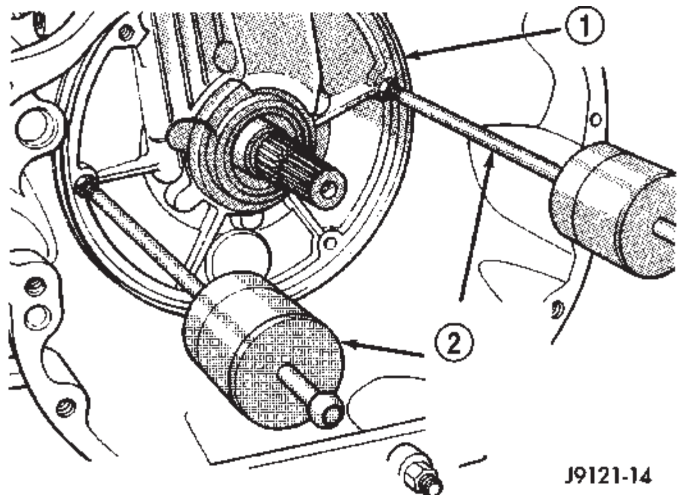

***Fig. 23 Oil Pump Removal Tools***

1 - PUMP HOUSING
2 - SLIDE HAMMER TOOLS (THREAD INTO PUMP HOUSING)

AUTOMATIC TRANSMISSION - 47RE (Continued)

(d) Remove oil pump and reaction shaft support by bumping slide hammers outward alternately to pull pump from case (Fig. 24).

(14) Remove oil pump gasket (Fig. 25). Note gasket position in case for assembly reference.

(15) Loosen front band adjusting screw until band is completely loose.

(16) Remove front band strut and anchor (Fig. 26).

(17) Squeeze front band together slightly and slide band over front clutch retainer and out of case (Fig. 27).

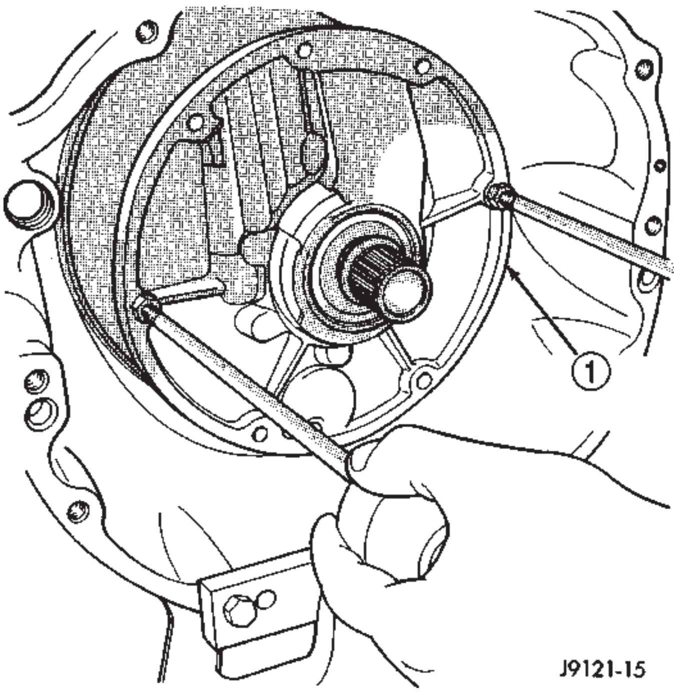

**Fig. 24 Oil Pump Removal**

1 - OIL PUMP AND REACTION SHAFT SUPPORT

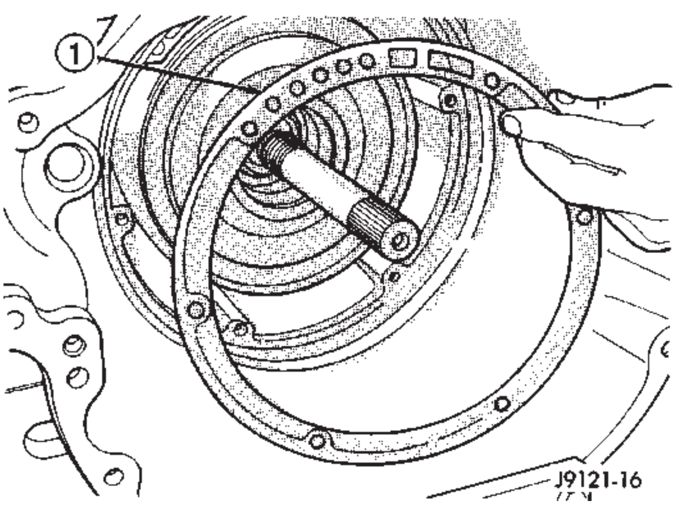

**Fig. 25 Oil Pump Gasket**

4 - FRONT BAND

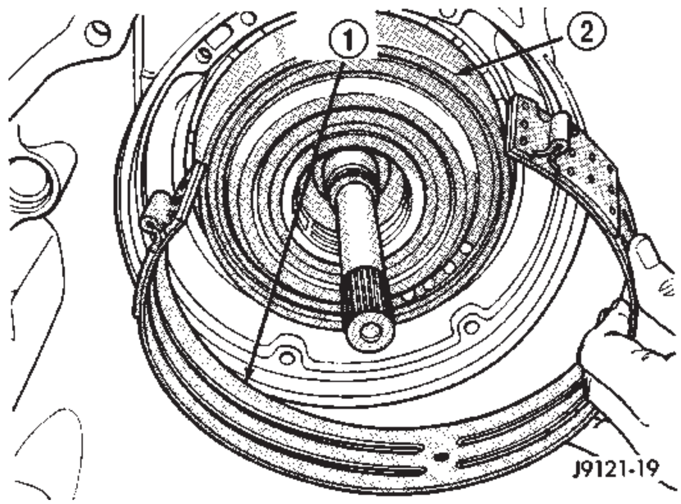

**Fig. 27 Front Band Removal**

1 - FRONT BAND
2 - FRONT CLUTCH RETAINER

AUTOMATIC TRANSMISSION - 47RE (Continued)

(18) Remove front and rear clutch assemblies as a unit (Fig. 28).

(19) Remove front band reaction pin and lever. Start pin through lever and out of case bore with drift or punch. Then use pencil magnet to withdraw pin completely (Fig. 29).

(20) Remove intermediate shaft thrust washer. Triangular shaped washer will either be on shaft pilot hub or in rear clutch retainer (Fig. 30).

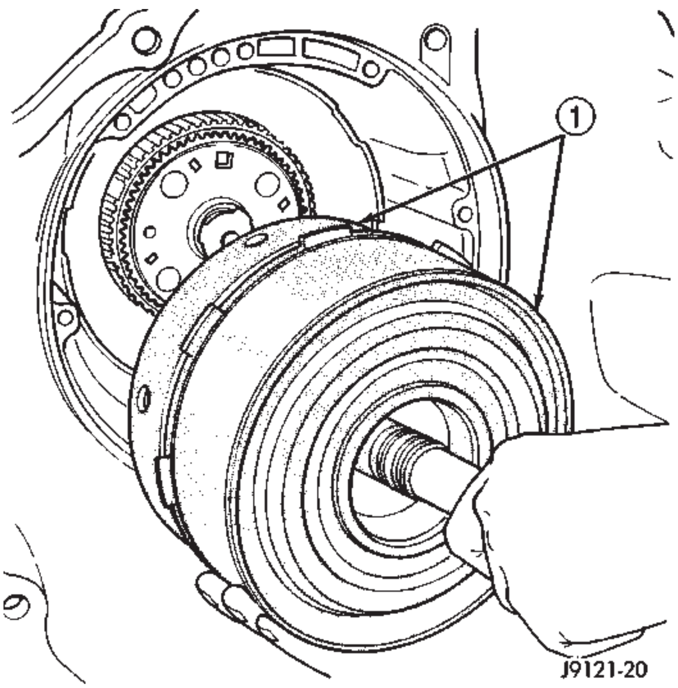

**Fig. 28 Removing Front/Rear Clutch Assemblies**

1 - FRONT AND REAR CLUTCH ASSEMBLIES

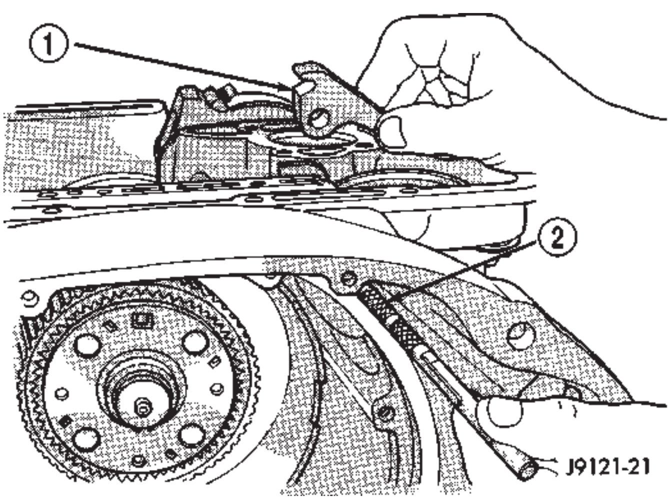

**Fig. 29 Front Band Lever And Pin**

1 - BAND LEVER
2 - USE PENCIL MAGNET TO REMOVE REACTION PIN

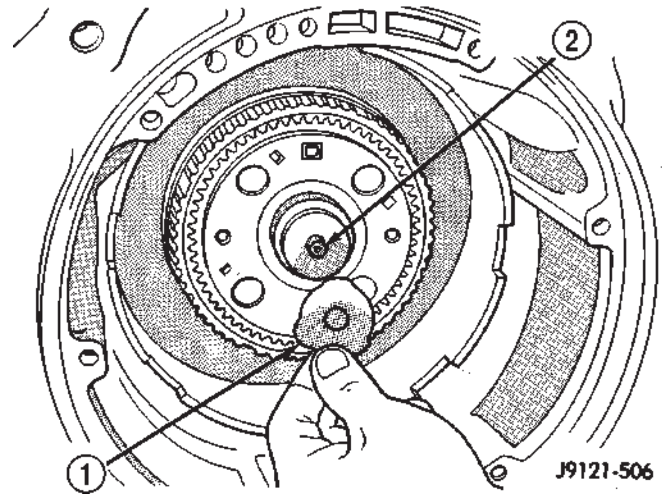

**Fig. 30 Intermediate Shaft Thrust Washer**

1 - THRUST WASHER
2 - INTERMEDIATE SHAFT PILOT HUB

(21) Remove thrust plate from intermediate shaft hub (Fig. 31).

(22) Remove intermediate shaft-planetary geartrain assembly (Fig. 32).

(23) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(24) Loosen rear band locknut and loosen adjusting screw 3-4 turns.

(25) Remove snap-ring that retains low-reverse drum on overdrive piston retainer hub (Fig. 33).

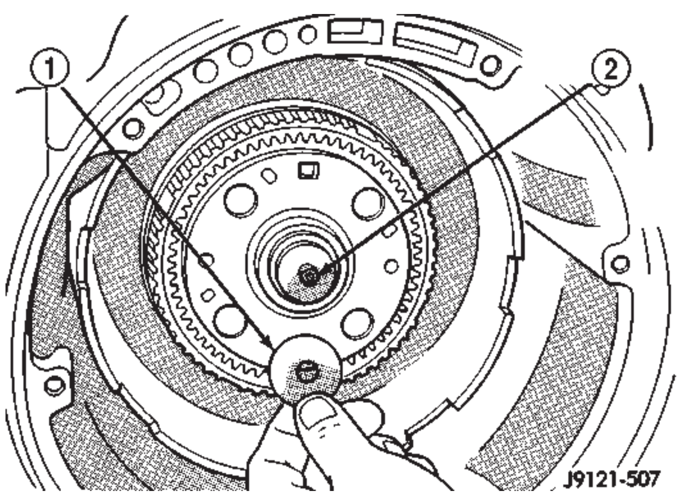

**Fig. 31 Intermediate Shaft Thrust Plate**

1 - SHAFT THRUST PLATE
2 - INTERMEDIATE SHAFT PILOT HUB

AUTOMATIC TRANSMISSION - 47RE (Continued)

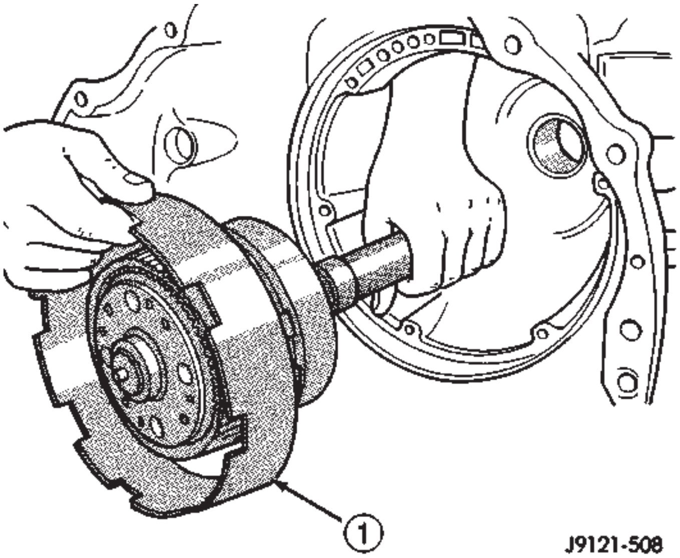

***Fig. 32 Intermediate Shaft And Planetary Geartrain***

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

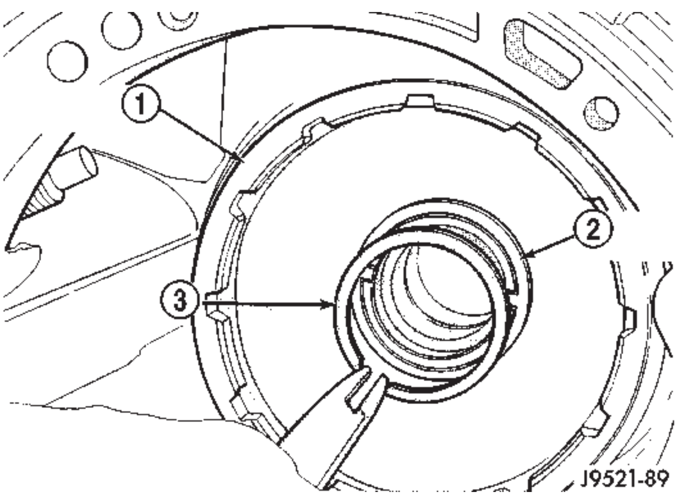

***Fig. 33 Low-Reverse Drum Snap-Ring***

1 - LOW-REVERSE DRUM
2 - TABBED WASHER
3 - SNAP-RING

(26) Slide low-reverse drum and thrust washer off piston retainer hub and out of rear band (Fig. 34).

(27) Note that overrunning clutch race will remain on splines of low-reverse drum after removal (Fig. 35). **The race is a permanent press fit on the hub splines. Do not attempt to remove the race.**

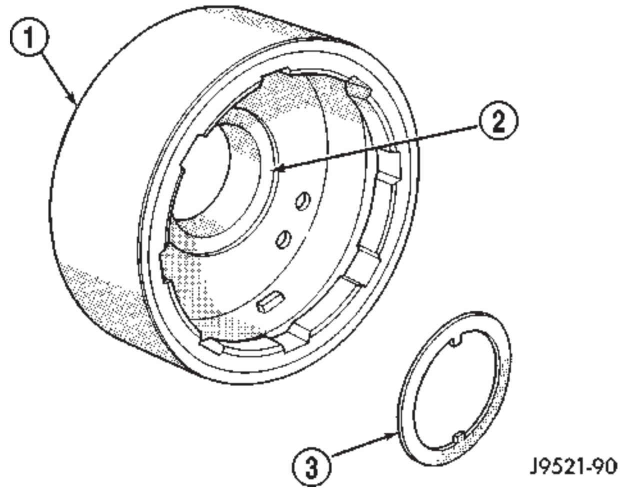

***Fig. 34 Low-Reverse Drum And Thrust Washer***

1 - LOW-REVERSE DRUM
2 - SPOTFACE FOR WASHER
3 - THRUST WASHER

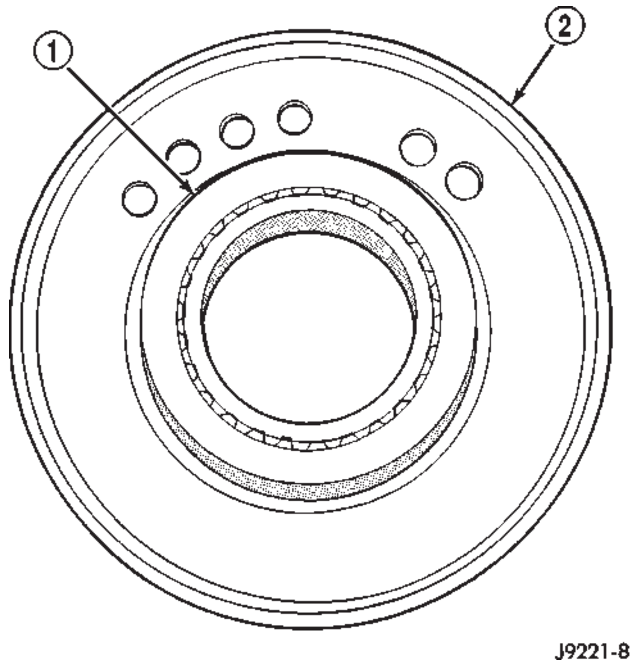

***Fig. 35 Overrunning Clutch Race Position On Low-Reverse Drum***

1 - OVERRUNNING CLUTCH RACE
2 - LOW-REVERSE DRUM

AUTOMATIC TRANSMISSION - 47RE (Continued)

(28) Remove overrunning clutch assembly (Fig. 36). Assembly can be removed without displacing rollers and springs if care is exercised. Note position of rollers and springs for assembly reference.

(29) Remove rear band adjusting lever and reaction pin.

(30) Remove rear band.

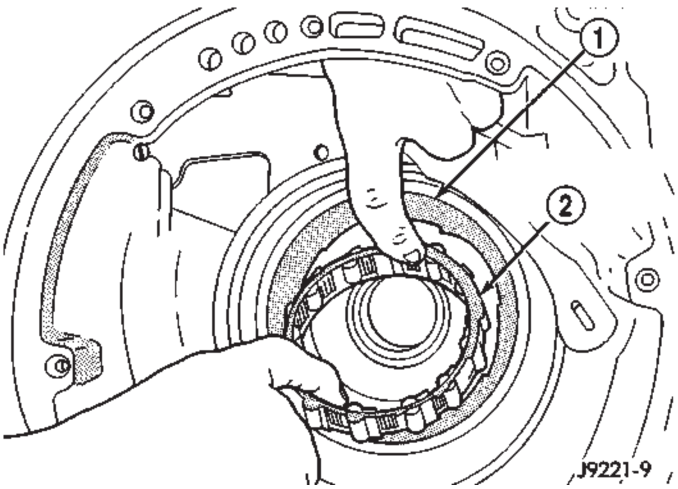

***Fig. 36 Overrunning Clutch***

1 - CLUTCH CAM
2 - OVERRUNNING CLUTCH ASSEMBLY

(31) Compress front servo rod guide with large C-clamp and Tool C-4470, or Compressor Tool C-3422-B (Fig. 37). Compress guide only enough to permit snap-ring removal (about 1/8 in.).

(32) Remove servo piston snap-ring (Fig. 37). Unseat one end of ring. Then carefully work removal tool around back of ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(33) Remove tools and remove servo piston and spring.

(34) Compress rear servo piston with C-clamp and Tool C-4470, or Valve Spring Compressor C-3422-B (Fig. 38). Compress servo spring retainer only enough to permit snap-ring removal.

(35) Remove servo piston snap-ring (Fig. 38). Start one end of ring out of bore. Then carefully work removal tool around back of snap-ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(36) Remove tools and remove rear servo retainer, spring and piston assembly.

## CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed

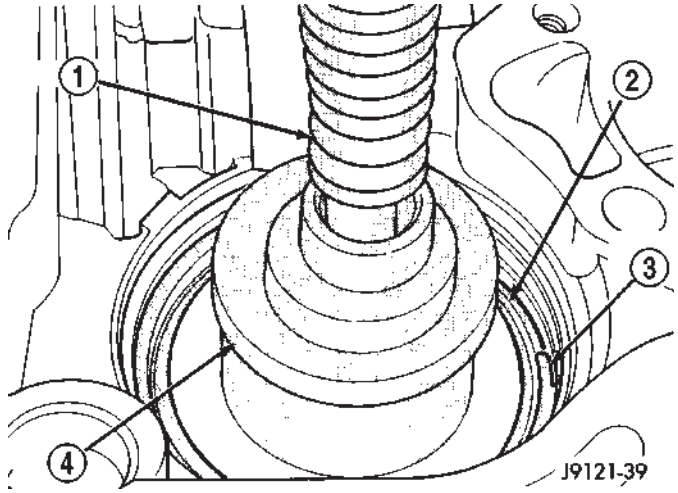

***Fig. 37 Front Servo Retaining Snap-Ring***

1 - C-CLAMP
2 - FRONT SERVO ROD GUIDE
3 - SNAP-RING
4 - TOOL C-4470

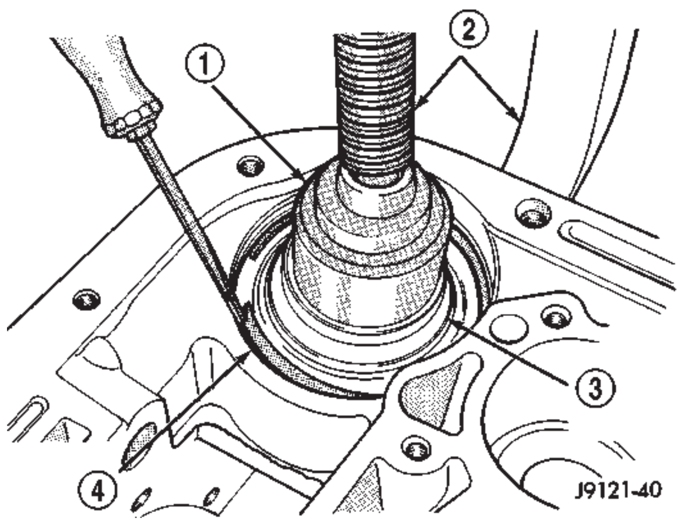

***Fig. 38 Rear Servo Retaining Snap-Ring***

1 - TOOL C-4470
2 - C-CLAMP
3 - REAR SERVO SPRING RETAINER
4 - RETAINER SNAP-RING

air. Be sure all solvent is removed from the case and that all fluid passages are clear.

**NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

AUTOMATIC TRANSMISSION - 47RE (Continued)

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

## INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

## ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for reassembly operations are equally clean.

Shop towels used for wiping off tools and your hands must be made from **lint free** materials. Lint will stick to transmission parts and could interfere with valve operation or even restrict fluid passages.

Lubricate transmission clutch and gear components with Mopar® ATF +4, type 9602, during reassembly. Soak clutch discs in transmission fluid before installation.

Use Mopar® Door Ease, or Ru-Glyde™ on piston seals and o-rings to ease installation. Petroleum jelly can also be used to lubricate and hold thrust washers and plates in position during assembly.

**Do not use chassis grease, bearing grease, white grease, or similar lubricants on any part.** These types of lubricants can eventually block or restrict fluid passages and valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and sub-assemblies are easily installed by hand when properly aligned. If a part seems difficult to install, it is either misaligned or incorrectly assembled. Verify that thrust washers, thrust plates and seal rings are correctly positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright. Either tilt the case upward with wood blocks, or cut a hole in the bench large enough for the intermediate shaft and rear support. Then lower the shaft and support into the hole and support the rear of the case directly on the bench.

## FRONT/REAR SERVO

(1) Lubricate rear servo piston seal with Mopar® Door Ease or ATF +4. Lubricate servo bore in case with ATF +4.

(2) Install rear servo piston in case. Position piston at slight angle to bore and insert piston with twisting motion (Fig. 39).

(3) Install rear servo spring and retainer in case bore (Fig. 40). Be sure spring is seated on piston.

(4) Compress rear servo piston with C-clamp or Valve Spring Compressor C-3422-B and install servo piston snap-ring (Fig. 41).

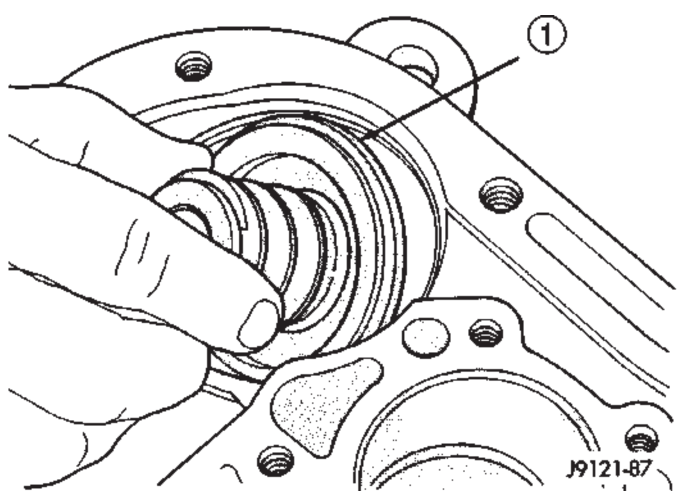

***Fig. 39 Rear Servo Piston***

1 - REAR SERVO PISTON

AUTOMATIC TRANSMISSION - 47RE (Continued)

(5) Lubricate front servo piston components and servo bore in case with transmission fluid.

(6) Install front servo piston in bore. Carefully "run" small, suitable tool around piston ring to press it back into groove and ease installation (Fig. 42). Rotate piston into bore at same time. Rock piston slightly to ease piston ring past snap-ring groove and into bore.

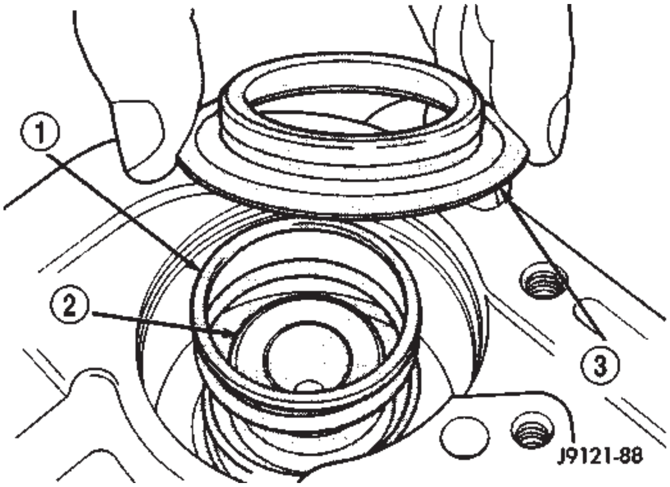

*Fig. 40 Rear Servo Piston Spring And Retainer*

1 - PISTON SPRING

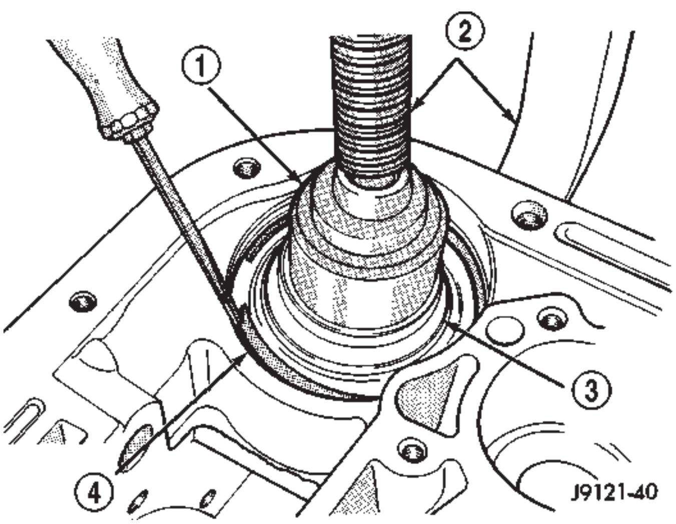

*Fig. 41 Rear Servo Snap-Ring*

1 - TOOL C-4470
2 - C-CLAMP
3 - REAR SERVO SPRING RETAINER
4 - RETAINER SNAP-RING

(7) Bottom front servo piston in bore and install servo spring.

(8) Install front servo piston rod guide as follows:

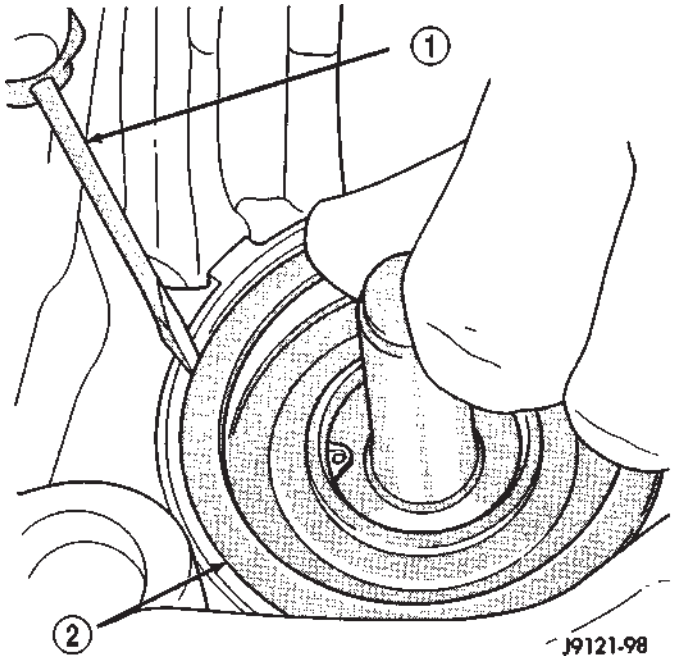

*Fig. 42 Front Servo Piston*

1 - USE SUITABLE TOOL TO HELP SEAT PISTON RING
2 - FRONT SERVO PISTON

(a) Place Tool SP-5560 (or similar size tool) on guide and position C-clamp on tool and case (Fig. 43).

(b) Slowly compress rod guide while simultaneously easing seal ring into bore with suitable tool.

(9) Install rod guide snap-ring (Fig. 43).

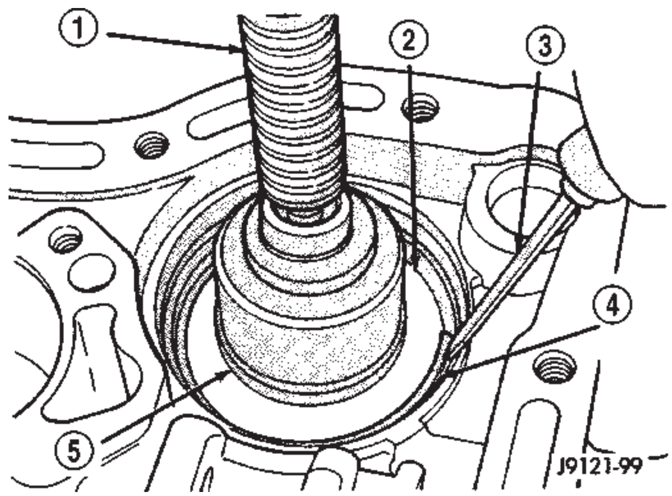

*Fig. 43 Front Servo Rod Guide And Snap-Ring*

1 - C-CLAMP
2 - ROD GUIDE
3 - SMALL SCREWDRIVER
4 - ROD GUIDE SNAP-RING
5 - TOOL SP-5560

AUTOMATIC TRANSMISSION - 47RE (Continued)

## OVERRUNNING CLUTCH, REAR BAND, AND LOW-REVERSE DRUM

(1) Install overrunning clutch components if not yet installed.

(2) Position rear band reaction pin and band in case. Be sure that the twin lugs on the band are seated against the reaction pin.

(3) Install low-reverse drum. Slide drum through rear band, onto piston retainer hub and into engagement with overrunning clutch and race.

(4) Install thrust washer in low-reverse drum spotface (Fig. 44). Use petroleum jelly to hold washer in place.

(5) Install snap-ring that secures low-reverse drum to piston retainer hub (Fig. 44).

(6) Insert the rear band pivot pin part way into the case.

(7) Install rear band adjusting lever and pivot pin. Be sure lever and the single lug on the band are aligned and engaged before seating band pivot pin in case.

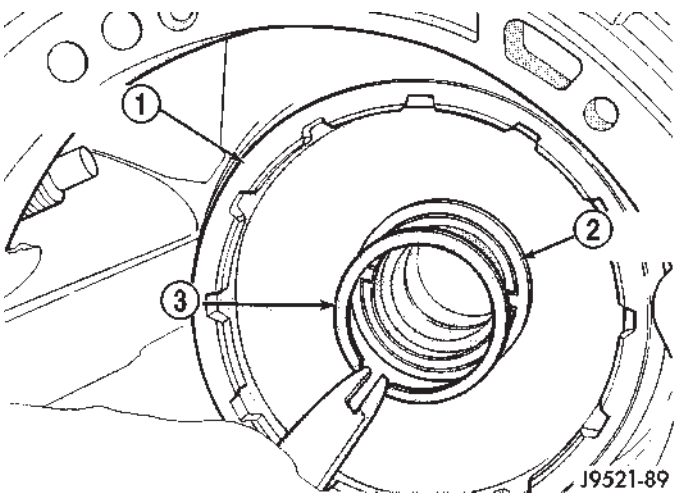

*Fig. 44 Low-Reverse Drum Snap-Ring*

1 - LOW-REVERSE DRUM
2 - TABBED WASHER
3 - SNAP-RING

## PLANETARY GEARTRAIN, FRONT/REAR CLUTCH, AND FRONT BAND

(1) Remove Alignment Shaft 6227-2, if installed previously.

(2) Install assembled intermediate shaft and planetary geartrain (Fig. 45). **Support shaft carefully during installation. Do not allow shaft bearing/ bushing surfaces to become nicked or scratched.**

(3) Lubricate intermediate shaft thrust plate with petroleum jelly and install plate on shaft pilot hub (Fig. 46).

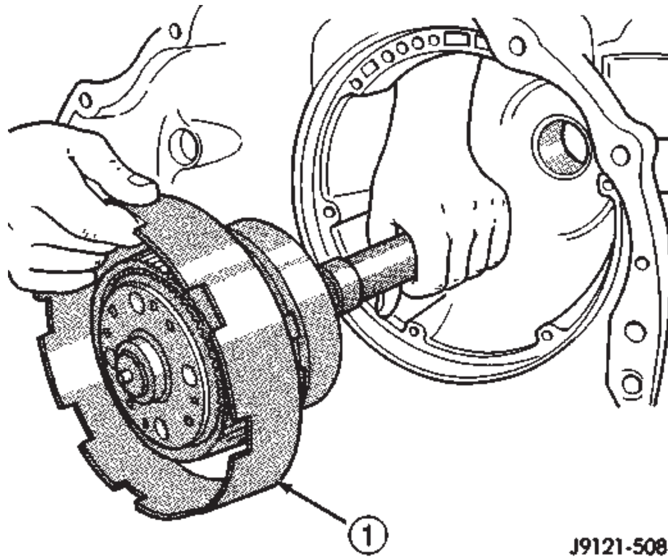

*Fig. 45 Intermediate Shaft And Planetary Geartrain*

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

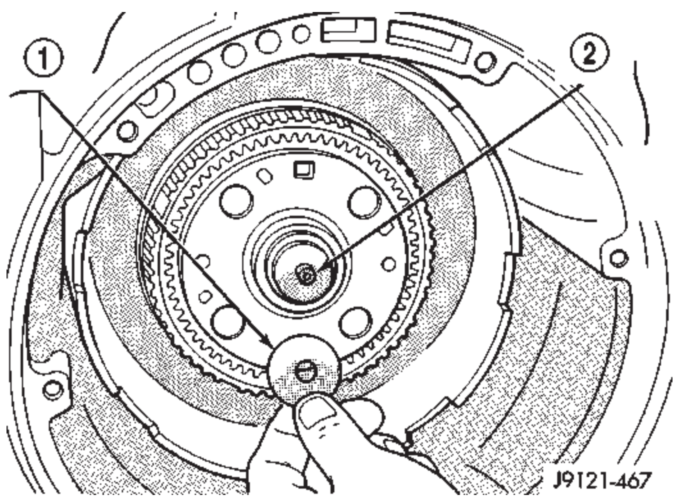

*Fig. 46 Intermediate Shaft Thrust Plate*

1 - SHAFT THRUST PLATE
2 - INTERMEDIATE SHAFT PILOT HUB

AUTOMATIC TRANSMISSION - 47RE (Continued)

(4) Check input shaft front seal rings, fiber thrust washer and rear seal ring (Fig. 47). Be ends of rear seal ring are hooked together and diagonal cut ends of front seal rings are firmly seated against each other as shown. Lubricate seal rings with petroleum jelly after checking them.

(5) Assemble front and rear clutches (Fig. 48). Align lugs on front clutch discs. Mount front clutch on rear clutch. Turn front clutch retainer back and forth until front clutch discs are fully seated on rear clutch splined hub.

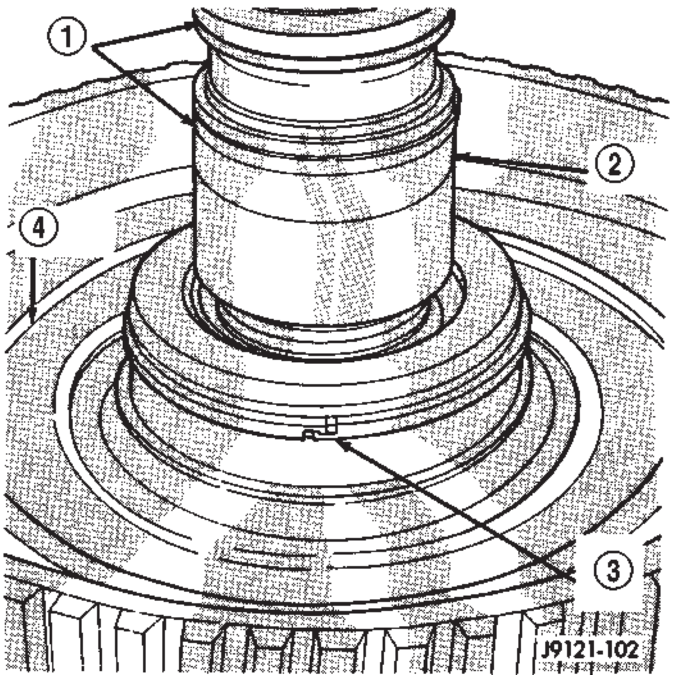

*Fig. 47 Input Shaft Seal Rings And Thrust Washer*

1 - TORLON® FRONT SEAL RINGS
2 - INPUT SHAFT
3 - REAR SEAL RING
4 - THRUST WASHER

(6) Install intermediate shaft thrust washer in hub of rear clutch retainer (Fig. 49). Use petroleum jelly to hold washer in place. Position washer so grooves are facing outward. **Washer only fits one way in clutch retainer hub.**

(7) Place transmission case in upright position, or place blocks under front end of transmission repair stand to tilt case rearward. This makes it easier to install front/rear clutch assembly.

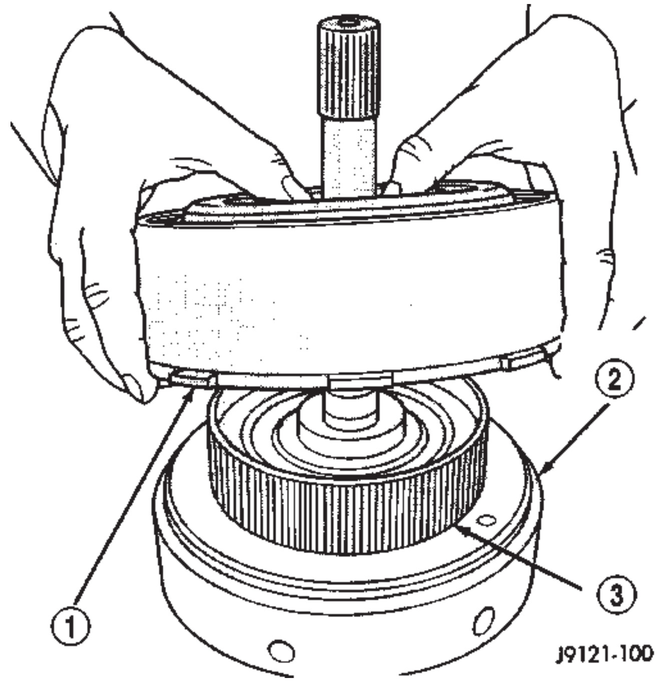

*Fig. 48 Assembling Front And Rear Clutches*

1 - FRONT CLUTCH ASSEMBLY
2 - REAR CLUTCH ASSEMBLY
3 - REAR CLUTCH SPLINED HUB

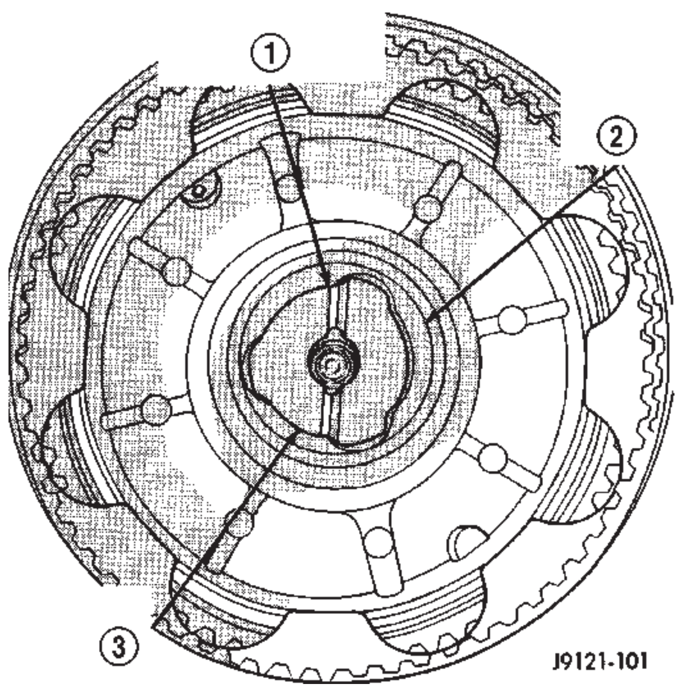

*Fig. 49 Intermediate Shaft Thrust Washer*

1 - BE SURE WASHER GROOVES FACE OUT AS SHOWN
2 - REAR CLUTCH RETAINER HUB
3 - OUTPUT SHAFT THRUST WASHER

AUTOMATIC TRANSMISSION - 47RE (Continued)

(8) Align discs in rear clutch. Then install and engage assembly in front planetary and driving shell (Fig. 50). Turn clutch retainers back and forth until both clutches are seated.

(9) Position front band lever in case and over servo rod guide. Then install front band lever pin in case and slide it through lever.

(10) Coat threads of front band pin access plug with sealer and install it in case. Tighten plug to 17 N·m (13 ft. lbs.) torque.

(11) Slide front band over front clutch retainer and install front band strut and anchor (Fig. 51).

(12) Tighten front band adjusting screw until band is tight on clutch retainer. This will hold clutches in place while oil pump is being installed. **Verify that front/rear clutch assembly is still properly seated before tightening band.**

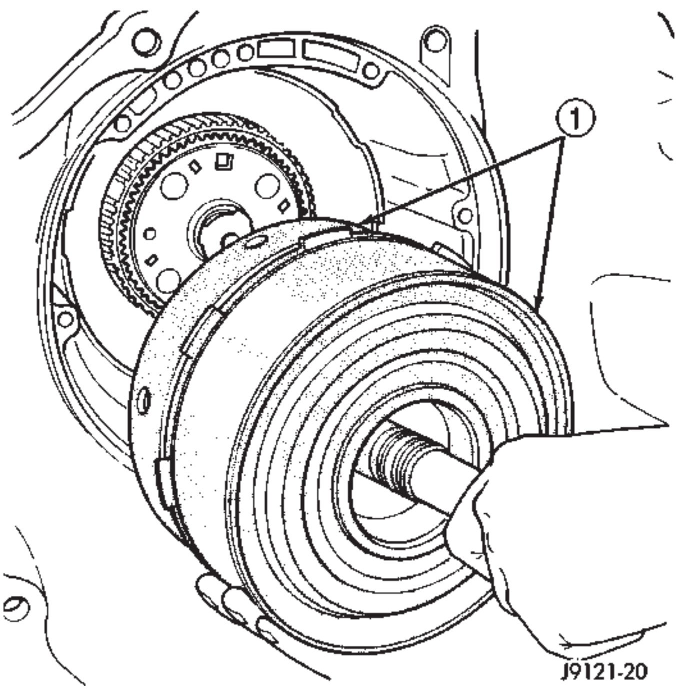

***Fig. 50 Front/Rear Clutch Assemblies***

1 - FRONT AND REAR CLUTCH ASSEMBLIES

## OIL PUMP

(1) Install oil pump Pilot Studs C-3288-B in case (Fig. 52).

(2) Install new oil pump gasket on pilot studs and seat it in case. Be sure gasket is properly aligned with fluid passages in case (Fig. 52).

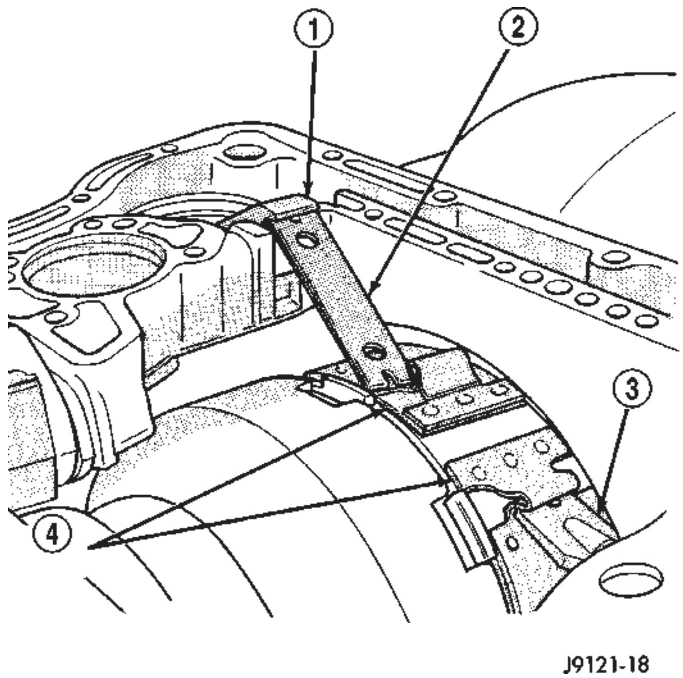

***Fig. 51 Front Band And Linkage***

1 - LEVER
2 - STRUT
3 - ANCHOR
4 - FRONT BAND

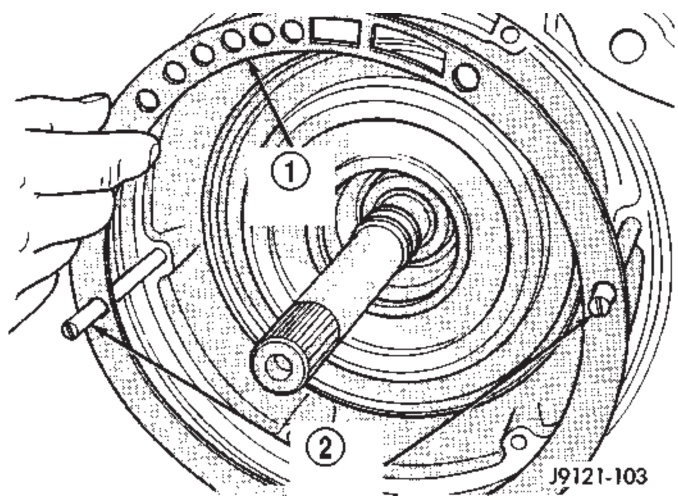

***Fig. 52 Oil Pump Gasket And Pilot Studs***

1 - OIL PUMP GASKET
2 - PILOT STUDS C-3288-B

AUTOMATIC TRANSMISSION - 47RE (Continued)

(3) Coat front clutch thrust washer with petroleum jelly to hold it in place. Then install washer over reaction shaft hub and seat it on pump (Fig. 53).

**CAUTION: The thrust washer bore (I.D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.**

(4) Check seal rings on reaction shaft support. Be sure rings are hooked together correctly. Also be sure fiber thrust washer is in position (Fig. 54). Use extra petroleum jelly to hold washer in place if necessary.

(5) Lubricate oil pump seals with petroleum Mopar® ATF +4, type 9602.

(6) Mount oil pump on pilot studs and slide pump into case opening (Fig. 55). **Work pump into case by hand. Do not use a mallet or similar tools to seat pump.**

(7) Remove pilot studs and install oil pump bolts. Tighten pump bolts alternately and evenly to fully seat pump in case. Then final-tighten pump bolts to 20 N·m (15 ft. lbs.) torque.

(8) Verify correct installation. Rotate input and intermediate shafts and check for bind. If bind exists, components are either mis-assembled, or not seated. Disassemble and correct as necessary before proceeding.

1 - SEAT OIL PUMP IN CASE BY HAND
2 - REMOVE PILOT STUDS WHEN PUMP IS SEATED

AUTOMATIC TRANSMISSION - 47RE (Continued)

## INPUT SHAFT END PLAY CHECK

**NOTE: Overdrive unit must be installed in order to correctly measure the input shaft end-play.**

(1) Measure input shaft end play (Fig. 56).

**NOTE: If end play is incorrect, transmission is incorrectly assembled, or reaction shaft thrust washer is incorrect. The reaction shaft thrust washer is selective.**

(a) Attach Adapter 8266-5 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. End play should be 0.86 - 2.13 mm (0.034 - 0.084 in.). Adjust as necessary.

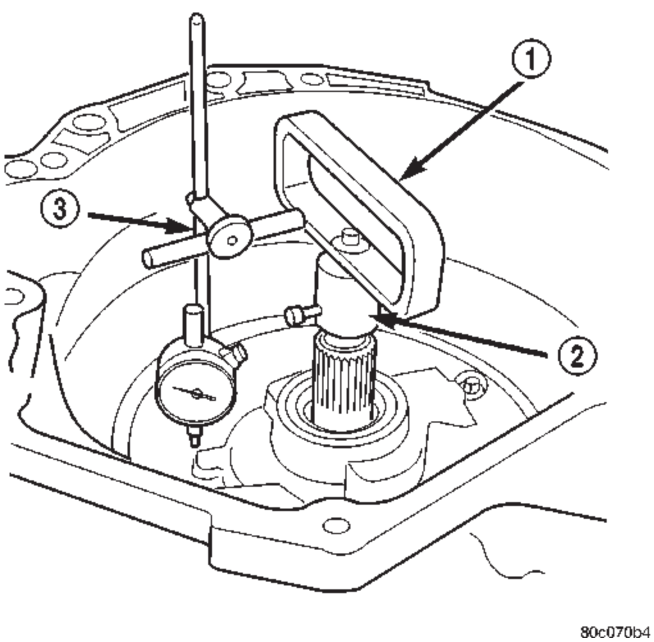

*Fig. 56 Checking Input Shaft End Play*

1 - TOOL 8266-8
2 - TOOL 8266-5
3 - TOOL C-3339

## ACCUMULATOR, VALVE BODY, OIL PAN, AND TORQUE CONVERTER

(1) Install accumulator inner spring, piston and outer spring (Fig. 57).

(2) Verify that park/neutral position switch has **not** been installed in case. Valve body can not be installed if switch is in position.

(3) Install new valve body manual shaft seal in case (Fig. 58). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

(4) Install valve body as follows:

(a) Start park rod into park pawl. If rod will not slide past park pawl, pawl is engaged in park gear. Rotate overdrive output shaft with suitable size 12 point socket; this will free pawl and allow rod to engage.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.**.

(5) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(6) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

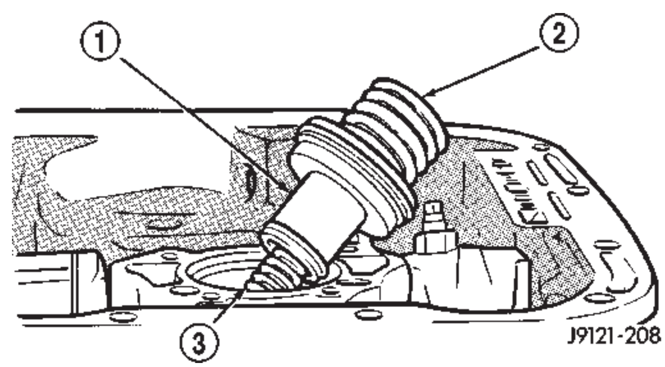

*Fig. 57 Accumulator Piston And Springs*

1 - ACCUMULATOR PISTON
2 - OUTER SPRING
3 - INNER SPRING

**CAUTION: If the condition of the transmission before the overhaul procedure caused excessive metallic or fiber contamination in the fluid, replace the torque converter and reverse flush the cooler(s) and cooler lines. Fluid contamination and transmission failure can result if not done.**

(7) Install torque converter. Use C-clamp or metal strap to hold converter in place for installation.

## BAND ADJUSTMENT AND FINAL

(1) Adjust front and rear bands as follows:

AUTOMATIC TRANSMISSION - 47RE (Continued)

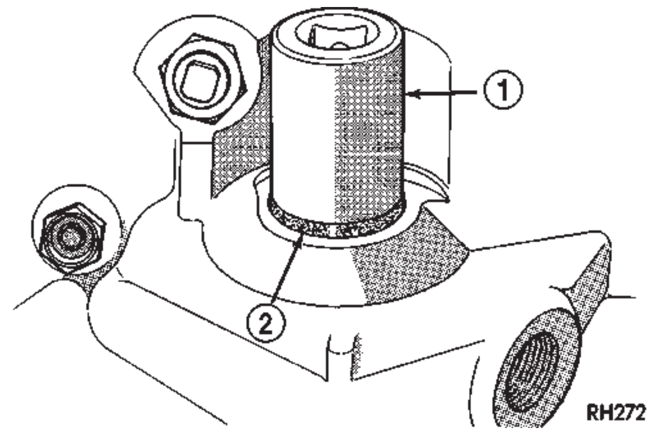

*Fig. 58 Manual Lever Shaft Seal*

1 - 15/16" SOCKET
2 - SEAL

(a) Loosen locknut on each band adjusting screw 4-5 turns.

(b) Tighten both adjusting screws to 8 N·m (72 in. lbs.).

(c) Back off front band adjusting screw 1-7/8 turns.

(d) Back off rear band adjusting screw 3 turns.

(e) Hold each adjusting screw in position and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(2) Install magnet in oil pan. Magnet seats on small protrusion at corner of pan.

(3) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(4) Install throttle valve and shift selector levers on valve body manual lever shaft.

(5) Apply small quantity of dielectric grease to terminal pins of solenoid case connector and neutral switch.

(6) Fill transmission with recommended fluid.

## INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 59). Surface of converter lugs should be 19mm (0.75 in.) to the rear of straightedge when the converter is fully seated.

(7) Temporarily secure converter with C-clamp.

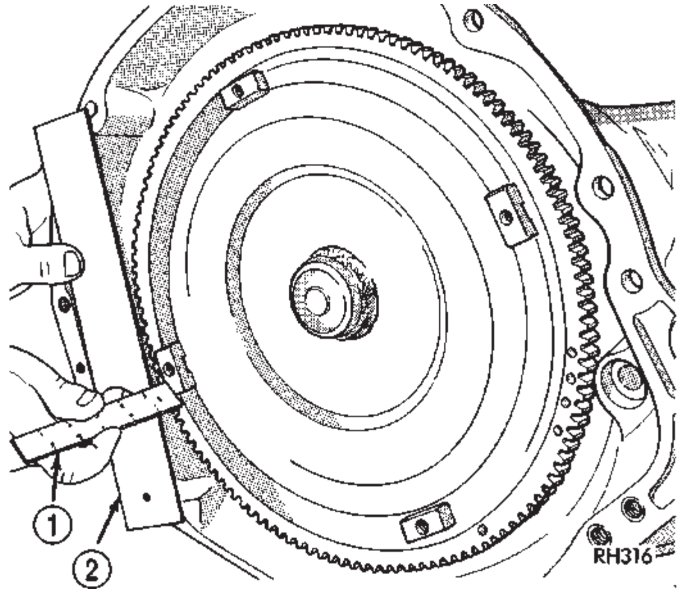

*Fig. 59 Checking Converter Seating - Typical*

1 - SCALE
2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

AUTOMATIC TRANSMISSION - 47RE (Continued)

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

**CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.**

(20) Install torque converter-to-driveplate bolts. Tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(27) Adjust gearshift linkage and throttle valve cable if necessary.

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

# ACCUMULATOR

## DESCRIPTION

The accumulator (Fig. 60) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 61).

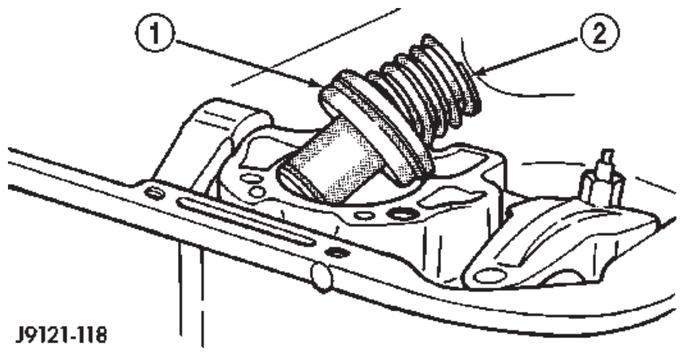

***Fig. 60 Accumulator***

1 - ACCUMULATOR PISTON
2 - PISTON SPRING

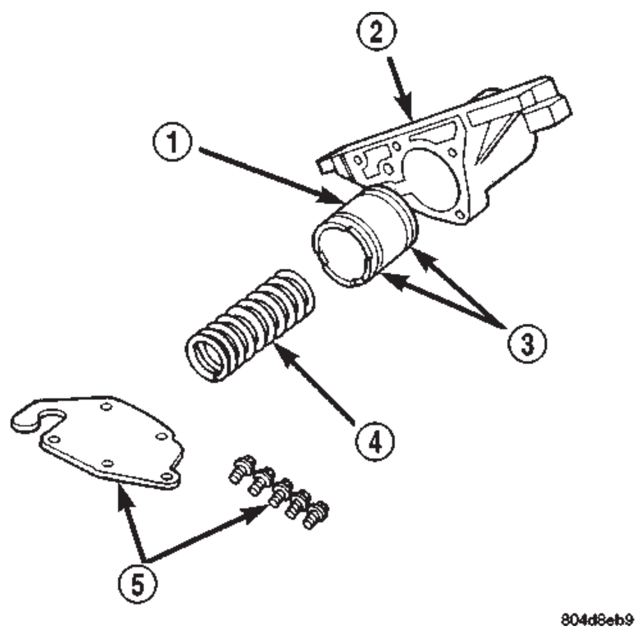

***Fig. 61 3-4 Accumulator and Housing***

1 - ACCUMULATOR PISTON
2 - 3-4 ACCUMULATOR HOUSING
3 - TEFLON SEALS
4 - PISTON SPRING
5 - COVER PLATE AND SCREWS

ACCUMULATOR (Continued)

## OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 62), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 63), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

**NOTE: The accumulator is shown in the inverted position for illustrative purposes.**

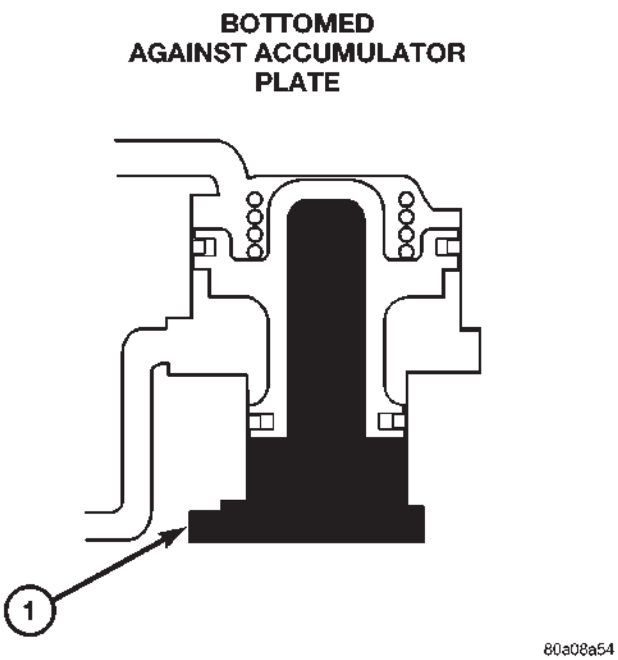

***Fig. 62 Accumulator in DRIVE - FIRST GEAR POSITION***

1 - LINE PRESSURE

## INSPECTION

Inspect the accumulator piston and seal rings (Fig. 64). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 64). Replace the springs if the coils are cracked, distorted or collapsed.

# BANDS

## DESCRIPTION

### KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 65) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/ wrap the drum that it holds).

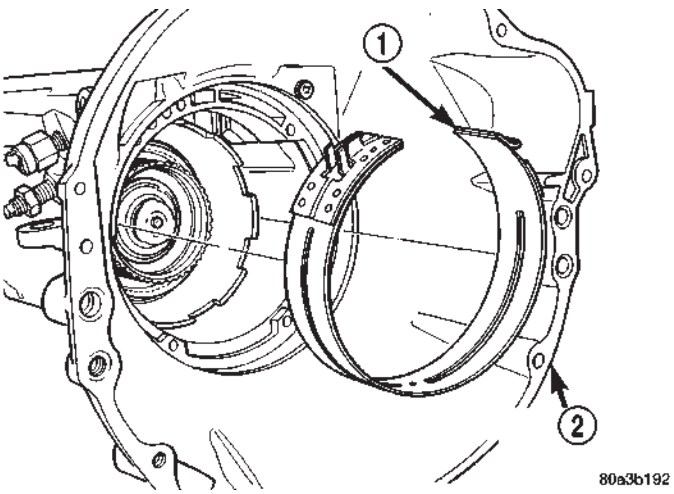

*Fig. 65 Front Band*

1 - FRONT BAND
2 - TRANSMISSION HOUSING

### LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 66) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/ wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

## OPERATION

### KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

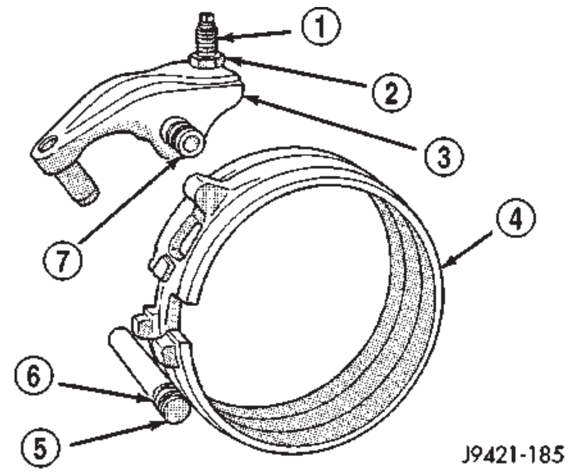

*Fig. 66 Rear Band*

1 - ADJUSTING SCREW
2 - LOCKNUT
3 - LEVER
4 - REAR BAND
5 - REACTION PIN
6 - O-RINGS
7 - PIVOT PIN

### LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

## ADJUSTMENT - BANDS

### FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Raise vehicle.

(2) Loosen band adjusting screw locknut (Fig. 67). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.

(3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and an appropriate Torx™ socket.

**CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.**

(4) Back off front band adjusting screw 1-7/8 turns.

(5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

(6) Lower vehicle.

BANDS (Continued)

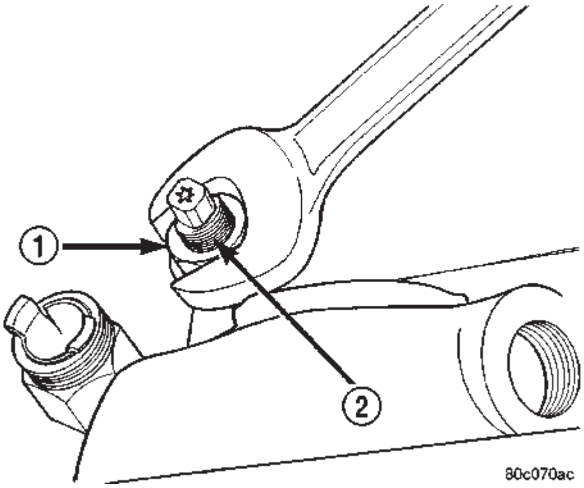

*Fig. 67 Front Band Adjustment Screw Location*

1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

### REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

(1) Raise vehicle.

(2) Remove transmission oil pan and drain fluid.

(3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.

(4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque (Fig. 68).

(5) Back off adjusting screw 3 turns.

(6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(8) Lower vehicle and refill transmission with Mopar® ATF +4, Type 9602 fluid.

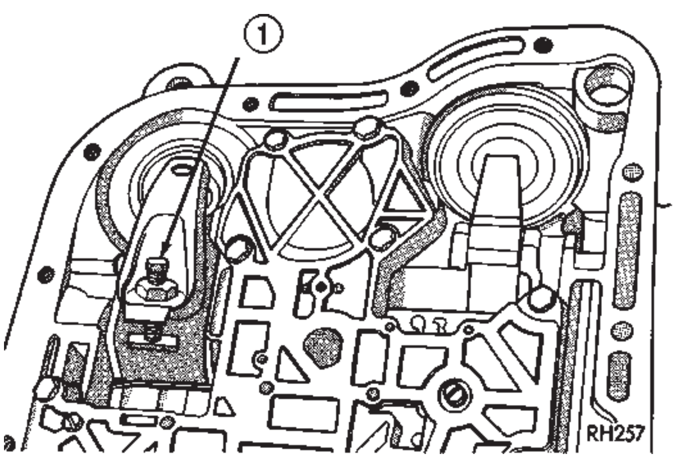

*Fig. 68 Rear Band Adjustment Screw Location*

1 - LOW-REVERSE BAND ADJUSTMENT

# ELECTRONIC GOVERNOR

## DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

### GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 69).

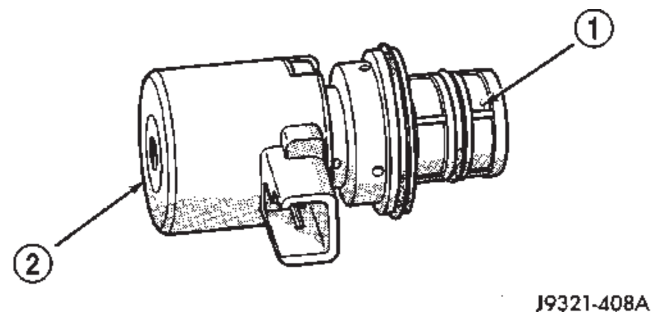

*Fig. 69 Governor Pressure Solenoid Valve*

1 - SOLENOID FILTER
2 - GOVERNOR PRESSURE SOLENOID

### GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 70).

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 70).

### GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, –1°C (30°F). A second curve is used when fluid

ELECTRONIC GOVERNOR (Continued)

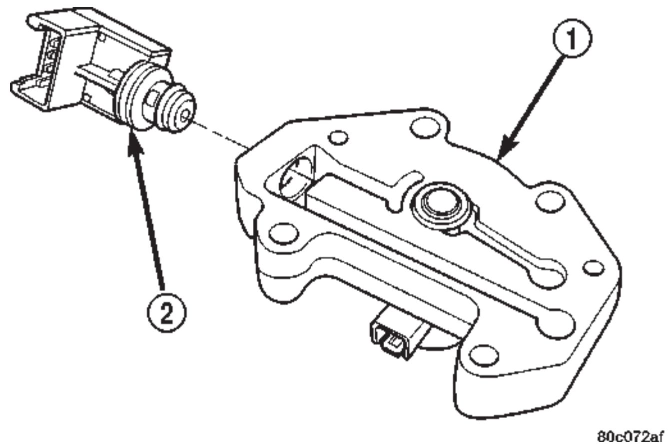

*Fig. 70 Governor Pressure Sensor*

1 - GOVERNOR BODY

2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

## OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output valves are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the ″cold″ period of operation.

### GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

### GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

### GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

### GOVERNOR PRESSURE CURVES

#### LOW TRANSMISSION FLUID TEMPERATURE

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

#### NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous standalone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade ″hunting″ prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

ELECTRONIC GOVERNOR (Continued)

### WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

### TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine ″flare.″ The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

## REMOVAL

(1) Hoist and support vehicle on safety stands.
(2) Remove transmission fluid pan and filter.
(3) Disengage wire connectors from pressure sensor and solenoid (Fig. 71).
(4) Remove screws holding pressure solenoid retainer to governor body.

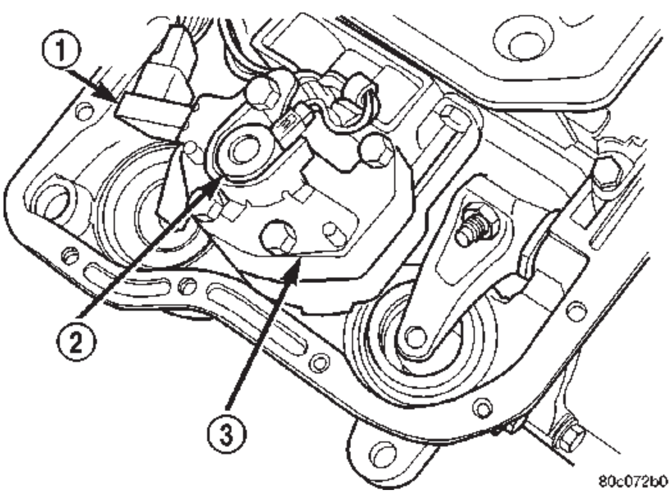

*Fig. 71 Governor Solenoid And Pressure Sensor*

1 - PRESSURE SENSOR
2 - PRESSURE SOLENOID
3 - GOVERNOR

(5) Separate solenoid retainer from governor (Fig. 72).
(6) Pull solenoid from governor body (Fig. 73).
(7) Pull pressure sensor from governor body.
(8) Remove bolts holding governor body to valve body.

ELECTRONIC GOVERNOR (Continued)

(9) Separate governor body from valve body (Fig. 74).

(10) Remove governor body gasket.

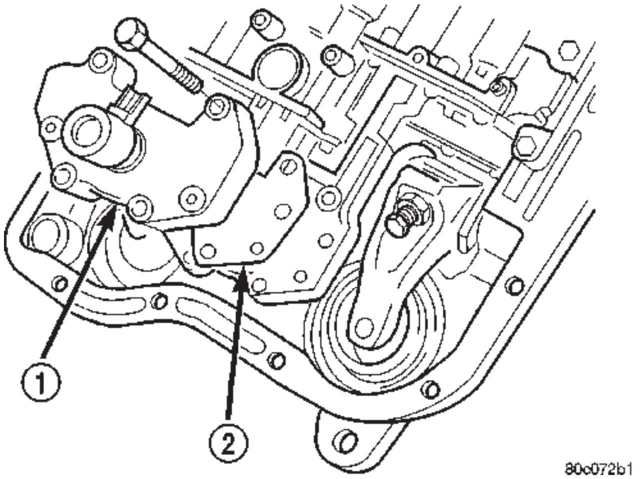

*Fig. 74 Governor Body and Gasket*

1 - GOVERNOR BODY
2 - GASKET

## INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace o-ring seals, clean the gasket surfaces and replace gasket.

(1) Place gasket in position on back of governor body (Fig. 75).

(2) Place governor body in position on valve body.

(3) Install bolts to hold governor body to valve body.

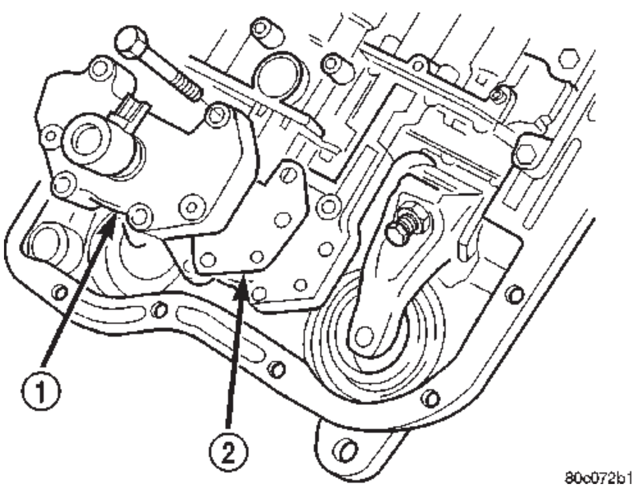

*Fig. 75 Governor Body and Gasket*

1 - GOVERNOR BODY
2 - GASKET

(4) Lubricate o-ring on pressure sensor with transmission fluid.

(5) Align pressure sensor to bore in governor body.

(6) Push pressure sensor into governor body.

(7) Lubricate o-ring, on pressure solenoid, with transmission fluid.

(8) Align pressure solenoid to bore in governor body (Fig. 76).

(9) Push solenoid into governor body.

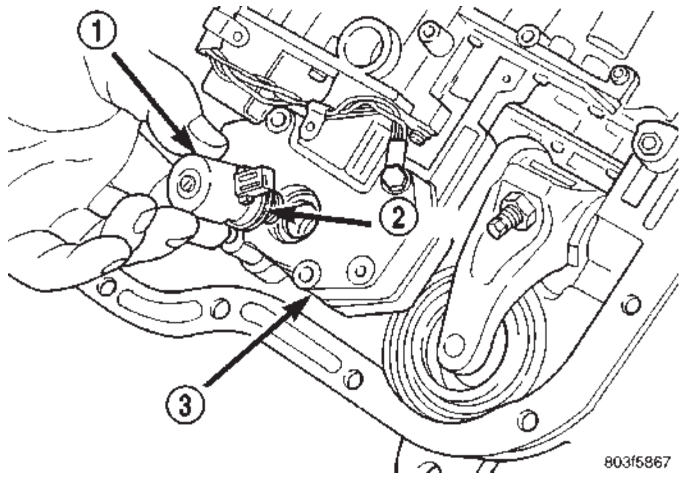

*Fig. 76 Pressure Solenoid and O-ring*

1 - PRESSURE SOLENOID
2 - O-RING
3 - GOVERNOR

(10) Place solenoid retainer in position on governor (Fig. 77).

(11) Install screws to hold pressure solenoid retainer to governor body.

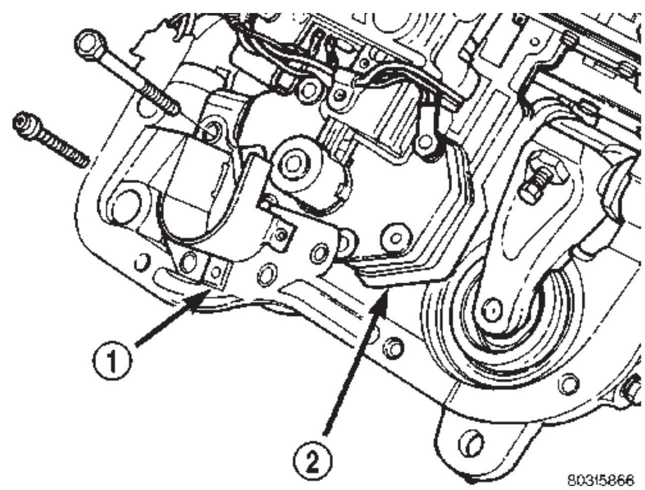

*Fig. 77 Pressure Solenoid Retainer*

1 - PRESSURE SOLENOID RETAINER
2 - GOVERNOR

ELECTRONIC GOVERNOR (Continued)

(12) Engage wire connectors into pressure sensor and solenoid (Fig. 78).

(13) Install transmission fluid pan and (new) filter.

(14) Lower vehicle and road test to verify repair.

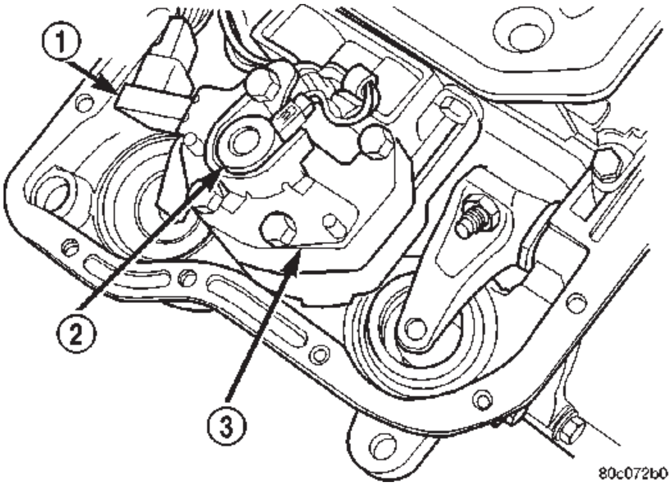

*Fig. 78 Governor Solenoid And Pressure Sensor*

1 - PRESSURE SENSOR
2 - PRESSURE SOLENOID
3 - GOVERNOR

# EXTENSION HOUSING BUSHING

## REMOVAL

(1) Remove extension housing yoke seal.

(2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 79).

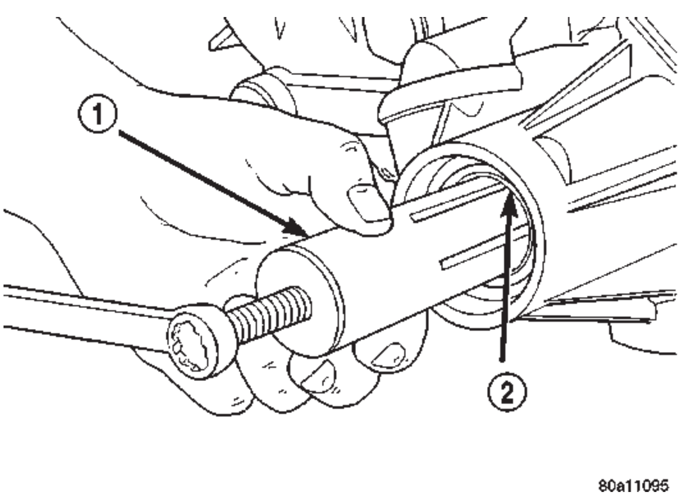

*Fig. 79 Bushing Removal - Typical*

1 - REMOVER
2 - EXTENSION HOUSING BUSHING

## INSTALLATION

(1) Align bushing oil hole with oil slot in extension housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 80).

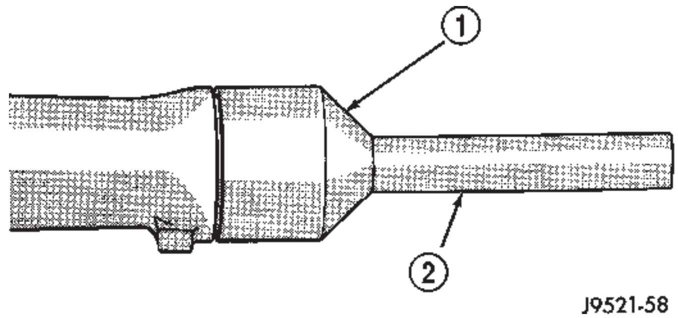

*Fig. 80 Extension Housing Seal Installation*

1 - SPECIAL TOOL C-3995-A OR C-3972-A
2 - SPECIAL TOOL C-4471

# EXTENSION HOUSING SEAL

## REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 81) from overdrive housing.

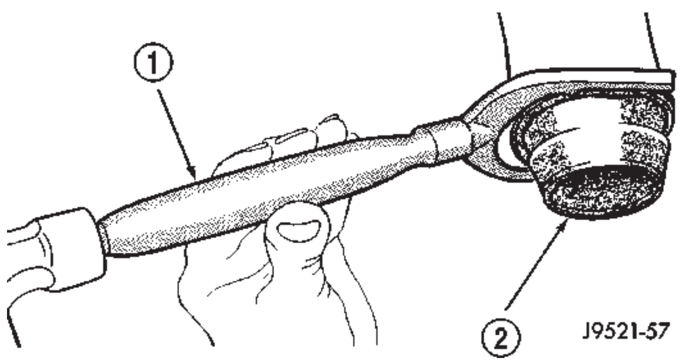

*Fig. 81 Removing Overdrive Housing Yoke Seal*

1 - SPECIAL TOOL C-3985-B
2 - SEAL

EXTENSION HOUSING SEAL (Continued)

### INSTALLATION

(1) Place seal in position on overdrive housing.

(2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 82).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

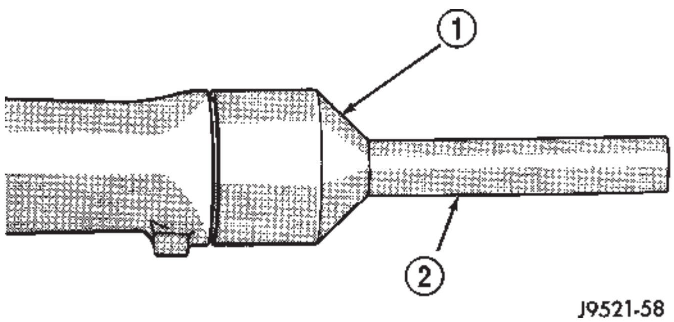

***Fig. 82 Installing Overdrive Housing Seal***

## FLUID AND FILTER

### DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

### DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

### DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

### STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

FLUID AND FILTER (Continued)

Improper filling can also raise the fluid level too high. When the transmssion has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

## PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 83) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not overfill.

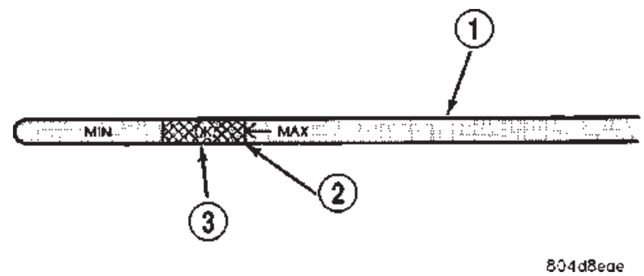

*Fig. 83 Dipstick Fluid Level Marks—Typical*

1 - DIPSTICK
2 - MAXIMUM CORRECT FLUID LEVEL
3 - ACCEPTABLE FLUID LEVEL

## PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

(5) Hook up DRB® scan tool and select engine.

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the chart.

(9) Adjust transmission fluid level shown on the dipstick according to the chart (Fig. 84).

**NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.**

(10) Check transmission for leaks.

FLUID AND FILTER (Continued)

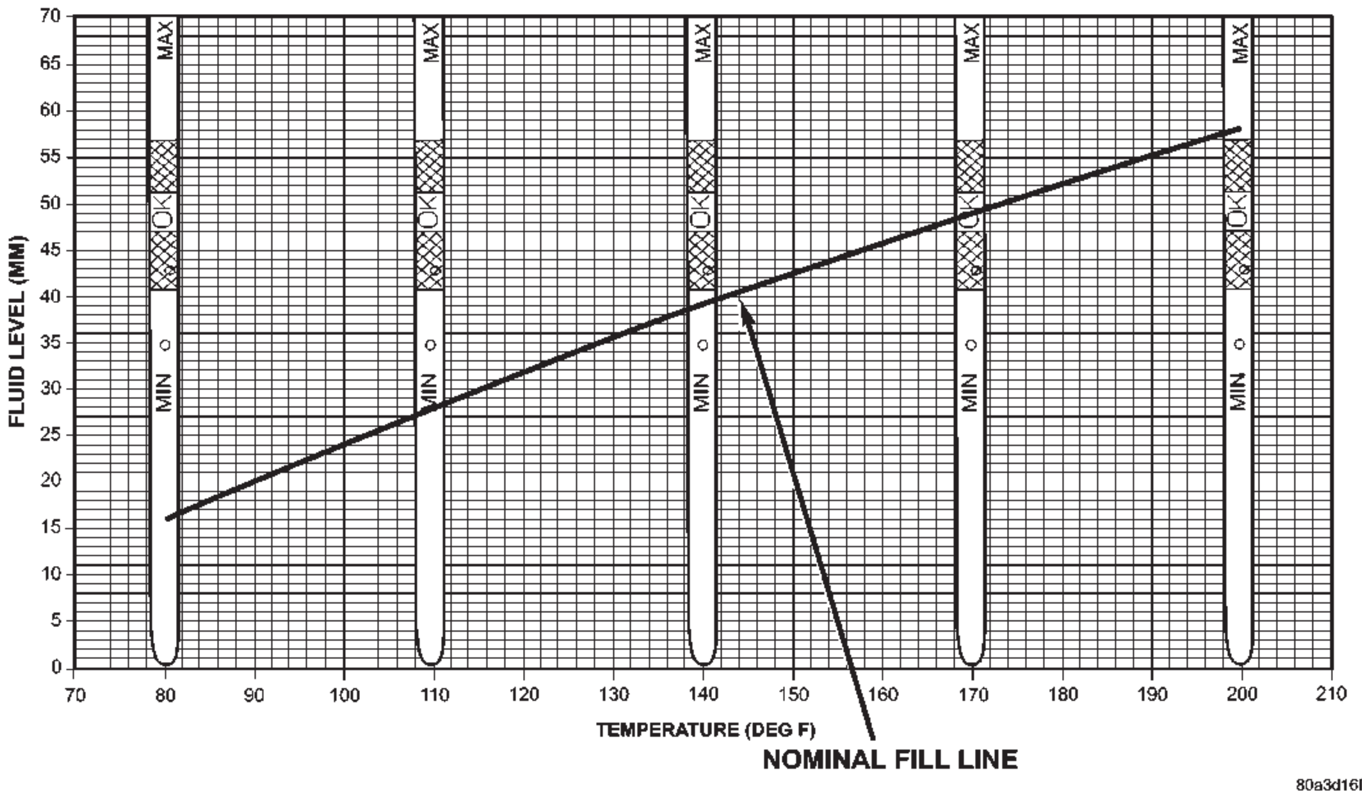

*Fig. 84 47RE Fluid Fill Graph*

## STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 85).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 86).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

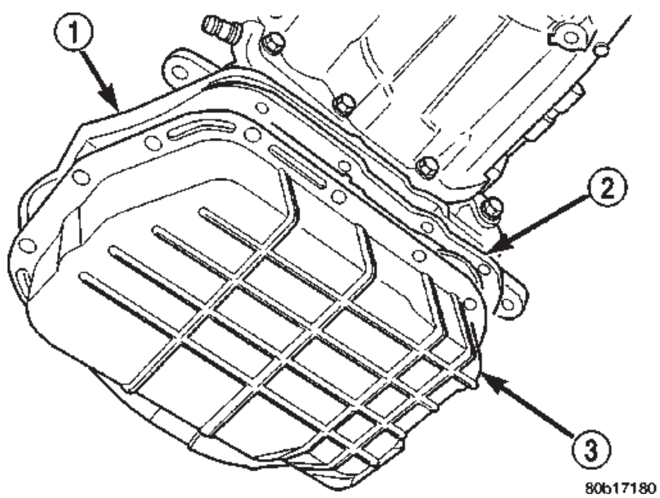

*Fig. 85 Transmission Pan*

1 - TRANSMISSION
2 - GASKET
3 - PAN

FLUID AND FILTER (Continued)

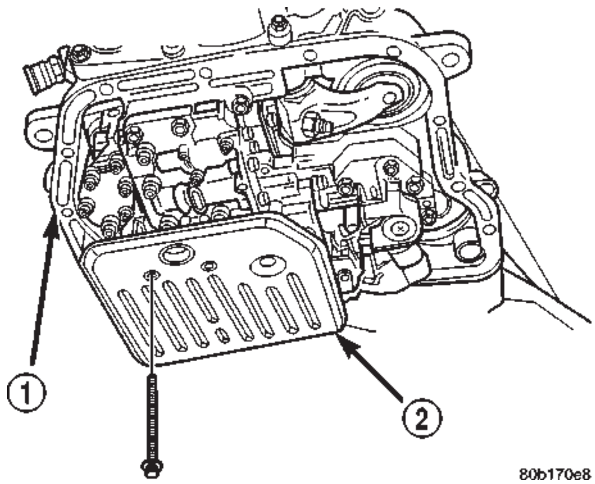

*Fig. 86 Transmission Filter*

1 - TRANSMISSION
2 - FILTER

## STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.**

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

# FRONT CLUTCH

## DESCRIPTION

The front clutch assembly (Fig. 87) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

FRONT CLUTCH (Continued)

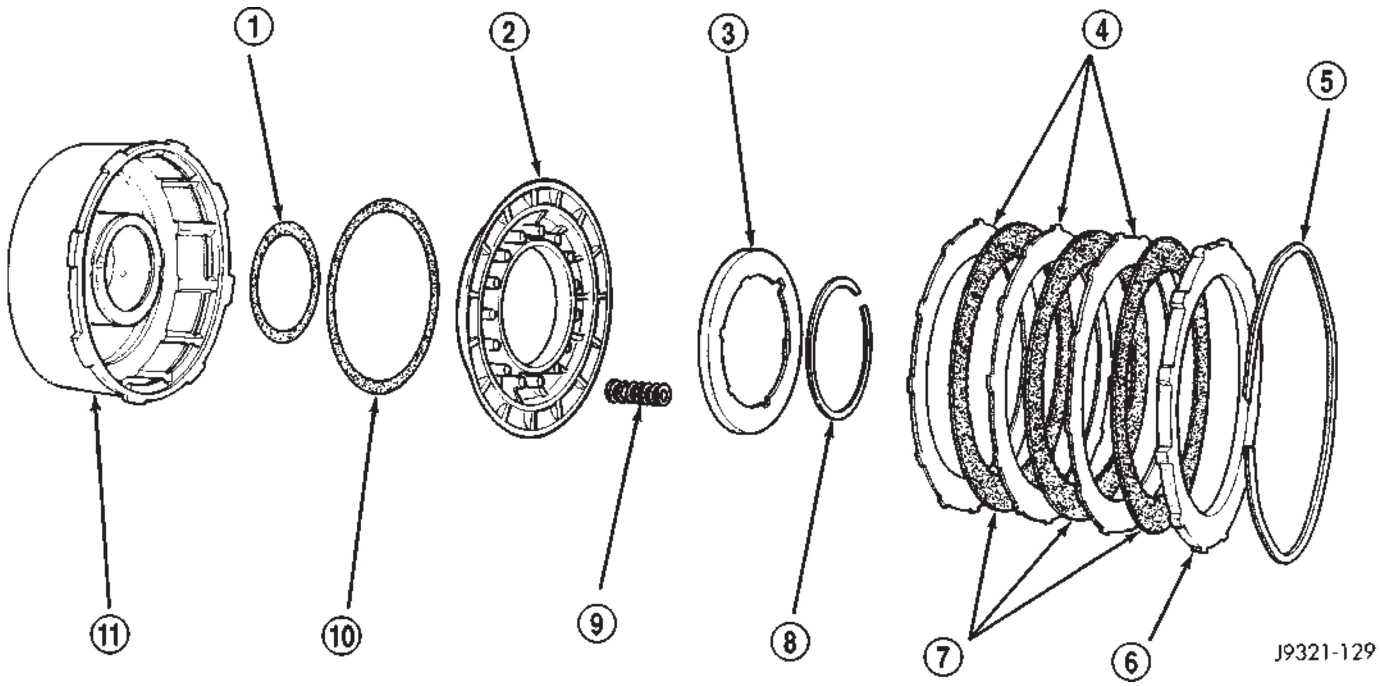

*Fig. 87 Front Clutch Components*

1 - INNER PISTON SEAL

7 - CLUTCH DISCS
8 - RETAINER SNAP-RING
9 - CLUTCH PISTON SPRINGS (9)
10 - OUTER PISTON SEAL
11 - FRONT CLUTCH RETAINER

## DISASSEMBLY

(1) Remove the waved snap-ring, reaction plate, clutch plates, and clutch discs.

(2) Compress clutch piston retainer and piston springs with Compressor Tool C-3863-A (Fig. 88).

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove clutch piston springs (Fig. 89). Note position of piston springs for assembly reference.

(5) Remove clutch piston from retainer with a twisting motion.

(6) Remove and discard clutch piston inner and outer seals.

(7) Assemble Tool Handle C-4171 and Bushing Remover SP-3629 (Fig. 90).

(8) Insert remover tool in bushing and drive bushing straight out of clutch retainer.

FRONT CLUTCH (Continued)

5 - FRONT CLUTCH RETAINER

## INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, the lugs are damaged, or if the facing is flaking off. Replace the steel plates and reaction plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plate are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston springs and spring retainer if either are distorted, warped or broken.

Check the lug grooves in the clutch piston retainer. The steel plates should slide freely in the slots. Replace the piston retainer if the grooves are worn or damaged. Also check action of the check ball in the piston retainer. The ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or there is any doubt about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check the clutch piston check ball. The ball should be securely in place. Replace the piston if the ball is missing, or seized in place.

## ASSEMBLY

**NOTE: The 47RE transmission uses four plates and discs for the front clutch.**

(1) Mount Bushing Installer SP-5511 on tool handle (Fig. 91).

(2) Slide new bushing onto installer tool and start bushing into retainer.

(3) Tap new bushing into place until installer tool bottoms against clutch retainer.

(4) Remove installer tools and clean retainer thoroughly.

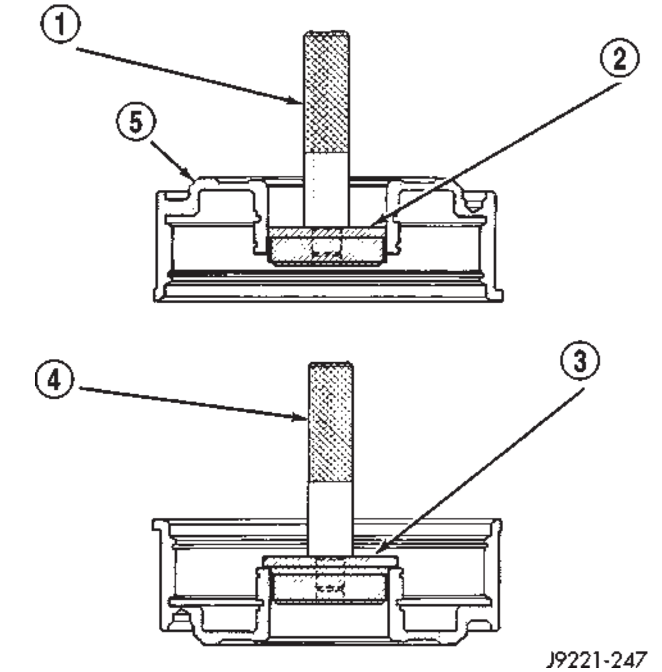

***Fig. 91 Front Clutch Retainer Bushing Replacement Tools***

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL SP-3629
3 - SPECIAL TOOL SP-5511
4 - SPECIAL TOOL C-4171
5 - FRONT CLUTCH RETAINER

(5) Soak clutch discs in transmission fluid.

(6) Install new inner piston seal onto the outer diameter of the clutch retainer inner hub.

(7) Install new outer seal onto the clutch piston. Be sure seal lips of both seals face the interior of the retainer.

(8) Lubricate new inner and outer piston seals with Ru-Glyde™, or Mopar® Door Ease.

(9) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.015 - 0.020 in. thick), can be used to guide seals into place if necessary.

FRONT CLUTCH (Continued)

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.**

(10) Install and position nine clutch piston springs (Fig. 92).

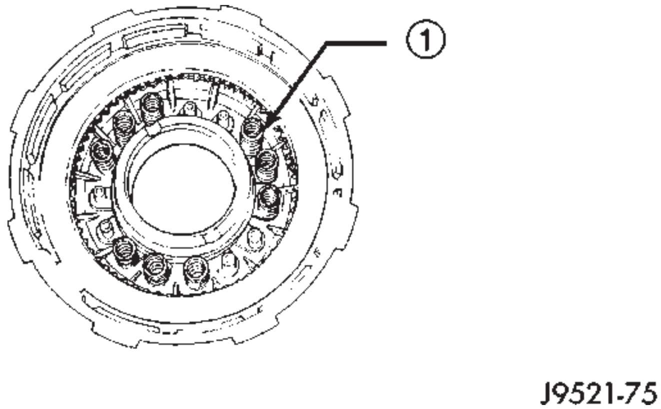

***Fig. 92 Front Clutch Spring Position***

1 - 9 SPRING CLUTCH

(11) Install spring retainer on top of piston springs.

(12) Compress spring retainer and piston springs with Tool C-3863-A.

(13) Install spring retainer snap-ring and remove compressor tool.

(14) Install clutch plates and discs (Fig. 95). Four clutch discs, four steel plates and one reaction plate are required.

(15) Install reaction plate followed by waved snap-ring.

(16) Check clutch pack clearance with feeler gauge (Fig. 93). Clearance between waved spring and pressure plate should 1.78-3.28 mm (0.070-0.129 in.). If clearance is incorrect, clutch plates, clutch discs, snap-ring, or pressure plate may have to be changed.

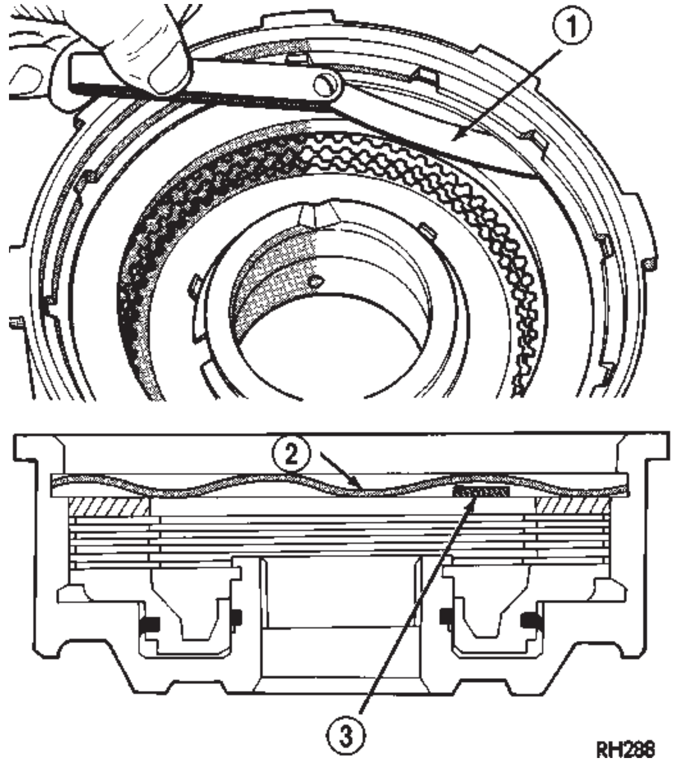

***Fig. 93 Typical Method Of Measuring Front Clutch Pack Clearance***

# FRONT SERVO

## DESCRIPTION

The kickdown servo (Fig. 94) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

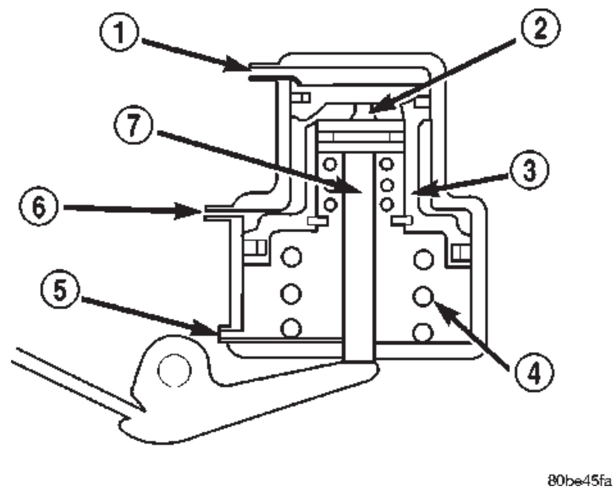

***Fig. 94 Front Servo***

1 - VENT
2 - INNER PISTON
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE
7 - PISTON ROD

FRONT SERVO (Continued)

## OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend though its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

## DISASSEMBLY

(1) Remove seal ring from rod guide (Fig. 95).

(2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.

(3) Remove and discard servo component O-ring and seal rings.

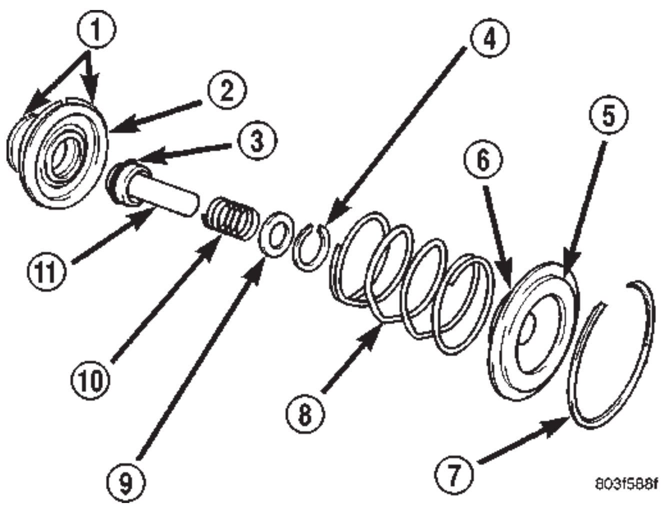

*Fig. 95 Front Servo*

## CLEANING

Clean the servo piston components (Fig. 96) with solvent and dry them with compressed air.

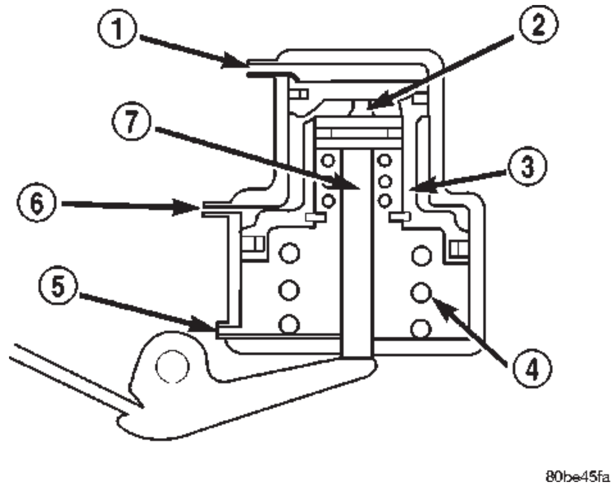

*Fig. 96 Front Servo*

1 - VENT
2 - INNER PISTON
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE
7 - PISTON ROD

## INSPECTION

Inspect the servo components (Fig. 97). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap-ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

## ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 98).

# OIL PUMP

## DESCRIPTION

The oil pump (Fig. 99) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a reaction shaft support.

## OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

## STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

**CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.**

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

10 - OUTER GEAR
11 - “O” RING

OIL PUMP (Continued)

## DISASSEMBLY

(1) Mark position of support in oil pump body for assembly alignment reference. Use scriber or paint to make alignment marks.

(2) Place pump body on two wood blocks.

(3) Remove reaction shaft support bolts and separate support from pump body (Fig. 100).

(4) Remove pump inner and outer gears (Fig. 101).

(5) Remove o-ring seal from pump body (Fig. 102). Discard seal after removal.

(6) Remove oil pump seal with Remover Tool C-3981. Discard seal after removal.

OIL PUMP (Continued)

## OIL PUMP BUSHING REMOVAL

(1) Position pump housing on clean, smooth surface with gear cavity facing down.

(2) Remove bushing with Tool Handle C-4171 and Bushing Remover SP-3550 (Fig. 103).

## REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Cup Tool SP-3633, Nut SP-1191 and Bushing Remover SP-5301 (Fig. 104).

(2) Hold cup tool firmly against reaction shaft. Thread remover tool into bushing as far as possible by hand.

(3) Using wrench, thread remover tool an additional 3-4 turns into bushing to firmly engage tool.

(4) Tighten tool hex nut against cup tool to pull bushing from shaft. Clean all chips from shaft and support after bushing removal.

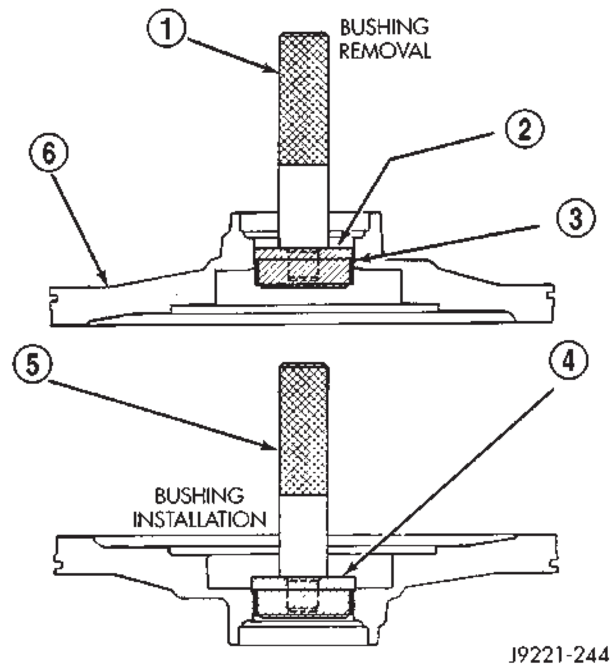

*Fig. 103 Oil Pump Bushing*

2 - SPECIAL TOOL SP-3550
3 - BUSHING
4 - SPECIAL TOOL SP-5118
5 - SPECIAL TOOL C-4171
6 - PUMP HOUSING

## CLEANING

Clean pump and support components with solvent and dry them with compressed air.

## INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

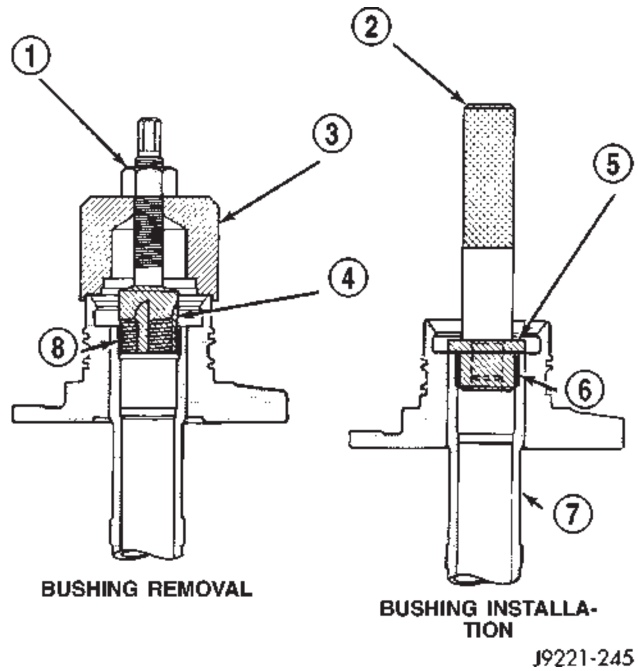

*Fig. 104 Reaction Shaft Bushing*

1 - SPECIAL TOOL SP-1191
2 - SPECIAL TOOL C-4171
3 - SPECIAL TOOL SP-3633
4 - SPECIAL TOOL SP-5301
5 - SPECIAL TOOL SP-5302
6 - BUSHING
7 - REACTION SHAFT
8 - BUSHING

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

OIL PUMP (Continued)

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge (Fig. 105).

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

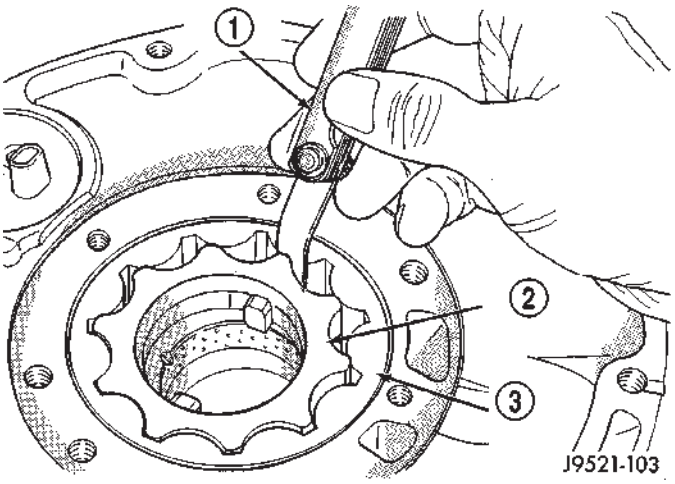

***Fig. 105 Checking Pump Gear Tip Clearance***

1 - FEELER GAUGE

3 - OUTER GEAR

## ASSEMBLY

### OIL PUMP BUSHING

(1) Assemble Tool Handle C-4171 and Bushing Installer SP-5118 (Fig. 106).

(2) Place bushing on installer tool and start bushing into shaft.

(3) Tap bushing into place until Installer Tool SP-5118 bottoms in pump cavity. Keep tool and bushing square with bore. Do not allow bushing to become cocked during installation.

(4) Stake pump bushing in two places with blunt punch. Remove burrs from stake points with knife blade (Fig. 107).

### REACTION SHAFT SUPPORT BUSHING

(1) Place reaction shaft support upright on a clean, smooth surface.

(2) Assemble Bushing Installer Tools C-4171 and SP-5302. Then slide new bushing onto installer tool (Fig. 108).

(3) Start bushing in shaft. Tap bushing into shaft until installer tool bottoms against support flange.

(4) Clean reaction shaft support thoroughly after bushing replacement (to remove any chips).

7 - REACTION SHAFT
8 - BUSHING

### OIL PUMP BODY

(1) Lubricate pump gears with transmission fluid and install them in pump body.

(2) Install thrust washer on reaction shaft support hub. Lubricate washer with petroleum jelly or transmission fluid before installation.

(3) If reaction shaft seal rings are being replaced, install new seal rings on support hub. Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

**CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.**

(4) Align and install reaction shaft support on pump body.

(5) Install bolts attaching reaction shaft support to pump. Tighten bolts to 20 N·m (175 in. lbs.) torque.

(6) Install new pump seal with Installer Tool C-3860-A (Fig. 109). Use hammer or mallet to tap seal into place.

(7) Install new o-ring on pump body. Lubricate oil seal and o-ring with petroleum jelly.

(8) Cover pump assembly to prevent dust entry and set aside for assembly installation.

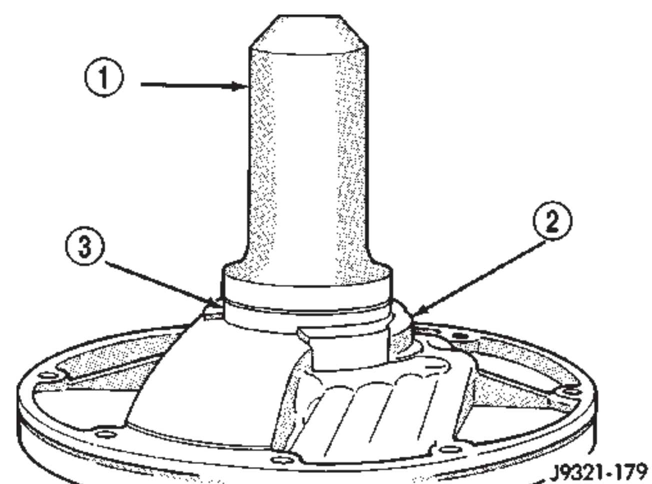

*Fig. 109 Oil Pump Seal*

1 - SPECIAL TOOL C-3860-A
2 - PUMP BODY
3 - PUMP SEAL

## OUTPUT SHAFT FRONT BEARING

### REMOVAL

(1) Remove overdrive unit from the vehicle.

(2) Remove overdrive geartrain from housing.

(3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 110).

(4) Pull bearing from output shaft.

### INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.

(2) Push bearing onto shaft until the snap-ring groove is visible.

(3) Install snap-ring to hold bearing onto output shaft.

OUTPUT SHAFT FRONT BEARING (Continued)

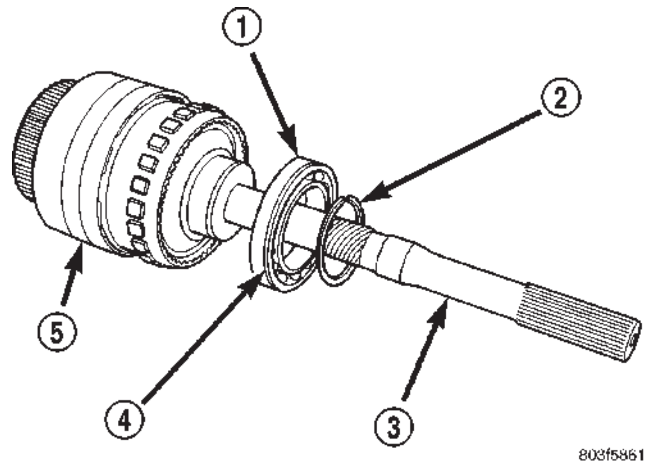

*Fig. 110 Output Shaft Front Bearing*

1 - OUTPUT SHAFT FRONT BEARING
2 - SNAP-RING
3 - OUTPUT SHAFT
4 - GROOVE TO REAR
5 - OVERDRIVE GEARTRAIN

(4) Install overdrive geartrain into housing.
(5) Install overdrive unit in vehicle.

# OUTPUT SHAFT REAR BEARING

## REMOVAL

(1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/OVERDRIVE - REMOVAL)
(2) Remove overdrive geartrain from housing.
(3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 111).
(4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

## INSTALLATION

(1) Place replacement bearing in position in housing.
(2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.
(3) Install snap-ring to hold bearing into housing (Fig. 112).
(4) Install overdrive geartrain into housing.
(5) Install overdrive unit in vehicle.

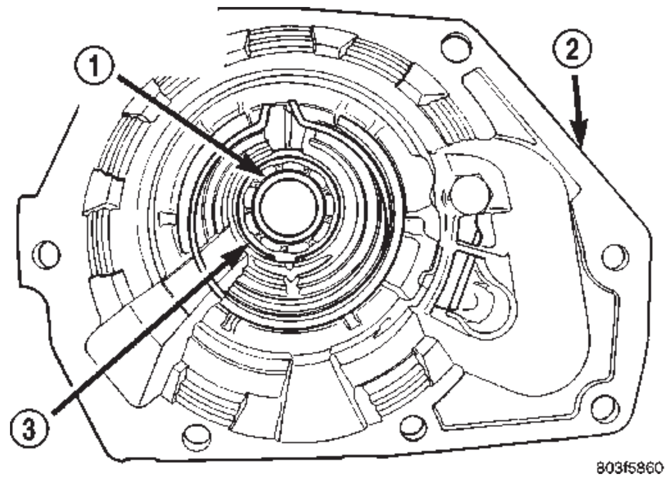

*Fig. 111 Output Shaft Rear Bearing*

1 - OUTPUT SHAFT REAR BEARING
2 - OVERDRIVE HOUSING
3 - SNAP-RING

# OVERDRIVE CLUTCH

## DESCRIPTION

The overdrive clutch (Fig. 112) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch

OVERDRIVE CLUTCH (Continued)

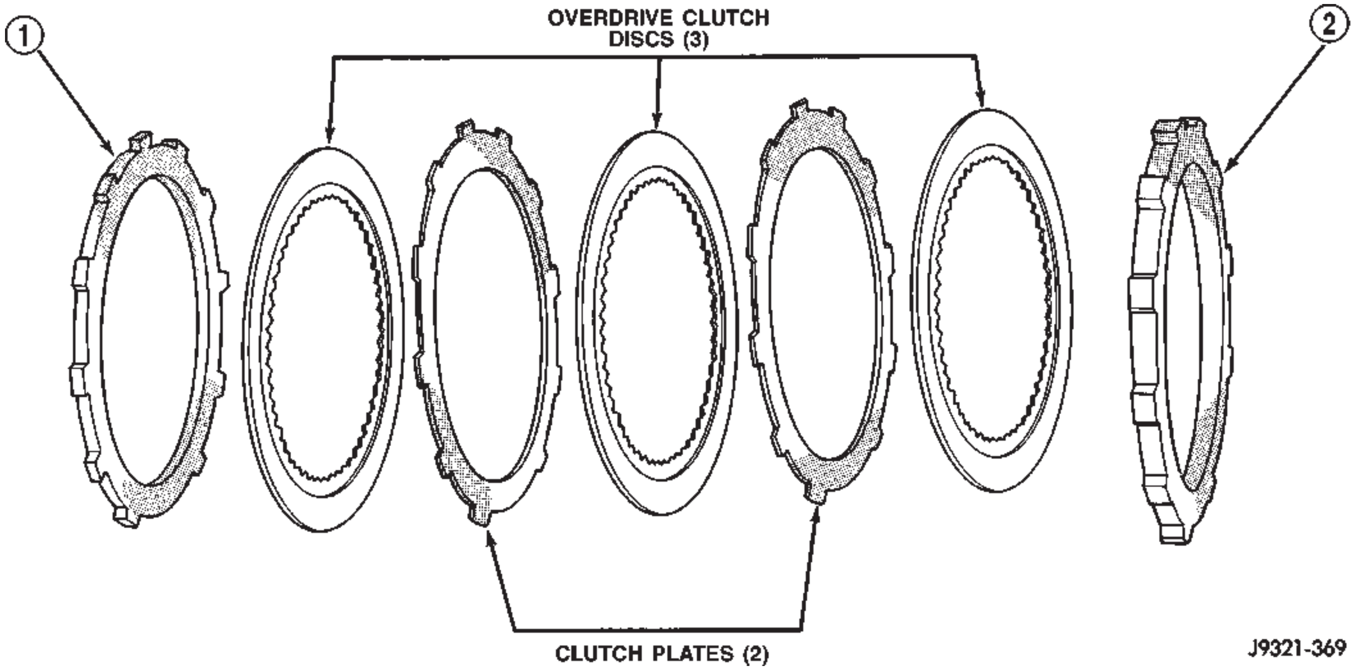

*Fig. 112 Overdrive Clutch*

1 - REACTION PLATE
2 - PRESSURE PLATE

drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

# OVERDRIVE SWITCH

## DESCRIPTION

The overdrive OFF (control) switch is located in the shift lever arm (Fig. 113). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

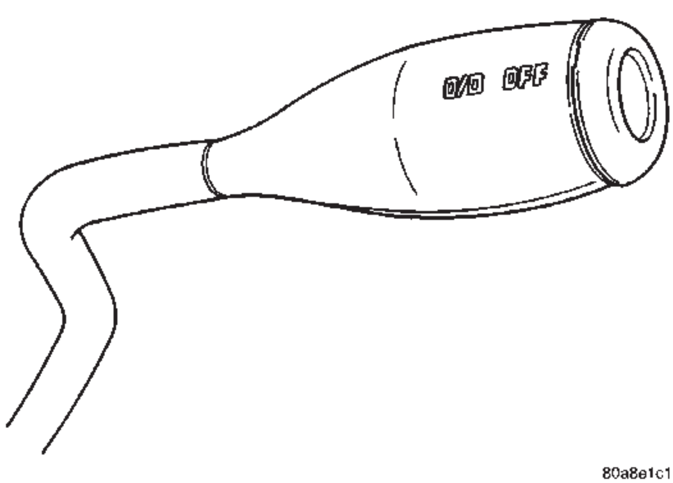

*Fig. 113 Overdrive Off Switch*

## OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

## DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

OVERDRIVE SWITCH (Continued)

### REMOVAL

(1) Using a plastic trim tool, remove the overdrive off switch retainer from the shift lever (Fig. 114).

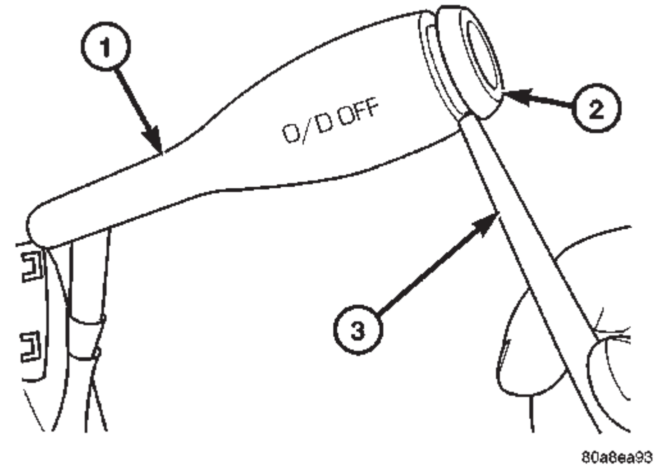

*Fig. 114 Overdrive Off Switch Retainer*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH RETAINER
3 - PLASTIC TRIM TOOL

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 115)

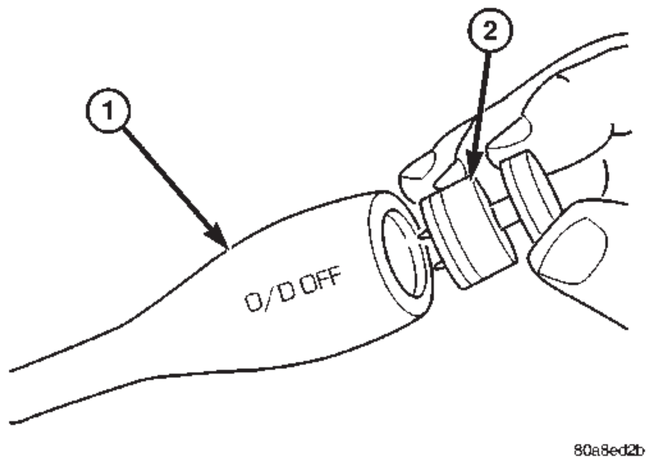

*Fig. 115 Remove the Overdrive Off Switch*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH

### INSTALLATION

**NOTE: There is enough slack in the wire to pull out the connector from the lever.**

(1) Pull the connector out of the lever just enough to grasp it.

**CAUTION: Be careful not to bend the pins on the overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.**

(2) Install the overdrive off switch into the connector (Fig. 116)

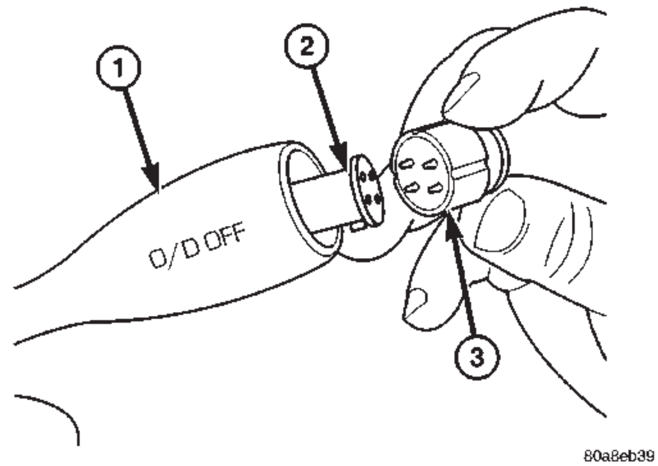

*Fig. 116 Install the Overdrive Off Switch*

1 - GEAR SHIFT LEVER
2 - OVERDRIVE OFF SWITCH WIRING CONNECTOR
3 - OVERDRIVE OFF SWITCH

(3) Push the overdrive off switch and wiring into the shift lever.
(4) Install the overdrive off switch retainer onto the shift lever.

## OVERDRIVE UNIT

### REMOVAL

(1) Shift transmission into PARK.
(2) Raise vehicle.
(3) Remove transfer case, if equipped.
(4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if neccesary.
(5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
(6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.
(7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.
(8) Support transmission with transmission jack.

OVERDRIVE UNIT (Continued)

(9) Remove bolts attaching overdrive unit to transmission (Fig. 117).

**CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.**

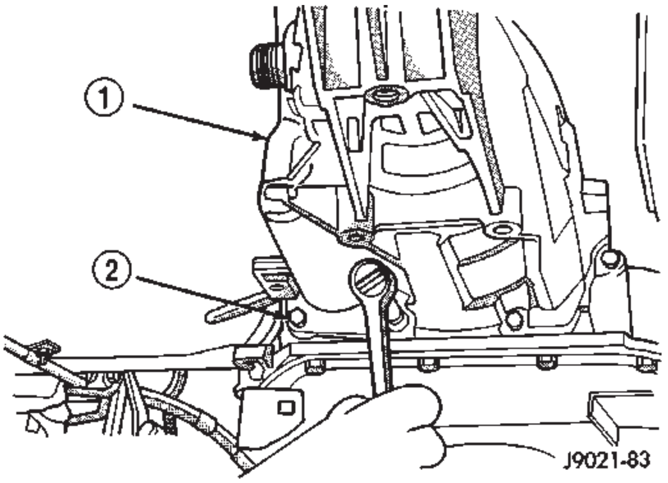

***Fig. 117 Overdrive Unit Bolts***

1 - OVERDRIVE UNIT
2 - ATTACHING BOLTS (7)

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

## DISASSEMBLY

(1) Remove transmission speed sensor and o-ring seal from overdrive case (Fig. 118).

(2) Remove overdrive piston thrust bearing (Fig. 119).

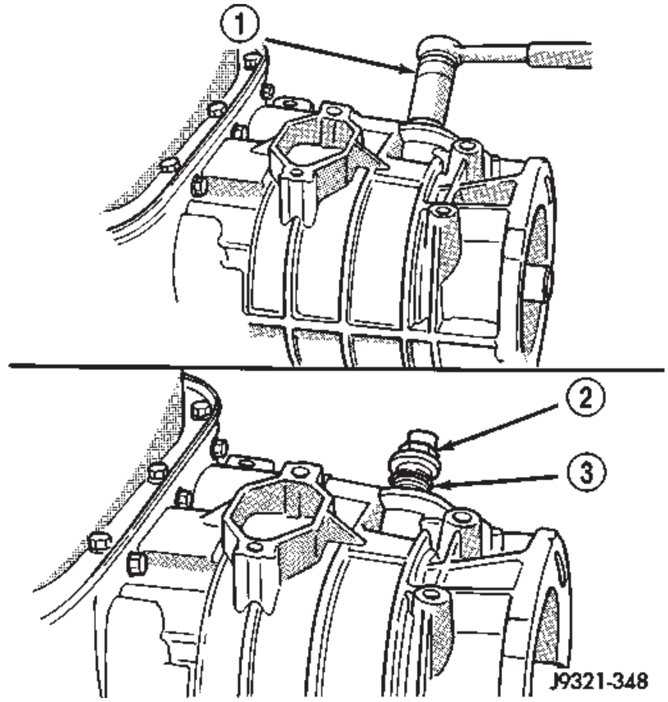

***Fig. 118 Transmission Speed Sensor***

1 - SOCKET AND WRENCH
2 - SPEED SENSOR
3 - O-RING

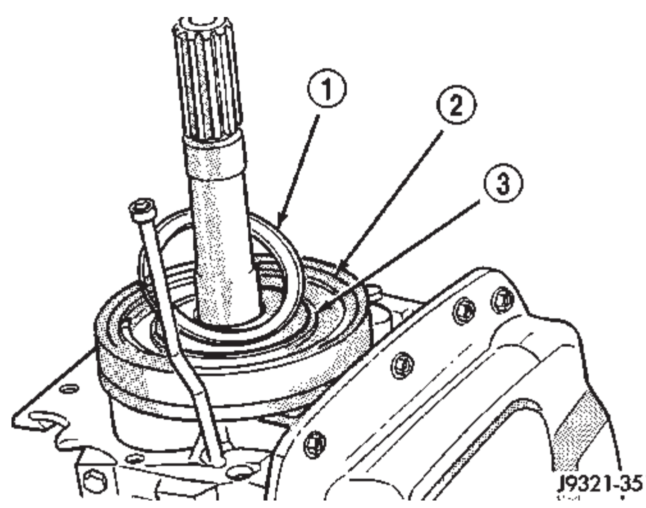

***Fig. 119 Overdrive Piston Thrust Bearing Removal/ Installation***

1 - THRUST BEARING
2 - OVERDRIVE PISTON
3 - THRUST PLATE

OVERDRIVE UNIT (Continued)

### OVERDRIVE PISTON

(1) Remove overdrive piston thrust plate (Fig. 120). Retain thrust plate. It is a select fit part and may possibly be reused.

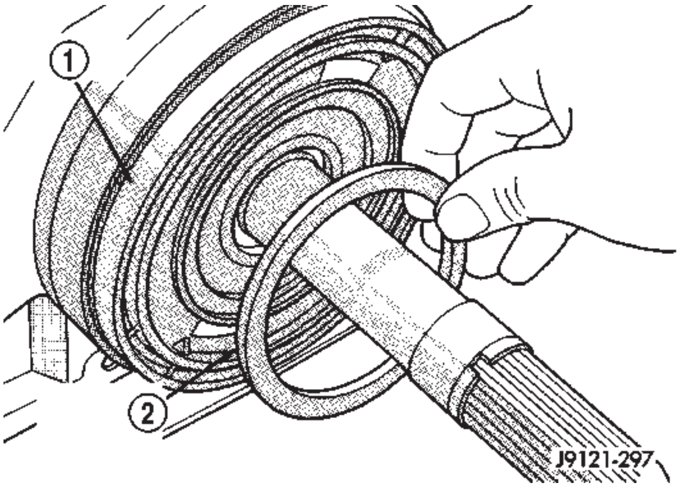

*Fig. 120 Overdrive Piston Thrust Plate Removal/ Installation*

1 - OVERDRIVE PISTON
2 - OVERDRIVE PISTON SPACER (SELECT FIT)

(2) Remove intermediate shaft spacer (Fig. 121). Retain spacer. It is a select fit part and may possibly be reused.

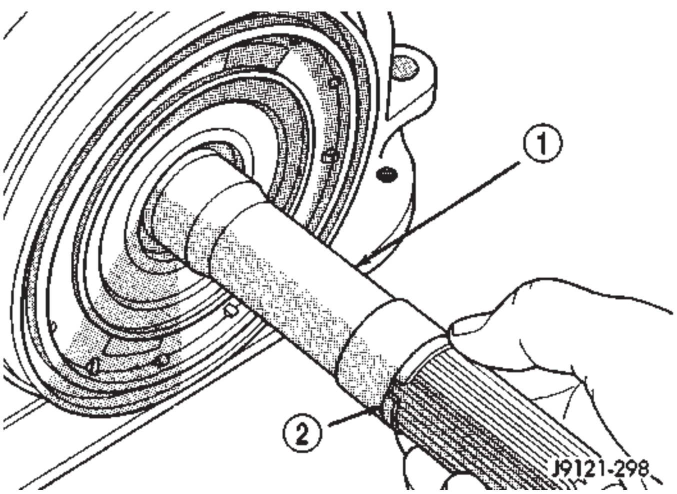

*Fig. 121 Intermediate Shaft Spacer Location*

1 - INTERMEDIATE SHAFT
2 - INTERMEDIATE SHAFT SPACER (SELECT FIT)

(3) Remove overdrive piston from retainer (Fig. 122).

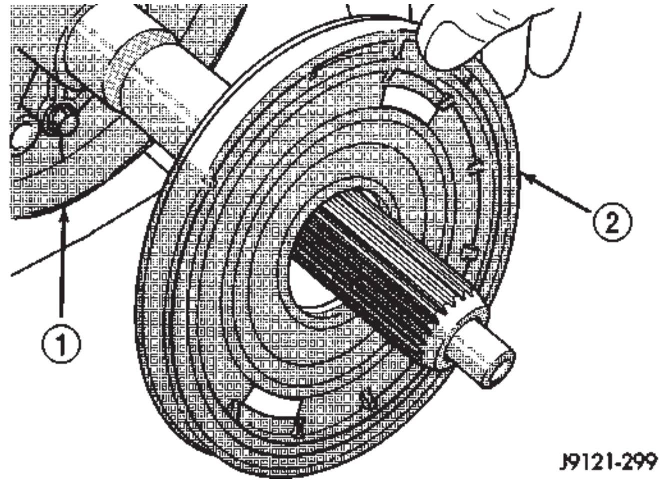

*Fig. 122 Overdrive Piston Removal*

1 - PISTON RETAINER
2 - OVERDRIVE PISTON

### OVERDRIVE CLUTCH PACK

(1) Remove overdrive clutch pack wire retaining ring (Fig. 123).
(2) Remove overdrive clutch pack (Fig. 124).
(3) Note position of clutch pack components for assembly reference (Fig. 125).

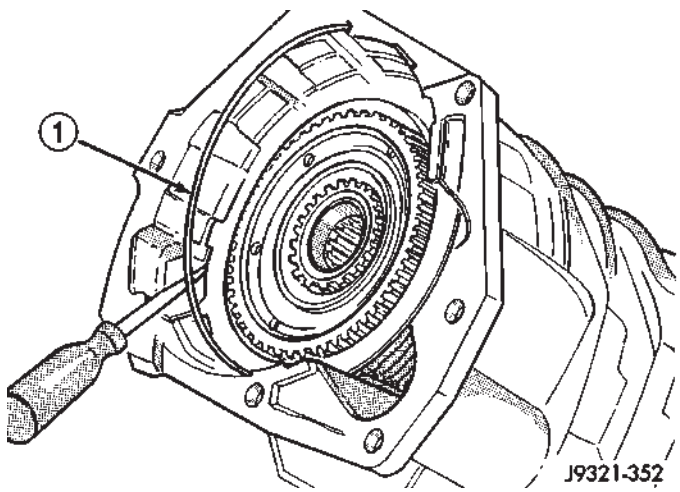

*Fig. 123 Removing Overdrive Clutch Pack Retaining Ring*

1 - OVERDRIVE CLUTCH PACK RETAINING RING

OVERDRIVE UNIT (Continued)

## OVERDRIVE GEARTRAIN

(1) Remove overdrive clutch wave spring (Fig. 126).

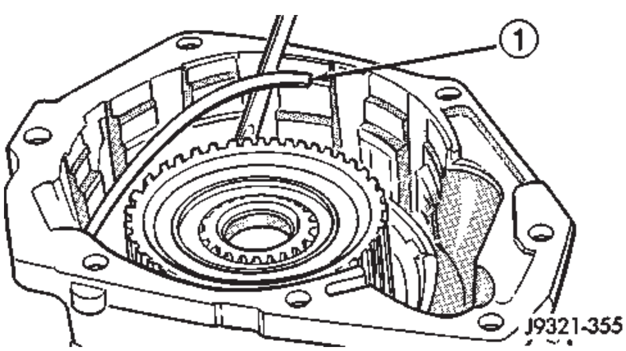

*Fig. 126 Overdrive Clutch Wave Spring Removal*

1 - WAVE SPRING

(2) Remove overdrive clutch reaction snap-ring (Fig. 127). Note that snap-ring is located in same groove as wave spring.

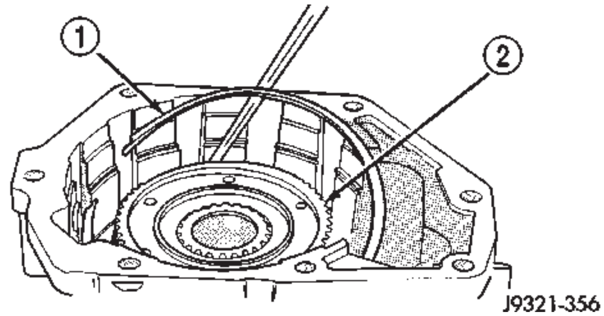

*Fig. 127 Overdrive Clutch Reaction Snap-Ring Removal*

1 - REACTION RING
2 - CLUTCH HUB

(3) Remove Torx™ head screws that attach access cover and gasket to overdrive case (Fig. 128).

(4) Remove access cover and gasket (Fig. 129).

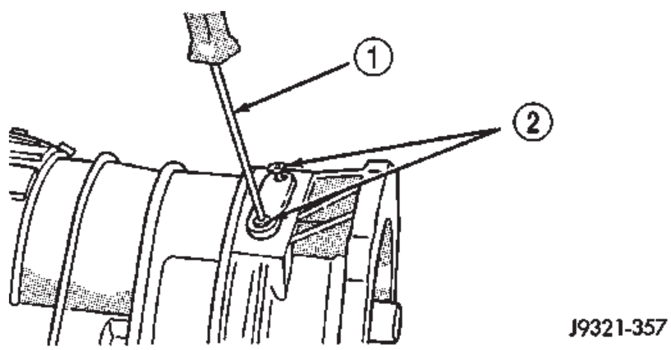

*Fig. 128 Access Cover Screw Removal*

1 - TORX SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

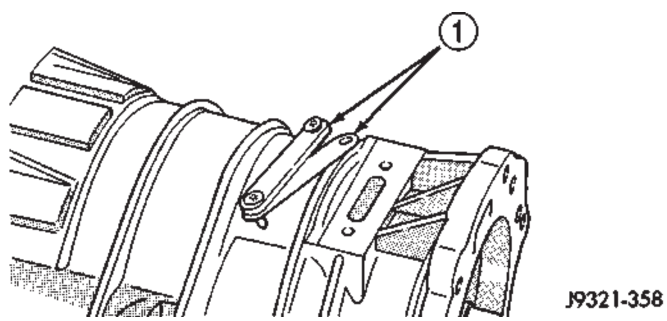

*Fig. 129 Access Cover And Gasket Removal*

1 - ACCESS COVER AND GASKET

OVERDRIVE UNIT (Continued)

(5) Expand output shaft bearing snap-ring with expanding-type snap-ring pliers. Then push output shaft forward to release shaft bearing from locating ring (Fig. 130).

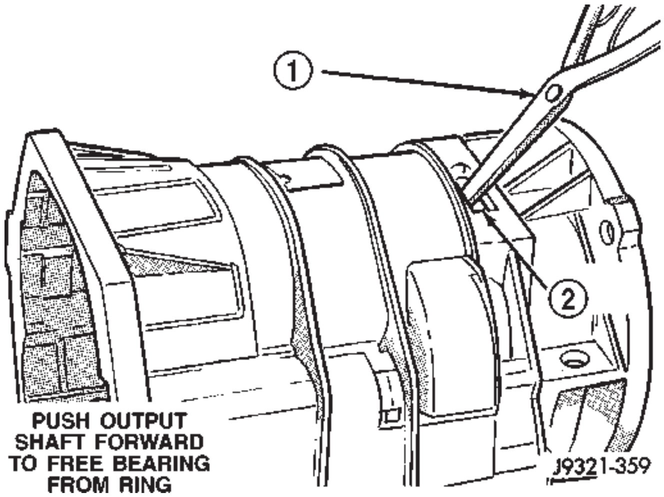

*Fig. 130 Releasing Bearing From Locating Ring*

1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

(6) Lift gear case up and off geartrain assembly (Fig. 131).

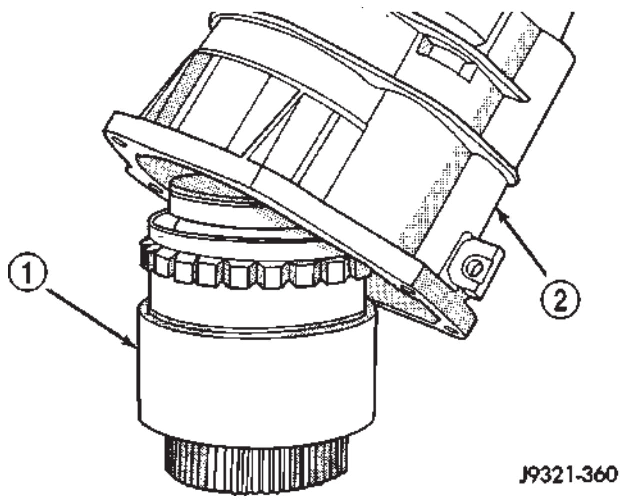

*Fig. 131 Removing Geartrain*

1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

(7) Remove snap-ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 132).

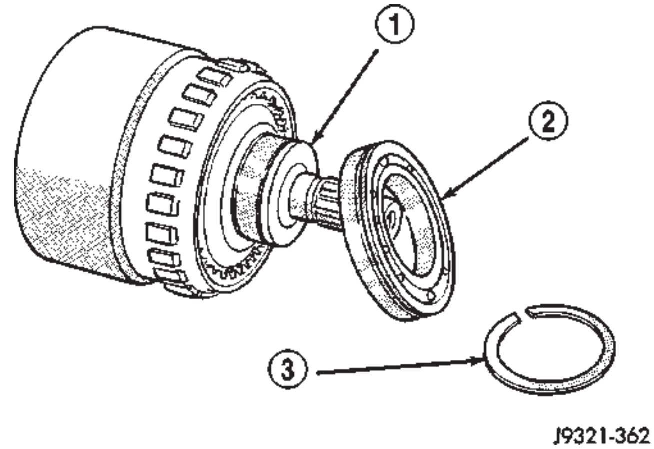

*Fig. 132 Rear Bearing Removal*

1 - OUTPUT SHAFT
2 - REAR BEARING
3 - SNAP-RING

## DIRECT CLUTCH, HUB AND SPRING

**WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(1) Mount geartrain assembly in shop press (Fig. 133).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 133). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 133).

OVERDRIVE UNIT (Continued)

(4) Remove direct clutch pack snap-ring (Fig. 134).

(5) Remove direct clutch hub retaining ring (Fig. 135).

(6) Release press load slowly and completely (Fig. 136).

(7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 136).

## GEARTRAIN

(1) Remove direct clutch hub and spring (Fig. 137).

(2) Remove sun gear and spring plate. Then remove planetary thrust bearing and planetary gear (Fig. 138).

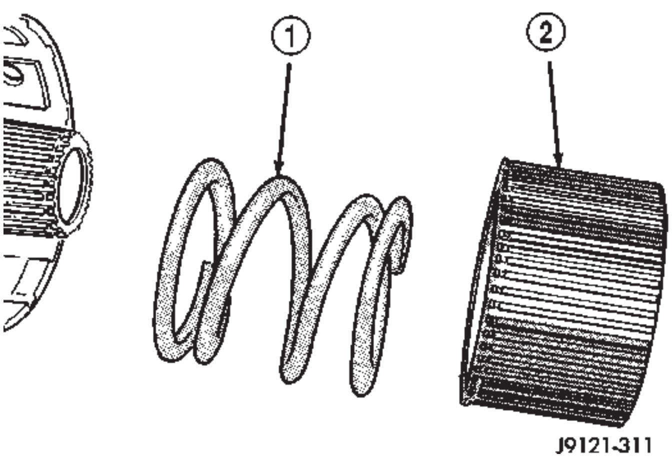

*Fig. 137 Direct Clutch Hub And Spring Removal*

1 - DIRECT CLUTCH SPRING
2 - DIRECT CLUTCH HUB

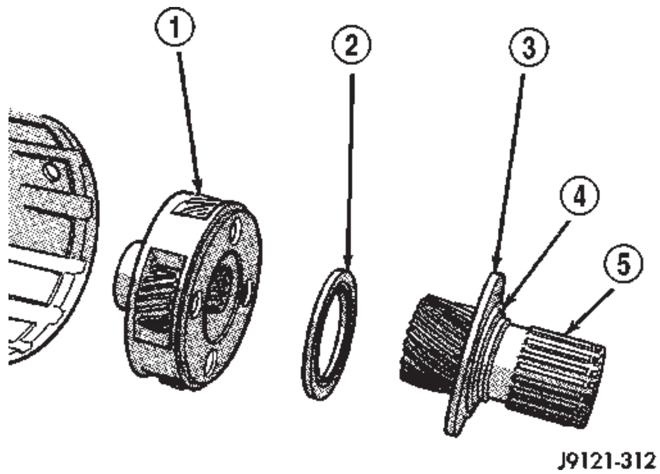

*Fig. 138 Removing Sun Gear, Thrust Bearing And Planetary Gear*

1 - PLANETARY GEAR
2 - PLANETARY THRUST BEARING
3 - CLUTCH SPRING PLATE
4 - SPRING PLATE SNAP-RING
5 - SUN GEAR

(3) Remove overrunning clutch assembly with expanding type snap-ring pliers (Fig. 139). Insert pliers into clutch hub. Expand pliers to grip hub splines and remove clutch with counterclockwise, twisting motion.

(4) Remove thrust bearing from overrunning clutch hub.

(5) Remove overrunning clutch from hub.

(6) Mark position of annulus gear and direct clutch drum for assembly alignment reference (Fig. 140). Use small center punch or scriber to make alignment marks.

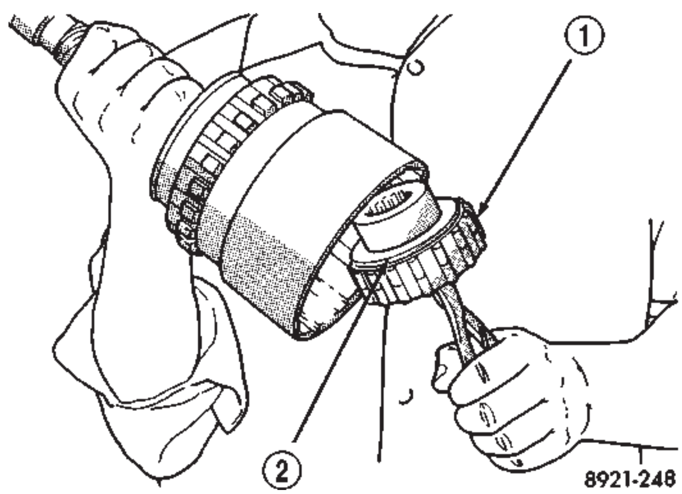

*Fig. 139 Overrunning Clutch Assembly Removal/Installation*

1 - OVERRUNNING CLUTCH
2 - NEEDLE BEARING

OVERDRIVE UNIT (Continued)

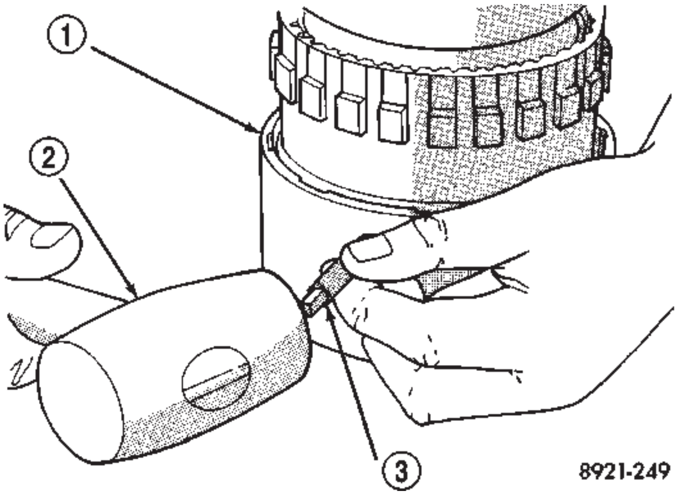

***Fig. 140 Marking Direct Clutch Drum And Annulus Gear For Assembly Alignment***

1 - DIRECT CLUTCH DRUM
2 - HAMMER
3 - PUNCH

(7) Remove direct clutch drum rear retaining ring (Fig. 141).

(8) Remove direct clutch drum outer retaining ring (Fig. 142).

(9) Mark annulus gear and output shaft for assembly alignment reference (Fig. 143). Use punch or scriber to mark gear and shaft.

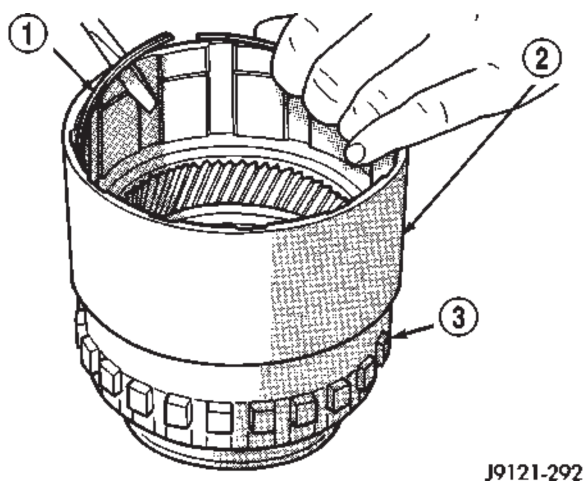

***Fig. 141 Clutch Drum Inner Retaining Ring Removal***

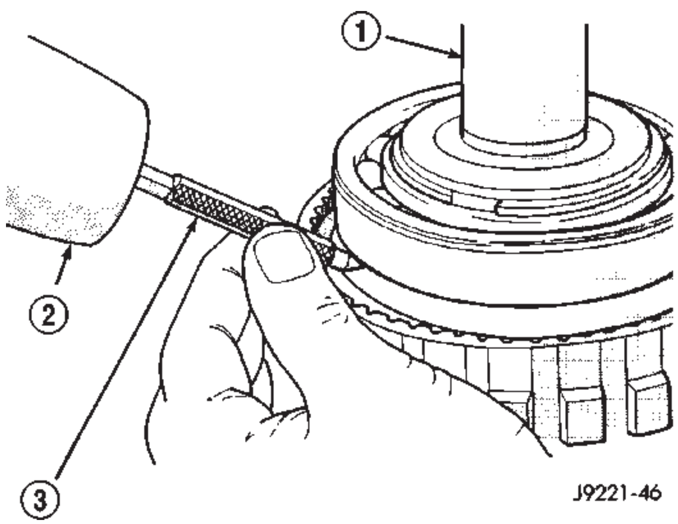

***Fig. 143 Marking Annulus Gear And Output Shaft For Assembly Alignment***

1 - OUTPUT SHAFT
2 - HAMMER
3 - PUNCH

OVERDRIVE UNIT (Continued)

(10) Remove snap-ring that secures annulus gear on output shaft (Fig. 144). Use two screwdrivers to unseat and work snap-ring out of groove as shown.

(11) Remove annulus gear from output shaft (Fig. 145). Use rawhide or plastic mallet to tap gear off shaft.

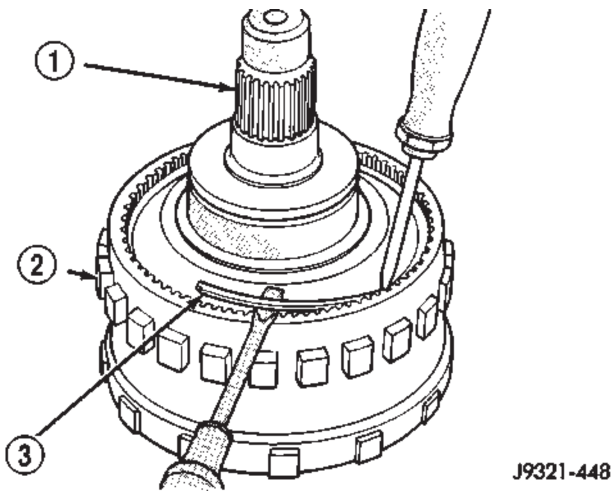

*Fig. 144 Annulus Gear Snap-Ring Removal*

1 - OUTPUT SHAFT
2 - ANNULUS GEAR
3 - SNAP-RING

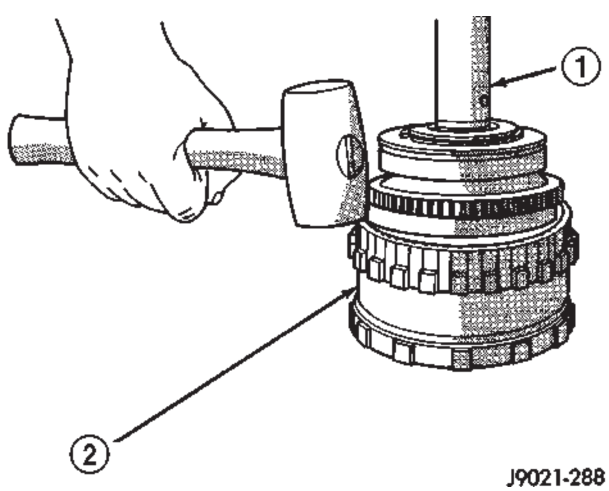

*Fig. 145 Annulus Gear Removal*

1 - OUTPUT SHAFT
2 - ANNULUS GEAR

## GEAR CASE AND PARK LOCK

(1) Remove locating ring from gear case.

(2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.

(3) Remove reaction plug snap-ring and remove reaction plug.

(4) Remove output shaft seal.

## CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

## INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

OVERDRIVE UNIT (Continued)

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

## ASSEMBLY

### GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 146). Lubricate bushings with petroleum jelly, or transmission fluid.

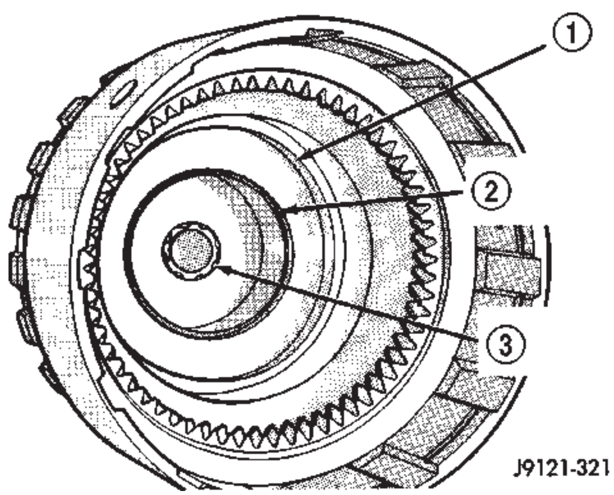

***Fig. 146 Output Shaft Pilot Bushing***

1 - OUTPUT SHAFT HUB
2 - OVERRUNNING CLUTCH HUB BUSHING
3 - INTERMEDIATE SHAFT PILOT BUSHING

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 147).

(4) Align and install clutch drum on annulus gear (Fig. 148). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 148).

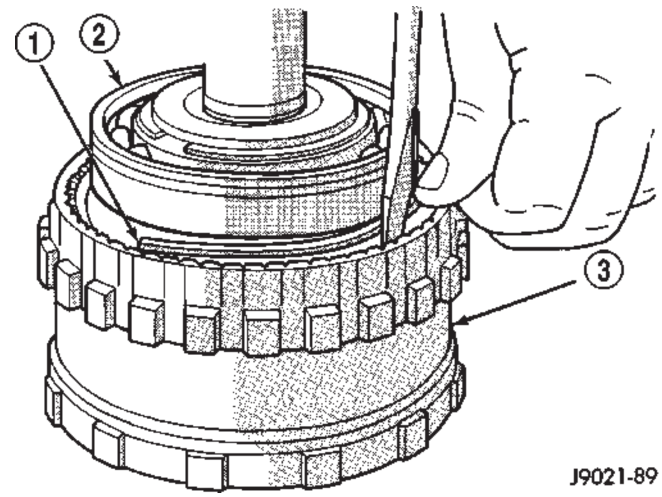

***Fig. 147 Annulus Gear Installation***

1 - SNAP-RING
2 - OUTPUT SHAFT FRONT BEARING
3 - ANNULUS GEAR

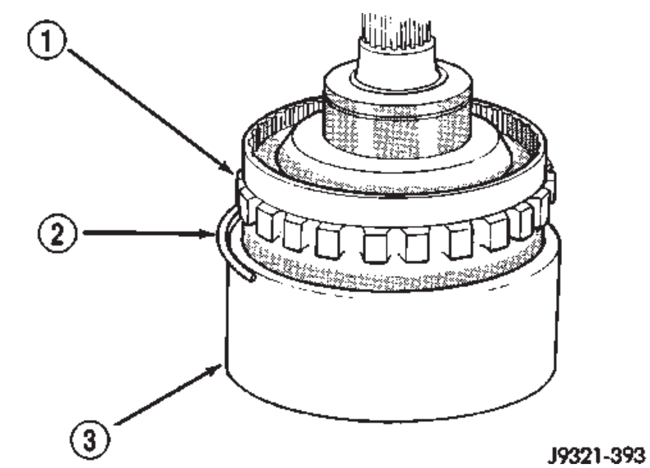

***Fig. 148 Clutch Drum And Outer Retaining Ring Installation***

1 - ANNULUS GEAR
2 - OUTER SNAP-RING
3 - CLUTCH DRUM

OVERDRIVE UNIT (Continued)

(6) Slide clutch drum forward and install inner retaining ring (Fig. 149).

(7) Install rear bearing and snap-ring on output shaft (Fig. 150). Be sure locating ring groove in bearing is toward rear.

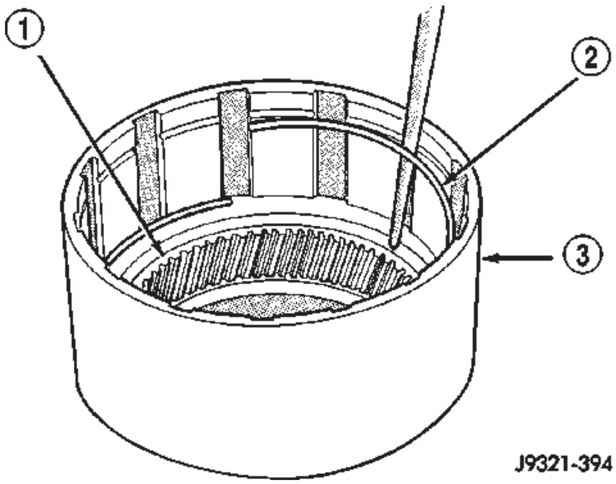

*Fig. 149 Clutch Drum Inner Retaining Ring Installation*

1 - ANNULUS GEAR
2 - INNER SNAP-RING
3 - CLUTCH DRUM

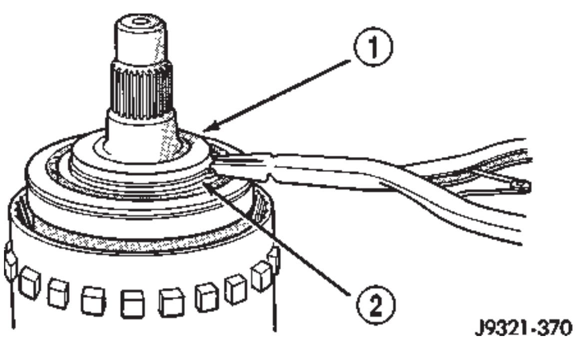

*Fig. 150 Rear Bearing And Snap-Ring Installation*

1 - REAR BEARING
2 - SNAP-RING

(8) Install overrunning clutch on hub (Fig. 151). Note that clutch only fits one way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

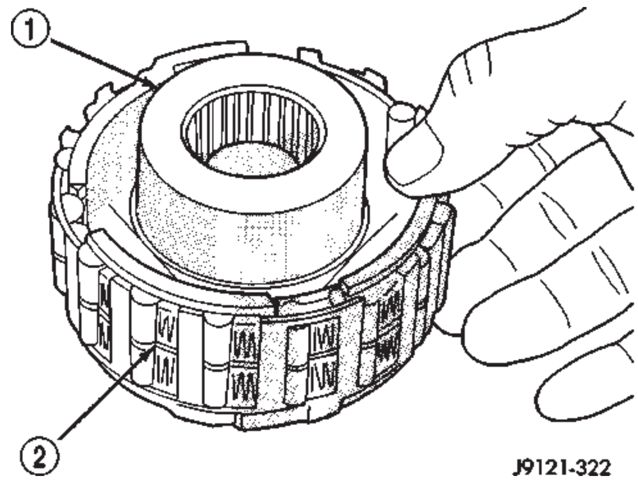

*Fig. 151 Assembling Overrunning Clutch And Hub*

1 - CLUTCH HUB
2 - OVERRUNNING CLUTCH

(10) Install overrunning clutch in output shaft (Fig. 152). Insert snap-ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 153). Be sure planetary pinions are fully seated in annulus gear before proceeding.

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

(13) Install planetary thrust bearing on sun gear (Fig. 154). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 155). Be sure sun gear and thrust bearing are fully seated before proceeding.

OVERDRIVE UNIT (Continued)

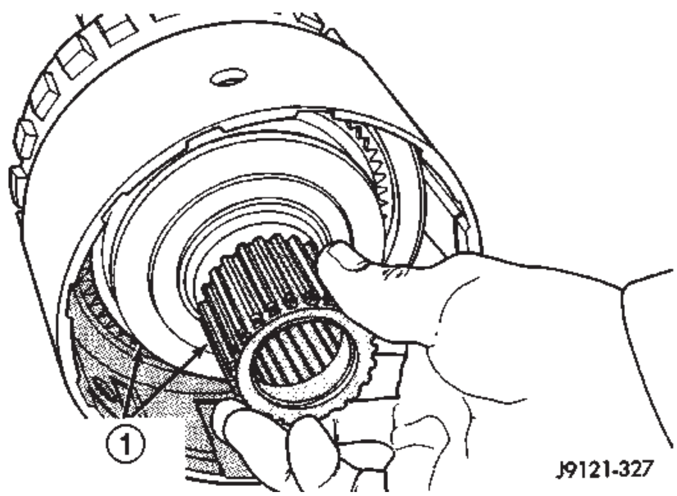

*Fig. 155 Sun Gear Installation*

1 - SUN GEAR AND SPRING PLATE ASSEMBLY

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 156). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 157). Be sure spring is properly seated on spring plate.

**NOTE: The direct clutch in a 47RE transmission uses 10 clutch discs.**

OVERDRIVE UNIT (Continued)

4 - SUN GEAR

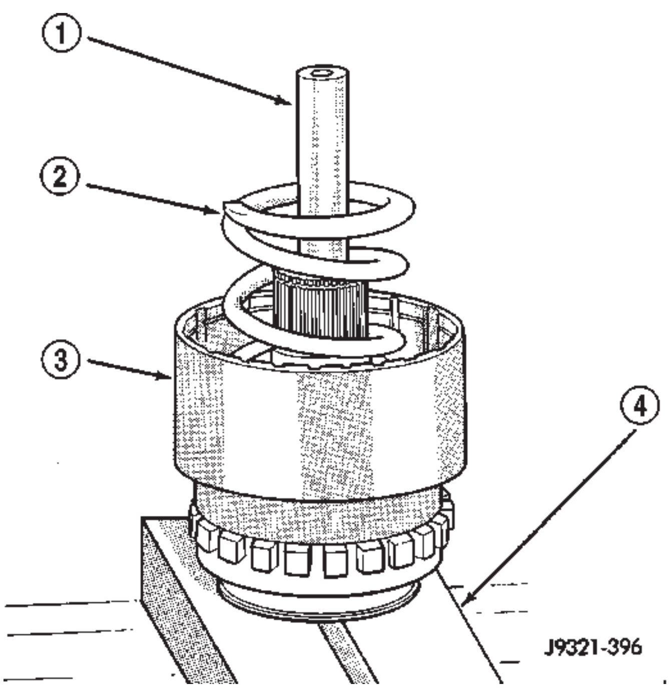

*Fig. 157 Direct Clutch Spring Installation*

1 - SPECIAL TOOL 6227-2
2 - DIRECT CLUTCH SPRING
3 - CLUTCH HUB
4 - PRESS PLATES

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components.

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 158).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 159).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 160). Be sure hub is started on sun gear splines before proceeding.

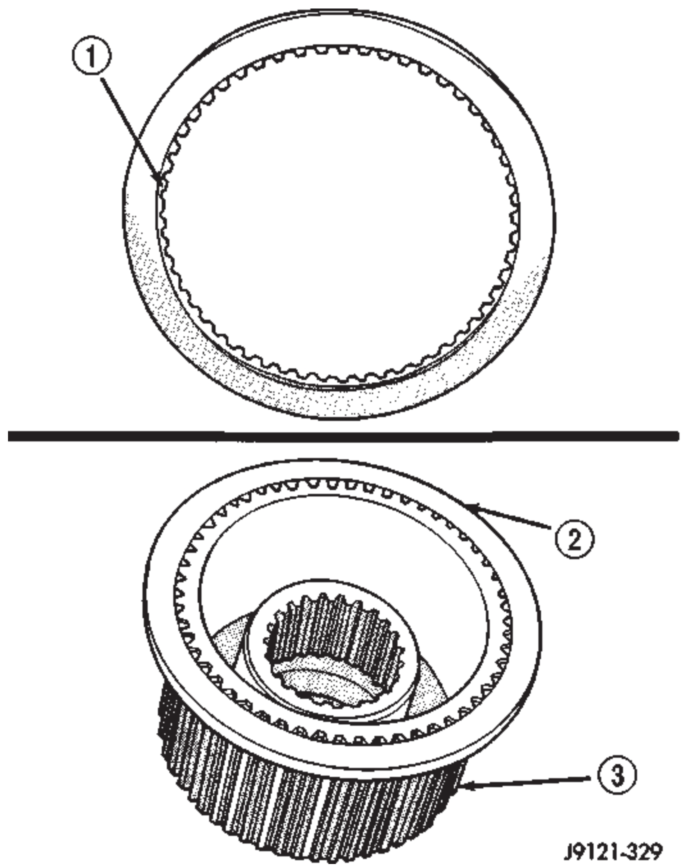

*Fig. 158 Correct Position Of Direct Clutch Reaction Plate*

3 - CLUTCH DRUM

**WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.**

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap-ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap-ring (Fig. 161). Be very sure snap-ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 162). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

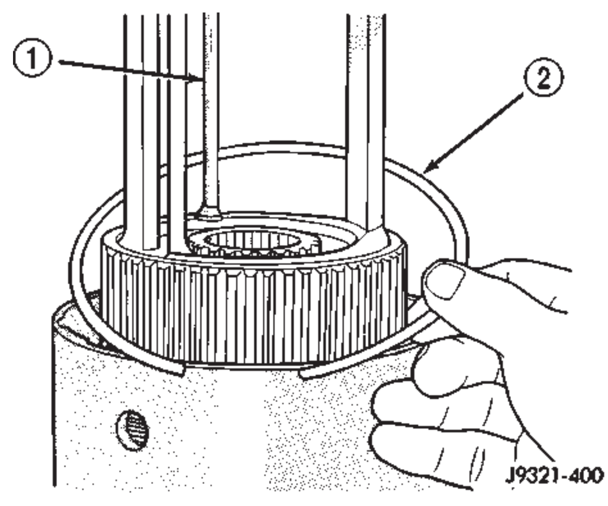

*Fig. 161 Direct Clutch Pack Snap-Ring Installation*

1 - SPECIAL TOOL 6227-1
2 - DIRECT CLUTCH PACK SNAP-RING

OVERDRIVE UNIT (Continued)

2 - SNAP-RING PLIERS

## GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 163). Be sure pin is seated in hole in case before installing snap-ring.

(4) Install reaction plug snap-ring (Fig. 164). Compress snap-ring only enough for installation; do not distort it.

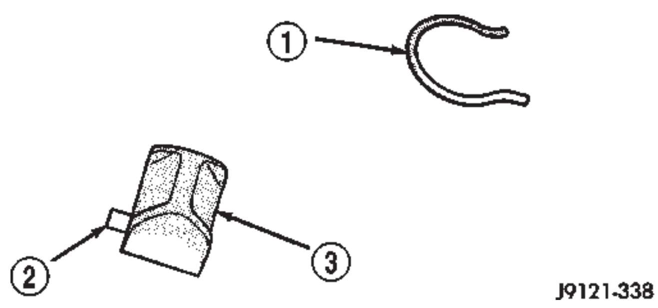

*Fig. 163 Reaction Plug Locating Pin And Snap-Ring*

1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)
2 - LOCATING PIN
3 - PARK LOCK REACTION PLUG

(5) Install new seal in gear case. Use Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 165).

(7) Support geartrain on Tool 6227-1 (Fig. 166). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 166).

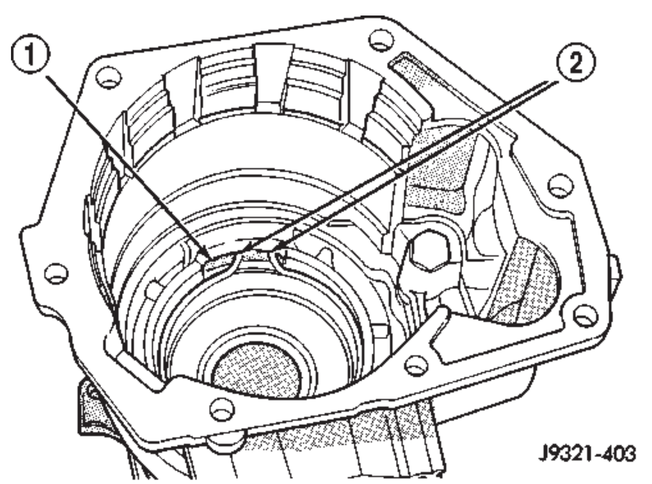

*Fig. 165 Correct Rear Bearing Locating Ring Position*

1 - CASE ACCESS HOLE
2 - TAB ENDS OF LOCATING RING

OVERDRIVE UNIT (Continued)

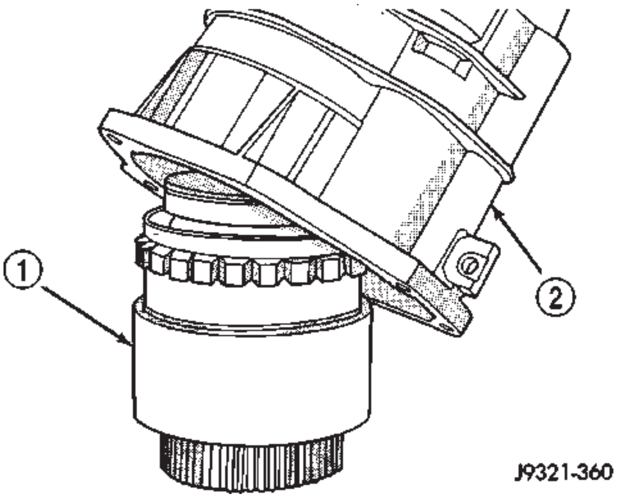

***Fig. 166 Overdrive Gear Case Installation***

1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

(9) Expand front bearing locating ring with snap-ring pliers (Fig. 167). Then slide case downward until locating ring locks in bearing groove and release snap-ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 168).

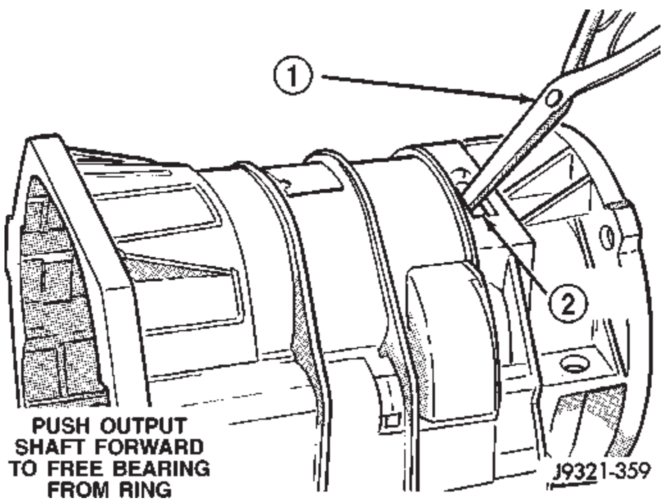

***Fig. 167 Seating Locating Ring In Rear Bearing***

1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

## OVERDRIVE CLUTCH

**NOTE: The overdrive clutch in a 47RE transmission uses 5 clutch discs.**

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 169).

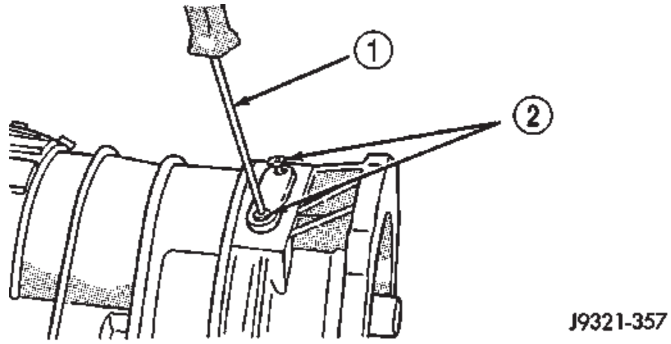

***Fig. 168 Locating Ring Access Cover And Gasket Installation***

1 - TORX SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

(2) Install wave spring on top of reaction ring (Fig. 170). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

(3) Assemble overdrive clutch pack.

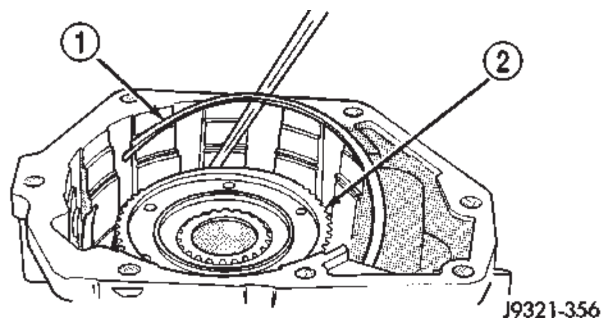

***Fig. 169 Overdrive Clutch Reaction Ring Installation***

1 - REACTION RING
2 - CLUTCH HUB

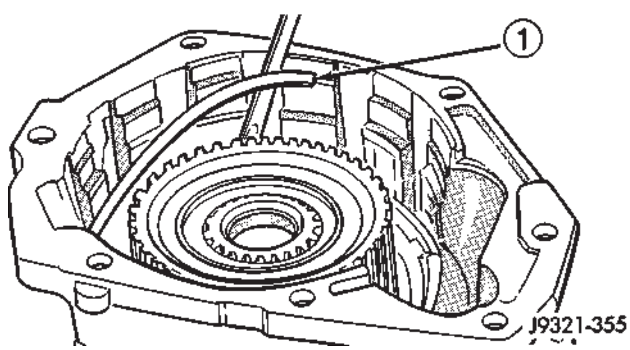

***Fig. 170 Overdrive Clutch Wave Spring Installation***

1 - WAVE SPRING

(4) Install overdrive clutch reaction plate first.

OVERDRIVE UNIT (Continued)

**NOTE: The reaction plate is thicker than the pressure plate in a 47RE transmission.**

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 171).

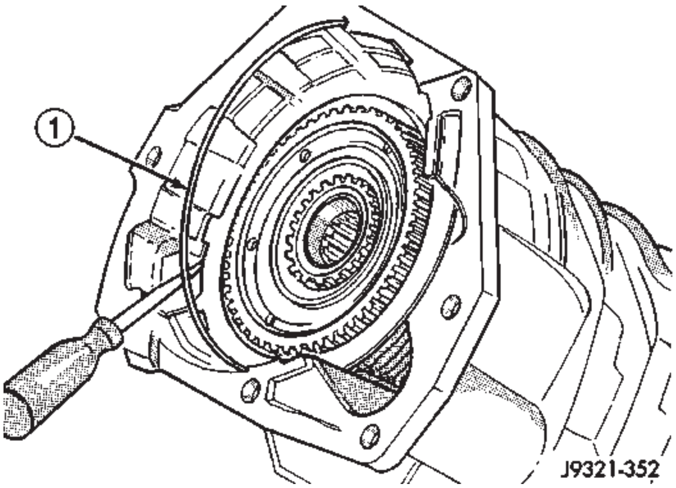

***Fig. 171 Overdrive Clutch Pack Retaining Ring Installation***

1 - OVERDRIVE CLUTCH PACK RETAINING RING

## INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 172). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 172).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 173).

(e) Remove Gauge Alignment Tool 6312.

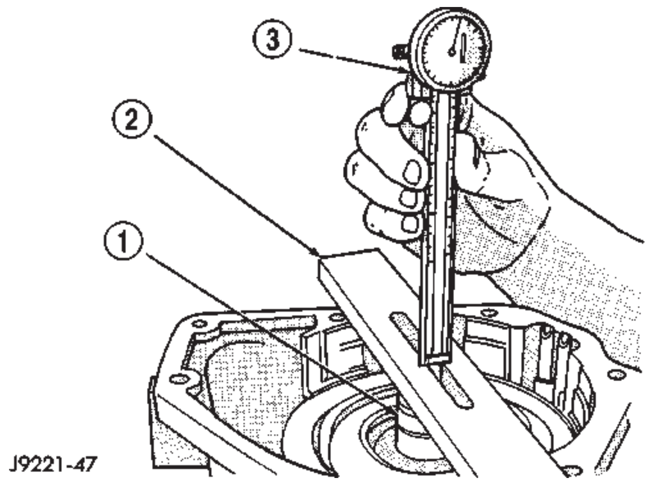

***Fig. 172 Shaft End Play Measurement***

1 - SPECIAL TOOL 6312
2 - SPECIAL TOOL 6311
3 - SPECIAL TOOL C-4962

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| .7336 - .7505 | .158 - .159 |
| .7506 - .7675 | .175 - .176 |
| .7676 - .7855 | .193 - .194 |
| .7856 - .8011 | .211 - .212 |

## OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 174).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 175).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

OVERDRIVE UNIT (Continued)

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

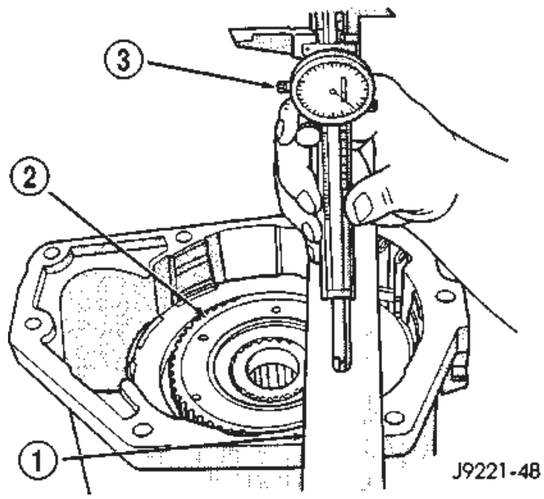

*Fig. 174 Overdrive Piston Thrust Plate Measurement*

2 - DIRECT CLUTCH HUB THRUST BEARING SEAT
3 - SPECIAL TOOL C-4962

| End Play Measurement (Inches) | Spacer Thickness (Inches) |
|---|---|
| 1.7500 - 1.7649 | .108 - .110 |
| 1.7650 - 1.7799 | .123 - .125 |
| 1.7800 - 1.7949 | .138 - .140 |
| 1.7950 - 1.8099 | .153 - .155 |
| 1.8100 - 1.8249 | .168 - .170 |
| 1.8250 - 1.8399 | .183 - .185 |
| 1.8400 - 1.8549 | .198 - .200 |
| 1.8550 - 1.8699 | .213 - .215 |
| 1.8700 - 1.8849 | .228 - .230 |
| 1.8850 - 1.8999 | .243 - .245 |

J9121-342

*Fig. 175 Overdrive Piston Thrust Plate Selection*

## OVERDRIVE PISTON

(1) Install new seals on overdrive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by:

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and o-ring seal in overdrive case.

## INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 176).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

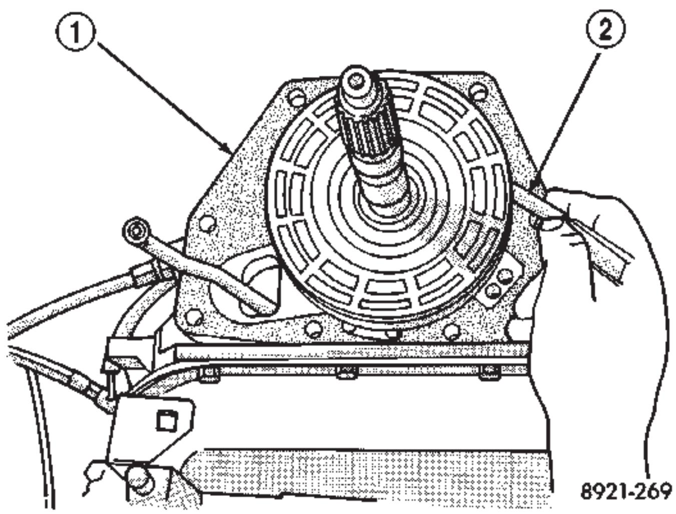

*Fig. 176 Trimming Overdrive Case Gasket*

1 - GASKET
2 - SHARP KNIFE

OVERDRIVE UNIT (Continued)

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 177).

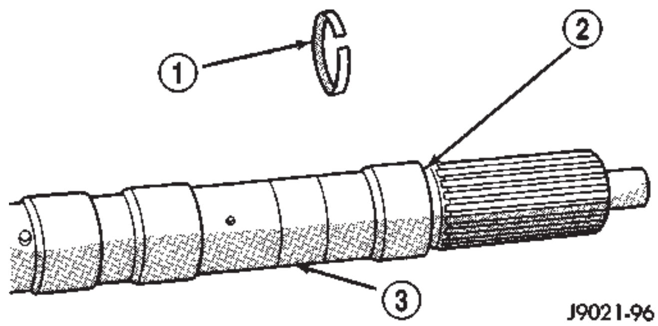

***Fig. 177 Intermediate Shaft Selective Spacer Location***

1 - SELECTIVE SPACER
2 - SPACER GROOVE
3 - INTERMEDIATE SHAFT

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

**CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.**

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

# OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

## DESCRIPTION

The overrunning clutch (Fig. 178) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

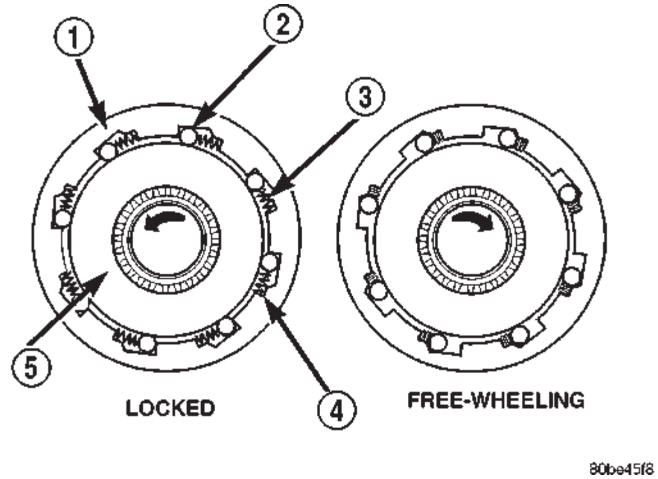

***Fig. 178 Overrunning Clutch***

1 - OUTER RACE (CAM)
2 - ROLLER
3 - SPRING
4 - SPRING RETAINER
5 - INNER RACE (HUB)

## OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a freewheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

## DISASSEMBLY

(1) Remove the overdrive piston (Fig. 179).
(2) Remove the overdrive piston retainer bolts.
(3) Remove overdrive piston retainer.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

(4) Remove case gasket.

(5) Tap old cam out of case with pin punch. Insert punch through bolt holes at rear of case (Fig. 180). Alternate position of punch to avoid cocking cam during removal.

(6) Clean clutch cam bore and case. Be sure to remove all chips/shavings generated during cam removal.

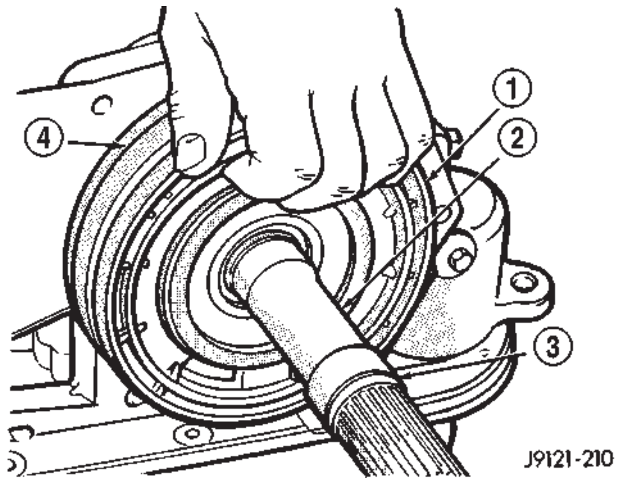

*Fig. 179 Overdrive Piston Removal*

1 - OVERDRIVE CLUTCH PISTON
2 - INTERMEDIATE SHAFT
3 - SELECTIVE SPACER
4 - PISTON RETAINER

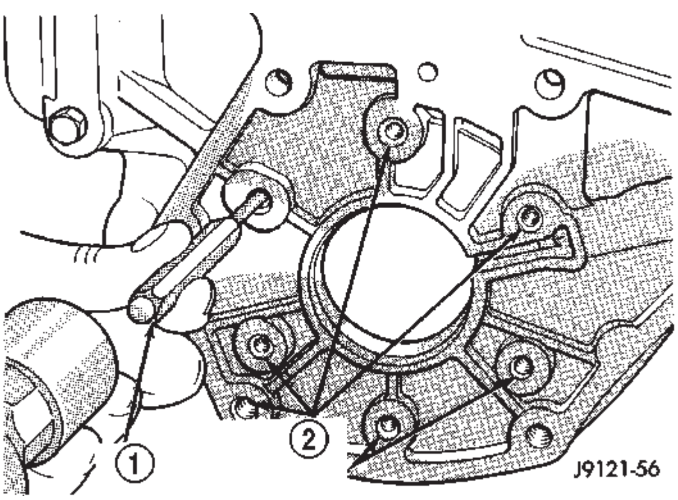

*Fig. 180 Overrunning Clutch Cam*

1 - PIN PUNCH
2 - REAR SUPPORT BOLT HOLES

## CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

## INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

## ASSEMBLY

(1) Temporarily install overdrive piston retainer in case. Use 3-4 bolts to secure retainer.

(2) Align and start new clutch cam in the transmission case. Be sure serrations on cam and in case are aligned (Fig. 181). Then tap cam into case just enough to hold it in place.

(3) Verify that cam is correctly positioned before proceeding any further. Narrow ends of cam ramps should be to left when cam is viewed from front end of case (Fig. 181).

(4) Insert Adapter Tool SP-5124 into piston retainer (Fig. 182).

(5) Assemble Puller Bolt SP-3701 and Press Plate SP-3583-A (Fig. 183).

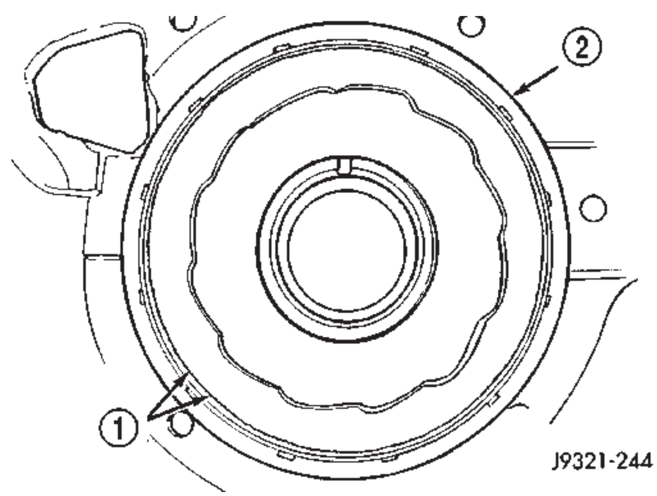

*Fig. 181 Positioning Replacement Clutch Cam In Case*

1 - ALIGN SERRATIONS ON CAM AND IN CASE
2 - CLUTCH CAM

2 - SPECIAL TOOL SP-5124

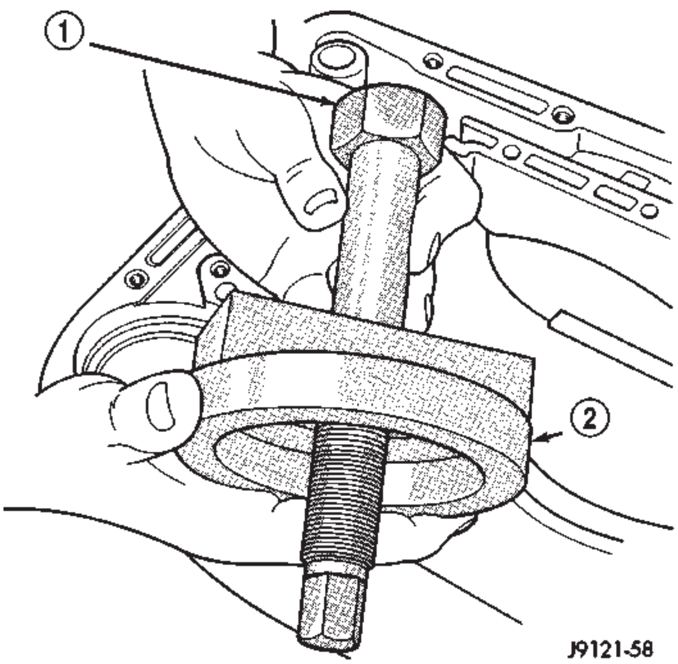

**Fig. 183 Assembling Clutch Cam Puller Bolt And Press Plate**

1 - PULLER BOLT SP-3701
2 - PRESS PLATE SP-3583-A

(6) Install assembled puller plate and bolt (Fig. 184). Insert bolt through cam, case and adapter tool. Be sure plate is seated squarely on cam.

(7) Hold puller plate and bolt in place and install puller nut SP-3701 on puller bolt (Fig. 185).

(8) Tighten puller nut to press clutch cam into case (Fig. 185). Be sure cam is pressed into case evenly and does not become cocked.

(9) Remove clutch cam installer tools.

(10) Stake case in 14 places around clutch cam to help secure cam in case. Use blunt punch or chisel to stake case.

(11) Remove piston retainer from case. Cover retainer with plastic sheeting, or paper to keep it dust free.

(12) Clean case and cam thoroughly. Be sure any chips/shavings generated during cam installation are removed from case.

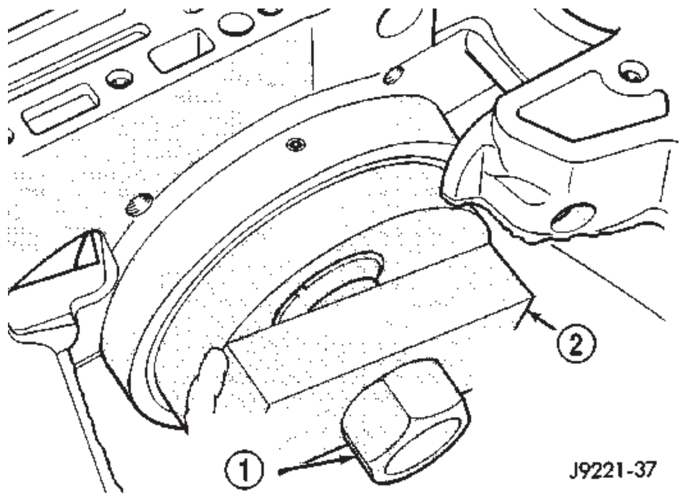

**Fig. 184 Positioning Puller Plate On Clutch Cam**

1 - SPECIAL TOOL SP-3701
2 - BE SURE PLATE SP-3583-A IS SEATED SQUARELY ON CAM

(13) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 186). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

2 - TIGHTEN NUT TO DRAW CAM INTO CASE (NUT IS PART OF BOLT SP-3701)
3 - SPECIAL TOOL SP-5124
4 - SPECIAL TOOL SP-3701

(14) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 187). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

(15) Install new seals on overdrive piston.

(16) Stand transmission case upright on bellhousing.

(17) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(18) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(19) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

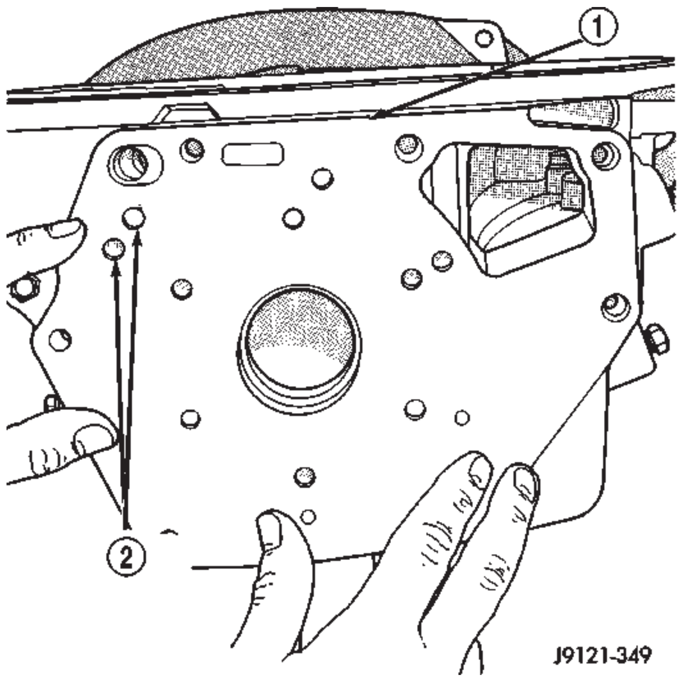

**Fig. 186 Installing/Aligning Case Gasket**

1 - CASE GASKET

# PARK/NEUTRAL POSITION SWITCH

## DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

### SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

## REMOVAL

(1) Raise vehicle and position drain pan under switch.

(2) Disconnect switch wires.

(3) Remove switch from case.

## INSTALLATION

(1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 188).

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

(3) Test continuity of new switch with 12V test lamp.

(4) Connect switch wires and lower vehicle.

(5) Top off transmission fluid level.

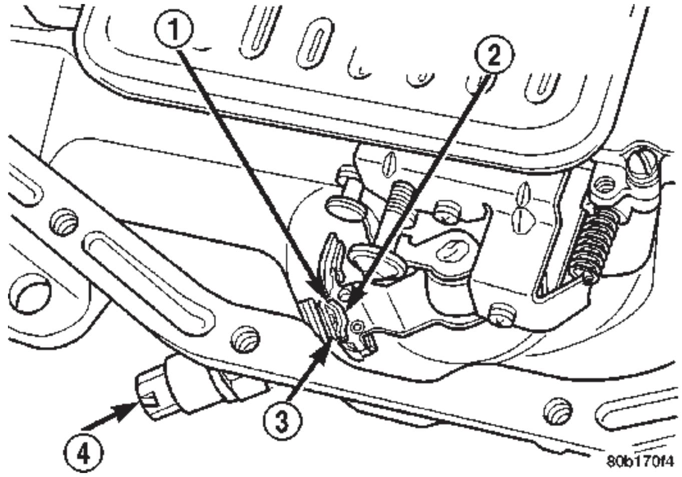

***Fig. 188 Park/Neutral Position Switch***

# PISTONS

## DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

## OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PISTONS (Continued)

## PRESSURE

Pressure (Fig. 189) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

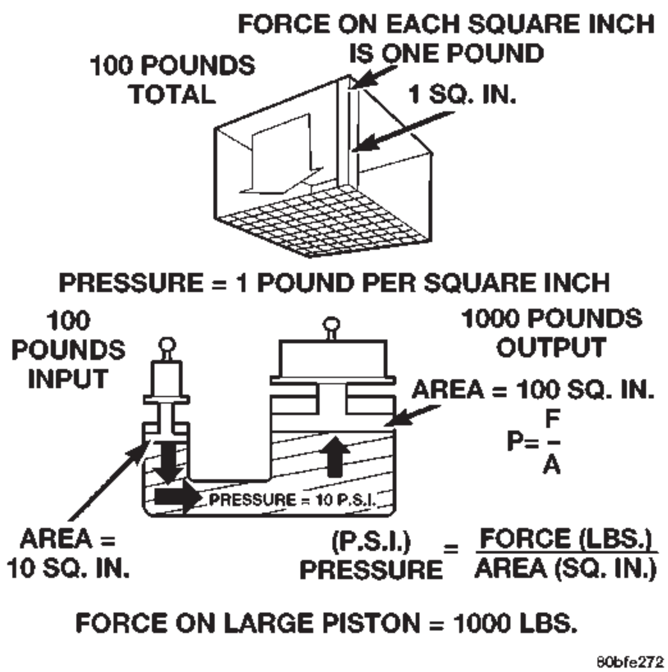

*Fig. 189 Force and Pressure Relationship*

## PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 190) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply “leak” past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal’s Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

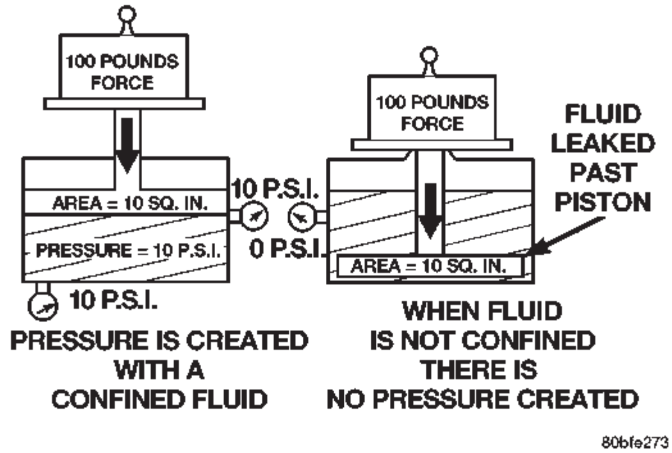

*Fig. 190 Pressure on a Confined Fluid*

## FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 191), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 191), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept “pressure is the same everywhere” means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

## PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it’s a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 192) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

PISTONS (Continued)

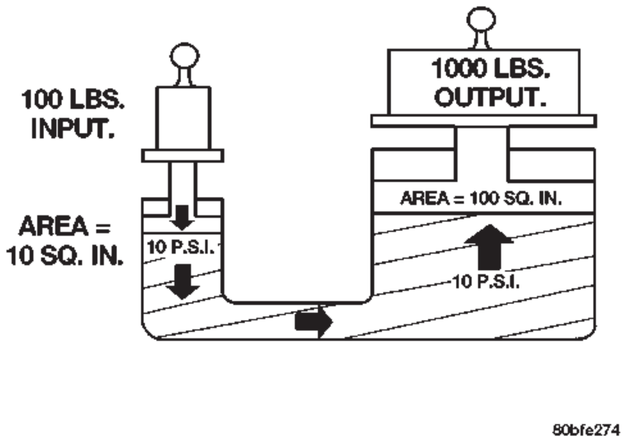

*Fig. 191 Force Multiplication*

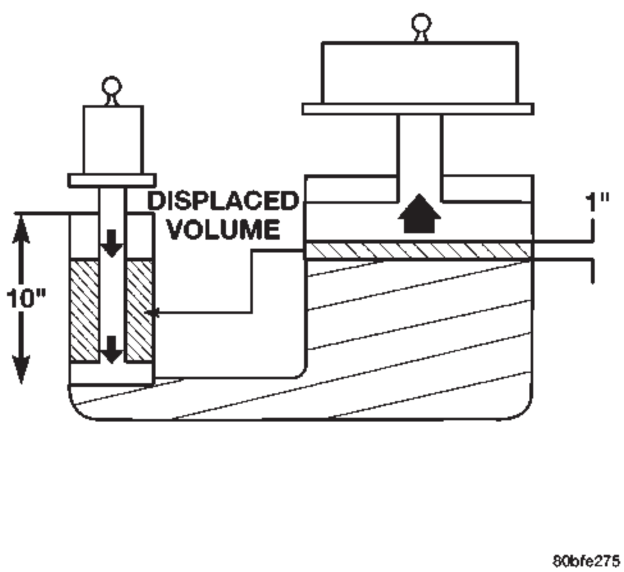

*Fig. 192 Piston Travel*

# PLANETARY GEARTRAIN/ OUTPUT SHAFT

## DESCRIPTION

The planetary gearsets (Fig. 193) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.

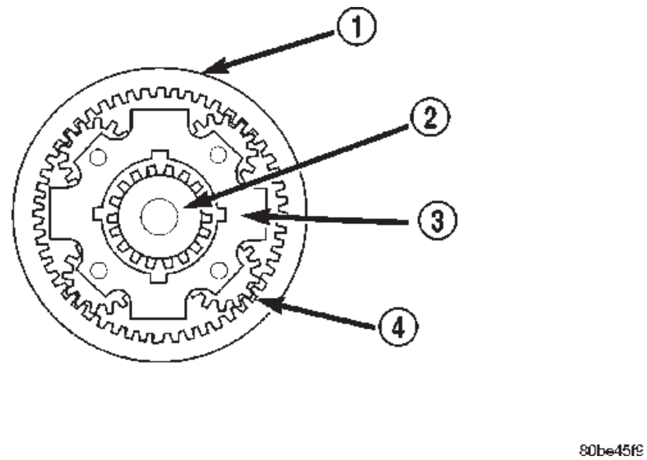

*Fig. 193 Planetary Gearset*

1 - ANNULUS GEAR
2 - SUN GEAR
3 - PLANET CARRIER
4 - PLANET PINIONS (4)

- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

**NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.**

## OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

**NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.**

## DISASSEMBLY

(1) Remove planetary snap-ring from intermediate shaft (Fig. 194). Discard snap-ring as it is not reusable.

(2) Remove front planetary gear and front annulus gear as assembly (Fig. 195).

(3) Remove front planetary gear and thrust washer from front annulus gear (Fig. 196). Note thrust washer position for assembly reference.

(4) Remove tabbed thrust washer from driving shell (Fig. 197). Note washer position for assembly reference.

(5) Remove sun gear and driving shell as assembly (Fig. 198).

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

## INSPECTION

Inspect the planetary gear sets and annulus gears. The planetary pinions, shafts, washers, and retaining pins are serviceable. However, if a pinion carrier is damaged, the entire planetary gear set must be replaced as an assembly.

Replace the annulus gears if the teeth are chipped, broken, or worn, or the gear is cracked. Replace the planetary thrust plates and the tabbed thrust washers if cracked, scored or worn.

Inspect the machined surfaces of the intermediate shaft. Be sure the oil passages are open and clear. Replace the shaft if scored, pitted, or damaged.

Inspect the sun gear and driving shell. If either component is worn or damaged, remove the sun gear rear retaining ring and separate the sun gear and thrust plate from the driving shell. Then replace the necessary component.

Replace the sun gear as an assembly if the gear teeth are chipped or worn. Also replace the gear as an assembly if the bushings are scored or worn. The sun gear bushings are not serviceable. Replace the thrust plate if worn, or severely scored. Replace the driving shell if distorted, cracked, or damaged in any way.

Replace all snap-rings during geartrain assembly. Reusing snap-rings is not recommended.

## ASSEMBLY

(1) Lubricate sun gear and planetary gears with transmission fluid during assembly. Use petroleum jelly to lubricate intermediate shaft bushing surfaces, thrust washers and thrust plates and to hold these parts in place during assembly.

(2) Install front snap-ring on sun gear and install gear in driving shell. Then install thrust plate over sun gear and against rear side of driving shell (Fig. 202). Install rear snap-ring to secure sun gear and thrust plate in driving shell.

(3) Install rear annulus gear on intermediate shaft (Fig. 203).

(4) Install thrust plate in annulus gear (Fig. 204). Be sure plate is seated on shaft splines and against gear.

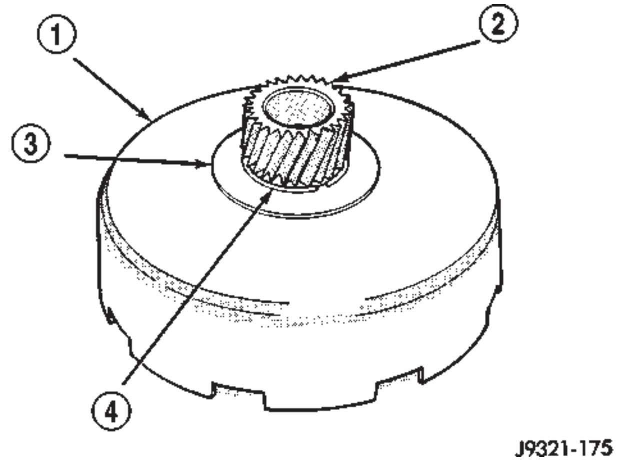

***Fig. 202 Sun Gear Installation***

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

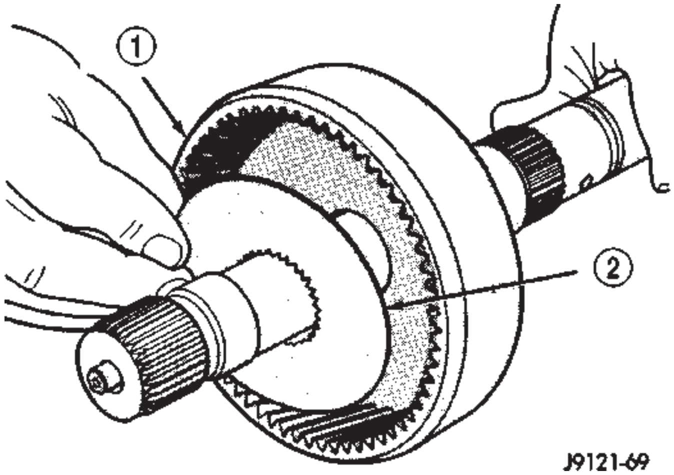

*Fig. 204 Installing Rear Annulus Thrust Plate*

1 - REAR ANNULUS GEAR
2 - THRUST PLATE

(5) Install rear planetary gear in rear annulus gear (Fig. 205). Be sure planetary carrier is seated against annulus gear.

(6) Install tabbed thrust washer on front face of rear planetary gear (Fig. 206). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

(7) Lubricate sun gear bushings with petroleum jelly or transmission fluid.

(8) Install sun gear and driving shell on intermediate shaft (Fig. 207). Seat shell against rear planetary gear. Verify that thrust washer on planetary gear was not displaced during installation.

(9) Install tabbed thrust washer in driving shell (Fig. 208), be sure washer tabs are seated in tab slots of driving shell. Use extra petroleum jelly to hold washer in place if desired.

(10) Install tabbed thrust washer on front planetary gear (Fig. 209). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

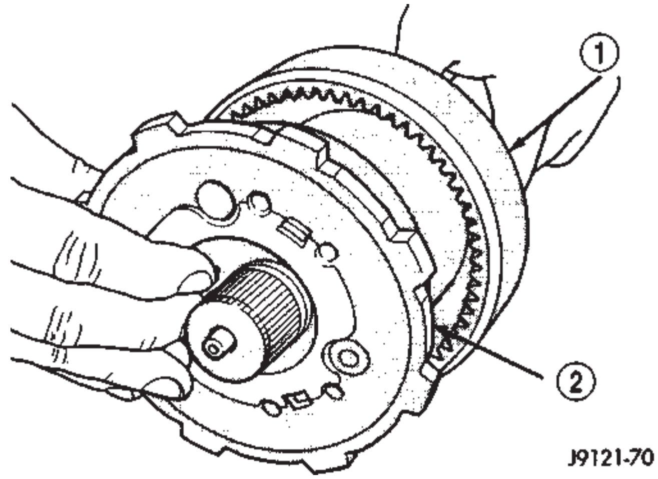

*Fig. 205 Installing Rear Planetary Gear*

1 - REAR ANNULUS GEAR

2 - DRIVING SHELL
3 - TABBED THRUST WASHER

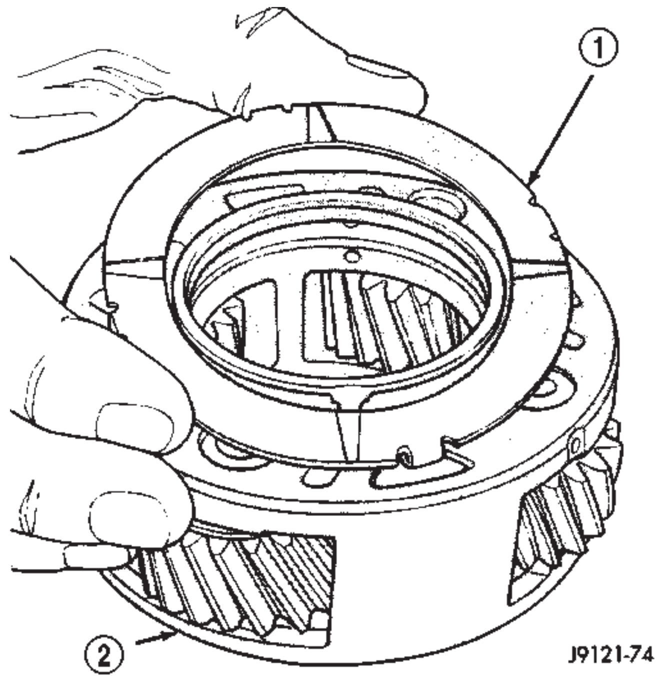

***Fig. 209 Installing Thrust Washer On Front Planetary Gear***

1 - TABBED THRUST WASHER
2 - FRONT PLANETARY GEAR

(11) Install front annulus gear over and onto front planetary gear (Fig. 210). Be sure gears are fully meshed and seated.

(12) Install front planetary and annulus gear assembly (Fig. 211). Hold gears together and slide them onto shaft. Be sure planetary pinions are seated on sun gear and that planetary carrier is seated on intermediate shaft.

(13) Place geartrain in upright position. Rotate gears to be sure all components are seated and properly assembled. Snap-ring groove at forward end of intermediate shaft will be completely exposed when components are assembled correctly.

(14) Install new planetary snap-ring in groove at end of intermediate shaft (Fig. 212).

(15) Turn planetary geartrain over. Position wood block under front end of intermediate shaft and support geartrain on shaft. Be sure all geartrain parts have moved forward against planetary snap-ring. This is important for accurate end play check.

(16) Check planetary geartrain end play with feeler gauge (Fig. 213). Insert gauge between rear annulus gear and shoulder on intermediate shaft as shown. End play should be 0.15 to 1.22 mm (0.006 to 0.048 in.).

(17) If end play is incorrect, install thinner/thicker planetary snap-ring as needed.

# REAR CLUTCH

## DESCRIPTION

The rear clutch assembly (Fig. 214) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

**NOTE: The number of discs and plates may vary with each engine and vehicle combination.**

## OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

19 - RETAINING RING

REAR CLUTCH (Continued)

## DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front and rear seal rings.

(3) Remove selective clutch pack snap-ring (Fig. 215).

(4) Remove the reaction plate, clutch discs, steel plates, pressure plate, wave spring, spacer ring, and piston spring (Fig. 215).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft retaining ring. It may be necessary to press the input shaft in slightly to relieve tension on the retaining ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

## CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

## INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

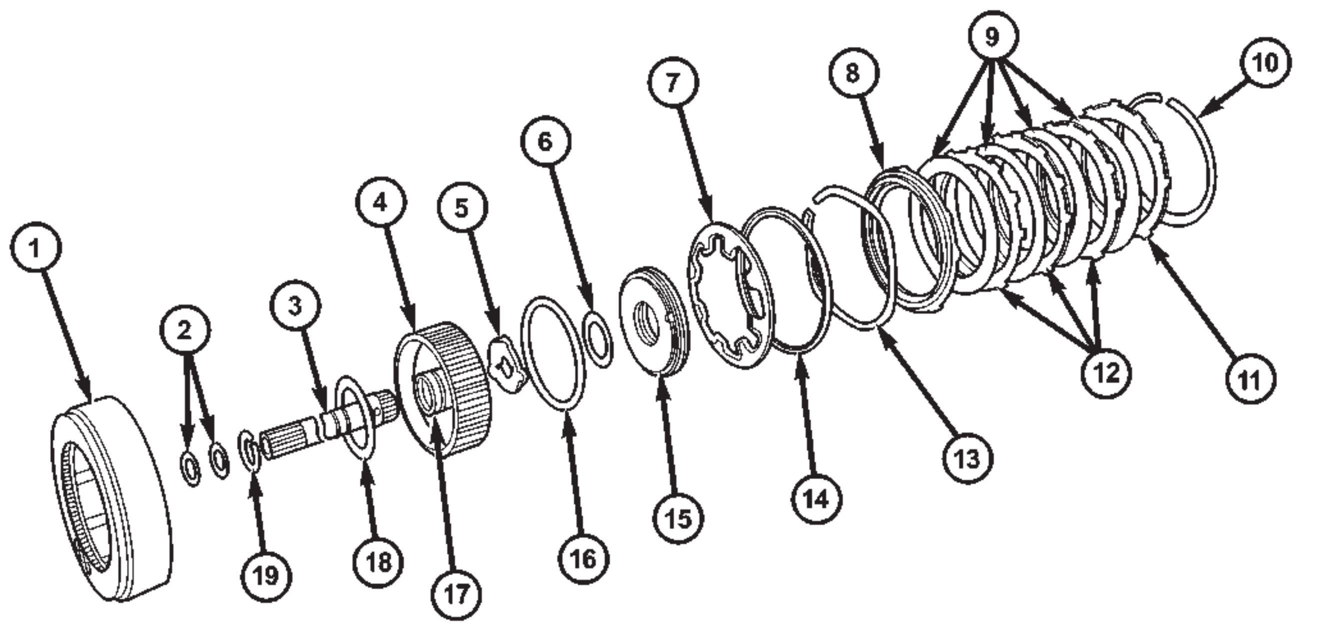

*Fig. 215 Rear Clutch Components*

15 - PISTON
16 - OUTER PISTON SEAL
17 - REAR SEAL RING
18 - FIBER THRUST WASHER
19 - RETAINING RING

REAR CLUTCH (Continued)

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

## ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary.

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then partially press input shaft into retainer (Fig. 216). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft retaining ring.

(5) Press the input shaft the remainder of the way into the clutch retainer.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020″ thick), can be used to guide seals into place if necessary.

**CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.**

(9) Install piston spring in retainer and on top of piston. Concave side of spring faces downward (toward piston).

(10) Install the spacer ring and wave spring into the retainer. Be sure spring is completely seated in retainer groove.

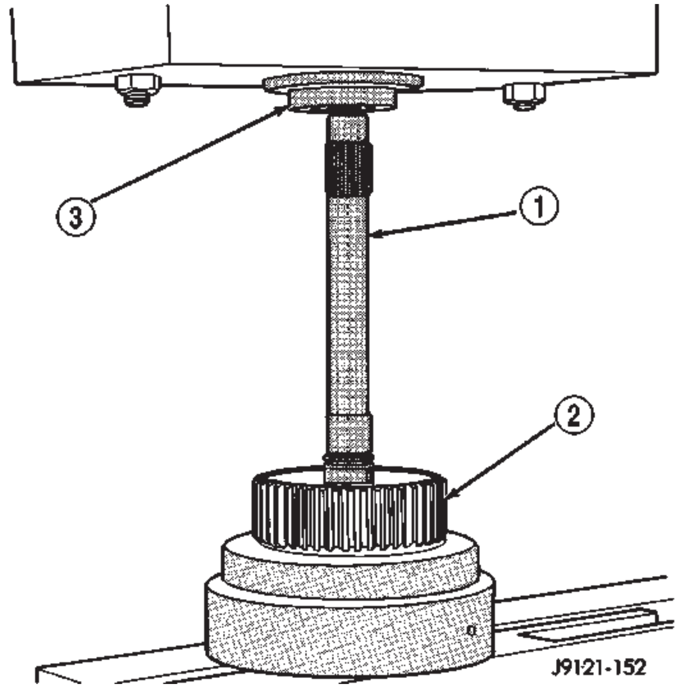

*Fig. 216 Pressing Input Shaft Into Rear Clutch Retainer*

1 - INPUT SHAFT
2 - REAR CLUTCH RETAINER
3 - PRESS RAM

(11) Install pressure plate (Fig. 223). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 223).

(13) Install the reaction plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 217).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 217).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.635 - 0.914 mm (0.025 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

REAR CLUTCH (Continued)

The selective snap ring thicknesses are:
- 0.107 - 0.109 in.
- 0.098 - 0.100 in.
- 0.095 - 0.097 in.
- 0.083 - 0.085 in.
- 0.076 - 0.078 in.
- 0.071 - 0.073 in.
- 0.060 - 0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 218). Use enough petroleum jelly to hold washer in place.

(17) Set rear clutch aside for installation during final assembly.

# REAR SERVO

## DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

## OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

REAR SERVO (Continued)

## DISASSEMBLY

(1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 219).

(2) Remove and discard servo piston seal ring.

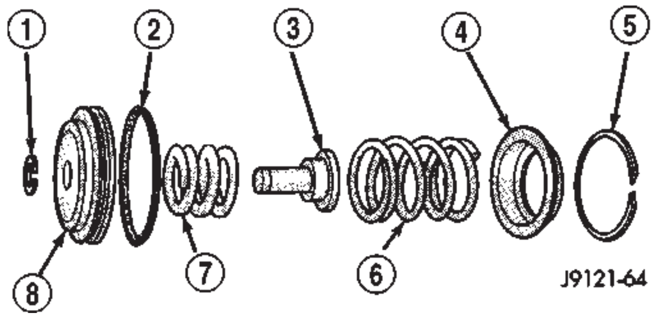

*Fig. 219 Rear Servo Components*

2 - PISTON SEAL
3 - PISTON PLUG
4 - SPRING RETAINER
5 - SNAP-RING
6 - PISTON SPRING
7 - CUSHION SPRING
8 - PISTON

## CLEANING

Remove and discard the servo piston seal ring (Fig. 220). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap-rings and use new ones at assembly.

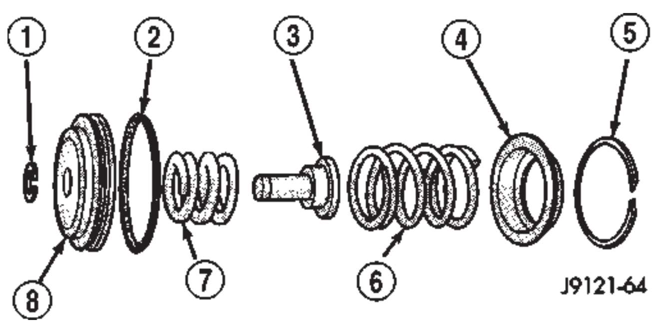

*Fig. 220 Rear Servo Components*

7 - CUSHION SPRING
8 - PISTON

## ASSEMBLY

(1) Lubricate piston and guide seals (Fig. 221) with petroleum jelly. Lubricate other servo parts with Mopar® ATF +4, type 9602, transmission fluid.

(2) Install new seal ring on servo piston.

(3) Assemble piston, plug, spring and new snap-ring.

(4) Lubricate piston seal lip with petroleum jelly.

# SHIFT MECHANISM

## DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

## OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position.

SHIFT MECHANISM (Continued)

No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

## ADJUSTMENT

Check linkage adjustment by starting engine in PARK and NEUTRAL. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

### LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 222). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

(1) Shift transmission into PARK.

(2) Raise and support vehicle.

(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 222).

(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.

(5) Move transmission shift lever fully rearward to the Park detent.

(6) Center adjusting swivel on shift rod.

(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).

(8) Lower vehicle and verify proper adjustment.

# SOLENOID

## DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the

SOLENOID (Continued)

plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

### OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## SPEED SENSOR

### DESCRIPTION

The speed sensor (Fig. 223) is located in the overdrive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

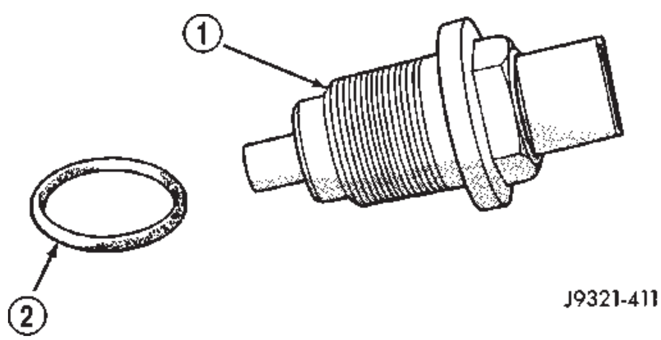

***Fig. 223 Transmission Output Speed Sensor***

1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
2 - SEAL

### OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

## THROTTLE VALVE CABLE

### DESCRIPTION

Transmission throttle valve cable (Fig. 224) adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

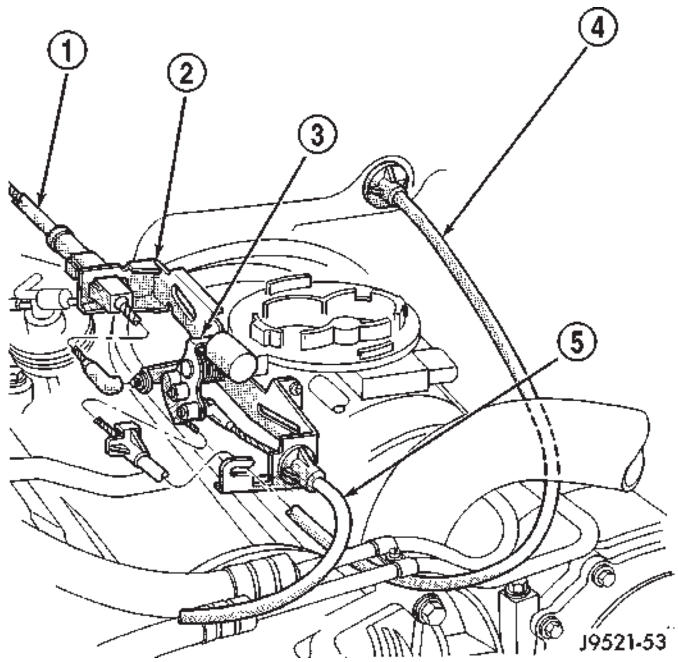

***Fig. 224 Throttle Valve Cable Attachment - At Engine***

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

THROTTLE VALVE CABLE (Continued)

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 225). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

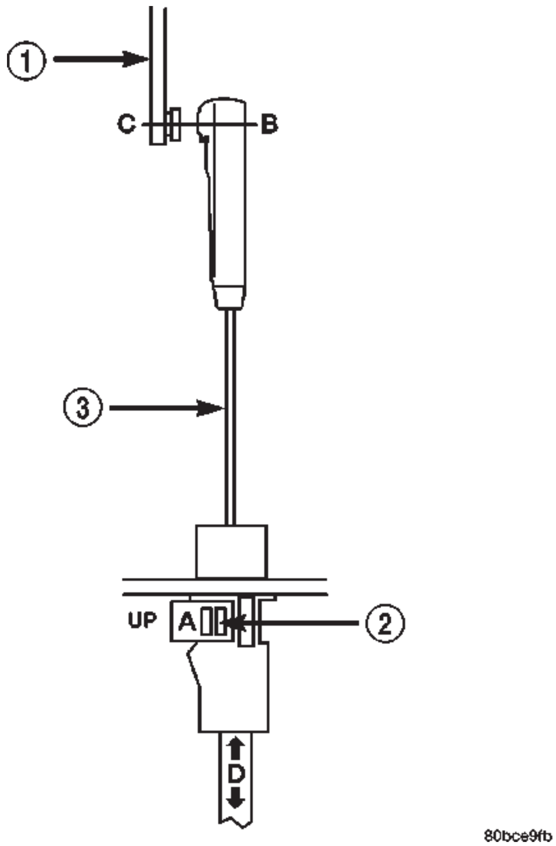

*Fig. 225 Throttle Valve Cable at Throttle Linkage*

1 - THROTTLE LINKAGE
2 - THROTTLE VALVE CABLE LOCKING CLIP
3 - THROTTLE VALVE CABLE

## ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

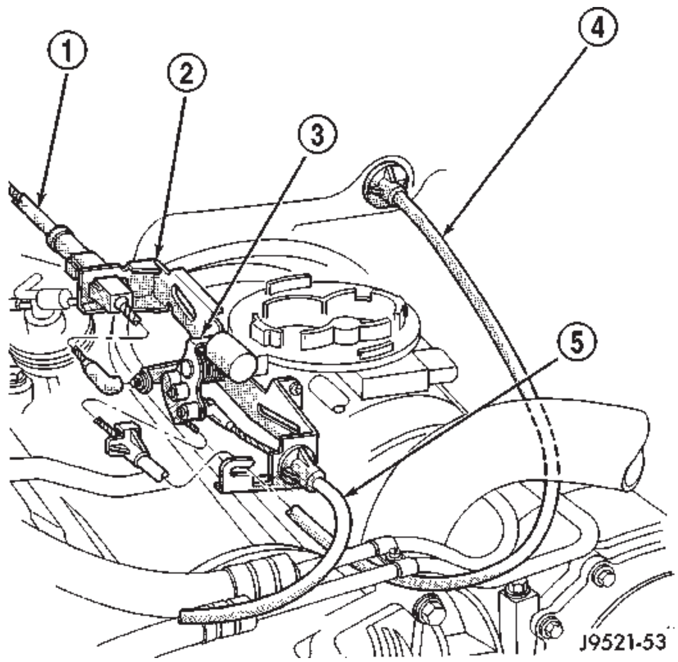

*Fig. 226 Throttle Valve Cable Attachment - At Engine*

1 - THROTTLE VALVE CABLE
2 - CABLE BRACKET
3 - THROTTLE BODY LEVER
4 - ACCELERATOR CABLE
5 - SPEED CONTROL CABLE

## ADJUSTMENT VERIFICATION

(1) Turn ignition key to OFF position.
(2) Remove air cleaner.
(3) Verify that lever on throttle body is at curb idle position (Fig. 226). Then verify that the transmission throttle lever (Fig. 227) is also at idle (fully forward) position.
(4) Slide cable off attachment stud on throttle body lever.
(5) Compare position of cable end to attachment stud on throttle body lever:

- Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 228).
- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

THROTTLE VALVE CABLE (Continued)

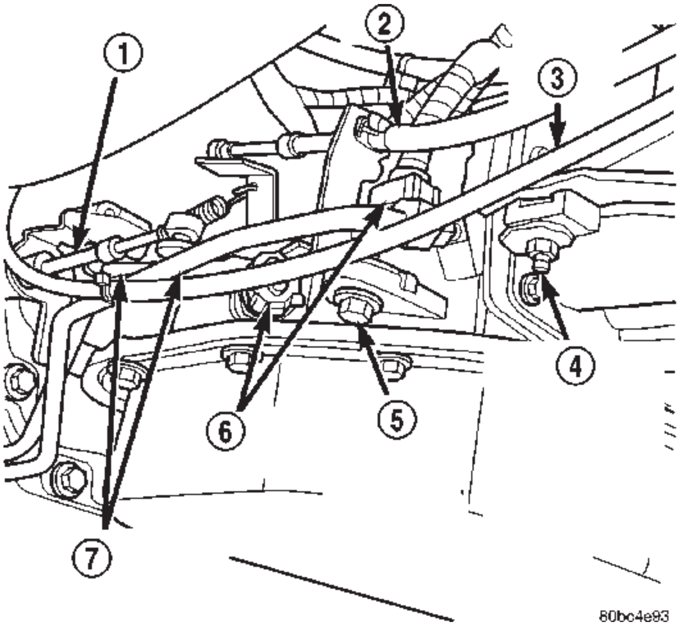

*Fig. 227 Throttle Valve Cable at Transmission*

1 - TRANSMISSION SHIFTER CABLE
2 - THROTTLE VALVE CABLE
3 - TRANSFER CASE SHIFTER CABLE
4 - TRANSFER CASE SHIFTER CABLE BRACKET RETAINING BOLT (1 OR 2)
5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
6 - ELECTRICAL CONNECTORS
7 - TRANSMISSION FLUID LINES

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.
- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

## ADJUSTMENT PROCEDURE

(1) Turn ignition switch to OFF position.

(2) Remove air cleaner if necessary.

(3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Pry the T.V. cable lock (A) into the UP position (Fig. 228). This will unlock the cable and allow for readjustment.

(6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable.**Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 228).

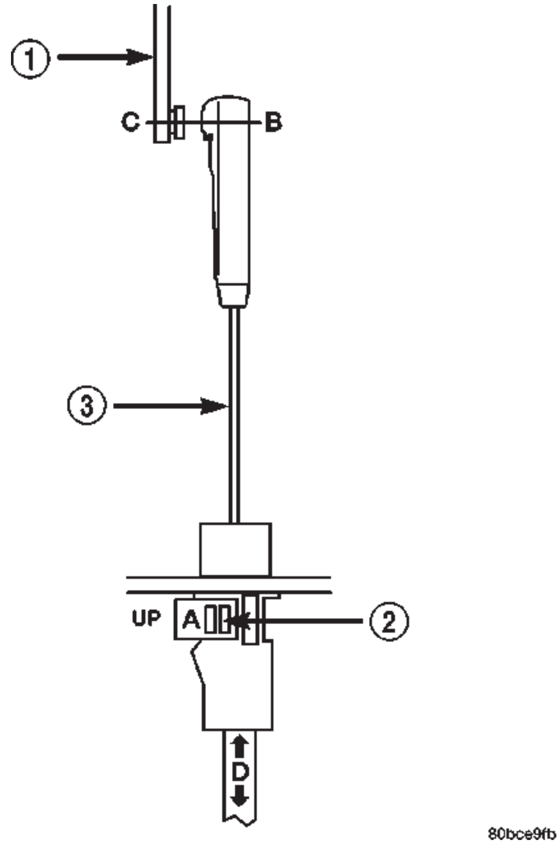

*Fig. 228 Throttle Valve Cable at Throttle Linkage*

1 - THROTTLE LINKAGE
2 - THROTTLE VALVE CABLE LOCKING CLIP
3 - THROTTLE VALVE CABLE

(7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 228). This will lock the present T.V. cable adjustment.

**NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.**

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

# TORQUE CONVERTER

## DESCRIPTION

The torque converter (Fig. 229) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.**

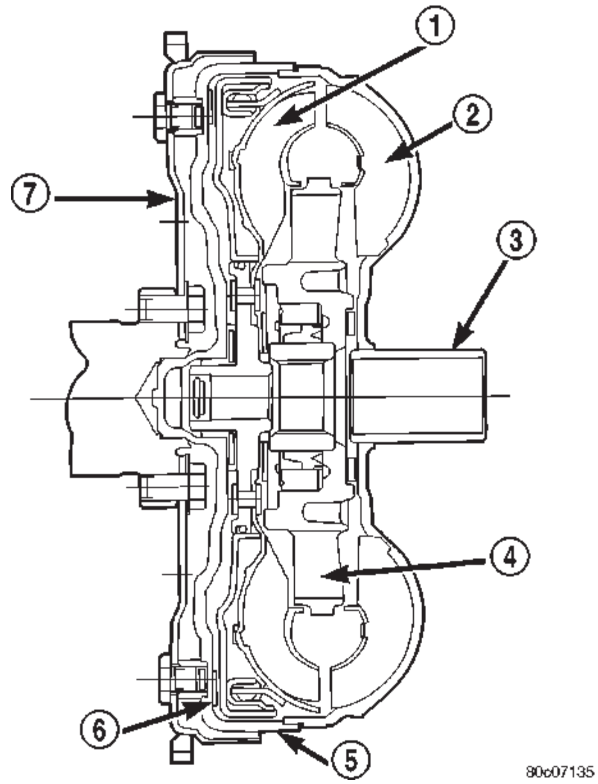

***Fig. 229 Torque Converter Assembly***

1 - TURBINE
2 - IMPELLER
3 - HUB
4 - STATOR
5 - FRONT COVER
6 - CONVERTER CLUTCH DISC
7 - DRIVE PLATE

TORQUE CONVERTER (Continued)

## IMPELLER

The impeller (Fig. 230) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

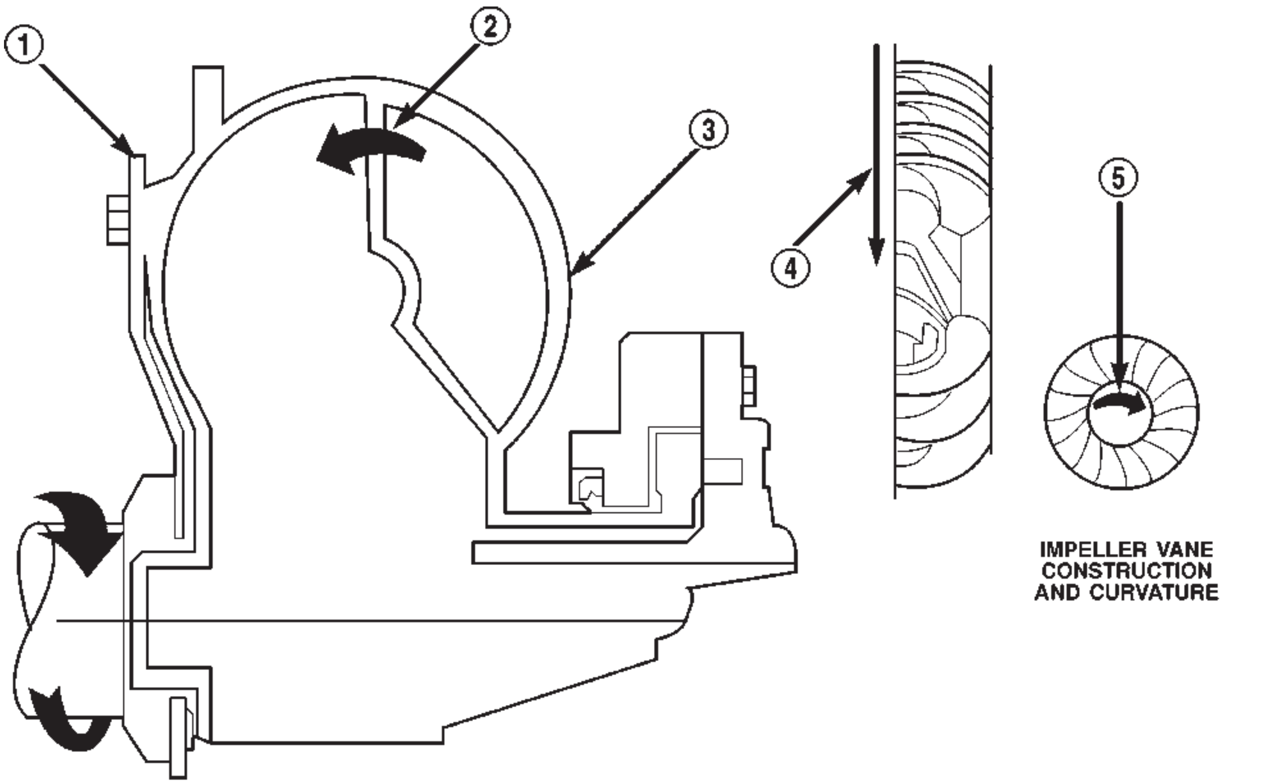

***Fig. 230 Impeller***

1 - ENGINE FLEXPLATE
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

## TURBINE

The turbine (Fig. 231) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

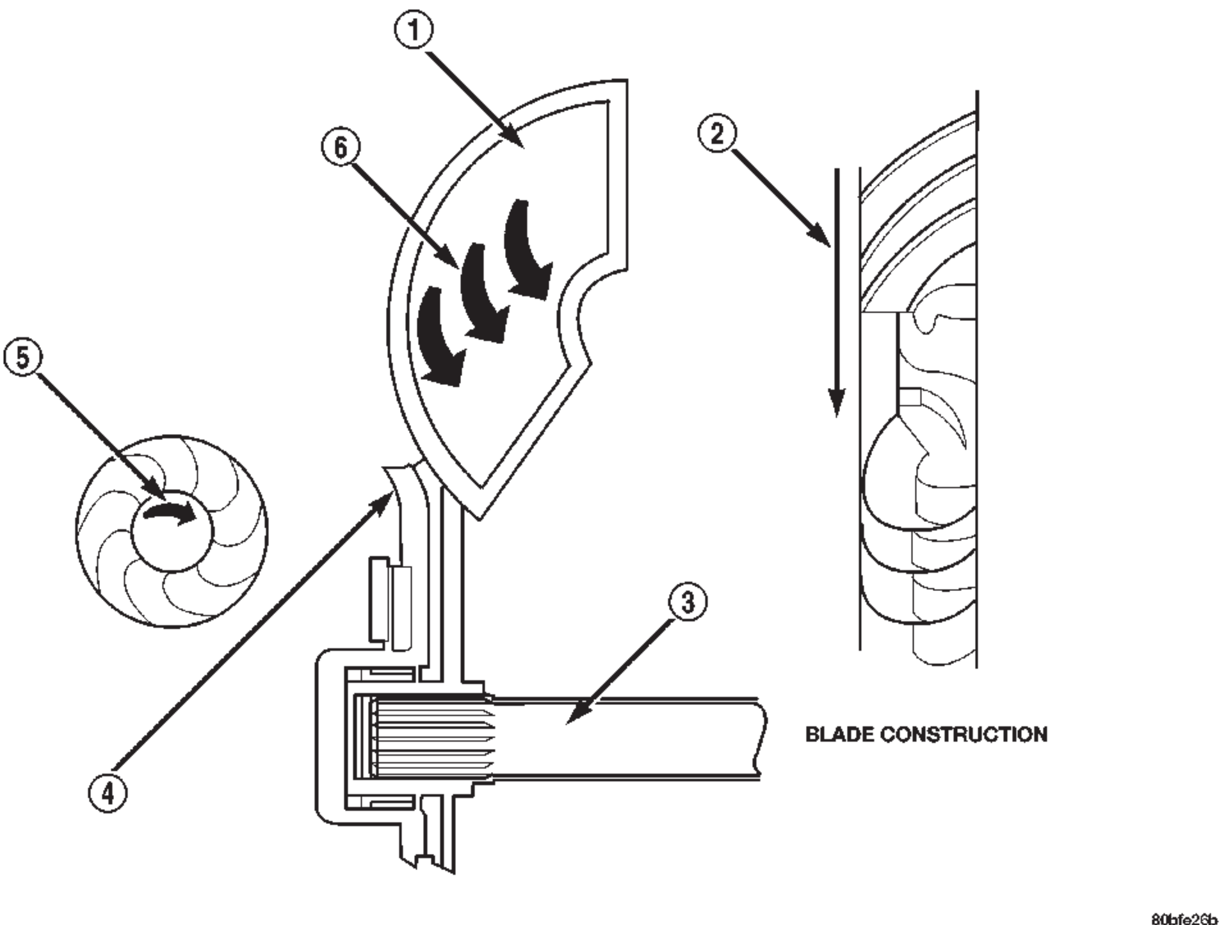

*Fig. 231 Turbine*

2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

## STATOR

The stator assembly (Fig. 232) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 233). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

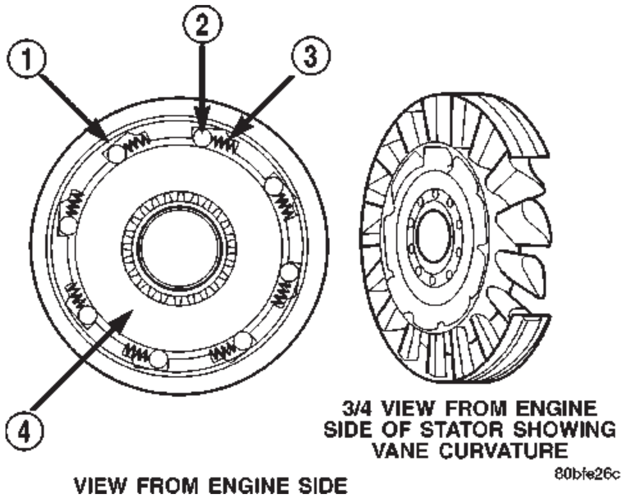

*Fig. 232 Stator Components*

2 - ROLLER
3 - SPRING
4 - INNER RACE

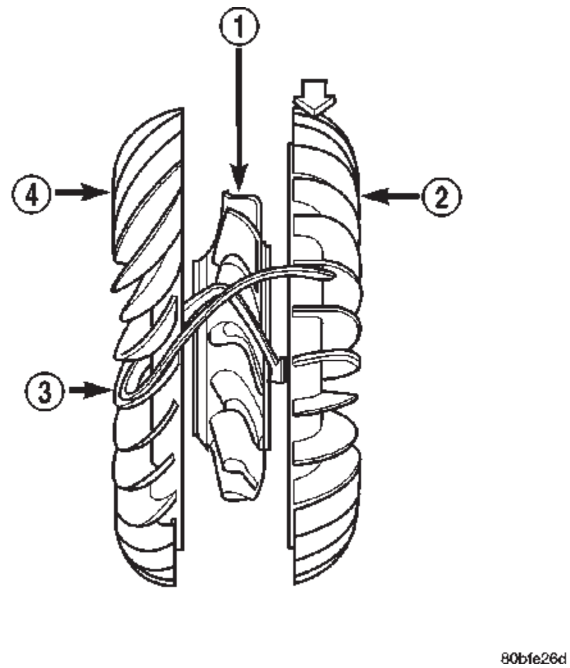

*Fig. 233 Stator Location*

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 234) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

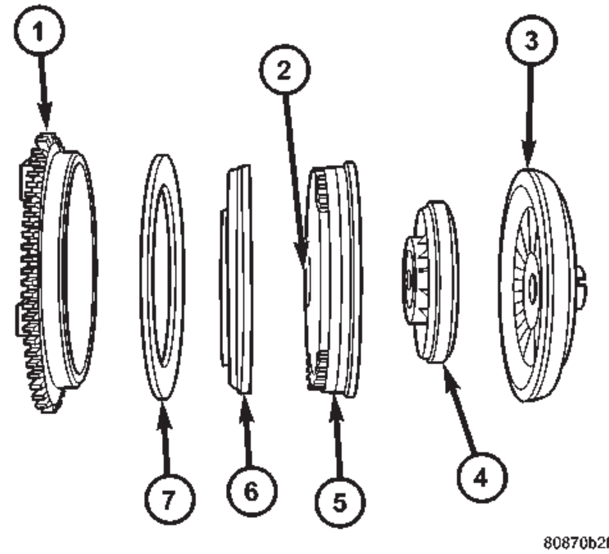

*Fig. 234 Torque Converter Clutch (TCC)*

1 - IMPELLER FRONT COVER
2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

TORQUE CONVERTER (Continued)

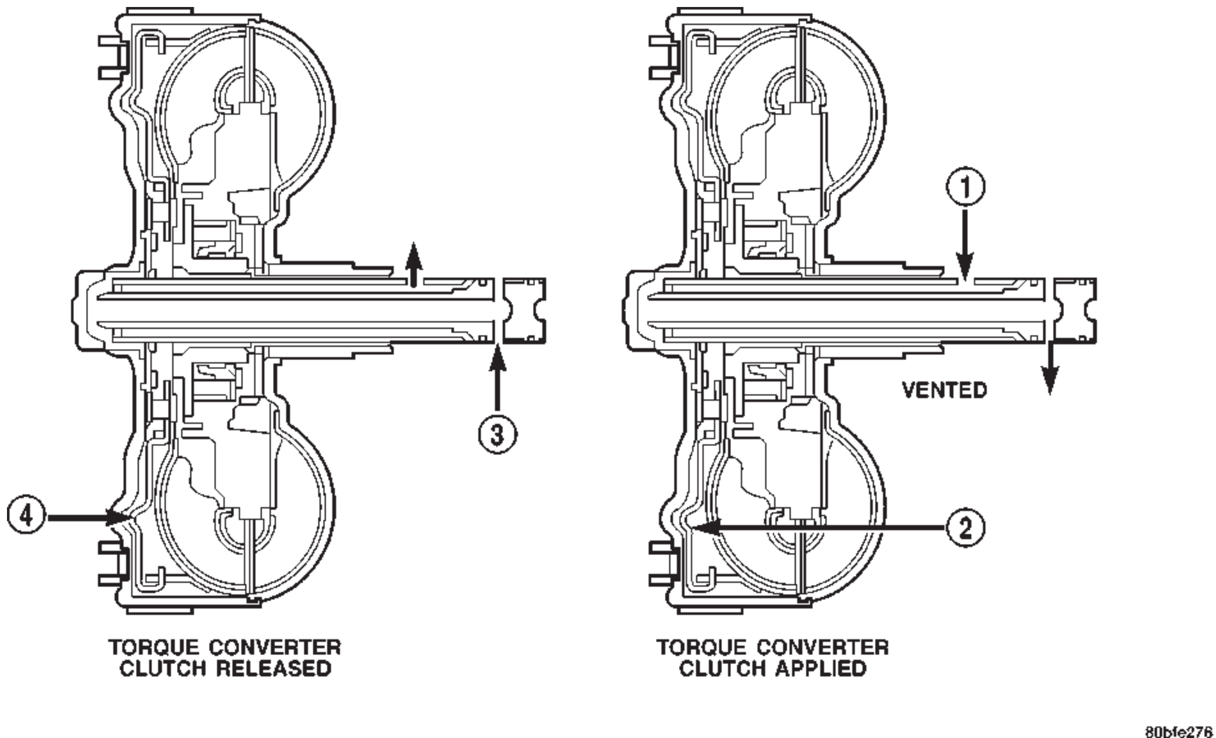

*Fig. 235 Torque Converter Fluid Operation*

1 - APPLY PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD
3 - RELEASE PRESSURE
4 - THE PISTON MOVES SLIGHTLY REARWARD

## OPERATION

The converter impeller (Fig. 235) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a “hindering” direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 236). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a “helping” direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER (Continued)

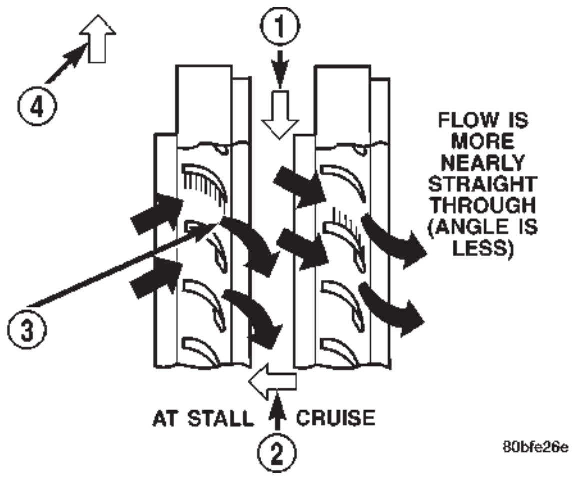

*Fig. 236 Stator Operation*

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

### TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.

### REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.**

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

### INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

**CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.**

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 237). Surface of converter lugs should be 19mm (0.75 in.) to the rear of the straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

## TORQUE CONVERTER DRAINBACK VALVE

### DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

### OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

### STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the

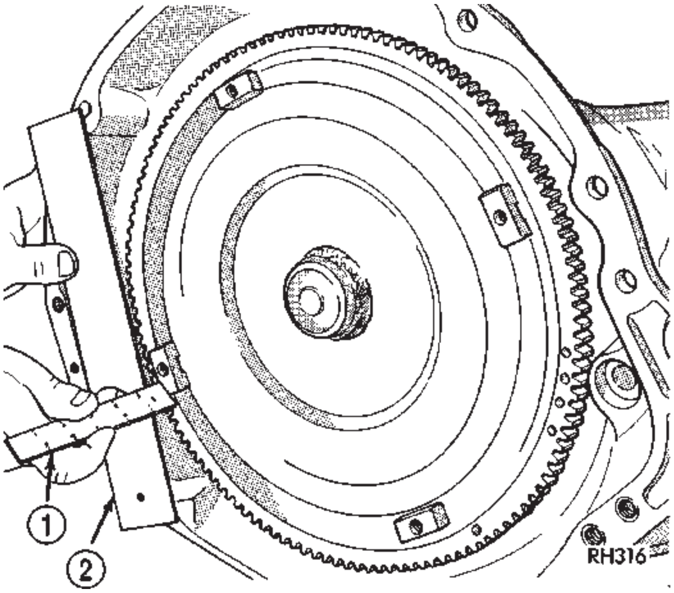

*Fig. 237 Typical Method Of Checking Converter Seating*

1 - SCALE
2 - STRAIGHTEDGE

vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

**CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.**

# TRANSMISSION TEMPERATURE SENSOR

## DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 238). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

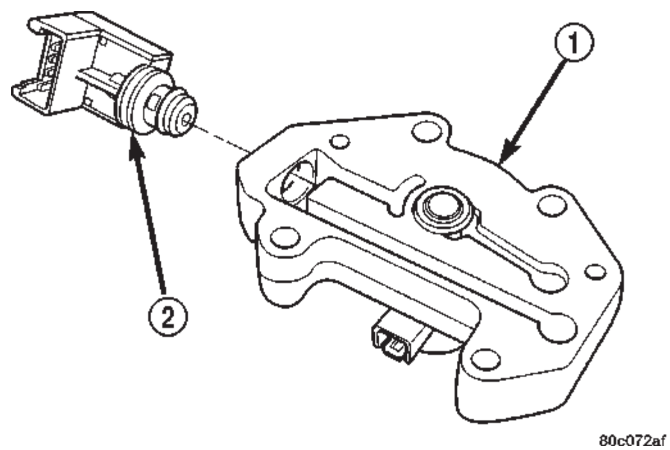

*Fig. 238 Governor Pressure Sensor*

1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

## OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

# VALVE BODY

## DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 239), (Fig. 240), (Fig. 241), and (Fig. 242):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

## OPERATION

**NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.**

VALVE BODY (Continued)

## CHECK BALLS

| CHECK BALL NUMBER | DESCRIPTION |
|---|---|
| 1 | Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug. |
| 2 | Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug. |
| 3 | Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch. |
| 4 | Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo. |
| 5 | Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure. |
| 6 | Provides a by-pass around the front servo orifice so that the servo can release quickly. |
| 7 | Provides a by-pass around the rear clutch orifice so that the clutch can release quickly. |
| 8 | Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient. |
| 9 | Provides a by-pass around the rear servo orifice so that the servo can release quickly. |
| ECE (10) | Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown. |

## REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 243) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 244), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

VALVE BODY (Continued)

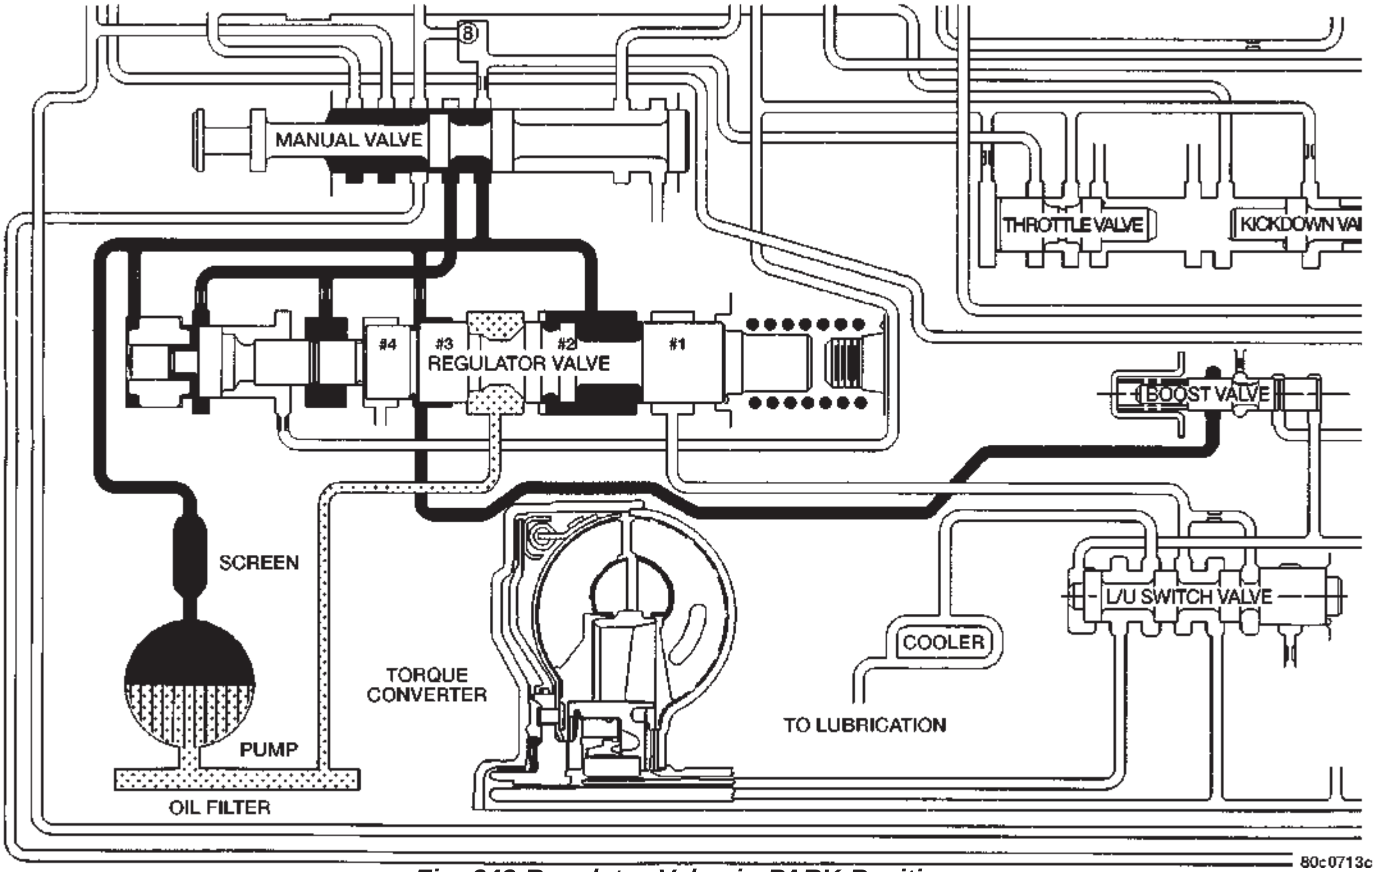

*Fig. 243 Regulator Valve in PARK Position*

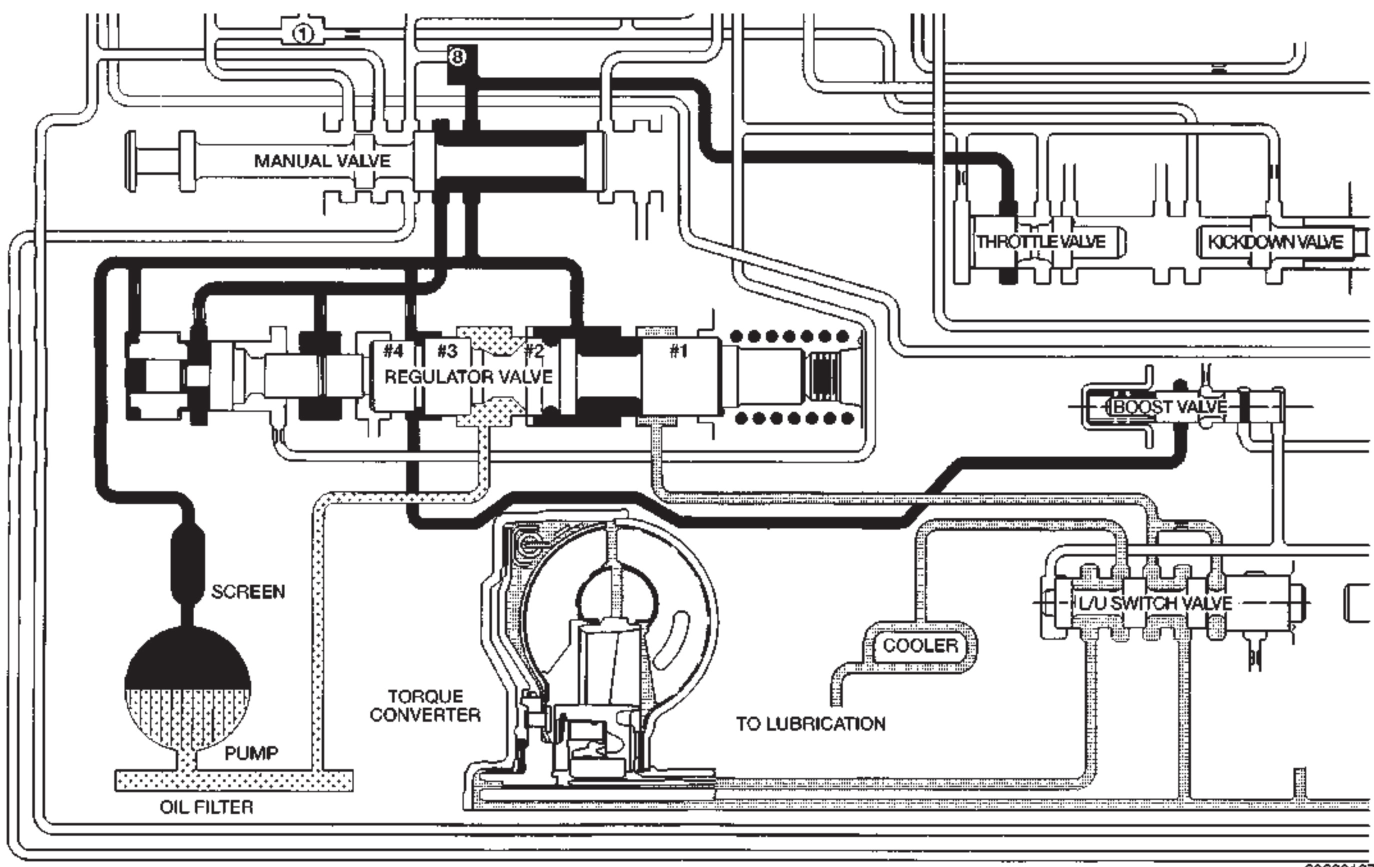

*Fig. 244 Regulator Valve in NEUTRAL Position*

VALVE BODY (Continued)

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 245). The regulated line pressure in REVERSE (Fig. 246) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

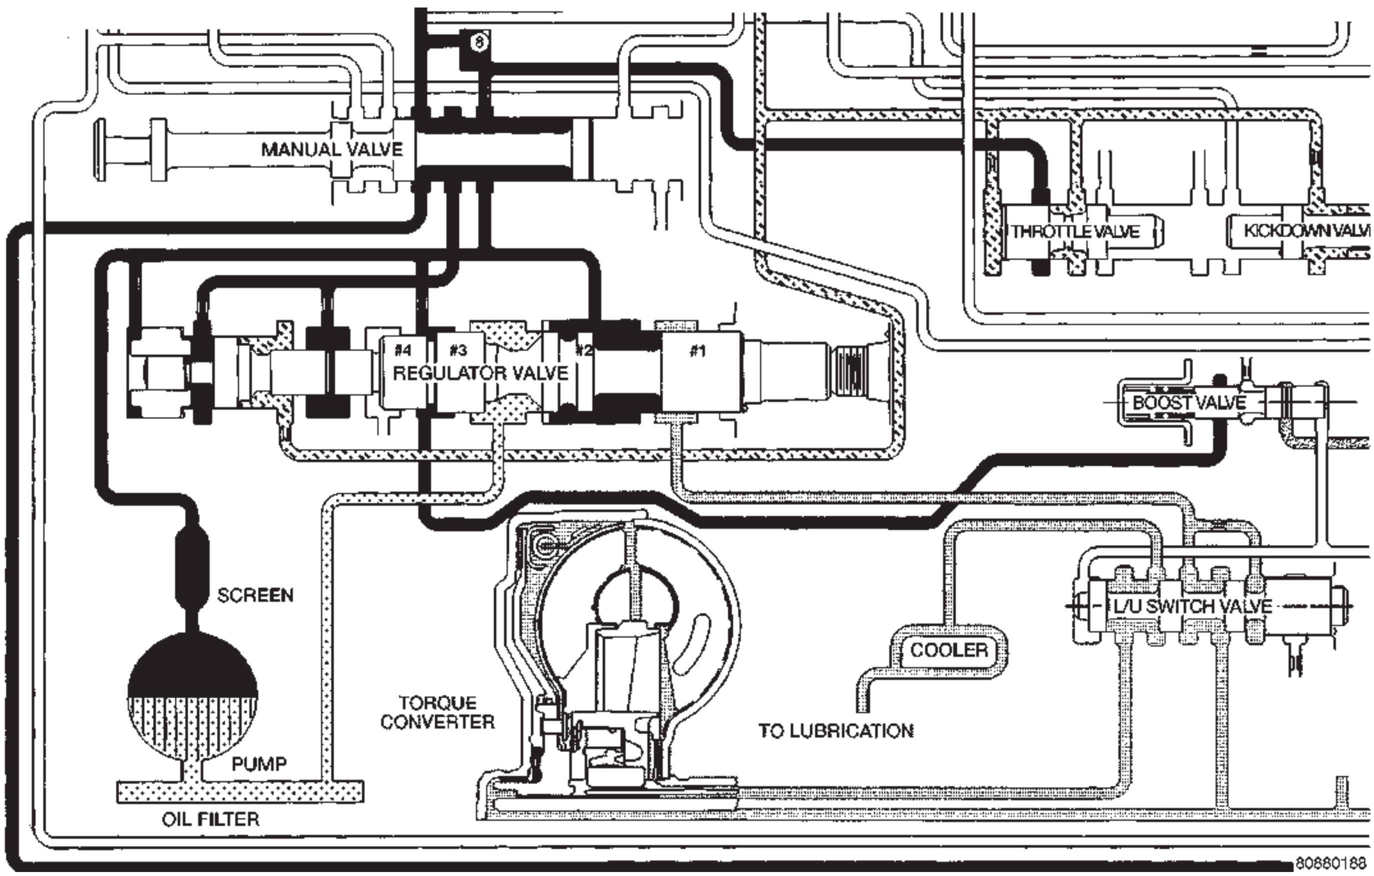

*Fig. 245 Regulator Valve in DRIVE Position*

VALVE BODY (Continued)

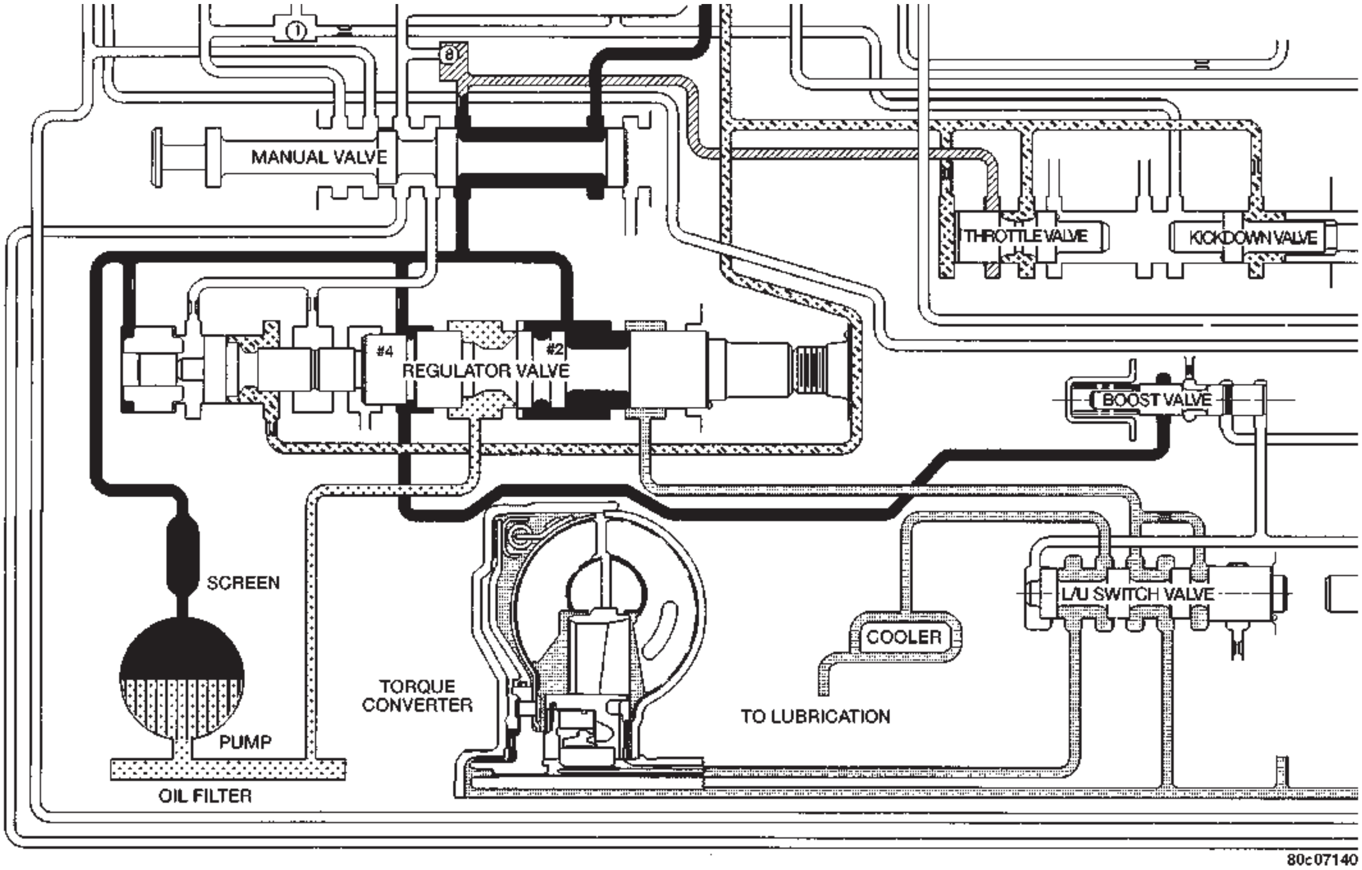

*Fig. 246 Regulator Valve in REVERSE Position*

## KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 247) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

## KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 248) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 249), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

VALVE BODY (Continued)

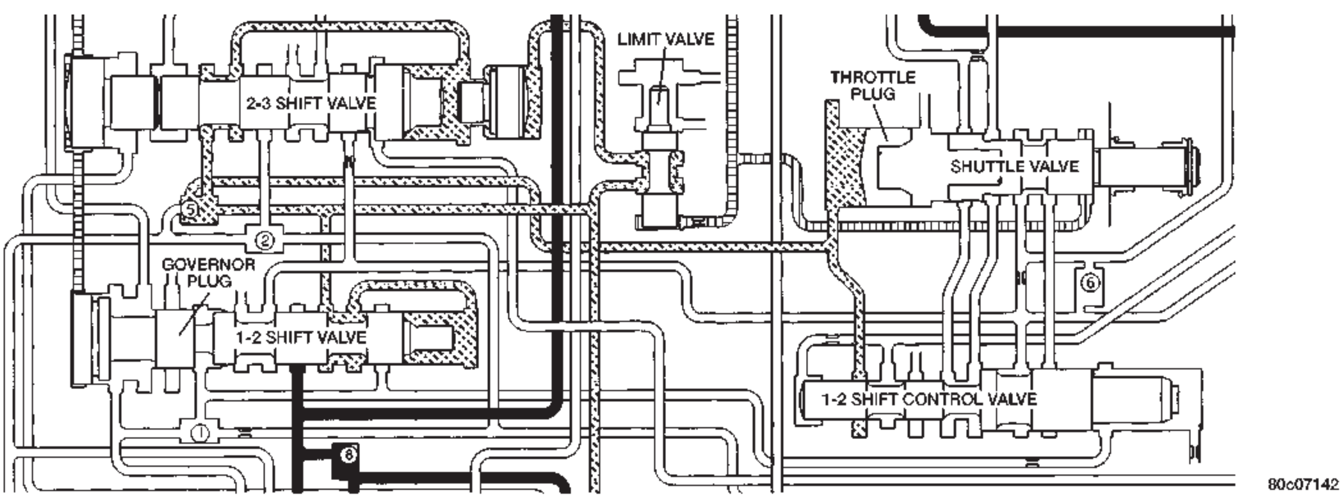

*Fig. 248 Kickdown Limit Valve-Low Speeds*

VALVE BODY (Continued)

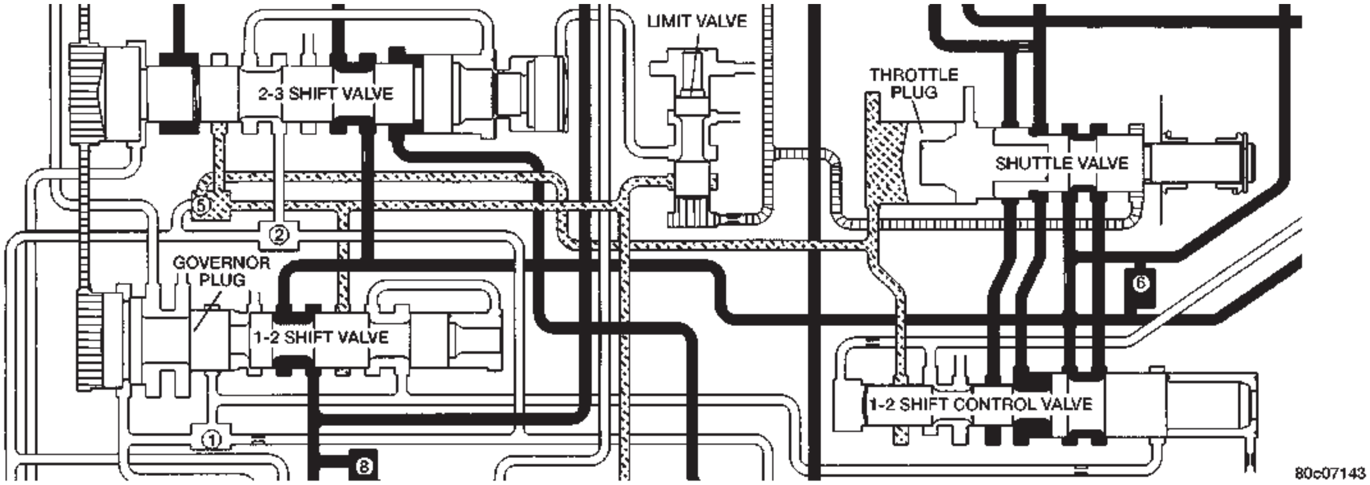

*Fig. 249 Kickdown Limit Valve-High Speeds*

## 1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 250), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 251).

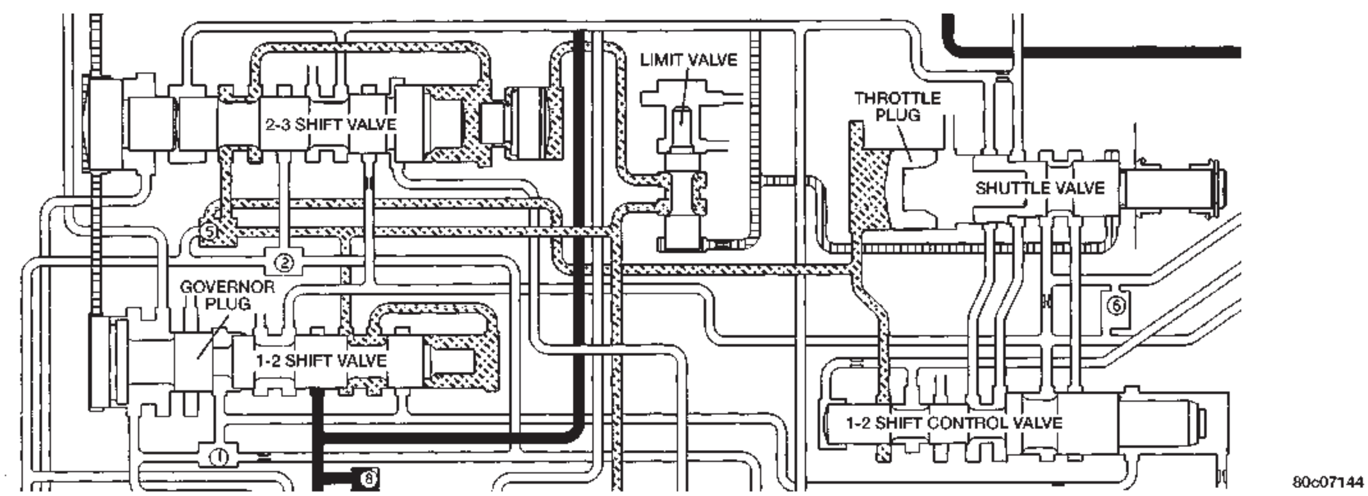

*Fig. 250 1-2 Shift Valve-Before Shift*

VALVE BODY (Continued)

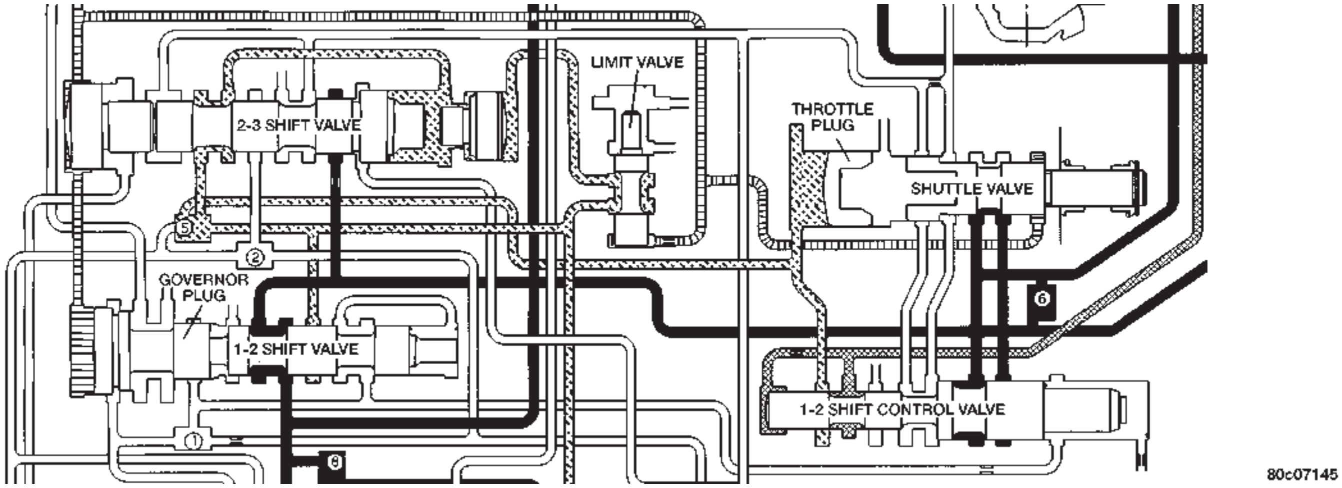

*Fig. 251 1-2 Shift Valve-After Shift*

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically "blocked" into position so no upshift can occur.

The physical blocking of the upshift while in the manual "1" position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

## 1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

The valve has two specific operations (Fig. 252):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kickdown ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

## 2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 253) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead–end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

VALVE BODY (Continued)

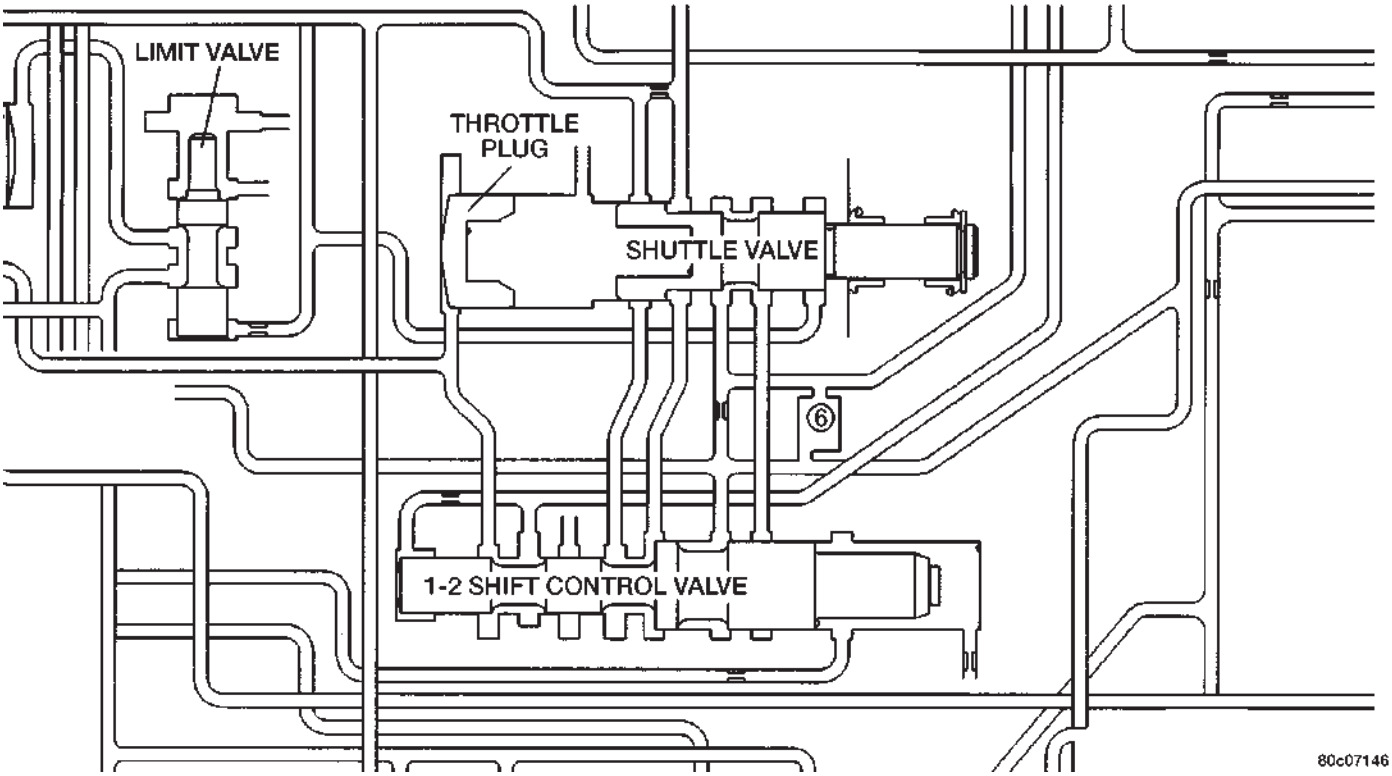

*Fig. 252 1-2 Shift Control Valve*

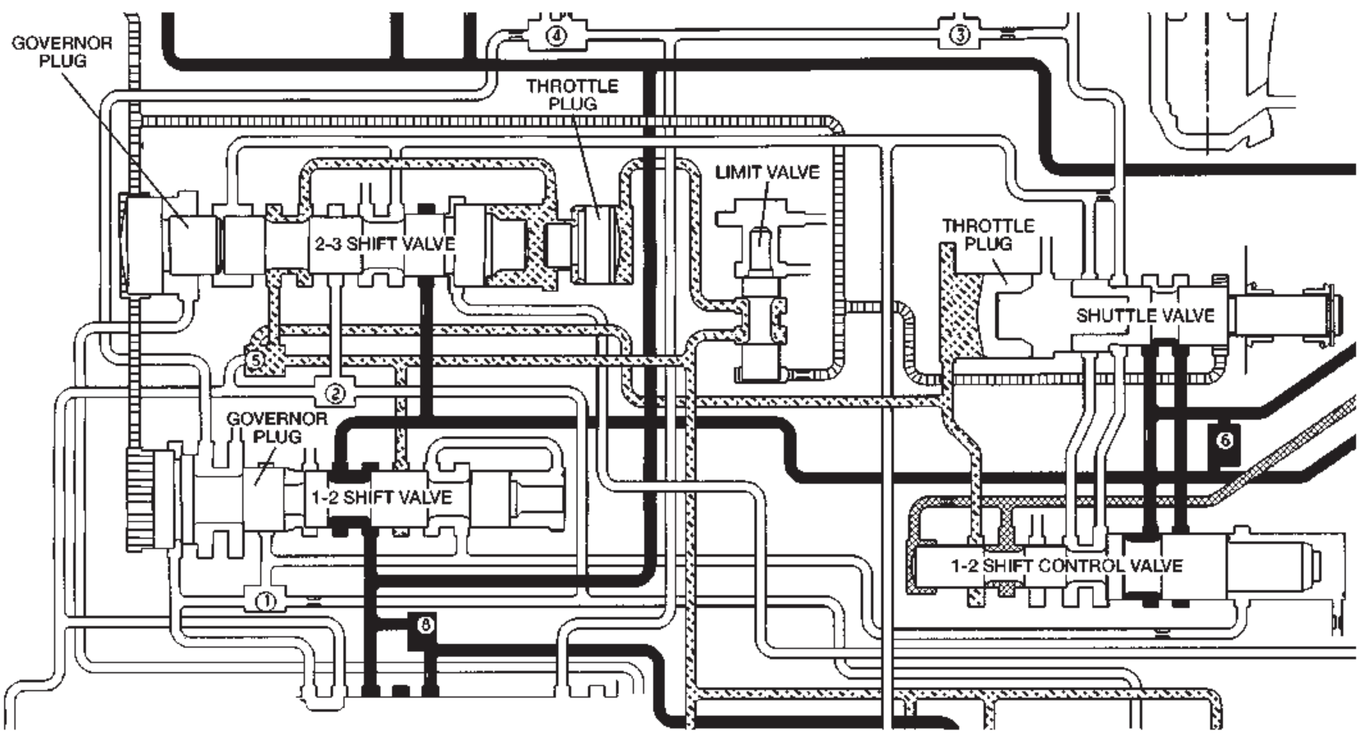

*Fig. 253 2-3 Shift Valve-Before Shift*

VALVE BODY (Continued)

After the shift (Fig. 254), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

## 3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 255). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 256). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

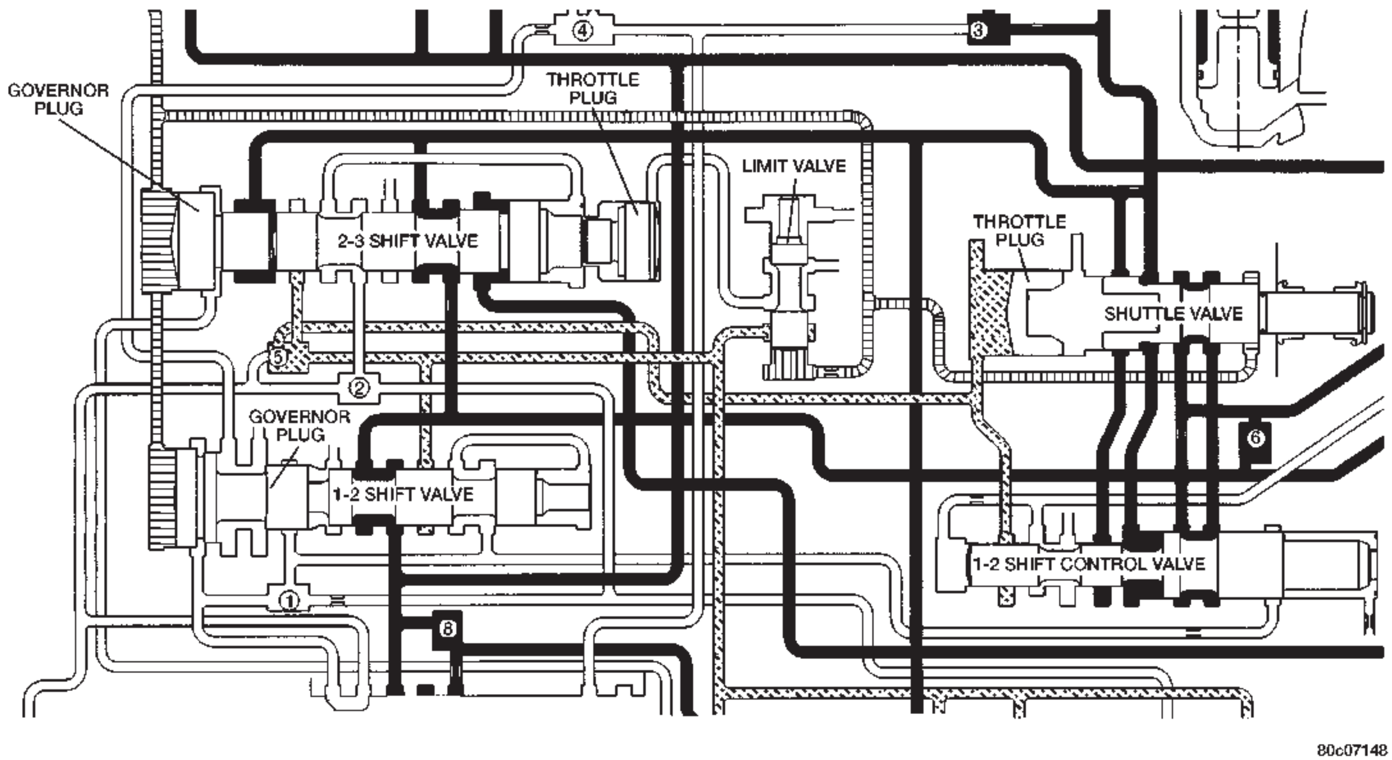

*Fig. 254 2-3 Shift Valve-After Shift*

VALVE BODY (Continued)

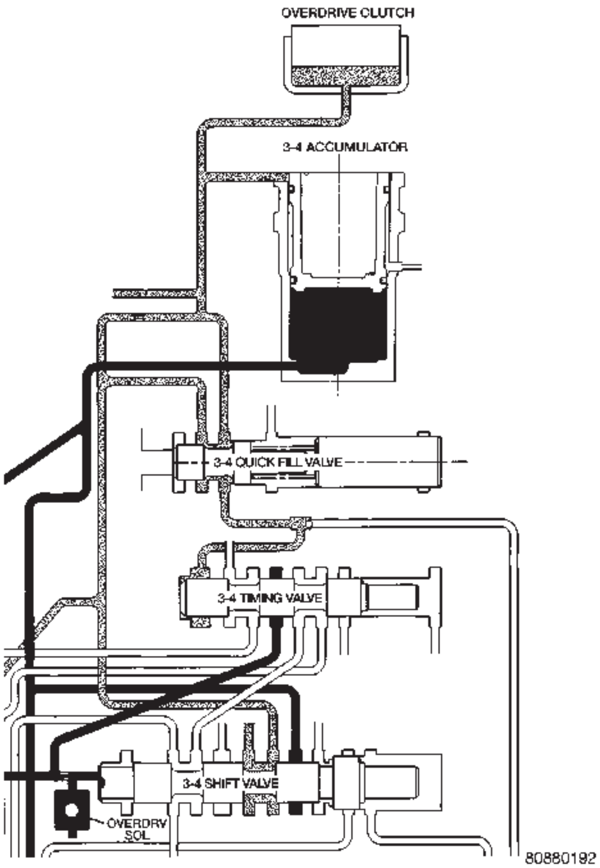

*Fig. 255 3-4 Shift Valve Before Shift*

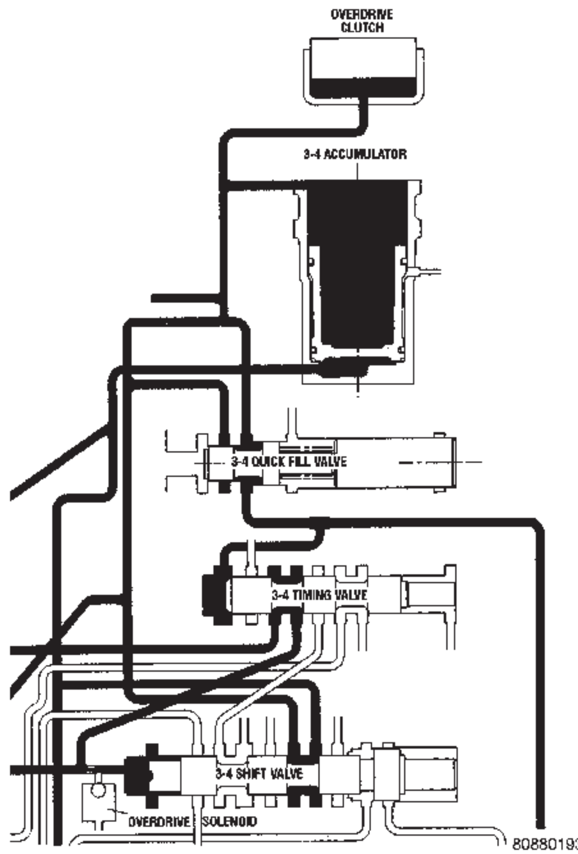

*Fig. 256 3-4 Shift Valve After Shift*

## 3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 256). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 255).

## 3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 255). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 256). Clutch fill is then completed through the regular feed orifice.

VALVE BODY (Continued)

### THROTTLE VALVE

In all gear positions the throttle valve (Fig. 257) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is “metered” out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

### SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 258), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and

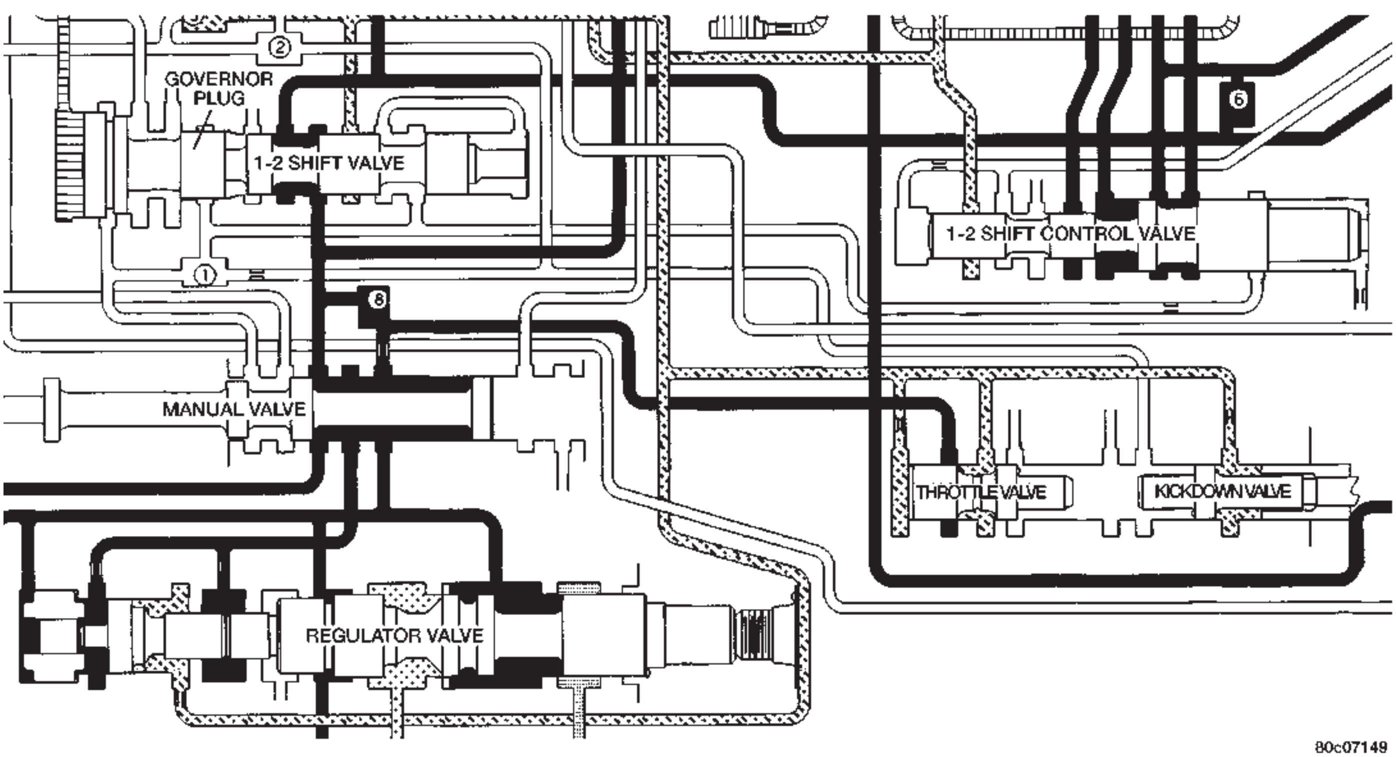

*Fig. 257 Throttle Valve*

VALVE BODY (Continued)

back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

Once the TCC control valve has moved to the right (Fig. 259), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

## MANUAL VALVE

The manual valve (Fig. 260) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is

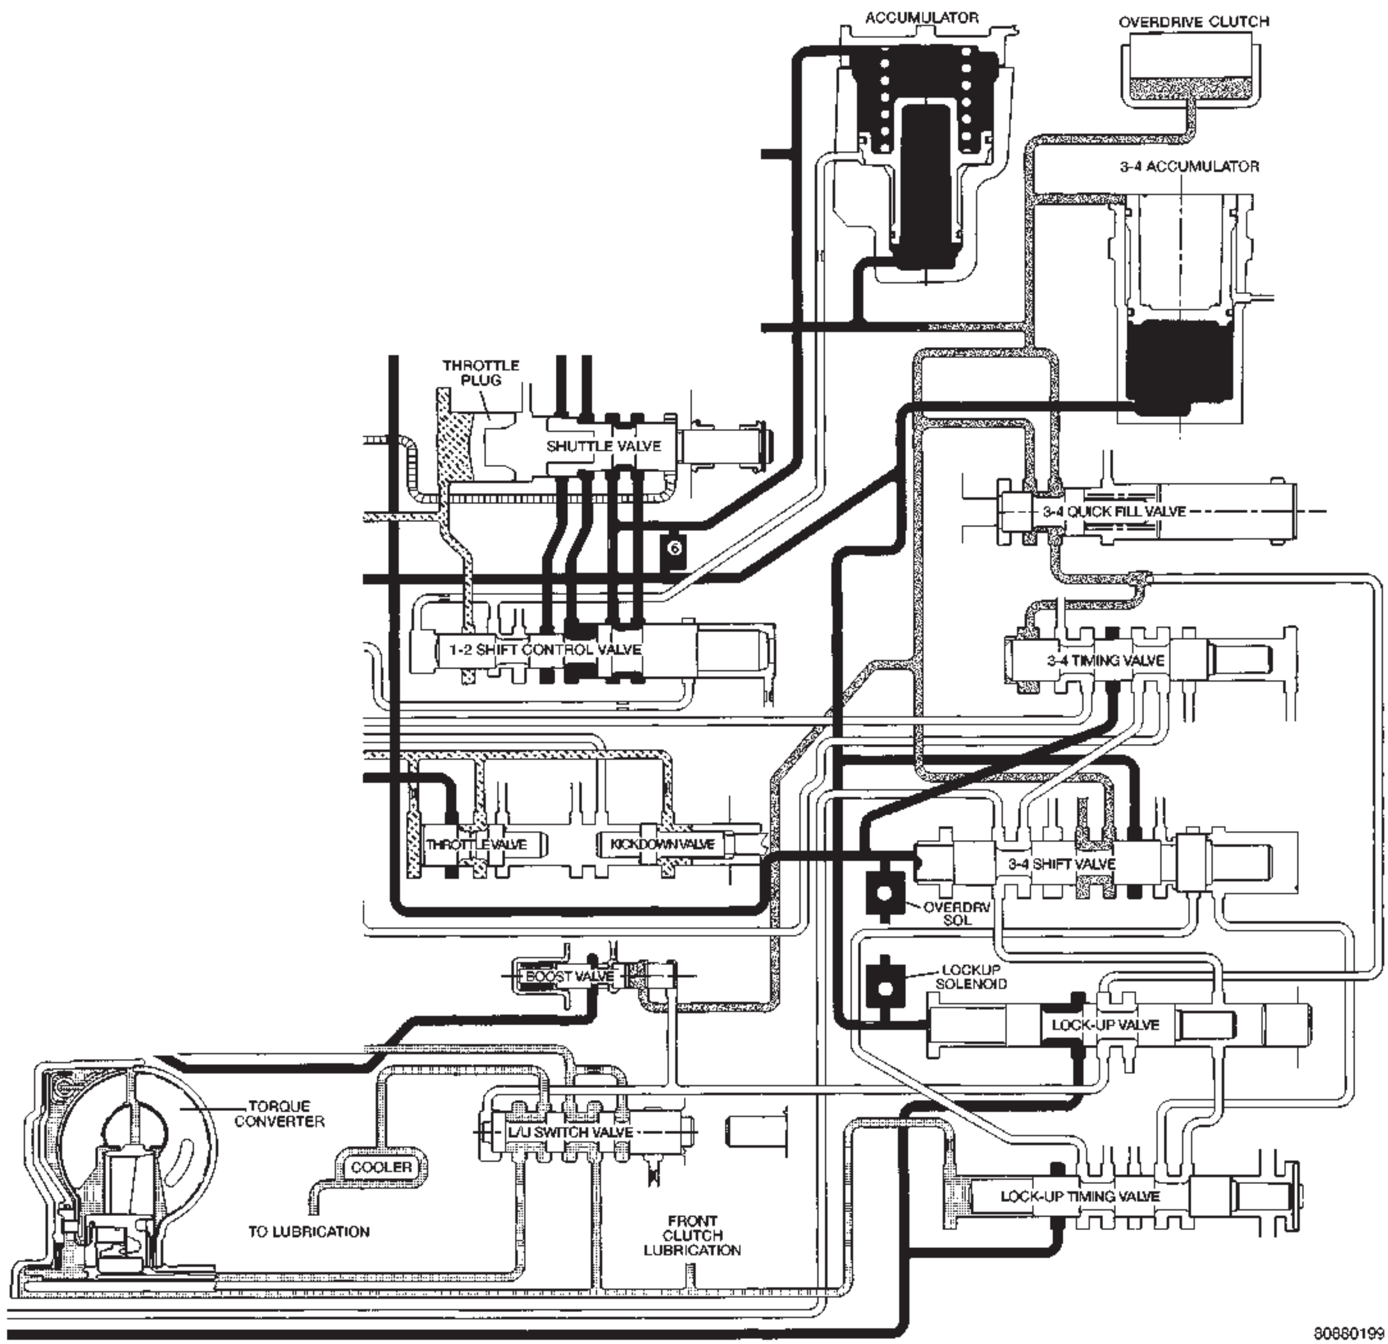

*Fig. 258 Switch Valve-Torque Converter Unlocked*

VALVE BODY (Continued)

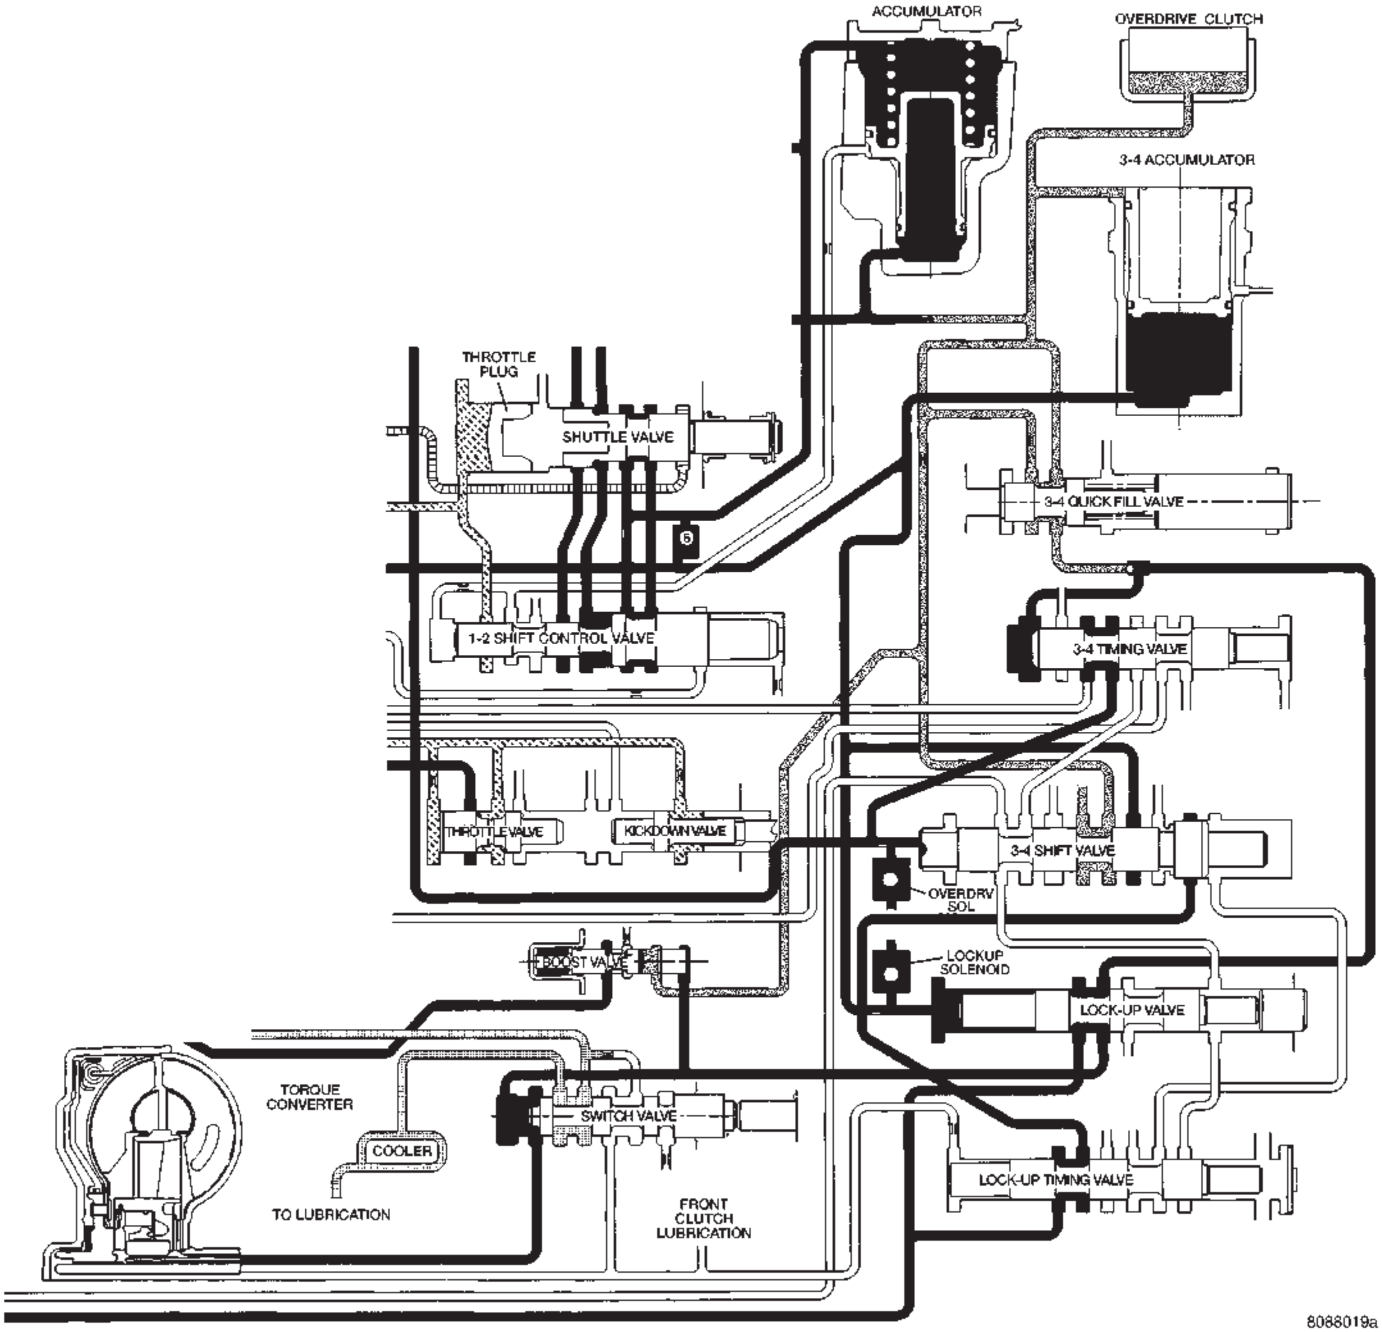

***Fig. 259 Switch Valve-Torque Converter Locked***

manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gearshift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

## CONVERTER CLUTCH LOCK-UP VALVE

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

## CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

VALVE BODY (Continued)

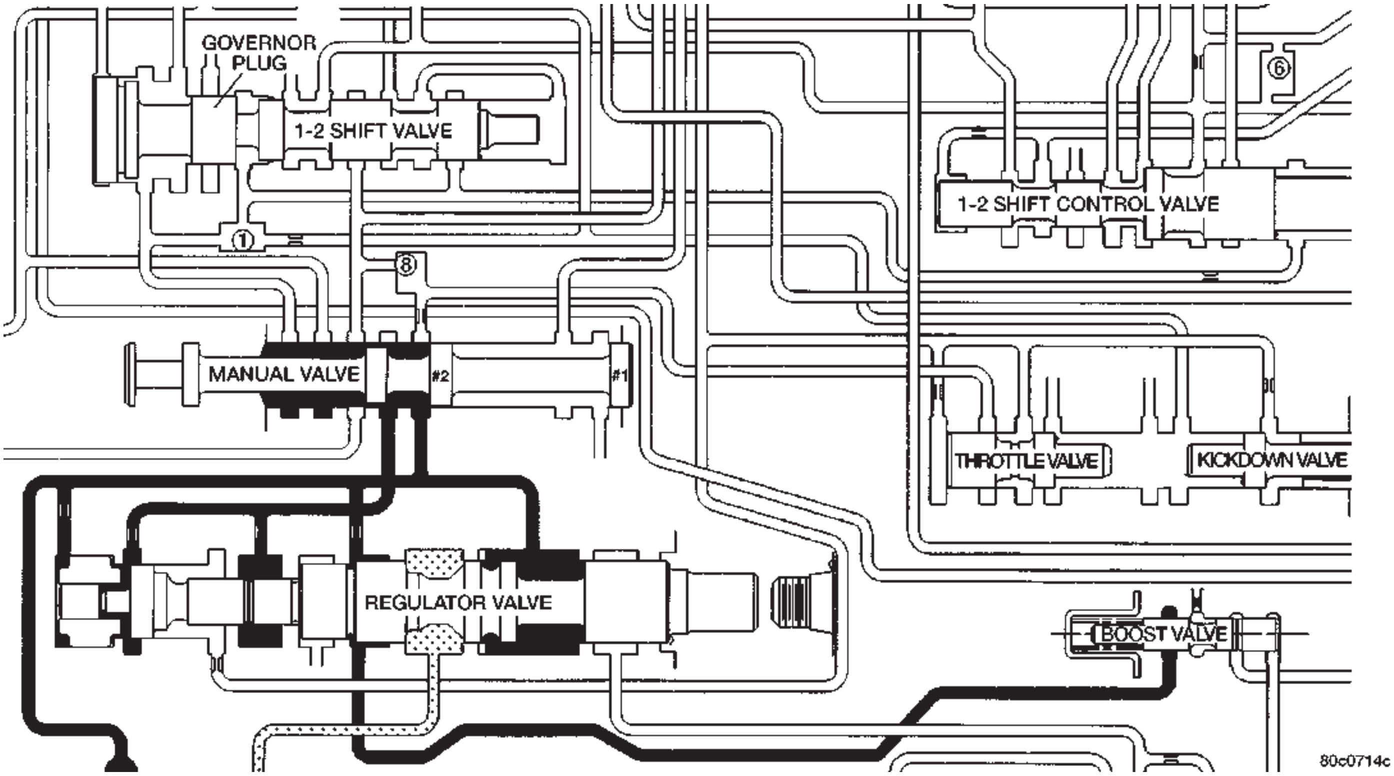

*Fig. 260 Manual Valve*

## SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 252) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by–pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 “lift foot” upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

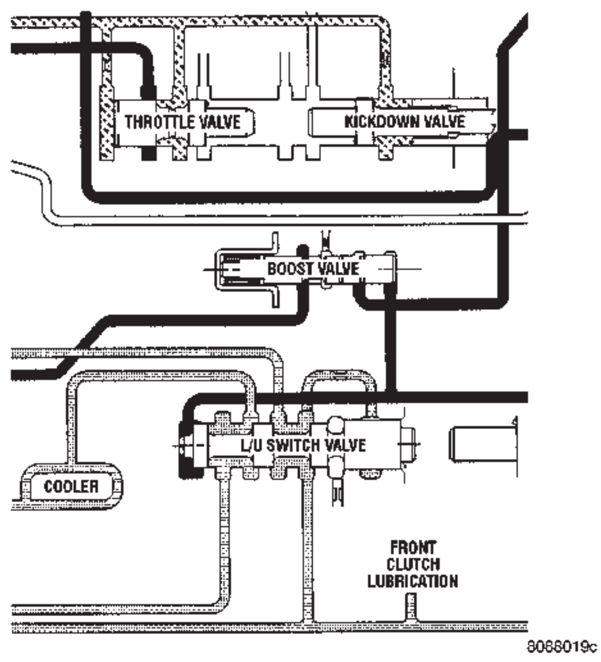

*Fig. 261 Boost Valve Before Lock-up*

## BOOST VALVE

The boost valve (Fig. 261) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 262), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

VALVE BODY (Continued)

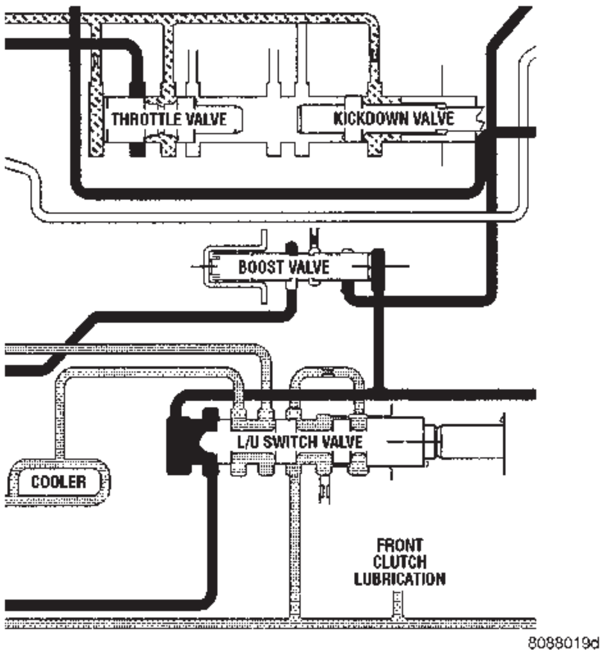

*Fig. 262 Boost Valve After Lock-up*

## REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).
- Converter clutch/overdrive solenoid assembly and harness .
- Governor housing gasket.
- Solenoid case connector O-rings.

(1) Shift transmission into NEUTRAL.

(2) Raise vehicle.

(3) Remove gearshift and throttle levers from shaft of valve body manual lever.

(4) Disconnect wires at solenoid case connector (Fig. 263).

(5) Position drain pan under transmission oil pan.

(6) Remove transmission oil pan and gasket.

(7) Remove fluid filter from valve body.

(8) Remove bolts attaching valve body to transmission case.

(9) Lower valve body enough to remove accumulator piston and springs.

(10) Work manual lever shaft and electrical connector out of transmission case.

(11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 264).

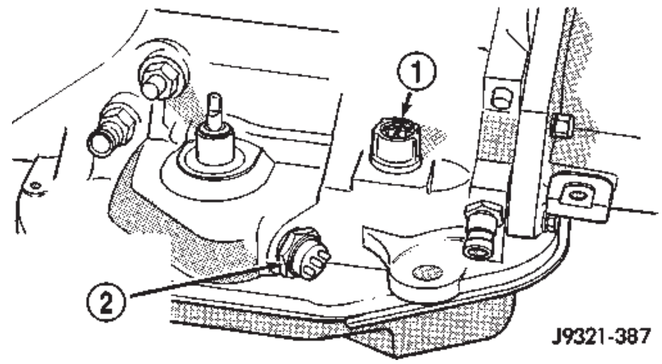

*Fig. 263 Transmission Case Connector*

VALVE BODY (Continued)

## DISASSEMBLY

**CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.**

(1) Disconnect wires from governor pressure sensor and solenoid.

(2) Remove screws attaching governor body and retainer plate to transfer plate.

(3) Remove retainer plate, governor body and gasket from transfer plate.

(4) Remove governor pressure sensor from governor body.

(5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 265). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

(7) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 266).

(8) Turn valve body over and remove screws that attach overdrive/converter solenoid assembly to valve body (Fig. 267).

(9) Remove solenoid and harness assembly from valve body (Fig. 268).

(10) Remove boost valve cover (Fig. 269).

(11) Remove boost valve retainer, valve spring and boost valve (Fig. 270).

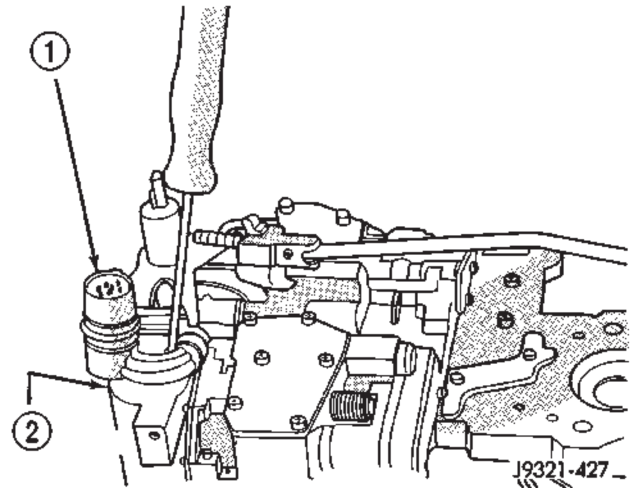

***Fig. 265 Solenoid Harness Case Connector Shoulder Bolt***

(12) Secure detent ball and spring with Retainer Tool 6583 (Fig. 271).

(13) Remove park rod E-clip and separate rod from manual lever (Fig. 272).

(14) Remove E-clip and washer that retains throttle lever shaft in manual lever (Fig. 273).

(15) Remove manual lever and throttle lever (Fig. 274). Rotate and lift manual lever off valve body and throttle lever shaft. Then slide throttle lever out of valve body.

(16) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 275).

VALVE BODY (Continued)

(17) Remove screws attaching pressure adjusting screw bracket to valve body and transfer plate (Fig. 276). Hold bracket firmly against spring tension while removing last screw.

(18) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 277). Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.

(19) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 278).

(20) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 278).

(21) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 279).

(22) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 280).

(23) Remove left-side screw and remove 3-4 accumulator housing from valve body (Fig. 281).

(24) Bend back tabs on boost valve tube brace (Fig. 282).

1 - BOOST VALVE TUBE
2 - TUBE BRACE (DOUBLE TAB)

(25) Remove boost valve connecting tube (Fig. 283). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

**CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.**

(26) Turn valve body over so lower housing is facing upward (Fig. 284). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(27) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 284). Note position of boost valve tube brace for assembly reference.

(28) Remove lower housing and overdrive separator plate from transfer plate (Fig. 284).

(29) Remove the ECE check ball from the transfer plate (Fig. 285). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(30) Remove transfer plate from upper housing (Fig. 286).

(31) Turn transfer plate over so upper housing separator plate is facing upward.

(32) Remove upper housing separator plate from transfer plate (Fig. 287). Note position of filter in separator plate for assembly reference.

(33) Remove rear clutch and rear servo check balls from transfer plate. Note check ball location for assembly reference (Fig. 288).

VALVE BODY (Continued)

### VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 289). Then remove the one large diameter and the six smaller diameter check balls.

(2) Remove governor plug and shuttle valve covers (Fig. 291).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 290).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 291).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 278).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 292).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 292).

(9) Remove 1-2 shift control valve and spring (Fig. 292).

(10) Remove 1-2 shift valve and spring (Fig. 292).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 292).

(12) Remove pressure plug cover (Fig. 292).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 292).

## VALVE BODY LOWER HOUSING

(1) Remove timing valve cover.
(2) Remove 3-4 timing valve and spring.
(3) Remove 3-4 quick fill valve, spring and plug.
(4) Remove 3-4 shift valve and spring.
(5) Remove converter clutch valve, spring and plug (Fig. 293).
(6) Remove converter clutch timing valve, retainer and valve spring.

## 3-4 ACCUMULATOR HOUSING

(1) Remove end plate from housing.
(2) Remove piston spring.
(3) Remove piston. Remove and discard piston seals (Fig. 294).

## CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either

part has sustained physical damage (dented, deformed, broken, etc.).

**CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.**

## INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

VALVE BODY (Continued)

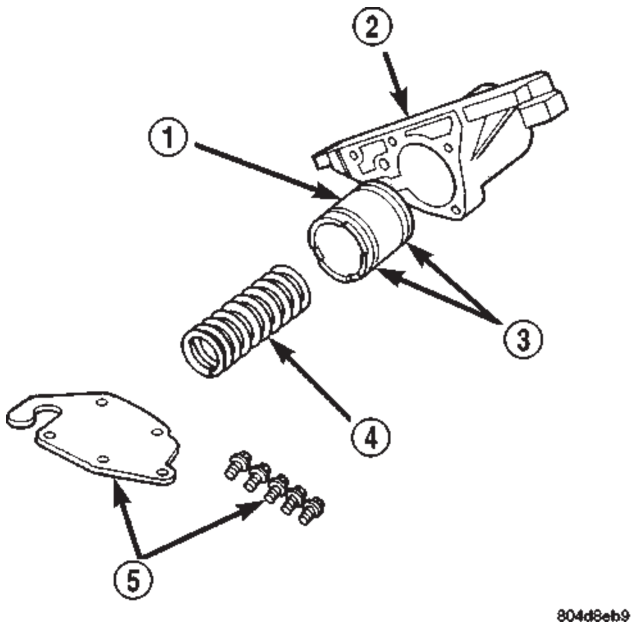

*Fig. 294 3-4 Accumulator and Housing*

1 - ACCUMULATOR PISTON
2 - 3-4 ACCUMULATOR HOUSING
3 - TEFLON SEALS
4 - PISTON SPRING
5 - COVER PLATE AND SCREWS

**CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.**

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.**Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

## ASSEMBLY

**CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.**

### LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 298).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

## 3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 299).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

## TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 295).

(2) Install filter screen in upper housing separator plate (Fig. 296).

(3) Align and position upper housing separator plate on transfer plate (Fig. 297).

(4) Install brace plate (Fig. 297). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

## UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 298). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 299). Be sure filter screen is seated in proper housing recess.

(3) Install the ECE check ball into the transfer plate (Fig. 290). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 300).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 301).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 301).

## UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 302), (Fig. 303) and (Fig. 304) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

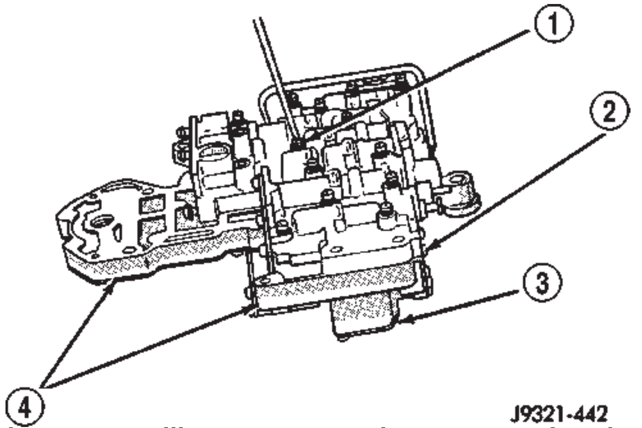

***Fig. 301 Installing Lower Housing On Transfer Plate And Upper Housing***

1 - VALVE BODY SCREWS (13)
2 - LOWER HOUSING
3 - UPPER HOUSING
4 - TRANSFER PLATE

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

13 - SHUTTLE VALVE PRIMARY SPRING

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

## BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 305).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 305).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 306).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 306).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 307).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

VALVE BODY (Continued)

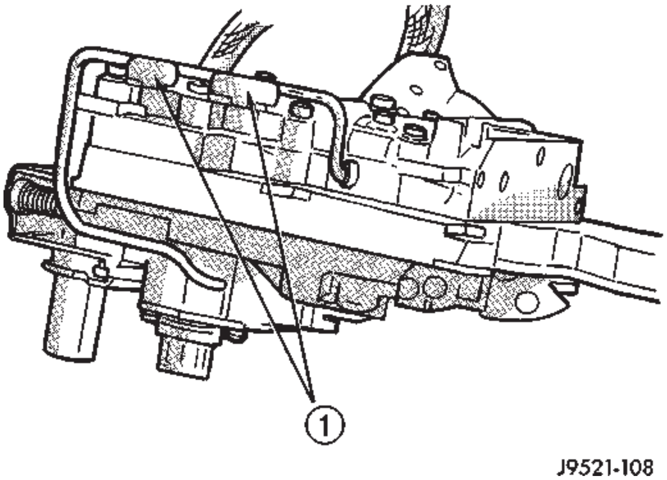

***Fig. 307 Securing Boost Valve Tube With Brace Tabs***

1 - BEND TABS UP AGAINST TUBE AS SHOWN

## 3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 308).

(2) Loosely attach accumulator housing with right-side screw (Fig. 308). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 309). Tighten screws to 4 N·m (35 in. lbs.).

## VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 310).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

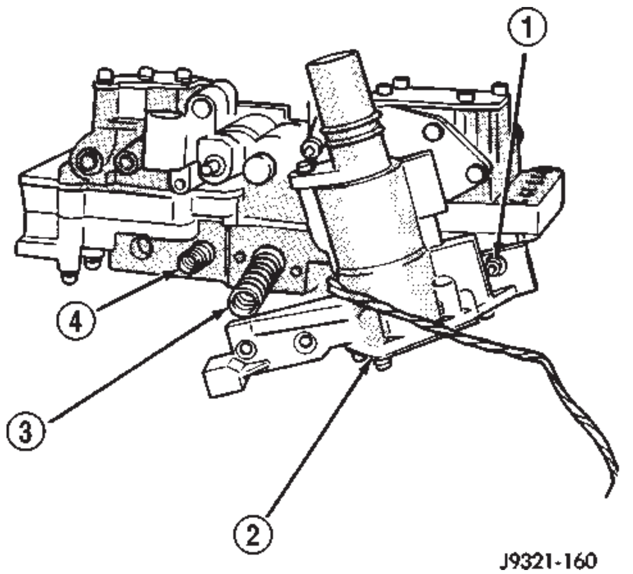

***Fig. 308 Converter Clutch And 3-4 Shift Valve Springs***

1 - RIGHT-SIDE SCREW
2 - 3-4 ACCUMULATOR
3 - 3-4 SHIFT VALVE SPRING
4 - CONVERTER CLUTCH VALVE SPRING

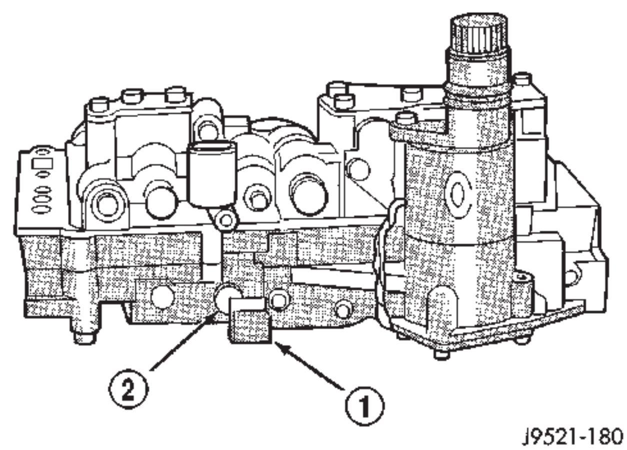

***Fig. 309 Seating 3-4 Accumulator On Lower Housing***

1 - ACCUMULATOR BOX
2 - CONVERTER CLUTCH VALVE PLUG

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 311).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

VALVE BODY (Continued)

(11) Install manual valve.
(12) Install throttle valve and spring.
(13) Install kickdown valve and detent.
(14) Install pressure regulator valve.
(15) Install switch valve.
(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.
(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)
(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.
(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 312). Seat tang in dimple before tightening connector screw.
(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.
(21) Verify that solenoid wire harness is properly routed (Fig. 313). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

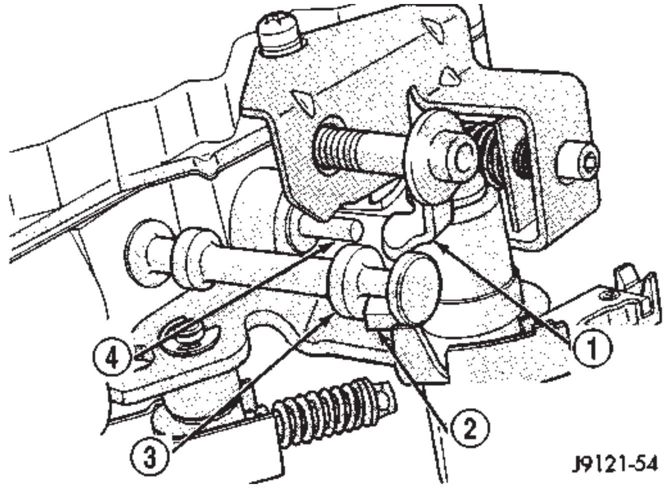

*Fig. 311 Manual And Throttle Lever Alignment*

1 - THROTTLE LEVER
2 - MANUAL LEVER VALVE ARM
3 - MANUAL VALVE
4 - KICKDOWN VALVE

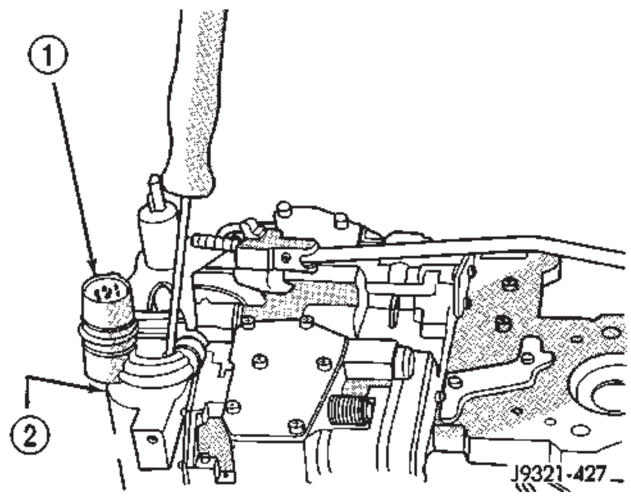

*Fig. 312 Solenoid Harness Case Connector Shoulder Bolt*

1 - SOLENOID HARNESS CASE CONNECTOR
2 - 3-4 ACCUMULATOR HOUSING

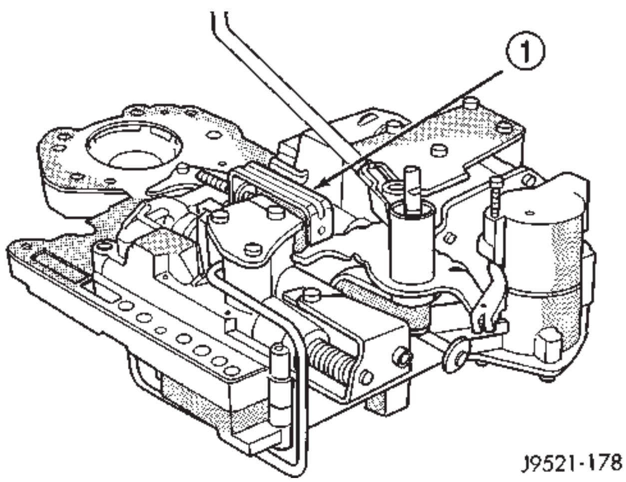

*Fig. 310 Detent Ball Spring*

1 - SPECIAL TOOL 6583 POSITIONED ON DETENT HOUSING

## GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.
(2) Install new O-rings on governor pressure solenoid and sensor.
(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.
(4) Install governor pressure sensor in governor body.
(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.
(6) Position governor body gasket on transfer plate.
(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.
(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

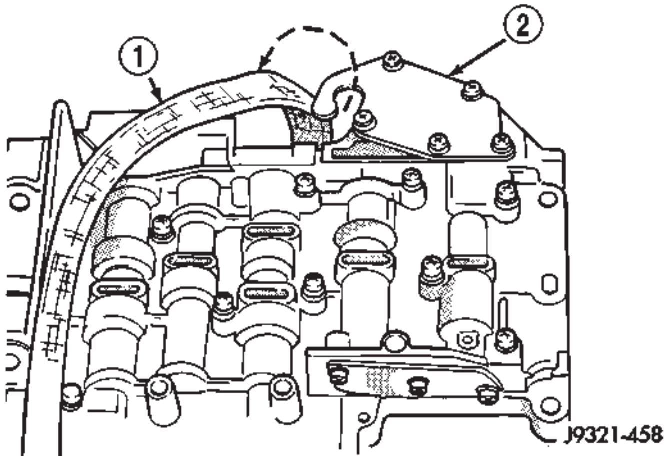

*Fig. 313 Solenoid Harness Routing*

1 - OVERDRIVE/CONVERTER SOLENOID WIRE HARNESS
2 - 3-4 ACCUMULATOR COVER PLATE

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

## INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 314). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 315).

(3) Check condition of seals on accumulator piston (Fig. 316). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

**CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.**

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

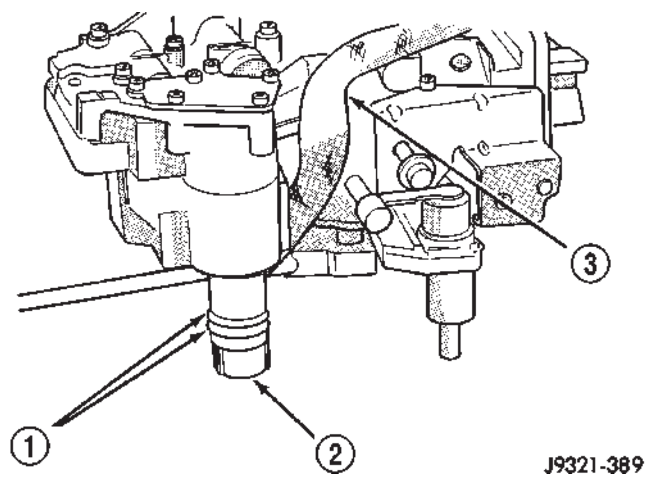

*Fig. 314 Valve Body Harness Connector O-Ring Seal*

1 - CONNECTOR O-RINGS
2 - VALVE BODY HARNESS CONNECTOR
3 - HARNESS

## ADJUSTMENTS - VALVE BODY

### CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

VALVE BODY (Continued)

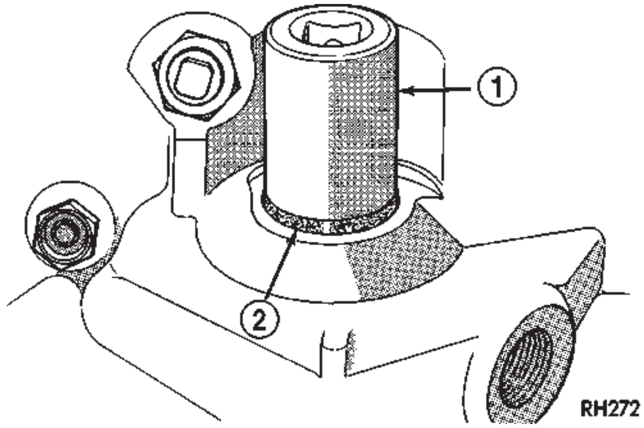

*Fig. 315 Manual Lever Shaft Seal*

1 - 15/16" SOCKET
2 - SEAL

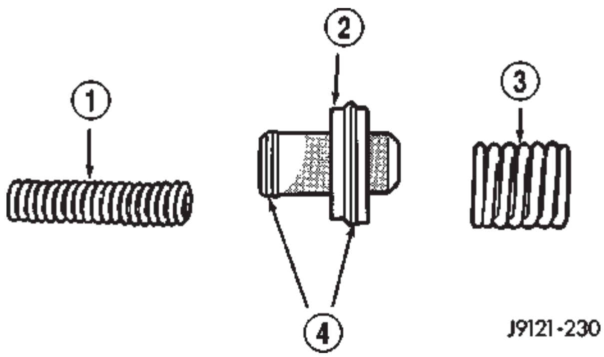

*Fig. 316 Accumulator Piston Components*

1 - INNER SPRING
2 - ACCUMULATOR PISTON
3 - OUTER SPRING
4 - SEAL RINGS

#### LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 317).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

**NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.**

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

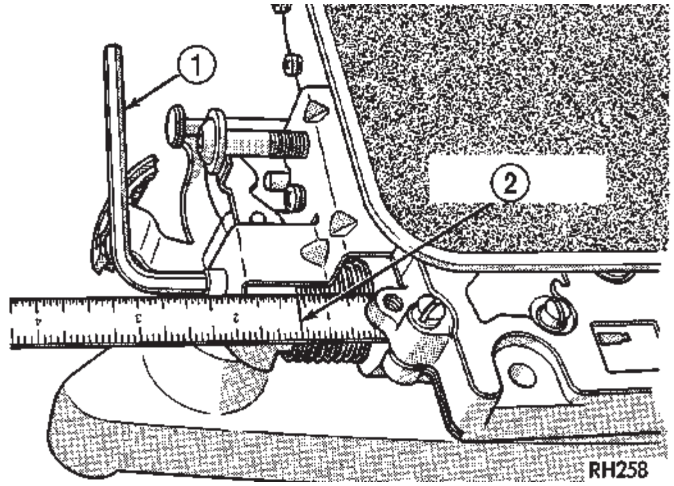

*Fig. 317 Line Pressure Adjustment*

1 - WRENCH
2 - 1–5/16 INCH

#### THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 318).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

**NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.**

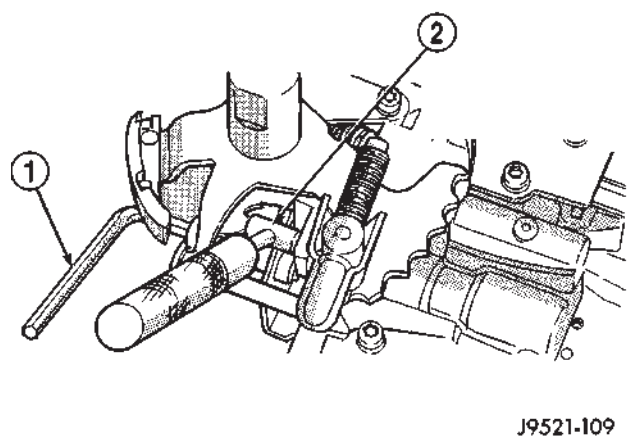

*Fig. 318 Throttle Pressure Adjustment*

1 - HEX WRENCH (IN THROTTLE LEVER ADJUSTING SCREW)
2 - SPECIAL TOOL C-3763 (POSITIONED BETWEEN THROTTLE LEVER AND KICKDOWN VALVE)

# TRANSFER CASE - NV231HD

## TABLE OF CONTENTS

# TRANSFER CASE - NV231HD

## DESCRIPTION

The NV231HD transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The synchronizer mechanism consists of a brass stop ring, synchro hub, and the sliding clutch. The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

## IDENTIFICATION

An identification tag (Fig. 1) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

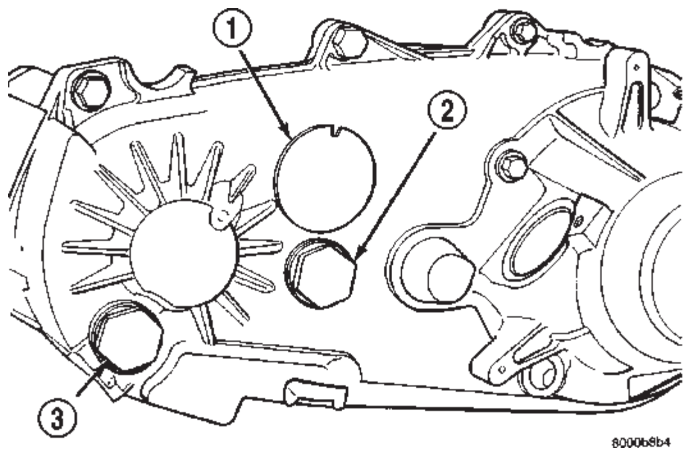

***Fig. 1 Transfer Case Identification Tag - Typical***

1 - I.D. TAG
2 - FILL PLUG
3 - DRAIN PLUG

## OPERATION

### OPERATING RANGES

Transfer case operating ranges are:

- 4x2 (2-wheel drive)
- 4x4 (4-wheel drive)
- 4 Lo (4-wheel drive low range

TRANSFER CASE - NV231HD (Continued)

The 4x2 range is for use on any road surface at any time.

The 4x4 and 4 Lo ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4 Lo range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer case. The switch is operated by the transfer case range rod.

## SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

## SHIFTING

The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into the 4L operating range.

## DIAGNOSIS AND TESTING - TRANSFER CASE

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

**DIAGNOSIS CHART**

| Condition | Possible Cause | Correction |
|---|---|---|
| Transfer Case difficult to shift or will not shift into desired range. | 1) Vehicle speed too great to permit shifting. | 1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. |
| | 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. | 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. |
| | 3) Transfer case external shift linkage binding. | 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. |
| | 4) Insufficient or incorrect lubricant. | 4) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. |
| | 5) Internal components binding, worn, or damaged. | 5) Disassemble the transfer case and replace worn or damaged components as necessary. |
| Transfer Case noisy in all operating ranges. | 1) Insufficient or incorrect lubricant. | 1) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. |

TRANSFER CASE - NV231HD (Continued)

| Condition | Possible Cause | Correction |
|---|---|---|
| Noisy in, or jumps out of, four wheel drive low range. | 1) Transfer case not completely engaged in 4L position. | 1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. |
| | 2) Shift linkage out of adjustment. | 2) Adjust linkage. |
| | 3) Shift linkage loose or binding. | 3) Tighten, lubricate, or repair linkage as necessary. |
| | 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. | 4) Disassemble unit and repair as necessary. |
| | 5) Low range gear worn or damaged. | 5) Disassemble unit and repair as necessary. |
| Lubricant leaking from output shaft seal or vent. | 1) Transfer case overfilled. | 1) Drain lubricant to the correct level. |
| | 2) Vent closed or restricted. | 2) Clear or replace vent as necessary. |
| | 3) Output shaft seals damaged or installed incorrectly. | 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal. |
| Abnormal tire wear. | 1) Extended operation on hard, dry surfaces in the 4H position. | 1) Operate vehicle in the 2H position on hard, dry surfaces. |

## REMOVAL

(1) Raise and support vehicle.

(2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)

(3) Position drain oil container under transfer case.

(4) Remove transfer case drain plug and drain lubricant into container.

(5) Disconnect vent hose and vacuum harness at transfer case switch.

(6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.

(7) Support transmission with jack stand.

(8) Remove rear crossmember.

(9) Mark front and rear propeller shafts for assembly reference.

(10) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.

(12) Remove nuts attaching transfer case to transmission.

(13) Move transfer case assembly rearward until free of transmission output shaft.

(14) Lower jack and move transfer case from under vehicle.

## DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

TRANSFER CASE - NV231HD (Continued)

## REAR EXTENSION, RETAINER, AND REAR CASE

(1) Remove rear extension bolts (Fig. 2).

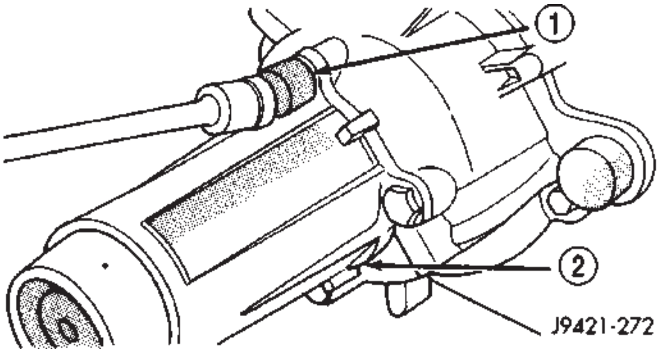

*Fig. 2 Rear Extension Bolt Removal*

1 - SOCKET
2 - REAR EXTENSION

(2) Remove rear extension housing (Fig. 3). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

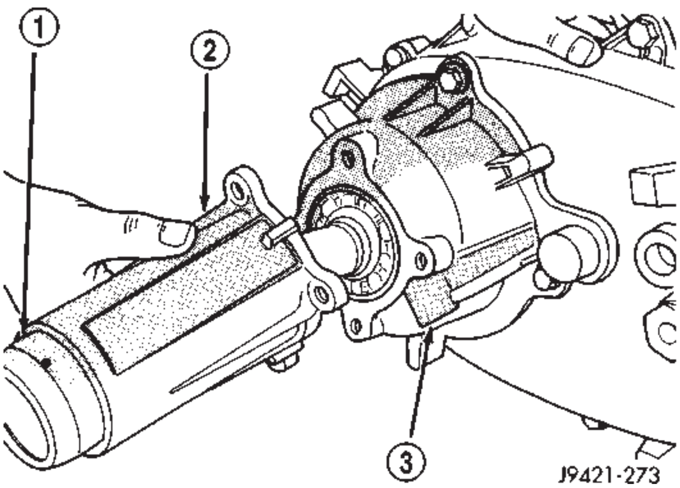

*Fig. 3 Rear Extension Housing Removal*

1 - SEAL
2 - REAR EXTENSION HOUSING
3 - REAR RETAINER

(3) Remove output bearing retaining ring with heavy duty snap-ring pliers (Fig. 4).
(4) Remove rear retainer bolts (Fig. 5).
(5) Loosen rear retainer with pry bar placed under flange (Fig. 6).
(6) Remove rear retainer and output bearing as assembly (Fig. 7).

## COMPANION FLANGE AND SHIFT LEVER

(1) Shift transfer case into NEUTRAL.
(2) Remove companion flange nut (Fig. 8). Discard nut after removal. It is not reusable.

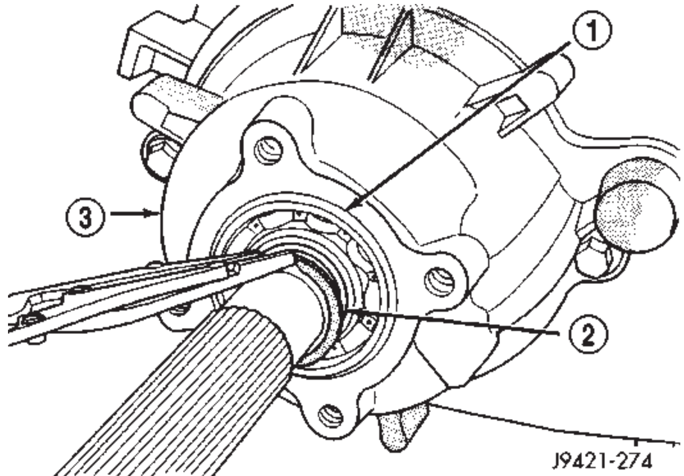

*Fig. 4 Removing Output Bearing Retaining Ring*

1 - OUTPUT BEARING
2 - RETAINING RING
3 - REAR RETAINER

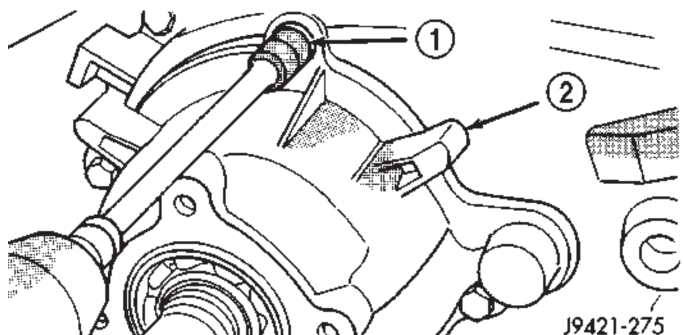

*Fig. 5 Removing Rear Extension Bolts*

1 - SOCKET
2 - REAR RETAINER

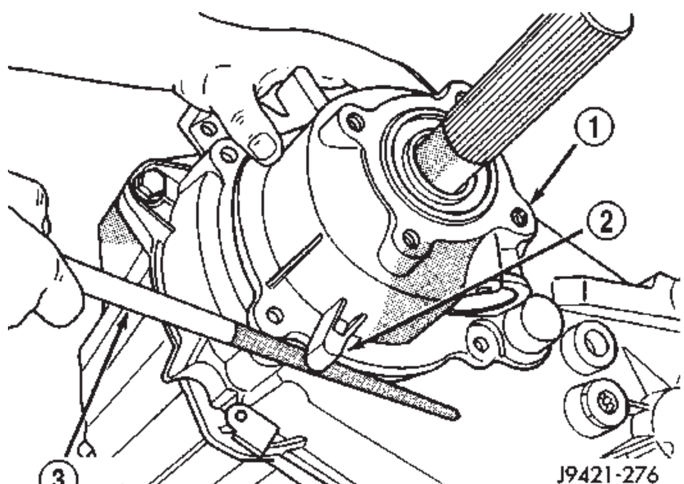

*Fig. 6 Loosening Rear Retainer*

1 - REAR RETAINER
2 - FLANGE
3 - PRY TOOL

TRANSFER CASE - NV231HD (Continued)

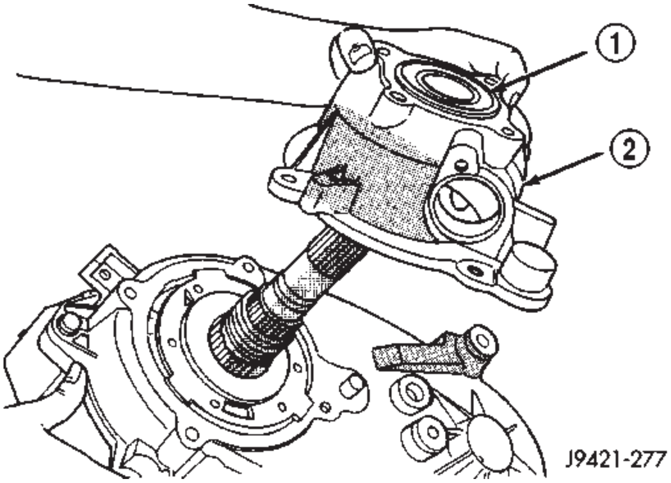

*Fig. 7 Rear Retainer Removal*

1 - OUTPUT BEARING
2 - REAR RETAINER

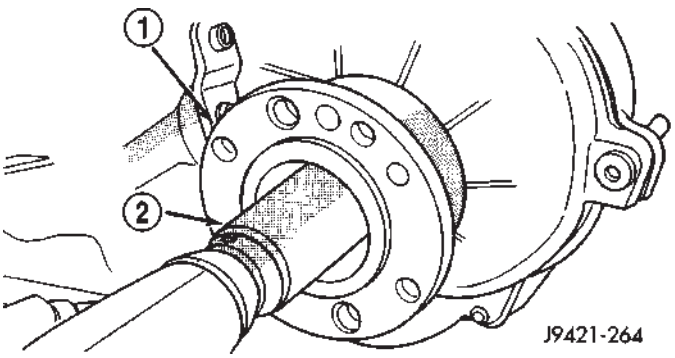

*Fig. 8 Removing Companion Flange Nut*

1 - COMPANION FLANGE
2 - SOCKET

(3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.

(4) Remove companion flange rubber seal from front output shaft (Fig. 9).

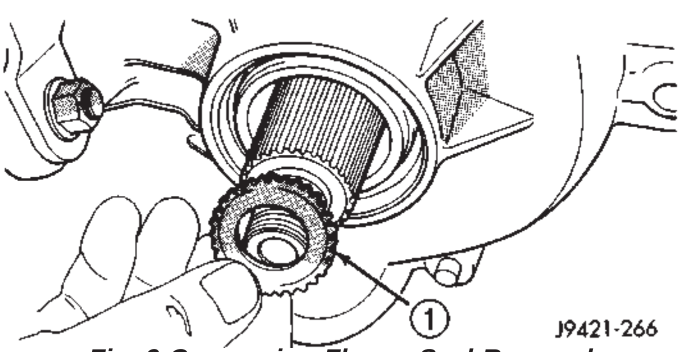

*Fig. 9 Companion Flange Seal Removal*

1 - FLANGE SEAL

(5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 10).

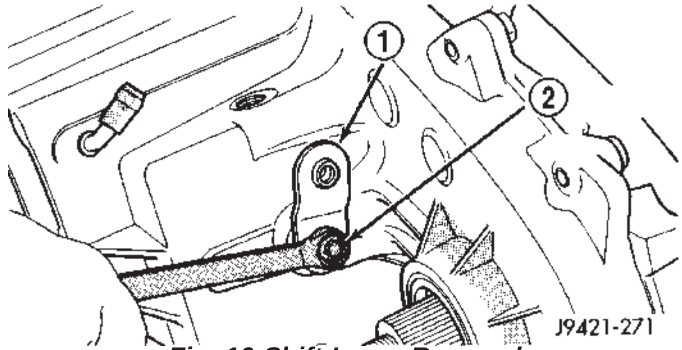

*Fig. 10 Shift Lever Removal*

1 - SHIFT LEVER
2 - NUT/WASHER

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove output bearing retaining ring with heavy duty snap-ring pliers.

(2) Remove output shaft bearing.

(3) Note position of bolts that attach rear case to front case (Fig. 11). Some bolts/studs at ends of case require flat washers. Mark position of these bolts with paint or scriber.

(4) Remove rear case-to-front case bolts.

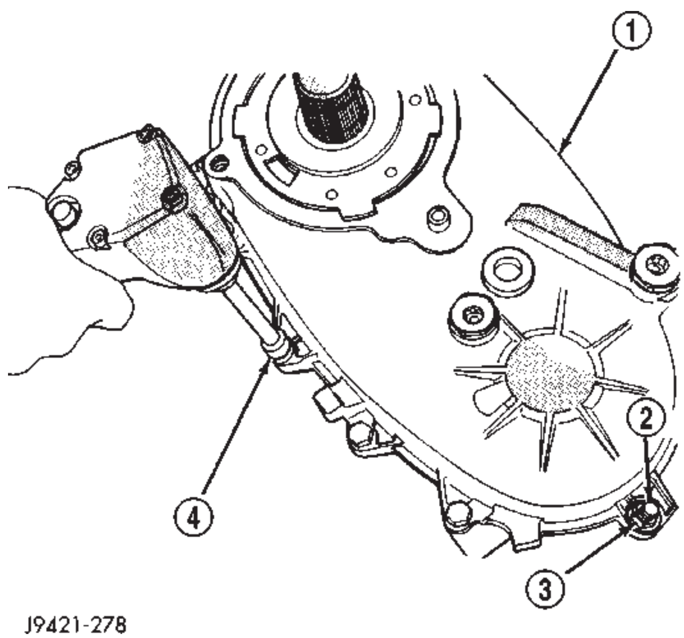

*Fig. 11 Removing Case Attaching Bolts*

1 - REAR CASE
2 - STUD
3 - NUT AND WASHER
4 - SOCKET

TRANSFER CASE - NV231HD (Continued)

(5) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 12).

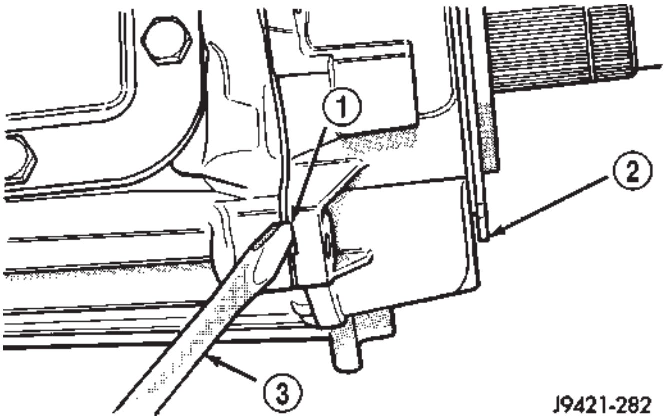

*Fig. 12 Loosening Rear Case (Breaking Sealer Bead)*

1 - SLOT
2 - REAR CASE
3 - PRY TOOL

(6) Unseat rear case from alignment dowels (Fig. 13).

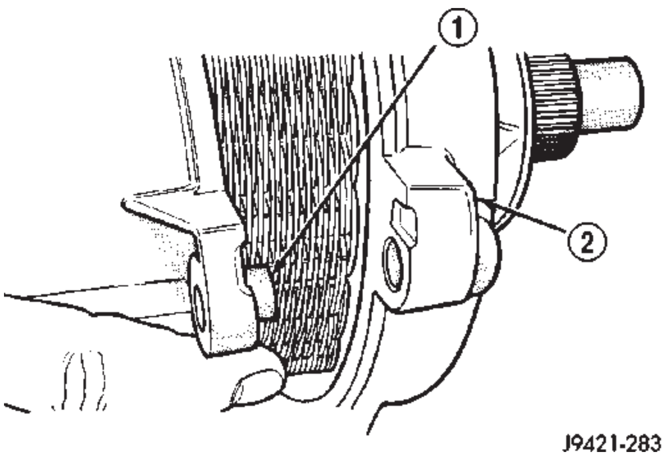

*Fig. 13 Removing Rear Case From Alignment Dowels*

1 - CASE DOWELS (2)
2 - REAR CASE

(7) Remove rear case and oil pump assembly from front case.

(8) Remove shift rail cup and spring (Fig. 14).

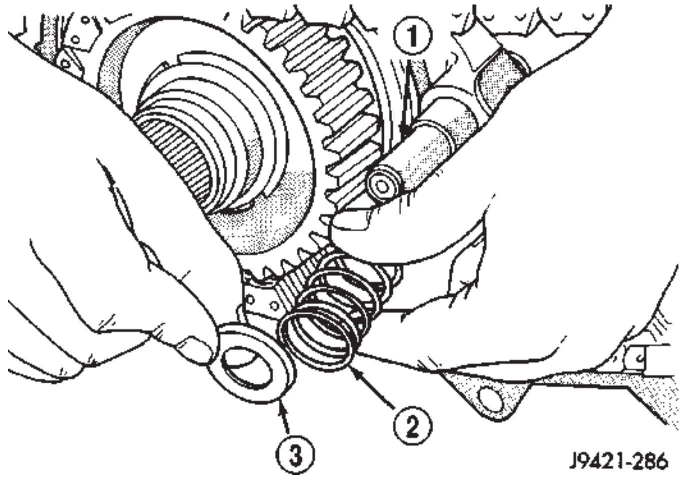

*Fig. 14 Shift Rail Cup And Spring Removal*

1 - SHIFT RAIL
2 - SPRING
3 - CUP

(9) Remove front sprocket retaining ring (Fig. 15).

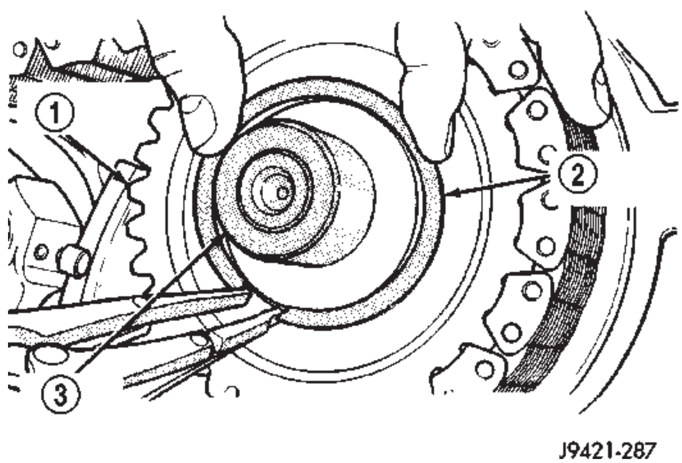

*Fig. 15 Removing Front Sprocket Retaining Ring*

1 - FRONT SPROCKET
2 - RETAINING RING
3 - FRONT OUTPUT SHAFT

TRANSFER CASE - NV231HD (Continued)

(10) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1-inch) simultaneously (Fig. 16).

(11) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

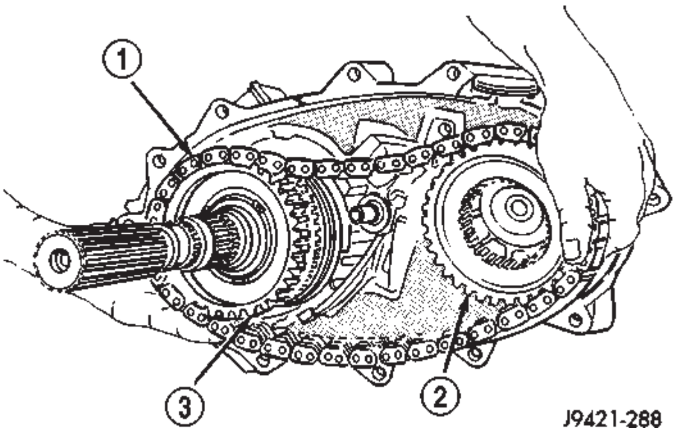

***Fig. 16 Removing Drive Chain And Front Sprocket***

1 - CHAIN
2 - DRIVE SPROCKET
3 - FRONT SPROCKET

## SHIFT FORKS AND MAINSHAFT

(1) Remove vacuum/indicator switch (Fig. 17).

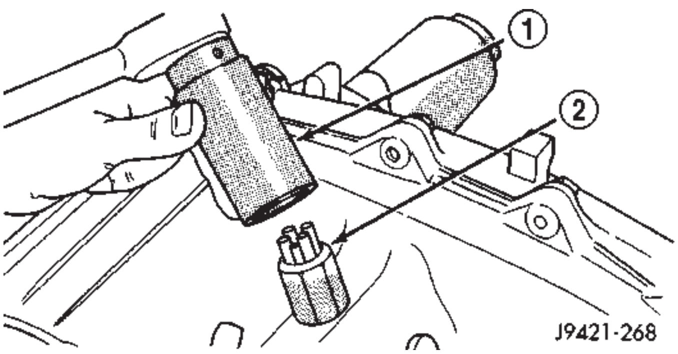

***Fig. 17 Vacuum/Indicator Switch Removal***

1 - 1-1/16" SOCKET
2 - INDICATOR SWITCH

(2) Loosen poppet plunger screw (Fig. 18).

(3) Remove poppet plunger screw and spring (Fig. 19). Note that screw has O-ring seal. Remove and discard seal this seal.

(4) Remove poppet plunger with magnet (Fig. 20).

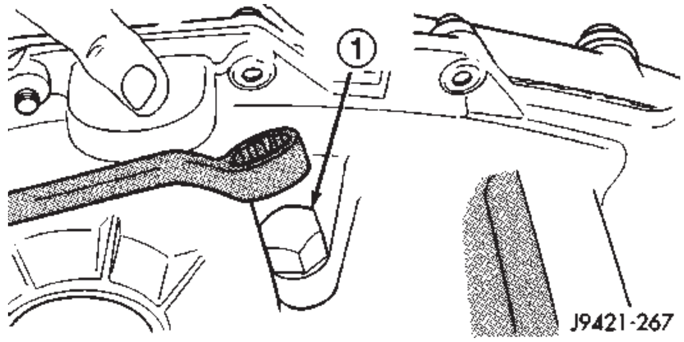

***Fig. 18 Loosening Poppet Plunger Screw***

1 - POPPET PLUNGER SCREW

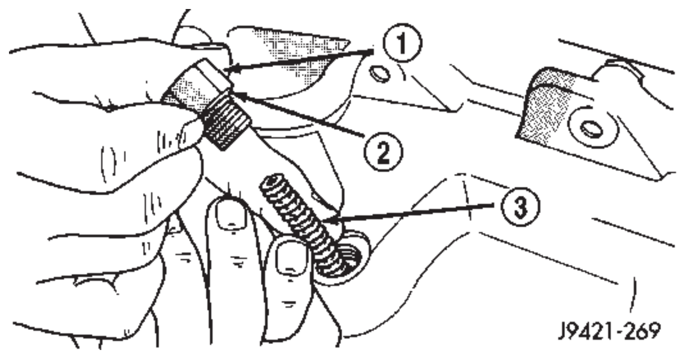

***Fig. 19 Poppet Plunger Screw And Spring Removal***

1 - POPPET PLUNGER SCREW
2 - O-RING
3 - PLUNGER SPRING

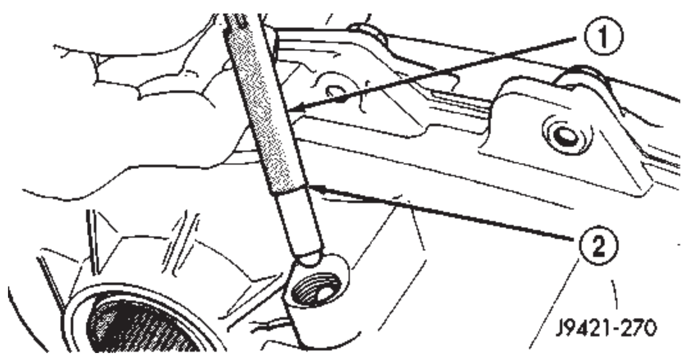

***Fig. 20 Poppet Plunger Removal***

1 - MAGNET
2 - POPPET PLUNGER

TRANSFER CASE - NV231HD (Continued)

(5) Remove front output shaft from bearing in case (Fig. 21).

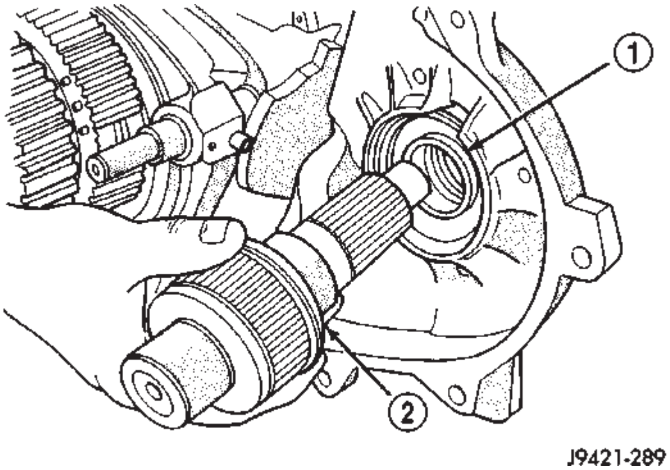

*Fig. 21 Front Output Shaft Removal*

1 - BALL BEARING
2 - FRONT OUTPUT SHAFT

(6) Pull mainshaft assembly out of input gear, sliding clutch and case (Fig. 22).

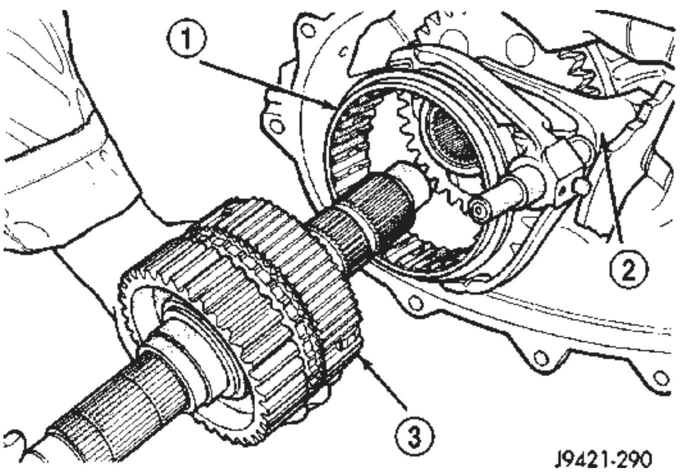

*Fig. 22 Mainshaft Assembly Removal*

1 - SLIDING CLUTCH
2 - MODE FORK
3 - MAINSHAFT ASSEMBLY

(7) Remove mode fork, sliding clutch and shift rail as assembly (Fig. 23). Note which way clutch fits in fork (long side of clutch goes to front).

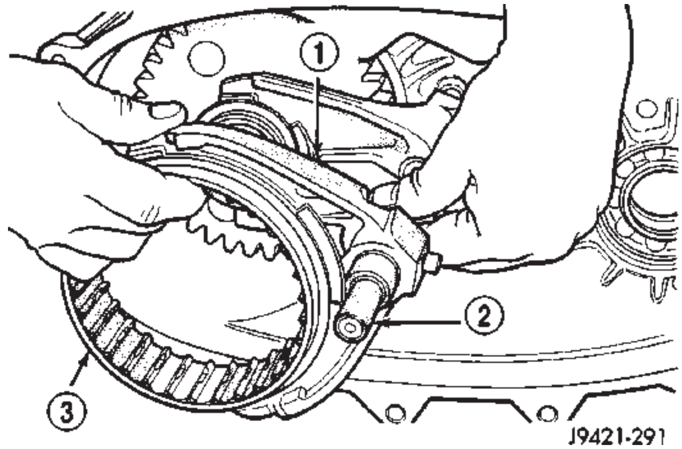

*Fig. 23 Mode Fork, Shift Rail And Sliding Clutch Removal*

1 - MODE FORK
2 - SHIFT RAIL
3 - SLIDING CLUTCH

(8) Remove range fork retaining ring.

(9) Remove range fork and hub as an assembly (Fig. 24). Note fork position for installation reference.

(10) Remove shift sector (Fig. 25).

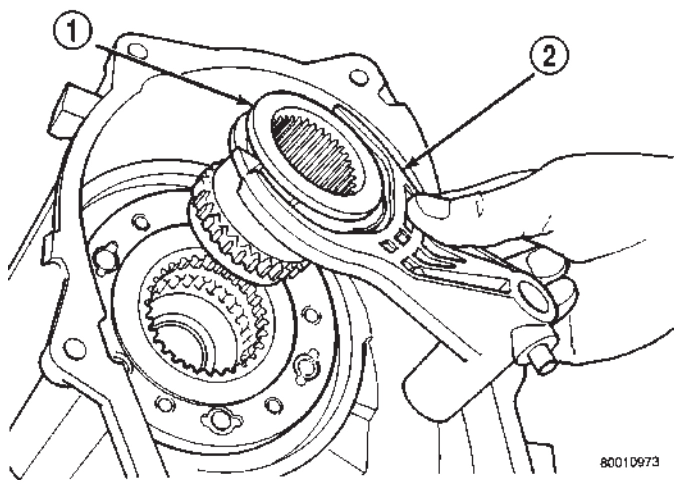

*Fig. 24 Range Fork And Hub Removal*

1 - RANGE HUB
2 - RANGE FORK

TRANSFER CASE - NV231HD (Continued)

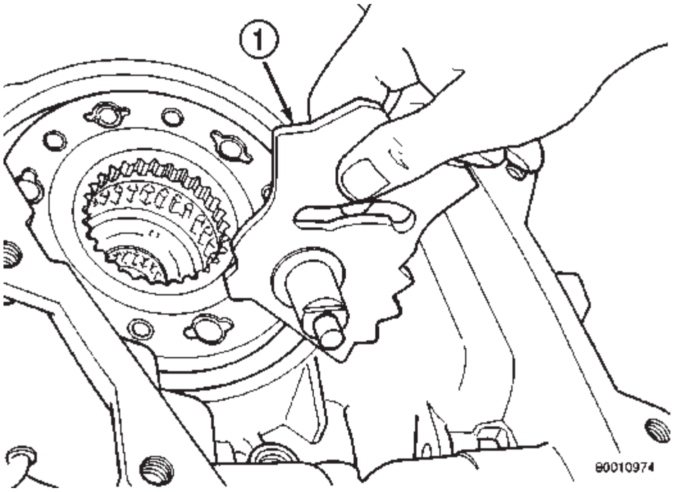

***Fig. 25 Shift Sector Removal***

1 - SHIFT SECTOR

(11) Remove shift sector shaft nylon retainer and O-ring from shaft bore in front case (Fig. 26).

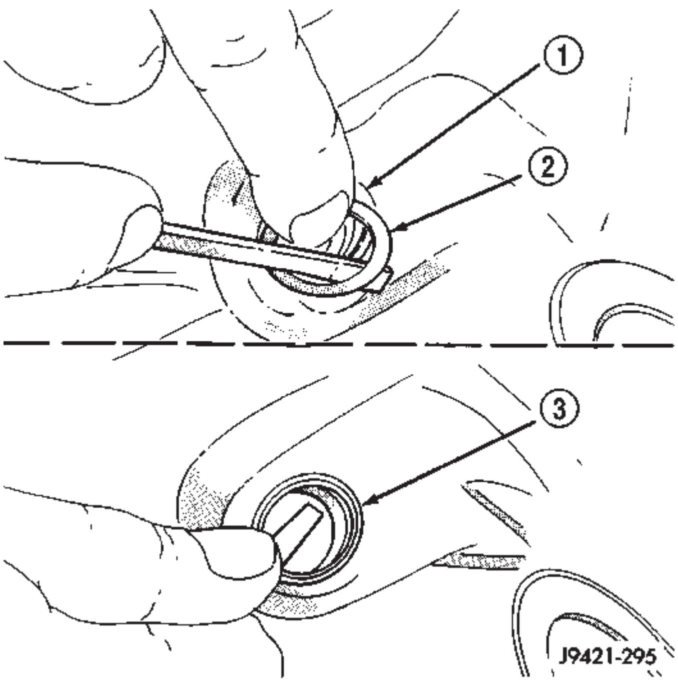

***Fig. 26 Removing Sector Shaft O-Ring And Retainer***

1 - SHAFT BORE
2 - NYLON RETAINING RING
3 - SECTOR SHAFT O-RING

## MAINSHAFT

(1) Remove retaining ring that secures synchronizer hub onto mainshaft (Fig. 27). Use standard (instead of parallel jaw) snap-ring pliers to remove this retaining ring.

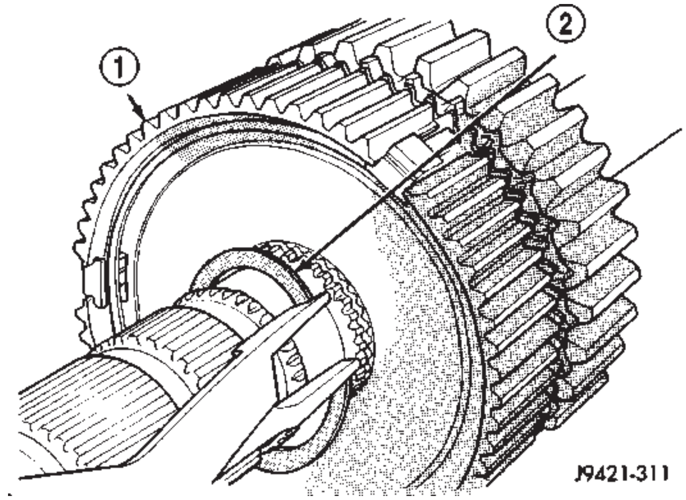

***Fig. 27 Synchronizer Hub Retaining Ring Removal***

1 - SYNCHRONIZER HUB
2 - RETAINING RING

(2) Remove synchronizer hub (Fig. 28).

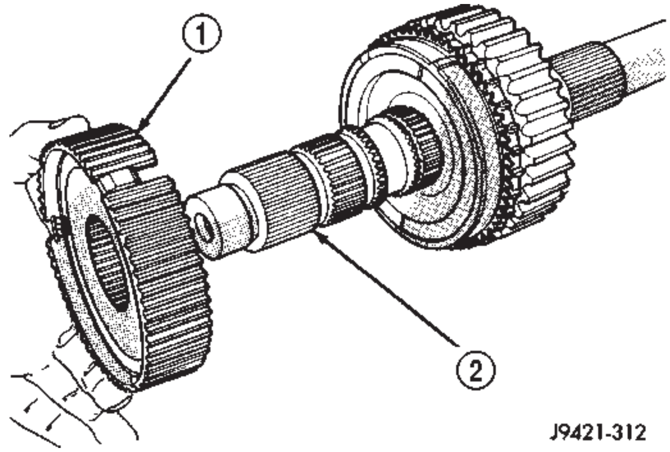

***Fig. 28 Synchronizer Hub Removal***

1 - SYNCHRONIZER HUB
2 - MAINSHAFT

TRANSFER CASE - NV231HD (Continued)

(3) Inspect synchronizer hub struts and springs. If struts appear worn, remove struts and springs from hub. Note position of springs for installation reference (Fig. 29).

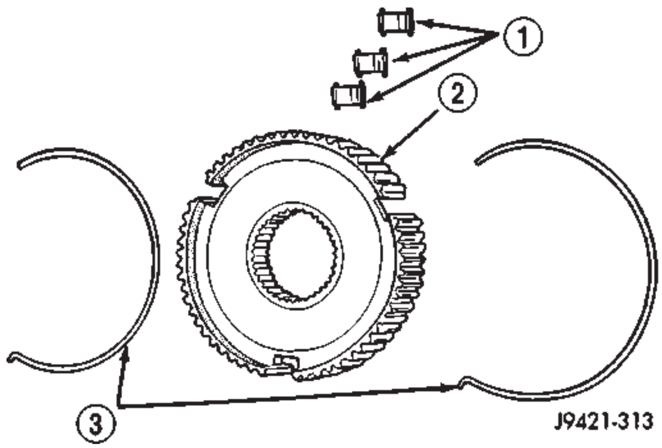

*Fig. 29 Synchronizer Strut And Spring Removal*

1 - SYNCHRONIZER STRUTS
2 - SYNCHRONZER HUB
3 - SYNCHRONIZER SPRINGS

(4) Remove brass stop ring (Fig. 30). Discard stop ring if worn, cracked, or any teeth are missing.

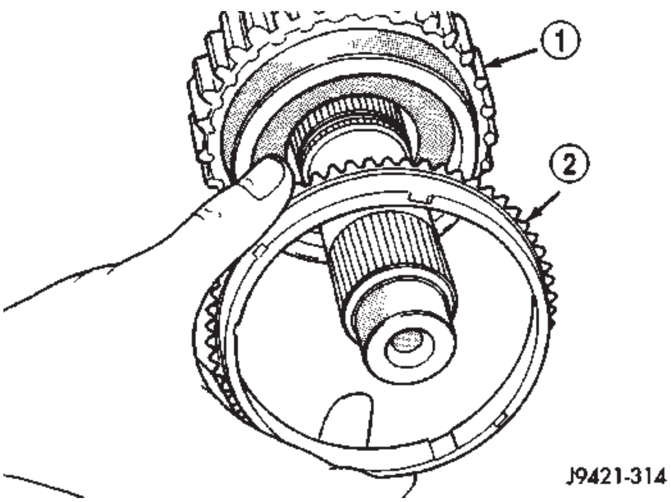

*Fig. 30 Synchronizer Stop Ring Removal*

1 - DRIVE SPROCKET
2 - STOP RING

(5) Remove drive sprocket (Fig. 31).

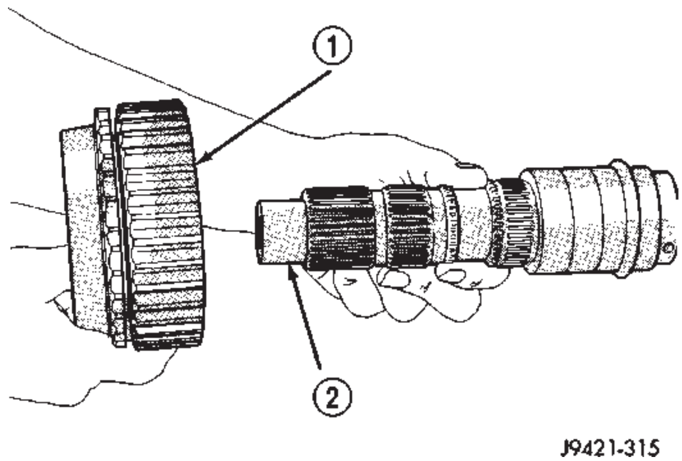

*Fig. 31 Drive Sprocket Removal*

1 - DRIVE SPROCKET
2 - MAINSHAFT

## INPUT AND PLANETARY GEAR

(1) Remove front bearing retainer attaching bolts (Fig. 32).

(2) Remove front bearing retainer. Pry retainer loose with pry tool positioned in slots at each end of retainer (Fig. 33).

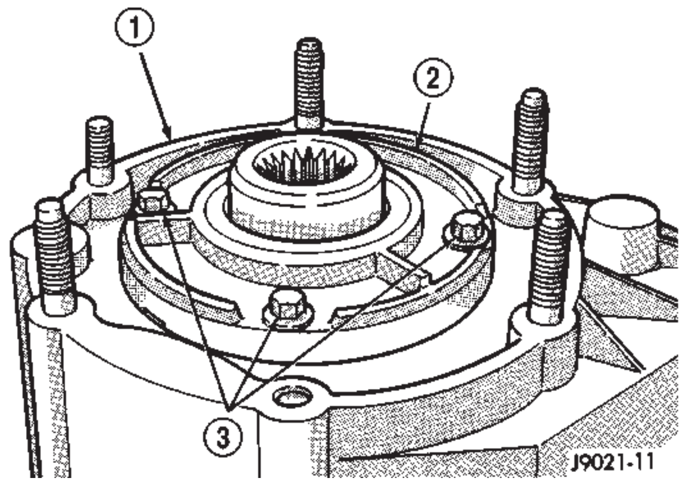

*Fig. 32 Front Bearing Retainer Bolts*

1 - FRONT CASE
2 - FRONT BEARING RETAINER
3 - RETAINER BOLTS

TRANSFER CASE - NV231HD (Continued)

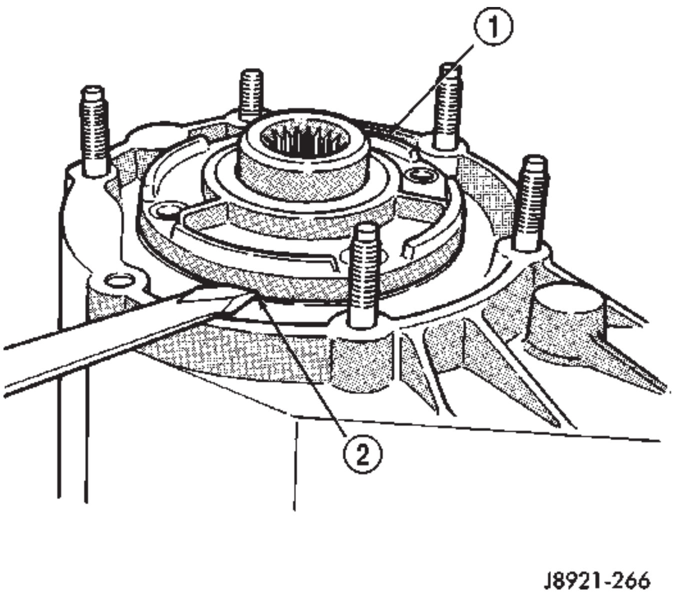

***Fig. 33 Front Bearing Retainer Removal***

1 - FRONT BEARING RETAINER
2 - RETAINER SLOT

(3) Remove front bearing retainer seal. Tap seal out with drift and hammer.

(4) Remove input gear retaining ring with heavy duty snap-ring pliers (Fig. 34).

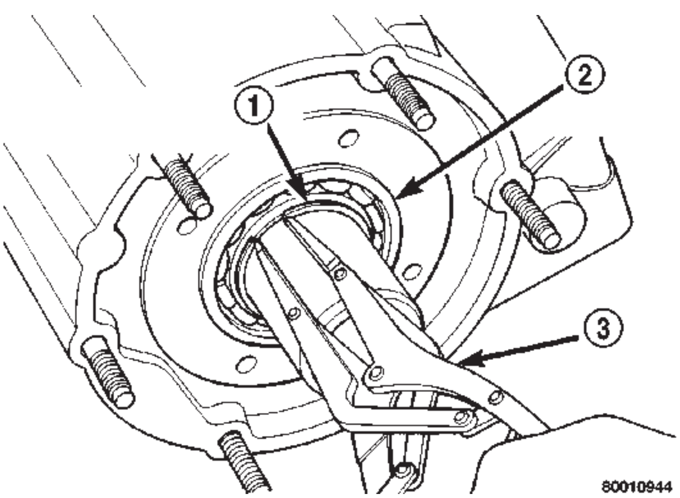

***Fig. 34 Removing Input Gear Retaining Ring***

1 - INPUT GEAR BEARING RETAINING RING
2 - INPUT GEAR BEARING
3 - SNAP-RING PLIERS

(5) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 35). Tap gear out of bearing with plastic mallet, if necessary.

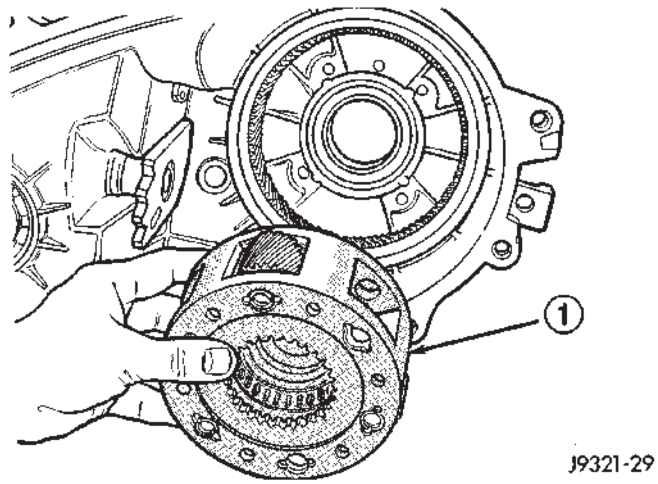

***Fig. 35 Input Gear And Planetary Carrier Removal***

1 - INPUT AND LOW RANGE GEAR ASSEMBLY

## INPUT AND PLANETARY GEAR

(1) Remove snap-ring that retains input gear in low range gear (Fig. 36).

(2) Remove retainer (Fig. 37).

(3) Remove front tabbed thrust washer (Fig. 38).

(4) Remove input gear (Fig. 39).

(5) Remove rear tabbed thrust washer from low range gear (Fig. 40).

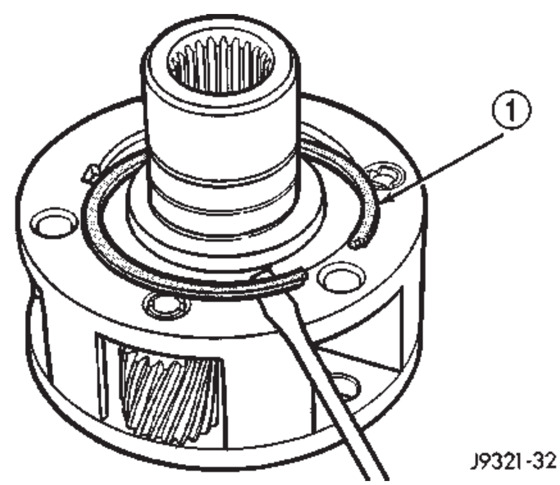

***Fig. 36 Input Gear Snap-Ring Removal***

1 - INPUT GEAR SNAP-RING

TRANSFER CASE - NV231HD (Continued)

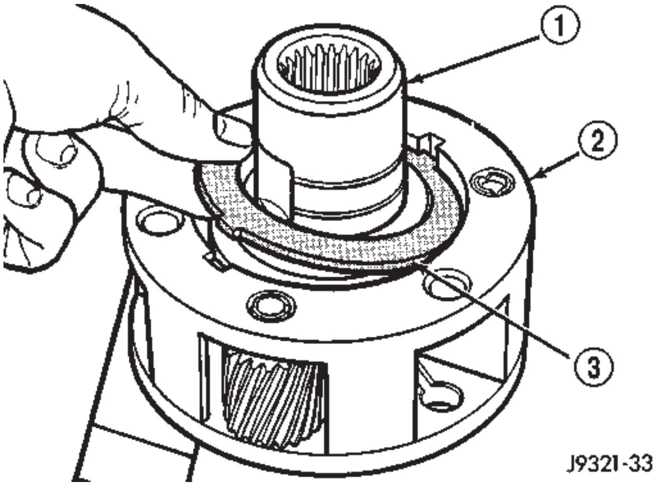

*Fig. 37 Input Gear Retainer Removal*

1 - INPUT GEAR
2 - LOW RANGE GEAR
3 - RETAINER

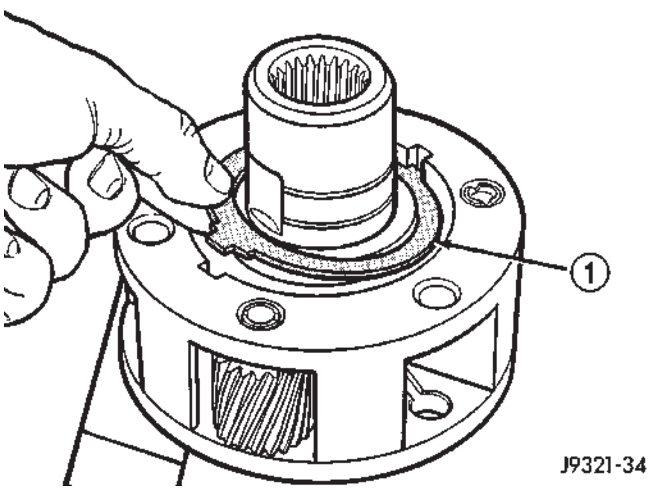

*Fig. 38 Front Tabbed Thrust Washer Removal*

1 - FRONT TABBED THRUST WASHER

## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

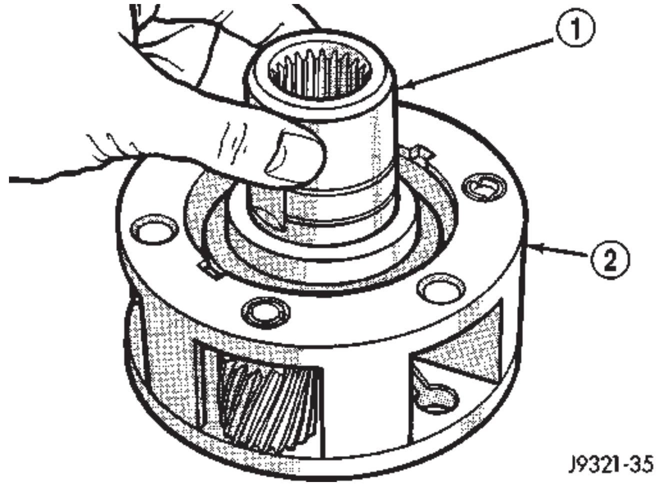

*Fig. 39 Input Gear Removal*

1 - INPUT GEAR
2 - LOW RANGE GEAR

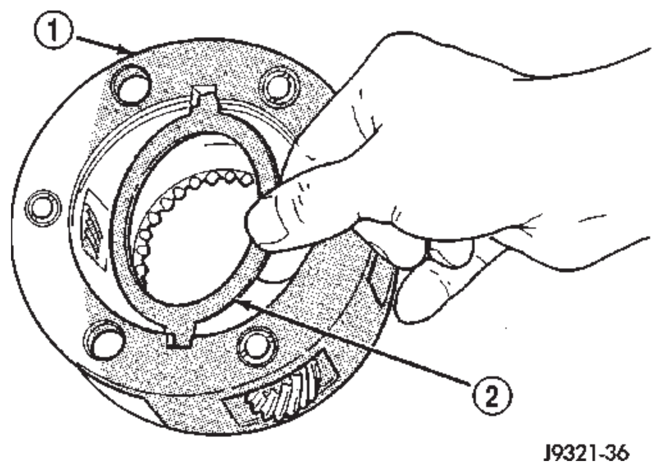

*Fig. 40 Rear Tabbed Thrust Washer Removal*

1 - LOW RANGE GEAR
2 - REAR TABBED THRUST WASHER

TRANSFER CASE - NV231HD (Continued)

## INSPECTION

### MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket (Fig. 41). Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

Inspect the spline teeth on the synchronizer hub. If evidence of chipping or excessive wear is apparent, replace the hub. The hooked end of each synchronizer spring should be inserted in one of the struts. In addition, the springs should not interfere with the polished gear cone or inside diameters of the hub.

Inspect the stop ring for cracks and wear . Replace the ring if necessary or if doubt exists over condition. Check a replacement synchronizer ring for proper fit on the cone with a minimum of wobble. Also check the synchronizer struts for wear or damage.

### INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 42). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

### SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 43). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (Fig. 44). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

### REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

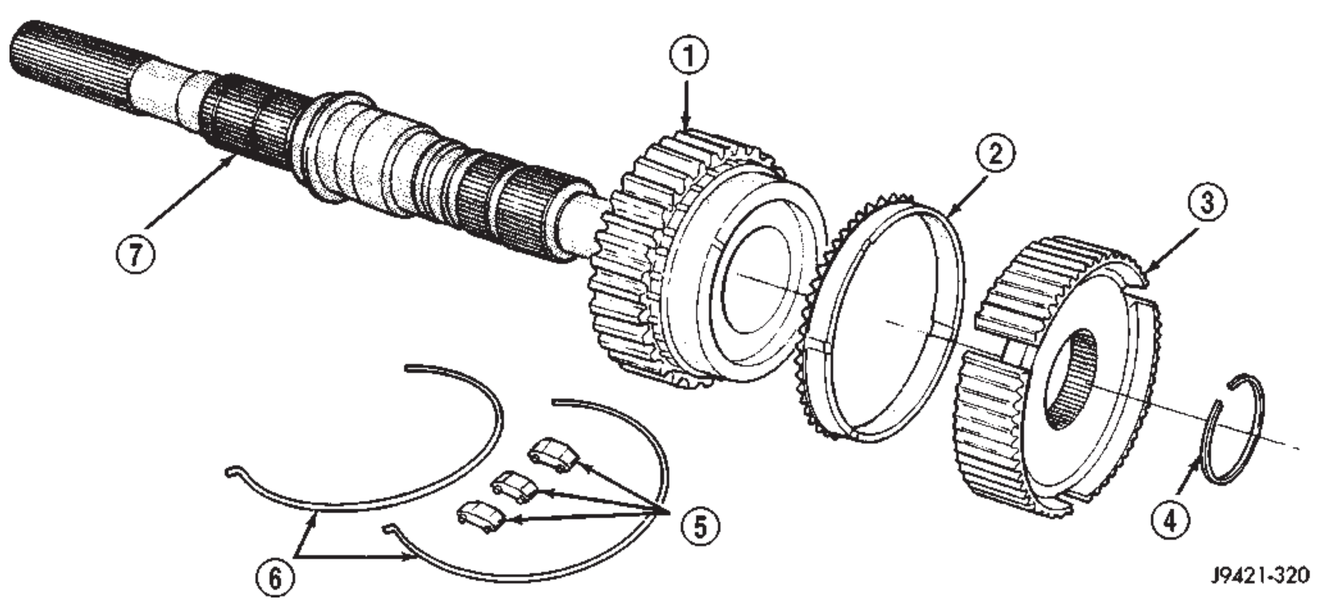

***Fig. 41 Mainshaft Components***

4 - CARRIER LOCK RING
5 - CARRIER LOCK RETAINING RING
6 - INPUT GEAR

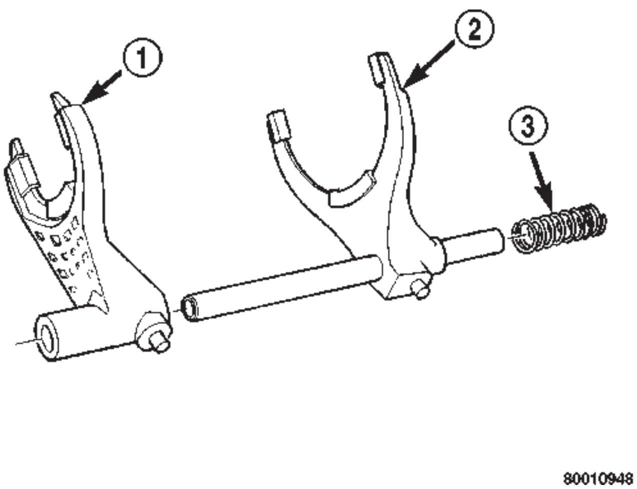

*Fig. 43 Shift Forks*

1 - RANGE FORK
2 - MODE FORK AND RAIL
3 - MODE SPRING

Inspect rear extension bushing. Replace if worn or scored.

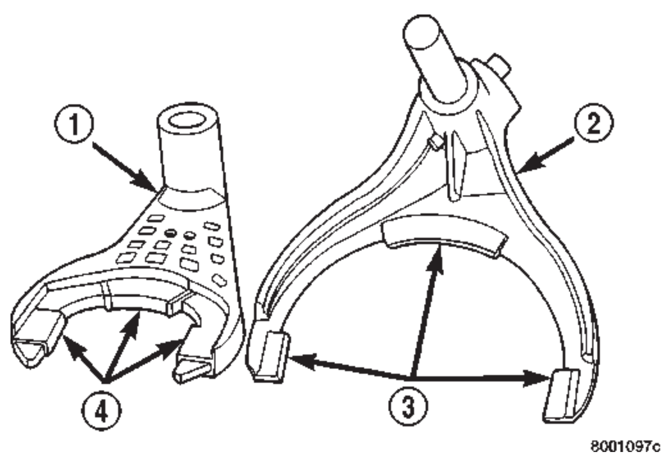

*Fig. 44 Shift Fork And Wear Pad Locations*

1 - RANGE FORK
2 - MODE FORK
3 - WEAR PADS (SERVICEABLE)
4 - WEAR PADS (NON-SERVICEABLE)

## DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

### LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 45)

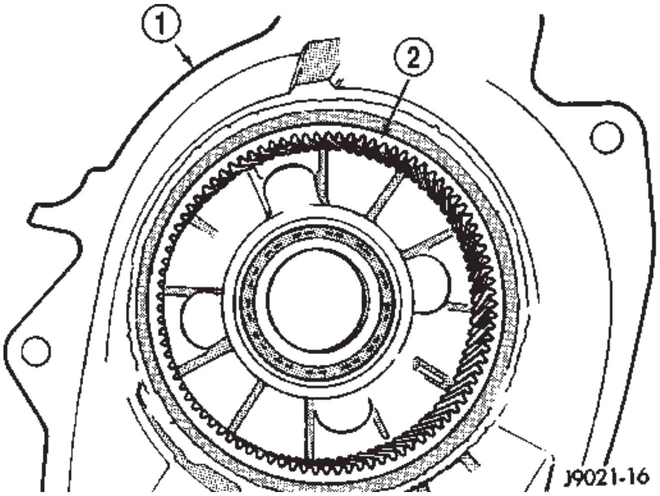

*Fig. 45 Low Range Annulus Gear*

1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

### FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Replace the input retainer seal, do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

### OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

## ASSEMBLY

### BEARINGS AND SEALS

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 46).

(2) Install locating ring on new bearing.

(3) Position case so that the forward end is facing upward.

(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 47).

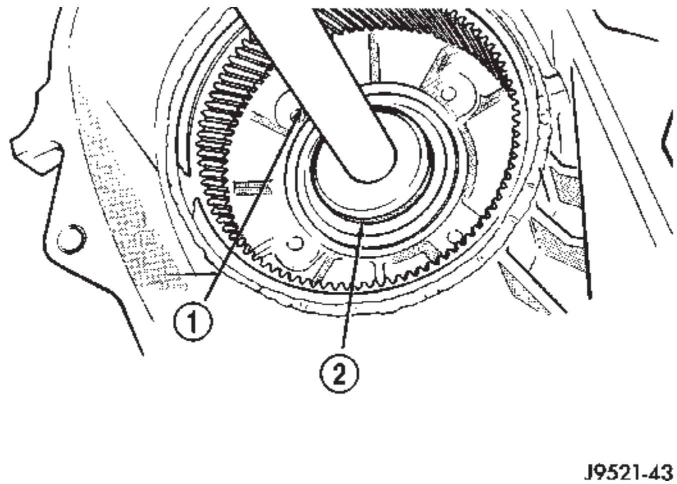

*Fig. 46 Input Shaft Bearing Removal*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL C-4210

(5) Using Installer 6953, remove front output shaft bearing.

(6) Start front shaft output bearing in case (Fig. 48). Then seat bearing with Handle C-4171 and Installer 6953.

(7) Install front output bearing retaining ring.

(8) Install new front output seal front case with Installer Tool 8143-A as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore with light taps from hammer (Fig. 49). Once seal is started, continue tapping seal into bore until installer tool seats against case.

(9) Remove seal from front bearing retainer with suitable pry tool.

(10) Install new oil seal in front bearing retainer with Installer 7884 (Fig. 50).

TRANSFER CASE - NV231HD (Continued)

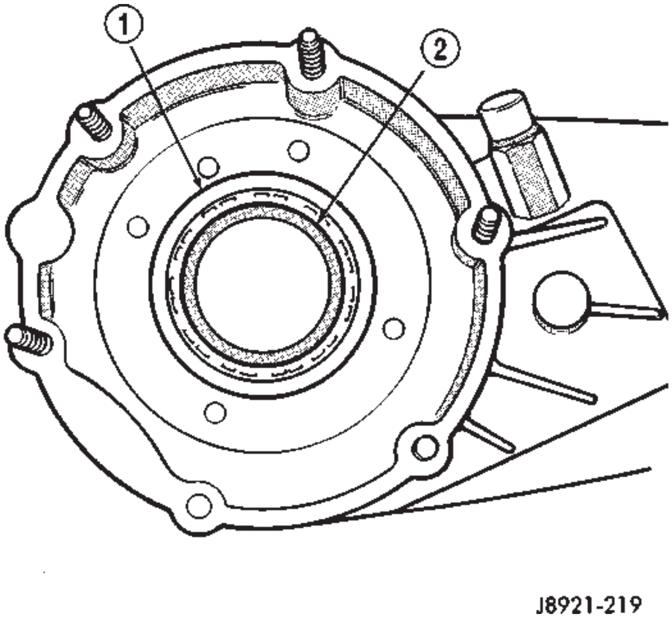

***Fig. 47 Seating Input Shaft Bearing***

2 - TRANSFER CASE

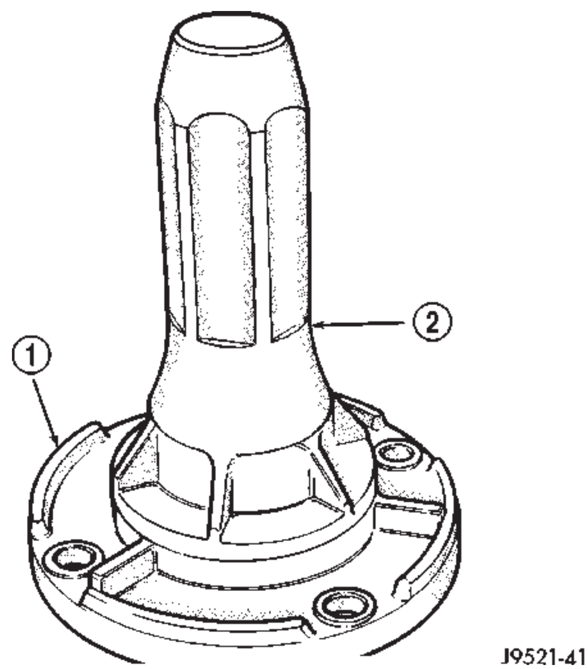

***Fig. 50 Install Front Bearing Retainer Seal***

1 - FRONT BEARING RETAINER
2 - SPECIAL TOOL 7884

TRANSFER CASE - NV231HD (Continued)

(11) Remove seal from oil pump with suitable pry tool.

(12) Install new seal in oil pump with Installer 7888 (Fig. 51).

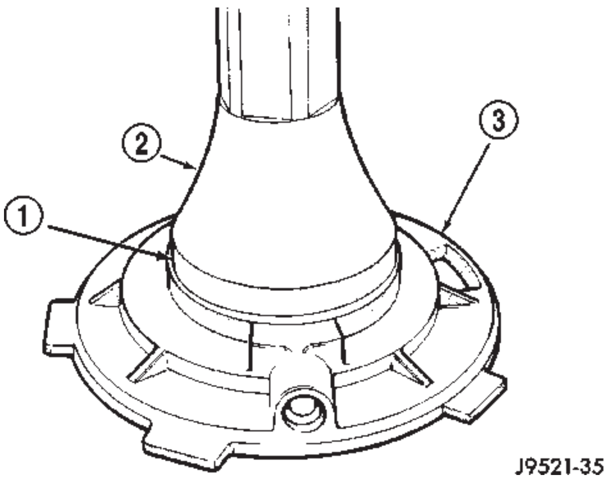

***Fig. 51 Install Oil Pump Seal***

1 - HOUSING SEAL
2 - SPECIAL TOOL 7888
3 - OIL PUMP FEED HOUSING

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 52).

(14) Install new pilot bearing with Plug C-293-3.

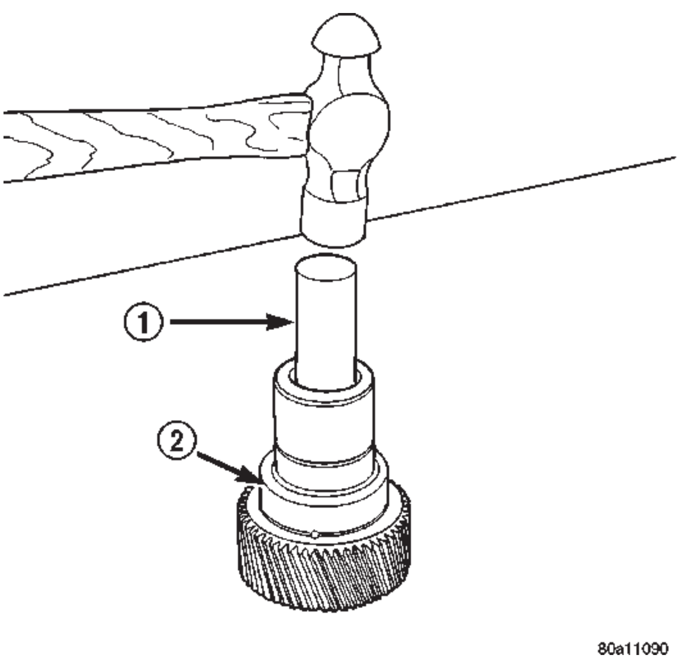

***Fig. 52 Remove Input Gear Pilot Bearing***

1 - DRIFT
2 - INPUT GEAR

(15) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 53).

(16) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 54). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 55).

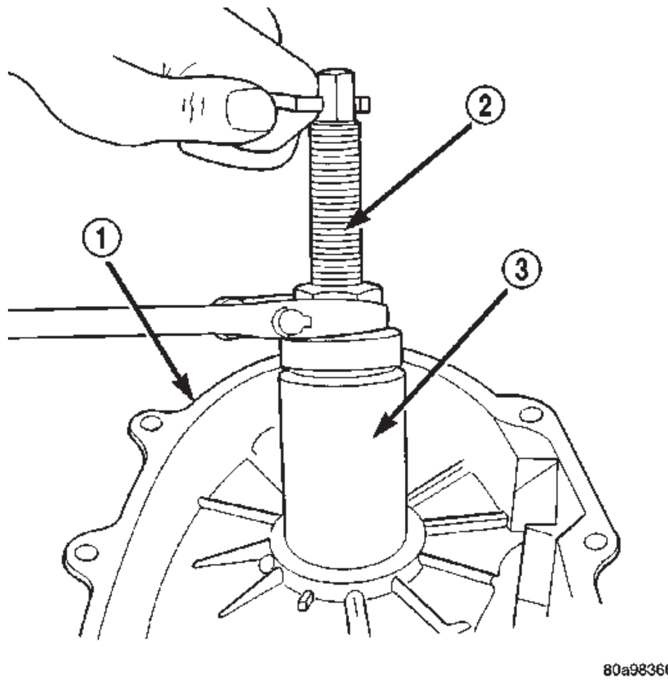

***Fig. 53 Output Shaft Rear Bearing Removal***

1 - REAR CASE
2 - SPECIAL TOOL L-4454-1 AND L-4454-3
3 - SPECIAL TOOL 8148

## INPUT AND PLANETARY GEAR

(1) Lubricate gears and thrust washers (Fig. 56) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 56). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

(6) Align and install low range/input gear assembly in front case (Fig. 57). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

TRANSFER CASE - NV231HD (Continued)

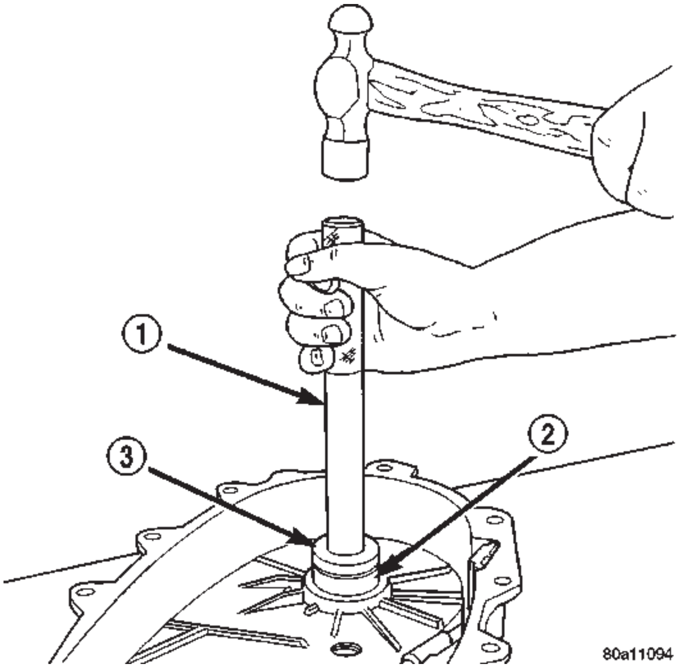

***Fig. 54 Output Shaft Rear Bearing Installation***

2 - OUTPUT SHAFT INNER BEARING
3 - INSTALLER 5066

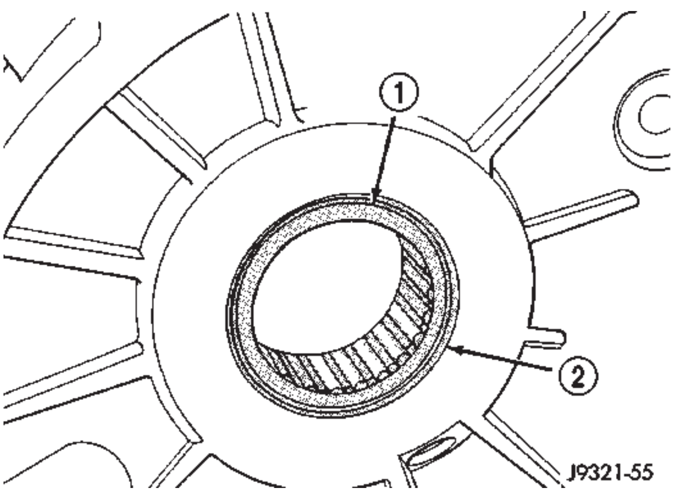

***Fig. 55 Output Shaft Rear Bearing Installation Depth***

1 - BEARING (SEATED) AT LOWER EDGE OF CHAMFER
2 - CHAMFER

(7) Install snap-ring to hold input/low range gear into front bearing (Fig. 58).

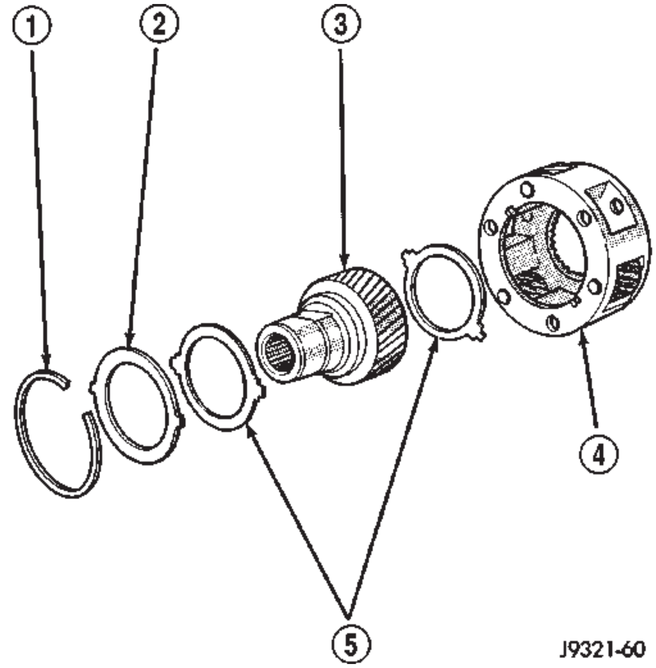

***Fig. 56 Input/Low Range Gear Components***

1 - SNAP-RING
2 - RETAINER PLATE
3 - INPUT GEAR
4 - LOW RANGE GEAR
5 - THRUST WASHERS

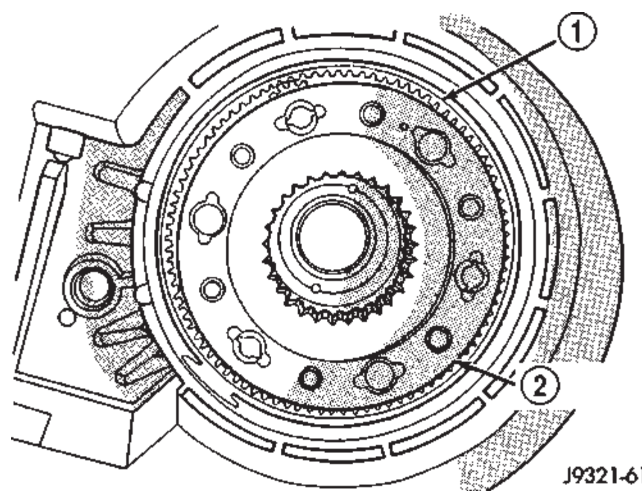

***Fig. 57 Input/Low Range Gear Installation***

1 - ANNULUS GEAR
2 - INPUT/LOW RANGE GEAR

TRANSFER CASE - NV231HD (Continued)

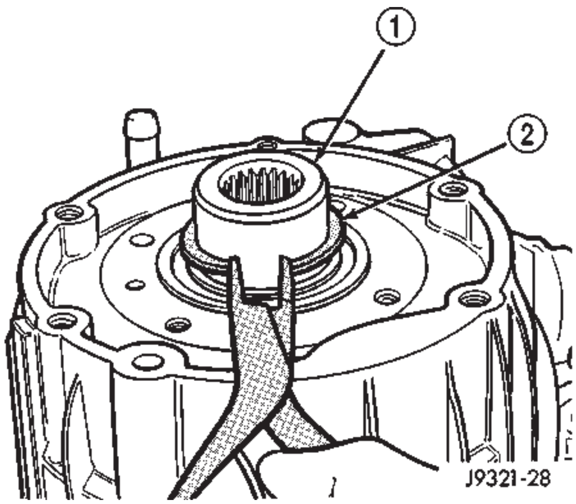

*Fig. 58 Install Input Gear Snap-Ring*

1 - INPUT GEAR
2 - SNAP-RING

(8) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(9) Apply a 3 mm (1/8 in.) bead of Mopar® Gasket Maker, or equivalent silicone adhesive, to sealing surface of retainer.

(10) Align cavity in seal retainer with fluid return hole in front of case.

**CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® Gasket Maker, or equivalent silicone adhesive sealer. Seal failure and fluid leak can result.**

(11) Install bolts to hold retainer to transfer case (Fig. 59). Tighten to 21 N·m (16 ft. lbs.) of torque.

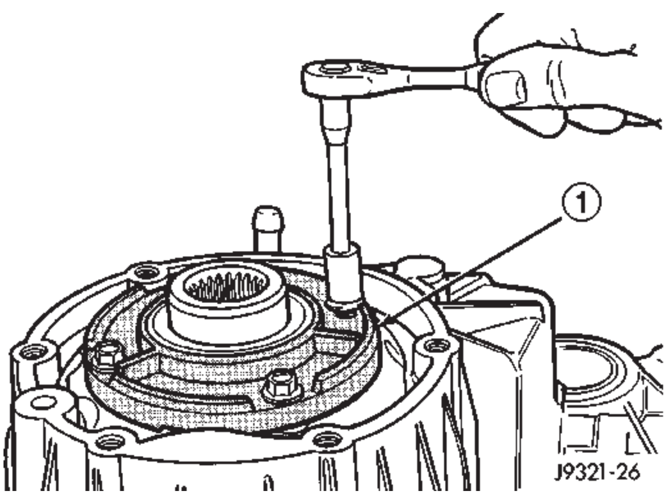

*Fig. 59 Install Front Bearing Retainer*

1 - FRONT BEARING RETAINER

## SHIFT FORKS AND MAINSHAFT

(1) Lubricate mainshaft splines with recommended transmission fluid.

(2) Install drive sprocket on mainshaft (Fig. 60).

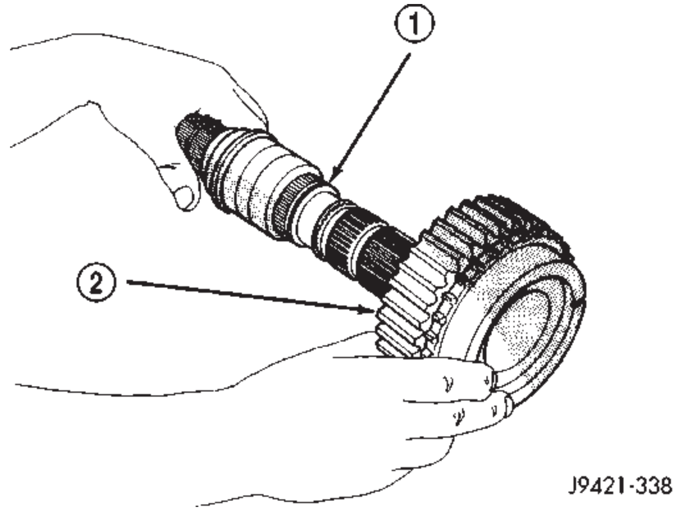

*Fig. 60 Drive Sprocket Installation*

1 - MAINSHAFT
2 - DRIVE SPROCKET

(3) Install brass stop ring on drive sprocket (Fig. 61).

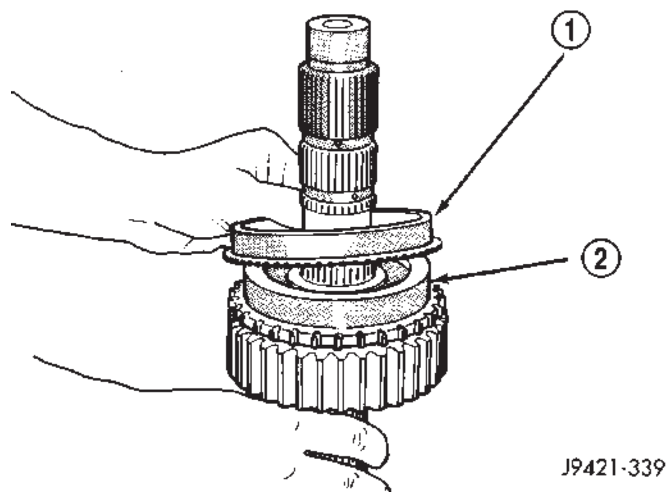

*Fig. 61 Synchro Stop Ring Installation*

1 - BRASS STOP RING
2 - DRIVE SPROCKET

(4) Install 3 synchro struts and 2 springs in hub as follows:

(a) Insert first strut in hub (Fig. 62). Strut shoulders rest (and slide) on sides hub slot as shown.

(b) Insert hooked end of first spring in center of strut to secure it. Then work spring into hub (Fig. 63).

TRANSFER CASE - NV231HD (Continued)

(c) Press spring inward and insert last two struts in hub slots. Be sure spring is positioned under struts to properly secure them (Fig. 64).

(d) Turn hub over and install remaining spring in hub. Position hooked end of second spring 180° away from first spring end.

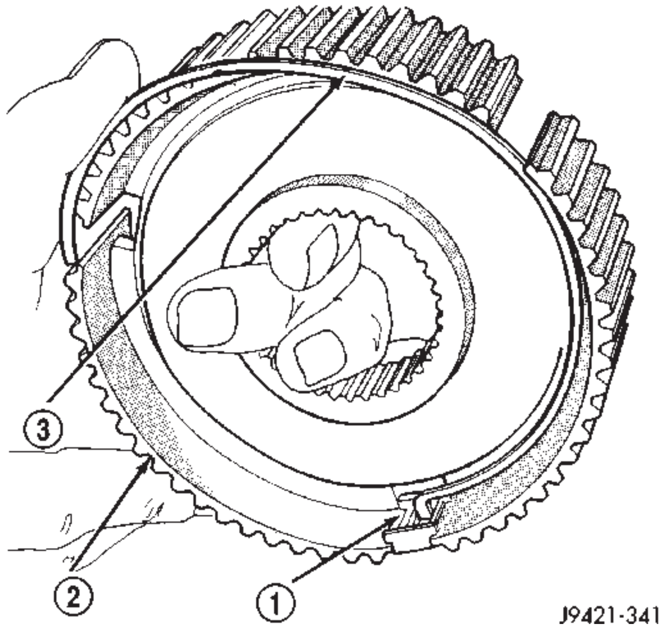

***Fig. 62 Installing First Synchro Strut And Spring***

1 - FIRST STRUT
2 - SYNCHRONIZER HUB
3 - SPRING

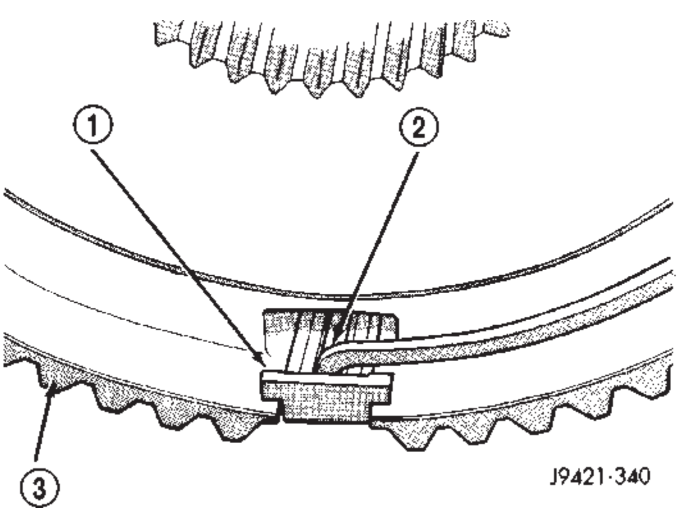

***Fig. 63 Synchro Spring Installation***

1 - STRUT SHOULDER
2 - SPRING (SEATED IN STRUT)
3 - HUB

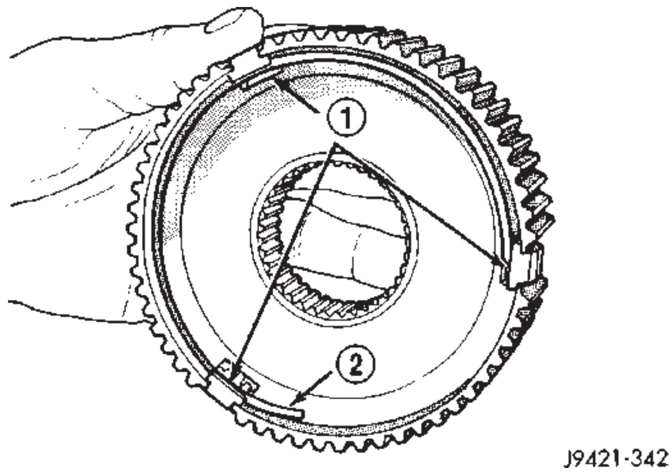

***Fig. 64 Correct Position Of Struts And Springs***

1 - STRUTS
2 - SPRING

(5) Install assembled synchro hub on mainshaft (Fig. 65). Hub has shoulder on one side which goes toward sprocket (rear of shaft). Flat side of hub faces front of shaft.

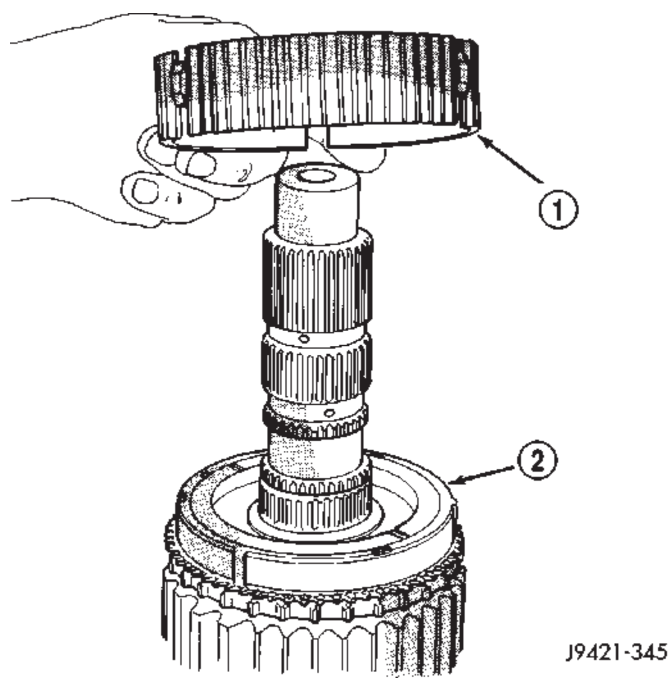

***Fig. 65 Synchro Hub Installation***

1 - SYNCHRONIZER HUB (SHOULDER SIDE DOWN)
2 - STOP RING AND SPROCKET

TRANSFER CASE - NV231HD (Continued)

(6) Install synchro hub retaining ring (Fig. 66). Be sure ring is fully seated before proceeding.

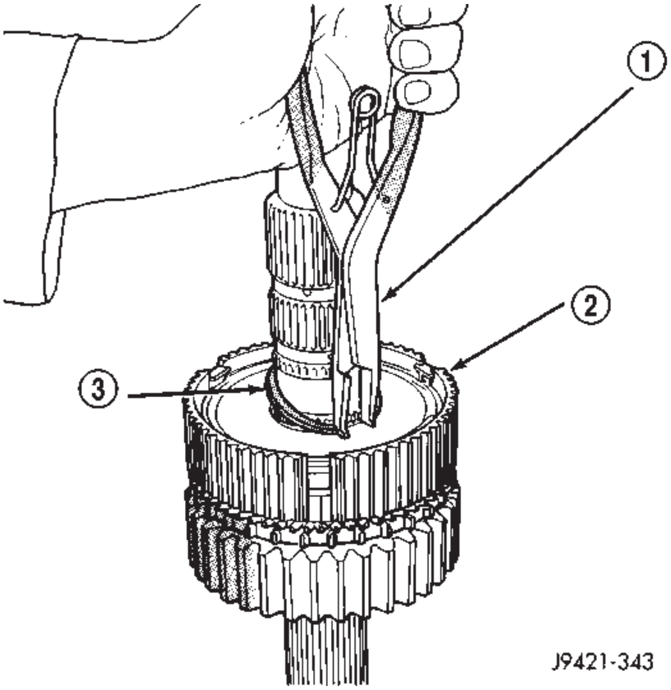

***Fig. 66 Synchro Hub Retaining Ring Installation***

1 - SNAP-RING PLIERS
2 - SYNCHRONIZER HUB
3 - HUB RETAINING RING

(7) Install sliding clutch (sleeve) on synchro hub (Fig. 67).

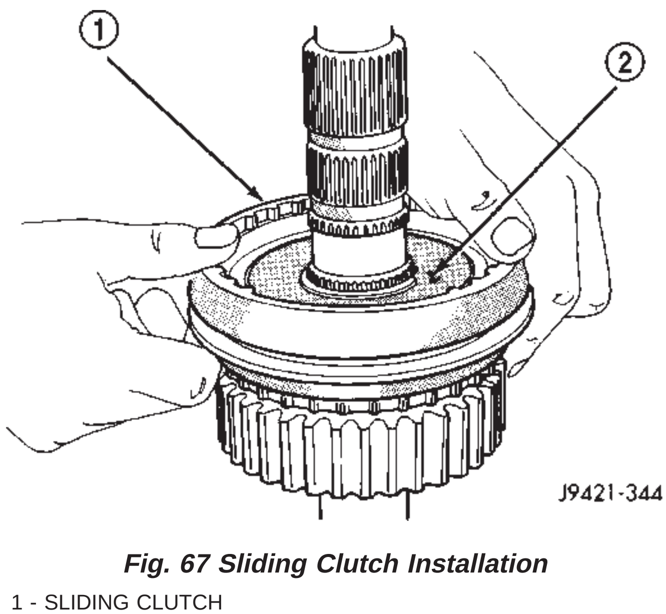

***Fig. 67 Sliding Clutch Installation***

1 - SLIDING CLUTCH
2 - SYNCHRONIZER HUB

**CAUTION: The sliding clutch must be correctly positioned to ensure proper shifting. Position the clutch on the hub so a clutch spline is centered over each strut as shown (Fig. 68). If the clutch is installed so a gap between splines is aligned with one or more struts, gear clash will result.**

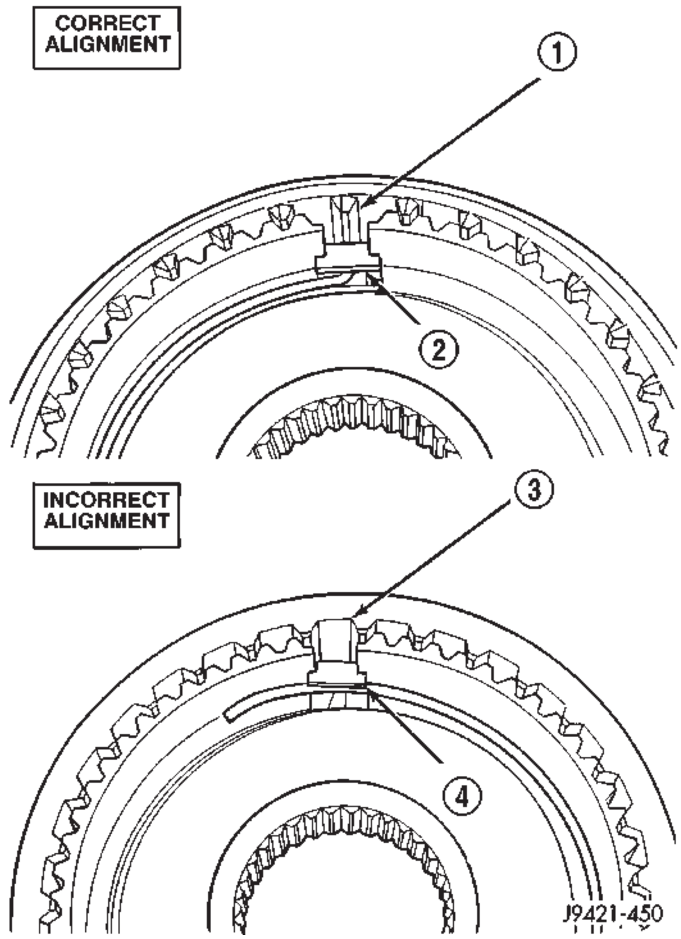

***Fig. 68 Correct Alignment Of Struts And Sliding Clutch***

1 - SLEEVE TOOTH ALIGNED WITH STRUT
2 - STRUT
3 - SLEEVE TOOTH **NOTALIGNED WITH STRUT**
4 - STRUT

(8) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

(9) Lubricate mainshaft components with transmission fluid.

(10) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 69). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

(11) Assemble and install range fork and hub (Fig. 70). Be sure hub is properly seated in low range gear and engaged to the input gear.

(12) Align and insert range fork pin in shift sector slot.

TRANSFER CASE - NV231HD (Continued)

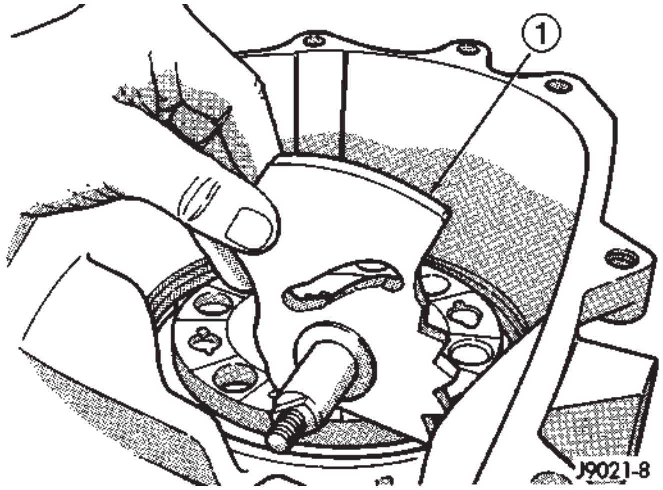

*Fig. 69 Shift Sector Installation*

1 - SHIFT SECTOR

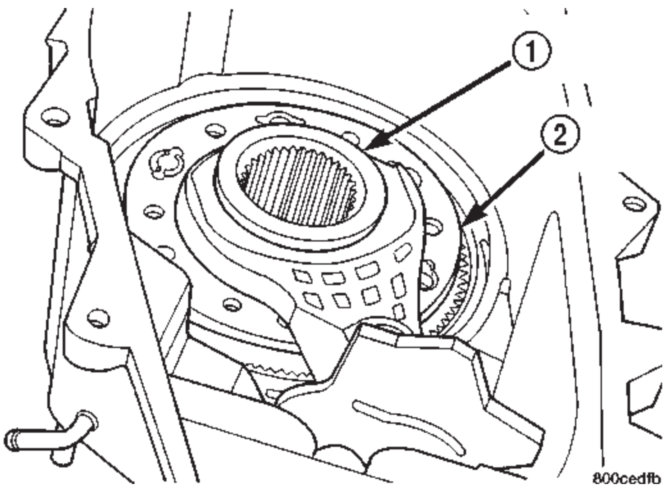

*Fig. 70 Install Range Fork And Hub Assembly*

1 - RANGE HUB
2 - RANGE FORK

(13) Install mode fork and shift rail in sliding clutch (Fig. 71).

(14) Install mainshaft/mode fork assembly (Fig. 72). Guide mainshaft through hub and into input gear and shift rail through range fork and into case bore.

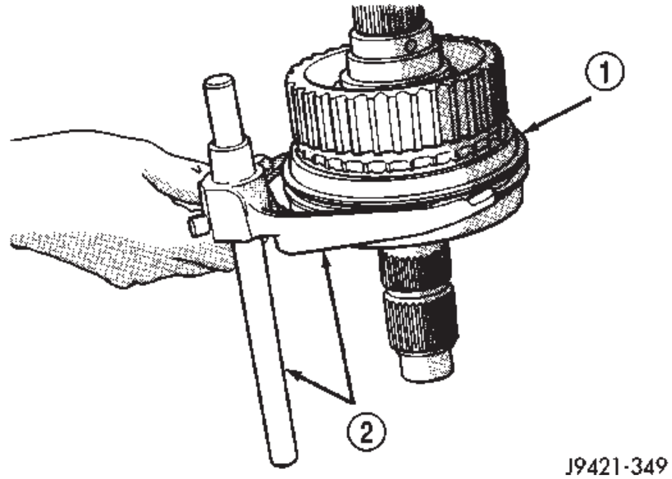

*Fig. 71 Assembling Mode Fork And Mainshaft*

1 - SLIDING CLUTCH
2 - MODE FORK AND SHIFT RAIL

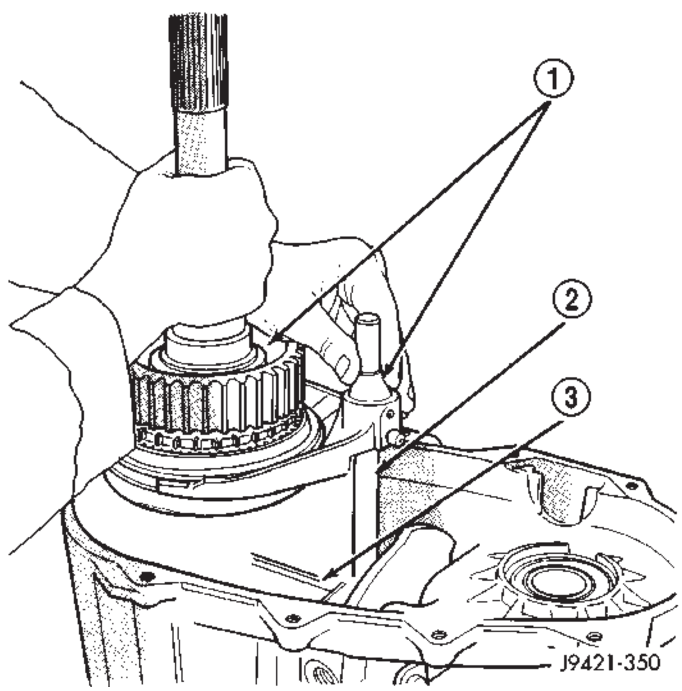

*Fig. 72 Installing Mainshaft And Mode Fork Assembly*

1 - MAINSHAFT AND MODE FORK ASSEMBLY
2 - SHIFT RAIL
3 - RANGE FORK

TRANSFER CASE - NV231HD (Continued)

(15) Install vacuum/indicator switch (Fig. 73). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque. Install new O-ring on switch beforehand, if necessary.

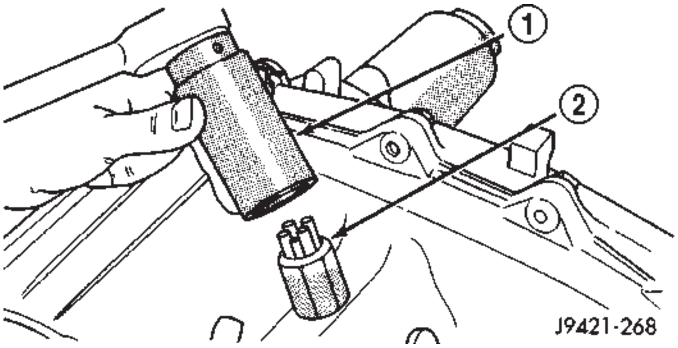

***Fig. 73 Vacuum/Indicator Switch Installation***

1 - 1-1/16" SOCKET
2 - INDICATOR SWITCH

(16) Install new sector shaft O-ring and O-ring retainer in sector shaft bore (Fig. 74). Lubricate O-ring with transmission fluid or petroleum jelly after installation.

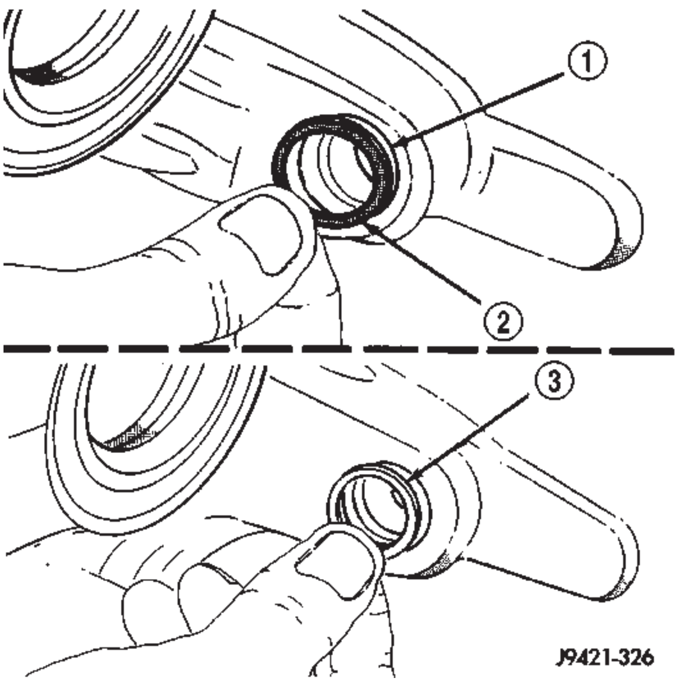

***Fig. 74 Sector Shaft O-Ring And Retainer Installation***

1 - SECTOR SHAFT BORE
2 - O-RING
3 - O-RING RETAINER

(17) Install shift lever on sector shaft (Fig. 75).

(18) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

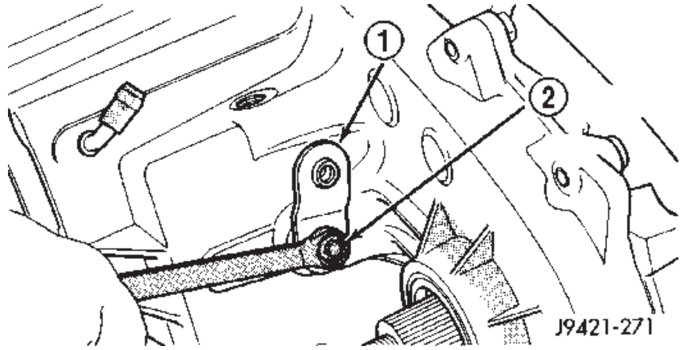

***Fig. 75 Shift Lever Installation***

1 - SHIFT LEVER
2 - NUT/WASHER

(19) Install poppet plunger and spring (Fig. 76).

(20) Install new O-ring on poppet screw and install screw in front case (Fig. 77). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

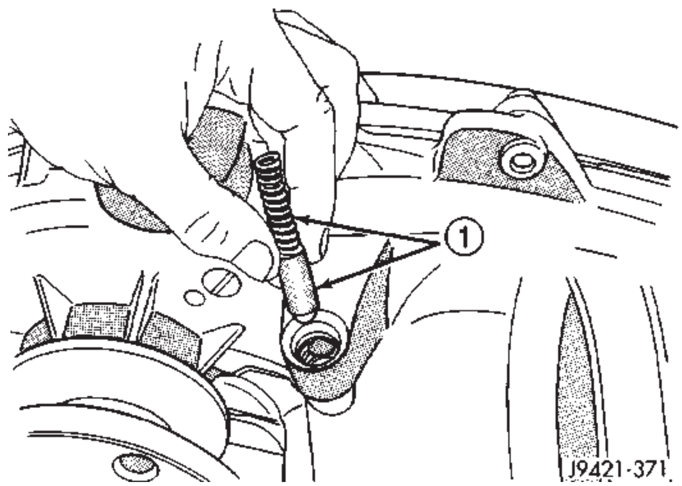

***Fig. 76 Poppet Plunger And Spring Installation***

1 - POPPET PLUNGER AND SPRING

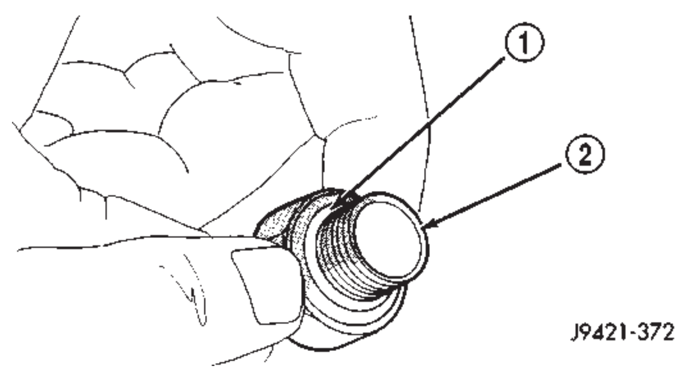

***Fig. 77 O-Ring Installation On Poppet Plunger Screw***

1 - O-RING
2 - PLUNGER SCREW

TRANSFER CASE - NV231HD (Continued)

### FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Install front output shaft in bearing (Fig. 78).

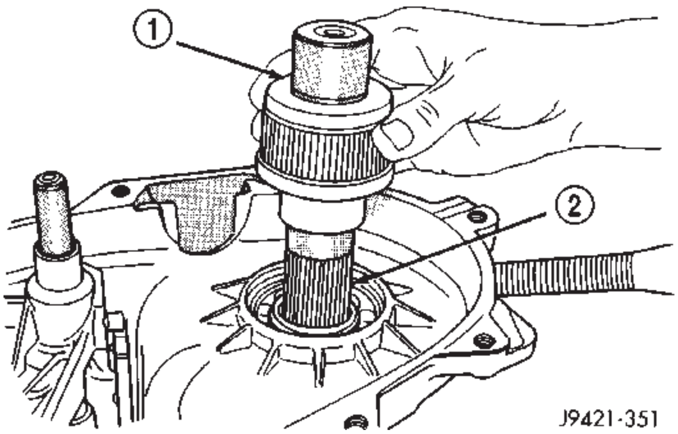

*Fig. 78 Front Output Shaft Installation*

1 - FRONT OUTPUT SHAFT
2 - BEARING

(2) Insert front sprocket in drive chain (Fig. 79).

(3) Install drive chain around mainshaft sprocket (Fig. 79). Then position front sprocket over front shaft.

(4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

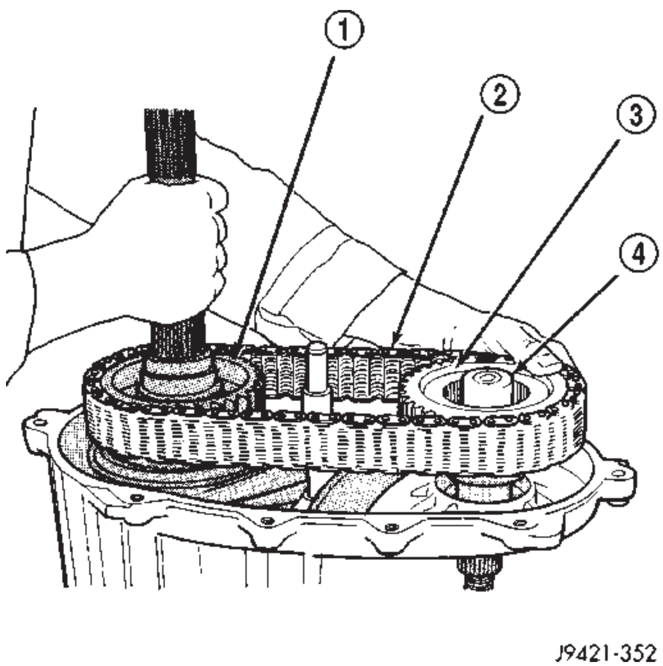

*Fig. 79 Drive Chain And Front Sprocket Installation*

1 - DRIVE SPROCKET
2 - DRIVE CHAIN
3 - FRONT SPROCKET
4 - FRONT SHAFT

(5) If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.

(6) Install front sprocket retaining ring (Fig. 80).

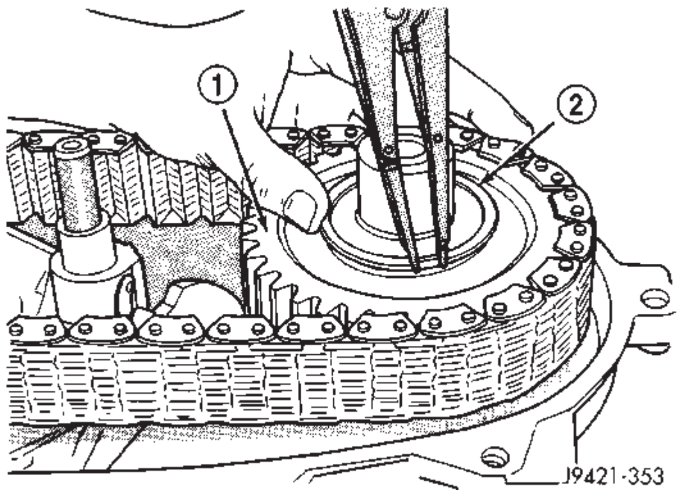

*Fig. 80 Front Sprocket Retaining Ring Installation*

1 - FRONT SPROCKET
2 - RETAINING RING

(7) Install spring and cup on shift rail (Fig. 81).

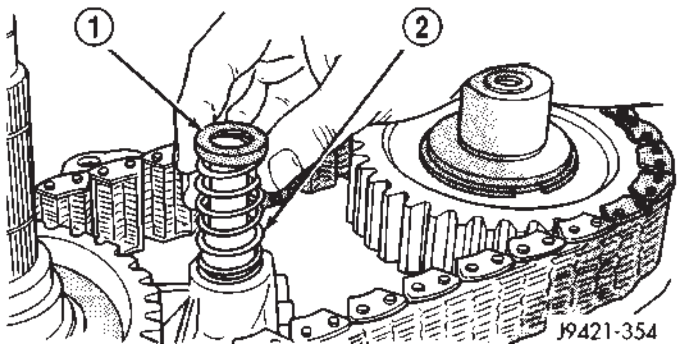

*Fig. 81 Shift Rail Spring And Cup Installation*

1 - CUP
2 - SPRING

TRANSFER CASE - NV231HD (Continued)

(8) Insert magnet in front case pocket (Fig. 82).

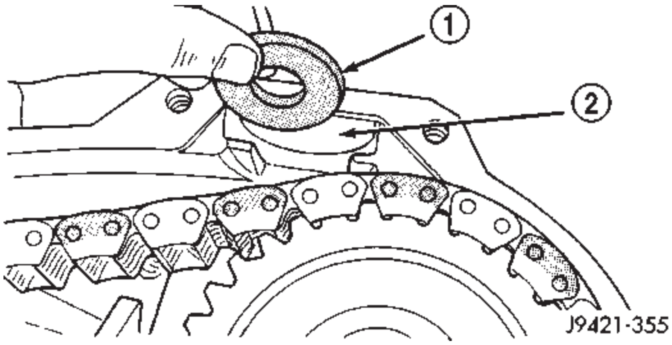

***Fig. 82 Case Magnet Installation***

1 - MAGNET
2 - CASE POCKET

## OIL PUMP AND REAR CASE

Lubricate the oil pump components with before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

(1) Install new O-ring in pickup tube inlet of oil pump (Fig. 83).

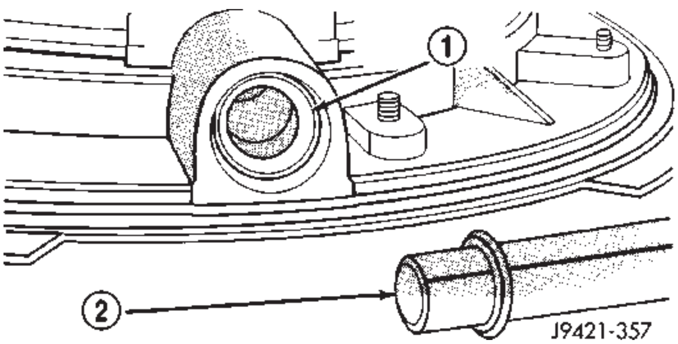

***Fig. 83 Pickup Tube O-Ring Installation***

1 - O-RING (PUMP PICKUP)
2 - PICKUP TUBE

(2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches (Fig. 84). Be sure hose that connects tube to filter is securely positioned.

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 85).

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

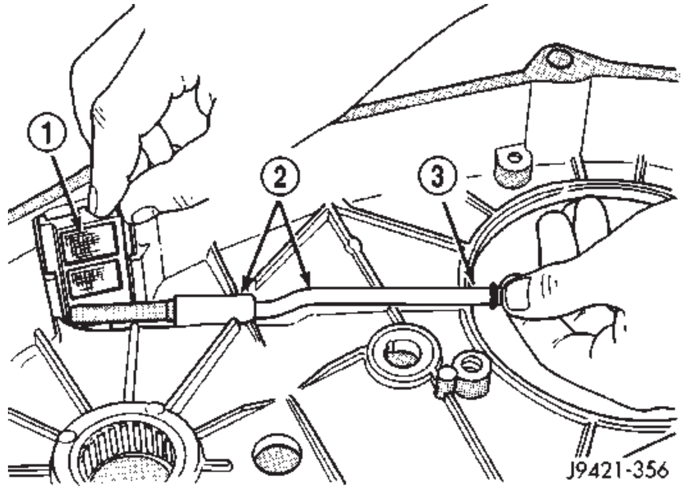

***Fig. 84 Oil Pickup Tube And Filter Position In Rear Case***

1 - FILTER
2 - TUBE AND HOSE
3 - TUBE IN NOTCH

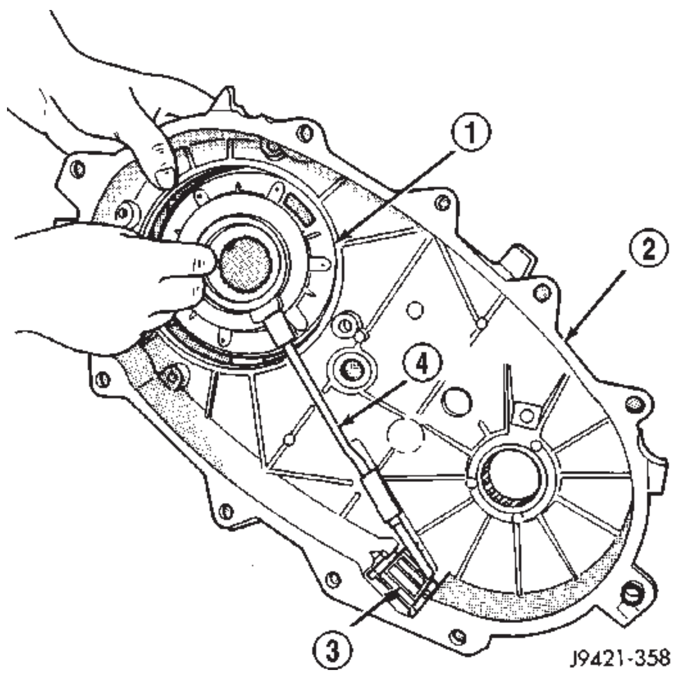

***Fig. 85 Positioning Oil Pump In Rear Case***

1 - OIL PUMP
2 - REAR CASE
3 - FILTER
4 - PICKUP TUBE

TRANSFER CASE - NV231HD (Continued)

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 86). Be sure oil pump and pickup tube remain in position during case installation.

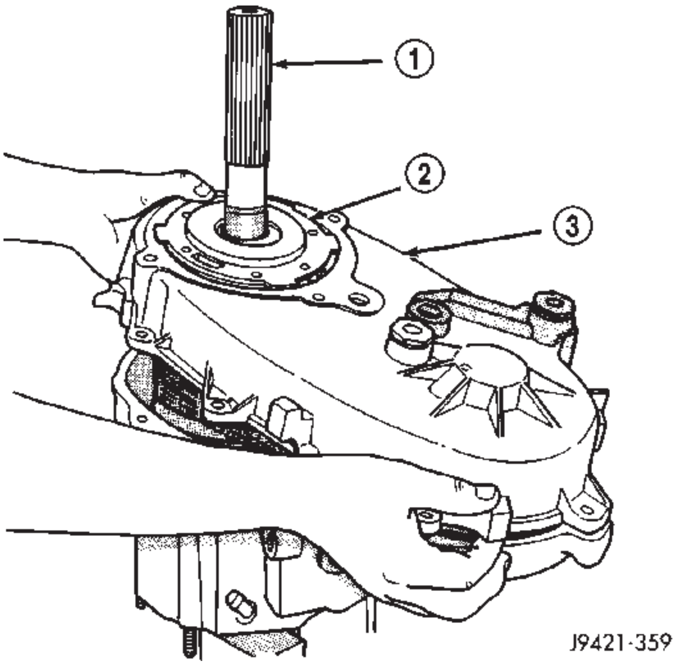

*Fig. 86 Rear Case And Oil Pump Installation*

1 - MAINSHAFT
2 - OIL PUMP
3 - REAR CASE

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

**CAUTION: Verify that shift rail (Fig. 87), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.**

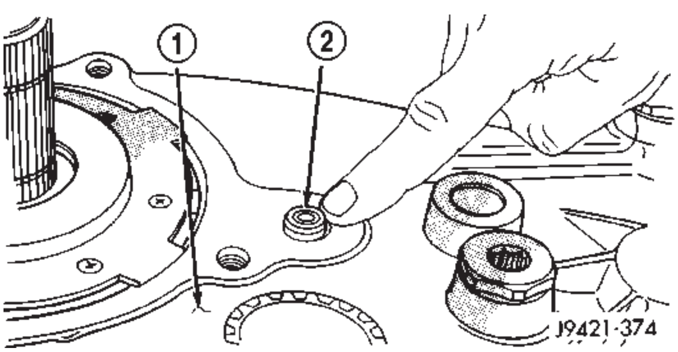

*Fig. 87 Shift Rail Seated In Rear Case Bore*

1 - REAR CASE
2 - SHIFT RAIL

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

(8) Check stud at end of case halves (Fig. 88). If stud was loosened or came out during disassembly, apply Loctite™ 242 to stud threads and reseat stud in case.

(9) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

- flange head bolts to 47-61 N·m (35-45 ft. lbs.)
- all other bolts/nuts to 27-34 N·m (20-25 ft. lbs.)

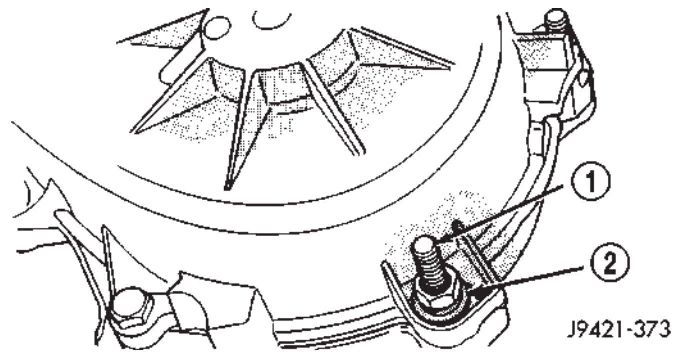

*Fig. 88 Washer Installation On Case Stud And Dowel Bolts*

1 - CASE STUD/BOLT
2 - WASHER

(10) Install oil pump retaining ring on mainshaft (Fig. 89).

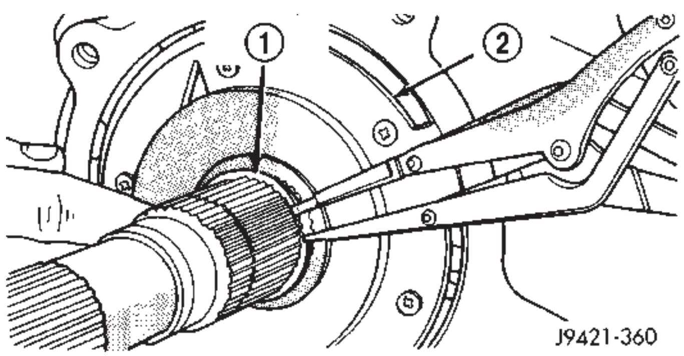

*Fig. 89 Oil Pump Retaining Ring Installation*

1 - RETAINING RING
2 - OIL PUMP

TRANSFER CASE - NV231HD (Continued)

(11) Install rear output bearing and snap-ring to output shaft.

## COMPANION FLANGE

(1) Install companion flange seal on front shaft (Fig. 90).

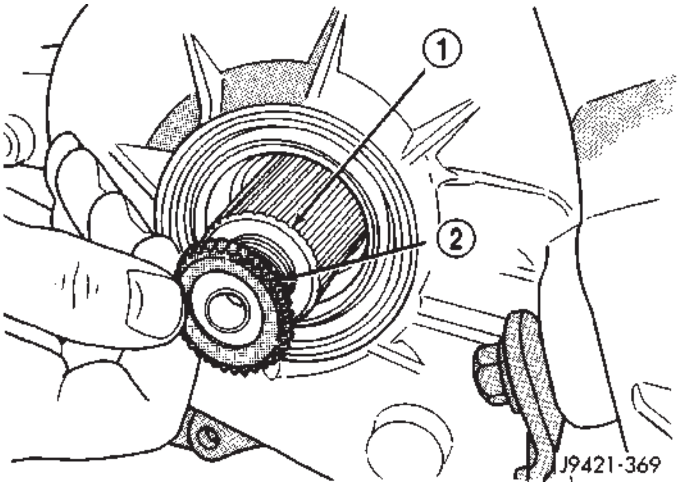

*Fig. 90 Installing Flange Seal On Front Shaft*

1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(2) Install companion flange on front shaft (Fig. 91). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

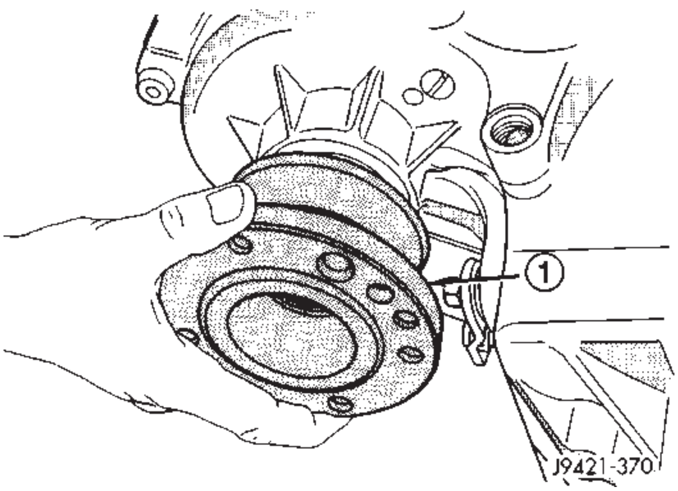

*Fig. 91 Installing Companion Flange On Front Shaft*

1 - COMPANION FLANGE

## REAR RETAINER AND EXTENSION

(1) Clean mating surfaces of transfer case housing and the rear retainer of any original gasket material.

(2) Install new rear retainer gasket onto the transfer case housing or rear retainer.

(3) Align and install rear retainer on rear case (Fig. 92).

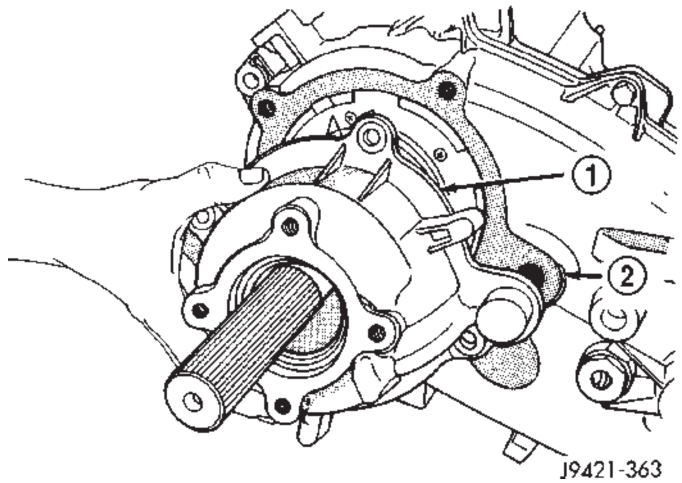

*Fig. 92 Rear Retainer Installation*

1 - REAR RETAINER
2 - SHIFT RAIL

(4) Apply Mopar® Silicone Sealer to threads of rear retainer bolts. Then install retainer bolts finger tight.

(5) Install output bearing on mainshaft and seat it in rear retainer with suitable size pipe tool (Fig. 93).

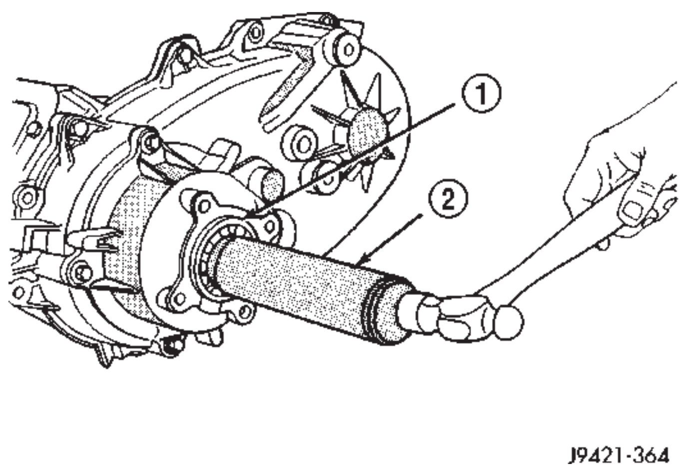

*Fig. 93 Output Bearing Installation*

1 - OUTPUT BEARING
2 - PIPE TOOL

TRANSFER CASE - NV231HD (Continued)

(6) Install output bearing retaining ring (Fig. 94).

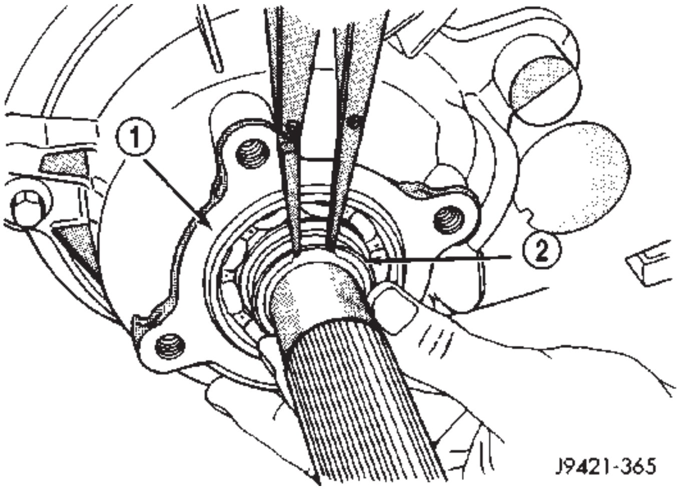

***Fig. 94 Output Bearing Retaining Ring Installation***

1 - OUTPUT BEARING
2 - RETAINING RING

(7) Tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.) torque.

(8) Install new seal in rear extension housing seal with suitable size installer tool.

(9) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

(10) Align and install rear extension on retainer (Fig. 95).

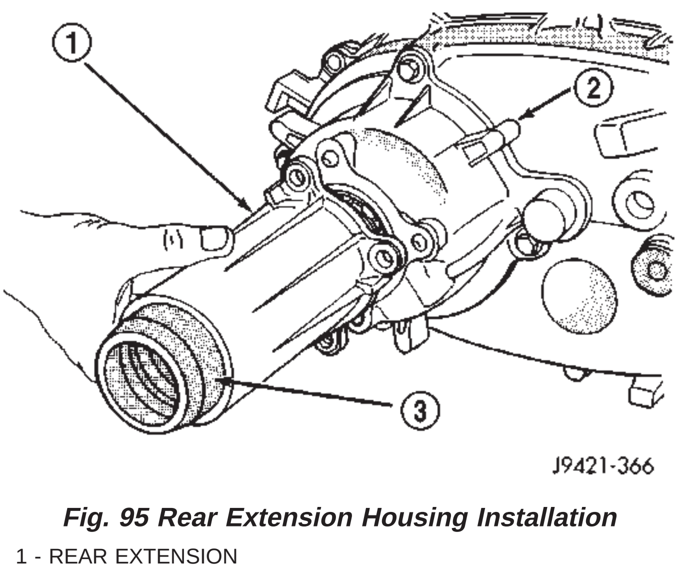

***Fig. 95 Rear Extension Housing Installation***

1 - REAR EXTENSION
2 - RETAINER
3 - EXTENSION SEAL

(11) Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

## INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

(2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft.lbs.).

(3) Install rear crossmember.

(4) Remove jack stand from under transmission.

(5) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Connect vacuum harness and vent hose.

(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

(8) Adjust shift linkage, if necessary.

(9) Fill transfer case with recommended transmission fluid and install fill plug.

(10) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

(11) Lower vehicle

TRANSFER CASE - NV231HD (Continued)

# EXTENSION HOUSING BUSHING AND SEAL

## REMOVAL

(1) Raise and support vehicle.

(2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

(4) Using Remover 8158, remove bushing from extension housing.

## INSTALLATION

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in extension housing with fluid port in bushing aligned with slot in housing.

(3) Using Installer 8157, drive bushing into housing until installer seats against case.

(4) Using Installer D-163, install seal in extension housing (Fig. 96).

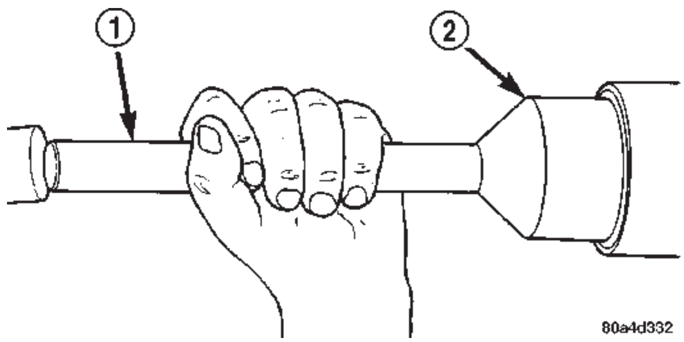

**Fig. 96 Install Rear Seal in Extension Housing**

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL D-163

(5) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Verify proper transfer case fluid level.

(7) Lower vehicle.

# FLUID

## STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs are both in the rear case (Fig. 97).

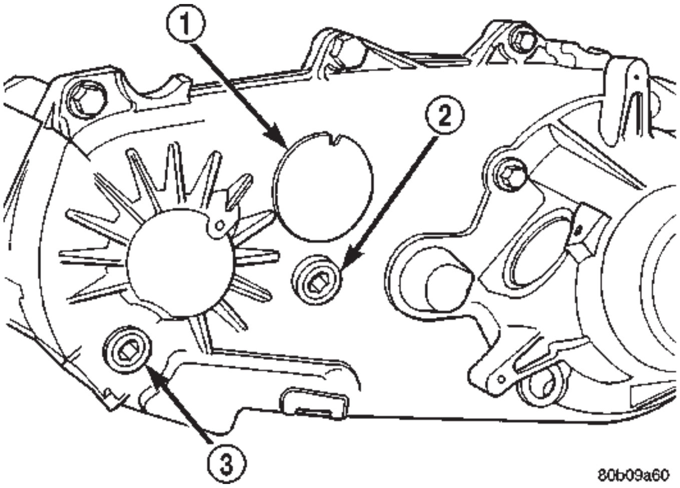

*Fig. 97 Fill/Drain Plug and I.D. Tag Location - Typical*

1 - I.D. TAG
2 - FILL PLUG
3 - DRAIN PLUG

(1) Raise vehicle.
(2) Position drain pan under transfer case.
(3) Remove drain and fill plugs and drain lubricant completely.
(4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).
(5) Remove drain pan.
(6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
(7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).
(8) Lower vehicle.

# FRONT OUTPUT SHAFT SEAL

## REMOVAL

(1) Shift transfer case into NEUTRAL.
(2) Raise vehicle.
(3) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
(4) Remove companion flange nut (Fig. 98).
(5) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

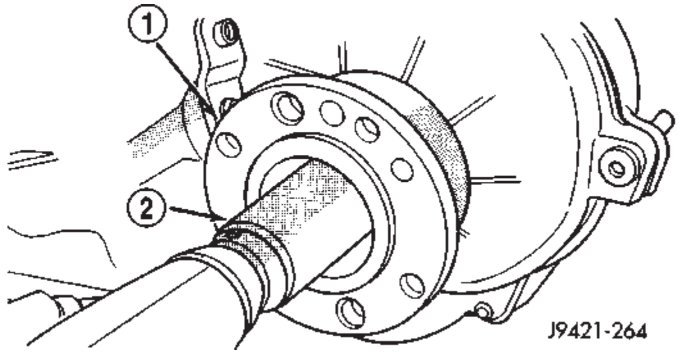

*Fig. 98 Removing Companion Flange Nut*

1 - COMPANION FLANGE
2 - SOCKET

(6) Remove companion flange rubber seal from front output shaft (Fig. 99).
(7) Remove seal from front case with pry tool (Fig. 100).

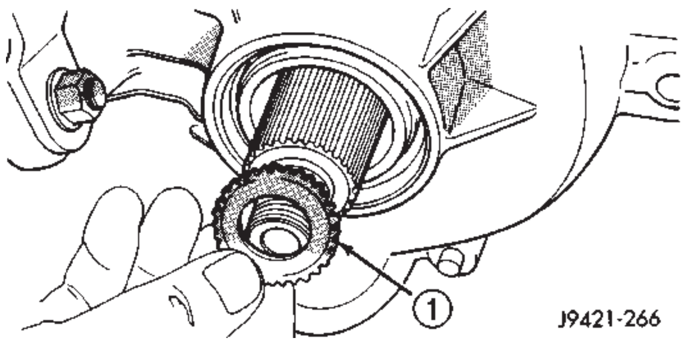

*Fig. 99 Companion Flange Seal Removal*

1 - FLANGE SEAL

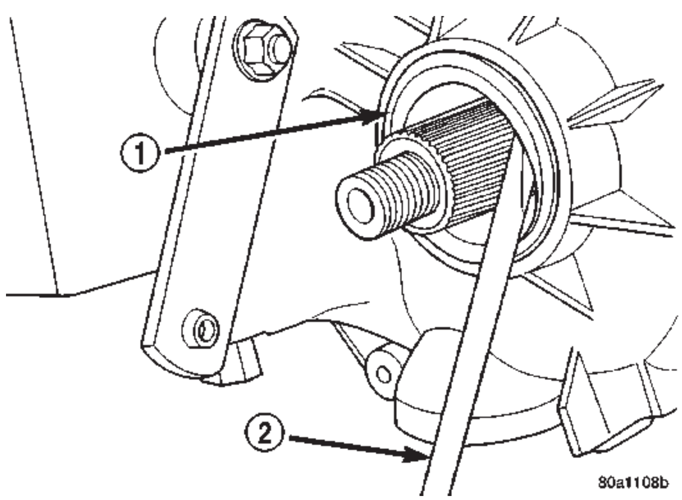

*Fig. 100 Remove Front Output Shaft Seal*

1 - OUTPUT SHAFT SEAL
2 - PRYBAR

FRONT OUTPUT SHAFT SEAL (Continued)

### INSTALLATION

(1) Install new front output seal in front case with Installer Tool 8143-A as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore with light taps from hammer (Fig. 101). Once seal is started, continue tapping seal into bore until installer tool seats against case.

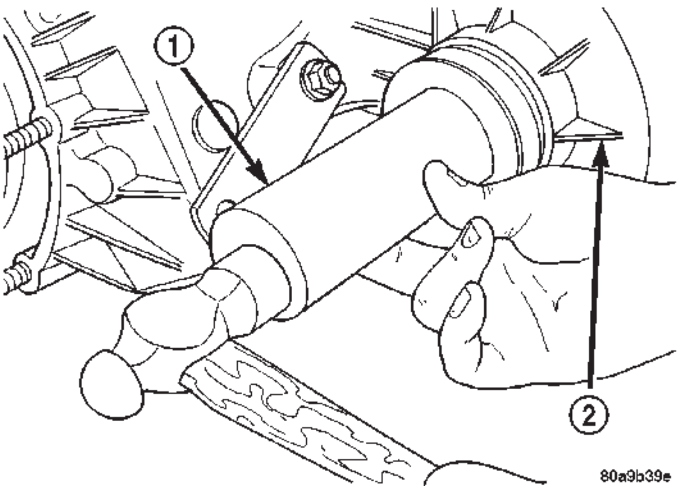

***Fig. 101 Front Output Seal Installation***

1 - INSTALLER 8143-A
2 - TRANSFER CASE

(2) Install companion flange seal on front shaft (Fig. 102).

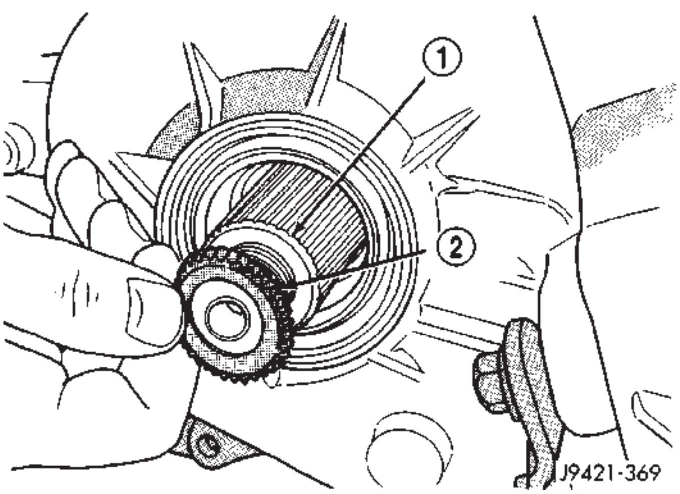

***Fig. 102 Installing Flange Seal On Front Shaft***

1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(3) Install companion flange on front shaft (Fig. 103). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

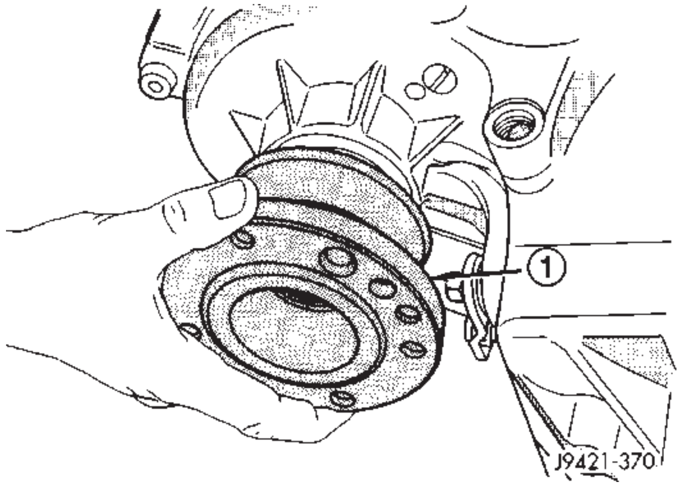

***Fig. 103 Installing Companion Flange On Front Shaft***

1 - COMPANION FLANGE

(4) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

## SHIFT LEVER

### REMOVAL

(1) Shift transfer case into 2H.

(2) Remove transfer case shifter knob cap.

(3) Remove nut holding shifter knob to shift lever.

(4) Remove shifter knob.

(5) Remove the shift boot from the shifter bezel.

(6) Remove the bolts securing the shifter mechanism to the floor pan along the driver's side of the transmission tunnel (Fig. 104).

(7) Raise and support the vehicle.

(8) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.

(9) Remove the nuts holding the shifter mechanism to the underside of the floor pan.

(10) Separate shift lever mechanism from the vehicle.

SHIFT LEVER (Continued)

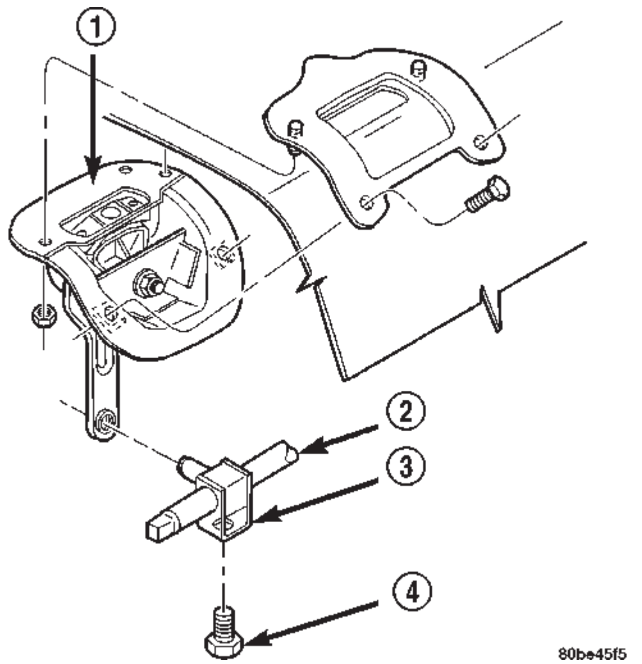

*Fig. 104 Transfer Case Shifter*

1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

## INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 105).

(2) Position shift lever on vehicle.

(3) Install nuts to hold shift lever to the underside of the body.

(4) Install trunnion to shift lever, if necessary.

(5) Install shift rod to trunnion, if necessary.

(6) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).

(7) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.

(8) Lower vehicle.

(9) Install the bolts to hold the shifter mechanism to the floor pan.

(10) Install the transfer case shifter bezel.

(11) Install the shifter boot and the shifter knob onto the shifter lever.

(12) Install nut to hold shifter knob to shift lever.

(13) Install shifter knob cap.

(14) Verify transfer case operation.

## ADJUSTMENT - SHIFT LEVER

(1) Move shift lever into 2H position.

(2) Raise vehicle.

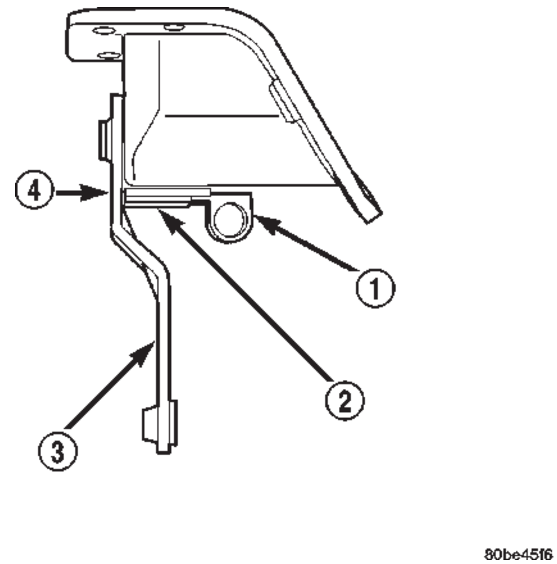

*Fig. 105 Shifter Adjustment*

1 - LOCATING PIN
2 - ADJUSTMENT CHANNEL
3 - LOWER SHIFTER LEVER
4 - LOCATING HOLE

(3) Loosen shift rod lock bolt at trunnion (Fig. 106).

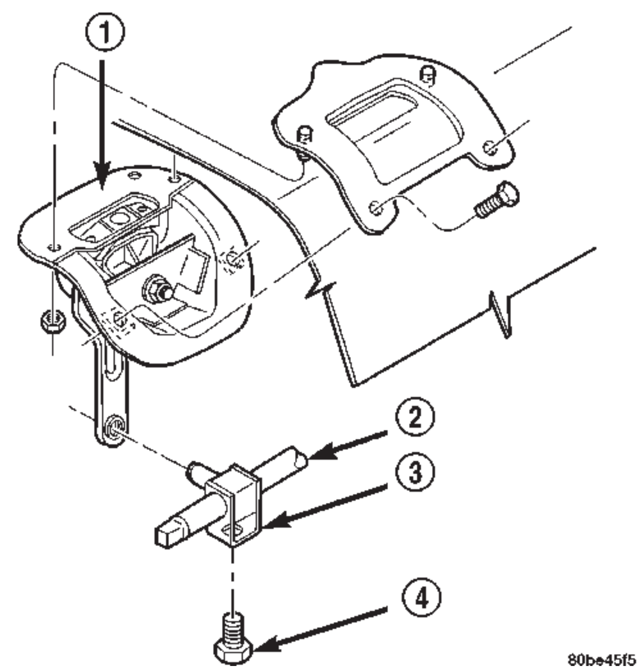

*Fig. 106 Shift Rod Lock Bolt Location*

1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

SHIFT LEVER (Continued)

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.

(5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.

(6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 107).

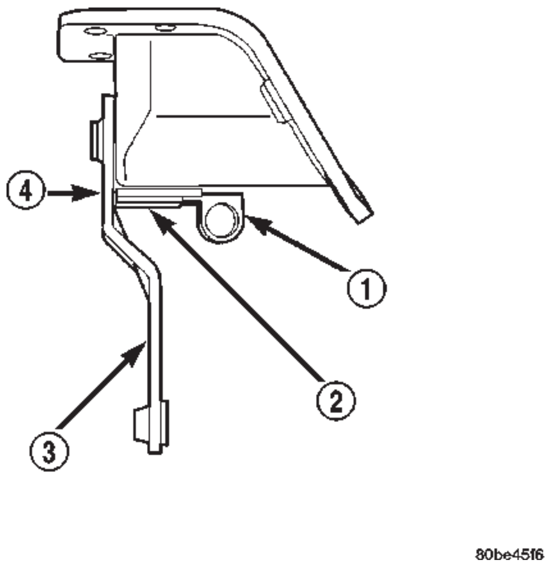

***Fig. 107 Shifter Adjustment Location***

1 - LOCATING PIN
2 - ADJUSTMENT CHANNEL
3 - LOWER SHIFTER LEVER
4 - LOCATING HOLE

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

# TRANSFER CASE - NV241LD

## TABLE OF CONTENTS

# TRANSFER CASE - NV241LD

## DESCRIPTION

The NV241LD transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The synchronizer mechanism consists of a brass stop ring, synchro hub, and the sliding clutch. The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

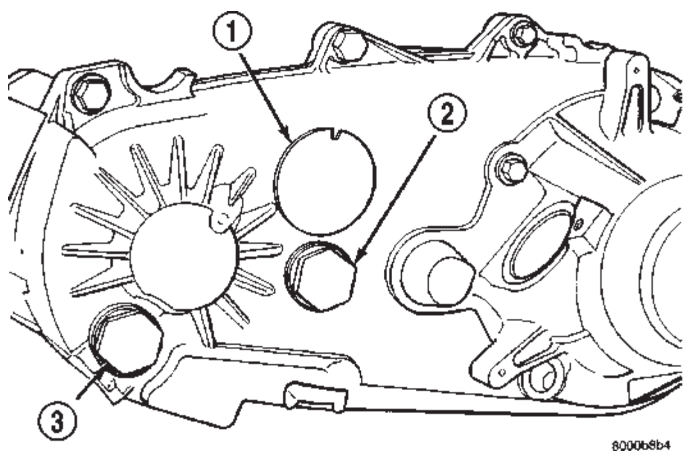

*Fig. 1 Transfer Case Identification Tag - Typical*

1 - I.D. TAG
2 - FILL PLUG
3 - DRAIN PLUG

## IDENTIFICATION

An identification tag (Fig. 1) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

## OPERATION

### OPERATING RANGES

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer

TRANSFER CASE - NV241LD (Continued)

case. The switch is operated by the transfer case range rod.

## SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

## SHIFTING

The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into the 4L operating range.

## DIAGNOSIS AND TESTING - TRANSFER CASE

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

TRANSFER CASE - NV241LD (Continued)

**DIAGNOSIS CHART**

| Condition | Possible Cause | Correction |
|---|---|---|
| Transfer Case difficult to shift or will not shift into desired range. | 1) Vehicle speed too great to permit shifting. | 1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. |
| | 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. | 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. |
| | 3) Transfer case external shift linkage binding. | 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. |
| | 4) Insufficient or incorrect lubricant. | 4) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. |
| | 5) Internal components binding, worn, or damaged. | 5) Disassemble the transfer case and replace worn or damaged components as necessary. |
| Transfer Case noisy in all operating ranges. | 1) Insufficient or incorrect lubricant. | 1) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. |
| Noisy in, or jumps out of, four wheel drive low range. | 1) Transfer case not completely engaged in 4L position. | 1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. |
| | 2) Shift linkage out of adjustment. | 2) Adjust linkage. |
| | 3) Shift linkage loose or binding. | 3) Tighten, lubricate, or repair linkage as necessary. |
| | 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. | 4) Disassemble unit and repair as necessary. |
| | 5) Low range gear worn or damaged. | 5) Disassemble unit and repair as necessary. |
| Lubricant leaking from output shaft seal or vent. | 1) Transfer case overfilled. | 1) Drain lubricant to the correct level. |
| | 2) Vent closed or restricted. | 2) Clear or replace vent as necessary. |
| | 3) Output shaft seals damaged or installed incorrectly. | 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal. |
| Abnormal tire wear. | 1) Extended operation on hard, dry surfaces in the 4H position. | 1) Operate vehicle in the 2H position on hard, dry surfaces. |

TRANSFER CASE - NV241LD (Continued)

## REMOVAL

(1) Raise and support vehicle.

(2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)

(3) Position drain oil container under transfer case.

(4) Remove transfer case drain plug and drain lubricant into container.

(5) Disconnect vent hose and vacuum harness at transfer case switch.

(6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.

(7) Support transmission with jack stand.

(8) Remove rear crossmember.

(9) Mark front and rear propeller shafts for assembly reference.

(10) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.

(12) Remove nuts attaching transfer case to transmission.

(13) Move transfer case assembly rearward until free of transmission output shaft.

(14) Lower jack and move transfer case from under vehicle.

## DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

### REAR EXTENSION, RETAINER, AND REAR CASE

(1) Remove rear extension bolts (Fig. 2).

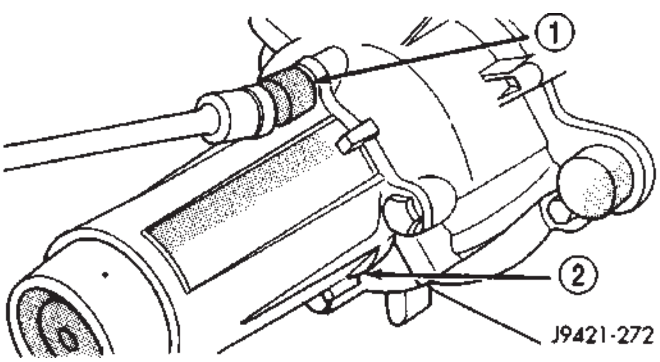

*Fig. 2 Rear Extension Bolt Removal*

1 - SOCKET
2 - REAR EXTENSION

(2) Remove rear extension housing (Fig. 3). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

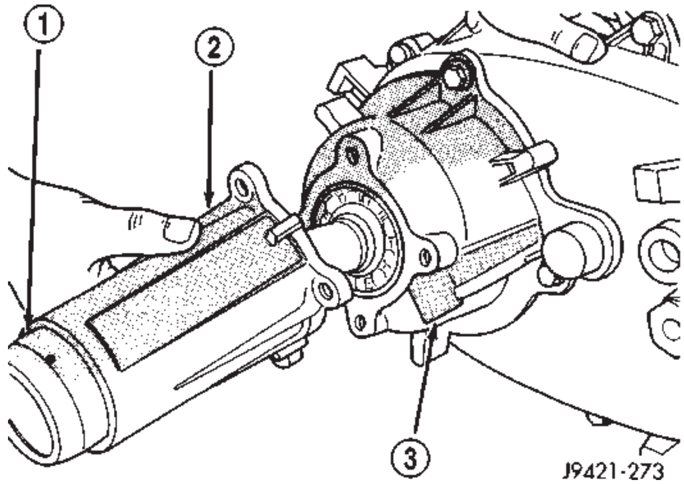

*Fig. 3 Rear Extension Housing Removal*

1 - SEAL
2 - REAR EXTENSION HOUSING
3 - REAR RETAINER

(3) Remove output bearing retaining ring with heavy duty snap-ring pliers (Fig. 4).

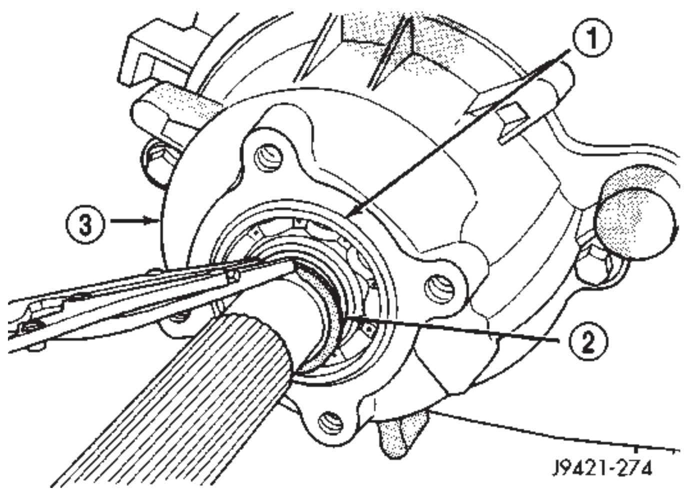

*Fig. 4 Removing Output Bearing Retaining Ring*

1 - OUTPUT BEARING
2 - RETAINING RING
3 - REAR RETAINER

TRANSFER CASE - NV241LD (Continued)

(4) Remove rear retainer bolts (Fig. 5).

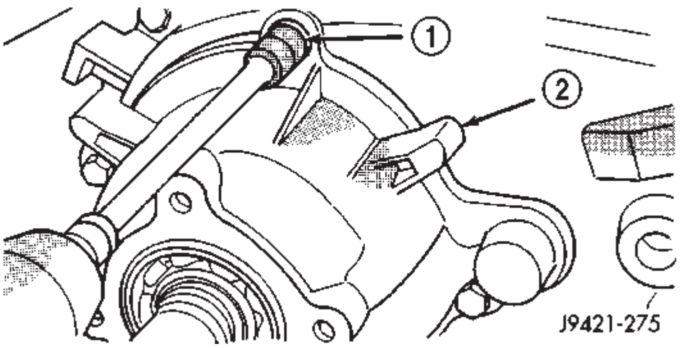

*Fig. 5 Removing Rear Extension Bolts*

1 - SOCKET
2 - REAR RETAINER

(5) Loosen rear retainer with pry bar placed under flange (Fig. 6).

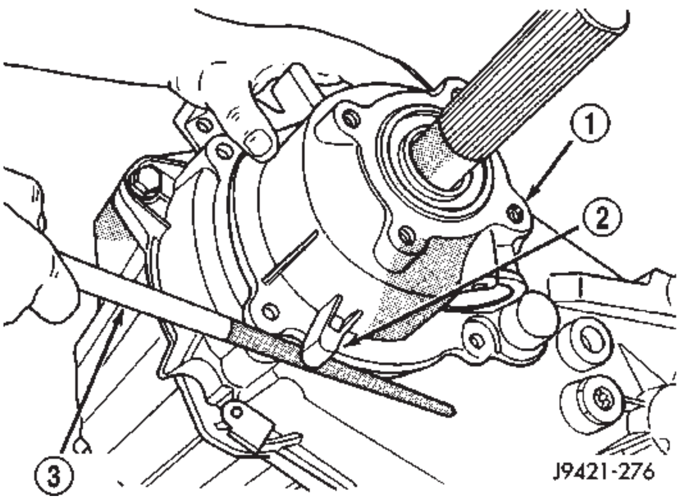

*Fig. 6 Loosening Rear Retainer*

1 - REAR RETAINER
2 - FLANGE
3 - PRY TOOL

(6) Remove rear retainer and output bearing as assembly (Fig. 7).

## COMPANION FLANGE AND SHIFT LEVER

(1) Shift transfer case into NEUTRAL.
(2) Remove companion flange nut (Fig. 8). Discard nut after removal. It is not reusable.
(3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.
(4) Remove companion flange rubber seal from front output shaft (Fig. 9).
(5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 10).

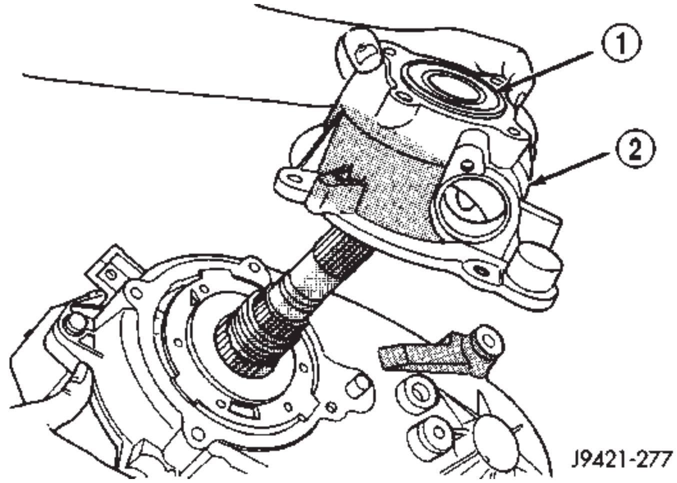

*Fig. 7 Rear Retainer Removal*

1 - OUTPUT BEARING
2 - REAR RETAINER

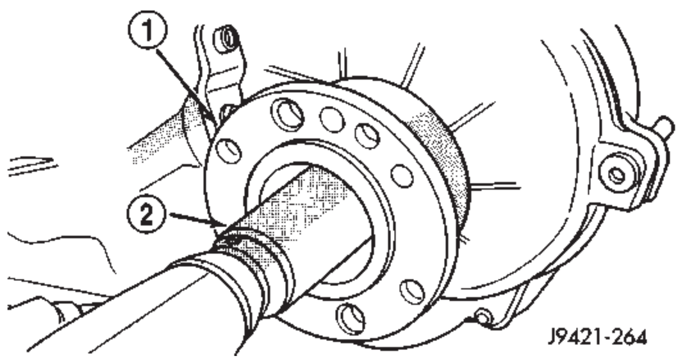

*Fig. 8 Removing Companion Flange Nut*

1 - COMPANION FLANGE
2 - SOCKET

1 - FLANGE SEAL

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove output bearing retaining ring with heavy duty snap-ring pliers.
(2) Remove output shaft bearing.

TRANSFER CASE - NV241LD (Continued)

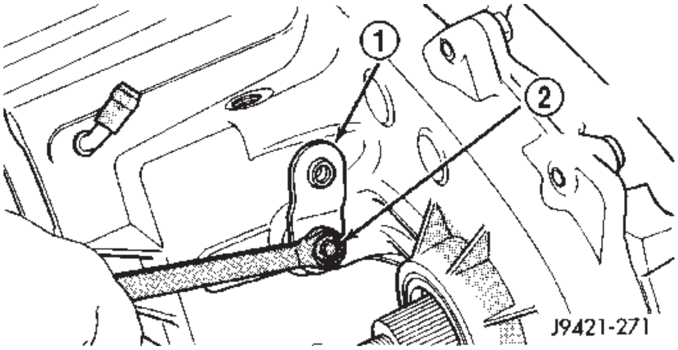

***Fig. 10 Shift Lever Removal***

1 - SHIFT LEVER
2 - NUT/WASHER

(3) Note position of bolts that attach rear case to front case (Fig. 11). Some bolts/studs at ends of case require flat washers. Mark position of these bolts with paint or scriber.

(4) Remove rear case-to-front case bolts.

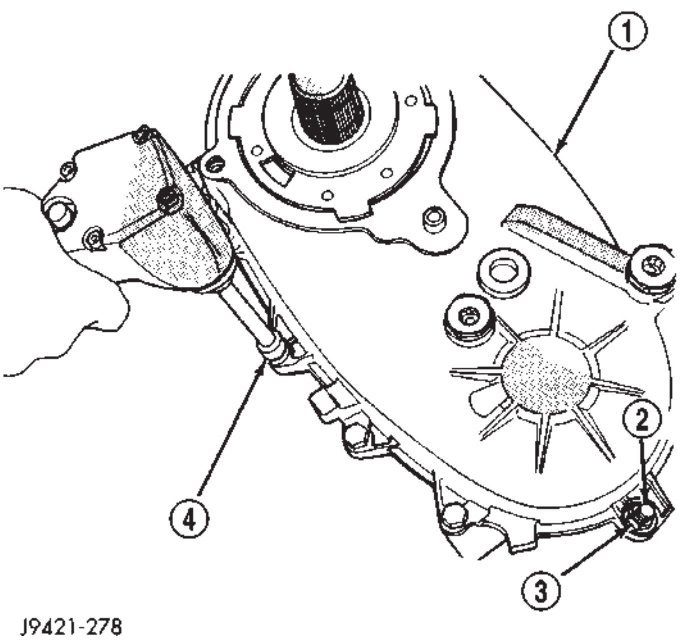

***Fig. 11 Removing Case Attaching Bolts***

1 - REAR CASE
2 - STUD
3 - NUT AND WASHER
4 - SOCKET

(5) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 12).

(6) Unseat rear case from alignment dowels (Fig. 13).

(7) Remove rear case and oil pump assembly from front case.

(8) Remove shift rail cup and spring (Fig. 14).

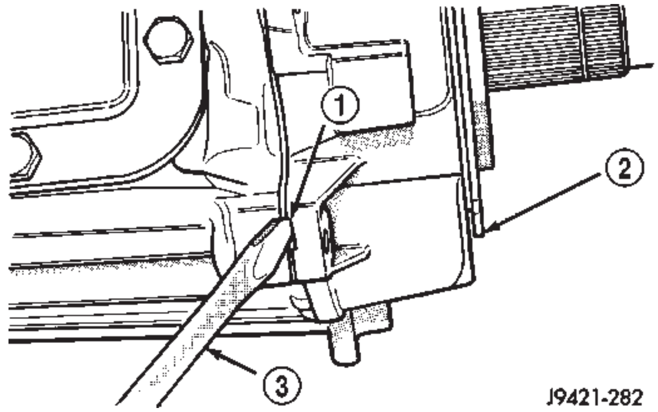

***Fig. 12 Loosening Rear Case (Breaking Sealer Bead)***

1 - SLOT
2 - REAR CASE
3 - PRY TOOL

TRANSFER CASE - NV241LD (Continued)

(9) Remove front sprocket retaining ring (Fig. 15).

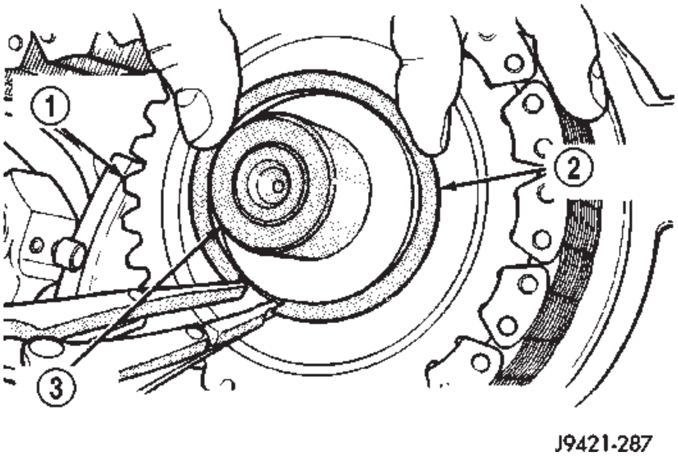

*Fig. 15 Removing Front Sprocket Retaining Ring*

1 - FRONT SPROCKET
2 - RETAINING RING
3 - FRONT OUTPUT SHAFT

(10) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1-inch) simultaneously (Fig. 16).

(11) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

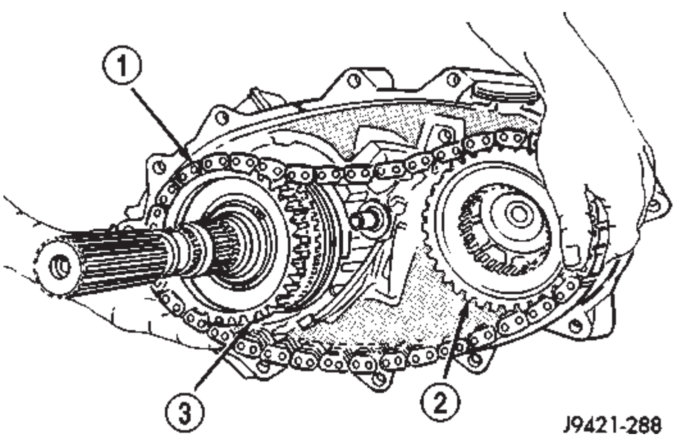

*Fig. 16 Removing Drive Chain And Front Sprocket*

1 - CHAIN
2 - DRIVE SPROCKET
3 - FRONT SPROCKET

## SHIFT FORKS AND MAINSHAFT

(1) Remove vacuum/indicator switch (Fig. 17).

(2) Loosen poppet plunger screw (Fig. 18).

(3) Remove poppet plunger screw and spring (Fig. 19). Note that screw has O-ring seal. Remove and discard seal this seal.

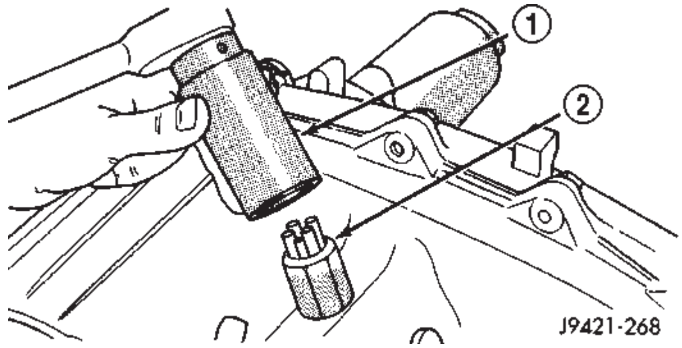

*Fig. 17 Vacuum/Indicator Switch Removal*

1 - 1-1/16” SOCKET
2 - INDICATOR SWITCH

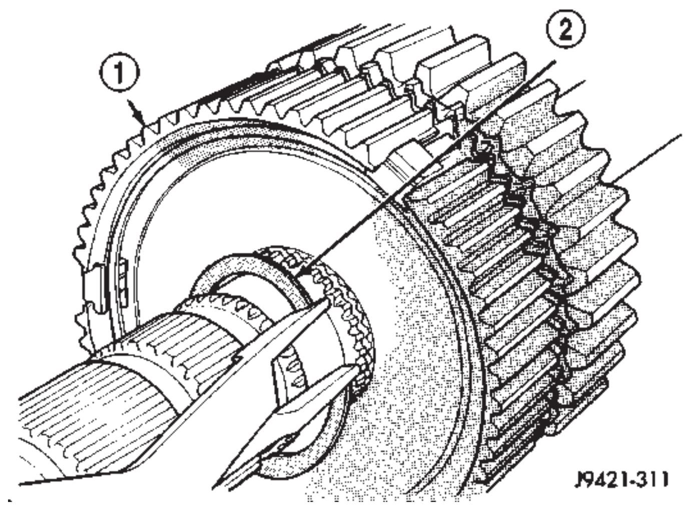

***Fig. 27 Synchronizer Hub Retaining Ring Removal***

1 - SYNCHRONIZER HUB
2 - RETAINING RING

TRANSFER CASE - NV241LD (Continued)

(2) Remove synchronizer hub (Fig. 28).

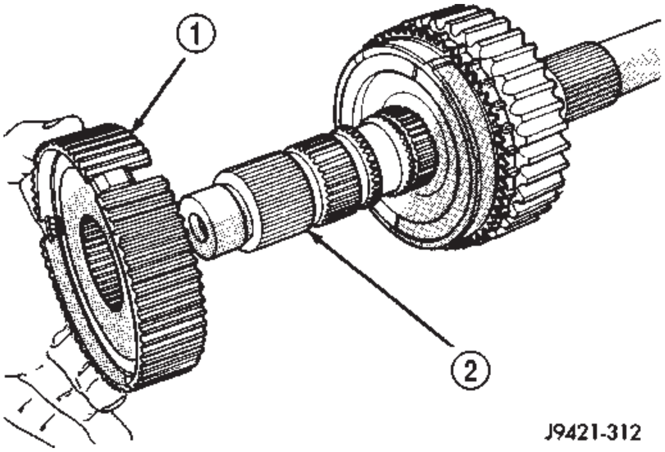

*Fig. 28 Synchronizer Hub Removal*

1 - SYNCHRONIZER HUB
2 - MAINSHAFT

(3) Inspect synchronizer hub struts and springs. If struts appear worn, remove struts and springs from hub. Note position of springs for installation reference (Fig. 29).

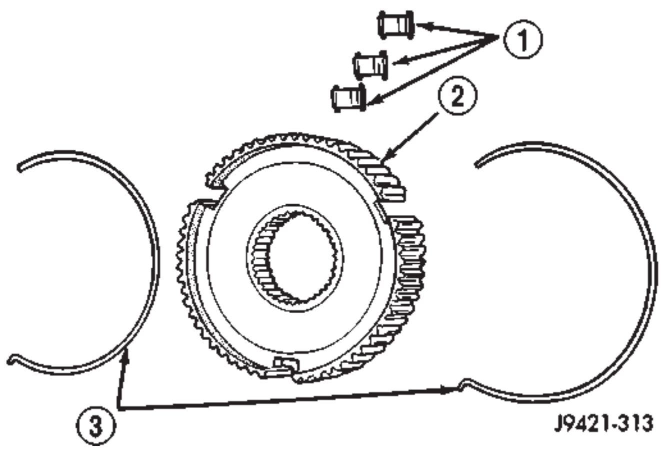

*Fig. 29 Synchronizer Strut And Spring Removal*

1 - SYNCHRONIZER STRUTS
2 - SYNCHRONZER HUB
3 - SYNCHRONIZER SPRINGS

(4) Remove brass stop ring (Fig. 30). Discard stop ring if worn, cracked, or any teeth are missing.

(5) Remove drive sprocket (Fig. 31).

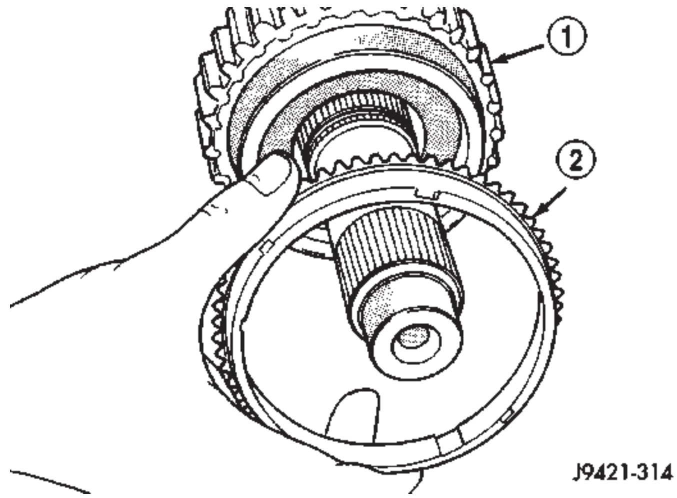

*Fig. 30 Synchronizer Stop Ring Removal*

1 - DRIVE SPROCKET
2 - STOP RING

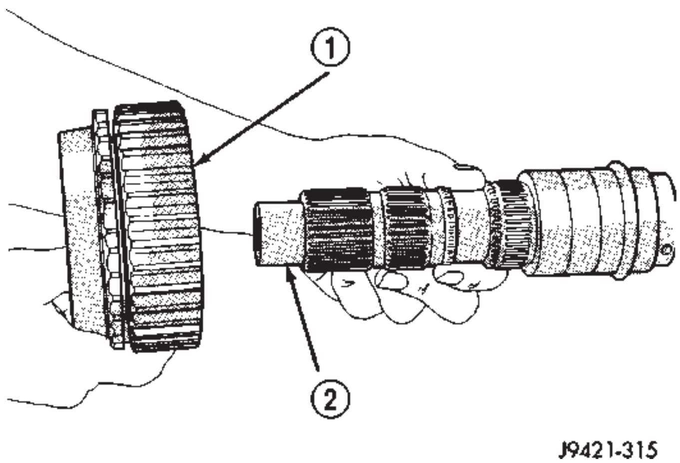

*Fig. 31 Drive Sprocket Removal*

1 - DRIVE SPROCKET
2 - MAINSHAFT

TRANSFER CASE - NV241LD (Continued)

### INPUT AND PLANETARY GEAR

(1) Remove front bearing retainer attaching bolts (Fig. 32).

(2) Remove front bearing retainer. Pry retainer loose with pry tool positioned in slots at each end of retainer (Fig. 33).

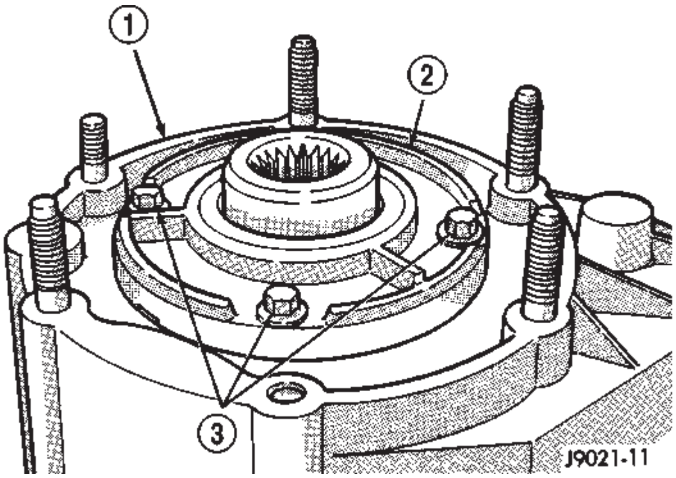

*Fig. 32 Front Bearing Retainer Bolts*

1 - FRONT CASE
2 - FRONT BEARING RETAINER
3 - RETAINER BOLTS

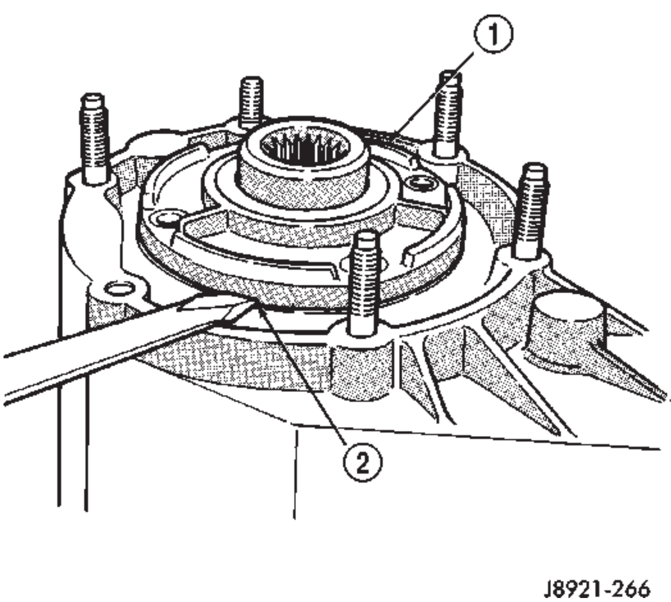

*Fig. 33 Front Bearing Retainer Removal*

1 - FRONT BEARING RETAINER
2 - RETAINER SLOT

(3) Remove front bearing retainer seal. Tap seal out with drift and hammer.

(4) Remove input gear retaining ring with heavy duty snap-ring pliers (Fig. 34).

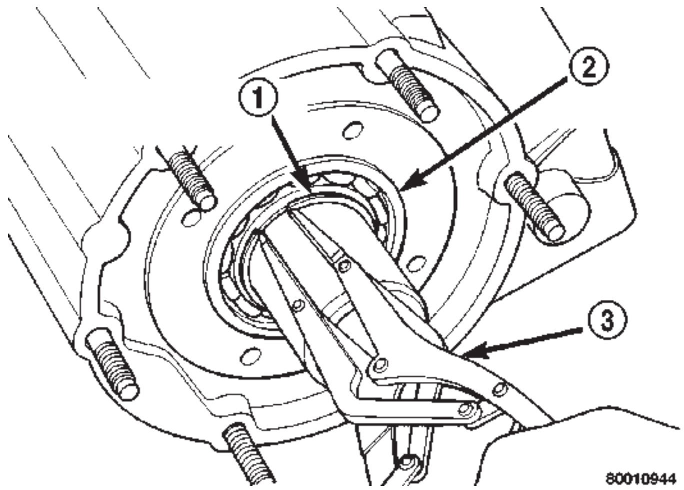

*Fig. 34 Removing Input Gear Retaining Ring*

1 - INPUT GEAR BEARING RETAINING RING
2 - INPUT GEAR BEARING
3 - SNAP-RING PLIERS

(5) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 35). Tap gear out of bearing with plastic mallet, if necessary.

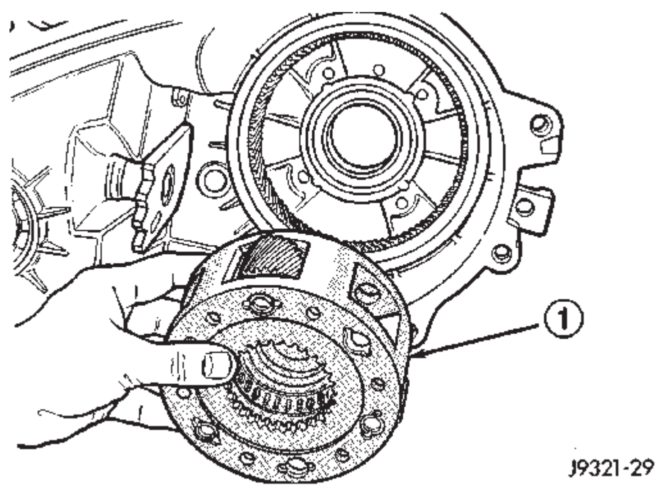

*Fig. 35 Input Gear And Planetary Carrier Removal*

1 - INPUT AND LOW RANGE GEAR ASSEMBLY

TRANSFER CASE - NV241LD (Continued)

## INPUT AND PLANETARY GEAR

(1) Remove snap-ring that retains input gear in low range gear (Fig. 36).
(2) Remove retainer (Fig. 37).
(3) Remove front tabbed thrust washer (Fig. 38).
(4) Remove input gear (Fig. 39).
(5) Remove rear tabbed thrust washer from low range gear (Fig. 40).

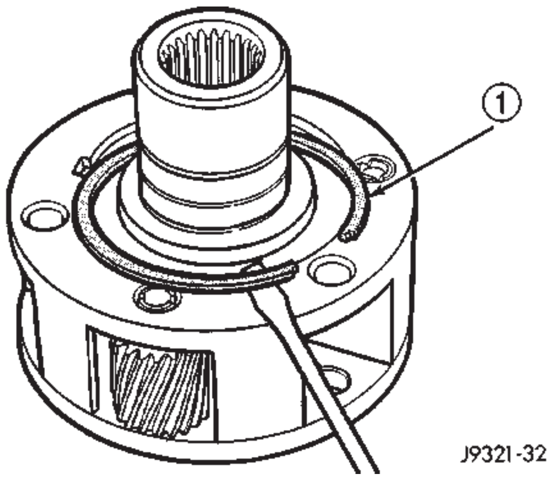

***Fig. 36 Input Gear Snap-Ring Removal***

1 - INPUT GEAR SNAP-RING

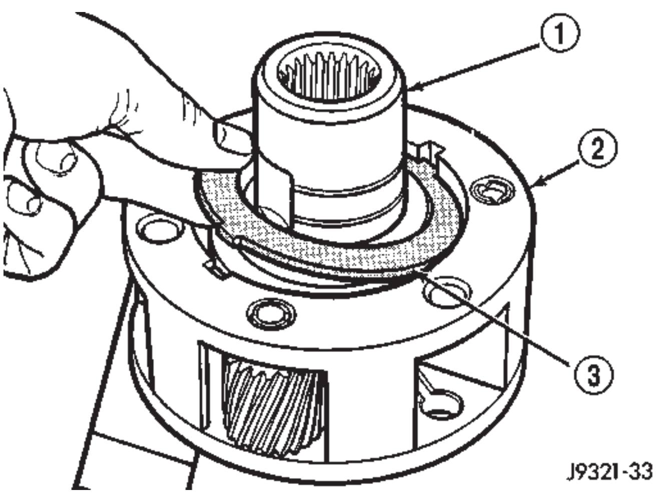

***Fig. 37 Input Gear Retainer Removal***

1 - INPUT GEAR
2 - LOW RANGE GEAR
3 - RETAINER

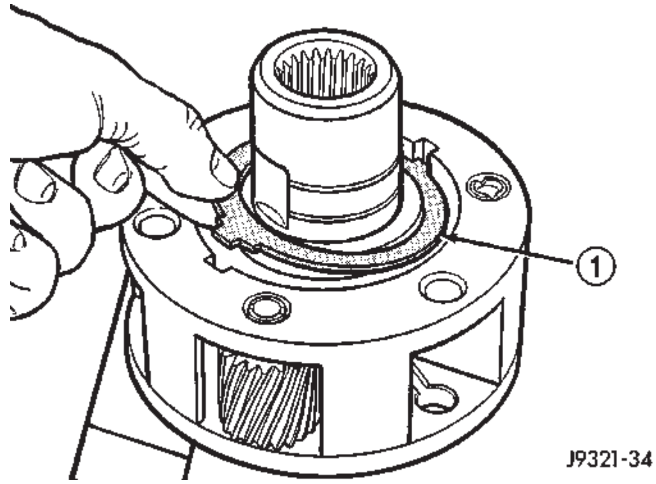

***Fig. 38 Front Tabbed Thrust Washer Removal***

1 - FRONT TABBED THRUST WASHER

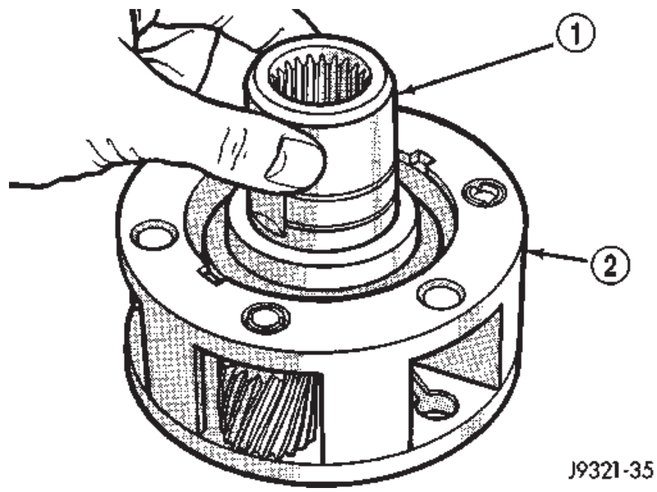

***Fig. 39 Input Gear Removal***

1 - INPUT GEAR
2 - LOW RANGE GEAR

## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

TRANSFER CASE - NV241LD (Continued)

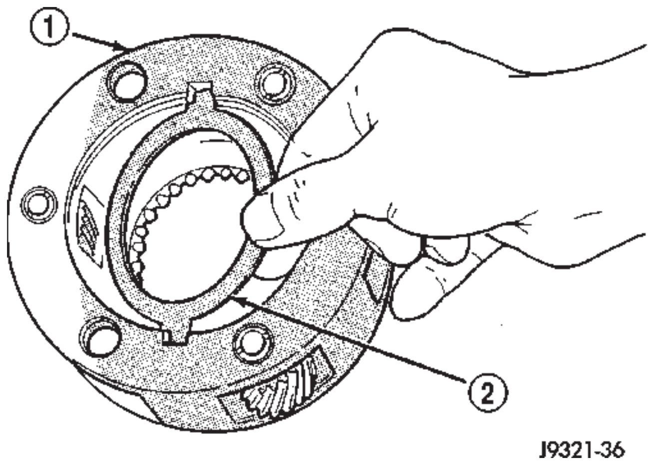

*Fig. 40 Rear Tabbed Thrust Washer Removal*

1 - LOW RANGE GEAR
2 - REAR TABBED THRUST WASHER

## INSPECTION

### MAINSHAFT/SPROCKET/HUB

Inspect the splines on the hub and shaft and the teeth on the sprocket (Fig. 41). Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

Inspect the spline teeth on the synchronizer hub. If evidence of chipping or excessive wear is apparent, replace the hub. The hooked end of each synchronizer spring should be inserted in one of the struts. In addition, the springs should not interfere with the polished gear cone or inside diameters of the hub.

Inspect the stop ring for cracks and wear . Replace the ring if necessary or if doubt exists over condition. Check a replacement synchronizer ring for proper fit on the cone with a minimum of wobble. Also check the synchronizer struts for wear or damage.

### INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 42). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

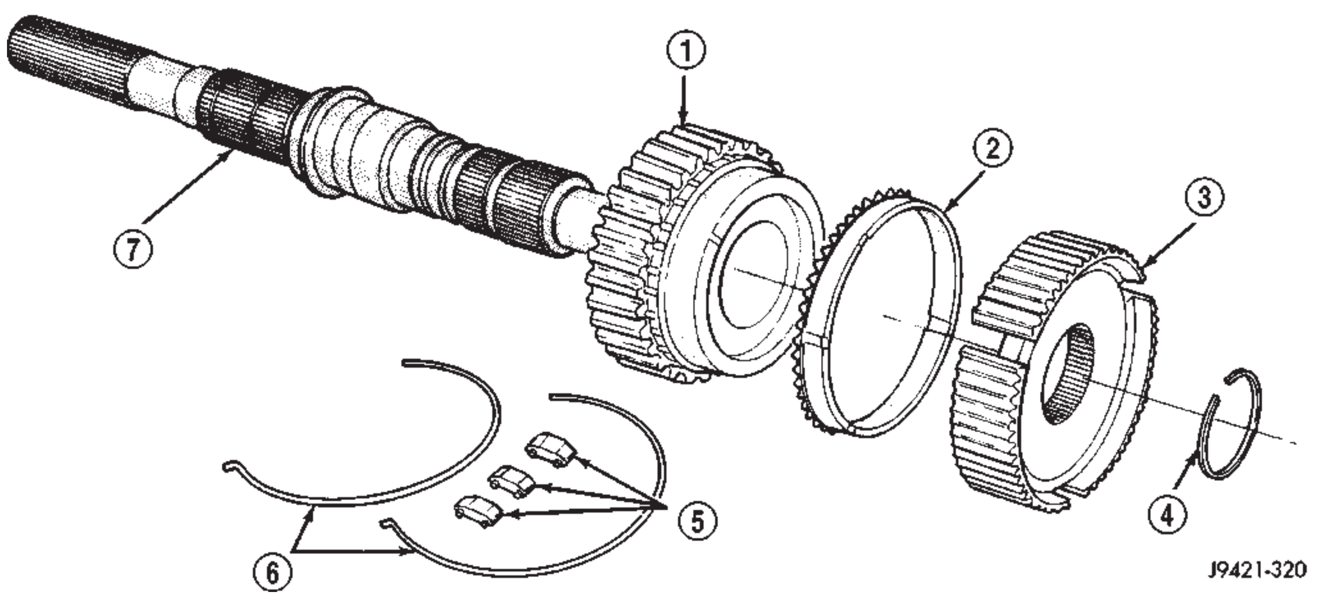

*Fig. 41 Mainshaft Components*

1 - DRIVE SPROCKET
2 - STOP RING
3 - SYNCHRONIZER HUB
4 - RETAINING RING
5 - STRUTS
6 - SYNCHRONIZER SPRINGS
7 - MAINSHAFT

TRANSFER CASE - NV241LD (Continued)

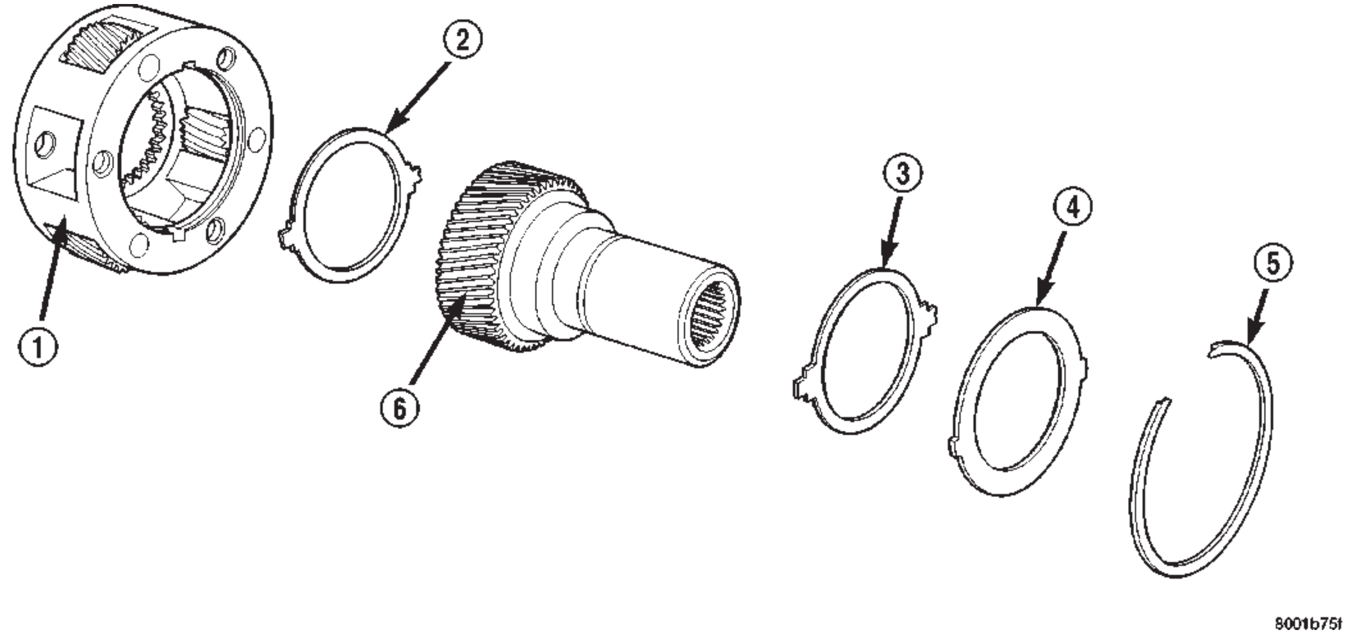

*Fig. 42 Input Gear And Carrier Components*

1 - PLANETARY CARRIER
2 - REAR THRUST WASHER
3 - FRONT THRUST WASHER
4 - CARRIER LOCK RING
5 - CARRIER LOCK RETAINING RING
6 - INPUT GEAR

## SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 43). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

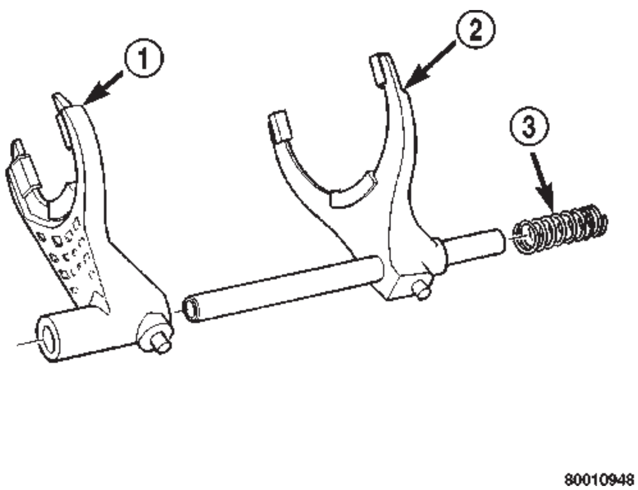

*Fig. 43 Shift Forks*

1 - RANGE FORK
2 - MODE FORK AND RAIL
3 - MODE SPRING

Inspect the shift fork wear pads (Fig. 44). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

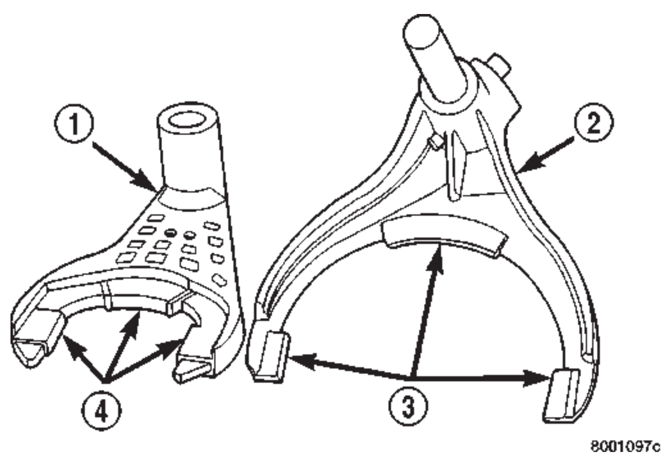

*Fig. 44 Shift Fork And Wear Pad Locations*

1 - RANGE FORK
2 - MODE FORK
3 - WEAR PADS (SERVICEABLE)
4 - WEAR PADS (NON-SERVICEABLE)

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

TRANSFER CASE - NV241LD (Continued)

### REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

Inspect rear extension bushing. Replace if worn or scored.

### DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

### LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 45)

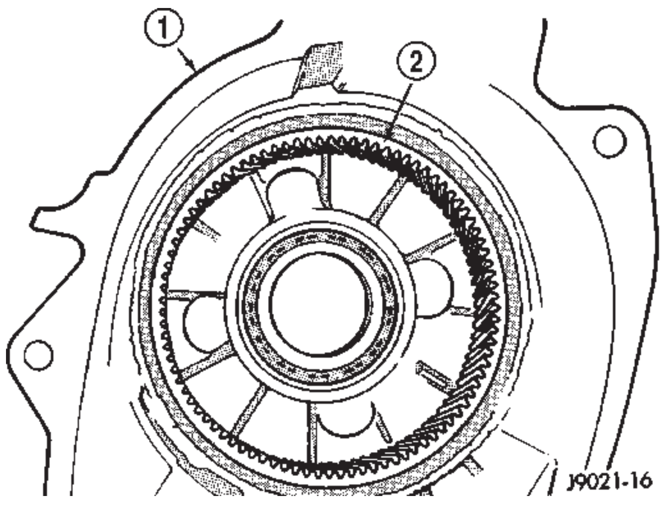

*Fig. 45 Low Range Annulus Gear*

1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

### FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Replace the input retainer seal, do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

### OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

## ASSEMBLY

### BEARINGS AND SEALS

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 46).

(2) Install locating ring on new bearing.

(3) Position case so that the forward end is facing upward.

(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 47).

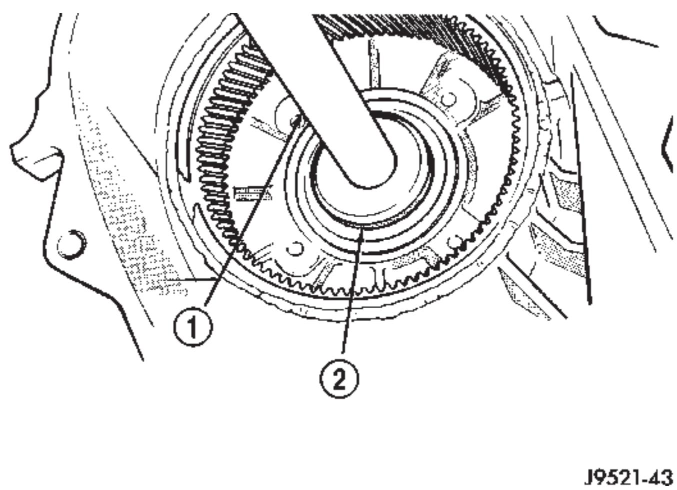

*Fig. 46 Input Shaft Bearing Removal*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL C-4210

(5) Using Installer 6953, remove front output shaft bearing.

(6) Start front output shaft bearing in case (Fig. 48). Then seat bearing with Handle C-4171 and Installer 6953.

(7) Install front output shaft bearing retaining ring.

(8) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

TRANSFER CASE - NV241LD (Continued)

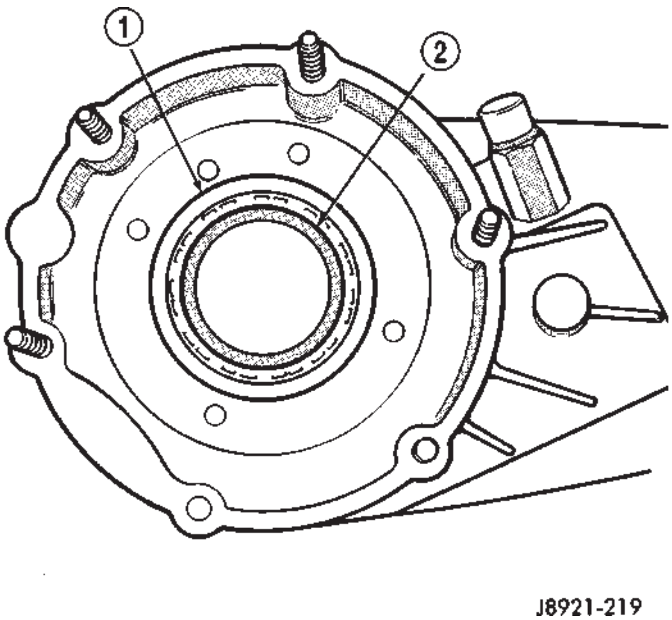

***Fig. 47 Seating Input Shaft Bearing***

1 - SNAP-RING
2 - INPUT SHAFT BEARING

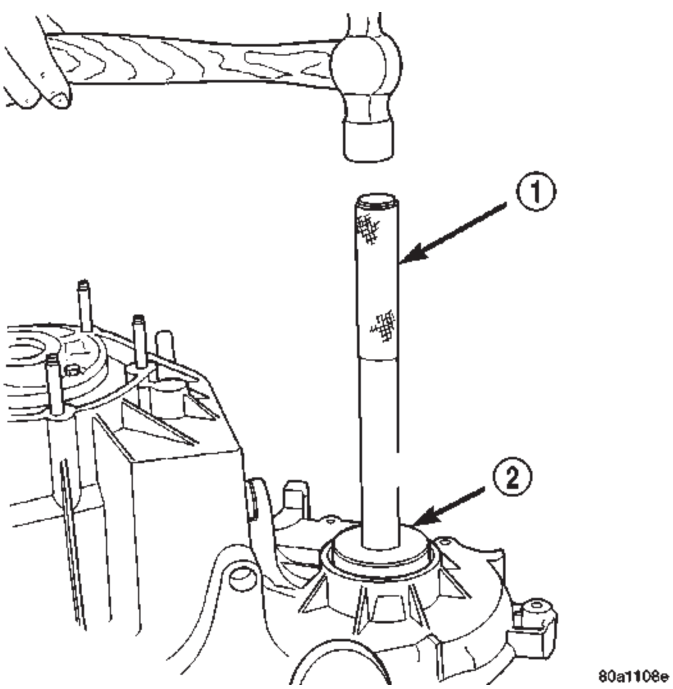

***Fig. 48 Front Output Shaft Bearing Installation***

1 - HANDLE C-4171
2 - REMOVER/INSTALLER 6953

(b) Start seal in bore with light taps from hammer (Fig. 49). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount (Fig. 50). Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case. This is correct final seal position.

**CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.**

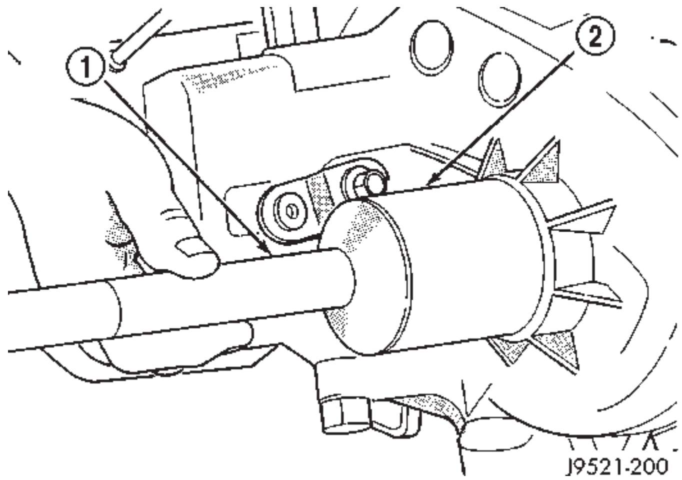

***Fig. 49 Front Output Seal Installation***

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL 6888

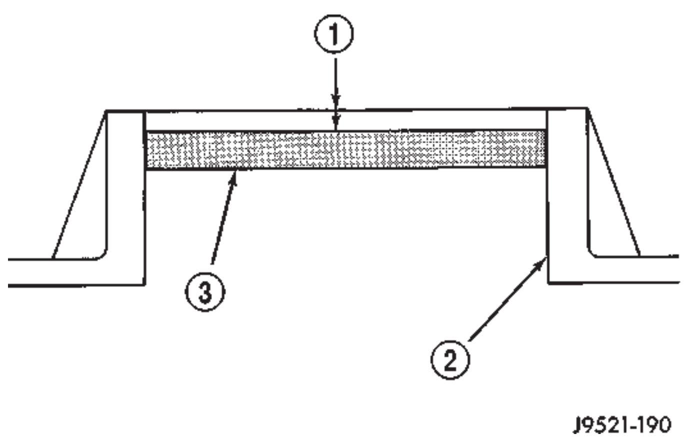

***Fig. 50 Checking Front Output Seal Installation Depth***

1 - CORRECT SEAL DEPTH IS 2.03-2.5 mm (0.080-0.100 in.) BELOW TOP EDGE OF BORE
2 - FRONT CASE SHAFT BORE
3 - FRONT OUTPUT SEAL

(9) Remove seal from front bearing retainer with suitable pry tool.

TRANSFER CASE - NV241LD (Continued)

(10) Install new oil seal in front bearing retainer with Installer 7884 (Fig. 51).

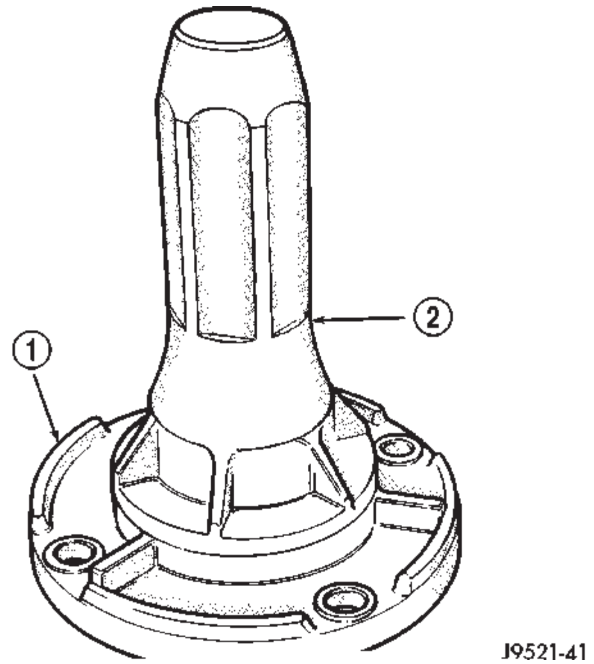

**Fig. 51 Install Front Bearing Retainer Seal**

1 - FRONT BEARING RETAINER
2 - SPECIAL TOOL 7884

(11) Remove seal from oil pump with suitable pry tool.

(12) Install new seal in oil pump with Installer 7888 (Fig. 52).

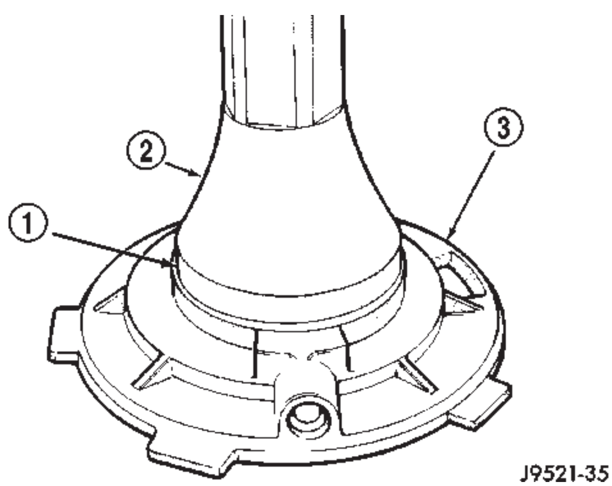

**Fig. 52 Oil Pump Seal Installation**

1 - HOUSING SEAL
2 - SPECIAL TOOL 7888
3 - OIL PUMP FEED HOUSING

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 53).

(14) Install new pilot bearing with Plug C-293-3.

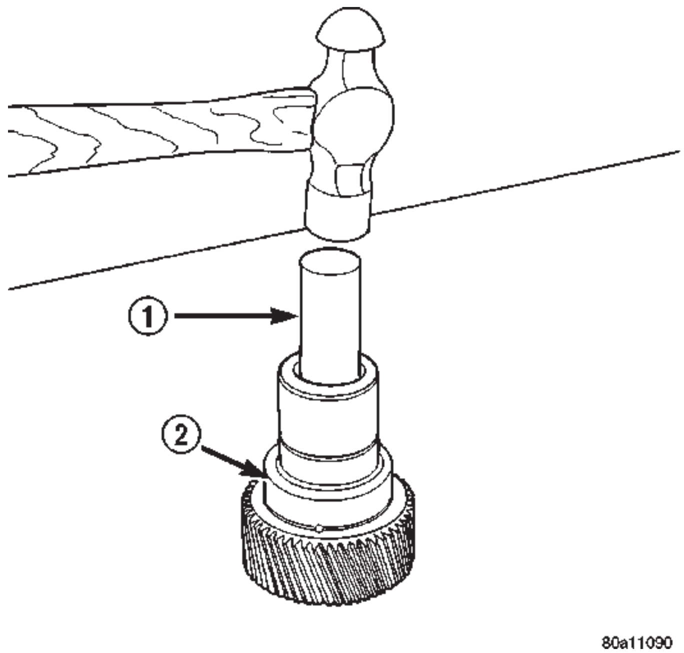

**Fig. 53 Remove Input Gear Pilot Bearing**

1 - DRIFT
2 - INPUT GEAR

(15) Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 54).

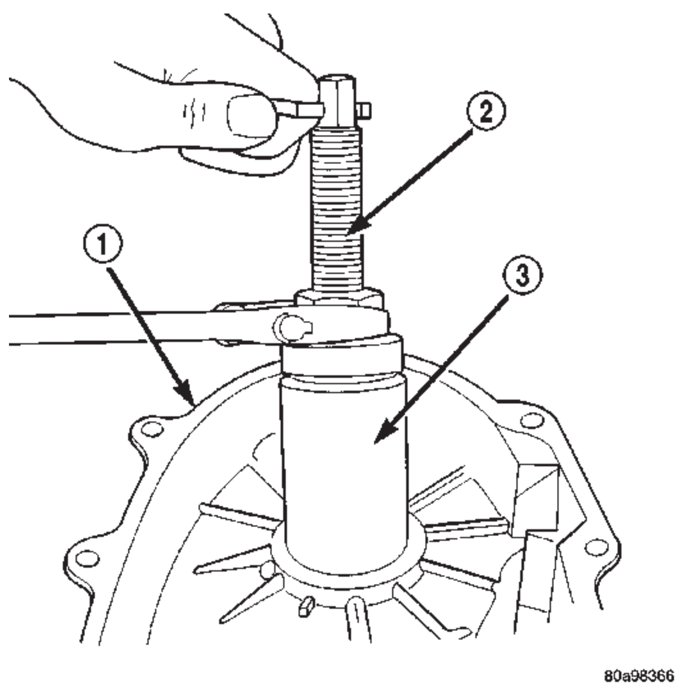

**Fig. 54 Front Output Shaft Rear Bearing Removal**

1 - REAR CASE
2 - SPECIAL TOOL L-4454-1 AND L-4454-3
3 - SPECIAL TOOL 8148

TRANSFER CASE - NV241LD (Continued)

(16) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 55). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 56).

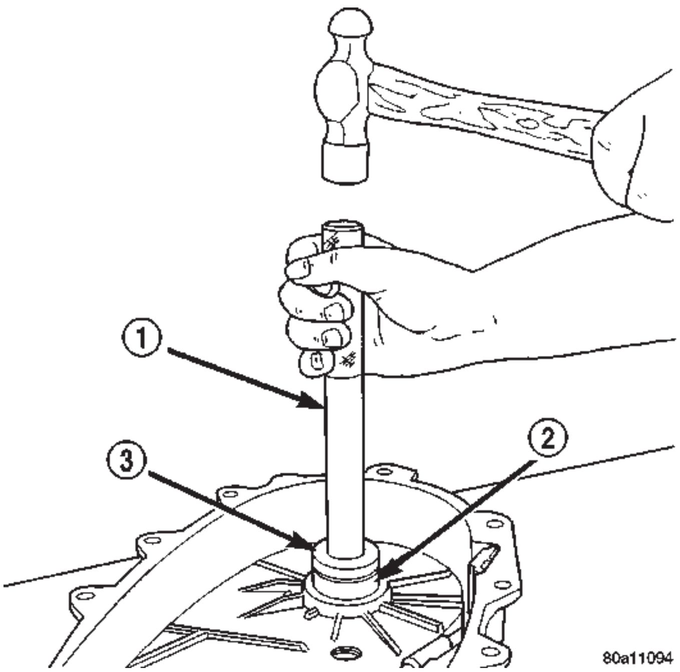

***Fig. 55 Output Shaft Rear Bearing Installation***

1 - HANDLE C-4171
2 - OUTPUT SHAFT INNER BEARING
3 - INSTALLER 5066

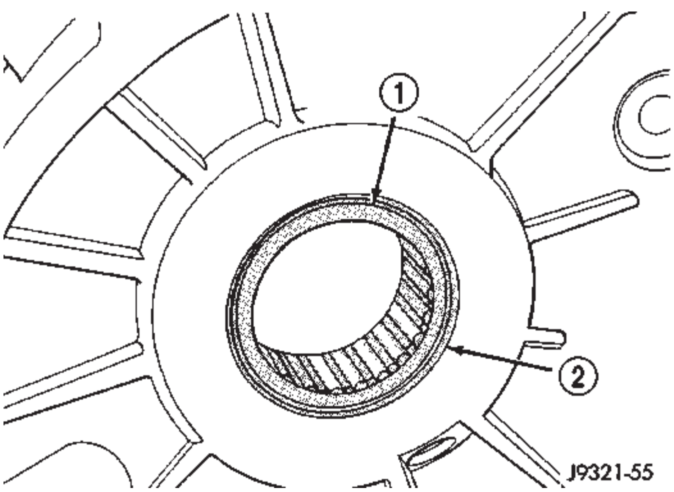

***Fig. 56 Output Shaft Rear Bearing Installation Depth***

1 - BEARING (SEATED) AT LOWER EDGE OF CHAMFER
2 - CHAMFER

## INPUT AND PLANETARY GEAR

(1) Lubricate gears and thrust washers (Fig. 57) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 57). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

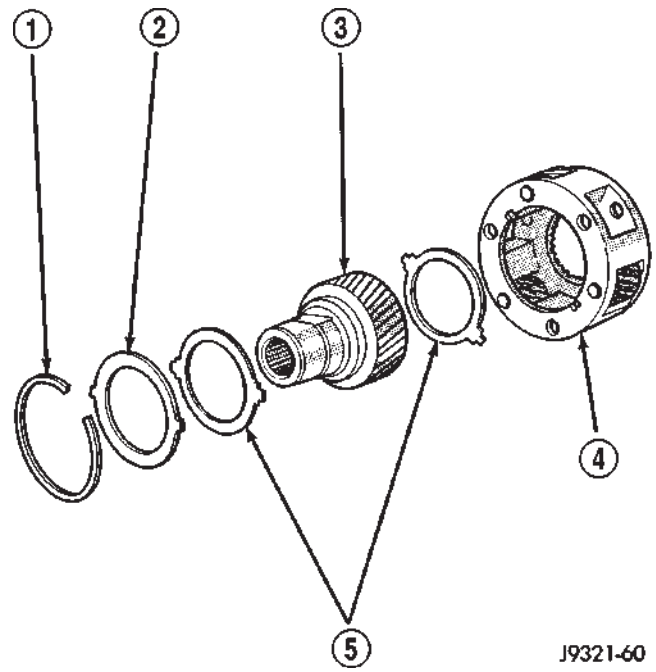

***Fig. 57 Input/Low Range Gear Components***

1 - SNAP-RING
2 - RETAINER PLATE
3 - INPUT GEAR
4 - LOW RANGE GEAR
5 - THRUST WASHERS

TRANSFER CASE - NV241LD (Continued)

(6) Align and install low range/input gear assembly in front case (Fig. 58). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(7) Install snap-ring to hold input/low range gear into front bearing (Fig. 59).

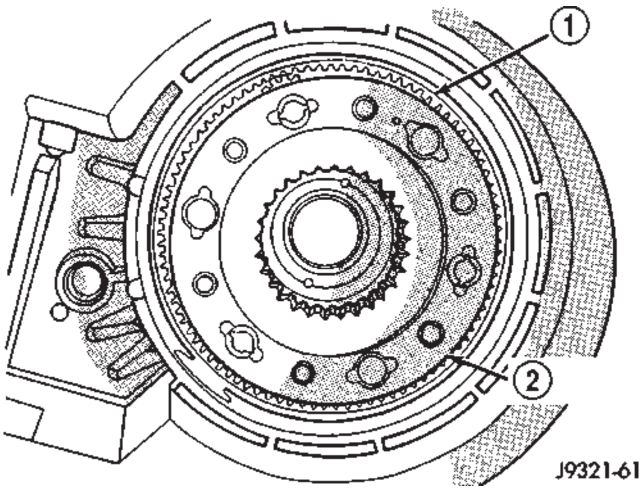

*Fig. 58 Input/Low Range Gear Installation*

1 - ANNULUS GEAR
2 - INPUT/LOW RANGE GEAR

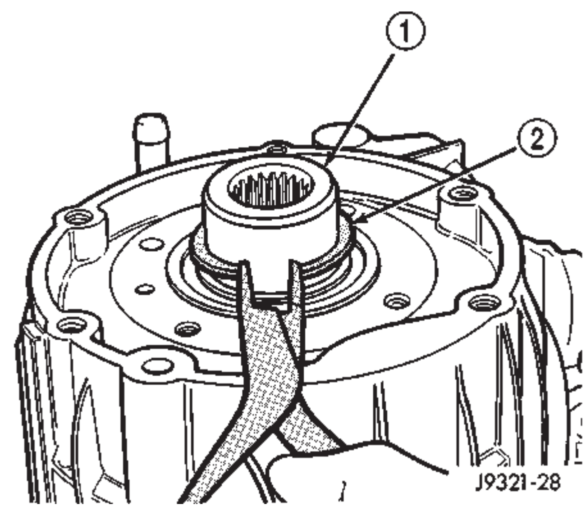

*Fig. 59 Install Input Gear Snap-Ring*

1 - INPUT GEAR
2 - SNAP-RING

(8) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(9) Apply a 3 mm (1/8 in.) bead of Mopar® Gasket Maker, or equivalent silicone adhesive, to sealing surface of retainer.

(10) Align cavity in seal retainer with fluid return hole in front of case.

**CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® Gasket Maker, or equivalent silicone adhesive sealer. Seal failure and fluid leak can result.**

(11) Install bolts to hold retainer to transfer case (Fig. 60). Tighten to 21 N·m (16 ft. lbs.) of torque.

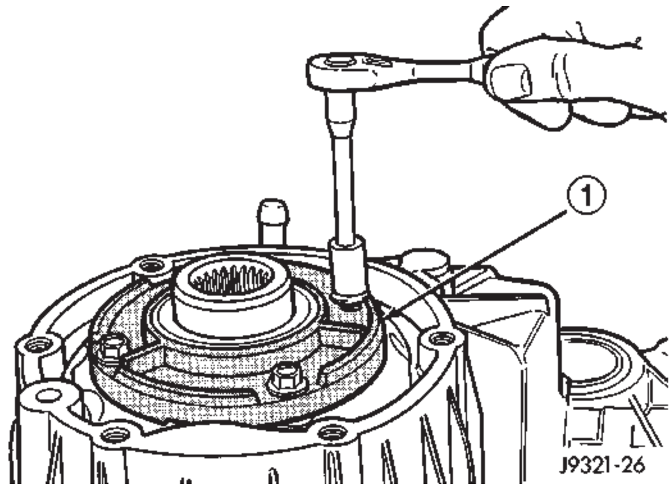

*Fig. 60 Install Front Bearing Retainer*

1 - FRONT BEARING RETAINER

## SHIFT FORKS AND MAINSHAFT

(1) Lubricate mainshaft splines with recommended transmission fluid.

(2) Install drive sprocket on mainshaft (Fig. 61).

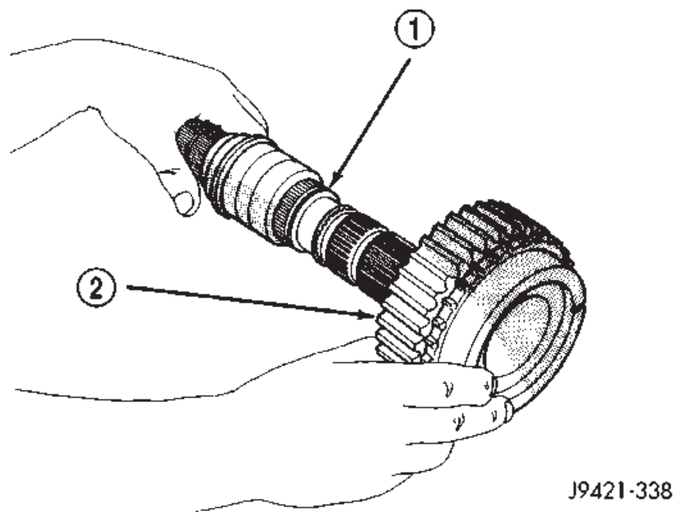

*Fig. 61 Drive Sprocket Installation*

1 - MAINSHAFT
2 - DRIVE SPROCKET

TRANSFER CASE - NV241LD (Continued)

(3) Install brass stop ring on drive sprocket (Fig. 62).

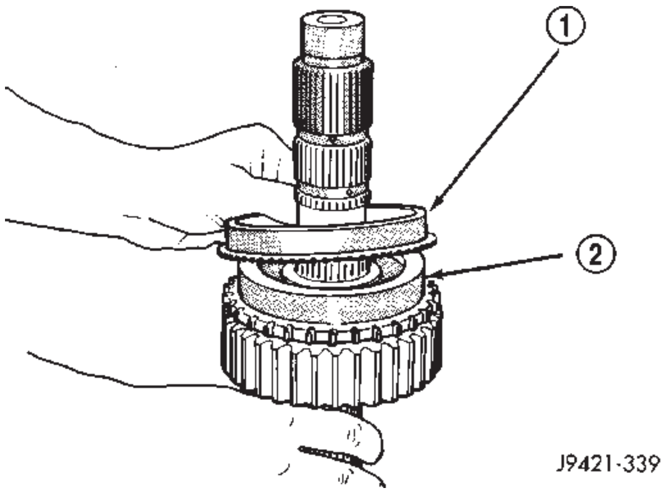

***Fig. 62 Synchronizer Stop Ring Installation***

1 - BRASS STOP RING
2 - DRIVE SPROCKET

(4) Install 3 synchronizer struts and 2 springs in hub as follows:

(a) Insert first strut in hub (Fig. 63). Strut shoulders rest (and slide) on sides hub slot as shown.

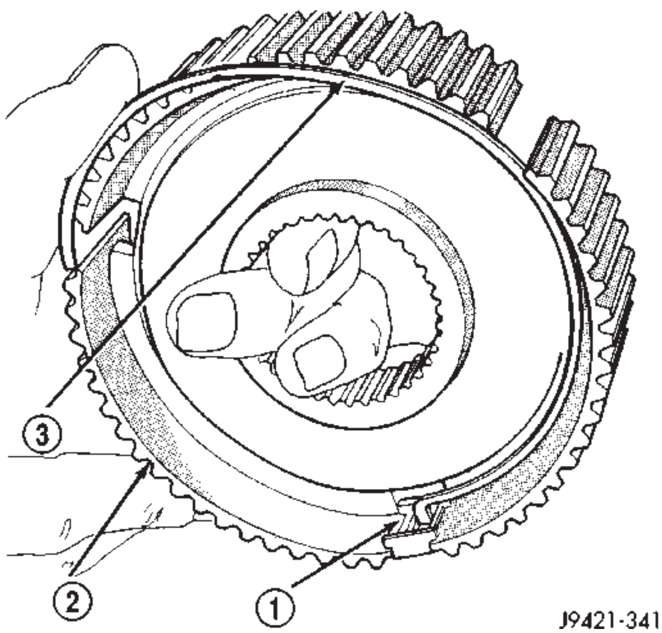

***Fig. 63 Installing First Synchronizer Strut And Spring***

1 - FIRST STRUT
2 - SYNCHRONIZER HUB
3 - SPRING

(b) Insert hooked end of first spring in center of strut to secure it. Then work spring into hub (Fig. 64).

(c) Press spring inward and insert last two struts in hub slots. Be sure spring is positioned under struts to properly secure them (Fig. 65).

(d) Turn hub over and install remaining spring in hub. Position hooked end of second spring opposite the first spring's hooked end.

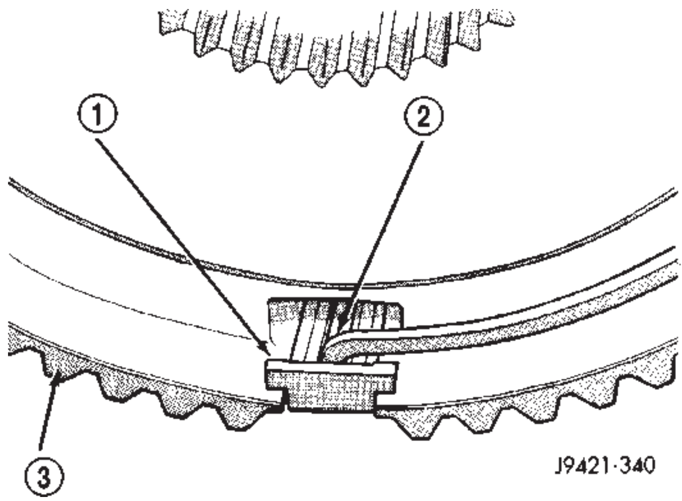

***Fig. 64 Synchronizer Spring Installation***

1 - STRUT SHOULDER
2 - SPRING (SEATED IN STRUT)
3 - HUB

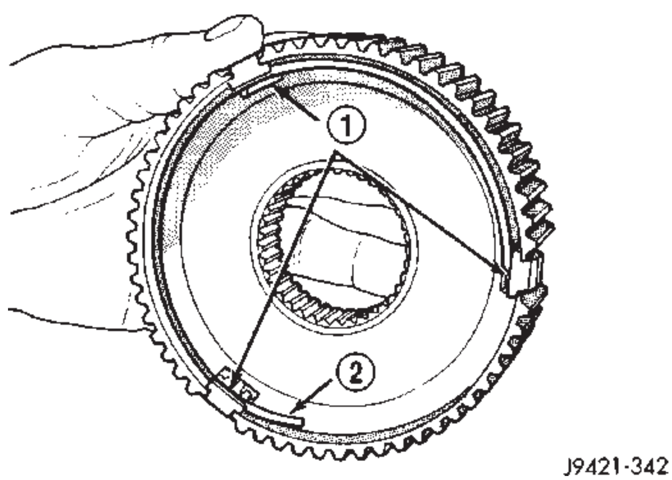

***Fig. 65 Correct Position Of Struts And Springs***

1 - STRUTS
2 - SPRING

TRANSFER CASE - NV241LD (Continued)

(5) Install assembled synchronizer hub on mainshaft (Fig. 66). Hub has shoulder on one side which goes toward sprocket (rear of shaft). Flat side of hub faces front of shaft.

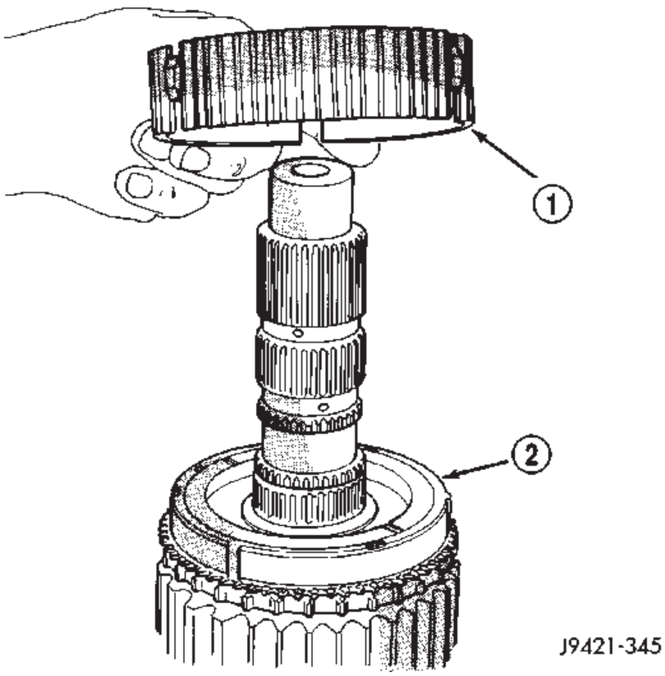

***Fig. 66 Synchronizer Hub Installation***

1 - SYNCHRONIZER HUB (SHOULDER SIDE DOWN)
2 - STOP RING AND SPROCKET

(6) Install synchronizer hub retaining ring (Fig. 67). Be sure ring is fully seated before proceeding.

(7) Install sliding clutch (sleeve) on synchronizer hub (Fig. 68).

**CAUTION: The sliding clutch must be correctly positioned to ensure proper shifting. Position the clutch on the hub so a clutch spline is centered over each strut as shown (Fig. 69). If the clutch is installed so a gap between splines is aligned with one or more struts, gear clash will result.**

(8) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

(9) Lubricate mainshaft components with transmission fluid.

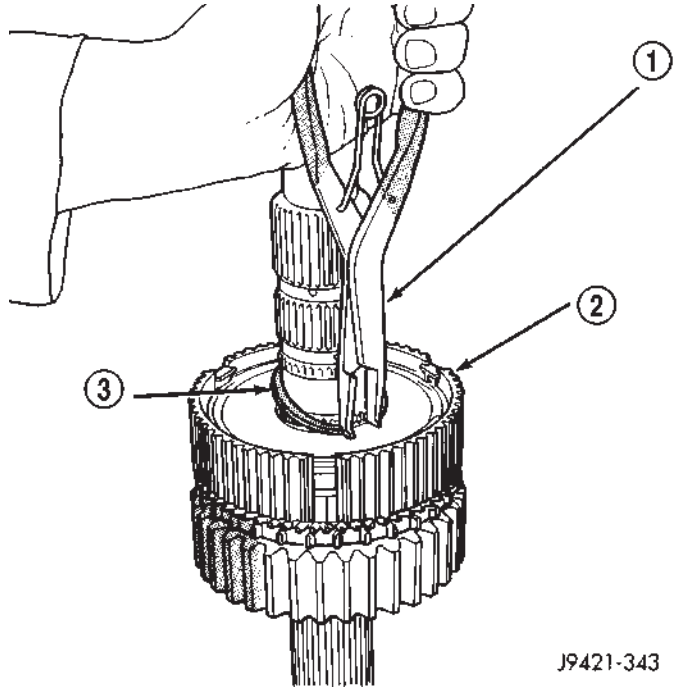

***Fig. 67 Synchronizer Hub Retaining Ring Installation***

1 - SNAP-RING PLIERS
2 - SYNCHRONIZER HUB
3 - HUB RETAINING RING

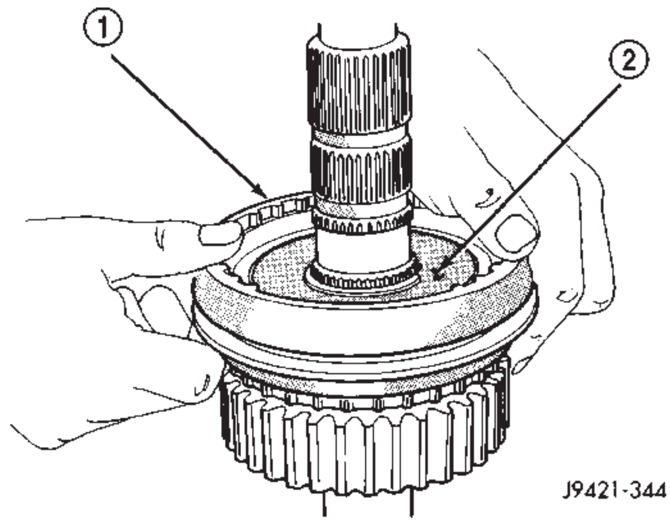

***Fig. 68 Sliding Clutch Installation***

1 - SLIDING CLUTCH

TRANSFER CASE - NV241LD (Continued)

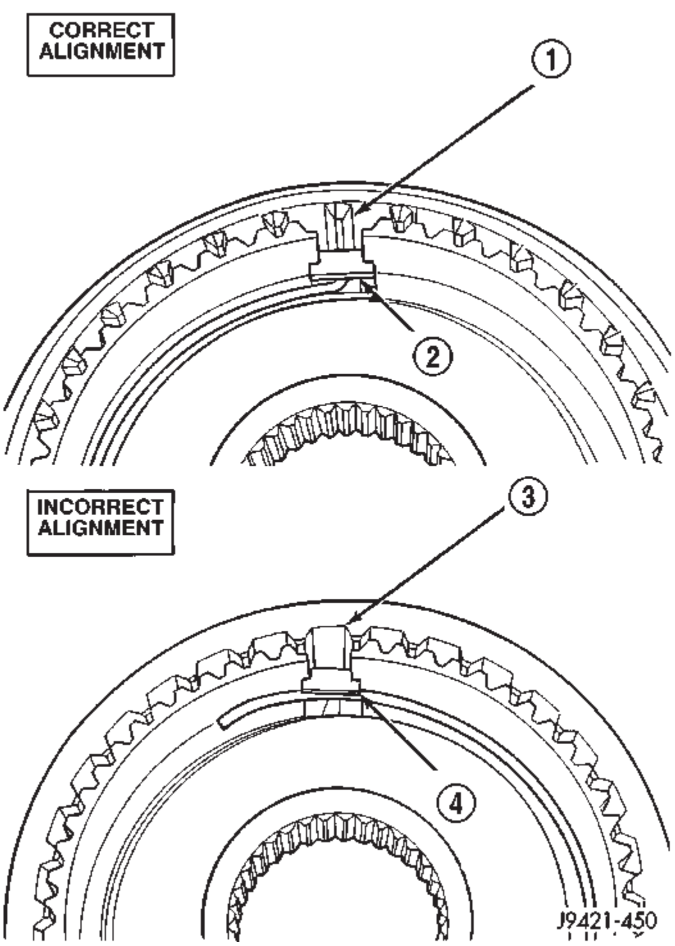

***Fig. 69 Correct Alignment Of Struts And Sliding Clutch***

1 - SLEEVE TOOTH ALIGNED WITH STRUT
2 - STRUT
3 - SLEEVE TOOTH **NOTALIGNED WITH STRUT**
4 - STRUT

(10) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 70). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

(11) Assemble and install range fork and hub (Fig. 71). Be sure hub is properly seated in low range gear and engaged to the input gear.

(12) Align and insert range fork pin in shift sector slot.

(13) Install mode fork and shift rail in sliding clutch (Fig. 72).

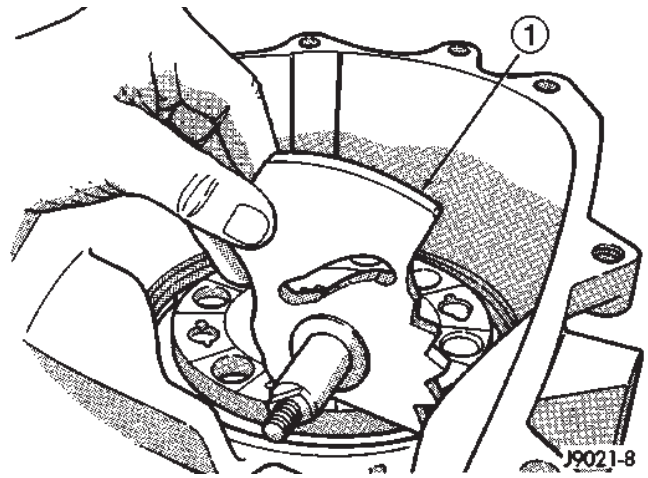

***Fig. 70 Shift Sector Installation***

1 - SHIFT SECTOR

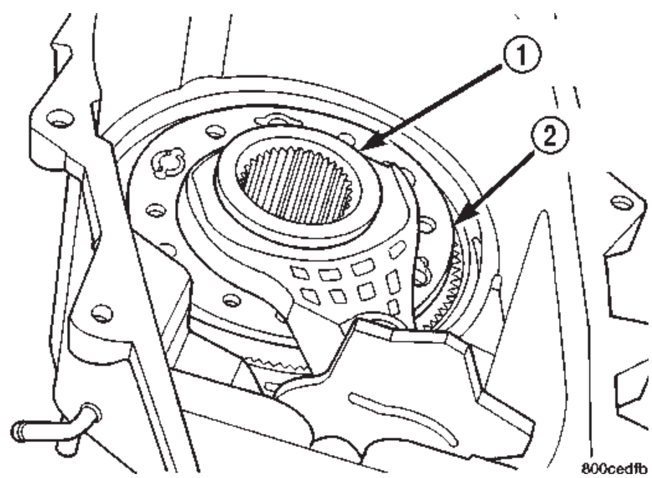

***Fig. 71 Install Range Fork And Hub Assembly***

1 - RANGE HUB
2 - RANGE FORK

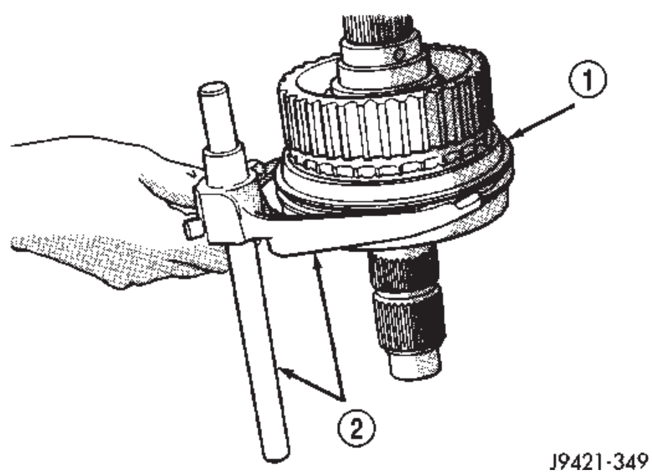

***Fig. 72 Assembling Mode Fork And Mainshaft***

1 - SLIDING CLUTCH
2 - MODE FORK AND SHIFT RAIL

TRANSFER CASE - NV241LD (Continued)

(14) Install mainshaft/mode fork assembly (Fig. 73). Guide mainshaft through hub and into input gear and shift rail through range fork and into case bore.

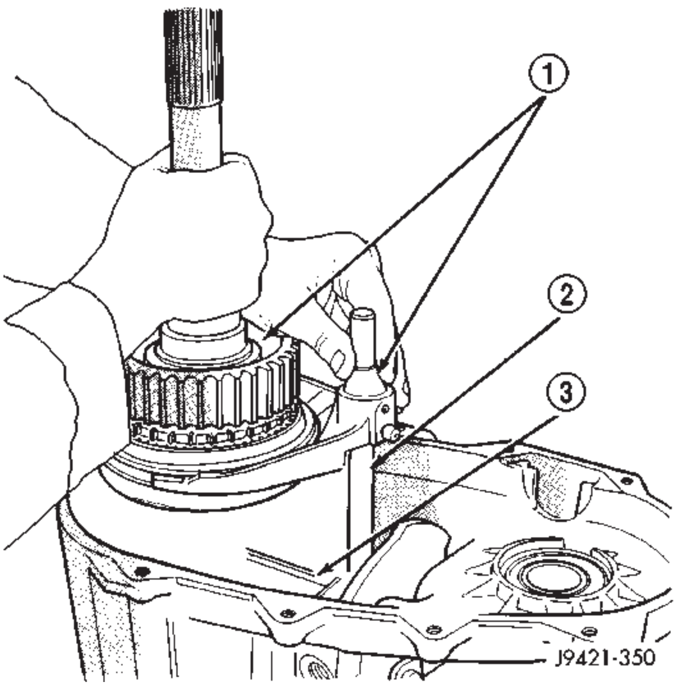

***Fig. 73 Installing Mainshaft And Mode Fork Assembly***

1 - MAINSHAFT AND MODE FORK ASSEMBLY
2 - SHIFT RAIL
3 - RANGE FORK

(15) Install new o-ring on vacuum/indicator switch, if necessary.Install vacuum/indicator switch (Fig. 74). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

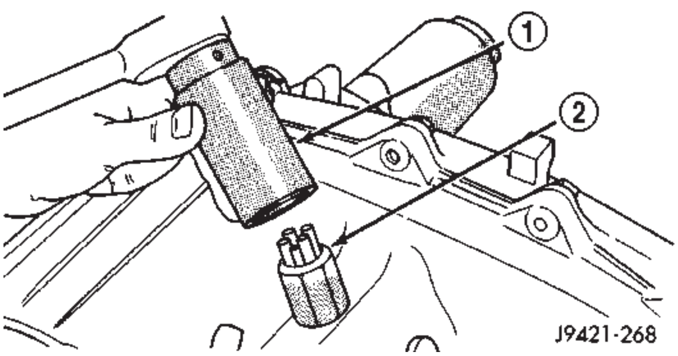

***Fig. 74 Vacuum/Indicator Switch Installation***

1 - 1-1/16" SOCKET
2 - INDICATOR SWITCH

(16) Install new sector shaft o-ring and o-ring retainer in sector shaft bore (Fig. 75). Lubricate o-ring with transmission fluid or petroleum jelly after installation.

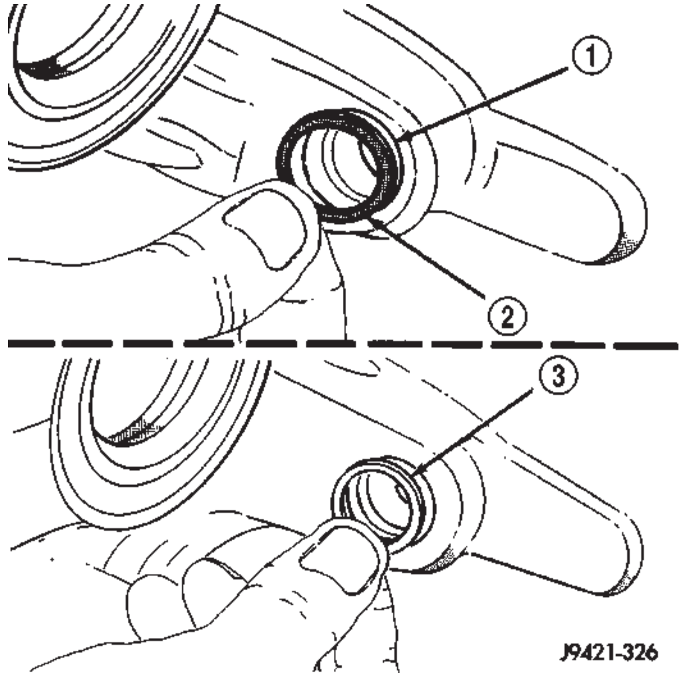

***Fig. 75 Sector Shaft O-Ring And Retainer Installation***

1 - SECTOR SHAFT BORE
2 - O-RING
3 - O-RING RETAINER

(17) Install shift lever on sector shaft (Fig. 76).

(18) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

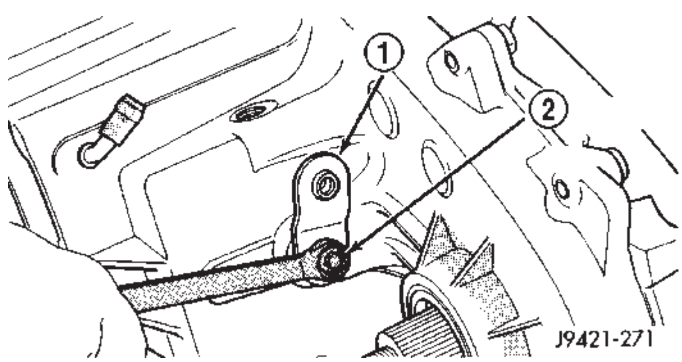

***Fig. 76 Shift Lever Installation***

1 - SHIFT LEVER
2 - NUT/WASHER

TRANSFER CASE - NV241LD (Continued)

(19) Install poppet plunger and spring (Fig. 77).

(20) Install new o-ring on poppet screw and install screw in front case (Fig. 78). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

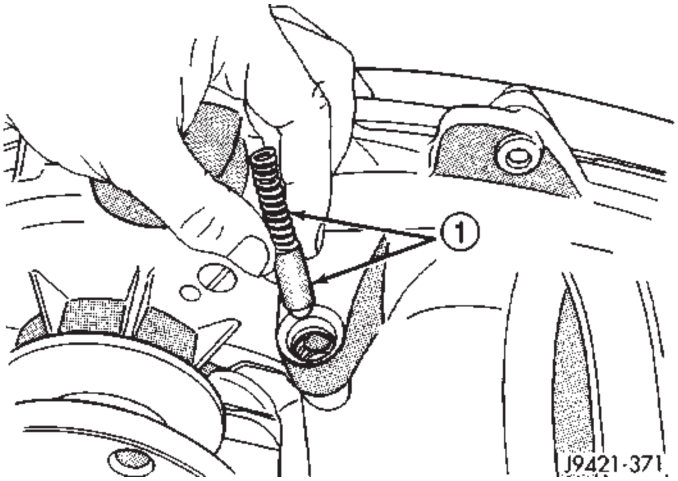

*Fig. 77 Poppet Plunger And Spring Installation*

1 - POPPET PLUNGER AND SPRING

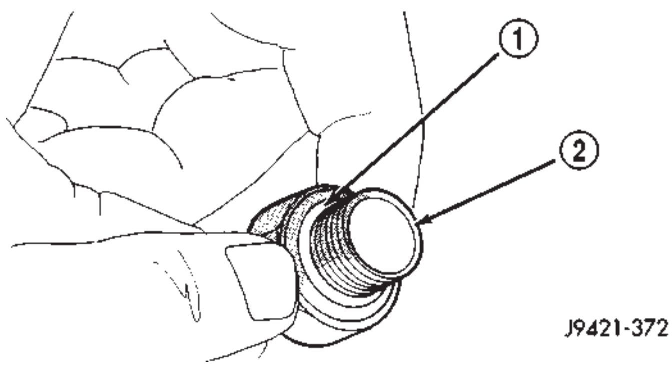

*Fig. 78 O-Ring Installation On Poppet Plunger Screw*

1 - O-RING
2 - PLUNGER SCREW

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Install front output shaft in bearing (Fig. 79).

(2) Insert front sprocket in drive chain (Fig. 80).

(3) Install drive chain around mainshaft sprocket (Fig. 80). Then position front sprocket over front shaft.

(4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

(5) If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.

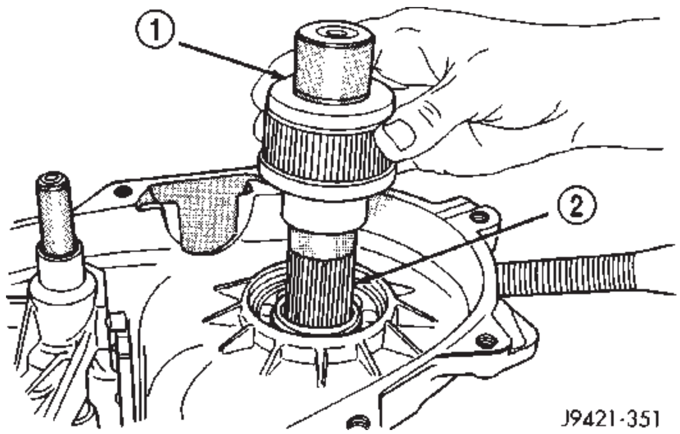

*Fig. 79 Front Output Shaft Installation*

1 - FRONT OUTPUT SHAFT
2 - BEARING

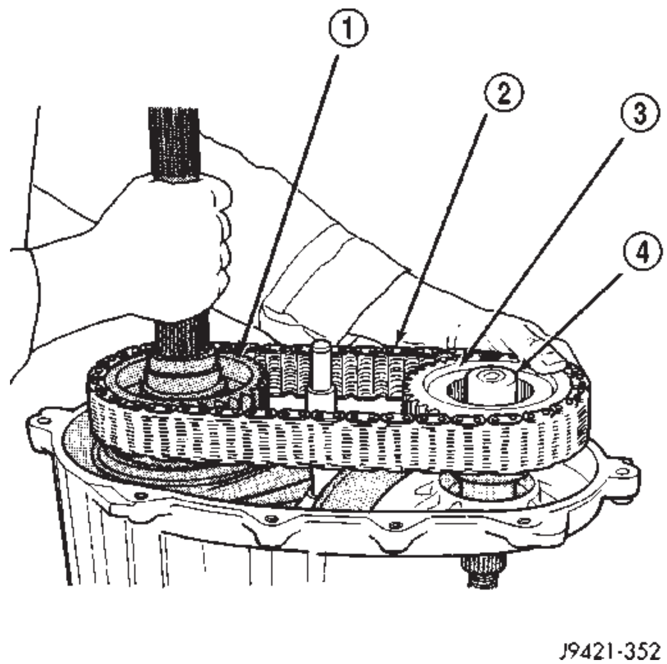

*Fig. 80 Drive Chain And Front Sprocket Installation*

1 - DRIVE SPROCKET
2 - DRIVE CHAIN
3 - FRONT SPROCKET
4 - FRONT SHAFT

TRANSFER CASE - NV241LD (Continued)

(6) Install front sprocket retaining ring (Fig. 81).

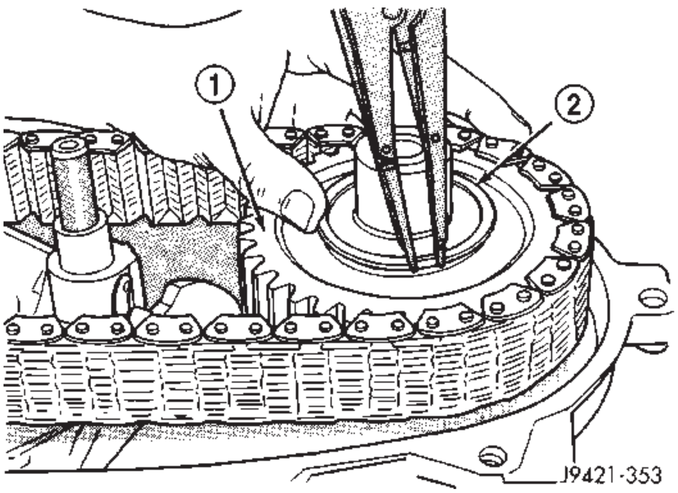

*Fig. 81 Front Sprocket Retaining Ring Installation*

1 - FRONT SPROCKET
2 - RETAINING RING

(7) Install spring and cup on shift rail (Fig. 82).

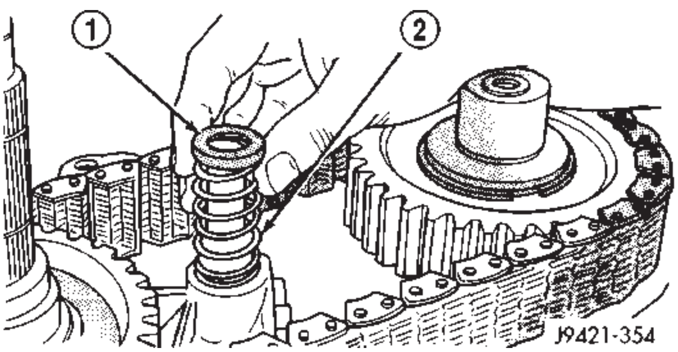

*Fig. 82 Shift Rail Spring And Cup Installation*

1 - CUP
2 - SPRING

(8) Insert magnet in front case pocket (Fig. 83).

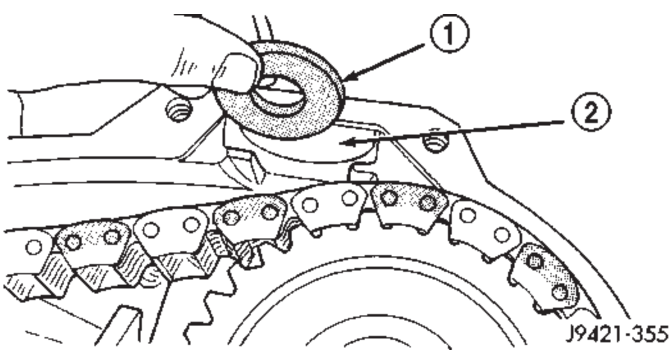

*Fig. 83 Case Magnet Installation*

1 - MAGNET
2 - CASE POCKET

## OIL PUMP AND REAR CASE

Lubricate the oil pump components with before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

(1) Install new o-ring in pickup tube inlet of oil pump (Fig. 84).

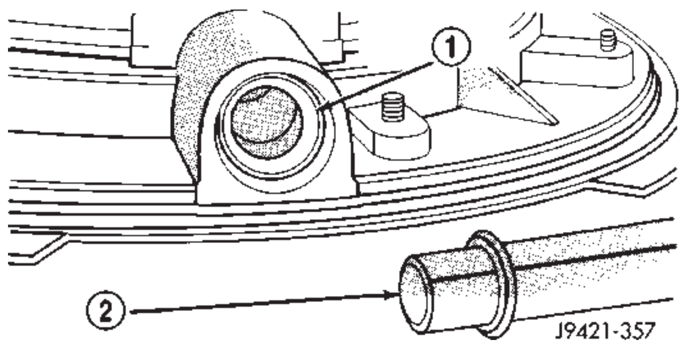

*Fig. 84 Pickup Tube O-Ring Installation*

1 - O-RING (PUMP PICKUP)
2 - PICKUP TUBE

(2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches (Fig. 85). Be sure hose that connects tube to filter is securely positioned.

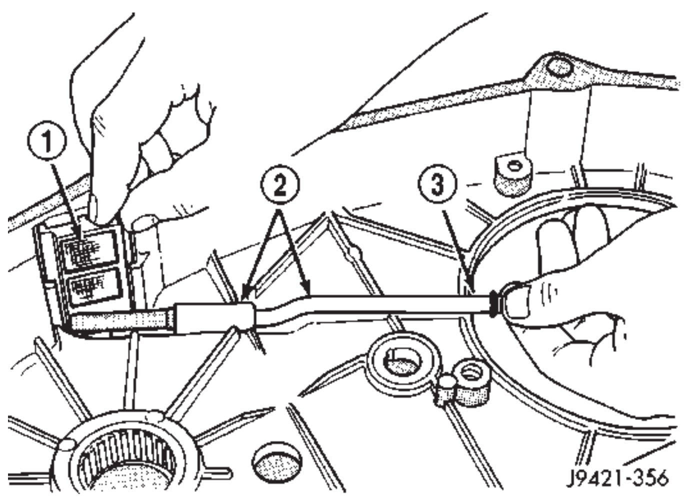

*Fig. 85 Oil Pickup Tube And Filter Position In Rear Case*

1 - FILTER
2 - TUBE AND HOSE
3 - TUBE IN NOTCH

TRANSFER CASE - NV241LD (Continued)

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 86).

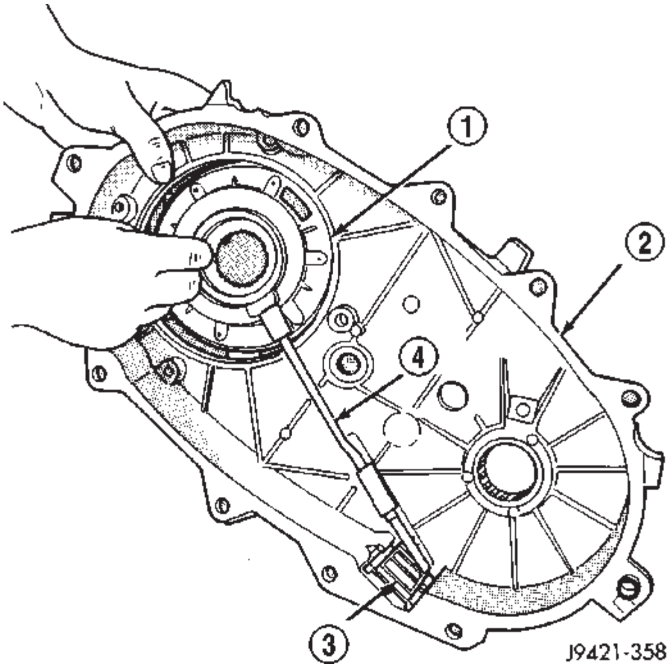

***Fig. 86 Positioning Oil Pump In Rear Case***

1 - OIL PUMP
2 - REAR CASE
3 - FILTER
4 - PICKUP TUBE

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 87). Be sure oil pump and pickup tube remain in position during case installation.

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

**CAUTION: Verify that shift rail (Fig. 88), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.**

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

(8) Check stud at end of case halves (Fig. 89). If stud was loosened or came out during disassembly, apply Loctite™ 242 to stud threads and reseat stud in case.

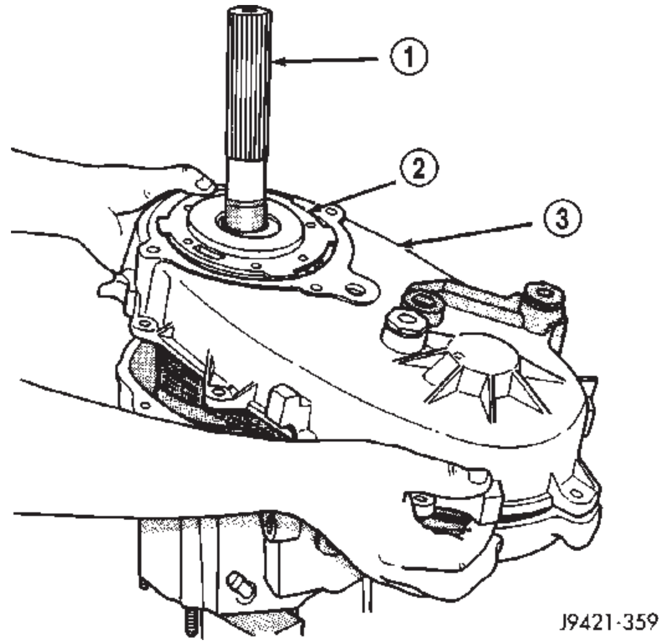

***Fig. 87 Rear Case And Oil Pump Installation***

1 - MAINSHAFT
2 - OIL PUMP
3 - REAR CASE

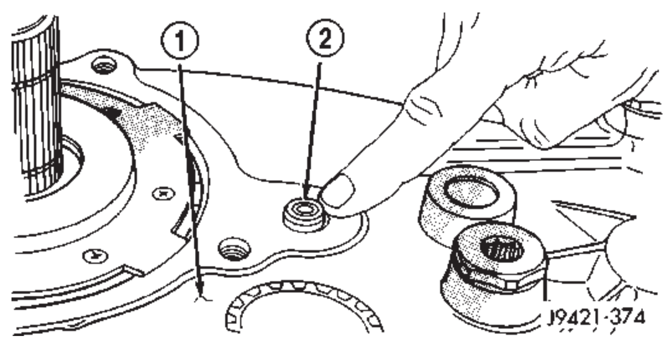

***Fig. 88 Shift Rail Seated In Rear Case Bore***

1 - REAR CASE
2 - SHIFT RAIL

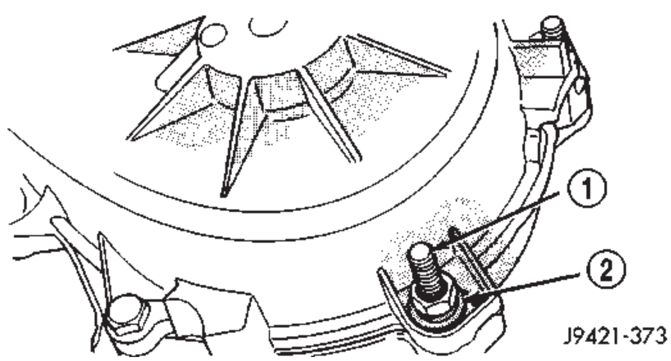

***Fig. 89 Washer Installation On Case Stud And Dowel Bolts***

1 - CASE STUD/BOLT
2 - WASHER

TRANSFER CASE - NV241LD (Continued)

(9) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

- flange head bolts to 47-61 N·m (35-45 ft. lbs.)
- all other bolts/nuts to 27-34 N·m (20-25 ft. lbs.)

(10) Install oil pump retaining ring on mainshaft (Fig. 90).

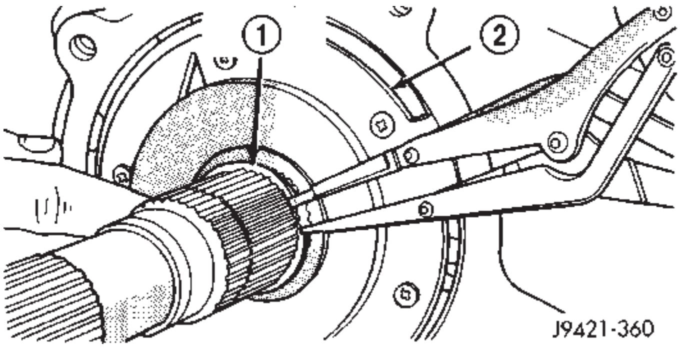

*Fig. 90 Oil Pump Retaining Ring Installation*

1 - RETAINING RING
2 - OIL PUMP

(11) Install rear output bearing and snap-ring to output shaft.

## COMPANION FLANGE

(1) Install companion flange seal on front shaft (Fig. 91).

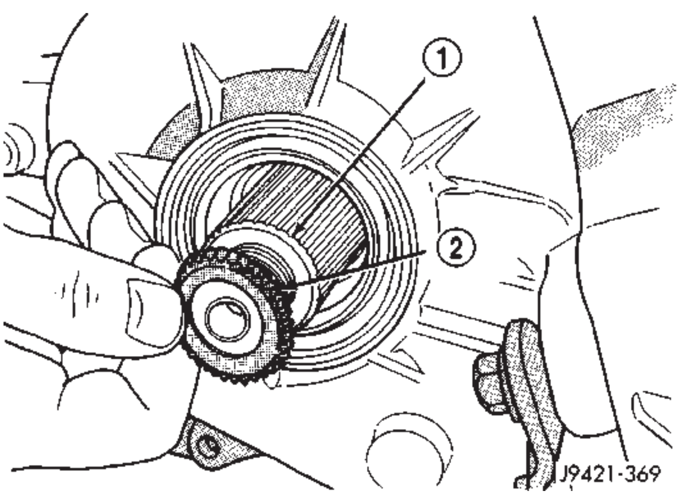

*Fig. 91 Installing Flange Seal On Front Shaft*

1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(2) Install companion flange on front shaft (Fig. 92). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

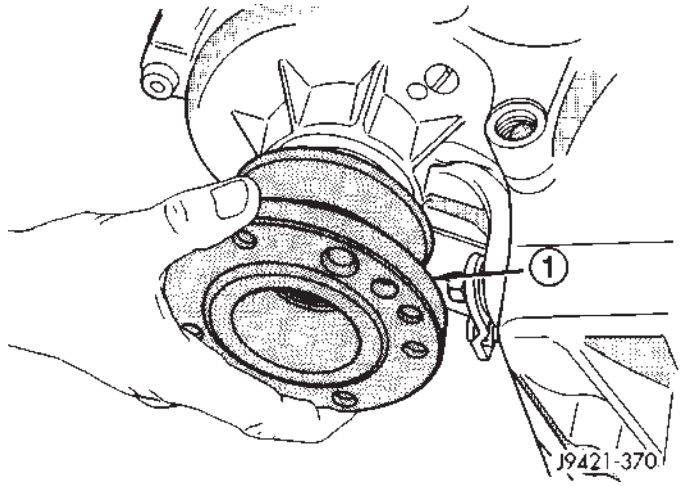

*Fig. 92 Installing Companion Flange On Front Shaft*

1 - COMPANION FLANGE

## REAR RETAINER AND EXTENSION

(1) Clean mating surfaces of transfer case housing and the rear retainer of any original gasket material.

(2) Install new rear retainer gasket onto the transfer case housing or rear retainer.

(3) Align and install rear retainer on rear case (Fig. 93).

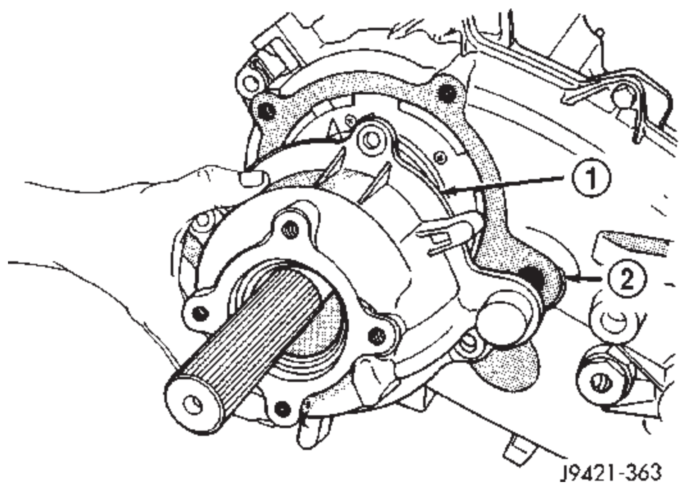

*Fig. 93 Rear Retainer Installation*

1 - REAR RETAINER
2 - SHIFT RAIL

TRANSFER CASE - NV241LD (Continued)

(4) Apply Mopar® Silicone Sealer to threads of rear retainer bolts. Then install retainer bolts finger tight.

(5) Install output bearing on mainshaft and seat it in rear retainer with suitable size pipe tool (Fig. 94).

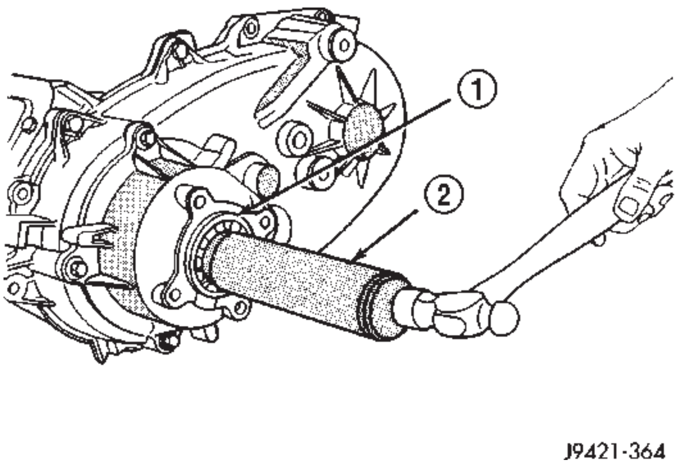

**Fig. 94 Output Bearing Installation**

1 - OUTPUT BEARING
2 - PIPE TOOL

(6) Install output bearing retaining ring (Fig. 95).

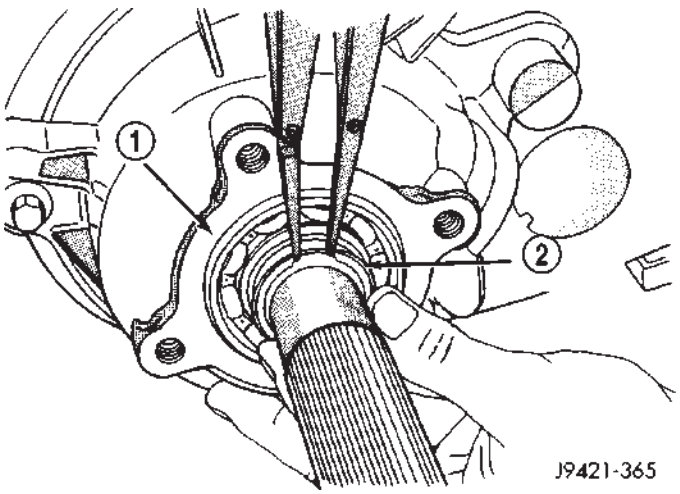

**Fig. 95 Output Bearing Retaining Ring Installation**

1 - OUTPUT BEARING
2 - RETAINING RING

(7) Tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.) torque.

(8) Install new seal in rear extension housing seal with suitable size installer tool.

(9) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

(10) Align and install rear extension on retainer (Fig. 96).

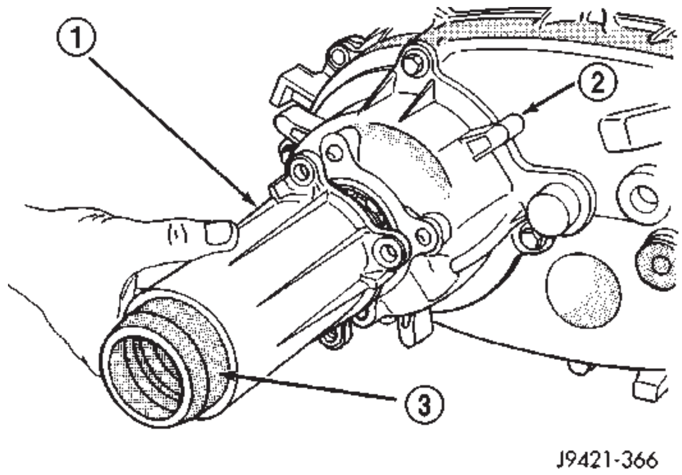

**Fig. 96 Rear Extension Installation**

1 - REAR EXTENSION
2 - RETAINER
3 - EXTENSION SEAL

(11) Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

## INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

(2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft.lbs.).

(3) Install rear crossmember.

(4) Remove jack stand from under transmission.

(5) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Connect vacuum harness and vent hose.

(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

(8) Adjust shift linkage, if necessary.

(9) Fill transfer case with recommended transmission fluid and install fill plug.

(10) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

(11) Lower vehicle

TRANSFER CASE - NV241LD (Continued)

# EXTENSION HOUSING BUSHING AND SEAL

## REMOVAL

(1) Raise and support vehicle.

(2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

(4) Using Remover 8158, remove bushing from extension housing.

## INSTALLATION

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in extension housing with fluid port in bushing aligned with slot in housing.

(3) Using Installer 8157, drive bushing into housing until installer seats against case.

(4) Using Installer D-163, install seal in extension housing (Fig. 97).

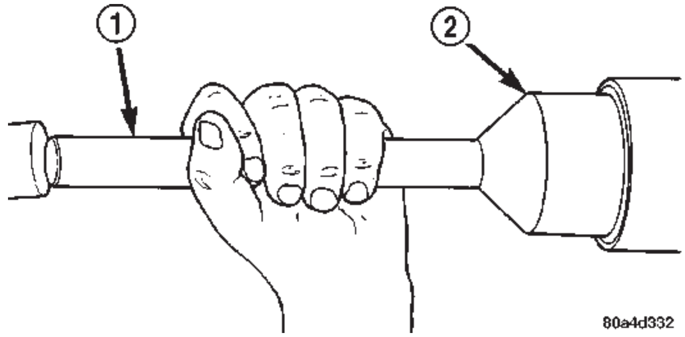

*Fig. 97 Install Rear Seal in Extension Housing*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL D-163

(5) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Verify proper transfer case fluid level.

(7) Lower vehicle.

# FLUID

## STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs are both in the rear case (Fig. 98).

(1) Raise vehicle.

(2) Position drain pan under transfer case.

(3) Remove drain and fill plugs and drain lubricant completely.

(4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).

(5) Remove drain pan.

(6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

(7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).

(8) Lower vehicle.

FLUID (Continued)

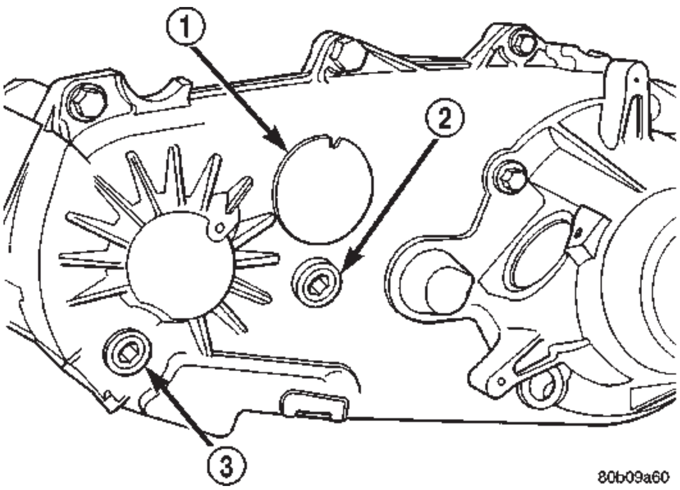

*Fig. 98 Fill/Drain Plug and I.D. Tag Location - Typical*

1 - I.D. TAG
2 - FILL PLUG
3 - DRAIN PLUG

# FRONT OUTPUT SHAFT SEAL

## REMOVAL

(1) Shift transfer case into NEUTRAL.

(2) Raise vehicle.

(3) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(4) Remove companion flange nut (Fig. 99). Discard nut after removal. It is not reusable.

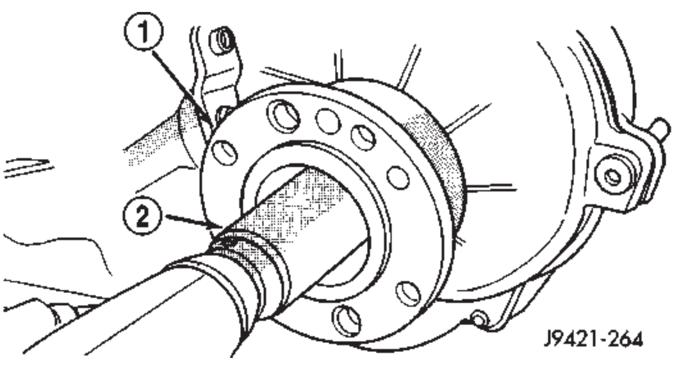

*Fig. 99 Removing Companion Flange Nut*

1 - COMPANION FLANGE
2 - SOCKET

(5) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

(6) Remove companion flange rubber seal from front output shaft (Fig. 100).

(7) Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

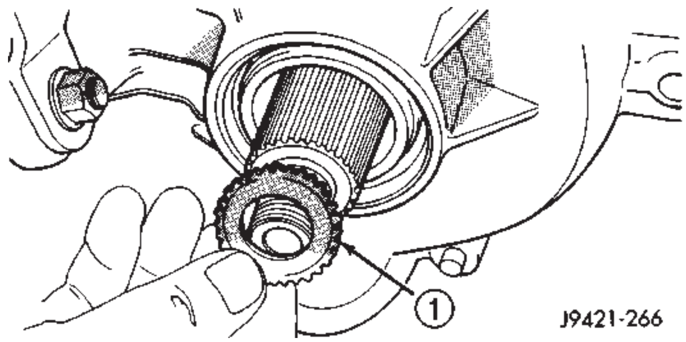

*Fig. 100 Companion Flange Seal Removal*

1 - FLANGE SEAL

## INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 (Fig. 101) as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 102). This is correct final seal position.

**CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.**

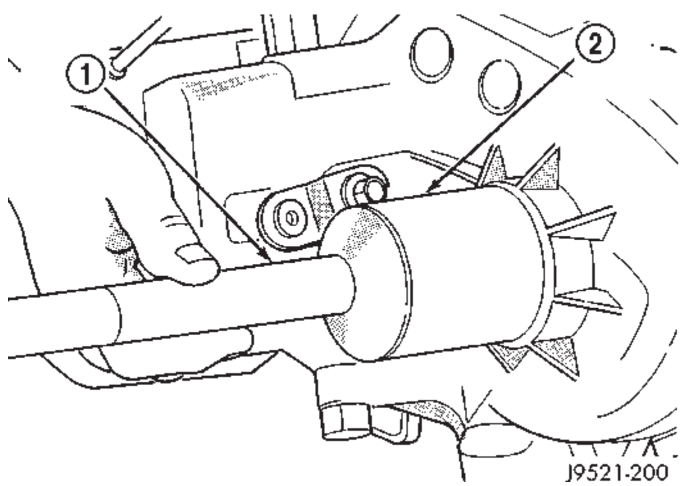

*Fig. 101 Front Output Seal Installation*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL 6888

(2) Install companion flange seal on front shaft (Fig. 103).

FRONT OUTPUT SHAFT SEAL (Continued)

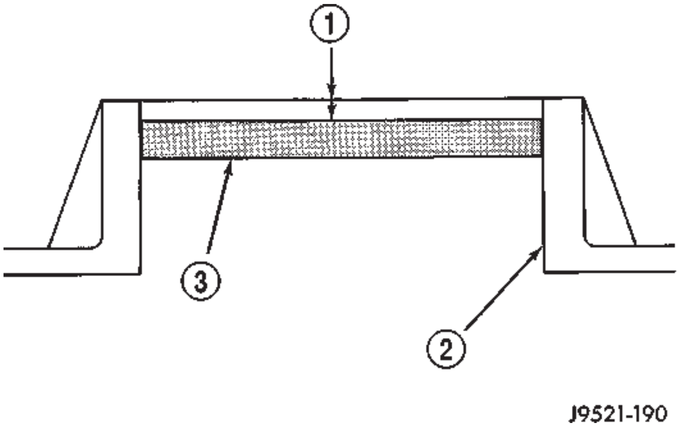

***Fig. 102 Checking Front Output Seal Installation Depth***

1 - CORRECT SEAL DEPTH IS 2.03-2.5 mm (0.080-0.100 in.) BELOW TOP EDGE OF BORE
2 - FRONT CASE SHAFT BORE
3 - FRONT OUTPUT SEAL

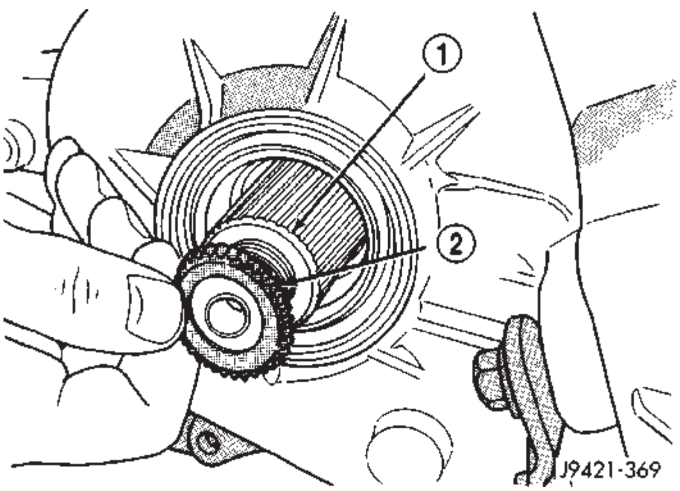

***Fig. 103 Installing Flange Seal On Front Shaft***

1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(3) Install companion flange on front shaft (Fig. 104). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

(4) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

## SHIFT LEVER

### REMOVAL

(1) Shift transfer case into 2H.
(2) Remove transfer case shifter knob cap.
(3) Remove nut holding shifter knob to shift lever.
(4) Remove shifter knob.

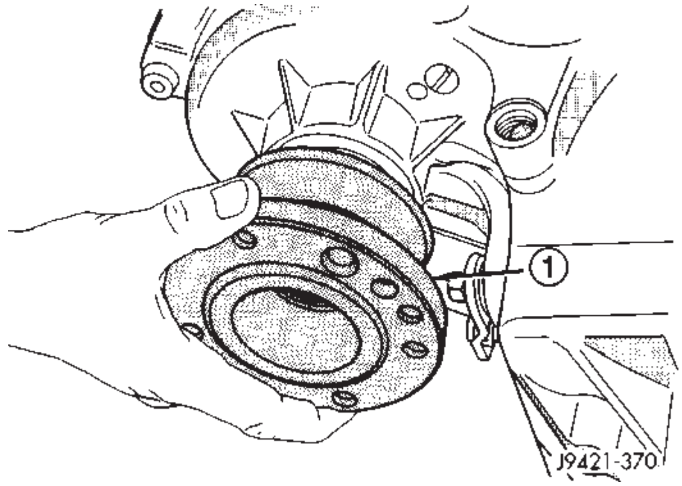

***Fig. 104 Installing Companion Flange On Front Shaft***

1 - COMPANION FLANGE

(5) Remove the shift boot from the shifter bezel.
(6) Remove the bolts securing the shifter mechanism to the floor pan along the driver's side of the transmission tunnel (Fig. 105).

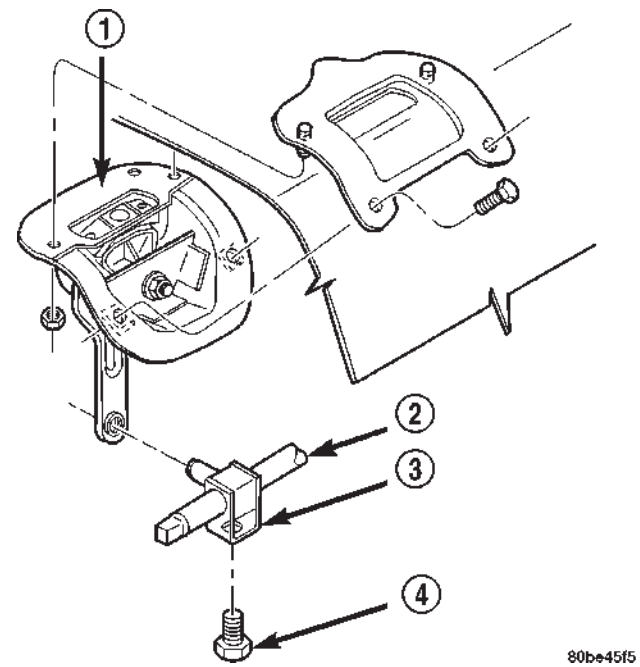

***Fig. 105 Transfer Case Shifter***

1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

(7) Raise and support the vehicle.
(8) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel

SHIFT LEVER (Continued)

to come out of trunnion, push trunnion out of shift lever.

(9) Remove the nuts holding the shifter mechanism to the underside of the floor pan.

(10) Separate shift lever mechanism from the vehicle.

## INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 106).

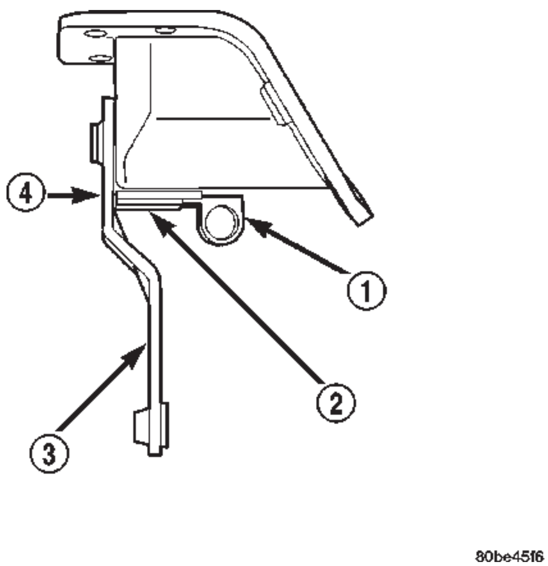

*Fig. 106 Shifter Adjustment*

1 - LOCATING PIN
2 - ADJUSTMENT CHANNEL
3 - LOWER SHIFTER LEVER
4 - LOCATING HOLE

(2) Position shift lever on vehicle.

(3) Install nuts to hold shift lever to the underside of the body.

(4) Install trunnion to shift lever, if necessary.

(5) Install shift rod to trunnion, if necessary.

(6) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).

(7) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.

(8) Lower vehicle.

(9) Install the bolts to hold the shifter mechanism to the floor pan.

(10) Install the transfer case shifter bezel.

(11) Install the shifter boot and the shifter knob onto the shifter lever.

(12) Install nut to hold shifter knob to shift lever.

(13) Install shifter knob cap.

(14) Verify transfer case operation.

## ADJUSTMENT - SHIFT LEVER

(1) Move shift lever into 2H position.

(2) Raise vehicle.

(3) Loosen shift rod lock bolt at trunnion (Fig. 107).

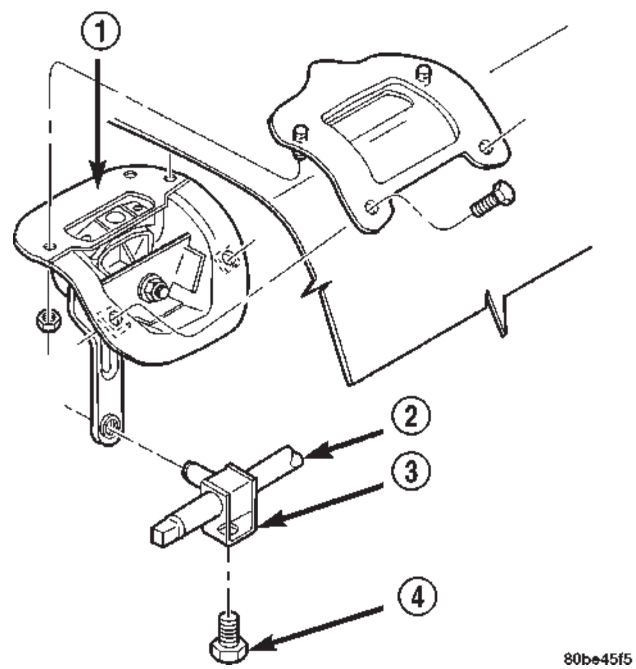

*Fig. 107 Shift Rod Lock Bolt Location*

1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

SHIFT LEVER (Continued)

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.

(5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.

(6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 108).

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

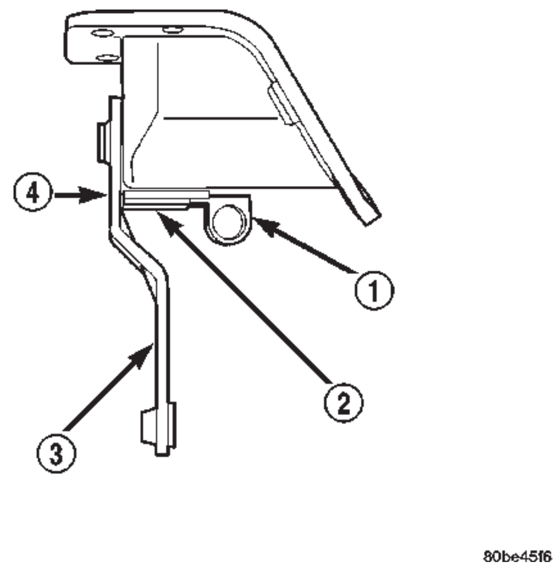

***Fig. 108 Shifter Adjustment Location***

1 - LOCATING PIN
2 - ADJUSTMENT CHANNEL
3 - LOWER SHIFTER LEVER
4 - LOCATING HOLE

# TRANSFER CASE - NV241HD

## TABLE OF CONTENTS

# TRANSFER CASE - NV241HD

## DESCRIPTION

The NV241HD is a part-time transfer case with a low-range gear system. The transfer case provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability. Operating ranges are: 2H, 4H, and 4LO.

The synchronizer mechanism consists of a brass stop ring, synchronizer hub, and the sliding clutch (Fig. 1). The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

TRANSFER CASE - NV241HD (Continued)

### PTO CAPABILITY

The NV241HD transfer case has power take-off capability. A PTO gear permanently attached to the planetary carrier, and a removable PTO cover are provided for this purpose.

### IDENTIFICATION

An identification tag (Fig. 2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

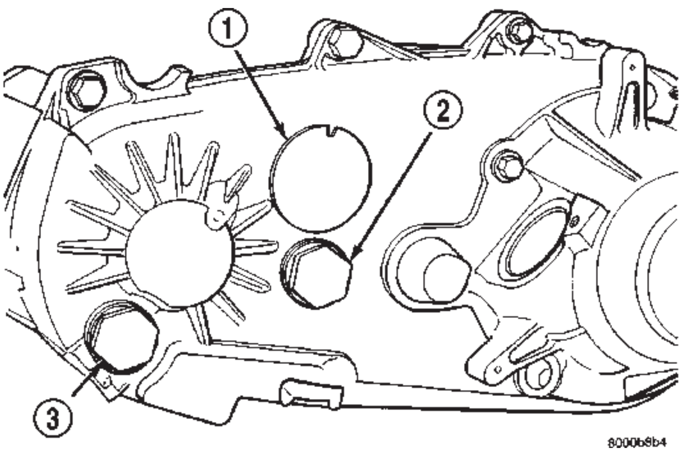

***Fig. 2 Transfer Case Identification Tag - Typical***

1 - I.D. TAG
2 - FILL PLUG
3 - DRAIN PLUG

## OPERATION

### OPERATING RANGES

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow or other loose, slippery material.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer case. The switch is operated by the transfer case range rod.

### SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

### SHIFTING

The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into the 4L operating range.

## DIAGNOSIS AND TESTING - TRANSFER CASE

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

TRANSFER CASE - NV241HD (Continued)

**DIAGNOSIS CHART**

| Condition | Possible Cause | Correction |
|---|---|---|
| Transfer Case difficult to shift or will not shift into desired range. | 1) Vehicle speed too great to permit shifting. | 1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. |
| | 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. | 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. |
| | 3) Transfer case external shift linkage binding. | 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. |
| | 4) Insufficient or incorrect lubricant. | 4) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. |
| | 5) Internal components binding, worn, or damaged. | 5) Disassemble the transfer case and replace worn or damaged components as necessary. |
| Transfer Case noisy in all operating ranges. | 1) Insufficient or incorrect lubricant. | 1) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. |
| Noisy in, or jumps out of, four wheel drive low range. | 1) Transfer case not completely engaged in 4L position. | 1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. |
| | 2) Shift linkage out of adjustment. | 2) Adjust linkage. |
| | 3) Shift linkage loose or binding. | 3) Tighten, lubricate, or repair linkage as necessary. |
| | 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. | 4) Disassemble unit and repair as necessary. |
| | 5) Low range gear worn or damaged. | 5) Disassemble unit and repair as necessary. |
| Lubricant leaking from output shaft seal or vent. | 1) Transfer case overfilled. | 1) Drain lubricant to the correct level. |
| | 2) Vent closed or restricted. | 2) Clear or replace vent as necessary. |
| | 3) Output shaft seals damaged or installed incorrectly. | 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal. |
| Abnormal tire wear. | 1) Extended operation on hard, dry surfaces in the 4H position. | 1) Operate vehicle in the 2H position on hard, dry surfaces. |

TRANSFER CASE - NV241HD (Continued)

## REMOVAL

(1) Raise and support vehicle.

(2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)

(3) Position drain oil container under transfer case.

(4) Remove transfer case drain plug and drain lubricant into container.

(5) Disconnect vent hose and vacuum harness at transfer case switch.

(6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.

(7) Support transmission with jack stand.

(8) Remove rear crossmember.

(9) Mark front and rear propeller shafts for assembly reference.

(10) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.

(12) Remove nuts attaching transfer case to transmission.

(13) Move transfer case assembly rearward until free of transmission output shaft.

(14) Lower jack and move transfer case from under vehicle.

## DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

### EXTENSION HOUSING

(1) Remove extension housing snap-ring access cover.

(2) Remove bolts holding extension housing to rear case half.

(3) Tap extension housing with plastic or rawhide hammer to loosen sealant.

(4) Disengage extension housing snap-ring from rear output shaft bearing.

(5) Separate extension housing from transfer case.

### COMPANION FLANGE AND SHIFT LEVER

(1) Shift transfer case into NEUTRAL.

(2) Remove companion flange nut (Fig. 3). Discard nut after removal. It is not reusable.

(3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.

(4) Remove companion flange rubber seal from front output shaft (Fig. 4).

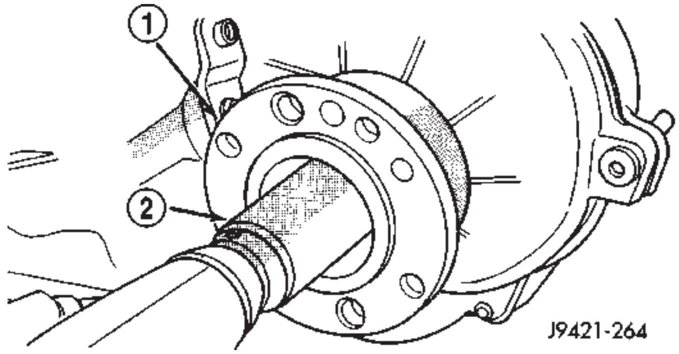

*Fig. 3 Removing Companion Flange Nut*

1 - COMPANION FLANGE
2 - SOCKET

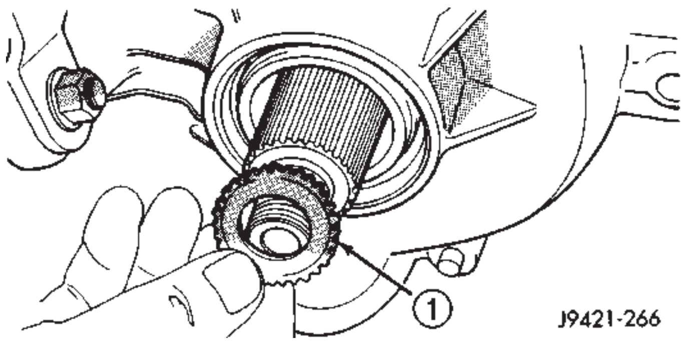

*Fig. 4 Companion Flange Seal Removal*

1 - FLANGE SEAL

(5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 5).

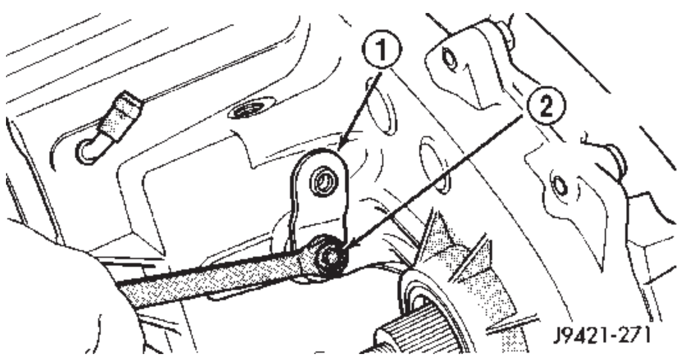

*Fig. 5 Shift Lever Removal*

1 - SHIFT LEVER
2 - NUT/WASHER

TRANSFER CASE - NV241HD (Continued)

### FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove output bearing retaining ring with heavy duty snap-ring pliers.

(2) Remove output shaft bearing.

(3) Note position of bolts that attach rear case to front case (Fig. 6). Some bolts/studs at ends of case require flat washers. Mark position of these bolts with paint or scriber.

(4) Remove rear case-to-front case bolts.

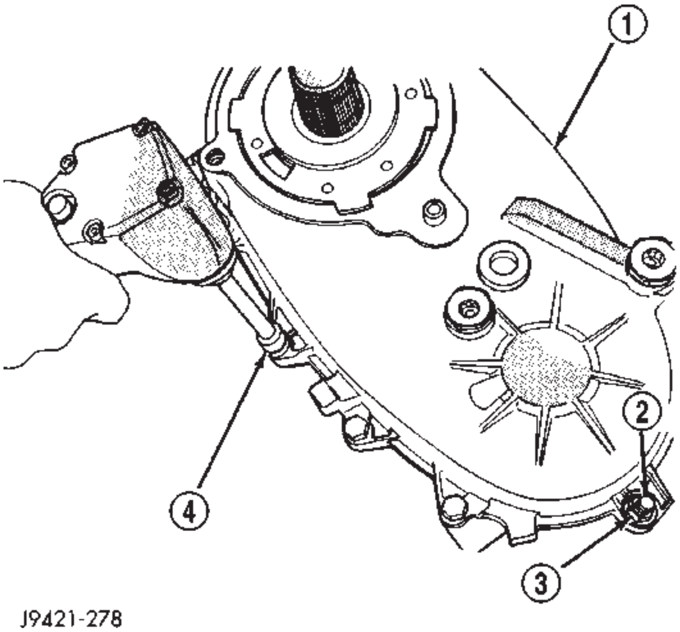

*Fig. 6 Removing Case Attaching Bolts*

1 - REAR CASE
2 - STUD
3 - NUT AND WASHER
4 - SOCKET

(5) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 7).

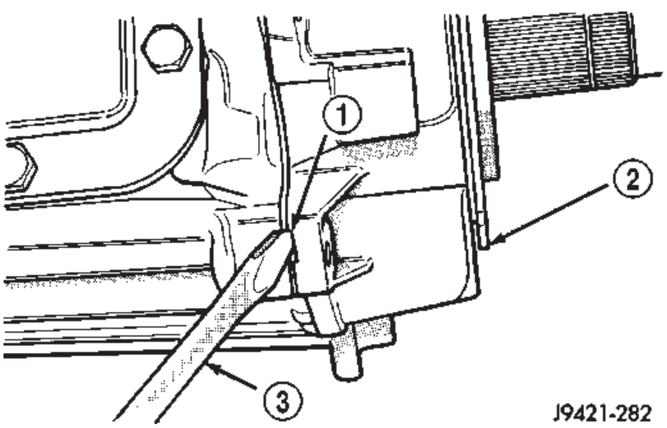

*Fig. 7 Loosening Rear Case (Breaking Sealer Bead)*

1 - SLOT
2 - REAR CASE
3 - PRY TOOL

(6) Unseat rear case from alignment dowels (Fig. 8).

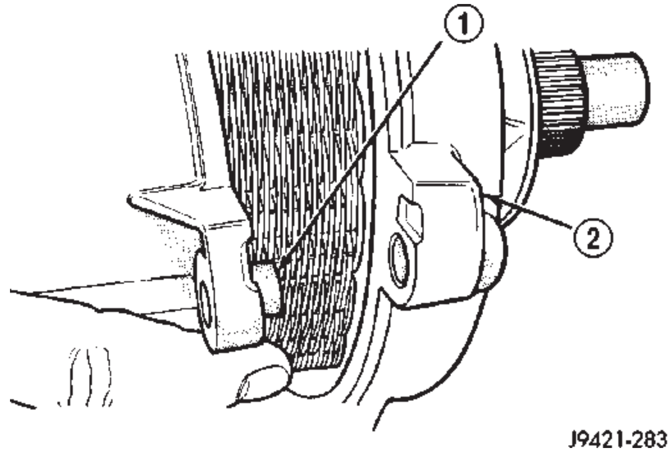

*Fig. 8 Removing Rear Case From Alignment Dowels*

1 - CASE DOWELS (2)
2 - REAR CASE

(7) Remove rear case and oil pump assembly from front case.

(8) Remove shift rail cup and spring (Fig. 9).

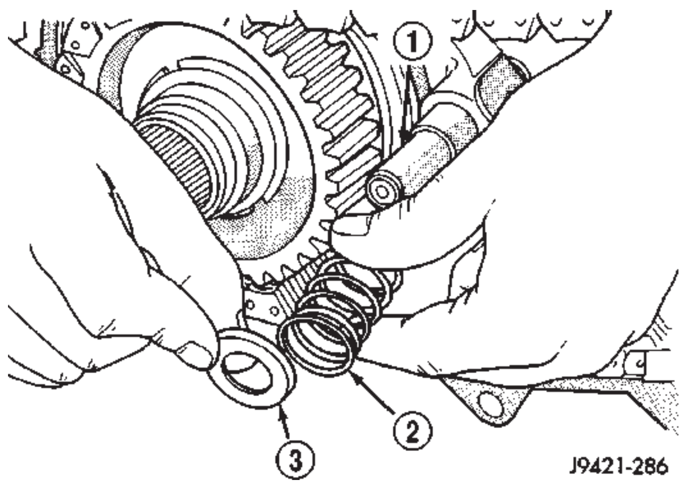

*Fig. 9 Shift Rail Cup And Spring Removal*

1 - SHIFT RAIL
2 - SPRING
3 - CUP

TRANSFER CASE - NV241HD (Continued)

(9) Remove front sprocket retaining ring (Fig. 10).

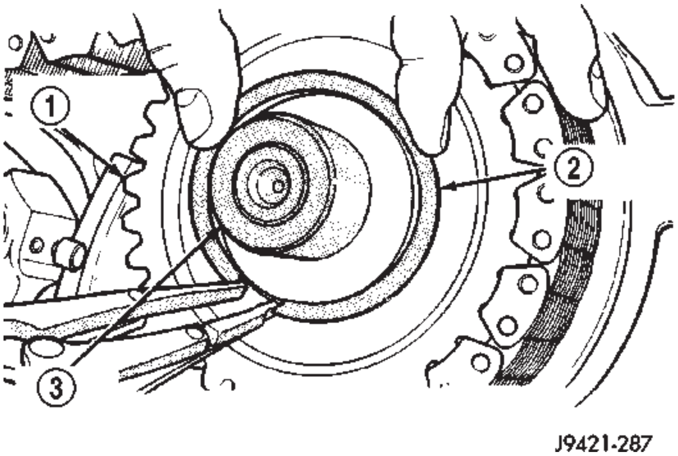

***Fig. 10 Removing Front Drive Sprocket Retaining Ring***

1 - FRONT SPROCKET
2 - RETAINING RING
3 - FRONT OUTPUT SHAFT

(10) Pull mainshaft, front sprocket, and chain outward about 25.4 mm (1-inch) simultaneously (Fig. 11).

(11) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as an assembly.

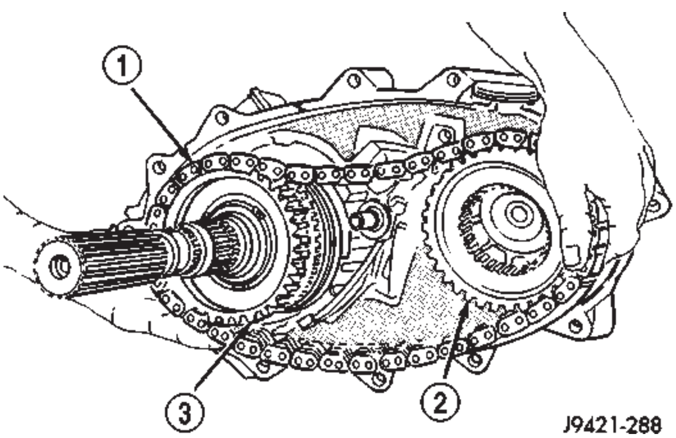

***Fig. 11 Removing Drive Chain And Front Sprocket***

1 - CHAIN
2 - DRIVE SPROCKET
3 - FRONT SPROCKET

## SHIFT FORK AND MAINSHAFT

(1) Remove vacuum/indicator switch (Fig. 12).

(2) Loosen poppet plunger screw (Fig. 13).

(3) Remove poppet plunger screw and spring (Fig. 14). Note that screw has o-ring seal. Remove and discard seal this seal.

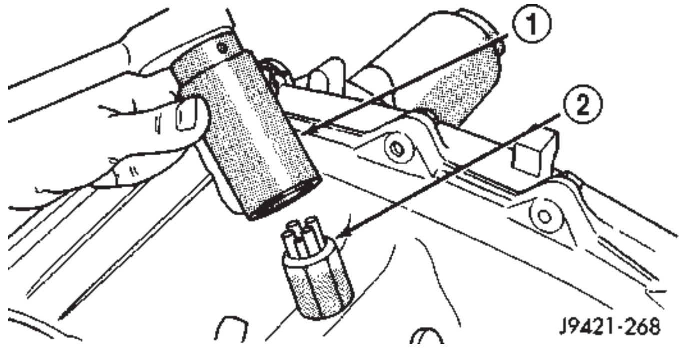

***Fig. 12 Vacuum/Indicator Switch Removal***

1 - 1-1/16” SOCKET
2 - INDICATOR SWITCH

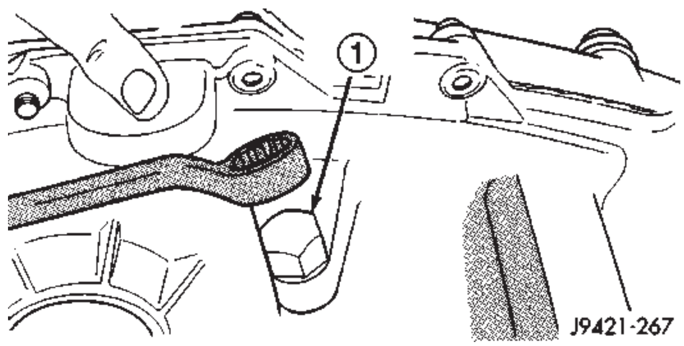

***Fig. 13 Loosening Poppet Plunger Screw***

1 - POPPET PLUNGER SCREW

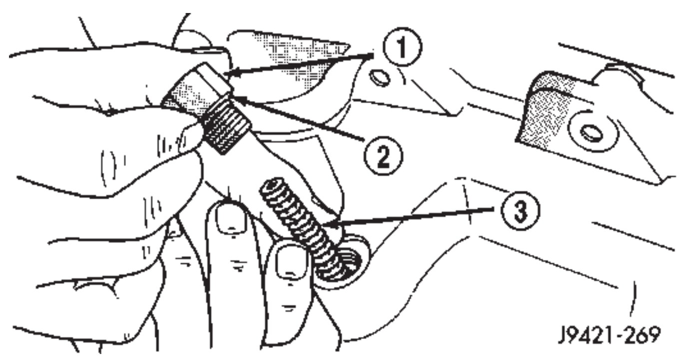

***Fig. 14 Poppet Plunger Screw And Spring Removal***

1 - POPPET PLUNGER SCREW
2 - O-RING
3 - PLUNGER SPRING

TRANSFER CASE - NV241HD (Continued)

(4) Remove poppet plunger with magnet (Fig. 15).

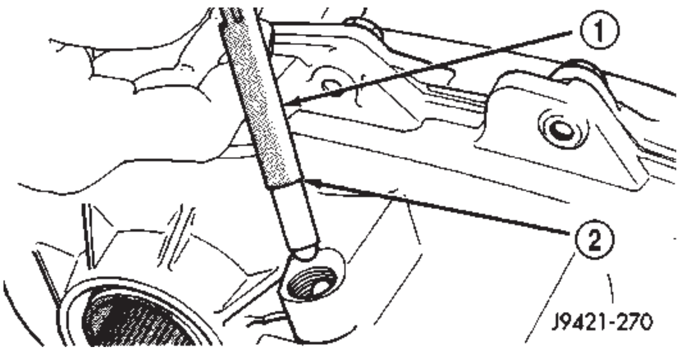

*Fig. 15 Poppet Plunger Removal*

1 - MAGNET
2 - POPPET PLUNGER

(5) Remove front output shaft from bearing in case (Fig. 16).

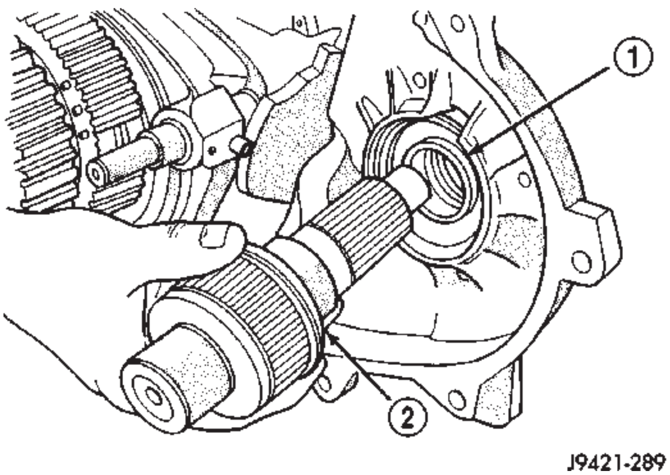

*Fig. 16 Front Output Shaft Removal*

1 - BALL BEARING
2 - FRONT OUTPUT SHAFT

(6) Pull mainshaft assembly out of input gear, sliding clutch and case (Fig. 17).

(7) Remove mode fork, sliding clutch and shift rail as assembly (Fig. 18). Note which way clutch fits in fork (long side of clutch goes to front).

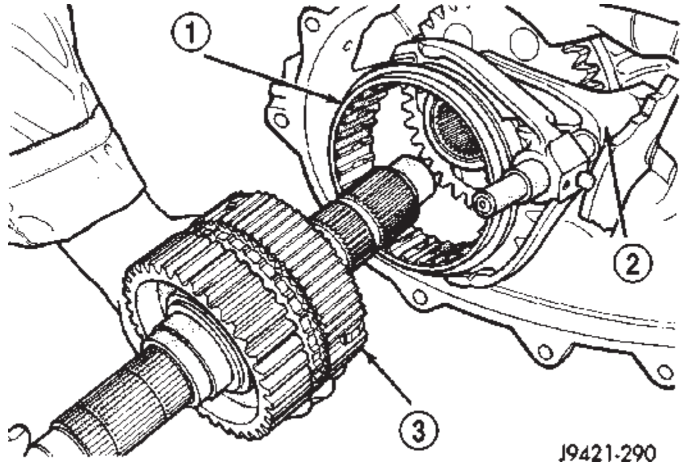

*Fig. 17 Mainshaft Assembly Removal*

1 - SLIDING CLUTCH
2 - MODE FORK
3 - MAINSHAFT ASSEMBLY

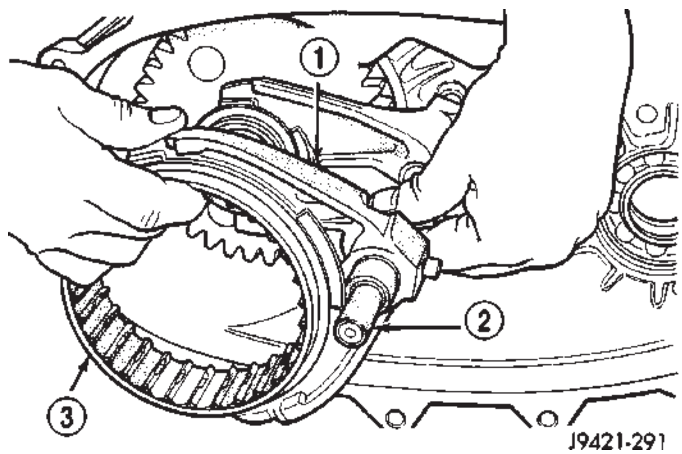

*Fig. 18 Mode Fork, Shift Rail And Sliding Clutch Removal*

1 - MODE FORK
2 - SHIFT RAIL
3 - SLIDING CLUTCH

TRANSFER CASE - NV241HD (Continued)

(8) Remove sliding hub retaining ring (Fig. 19).

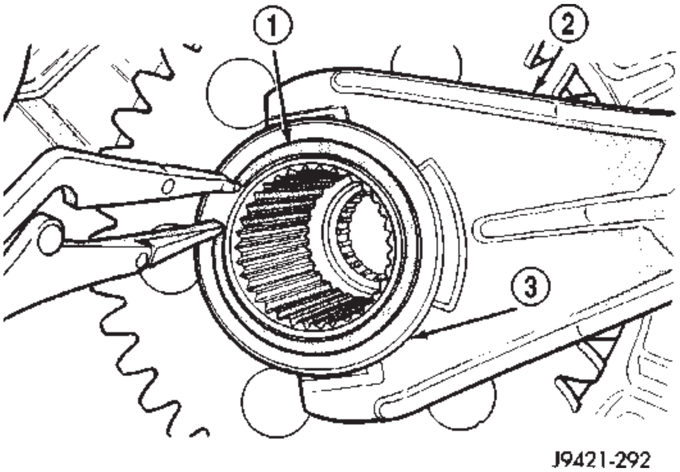

***Fig. 19 Sliding Hub Retaining Ring Removal***

1 - RETAINING RING
2 - RANGE FORK
3 - SLIDING HUB

(9) Remove range fork and sliding hub as an assembly (Fig. 20).

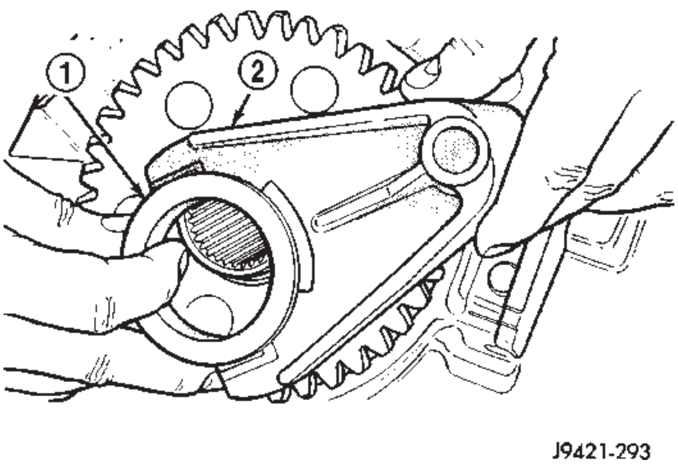

***Fig. 20 Range Fork And Sliding Hub Removal***

1 - SUPPORT SLEEVE
2 - RANGE FORK

(10) Remove shift sector (Fig. 21).

(11) Remove shift sector shaft nylon retainer and o-ring from shaft bore in front case (Fig. 22).

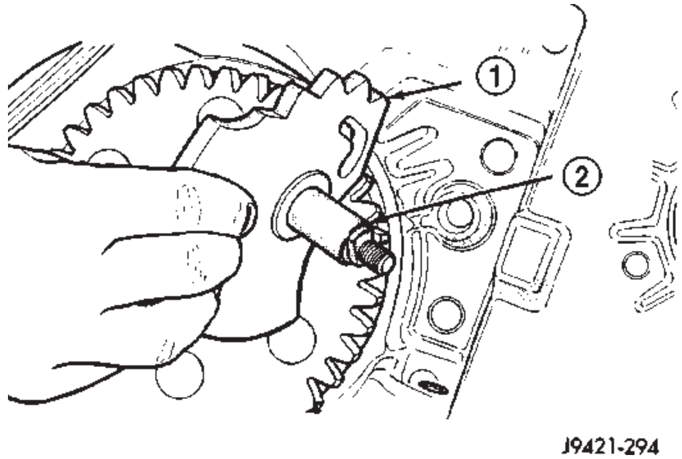

***Fig. 21 Shift Sector Removal***

1 - SHIFT SECTOR
2 - SECTOR SHAFT

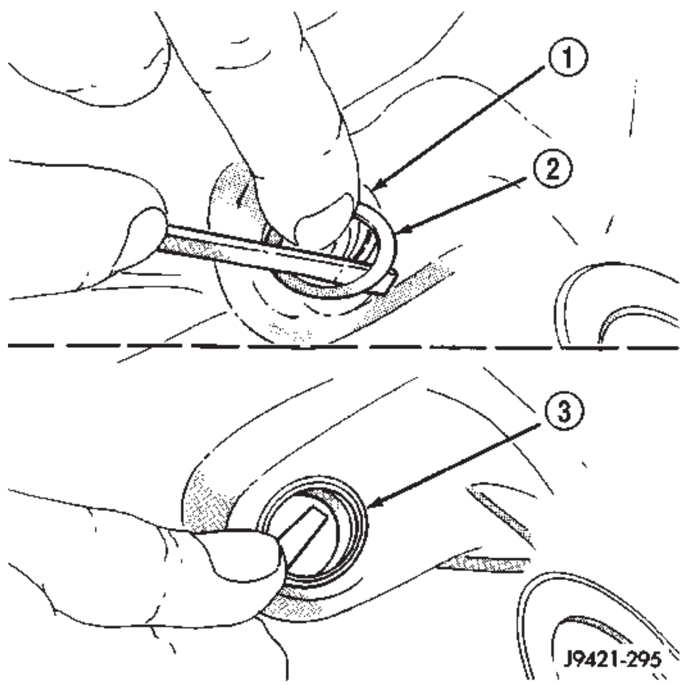

***Fig. 22 Removing Sector Shaft O-Ring And Retainer***

1 - SHAFT BORE
2 - NYLON RETAINING RING
3 - SECTOR SHAFT O-RING

TRANSFER CASE - NV241HD (Continued)

## MAINSHAFT

(1) Remove retaining ring that secures synchronizer hub on mainshaft (Fig. 23). Use standard (instead of parallel jaw) snap-ring pliers to remove this retaining ring.

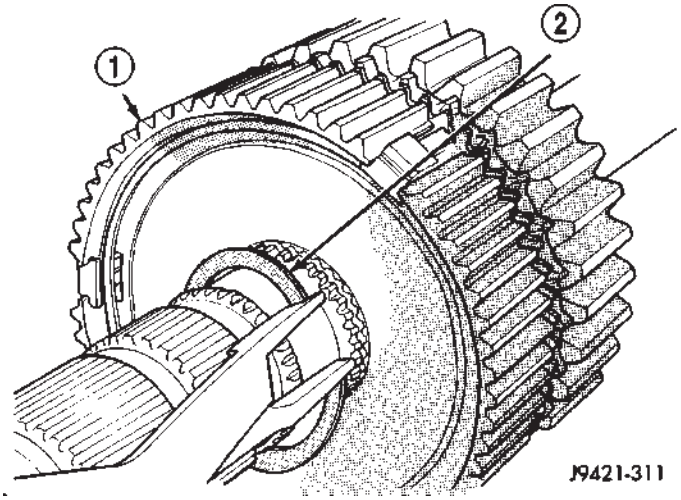

*Fig. 23 Synchronizer Hub Retaining Ring Removal*

1 - SYNCHRONIZER HUB
2 - RETAINING RING

(2) Remove synchronizer hub (Fig. 24).

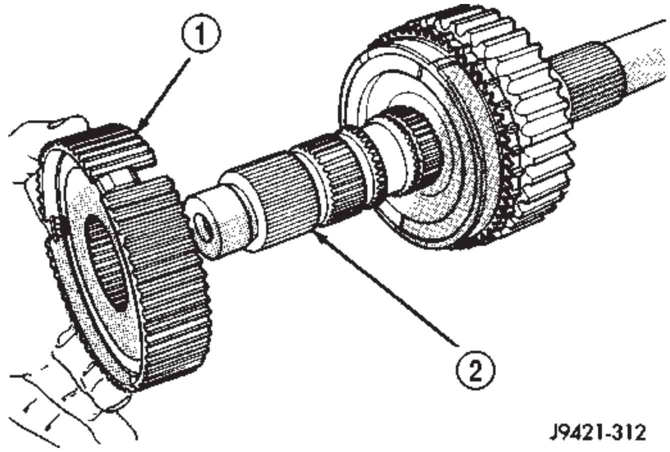

*Fig. 24 Synchronizer Hub Removal*

1 - SYNCHRONIZER HUB
2 - MAINSHAFT

(3) Inspect synchronizer hub struts and springs. If struts appear worn, remove struts and springs from hub. Note position of springs for installation reference (Fig. 25).

(4) Remove brass stop ring (Fig. 26). Discard stop ring if worn, cracked, or any teeth are missing.

(5) Remove drive sprocket (Fig. 27).

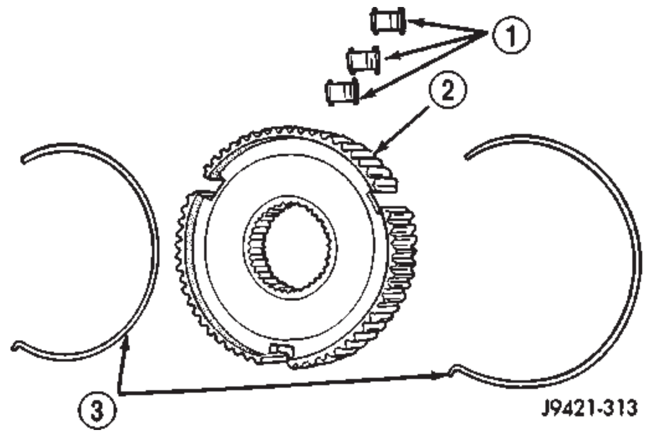

*Fig. 25 Synchronizer Strut And Spring Removal*

1 - SYNCHRONIZER STRUTS
2 - SYNCHRONZER HUB
3 - SYNCHRONIZER SPRINGS

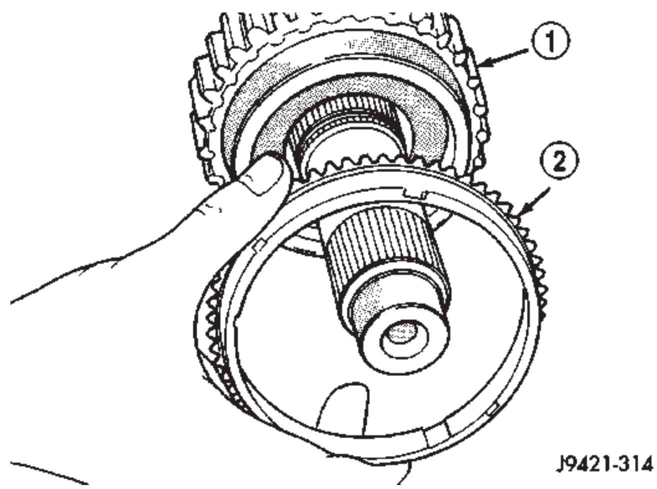

*Fig. 26 Synchronizer Stop Ring Removal*

1 - DRIVE SPROCKET
2 - STOP RING

TRANSFER CASE - NV241HD (Continued)

## INPUT AND PLANETARY GEAR

(1) Remove input bearing retainer bolts (Fig. 28).

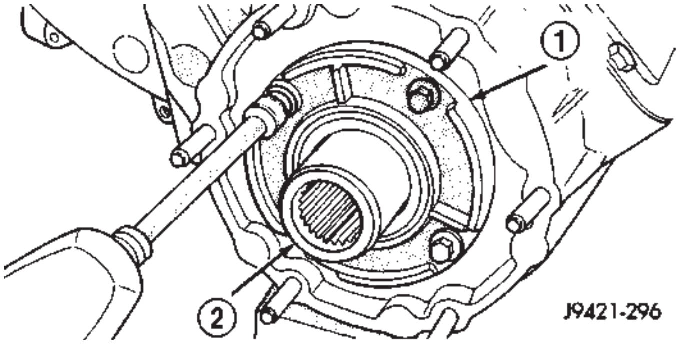

*Fig. 28 Removing Input Bearing Retainer Bolts*

1 - BEARING RETAINER
2 - INPUT GEAR

(2) Loosen bearing retainer with pry tool. Insert tool in retainer slot as shown (Fig. 29). Then remove retainer.

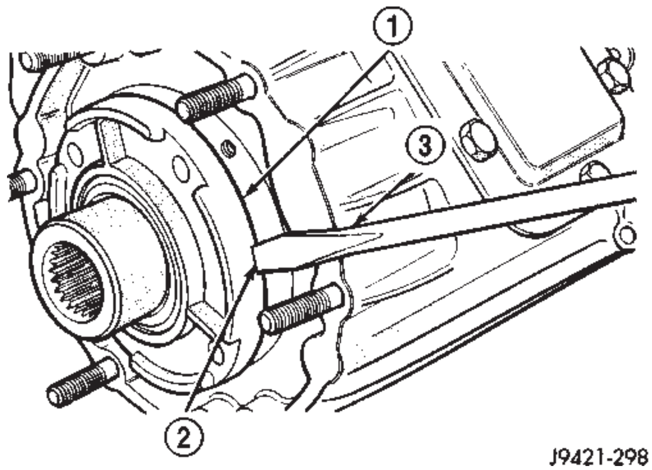

*Fig. 29 Loosening/Removing Input Bearing Retainer*

1 - BEARING RETAINER
2 - SLOT
3 - PRY TOOL

(3) Remove input gear retaining ring with heavy duty parallel jaw snap-ring pliers (Fig. 30).

(4) Tap input gear out of bearing with plastic mallet (Fig. 31).

(5) Remove input gear and planetary/PTO gear as assembly (Fig. 32).

## INPUT AND PLANETARY GEAR

The only removable parts in the planetary assembly are the snap-rings, needle bearing, thrust washers, lock ring, input gear, and support sleeve. **The planetary carrier, PTO gear, planetary pinions, and remaining planetary components are fixed parts and are serviced as an assembly.**

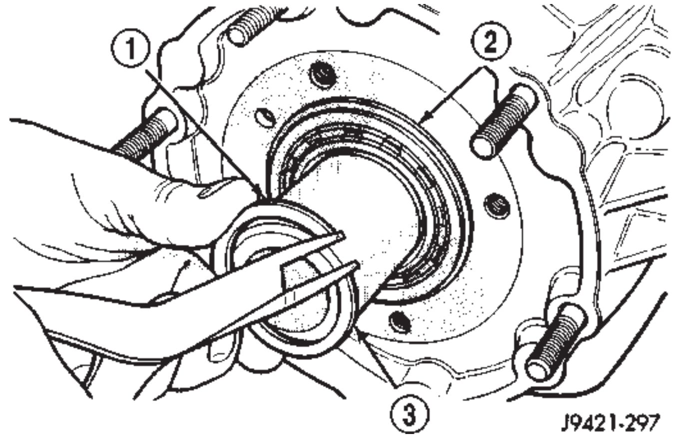

*Fig. 30 Removing Input Gear Retaining Ring*

1 - RETAINING RING
2 - INPUT BEARING
3 - INPUT GEAR

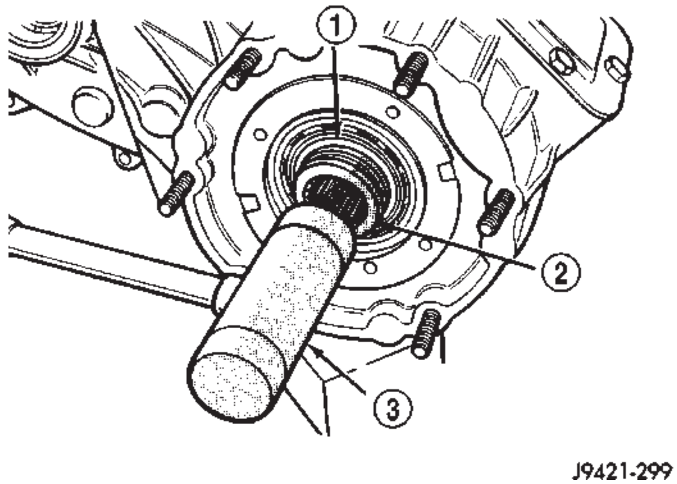

*Fig. 31 Removing Input Gear*

1 - BEARING
2 - INPUT GEAR
3 - PLASTIC MALLET

(1) Position planetary assembly so PTO gear is on bench (Fig. 33).

(2) Remove retaining ring that secures input gear and lock ring in planetary assembly.

(3) Remove lock ring and front thrust washer from carrier (Fig. 34). Note that lock ring and thrust washer are both tabbed.

(4) Remove input gear from planetary carrier (Fig. 35). Lift gear straight up and out of carrier.

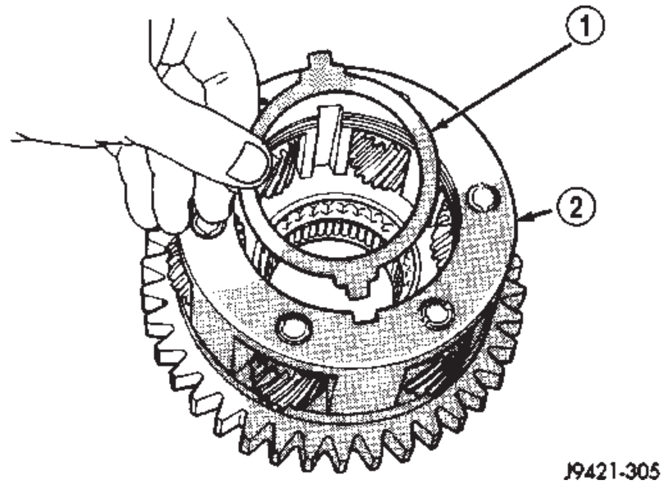

***Fig. 37 Rear Thrust Washer Removal***

1 - REAR THRUST WASHER
2 - PLANETARY CARRIER

(5) Remove support sleeve from carrier (Fig. 36).
(6) Remove rear thrust washer (Fig. 37).

## CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

## INSPECTION

If any pump component is worn, or damaged, the pump must be replaced as an assembly.

Inspect the spline teeth on the synchronizer hub (Fig. 38). If evidence of chipping or excessive wear is apparent, replace the hub. The hooked end of each synchronizer spring should be inserted in one of the struts. In addition, the springs should not interfere with the polished gear cone or inside diameters of the hub.

Inspect the stop ring for cracks and wear. Replace the ring if necessary or if doubt exists over condition.

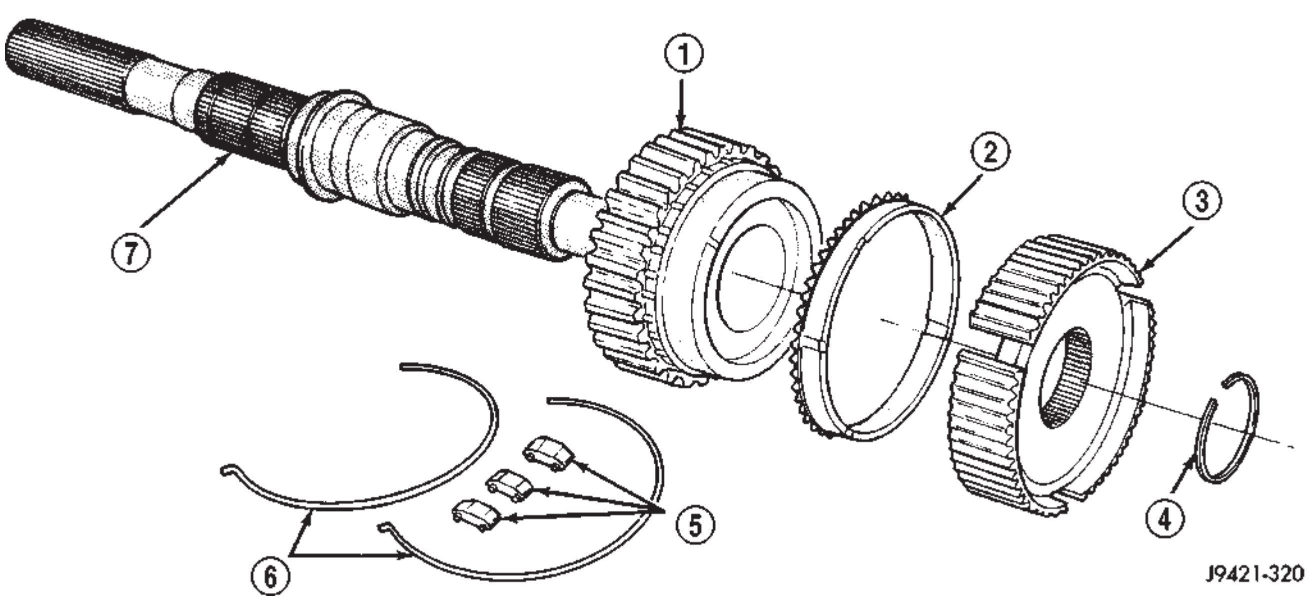

***Fig. 38 Mainshaft Components***

1 - DRIVE SPROCKET
2 - STOP RING
3 - SYNCHRONIZER HUB
4 - RETAINING RING
5 - STRUTS
6 - SYNCHRONIZER SPRINGS
7 - MAINSHAFT

TRANSFER CASE - NV241HD (Continued)

Check a replacement synchronizer ring for proper fit on the cone with a minimum of wobble. Also check the synchronizer struts for wear or damage.

Inspect all gear teeth and splines for wear or damage. Also check splines for burrs, or nicks. Remove minor nicks and scratches with an oil stone. Replace any part with damaged splines.

It is recommended that all retaining rings be replaced during overhaul. Most of the retaining rings can be distorted during removal and should not be reused.

Inspect the two case halves, for cracks, porosity, damaged mating surfaces, stripped bolt threads, or distortion. Replace either case half if necessary. However, stripped threads can be repaired with Heli-Coil™ stainless steel thread inserts. The case vent tube can be resecured with Loctite™ 680 if necessary.

Inspect the annulus gear. Be sure the gear teeth are in good condition. Replace the front case and annulus as an assembly if the gear is damaged.

Check condition of the shift fork pads (Fig. 39). The pads should be replaced if cracked, worn, or loose (won't stay on fork).

The shift forks, clutch and sleeve should all be checked for wear, cracks, or any type of damage (Fig. 40). The shift sector shaft and detents should be inspected for wear. The mode fork and shift rail are a one-piece unit. If either part is damaged, replace the fork and rail as an assembly. Replace the shift rail cup and spring if they exhibit wear.

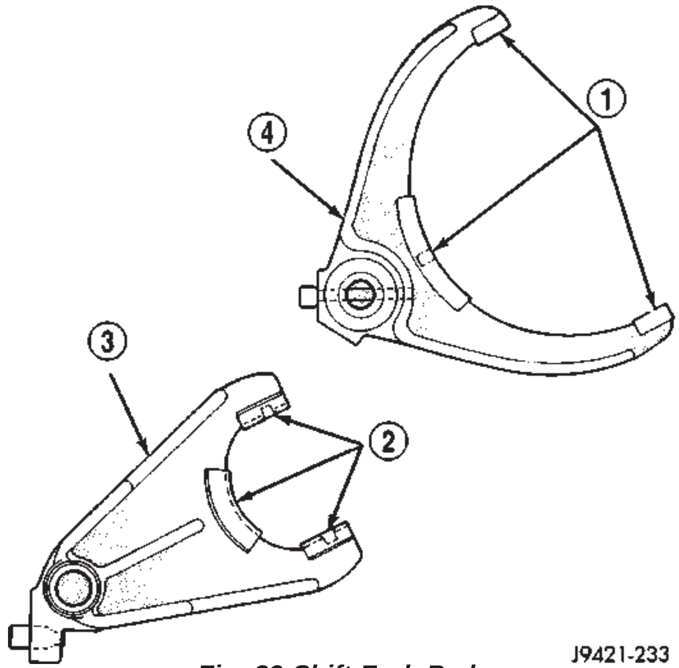

***Fig. 39 Shift Fork Pads***

1 - PADS
2 - PADS
3 - RANGE FORK
4 - MODE FORK

Inspect the planetary thrust washers (Fig. 41) carefully for wear or damage. Replace both washers if necessary.

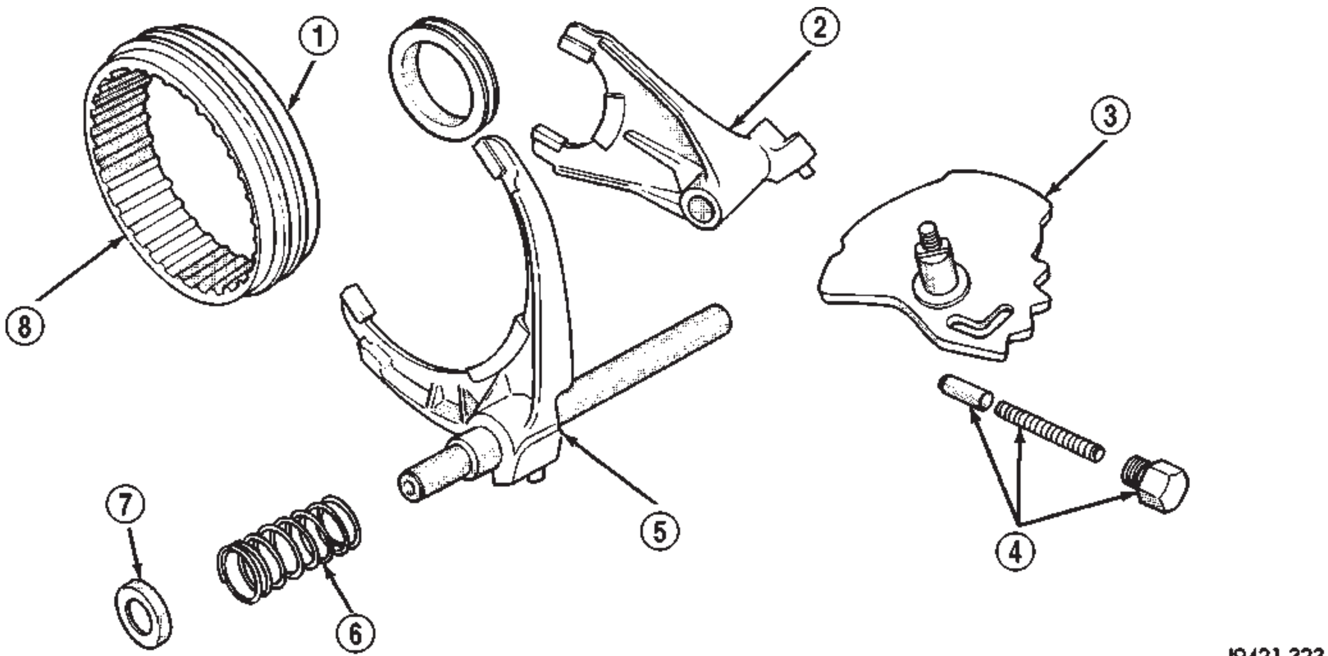

***Fig. 40 Shift Fork Components***

1 - SUPPORT SLEEVE
2 - RANGE FORK
3 - SHIFT SECTOR
4 - POPPET PLUNGER, SPRING, SCREW
5 - MODE FORK AND SHIFT RAIL
6 - SPRING
7 - CUP
8 - SLIDING CLUTCH

TRANSFER CASE - NV241HD (Continued)

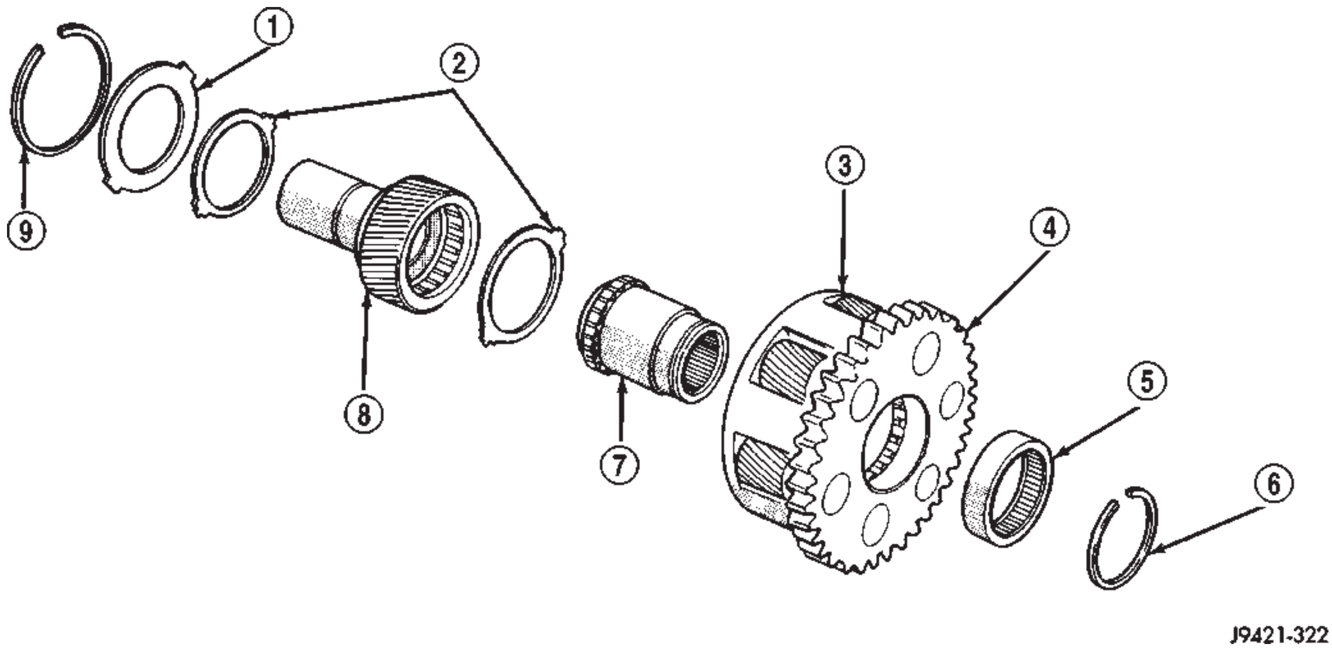

*Fig. 41 Planetary And Input Gear Components*

3 - PLANETARY CARRIER
4 - PTO GEAR
5 - BEARING
6 - RETAINING RING
7 - SUPPORT SLEEVE
8 - INPUT GEAR
9 - RETAINING RING

The planetary carrier cannot be disassembled. It must be serviced as an assembly if damaged. Check condition of the pinion teeth and PTO gear teeth. If pinion tooth wear is evident, it will also be necessary to check condition of the annulus gear teeth.

## ASSEMBLY

### BEARINGS AND SEALS

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 42).

(2) Install locating ring on new bearing.

(3) Position case so that the forward end is facing upward.

(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 43).

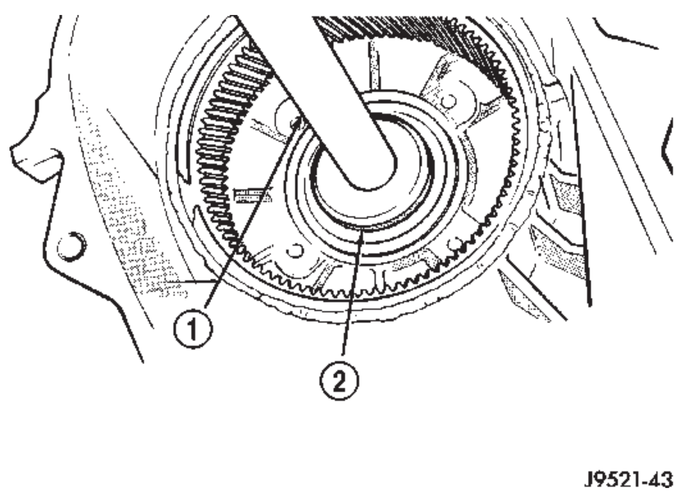

*Fig. 42 Input Shaft Bearing Removal*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL C-4210

TRANSFER CASE - NV241HD (Continued)

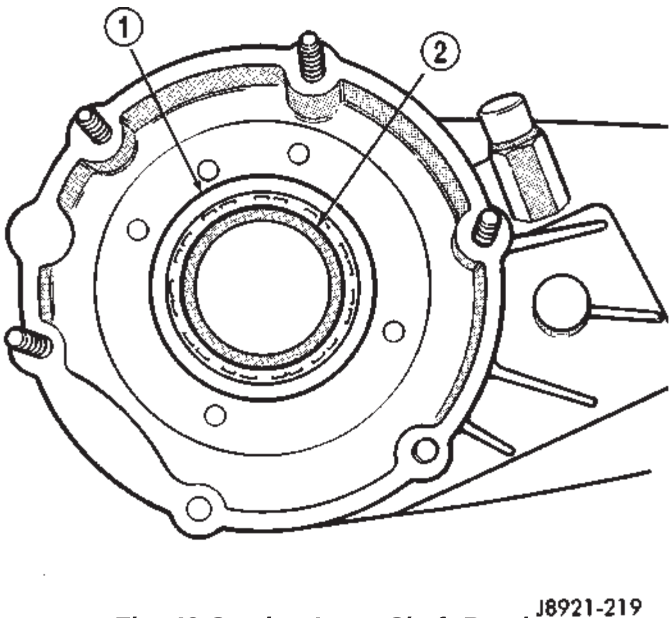

*Fig. 43 Seating Input Shaft Bearing*

1 - SNAP-RING
2 - INPUT SHAFT BEARING

(5) Using Installer 6953, remove front output shaft bearing.

(6) Start front shaft output bearing in case (Fig. 44). Then seat bearing with Handle C-4171 and Installer 6953.

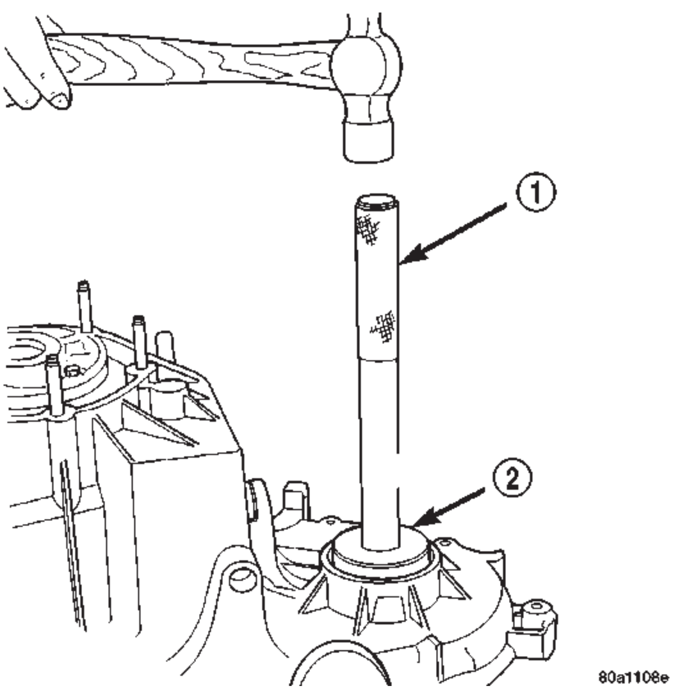

*Fig. 44 Front Output Bearing Installation*

1 - HANDLE C-4171
2 - REMOVER/INSTALLER 6953

(7) Install front output bearing retaining ring.

(8) Install new front output seal in front case with Installer Tool 6888 (Fig. 45) and Tool Handle C-4171 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 46). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case. This is correct final seal position.

**CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.**

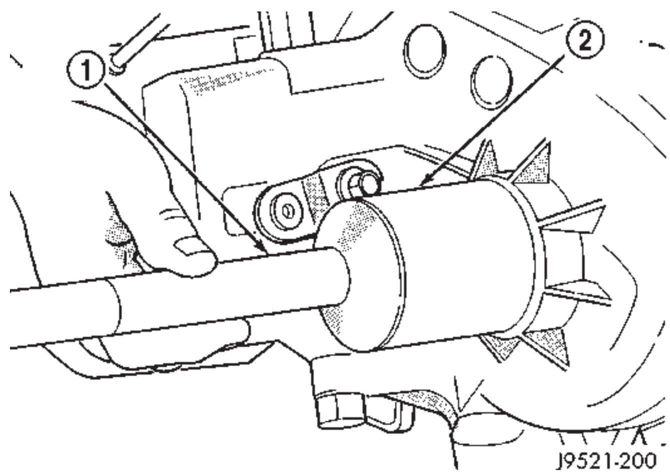

*Fig. 45 Front Output Seal Installation*

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL 6888

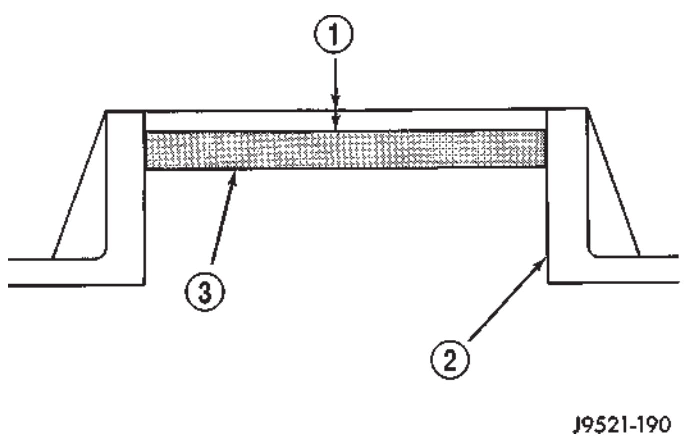

*Fig. 46 Checking Front Output Seal Installation Depth*

1 - CORRECT SEAL DEPTH IS 2.03-2.5 mm (0.080-0.100 in.) BELOW TOP EDGE OF BORE
2 - FRONT CASE SHAFT BORE
3 - FRONT OUTPUT SEAL

TRANSFER CASE - NV241HD (Continued)

(9) Remove seal from front bearing retainer with suitable pry tool.

(10) Install new oil seal in front bearing retainer with Installer 7884 (Fig. 47).

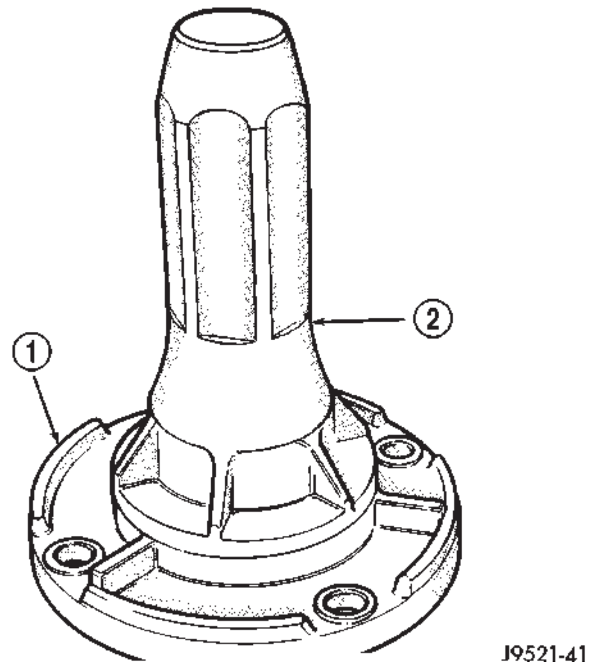

***Fig. 47 Install Front Bearing Retainer Seal***

1 - FRONT BEARING RETAINER
2 - SPECIAL TOOL 7884

(11) Remove seal from oil pump with suitable pry tool.

(12) Install new seal in oil pump with Installer 7888 (Fig. 48).

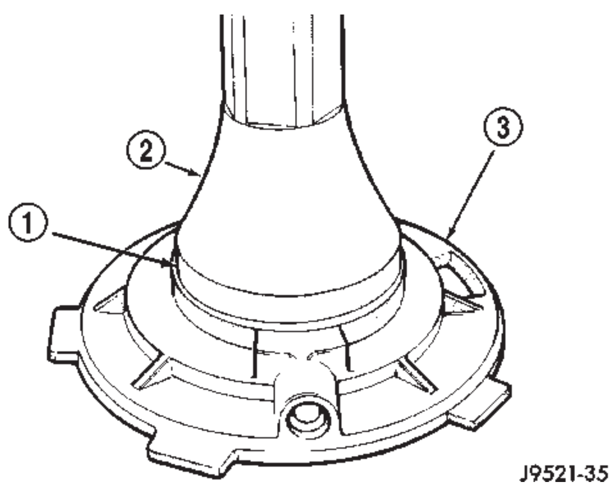

***Fig. 48 Install Oil Pump Seal***

1 - HOUSING SEAL
2 - SPECIAL TOOL 7888
3 - OIL PUMP FEED HOUSING

(13) Inspect carrier needle bearing. If bearing is worn, rough, or damaged in any way, remove it with a brass punch and hammer (Fig. 49).

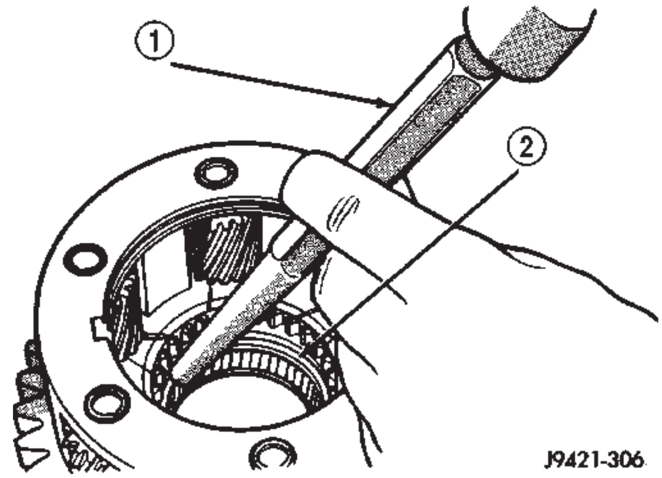

***Fig. 49 Carrier Needle Bearing Removal***

1 - BRASS PUNCH
2 - CARRIER NEEDLE BEARING

(14) Install new needle bearing in planetary carrier (Fig. 50). Use Handle C–4171 and Installer 5062 to install bearing.

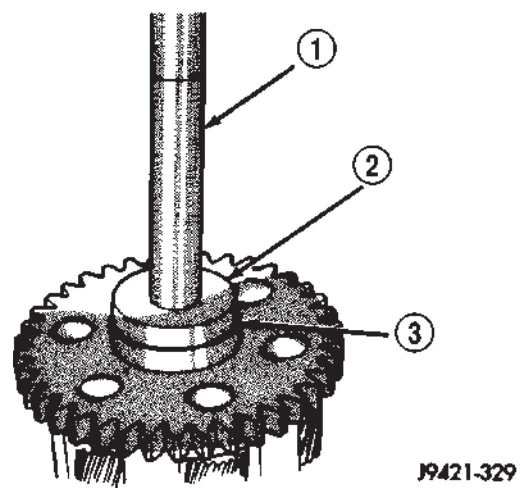

***Fig. 50 Planetary Carrier Needle Bearing Installation***

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL 5062
3 - CARRIER BEARING

(15) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 51).

(16) Install new pilot bearing with Plug C-293-3.

(17) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 52).

TRANSFER CASE - NV241HD (Continued)

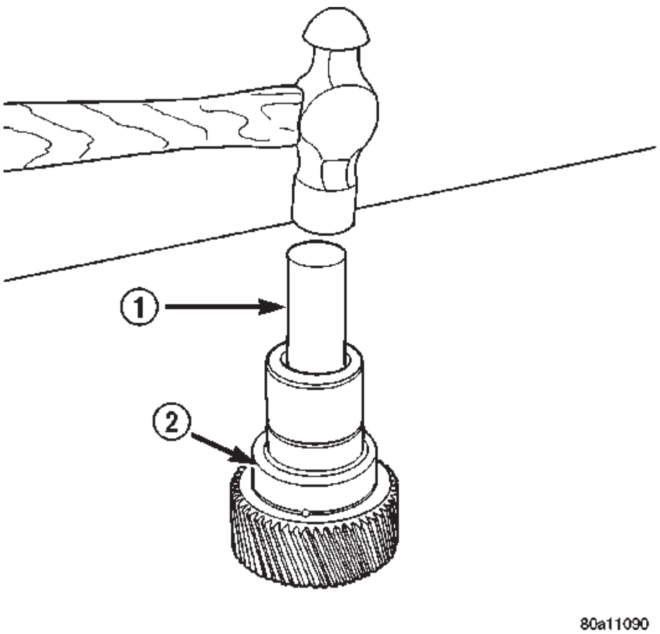

*Fig. 51 Remove Input Gear Pilot Bearing*

1 - DRIFT
2 - INPUT GEAR

(18) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 53). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 54).

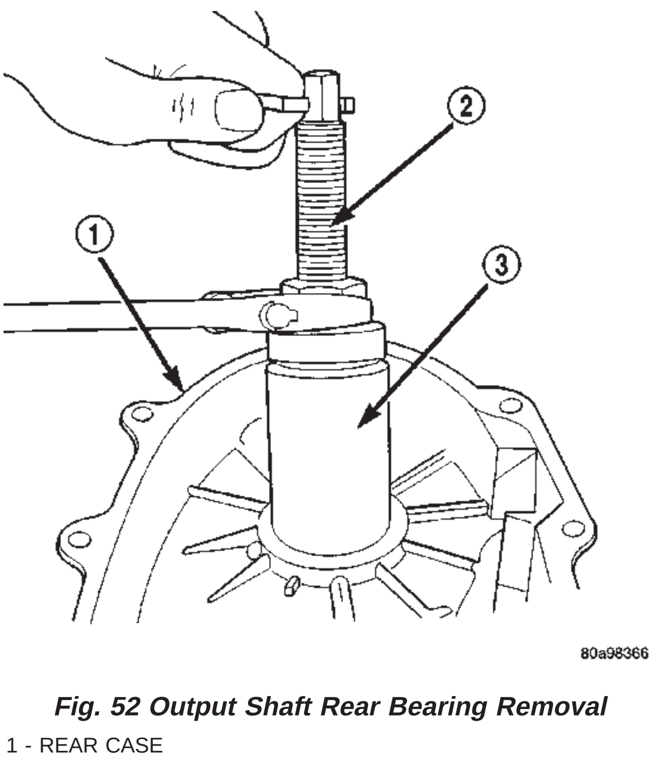

*Fig. 52 Output Shaft Rear Bearing Removal*

2 - CHAMFER

TRANSFER CASE - NV241HD (Continued)

### INPUT AND PLANETARY GEAR

(1) Lubricate planetary components with transmission fluid.

(2) Install first thrust washer in carrier (Fig. 55). Lube washer with petroleum jelly before installation.

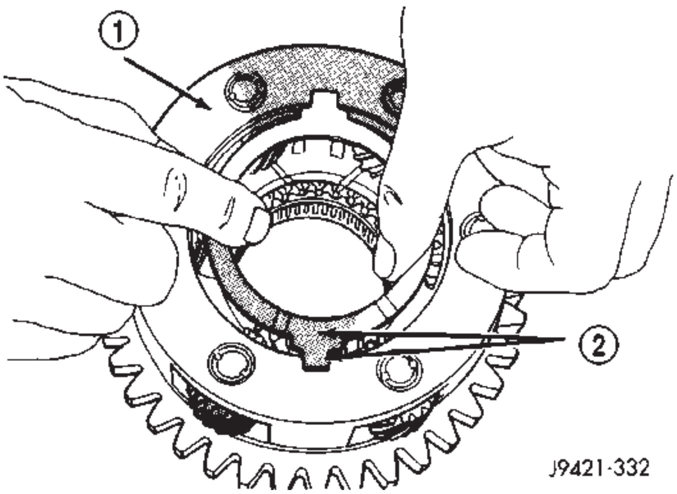

***Fig. 55 Thrust Washer Installation***

1 - THRUST WASHER
2 - TABS IN SLOTS

(3) Support carrier with wood blocks under PTO gear (Fig. 56).

(4) Install support sleeve in planetary carrier. Be sure sleeve is seated.

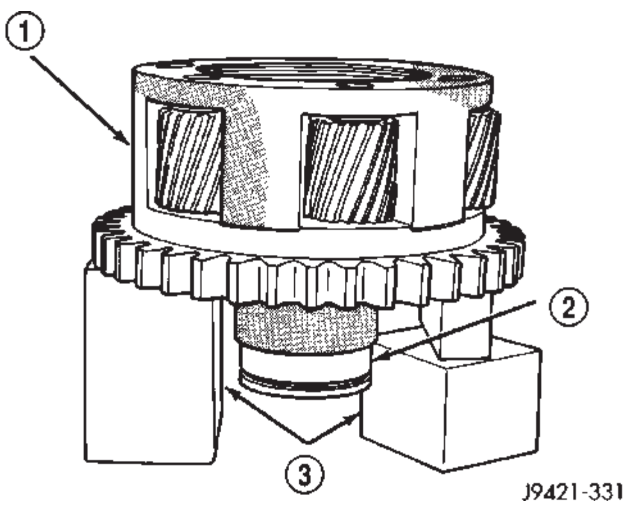

***Fig. 56 Support Sleeve Installation***

1 - PLANETARY
2 - SUPPORT SLEEVE
3 - WOOD BLOCKS

(5) Install input gear in planetary carrier (Fig. 57).

(6) Install second thrust washer in planetary carrier. Be sure washer tabs are seated in carrier slots.

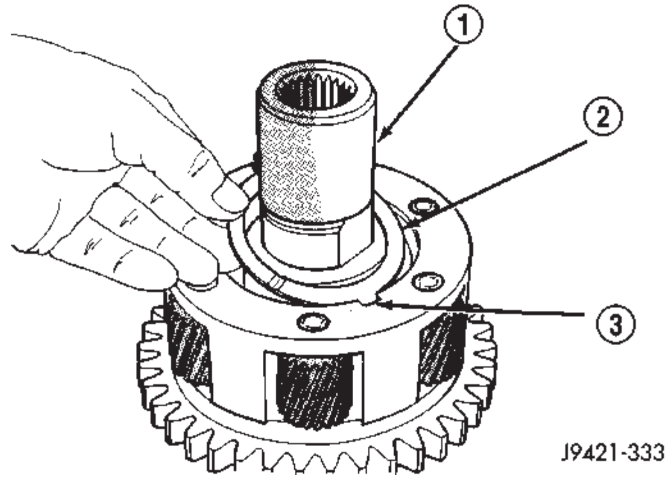

***Fig. 57 Input Gear And Thrust Washer Installation***

1 - INPUT GEAR
2 - THRUST WASHER
3 - TABS IN SLOTS

(7) Install lock ring (Fig. 58).

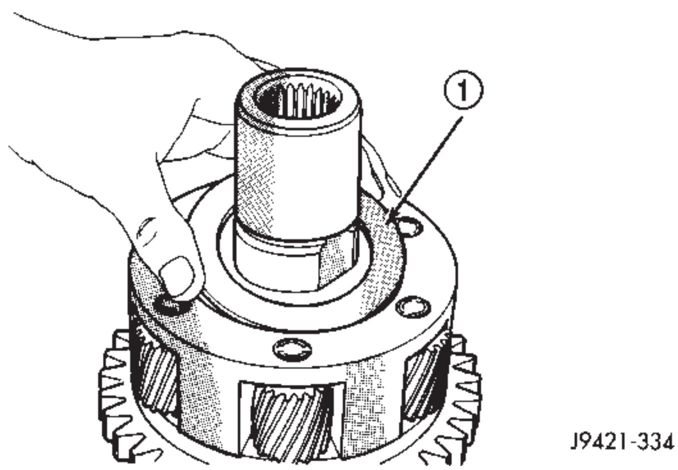

***Fig. 58 Lock Ring Installation***

1 - LOCK RING (BE SURE TABS ARE SEATED IN SLOTS)

TRANSFER CASE - NV241HD (Continued)

(8) Install retaining ring (Fig. 59).

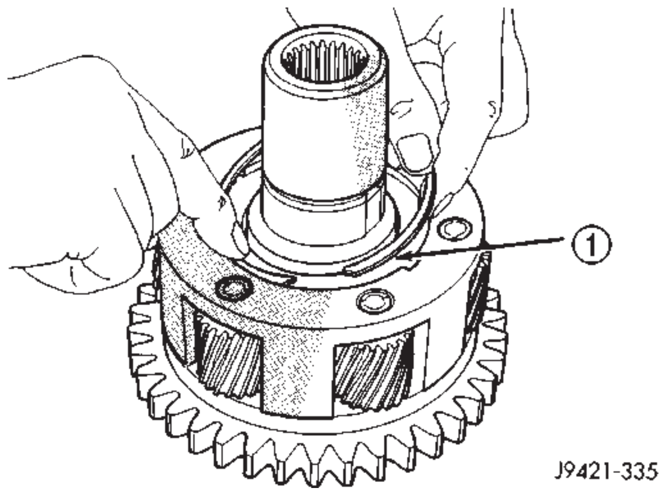

***Fig. 59 Retaining Ring Installation***

1 - RETAINING RING

## INPUT AND PLANETARY GEAR

(1) Lubricate planetary pinions and annulus gear with transmission fluid.

(2) Install planetary/input gear assembly in case (Fig. 60).

(3) Start planetary pinions in low range annulus gear. Then tap PTO gear, with hammer handle to seat planetary pinions in annulus gear.

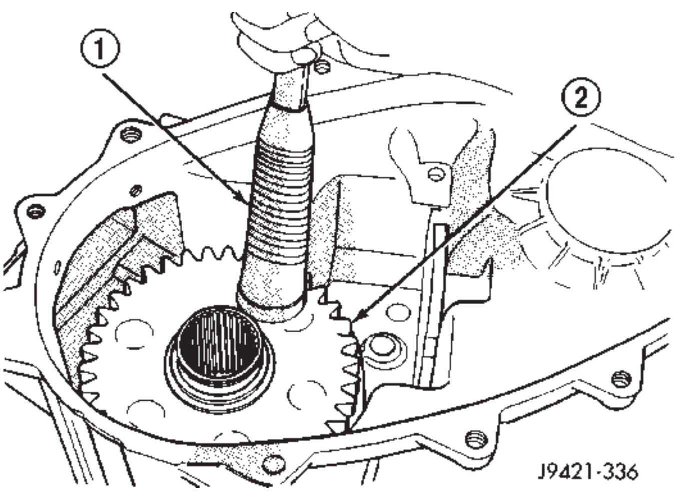

***Fig. 60 Planetary/Input Gear Assembly Installation***

1 - WOOD/RUBBER HAMMER HANDLE
2 - PLANETARY ASSEMBLY

(4) Install retaining ring on input gear (Fig. 61).

(5) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of input retainer. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into oil channel and feed hole in case.

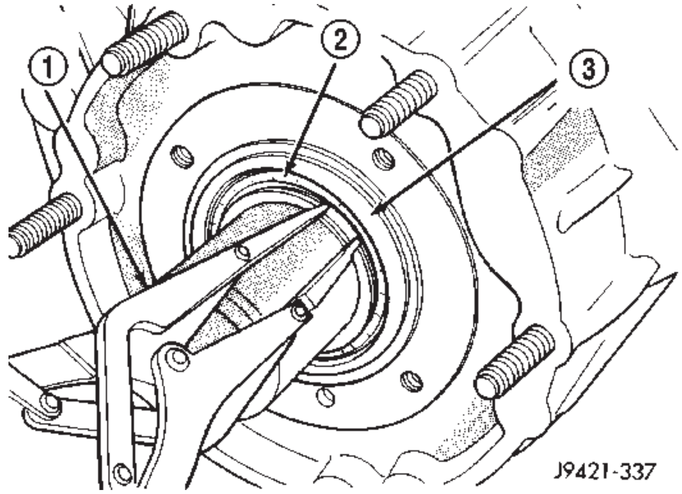

***Fig. 61 Installing Input Gear Retaining Ring***

1 - INPUT BEARING RETAINING RING
2 - SNAP-RING PLIERS
3 - INPUT GEAR

(6) Align oil channel in retainer with oil feed hole in front case (Fig. 62).

(7) Install retainer on input gear shaft and front case (Fig. 63).

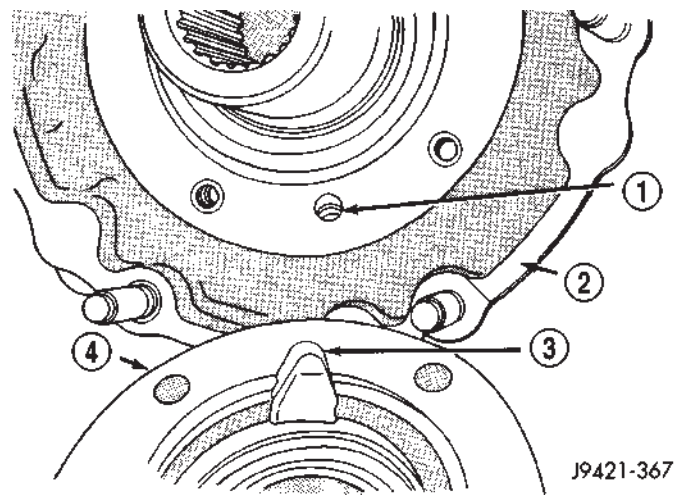

***Fig. 62 Aligning Retainer Oil Channel and Case Feed Holes***

1 - FEED HOLE
2 - FRONT CASE
3 - FEED CHANNEL
4 - BEARING RETAINER

TRANSFER CASE - NV241HD (Continued)

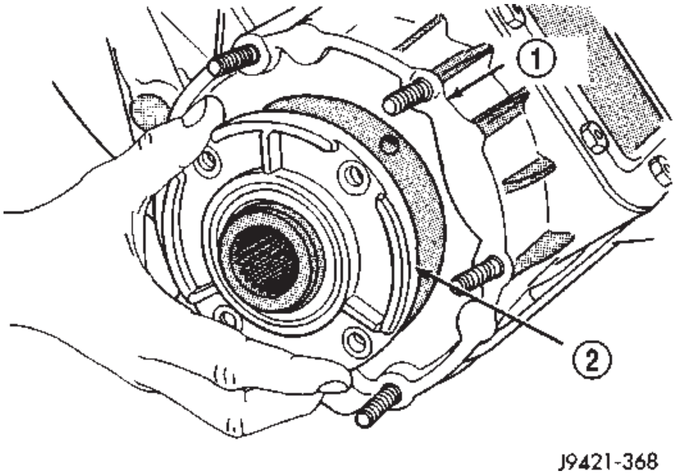

*Fig. 63 Input Bearing Retainer Installation*

1 - FRONT CASE
2 - INPUT BEARING RETAINER

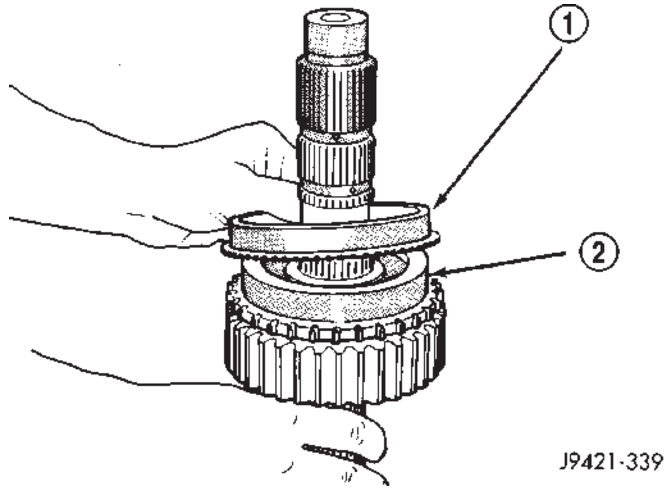

*Fig. 65 Synchronizer Stop Ring Installation*

1 - BRASS STOP RING
2 - DRIVE SPROCKET

(8) Apply Mopar® Silicone Sealer to threads of input retainer bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

## MAINSHAFT

(1) Install drive sprocket on mainshaft (Fig. 64).

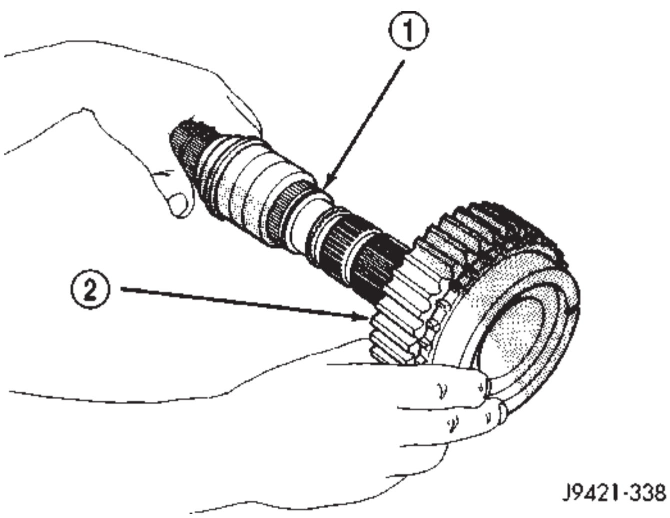

*Fig. 64 Drive Sprocket Installation*

1 - MAINSHAFT
2 - DRIVE SPROCKET

(2) Install brass stop ring on drive sprocket (Fig. 65).

(3) Install 3 synchronizer struts and 2 springs in hub as follows:

(a) Insert first strut in hub (Fig. 66). Strut shoulders rest (and slide) on sides hub slot as shown.

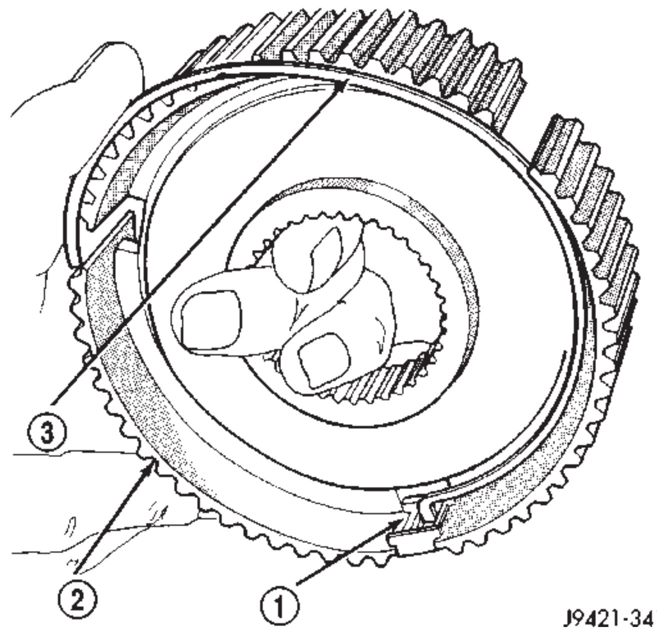

*Fig. 66 Installing First Synchronizer Strut And Spring*

1 - FIRST STRUT
2 - SYNCHRONIZER HUB
3 - SPRING

TRANSFER CASE - NV241HD (Continued)

(b) Insert hooked end of first spring in center of strut to secure it. Then work spring into hub (Fig. 67).

(c) Press spring inward and insert last two struts in hub slots. Be sure spring is positioned under struts to properly secure them (Fig. 68).

(d) Turn hub over and install remaining spring in hub. Position hooked end of second spring opposite the first spring's hooked end.

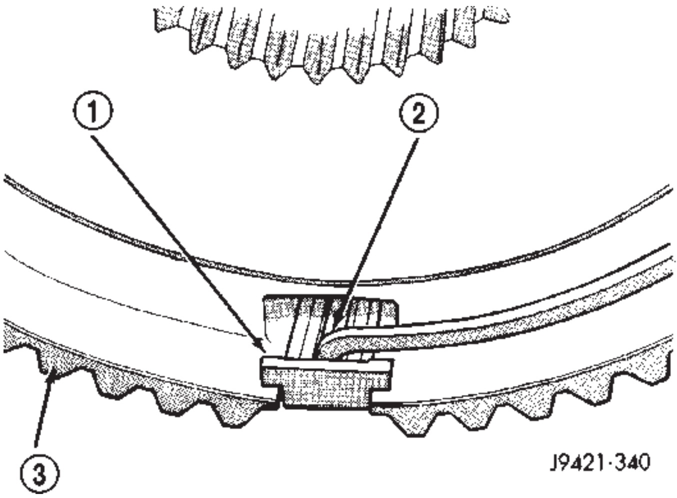

*Fig. 67 Synchronizer Spring Installation*

1 - STRUT SHOULDER
2 - SPRING (SEATED IN STRUT)
3 - HUB

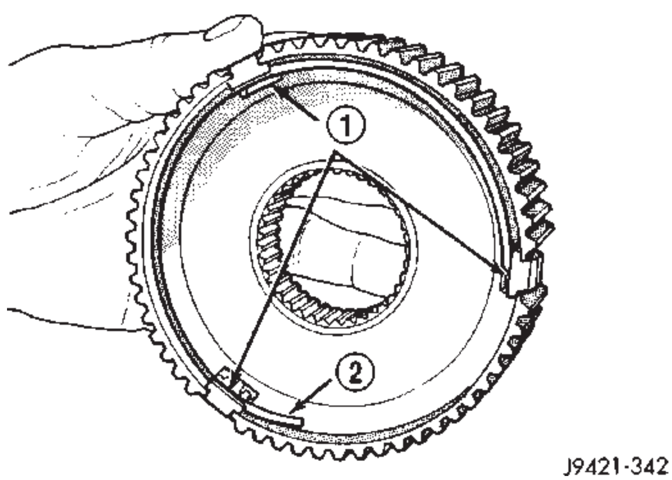

*Fig. 68 Correct Position Of Struts And Springs*

1 - STRUTS
2 - SPRING

(4) Install assembled synchronizer hub on mainshaft (Fig. 69). Hub has shoulder on one side which goes toward sprocket (rear of shaft). Flat side of hub faces front of shaft.

(5) Install synchronizer hub retaining ring (Fig. 70). Be sure ring is fully seated before proceeding.

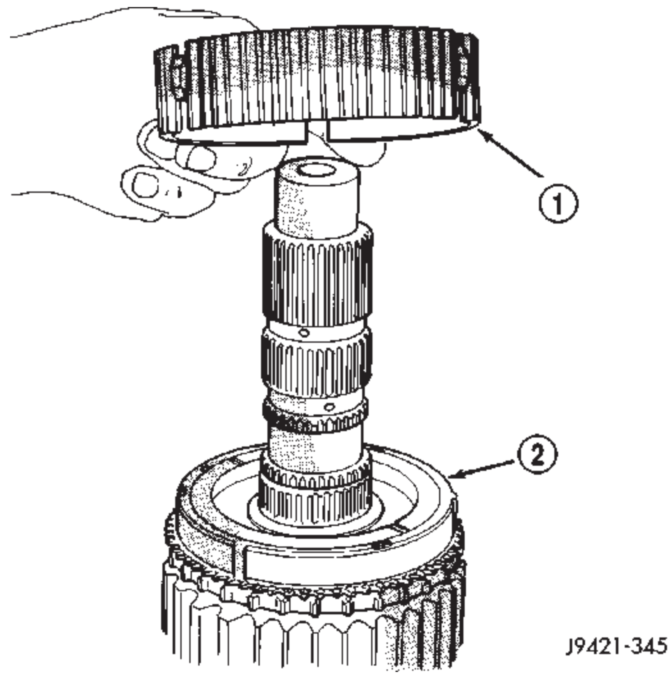

*Fig. 69 Synchronizer Hub Installation*

1 - SYNCHRONIZER HUB (SHOULDER SIDE DOWN)
2 - STOP RING AND SPROCKET

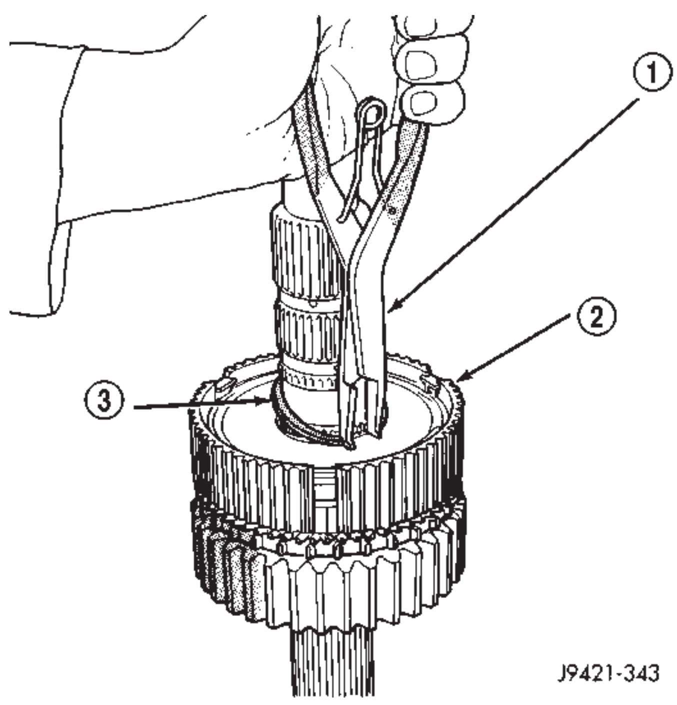

*Fig. 70 Synchronizer Hub Retaining Ring Installation*

1 - SNAP-RING PLIERS
2 - SYNCHRONIZER HUB
3 - HUB RETAINING RING

TRANSFER CASE - NV241HD (Continued)

(6) Install sliding clutch (sleeve) on synchronizer hub (Fig. 71).

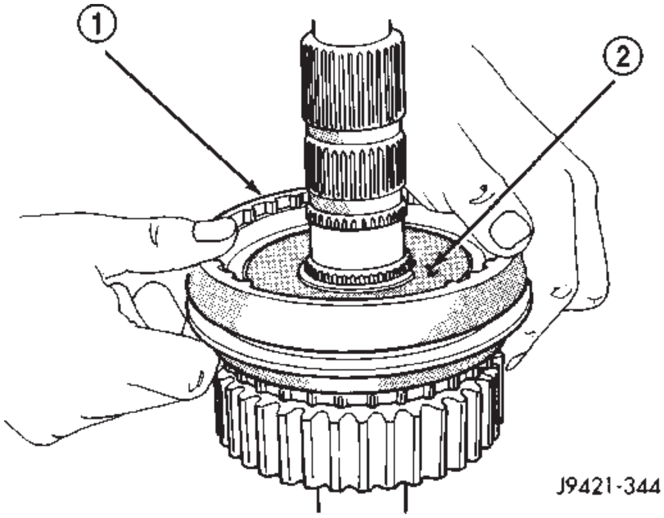

***Fig. 71 Sliding Clutch Installation***

1 - SLIDING CLUTCH
2 - SYNCHRONIZER HUB

**CAUTION: The sliding clutch must be correctly positioned to ensure proper shifting. Position the clutch on the hub so a clutch spline is centered over each strut as shown (Fig. 72). If the clutch is installed so a gap between splines is aligned with one or more struts, gear clash will result.**

## SHIFT FORKS AND MAINSHAFT

(1) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

(2) Lubricate mainshaft components with transmission fluid.

(3) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 73). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

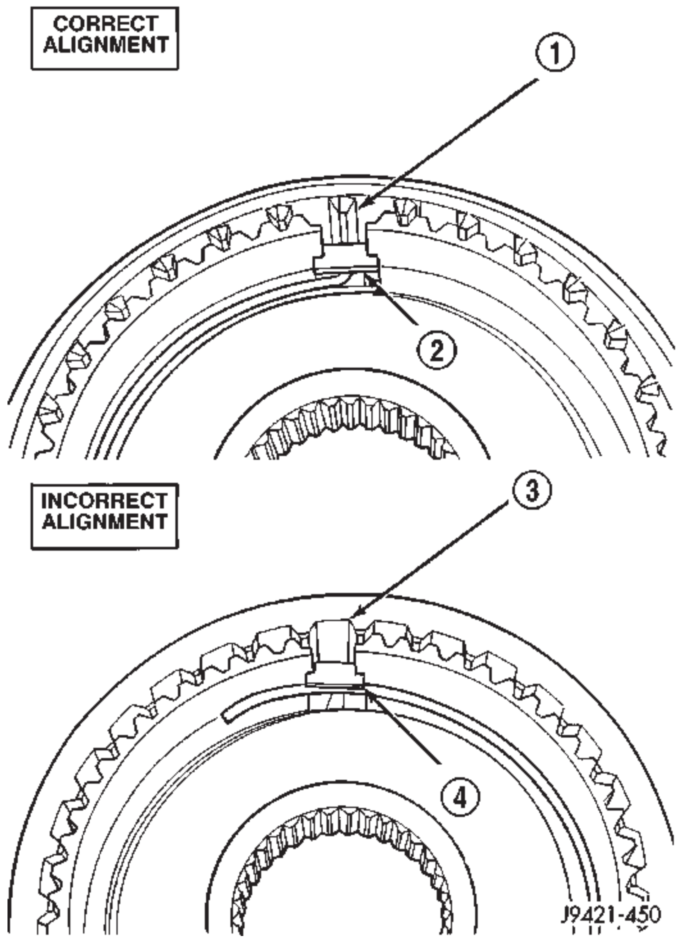

***Fig. 72 Correct Alignment Of Struts And Sliding Clutch***

1 - SLEEVE TOOTH ALIGNED WITH STRUT
2 - STRUT
3 - SLEEVE TOOTH **NOTALIGNED WITH STRUT**
4 - STRUT

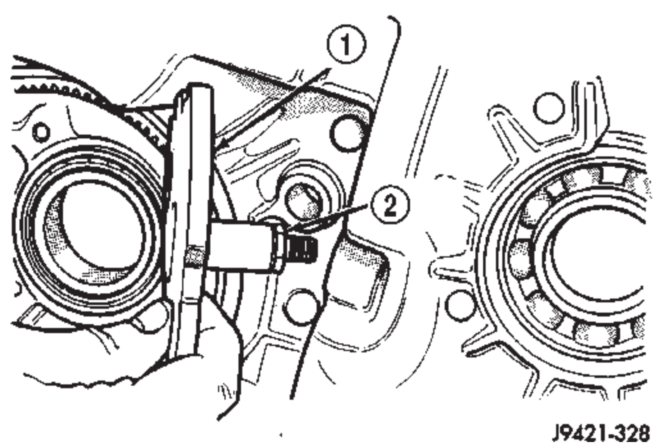

***Fig. 73 Shift Sector Installation***

1 - SHIFT SECTOR
2 - SECTOR SHAFT

TRANSFER CASE - NV241HD (Continued)

(4) Assemble range fork and sliding hub (Fig. 74). Then install fork and hub in case. Seat hub on support sleeve and seat range fork pin in shift sector slot (Fig. 75).

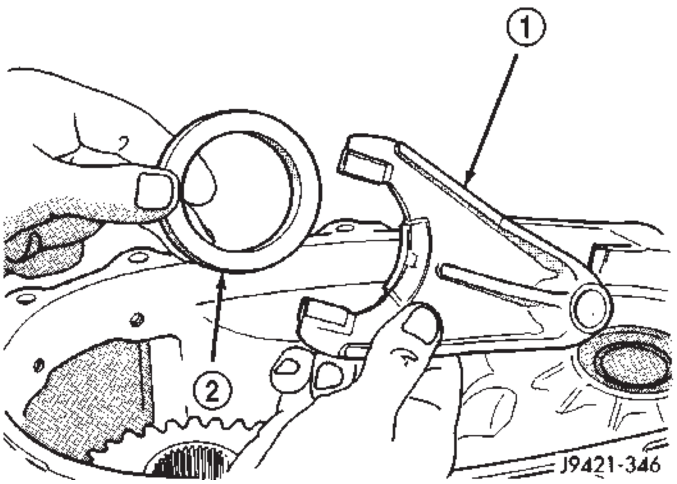

***Fig. 74 Assembling Range Fork And Sliding Hub***

1 - RANGE FORK
2 - SLIDING HUB

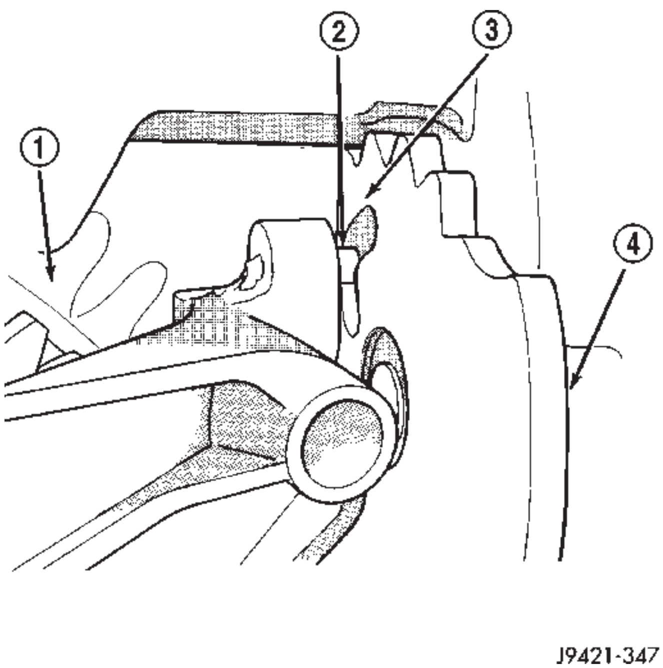

***Fig. 75 Seating Range Fork And Hub***

1 - RANGE FORK
2 - RANGE FORK PIN
3 - SECTOR SLOT
4 - SHIFT SECTOR

(5) Install sliding hub retaining ring (Fig. 76). Be sure ring is fully seated before proceeding.

(6) Install mode fork and shift rail in sliding clutch (Fig. 77).

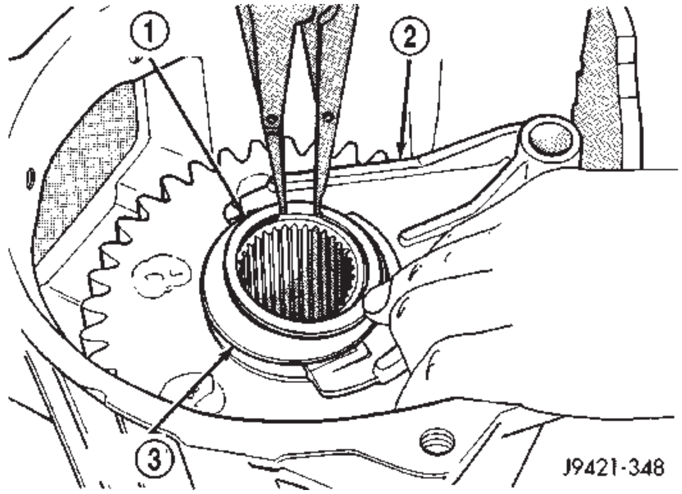

***Fig. 76 Sliding Hub Retaining Ring Installation***

1 - RETAINING RING
2 - RANGE FORK
3 - SLIDING HUB

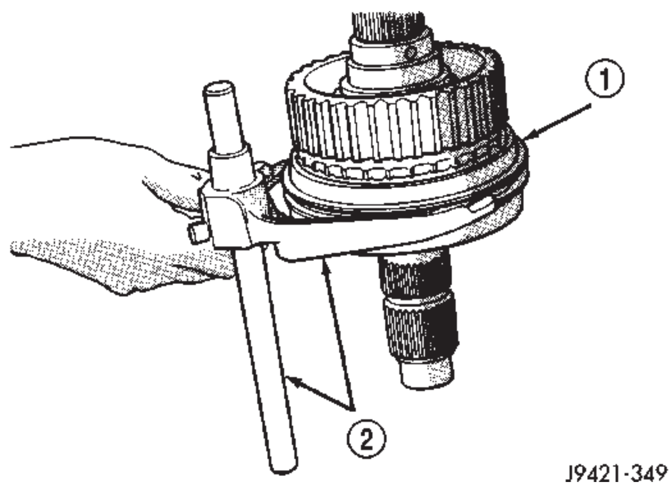

***Fig. 77 Assembling Mode Fork And Mainshaft***

1 - SLIDING CLUTCH
2 - MODE FORK AND SHIFT RAIL

TRANSFER CASE - NV241HD (Continued)

(7) Install mainshaft/mode fork assembly (Fig. 78). Guide mainshaft through hub and into input gear and shift rail through range fork and into case bore.

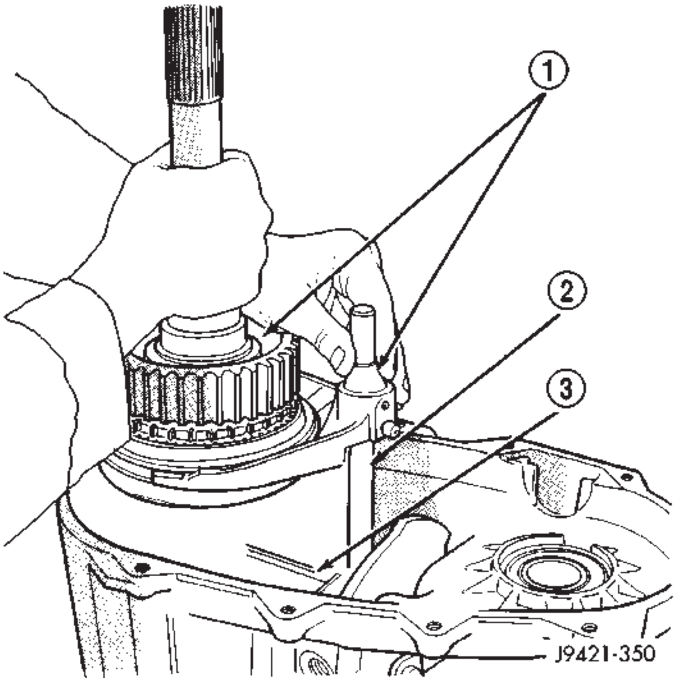

**Fig. 78 Installing Mainshaft And Mode Fork Assembly**

1 - MAINSHAFT AND MODE FORK ASSEMBLY
2 - SHIFT RAIL
3 - RANGE FORK

(8) Install new o-ring on vacuum/indicator switch, if necessary. Install vacuum/indicator switch (Fig. 79). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

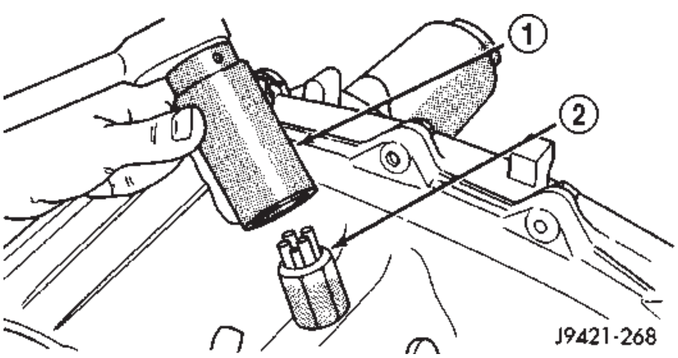

**Fig. 79 Vacuum/Indicator Switch Installation**

1 - 1-1/16" SOCKET
2 - INDICATOR SWITCH

(9) Install new sector shaft o-ring and o-ring retainer in sector shaft bore (Fig. 80). Lubricate o-ring with transmission fluid or petroleum jelly after installation.

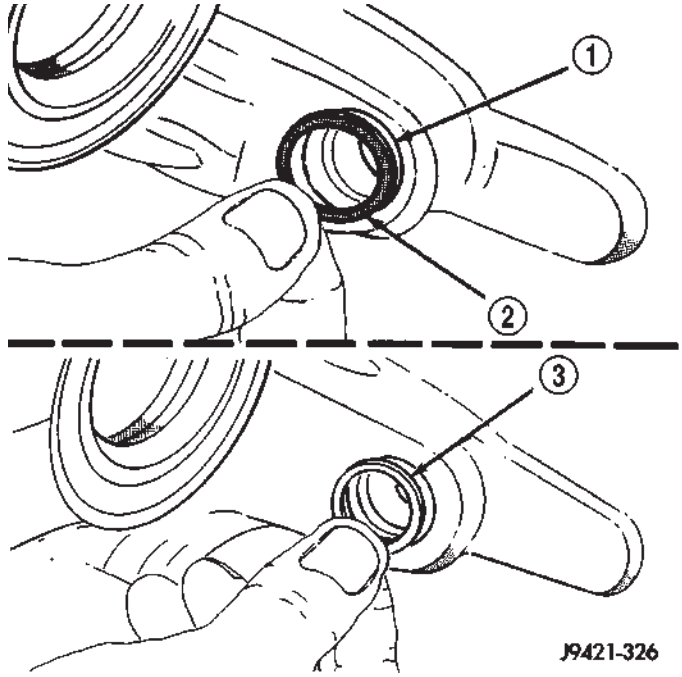

**Fig. 80 Sector Shaft O-Ring And Retainer Installation**

1 - SECTOR SHAFT BORE
2 - O-RING
3 - O-RING RETAINER

(10) Install shift lever on sector shaft (Fig. 81).

(11) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

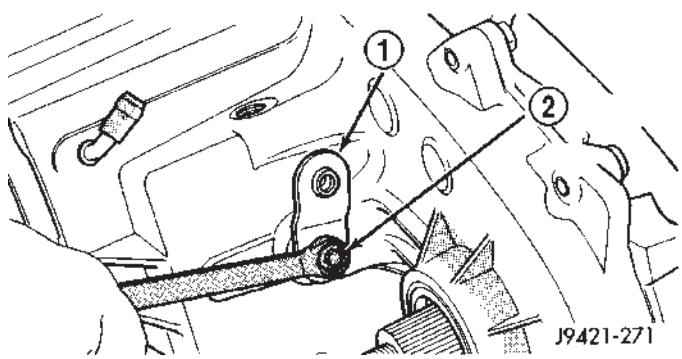

**Fig. 81 Shift Lever Installation**

1 - SHIFT LEVER
2 - NUT/WASHER

TRANSFER CASE - NV241HD (Continued)

(12) Install poppet plunger and spring (Fig. 82).

(13) Install new o-ring on poppet screw and install screw in front case (Fig. 83). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

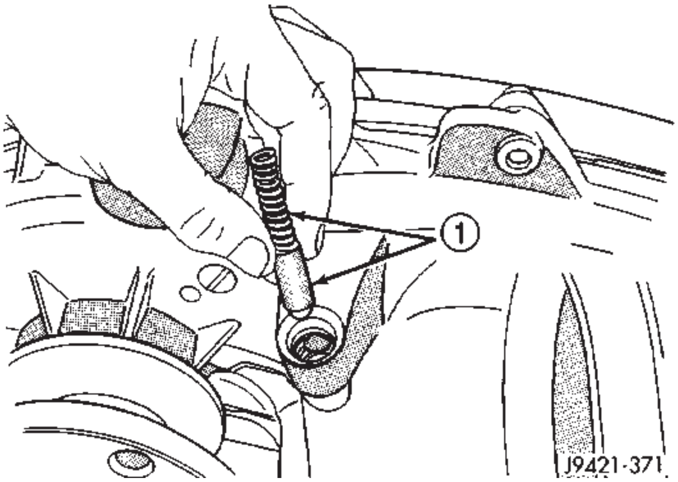

*Fig. 82 Poppet Plunger And Spring Installation*

1 - POPPET PLUNGER AND SPRING

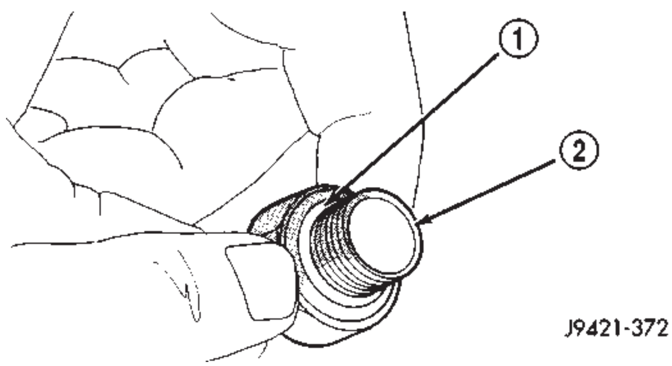

*Fig. 83 O-Ring Installation On Poppet Plunger Screw*

1 - O-RING
2 - PLUNGER SCREW

## FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Install front output shaft in bearing (Fig. 84).

(2) Insert front sprocket in drive chain (Fig. 85).

(3) Install drive chain around mainshaft sprocket (Fig. 85). Then position front sprocket over front shaft.

(4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

(5) If mainshaft and sliding clutch were unseated during chain installation, align and reseat mainshaft in input gear and hub. Then reseat synchronizer hub in sliding clutch. Press synchronizer struts inward to ease clutch back onto hub.

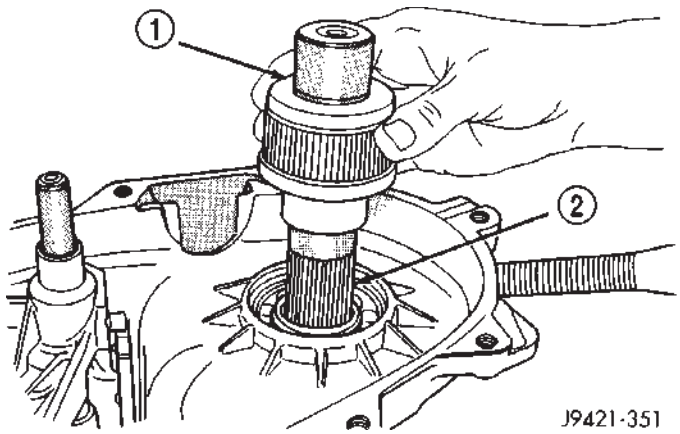

*Fig. 84 Front Output Shaft Installation*

1 - FRONT OUTPUT SHAFT
2 - BEARING

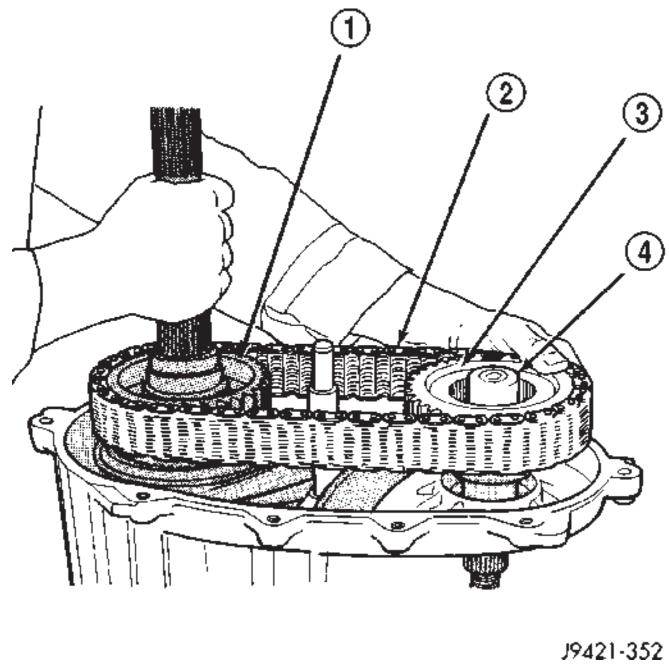

*Fig. 85 Drive Chain And Front Sprocket Installation*

1 - DRIVE SPROCKET
2 - DRIVE CHAIN
3 - FRONT SPROCKET
4 - FRONT SHAFT

TRANSFER CASE - NV241HD (Continued)

(6) Install front sprocket retaining ring (Fig. 86).

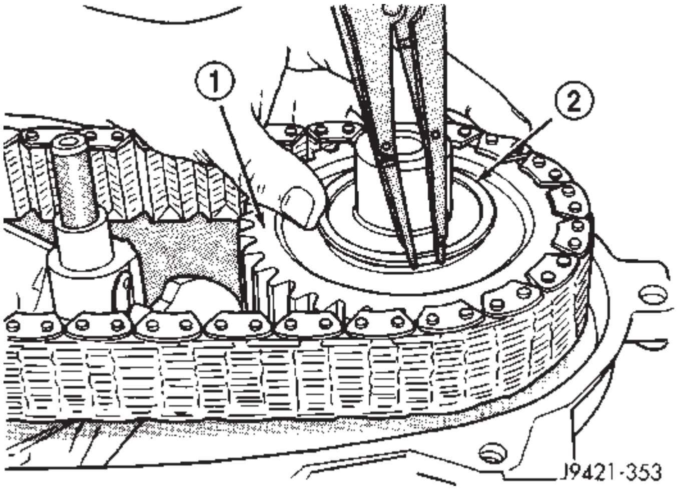

*Fig. 86 Front Sprocket Retaining Ring Installation*

1 - FRONT SPROCKET
2 - RETAINING RING

(7) Realign sliding clutch on synchronizer hub if necessary. Press synchronizer struts inward to ease realignment. Be sure mainshaft is fully seated before proceeding.

(8) Install spring and cup on shift rail (Fig. 87).

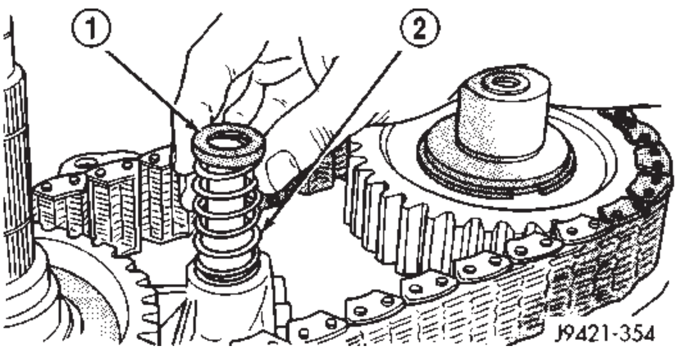

*Fig. 87 Shift Rail Spring And Cup Installation*

1 - CUP
2 - SPRING

(9) Insert magnet in front case pocket (Fig. 88).

## OIL PUMP AND REAR CASE

Lubricate the oil pump components before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

(1) Install new o-ring in pickup tube inlet of oil pump (Fig. 89).

(2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches (Fig. 90). Be sure hose that connects tube to filter is securely positioned.

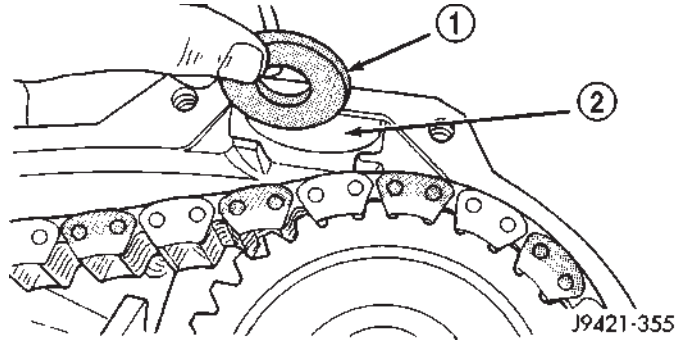

*Fig. 88 Case Magnet Installation*

1 - MAGNET
2 - CASE POCKET

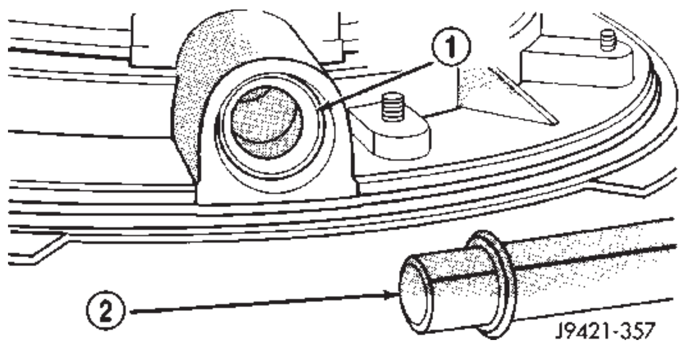

*Fig. 89 Pickup Tube O-Ring Installation*

1 - O-RING (PUMP PICKUP)
2 - PICKUP TUBE

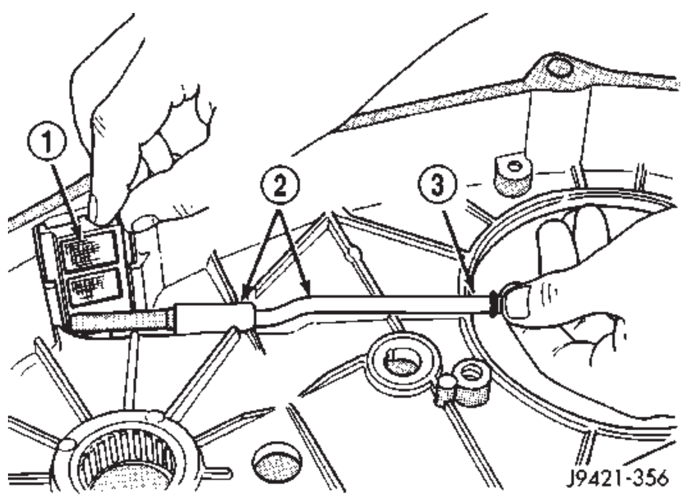

*Fig. 90 Oil Pickup Tube And Filter Position In Rear Case*

1 - FILTER
2 - TUBE AND HOSE
3 - TUBE IN NOTCH

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 91).

TRANSFER CASE - NV241HD (Continued)

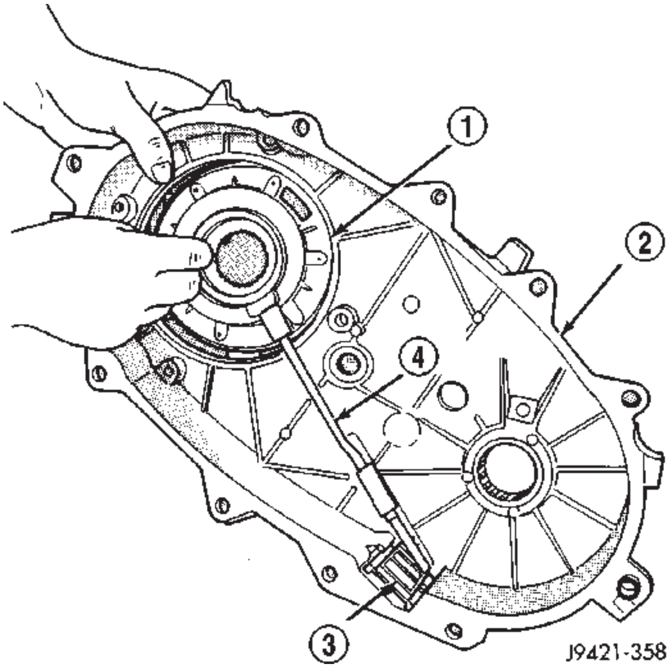

*Fig. 91 Positioning Oil Pump In Rear Case*

1 - MAINSHAFT
2 - OIL PUMP
3 - REAR CASE

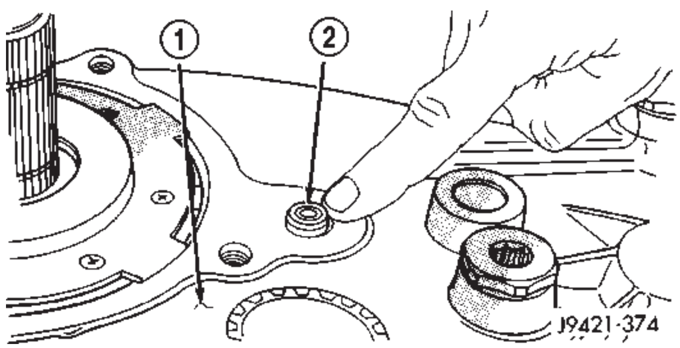

*Fig. 93 Shift Rail Seated In Rear Case Bore*

1 - REAR CASE
2 - SHIFT RAIL

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 92). Be sure oil pump and pickup tube remain in position during case installation.

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

**CAUTION: Verify that shift rail (Fig. 93), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.**

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

TRANSFER CASE - NV241HD (Continued)

(8) Check stud at end of case halves (Fig. 94). If stud was loosened or came out during disassembly, apply Loctite™ 242 to stud threads and reseat stud in case.

(9) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

- flange head bolts to 47-61 N·m (35-45 ft. lbs.)
- all other bolts/nuts to 27-34 N·m (20-25 ft. lbs.)

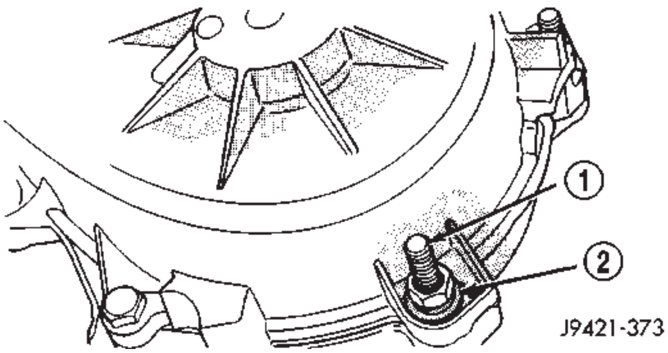

***Fig. 94 Washer Installation On Case Stud And Dowel Bolts***

1 - CASE STUD/BOLT
2 - WASHER

(10) Install oil pump retaining ring on mainshaft (Fig. 95).

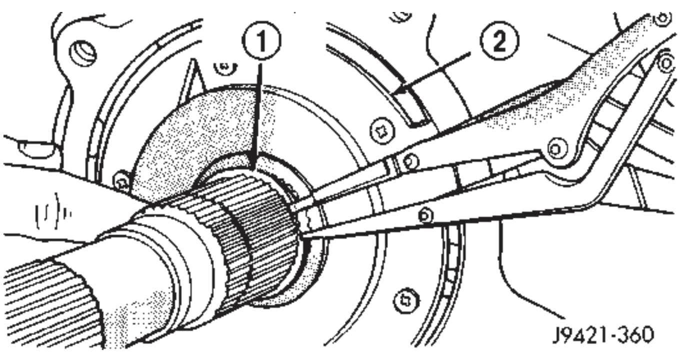

***Fig. 95 Oil Pump Retaining Ring Installation***

1 - RETAINING RING
2 - OIL PUMP

(11) Install rear output bearing and snap-ring to output shaft.

## COMPANION FLANGE

(1) Install companion flange seal on front shaft (Fig. 96).

(2) Install companion flange on front shaft (Fig. 97). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

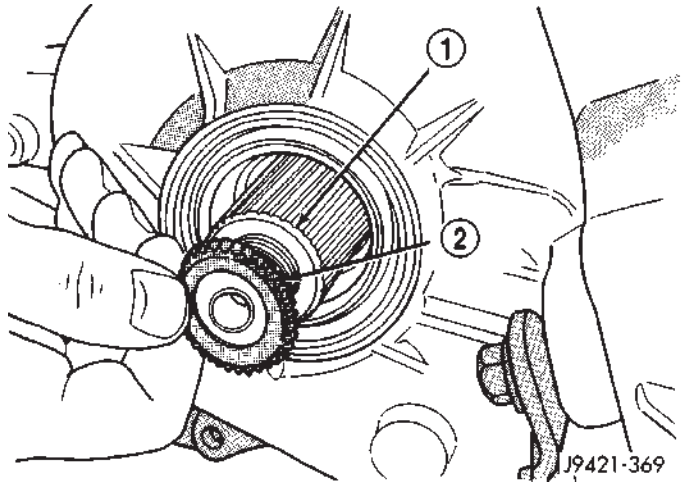

***Fig. 96 Installing Flange Seal On Front Shaft***

1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

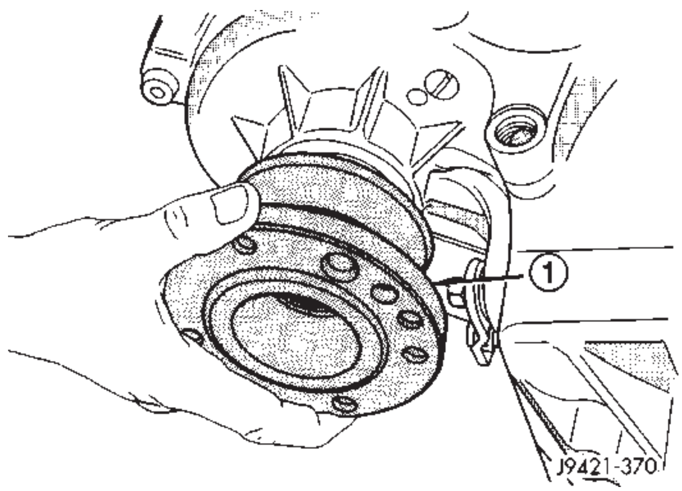

***Fig. 97 Installing Companion Flange On Front Shaft***

1 - COMPANION FLANGE

## EXTENSION HOUSING AND PTO COVER

(1) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into oil pump.

(2) Position extension housing over output shaft.

(3) Spread extension housing retaining ring and seat extension housing on rear case. Verify that the retaining ring is seated in output shaft rear bearing.

(4) Install retaining ring access cover.

(5) Apply Mopar® Silicone Sealer, or equivalent, to threads of extension housing bolts. Then install bolts finger tight.

(6) Tighten extension housing bolts to 27-34 N·m (20-25 ft. lbs.) torque.

TRANSFER CASE - NV241HD (Continued)

(7) Apply Mopar® Silicone Sealer to mating surface of PTO cover and to cover bolt shanks and underside of bolt heads. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

### INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

(2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft.lbs.).

(3) Install rear crossmember.

(4) Remove jack stand from under transmission.

(5) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Connect vacuum harness and vent hose.

(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

(8) Adjust shift linkage, if necessary.

(9) Fill transfer case with recommended transmission fluid and install fill plug.

(10) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

(11) Lower vehicle

## SPECIFICATIONS

### TRANSFER CASE

# EXTENSION HOUSING BUSHING AND SEAL

## REMOVAL

(1) Raise and support vehicle.

(2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

(4) Using Remover 8155, remove bushing from extension housing (Fig. 98).

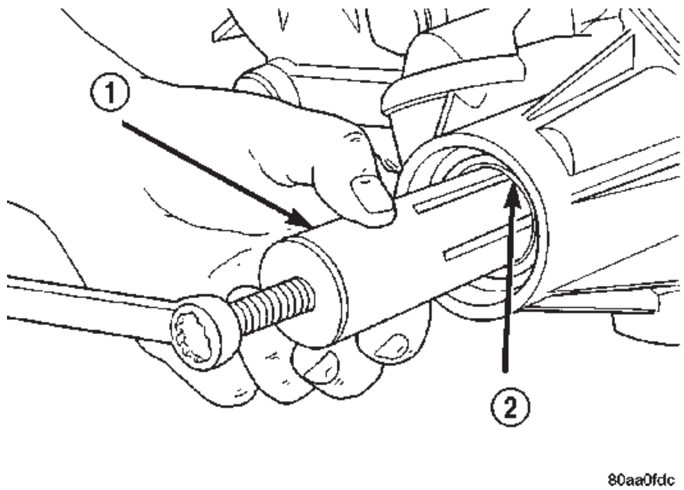

*Fig. 98 Extension Housing Bushing Removal*

1 - REMOVER 8155
2 - EXTENSION HOUSING BUSHING

## INSTALLATION

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in extension housing with fluid port in bushing aligned with slot in housing.

(3) Using Installer 8156, drive bushing into housing until installer seats against case (Fig. 99).

(4) Using Installer 8154, install seal in extension housing (Fig. 100).

(5) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Verify proper transfer case fluid level.

(7) Lower vehicle.

EXTENSION HOUSING BUSHING AND SEAL (Continued)

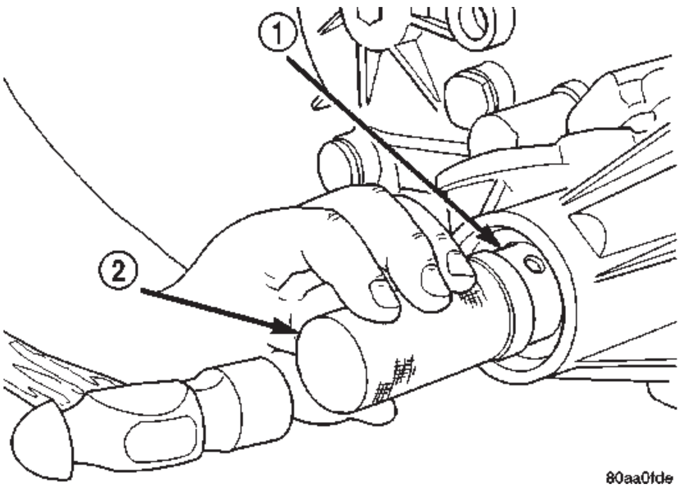

*Fig. 99 Extension Housing Bushing Installation*

1 - EXTENSION HOUSING BUSHING

# FLUID

## STANDARD PROCEDURE - FLUID DRAIN AND REFILL

(1) Raise vehicle.
(2) Position drain pan under transfer case.
(3) Remove drain and fill plugs and drain lubricant completely.
(4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).
(5) Remove drain pan.
(6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
(7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).
(8) Lower vehicle.

# FRONT OUTPUT SHAFT SEAL

## REMOVAL

(1) Shift transfer case into NEUTRAL.
(2) Raise vehicle.
(3) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
(4) Remove companion flange nut (Fig. 101). Discard nut after removal. It is not reusable.

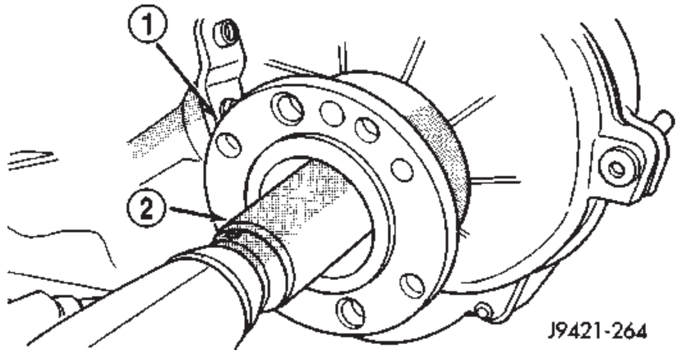

*Fig. 101 Removing Companion Flange Nut*

1 - COMPANION FLANGE
2 - SOCKET

(5) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.
(6) Remove companion flange rubber seal from front output shaft (Fig. 102).

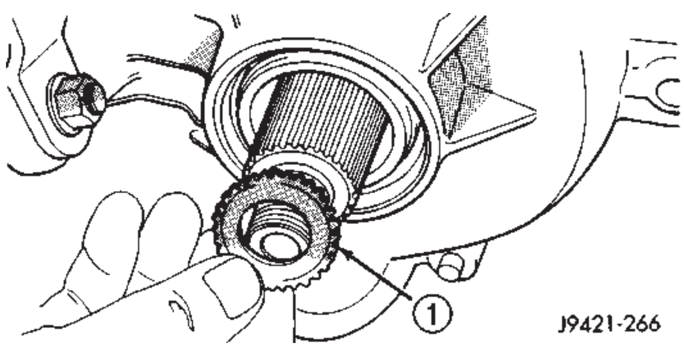

*Fig. 102 Companion Flange Seal Removal*

1 - FLANGE SEAL

(7) Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

## INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 (Fig. 103) as follows:
(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

FRONT OUTPUT SHAFT SEAL (Continued)

(b) Start seal in bore. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 104). This is correct final seal position.

**CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.**

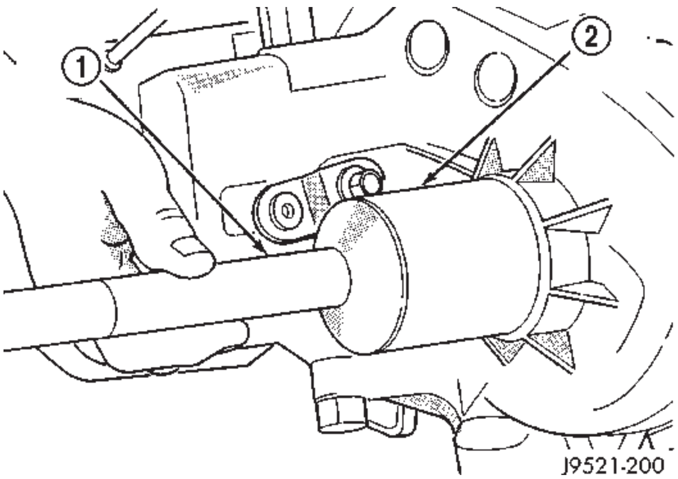

***Fig. 103 Front Output Seal Installation***

1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL 6888

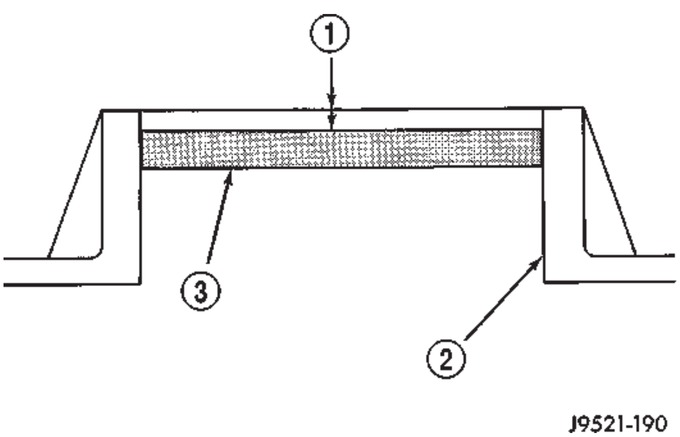

***Fig. 104 Checking Front Output Seal Installation Depth***

1 - CORRECT SEAL DEPTH IS 2.03-2.5 mm (0.080-0.100 in.) BELOW TOP EDGE OF BORE
2 - FRONT CASE SHAFT BORE
3 - FRONT OUTPUT SEAL

(2) Install companion flange seal on front shaft (Fig. 105).

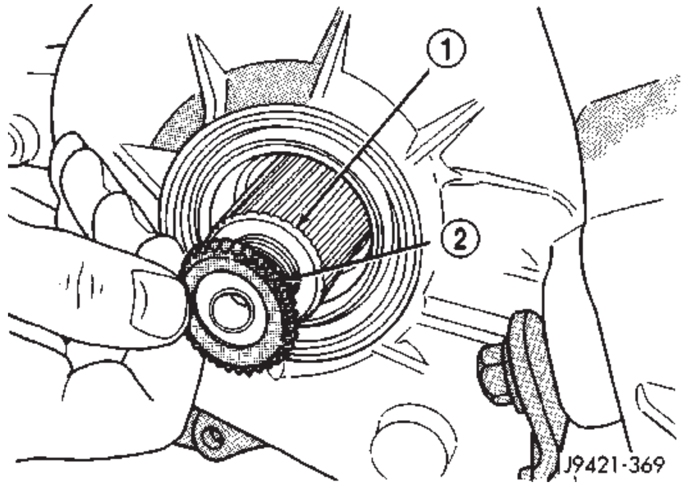

***Fig. 105 Installing Flange Seal On Front Shaft***

1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(3) Install companion flange on front shaft (Fig. 106). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

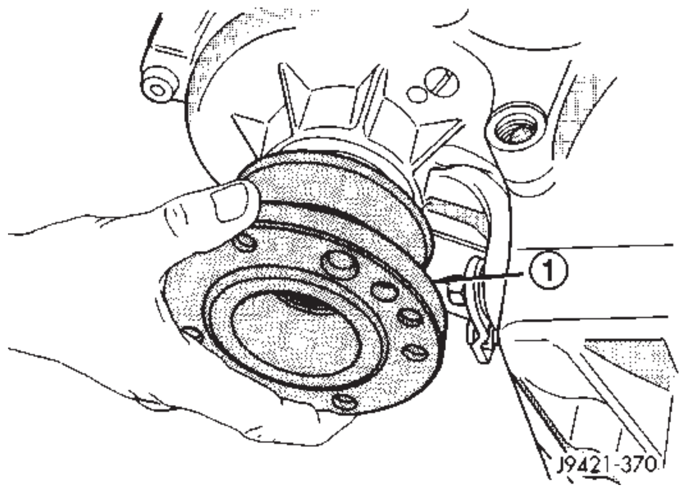

***Fig. 106 Installing Companion Flange On Front Shaft***

1 - COMPANION FLANGE

(4) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

# SHIFT LEVER

## REMOVAL

(1) Shift transfer case into 2H.
(2) Remove transfer case shifter knob cap.
(3) Remove nut holding shifter knob to shift lever.
(4) Remove shifter knob.
(5) Remove the shift boot from the shifter bezel.
(6) Remove the bolts securing the shifter mechanism to the floor pan along the driver's side of the transmission tunnel (Fig. 107).

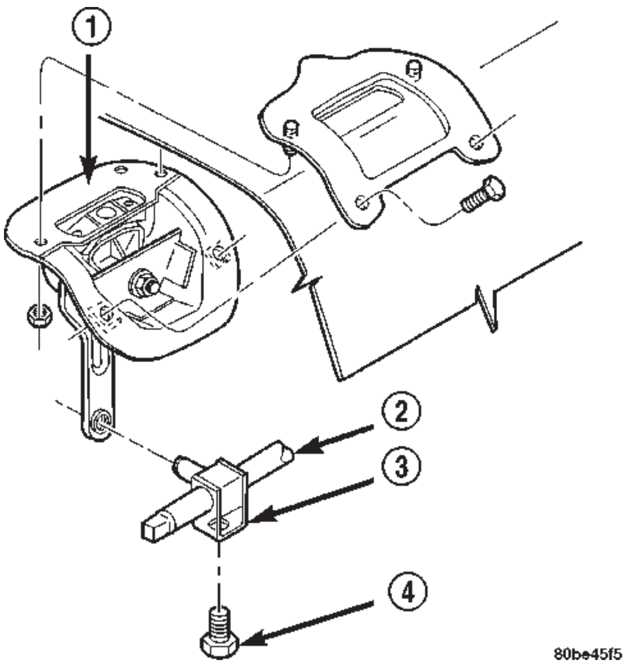

***Fig. 107 Transfer Case Shifter***

1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

(7) Raise and support the vehicle.
(8) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
(9) Remove the nuts holding the shifter mechanism to the underside of the floor pan.
(10) Separate shift lever mechanism from the vehicle.

## INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 108).

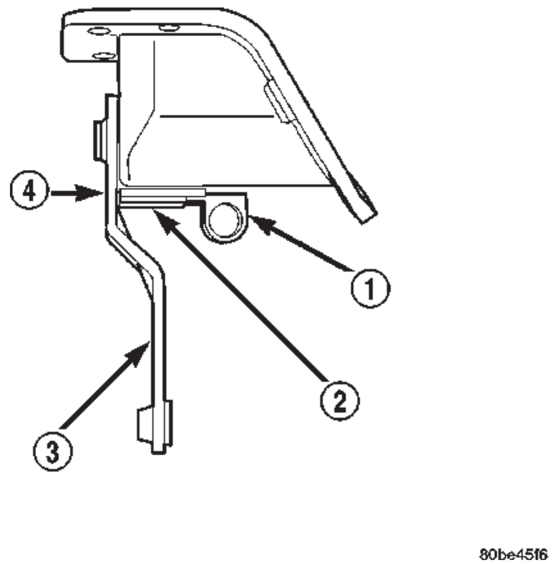

***Fig. 108 Shifter Adjustment***

1 - LOCATING PIN
2 - ADJUSTMENT CHANNEL
3 - LOWER SHIFTER LEVER
4 - LOCATING HOLE

(2) Position shift lever on vehicle.
(3) Install nuts to hold shift lever to the underside of the body.
(4) Install trunnion to shift lever, if necessary.
(5) Install shift rod to trunnion, if necessary.
(6) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).
(7) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.
(8) Lower vehicle.
(9) Install the bolts to hold the shifter mechanism to the floor pan.
(10) Install the transfer case shifter bezel.
(11) Install the shifter boot and the shifter knob onto the shifter lever.
(12) Install nut to hold shifter knob to shift lever.
(13) Install shifter knob cap.
(14) Verify transfer case operation.

SHIFT LEVER (Continued)

## ADJUSTMENT - SHIFT LEVER

(1) Move shift lever into 2H position.

(2) Raise vehicle.

(3) Loosen shift rod lock bolt at trunnion (Fig. 109).

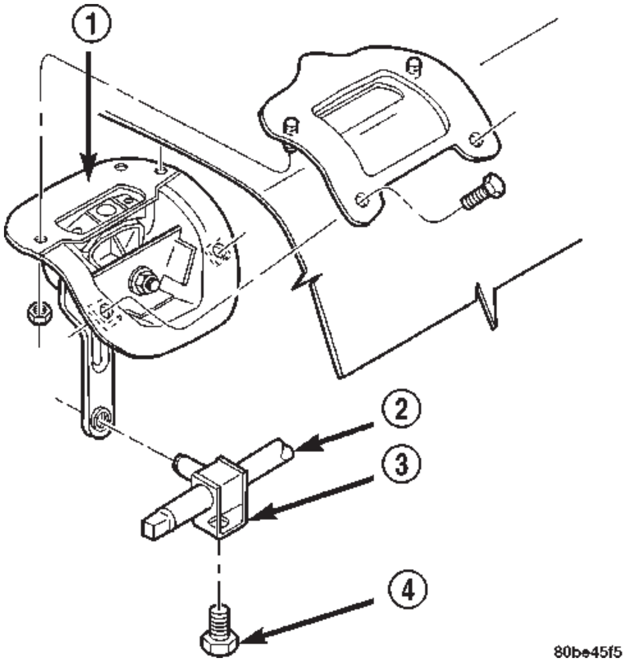

*Fig. 109 Shift Rod Lock Bolt Location*

1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.

(5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.

(6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 110).

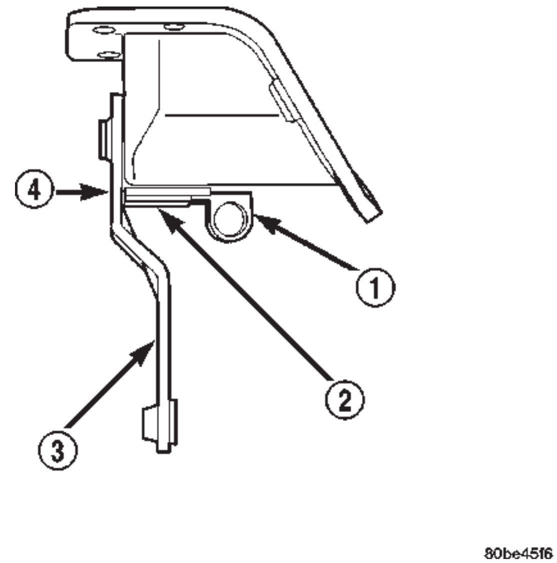

*Fig. 110 Shifter Adjustment Location*

1 - LOCATING PIN
2 - ADJUSTMENT CHANNEL
3 - LOWER SHIFTER LEVER
4 - LOCATING HOLE

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

# TIRES/WHEELS

TABLE OF CONTENTS

## TIRES/WHEELS

### DIAGNOSIS AND TESTING - TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 1).

Lateral runout is the **wobble** of the tire or wheel.

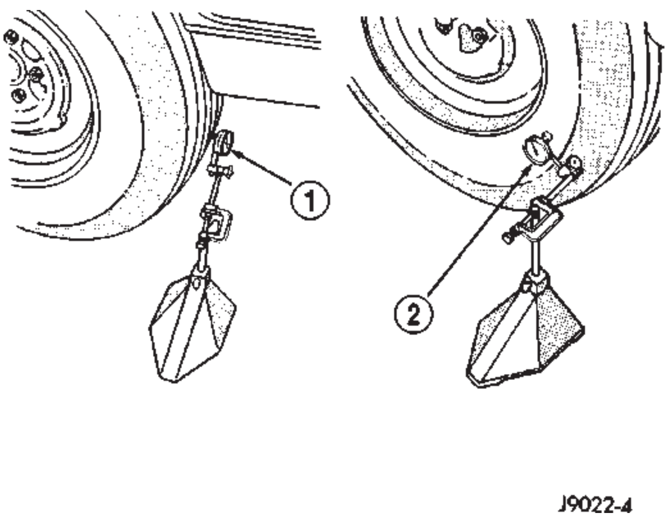

*Fig. 1 Checking Tire/Wheel/Hub Runout*

1 - RADIAL RUNOUT
2 - LATERAL RUNOUT

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

#### METHOD 1 (RELOCATE WHEEL ON HUB)

(1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.

(2) Check wheel bearings and adjust if adjustable or replace if necessary.

(3) Check the wheel mounting surface.

(4) Relocate wheel on the mounting, two studs over from the original position.

(5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.

(6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

TIRES/WHEELS (Continued)

### METHOD 2 (RELOCATE TIRE ON WHEEL)

**NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.**

(1) Remove tire from wheel and mount wheel on service dynamic balance machine.

(2) Check wheel radial runout (Fig. 2) and lateral runout (Fig. 3).

- STEEL WHEELS: Radial runout 0.040 in., Lateral runout 0.045 in. (maximum)
- ALUMINUM WHEELS: Radial runout 0.030 in., Lateral runout 0.035 in. (maximum)

(3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout, Refer to match mounting procedure.

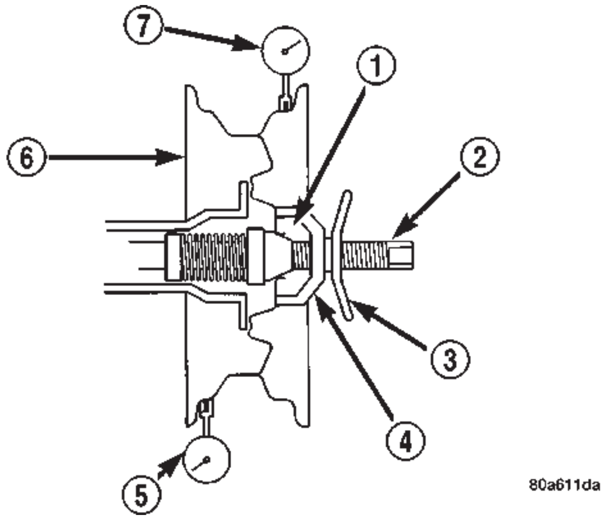

*Fig. 2 Radial Runout*

1 - MOUNTING CONE
2 - SPINDLE SHAFT
3 - WING NUT
4 - PLASTIC CUP
5 - DIAL INDICATOR
6 - WHEEL
7 - DIAL INDICATOR

## STANDARD PROCEDURES - TIRE ROTATION

Tires on the front and rear axles operate at different loads and perform different steering, driving, and braking functions. For these reasons, the tires wear at unequal rates. They may also develop irregular wear patterns. These effects can be reduced by rotating the tires according to the maintenance schedule in the Owners Manual. This will improve tread life, traction and maintain a smooth quiet ride.

The recommended method of tire rotation is (Fig. 4). Other methods can be used, but may not provide the same tire longevity benefits.

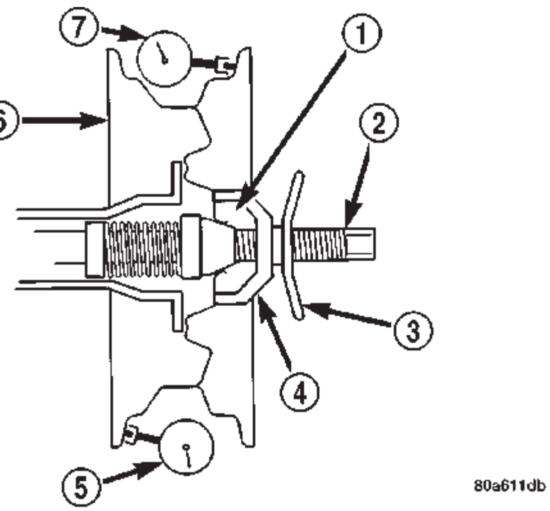

*Fig. 3 Lateral Runout*

1 - MOUNTING CONE
2 - SPINDLE SHAFT
3 - WING NUT
4 - PLASTIC CUP
5 - DIAL INDICATOR
6 - WHEEL
7 - DIAL INDICATOR

Dual wheel vehicles require a different tire rotation pattern. Refer to (Fig. 5) for the proper tire rotation with dual wheels.

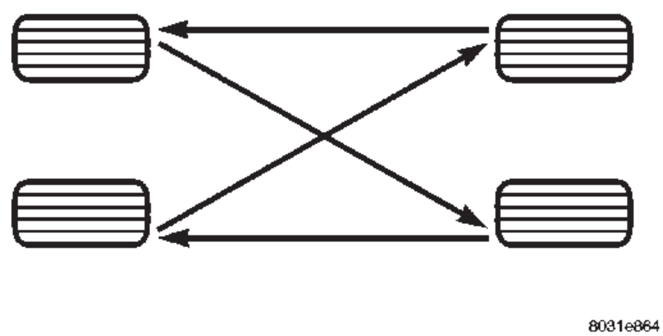

*Fig. 4 Tire Rotation Pattern*

## STANDARD PROCEDURES - MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the outboard surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the out-

TIRES/WHEELS (Continued)

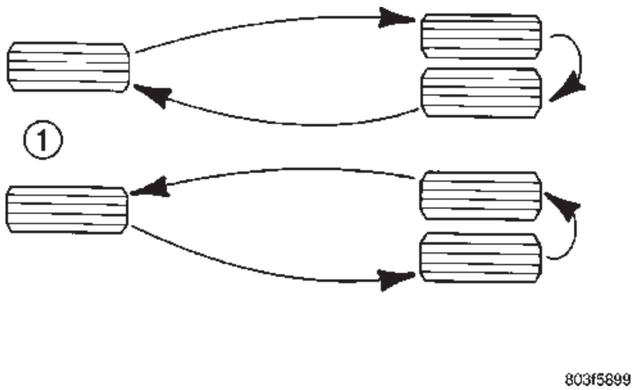

*Fig. 5 Dual Wheel Tire Rotation Pattern*

1 - FRONT

board flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.

(2) Measure the total runout on the center of the tire tread rib with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot. Place a mark on the tire at the valve stem location (Fig. 6).

(3) Break down the tire and remount it 180 degrees on the rim (Fig. 7).

(4) Measure the total indicator runout again. Mark the tire to indicate the high spot.

(5) If runout is still excessive, the following procedures must be done.

- If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
- If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
- If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 8). This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

2 - 1ST HIGH SPOT ON TIRE

## STANDARD PROCEDURES - TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

**NOTE: Static should be used only when a two plane balancer is not available.**

**NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.**

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 9).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 10).

# TIRES

## DESCRIPTION

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

## DESCRIPTION

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

## TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 11).

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **R** up to 106 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S, M & S or M–S** (indicating mud and snow traction) imprinted on the side wall.

## TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

TIRES (Continued)

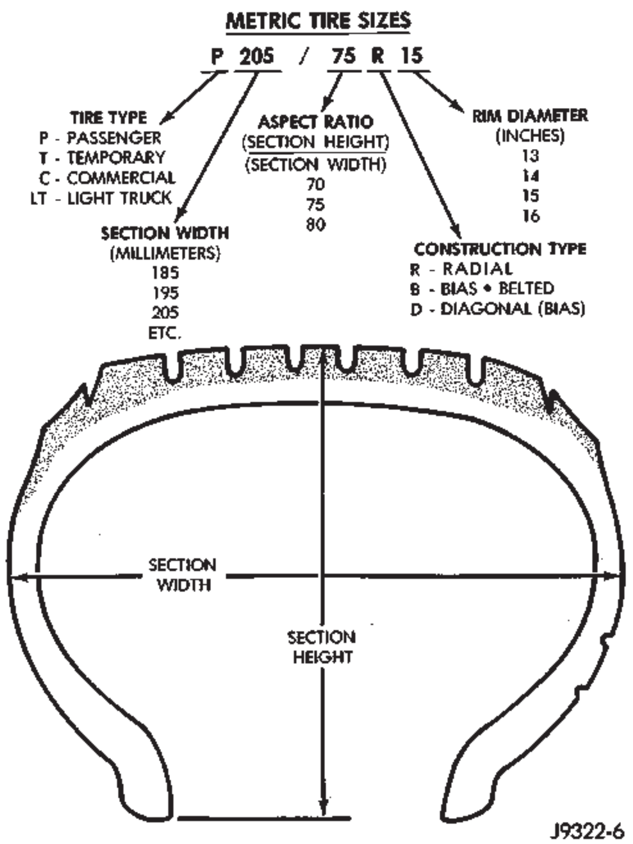

*Fig. 11 Tire Identification*

## DESCRIPTION

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

## DESCRIPTION

Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. For speeds up to and including 120 km/h (75 mph), tires must be inflated to the pressures shown on the tire placard. For continuous speeds in excess of 120 km/h (75 mph), tires must be inflated to the maximum pressure specified on the tire sidewall.

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

For emergency vehicles that are driven at speeds over 90 mph (144 km/h), special high speed tires must be used. Consult tire manufacturer for correct inflation pressure recommendations.

## DESCRIPTION

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

**WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.**

## DESCRIPTION

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure (Fig. 12) .

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks (Fig. 13) .

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the Tire Inflation Pressure Chart provided with the vehicles Owners Manual. A Certification Label on the drivers side door pillar provides the minimum tire and rim size for the vehicle. The label also list the cold inflation pressure for these tires at full load operation

TIRES (Continued)

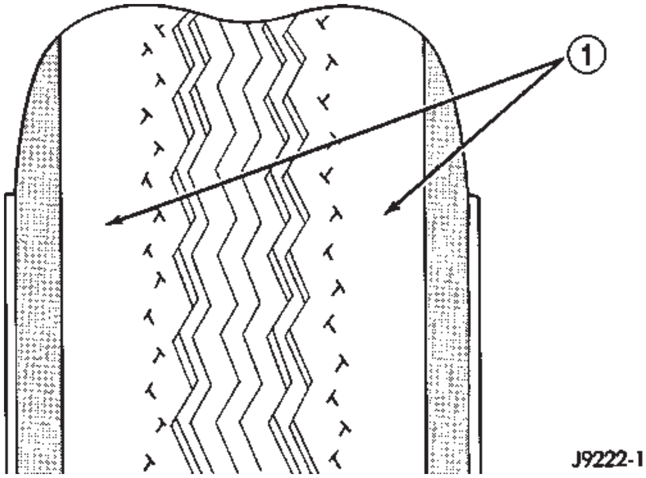

*Fig. 12 Under Inflation Wear*

1 - THIN TIRE THREAD AREAS

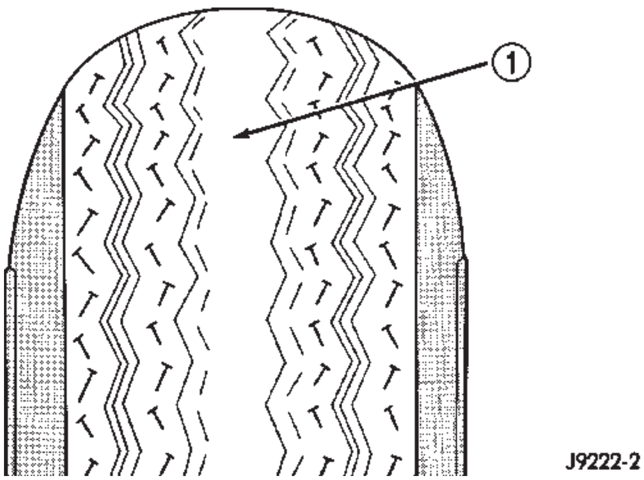

*Fig. 13 Over Inflation Wear*

1 - THIN TIRE THREAD AREA

Tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. Tire pressure should be checked cold once a month. Tire pressure decreases as the ambient temperature drops. Check tire pressure frequently when ambient temperature varies widely.

Tire inflation pressures are cold inflation pressure. The vehicle must sit for at least 3 hours to obtain the correct cold inflation pressure reading. Or be driven less than one mile after sitting for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure build-up.

**WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.**

## DIAGNOSIS AND TESTING - PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

## DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 14).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

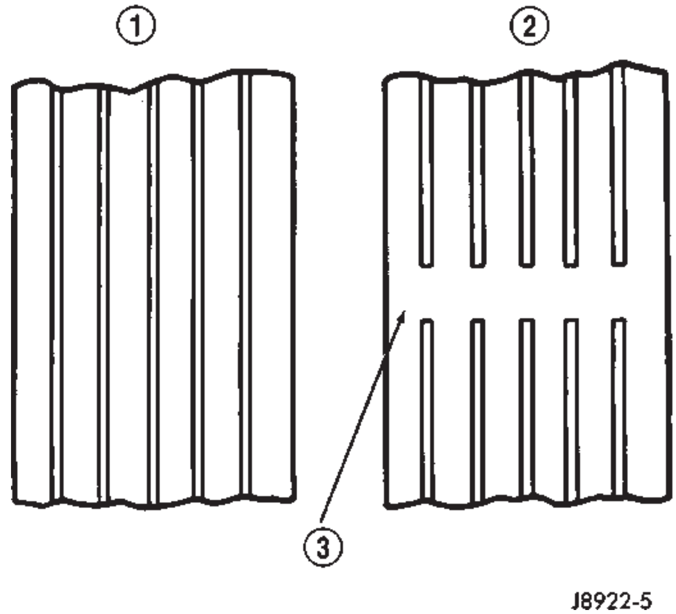

*Fig. 14 Tread Wear Indicators*

1 - TREAD ACCEPTABLE
2 - TREAD UNACCEPTABLE
3 - WEAR INDICATOR

## DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 15).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 15).

TIRES (Continued)

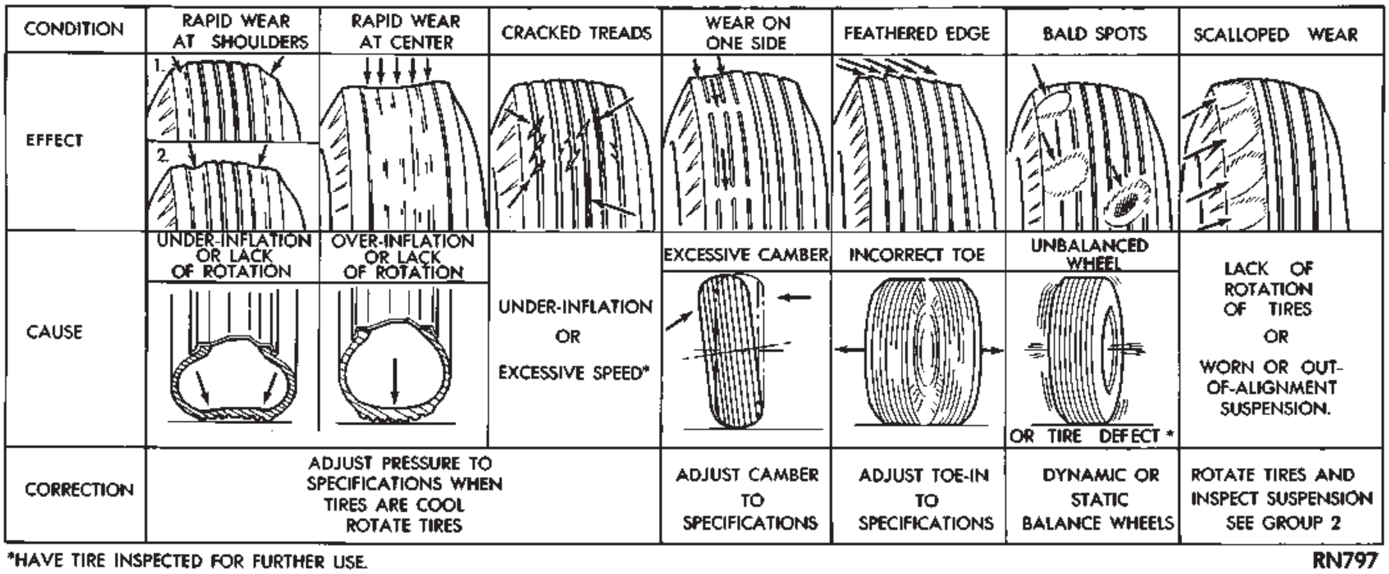

*Fig. 15 Tire Wear Patterns*

## DIAGNOSIS AND TESTING - TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

## STANDARD PROCEDURES - REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 16). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification, (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

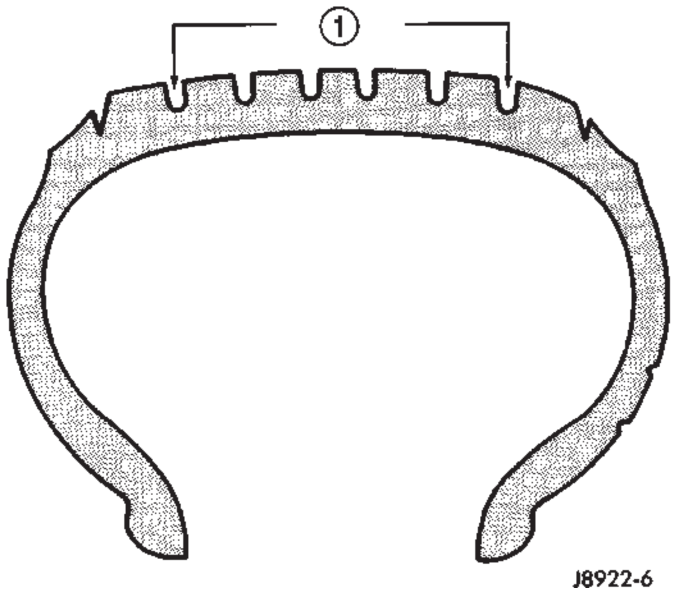

*Fig. 16 Tire Repair Area*

## SPARE TIRE

### DESCRIPTION

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

## WHEELS

### DESCRIPTION

Original equipment wheels are designed for the specified Maximum Vehicle Capacity.

All models use steel or cast aluminum drop center wheels.

Cast aluminum wheels require special balance weights and alignment equipment.

Ram Truck Models equipped with dual rear wheels have eight-stud hole rear wheels. The wheels have a flat mounting surface (Fig. 17). The slots in the wheel must be aligned to provide access to the valve stem (Fig. 18).

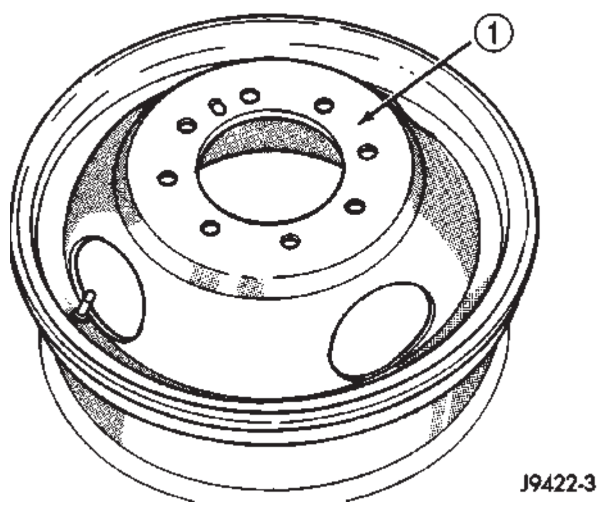

*Fig. 17 Flat Face Wheel*

1 - FLAT FACE

WHEELS (Continued)

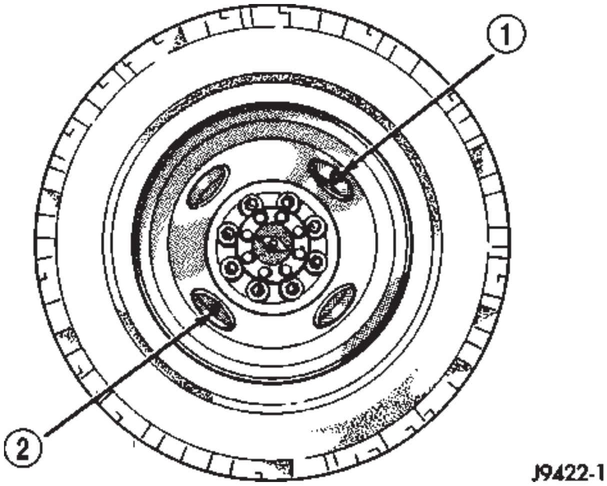

*Fig. 18 Dual Rear Wheels*

1 - INBOARD WHEEL VALVE STEM
2 - OUTBOARD WHEEL VALVE STEM

## OPERATION

The wheel (Fig. 19) has raised sections between the rim flanges and the rim well. Initial inflation of the tire forces the bead over these raised sections. In case of tire failure, the raised sections hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

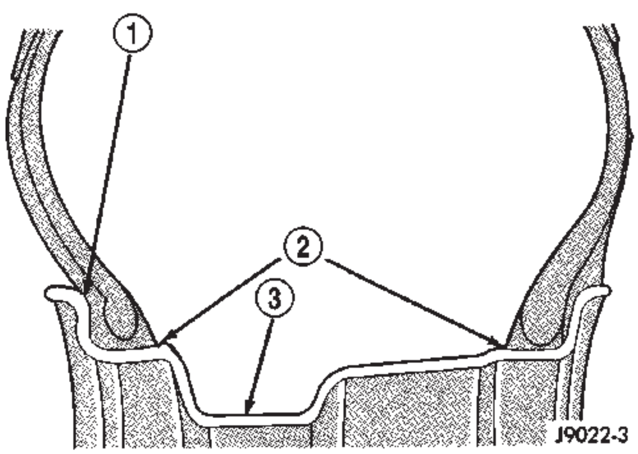

*Fig. 19 Safety Rim*

1 - FLANGE
2 - RIDGE
3 - WELL

## DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:
- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

**NOTE: Do not attempt to repair a wheel by hammering, heating or welding.**

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

**WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.**

## STARDARD PROCEDURE - DUAL REAR WHEEL INSTALLATION

Dual rear wheels use a special heavy duty lug nut wrench. It is recommended to remove and install dual rear wheels only when the proper wrench is available. The wrench is also use to remove wheel center caps for more information refer to Owner’s Manual.

The tires on both wheels must be completely raised off the ground when tightening the lug nuts. This will ensure correct wheel centering and maximum wheel clamping.

A two piece flat face lug nut with right-hand threads is used for retaining the wheels on the hubs (Fig. 20).

The dual rear wheel lug nuts should be tightened according to the following procedure:

- Place two drops of oil to the interface of the nut/washer (Fig. 20) before installing on the wheel stud.

**NOTE: Do not use more then two drops of oil on the nut/washer, since the center caps attach in this area.**

- Tighten the wheel lug nuts in the numbered sequential pattern until they are snug tight. Then tighten lug nut to specified torque following same number sequence, (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

WHEELS (Continued)

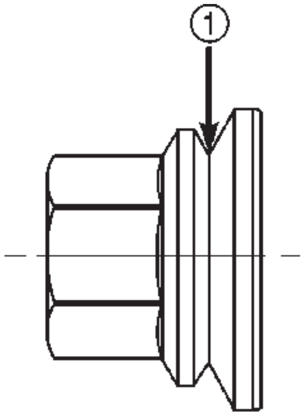

*Fig. 20 Oil Location*

1 - PLACE TWO DROPS OF OIL HERE

• Tighten lug nuts in same numbered sequence a second time to the specified torque. This will ensure that the wheels are thoroughly mated.

• Check lug nut specified torque after 100 miles (160 kilometers). Also after 500 miles (800 kilometers) of vehicle operation.

**NOTE: Wheel lug nuts should be tightened to specified torque at every maintenance interval thereafter.**

## SPECIFICATIONS

### TORQUE CHART

*TORQUE SPECIFICATIONS*

| DESCRIPTION | N·m | Ft. Lbs. | In. Lbs. |
|---|---|---|---|
| Lug Nut BR1500 (5 Stud Wheel) | 130 | 95 | — |
| Lug Nut BR2500 (8 Stud Wheel) | 180 | 135 | — |
| Lug Nut BR3500 (8 Stud Dual Wheel) | 195 | 145 | — |

# STUDS

## REMOVAL

(1) Raise and support the vehicle.
(2) Remove the wheel and tire assembly.
(3) Remove the brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
(4) Remove the stud from the hub with Remover C-4150A (Fig. 21).

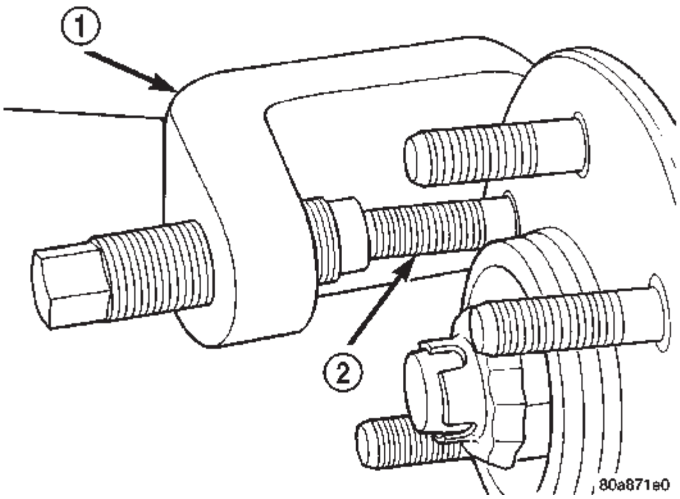

*Fig. 21 Wheel Stud Removal*

1 - REMOVER
2 - WHEEL STUD

## INSTALLATION

(1) Install the new stud into the hub flange.
(2) Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
(3) Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
(4) Remove the lug nut and washers.
(5) Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
(6) Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE), use new the lug nut on stud or studs that were replaced.
(7) Remove the support and lower vehicle.

# WHEEL COVER

## REMOVAL

(1) Insert a hub/cap remover/installer combination tool around the circumference of the wheel between the wheel and wheel trim cover.
(2) Twist the tool to remove wheel trim cover.

## INSTALLATION - REAR

(1) Install one 1 1/2 in. valve stem extension on each rear inner wheel.

**NOTE: A 3/8 in. drive 10mm deep wheel socket with a 10 in. or greater extension can be used to remove the existing valve stem cap and install the extension.**

(2) Install one 1 in. valve stem extension on each outer wheel.
(3) Align the cooling windows of the wheel skin with the cooling windows of the wheel. Seat one side of the wheel skin's retainer onto the wheel. Using a rubber mallet, strike thew wheel skin on the outer circumference. Strike at several locations around the circumference until the skin is fully seated.

**NOTE: The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/cap and the wheel.**

(4) Tug on the hub/cap wheel skin to ensure that they are properly installed.

## INSTALLATION - FRONT

(1) Align the valve stem with the notch in the wheel skin.
(2) Seat on side of the wheel skin's wire retainer on to the wheel.
(3) Using a rubber mallet, strike the opposite side of the wheel skin until the skin is properly seated.

**NOTE: The wheel skin and the hub cap are fully seated when there is a consistant gap between the skin/ cap and the wheel.**

(4) Tug on the hub cap/wheel skin to ensure that they are properly installed.

# BODY

TABLE OF CONTENTS

## BODY

### DESCRIPTION – PUSH-IN FASTENERS

DaimlerChrysler Corporation uses many different types of push-in fasteners to secure the interior and exterior trim to the body. Most of these fasteners can be reused to assemble the trim during various repair procedures. At times, a push-in fastener cannot be removed without damaging the fastener or the component it is holding. If it is not possible to remove a fastener without damaging a component or body, cut or break the fastener and use a new one when installing the component. Never pry or pound on a plastic or pressed-board trim component. Using a suitable fork-type prying device, pry the fastener from the retaining hole behind the component being removed. When installing, verify fastener alignment with the retaining hole by hand. Push directly on or over the fastener until it seats. Apply a low-force pull to the panel to verify that it is secure.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges holding the component in place.

### DESCRIPTION – LOCK CYLINDERS

Ignition, door, deck lid, and rear hatch lock cylinders are all codable to the key. Lock barrels, tumblers, and tumbler springs are available to allow the technician to change replacement locks cylinders to match the customer's original key set. See the appropriate section in this manual for lock cylinder removal. See the Mopar® catalogue for part numbers and lock coding procedures.

### SAFETY PRECAUTIONS AND WARNINGS

**WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**
**AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**
**DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

**CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.**
**Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
**Always have a fire extinguisher ready for use when welding.**
**Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.**
**Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
**Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
**Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

BODY (Continued)

## DIAGNOSIS AND TESTING – WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

## VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

## WATER LEAK TESTS

**WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations refer to Group 0, Lubrication and Maintenance, General Information section.

## WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

### MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

### BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

### PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

BODY (Continued)

## DIAGNOSIS AND TESTING – WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

Wind noise can also be caused by improperly fitted exterior moldings or body ornamentation. Loose moldings can flutter, creating a buzzing or chattering noise. An open cavity or protruding edge can create a whistling or howling noise. Inspect the exterior of the vehicle to verify that these conditions do not exist.

## VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

### ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

### POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

# DECKLID/HATCH/LIFTGATE/TAILGATE

### TABLE OF CONTENTS

## APPLIQUE

### REMOVAL

(1) Apply a length of masking tape on the body, parallel to the top edge of the applique to use as a guide, if necessary.

(2) Warm the tailgate applique and tailgate metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(3) Pull applique from tailgate (Fig. 1).

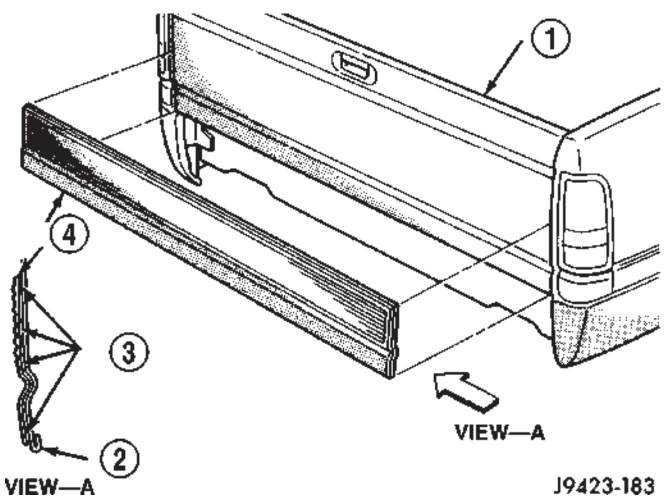

*Fig. 1 Tailgate Applique*

1 - TAILGATE
2 - TAILGATE
3 - ADHESIVE TAPE
4 - APPLIQUE

### INSTALLATION

(1) Remove adhesive tape residue from painted surface of tailgate.

(2) If applique is to be reused, remove tape residue from applique. Clean back of applique with MOPAR®, Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of applique.

(3) Clean tailgate surface with MOPAR®, Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth. An adhesion promoter must be applied to ensure proper applique adhesion.

(4) Remove protective cover from tape on back of applique. Apply applique to body below the masking tape guide (Fig. 1).

(5) Remove masking tape guide and heat tailgate and applique, see step one. Firmly press applique to tailgate to assure adhesion.

## CHECK CABLE

### REMOVAL

(1) Open tailgate.

(2) Pry lock tab outward to clear stud head on cargo box (Fig. 2).

(3) Push cable end forward until stud head is in clearance hole portion of cable end.

(4) Separate cable end from stud.

(5) Remove screw attaching cable to tailgate.

(6) Separate check cable from tailgate.

CHECK CABLE (Continued)

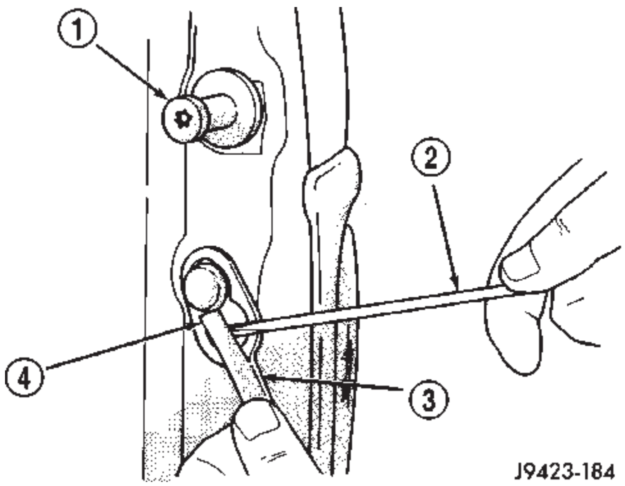

*Fig. 2 Tailgate Check*

1 - TAILGATE STRIKER
2 - SCREW DRIVER
3 - TAILGATE CHECK CABLE
4 - LOCK TAB

### INSTALLATION

(1) Position check cable on tailgate.
(2) Install screw attaching small end of cable to tailgate.
(3) Position large end of cable onto stud head and slide downward to secure lock tab.

## DECALS

### REMOVAL

(1) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
(2) Peel tape stripe from body panel using an even pressure pull.
(3) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

### INSTALLATION

(1) Clean painted body surface with Mopar® Super Clean solvent or equivalent and a lint free cloth.
(2) Remove protective cover from back side of decal.
(3) Position decal properly on body.
(4) Press decal firmly to body with palm of hand.
(5) If temperature is below 21°C (70°F) warm decal with a heat lamp or gun to assure adhesion. Do not exceed 65°C (150°F) when heating emblem.

## HANDLE ESCUTCHEON

### REMOVAL

(1) Lift and hold tailgate latch release handle.
(2) Using a trim stick (C–4755), pry bottom of escutcheon outward to disengage clips.
(3) Rotate escutcheon upward to disengage clip above release handle.
(4) Push escutcheon downward from behind to clear handle.
(5) Separate escutcheon from tailgate (Fig. 3).

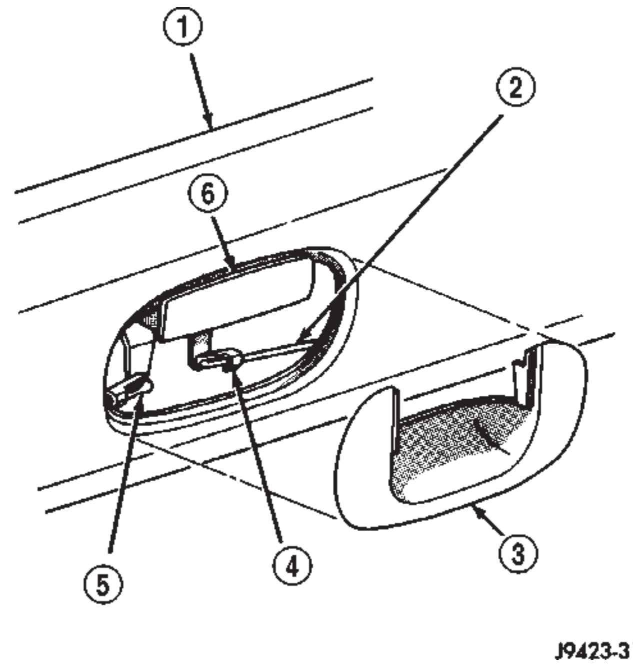

*Fig. 3 Tailgate Handle Escutcheon*

1 - TAILGATE
2 - HANDLE—TO—RIGHT LATCH CONTROL ROD
3 - ESCUTCHEON
4 - LATCH ROD RETAINER
5 - HANDLE—TO—LATCH CONTROL ROD AND RETAINER
6 - HANDLE

### INSTALLATION

(1) Insert upper ends of escutcheon into handle opening.
(2) Lift escutcheon upward from behind release handle.
(3) Press bottom of escutcheon inward to engage clips.

# LATCH

## REMOVAL

(1) Remove tailgate latch handle escutcheon (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - REMOVAL).

(2) Open tailgate.

(3) Disengage linkage rod from latch handle.

(4) Remove screws attaching latch to tailgate (Fig. 4).

(5) Separate latch from tailgate.

(6) Pull latch and linkage rod from tailgate (Fig. 5).

## INSTALLATION

(1) Position latch and linkage rod in tailgate.

(2) Install upper screw attaching latch to tailgate.

(3) Install lower screw attaching check cable and latch to tailgate.

(4) Engage linkage rod to latch handle.

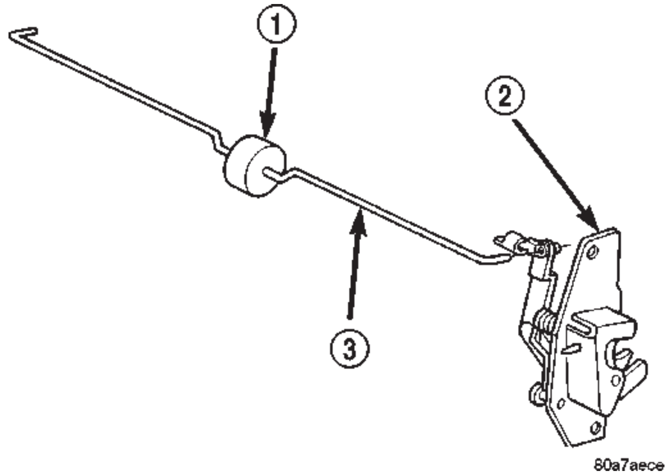

***Fig. 5 Tailgate Latch and Linkage Rod***

1 - SILENCER
2 - LATCH ASSEMBLY
3 - LINKAGE ROD

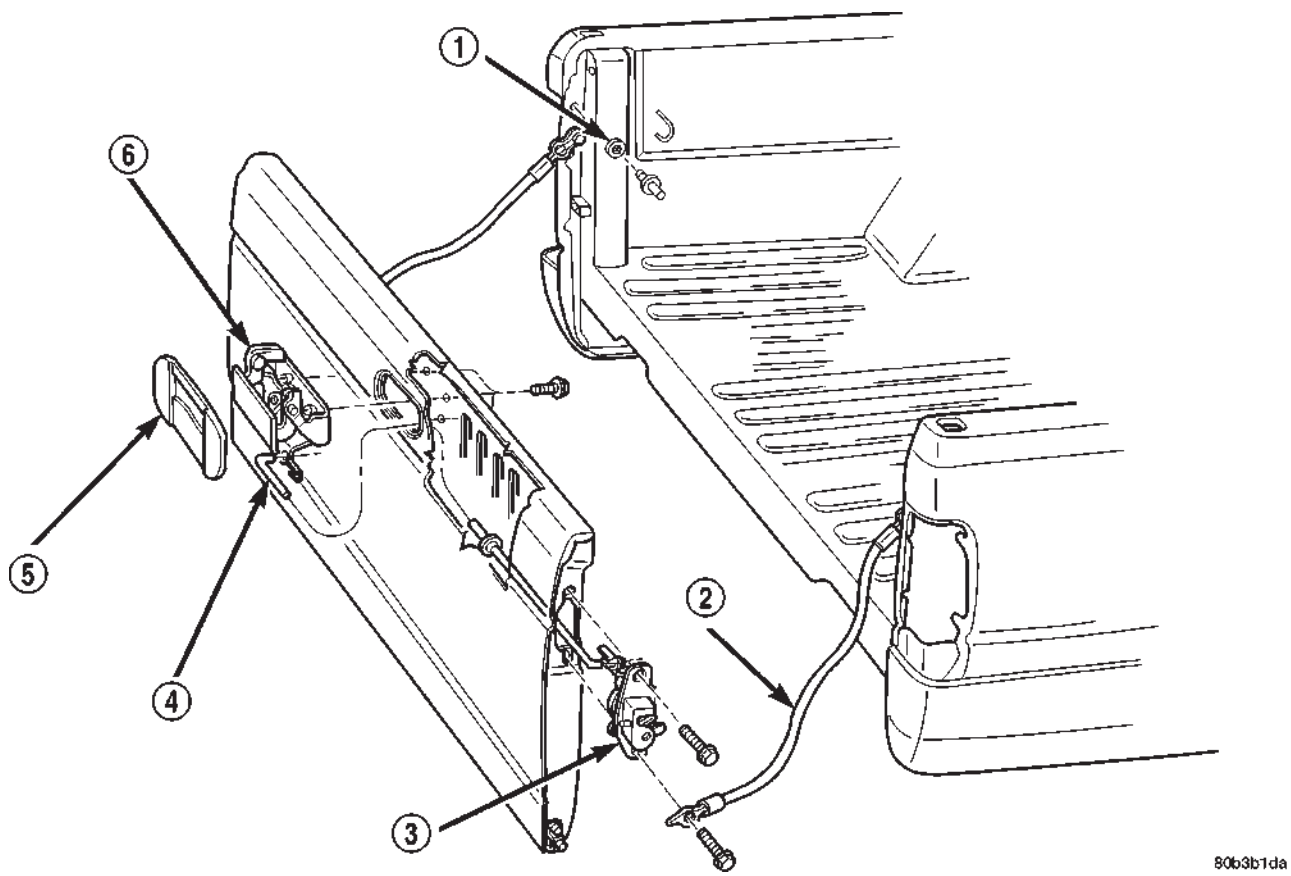

***Fig. 4 Tailgate Latch***

1 - SPACER
2 - CHECK CABLE
3 - LATCH
4 - LINKAGE ROD
5 - HANDLE ESCUTCHEON
6 - LATCH HANDLE

LATCH (Continued)

(5) Install tailgate latch handle escutcheon (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - INSTALLATION).

# LATCH HANDLE

## REMOVAL

(1) Remove tailgate latch handle escutcheon (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - REMOVAL).

(2) Disengage clips holding linkage rods to latch handle.

(3) Separate linkage rods from handle.

(4) Remove screws attaching latch handle to tailgate (Fig. 6).

(5) Separate latch handle from tailgate.

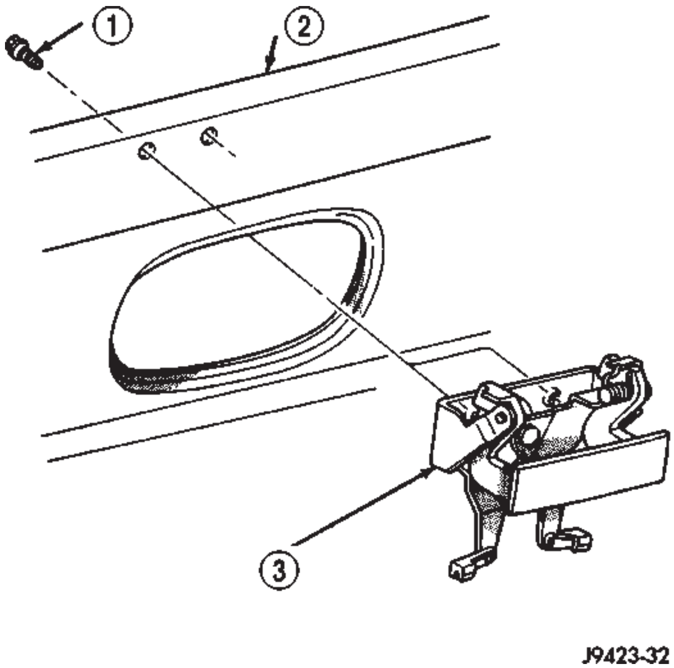

*Fig. 6 Tailgate Latch Handle*

1 - SCREW
2 - TAILGATE
3 - HANDLE ASSEMBLY

## INSTALLATION

(1) Position latch handle in tailgate.

(2) Install screws attaching latch handle to tailgate.

(3) Install linkage rods to latch handle.

(4) Engage clips to linkage rods.

(5) Install tailgate latch handle escutcheon.

# LATCH STRIKER

## REMOVAL

(1) Open tailgate.

(2) Mark outline of striker on cargo box jamb to aid installation.

(3) Using a Torx drive wrench, remove striker and washer from cargo box (Fig. 7).

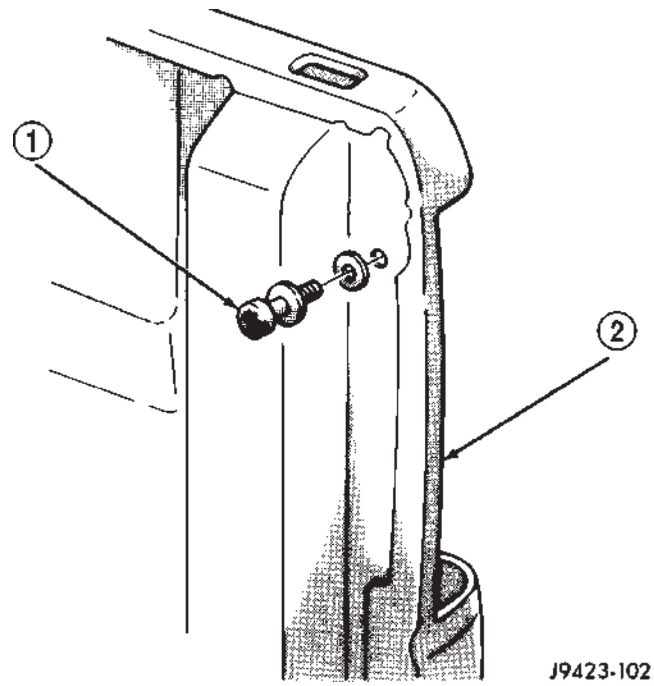

*Fig. 7 Tailgate Striker*

1 - TAILGATE STRIKER
2 - CARGO BOX

## INSTALLATION

(1) Position striker and washer on jamb using alignment outline as reference and install with Torx drive wrench.

# SLAM BUMPER

## REMOVAL

(1) Open tailgate.
(2) Remove screw holding slam bumper to cargo box (Fig. 8).
(3) Separate slam bumper from vehicle.

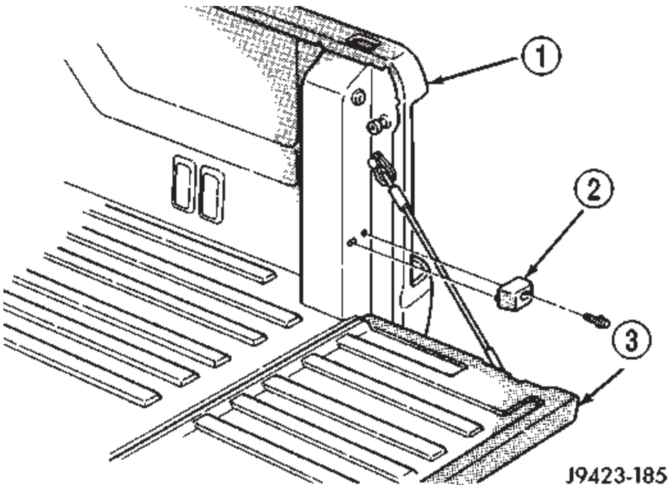

*Fig. 8 Tailgate Slam Bumper*

1 - CARGO BOX
2 - SLAM BUMPER
3 - TAILGATE

## INSTALLATION

(1) Position slam bumper on vehicle.
(2) Install screw holding slam bumper to cargo box.
(3) Close tailgate and verify operation.

# TAILGATE

## REMOVAL

(1) Open tailgate.
(2) Disconnect tailgate marker light harness, if equipped.
(3) Remove tailgate check cables (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/CHECK CABLE - REMOVAL).
(4) Close tailgate until the notch in the right hand collar aligns with the pivot pin.
(5) Slip tailgate hinge collar from pivot pins.
(6) Slide tailgate to the right and separate left hand collar from the pivot pin.
(7) Separate tailgate from vehicle.

## INSTALLATION

(1) Position tailgate collar on left hand pivot pin and slide tailgate to the left.
(2) Raise tailgate until the notch in the right hand collar aligns with the pivot pin.
(3) Install tailgate check cables (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/CHECK CABLE - INSTALLATION).
(4) Connect tailgate marker light harness, if equipped.

# DOOR - FRONT

## TABLE OF CONTENTS

# APPLIQUE

## REMOVAL

(1) Using a heat lamp, warm B-pillar to 38° C (100° F).

(2) Remove glass run weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR GLASS RUN WEATHERSTRIP - REMOVAL).

(3) Remove outer belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - REMOVAL).

(4) Using an even pressure pull, peel B-pillar applique away from the B-pillar.

## INSTALLATION

Installation equipment needed:

- Lint free applicator cloth
- six inch applicator squeegee
- Piercing pin

(1) Clean B-pillar using Mopar Super Kleen or equivalent.

(2) Wipe surface with a lint free cloth.

(3) Using a heat gun, warm surface to 22° C (70° F).

(4) Fold down, up/down locator tab (1a or 1b) (Fig. 1)along crease.

(5) Remove carrier from adhesion strip (2).

(6) Using up/down locator tab (1a or 1b) and fore/aft locator tab (3a or 3b), position the applique on the upper portion of the B-pillar.

(7) Using the lower edge locator (4), position the applique on the lower portion of the B-pillar.

(8) Verify the applique is positioned correctly and press the adhesion strip (2) to the door to temporarily secure it in place.

(9) Remove the carrier for the applique.

(10) Holding the applique from the surface, apply firm downward pressure with a six inch applicator squeegee. Ensure the lower rear edge (4) is aligned correctly.

(11) Wrap edges around door to at least a 90° angle.

(12) Remove premask by pulling in a firm continuous manner from top down at 180°.

(13) Complete wrapping applique around the door edges.

(14) Inspect for air bubbles. Small bubbles can be pierced with a sharp pin and smoothed out.

APPLIQUE (Continued)

(15) Install outer belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - INSTALLATION).

(16) Install glass run weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR GLASS RUN WEATHERSTRIP - INSTALLATION).

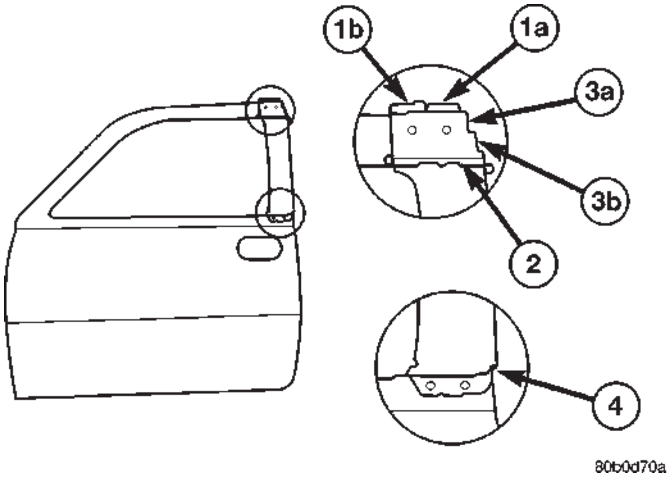

*Fig. 1 B-Pillar Applique*

1A = Club Cab - Up/Down
1B = Quad Cab - Up/Down
2 = Adhesion Strip
3A = Club Cab - For/Aft
3B = Quad Cab - For/Aft
4 = Rear Edge Locator

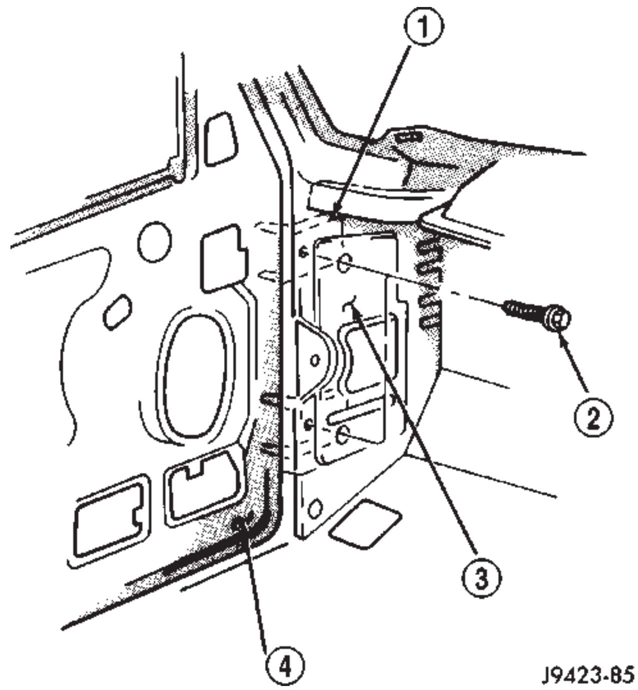

*Fig. 2 Door Hinge Hidden Bolt*

1 - HINGE
2 - DOOR HINGE SCREW
3 - A—PILLER
4 - DOOR

# DOOR

## REMOVAL

(1) Remove cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).

(2) Disengage door wire harness connector of instrument panel harness and push door harness through access hole in pillar.

(3) Remove hidden bolts attaching door hinge to hinge pillar from behind cowl panel (Fig. 2).

(4) Using a grease pencil or equivalent, mark the outline of the door hinges on the hinge pillar to aid installation.

(5) Support door on a suitable lifting device.

(6) Remove bolts attaching lower door hinge to hinge pillar (Fig. 3).

(7) While holding door steady on lift, remove bolts attaching upper door hinge to hinge pillar.

(8) Separate door from vehicle.

## INSTALLATION

(1) While holding door steady on lift, position door at A-pillar.

(2) Align hinges using reference marks.

(3) Install bolts attaching upper door hinge to hinge pillar.

(4) Install bolts attaching lower door hinge to hinge pillar (Fig. 3).

(5) Install hidden bolts attaching door hinge to hinge pillar from behind cowl panel (Fig. 2).

(6) Align door to achieve equal spacing on all sides and flush across the gaps.

(7) Tighten hinge bolts to 28 N·m (21 ft. lbs.) torque.

(8) Route harness through door and engage door wire harness connector.

(9) Install cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

## ADJUSTMENT – FRONT DOOR FORE/AFT

Fore/aft (lateral) door adjustment is done by loosening the hinge to cowl screws one hinge at a time. Then move the door to the correct position.

(1) Support the door with a padded floor jack.

(2) Loosen the hinge to cowl screws, if necessary, refer to the front door hinge removal/installation procedure for hinge fastener location. Move the door to the correct fore/aft position.

(3) Tighten the hinge to cowl screws.

(4) Remove the floor jack from the door.

DOOR (Continued)

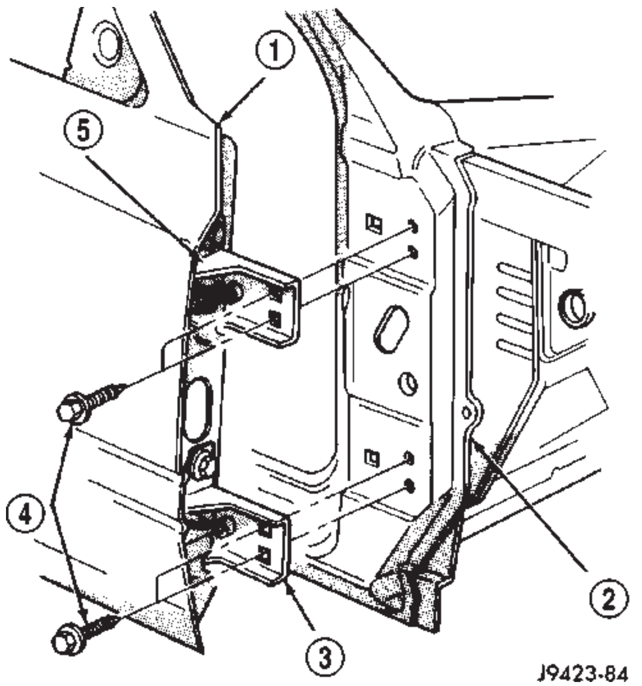

*Fig. 3 Door*

1 - DOOR
2 - A—PILLER
3 - LOWER DOOR HINGE
4 - SCREW
5 - UPPER DOOR HINGE

### ADJUSTMENT – FRONT DOOR UP/DOWN

Up/down door adjustment is done by loosening the hinge to cowl fasteners at both hinges. Then move the door to the correct position.

(1) Support the door with a padded floor jack.
(2) Loosen hinge to cowl fasteners at both hinges. Move the door to the correct up/down position.
(3) Tighten the hinge to cowl fasteners.
(4) Remove the floor jack from the door.

### ADJUSTMENT – FRONT DOOR IN/OUT

In/out door adjustment is done by loosening the hinge to door fasteners. Then move the door to the correct position.

(1) Support the door with a padded floor jack.
(2) Loosen the applicable hinge to door fasteners. Move the door to the correct in/out position.
(3) If necessary, loosen the other hinge to door fasteners and move the door to the correct in/out position.
(4) Tighten the hinge to door fasteners.
(5) Remove the floor jack from the door.

## DOOR GLASS

### REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
(2) Remove inner door belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL).
(3) Align door glass lift plate to access holes in inner door panel.
(4) Loosen bolts attaching front lower run channel to inner door panel.
(5) Remove nuts attaching door glass to lift plate (Fig. 4).
(6) Separate glass from lift plate.
(7) Lift glass upward and out of opening at top of door.

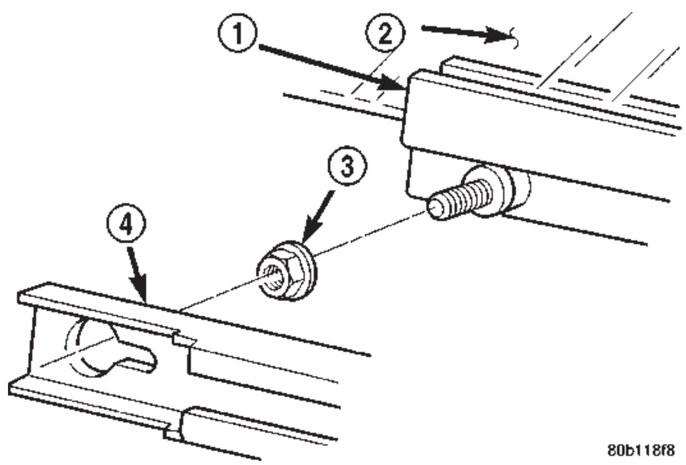

*Fig. 4 Door Glass*

1 - GLASS LIFT PLATE
2 - GLASS
3 - NUT
4 - REGULATOR ARM LOWER CHANNEL

### INSTALLATION

(1) Position in door.
(2) Insert glass in lift plate.

**CAUTION: Do not exceed 11 N·m (8 ft. lbs.) torque when tightening the nuts that attach the glass to the lift plate.**

(3) Install nuts attaching glass to lift plate (Fig. 4). Tighten nuts to 9 N·m (7 ft. lbs.) torque.
(4) Tighten bolts attaching front lower run channel to inner door panel.
(5) Install inner door belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - INSTALLATION).
(6) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

## EXTERIOR HANDLE

### REMOVAL

(1) Remove the waterdam (Refer to 23 - BODY/ DOOR - FRONT/WATERDAM - REMOVAL).
(2) Raise the window to the closed position.
(3) Remove fastener access plug from door end panel.
(4) Disengage clips holding latch and lock rods to door latch.
(5) Separate latch and lock rods from door latch.
(6) Remove nuts attaching outside door handle to door (Fig. 5).
(7) Separate outside door handle from door.

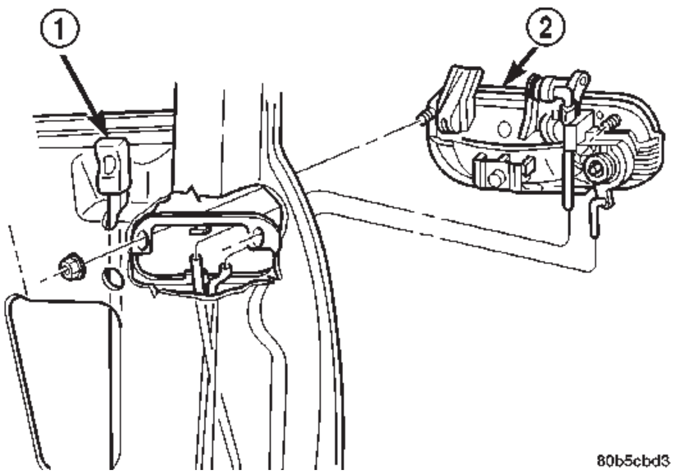

*Fig. 5 Outside Door Handle*

1 - LOCK KNOB
2 - OUTSIDE HANDLE

### INSTALLATION

(1) Position outside door handle in door.
(2) Install nuts attaching outside door handle to door.
(3) Engage latch and lock rods to door latch.
(4) install access plug to door end panel.
(5) Install the door waterdam (Refer to 23 - BODY/ DOOR - FRONT/WATERDAM - INSTALLATION).

## GLASS RUN CHANNEL

### REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
(2) Raise the window to the closed position..
(3) Remove bolts holding run channel to inner door panel (Fig. 6) and (Fig. 7).
(4) Slide channel downward to disengage it from the upper glass frame.
(5) Separate door glass run channel from door.

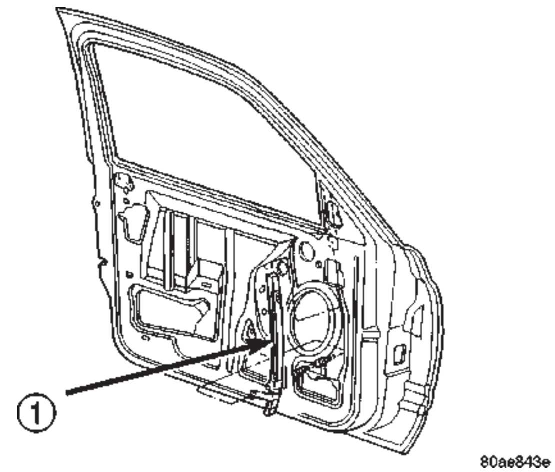

*Fig. 6 Front Glass Run Lower Channel*

1 - FRONT GLASS RUN CHANNEL

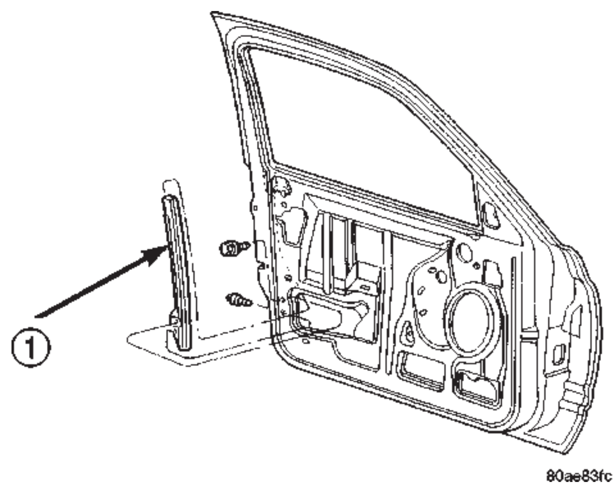

*Fig. 7 Rear Glass Run Lower Channel*

1 - REAR GLASS RUN CHANNEL

### INSTALLATION

(1) Position door glass run channels on inner door panel.
(2) Slide channel upward to engage it in the upper glass frame.
(3) Install bolts attaching run channels to inner door panel (Fig. 6) and (Fig. 7).
(4) Install the door waterdam (Refer to 23 - BODY/ DOOR - FRONT/WATERDAM - INSTALLATION).

## HINGE

### REMOVAL

(1) Remove cowl trim panel (Refer to 23 - BODY/ INTERIOR/COWL TRIM COVER - REMOVAL).
(2) Remove hidden bolt attaching door hinge to hinge pillar (Fig. 2).

HINGE (Continued)

(3) Support door on a suitable lifting device.

(4) Using a grease pencil or equivalent, mark the outline of the door hinge on the hinge pillar to aid installation.

(5) Remove bolts attaching door hinge to hinge pillar (Fig. 3).

(6) Remove nut and bolt attaching door hinge to door end frame (Fig. 8).

(7) Separate door hinge from vehicle.

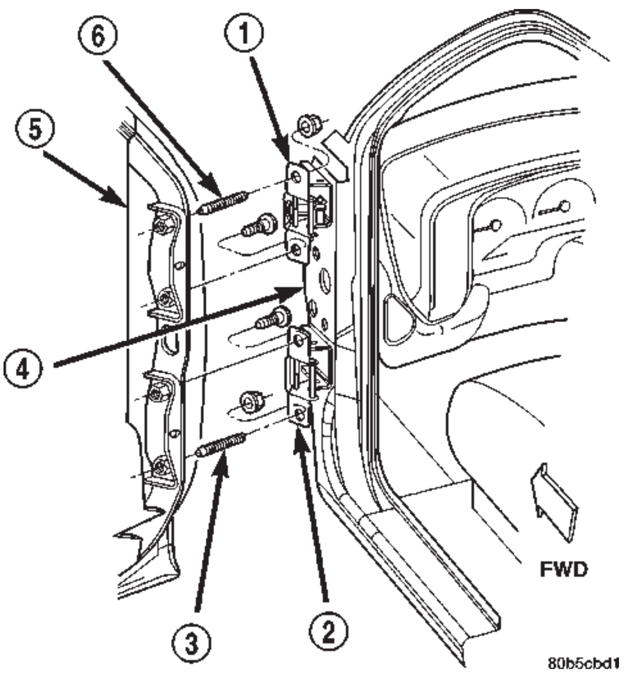

*Fig. 8 Door Hinge*

1 - UPPER HINGE
2 - LOWER HINGE
3 - STUD
4 - HINGE PILLAR
5 - DOOR
6 - STUD

## INSTALLATION

(1) If necessary, paint replacement door hinge before installation.

(2) Position hinge on door end frame.

(3) Align hinge using reference marks.

(4) Install nuts and bolts attaching door hinge to door end frame. Tighten nuts and bolts to 28 N·m (21 ft. lbs.) torque.

(5) Install bolts attaching door hinge to hinge pillar. Tighten bolts to 28 N·m (21 ft. lbs.) torque.

(6) Install hidden bolt attaching door hinge to hinge pillar. Tighten bolt to 28 N·m (21 ft. lbs.) torque.

(7) Remove support.

(8) Install cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

# INSIDE HANDLE ACTUATOR

## REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Raise the window to the closed position.

(3) Remove the screws attaching the actuator to the door (Fig. 9).

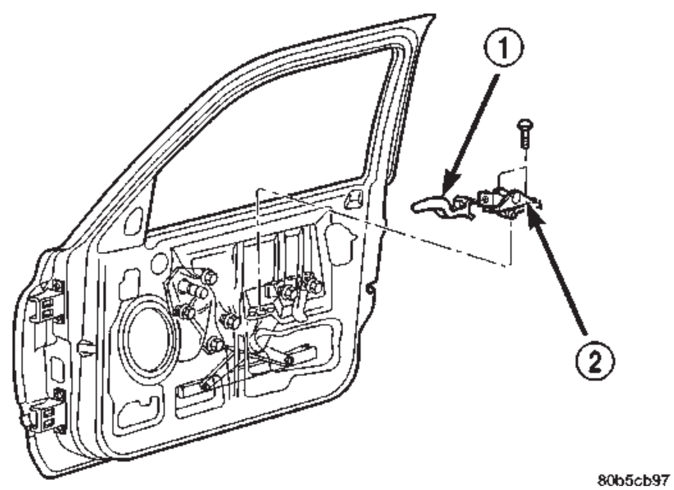

*Fig. 9 Front Door Inside Handle Actuator*

1 - INSIDE HANDLE
2 - ACTUATOR

## INSTALLATION

(1) Install the screws attaching the actuator to the door.

(2) Test handle for proper operation.

(3) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

# LATCH

## REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Disengage clips attaching lock and latch rods to door latch.

(3) Disconnect power door lock/latch connector, if equipped (Fig. 10).

(4) Remove screws attaching door latch to door end panel (Fig. 11).

(5) Separate door latch/lock from door.

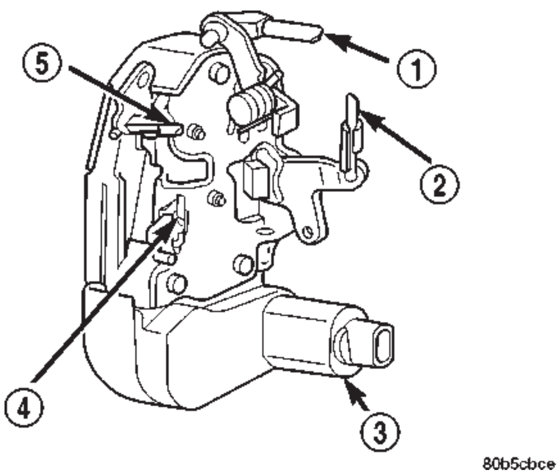

*Fig. 10 Power Lock/Latch Connector*

1 - INSIDE HANDLE—TO—LATCH ROD
2 - LOCK KNOB—TO—LATCH ROD
3 - POWER LATCH CONNECTOR
4 - LOCK CYLINDER—TO—LATCH ROD
5 - OUTSIDE HANDLE—TO—LATCH ROD

## INSTALLATION

(1) Position door latch/lock in door.

(2) Install screws attaching door latch to door end panel. Tighten screws to 10 N·m (7 ft. lbs.) torque.

(3) Connect power door lock/latch connector, if equipped.

(4) Engage clips attaching lock and latch rods to door latch.

(5) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

## ADJUSTMENT – FRONT DOOR LATCH

(1) Insert a hex-wrench through the elongated hole in the door end frame near the latch striker opening (Fig. 12).

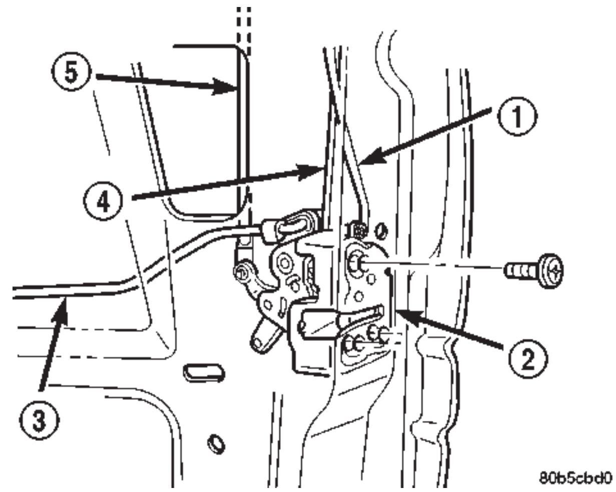

*Fig. 11 Front Door Latch*

1 - OUTSIDE HANDLE—TO—LATCH ROD
2 - LATCH
3 - INSIDE HANDLE—TO—LATCH ROD
4 - LOCK CYLINDER—TO—LATCH ROD
5 - LOCK KNOB—TO—LATCH ROD

(2) Loosen torx head screw on the side of the latch linkage.

(3) Lift upward on outside door handle and release it.

(4) Tighten torx head screw on latch.

(5) Verify latch operation.

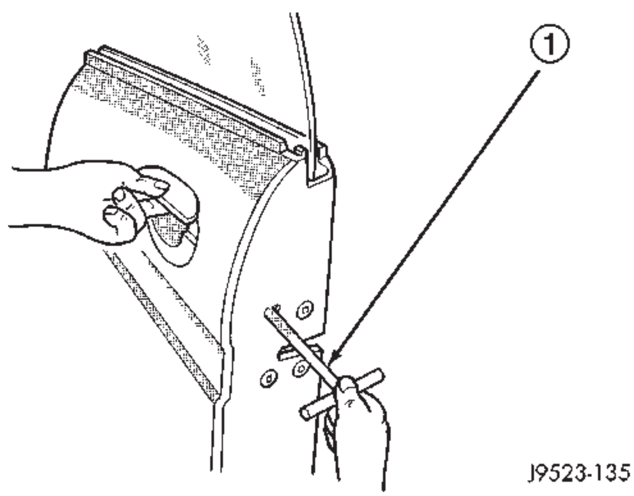

*Fig. 12 DOOR LATCH ADJUSTMENT*

1 - HEX WRENCH

# LATCH STRIKER

## REMOVAL

(1) Mark outline of striker base on B-pillar with a grease pencil or equivalent to aid installation.

(2) Remove screws attaching striker to B-pillar (Fig. 13).

(3) Separate striker from vehicle.

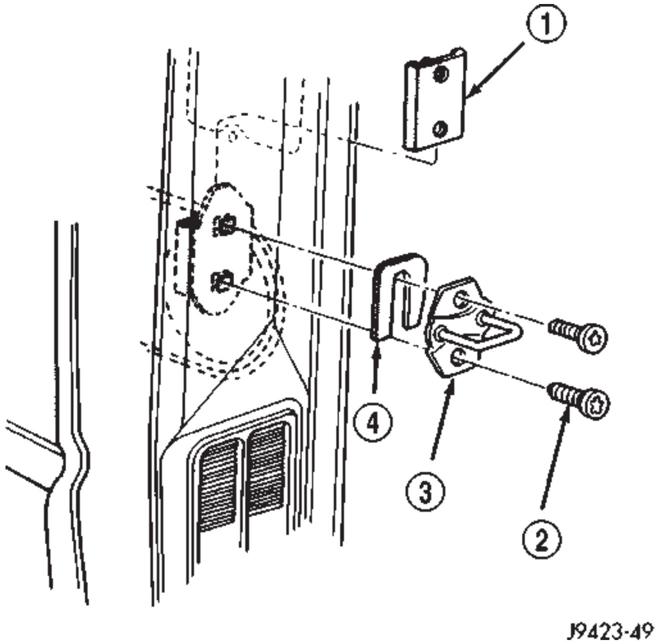

*Fig. 13 Front Door Latch Striker*

1 - RETAINING PLATE
2 - SCREW
3 - STRIKER
4 - SPACER

## INSTALLATION

(1) Position striker on vehicle and align with reference marks.

(2) Install screws attaching striker to B-pillar. Tighten screws to 28 N·m (21 ft. lbs.) torque. (Fig. 13).

# LOCK CYLINDER

## REMOVAL

(1) Remove outside door handle (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL).

(2) Remove clip securing lock cylinder to outside door handle (Fig. 14).

(3) Pull lock cylinder from door handle.

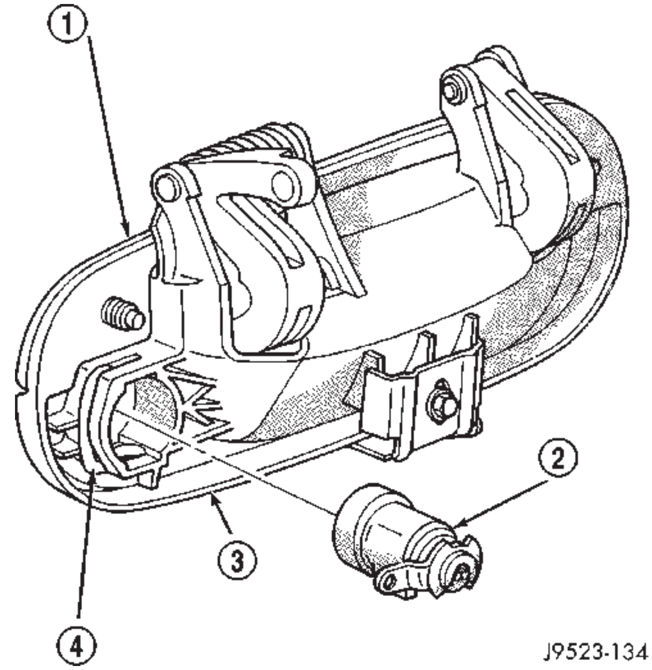

*Fig. 14 Door Lock Cylinder*

1 - DOOR HANDLE
2 - LOCK CYLINDER
3 - LOCK CYLINDER RETAINER
4 - LOCK RETAINING CLIP

## INSTALLATION

(1) Position lock cylinder in door handle.

(2) Install clip securing lock cylinder to outside door handle.

(3) Install outside door handle (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION).

# SIDE VIEW MIRROR FLAG

## REMOVAL

(1) Remove door trim panel.
(2) Remove flag door seal.
(3) Remove nuts attaching mirror flag cover to door frame (Fig. 15).
(4) Separate flag cover from door.

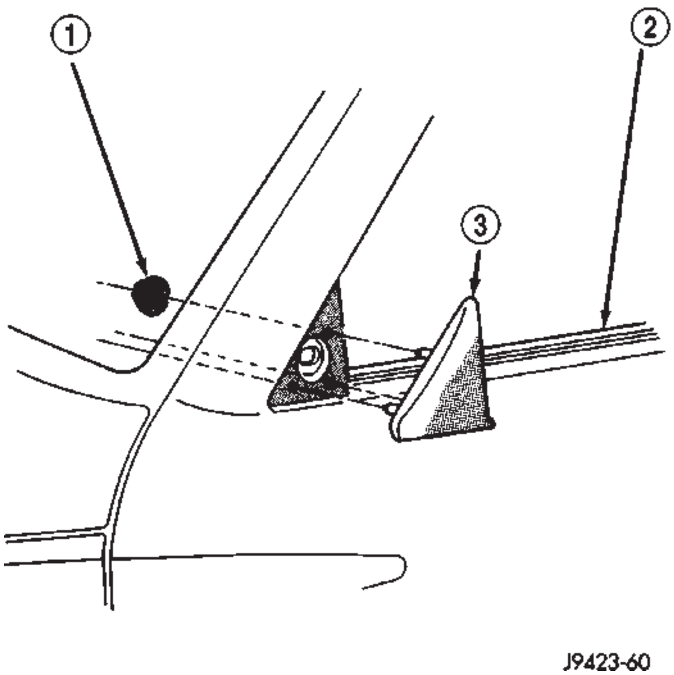

*Fig. 15 Mirror Flag Cover*

1 - NUT
2 - DOOR
3 - FLAG COVER ASSEMBLY

## INSTALLATION

(1) Position flag cover on door.
(2) Install nuts attaching mirror flag cover to door frame.
(3) Install flag door seal.
(4) Install door trim panel.

# TRIM PANEL

## REMOVAL

(1) Roll window down.
(2) Remove window crank (Fig. 16), if equipped.
(3) Remove screw attaching trim panel to outside mirror frame.
(4) Remove screws attaching pull cup to door (Fig. 17).
(5) Using a trim panel removal tool, disengage clips around perimeter of trim panel, attaching trim panel to door.
(6) While holding bottom of trim panel away from door, simultaneously lift upward and inboard.
(7) Disengage power mirror switch connector, if equipped.
(8) Disengage power window/lock switch connectors from switch panel, if equipped (Fig. 18).
(9) Separate trim panel from door.

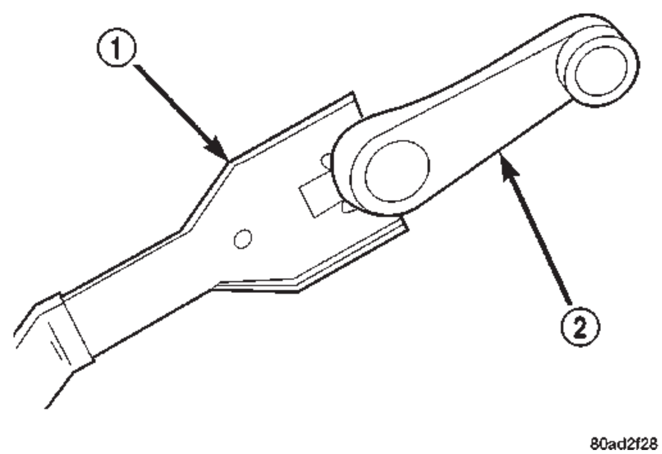

*Fig. 16 Window Crank—Typical*

1 - WINDOW CRANK REMOVAL TOOL
2 - WINDOW CRANK

## INSTALLATION

**NOTE: When replacing door trim panel, installer must replace the X-mas tree style pin 6506878aa.**

(1) Engage power mirror switch connector, if equipped.
(2) Engage power window/lock switch connectors to switch panel, if equipped.
(3) Position trim panel on door.
(4) Engage clips around perimeter of trim panel, attaching trim panel to door.
(5) Install screws attaching pull cup to door.
(6) Install screw attaching trim panel to outside mirror frame.
(7) Install window crank, if equipped.

TRIM PANEL (Continued)

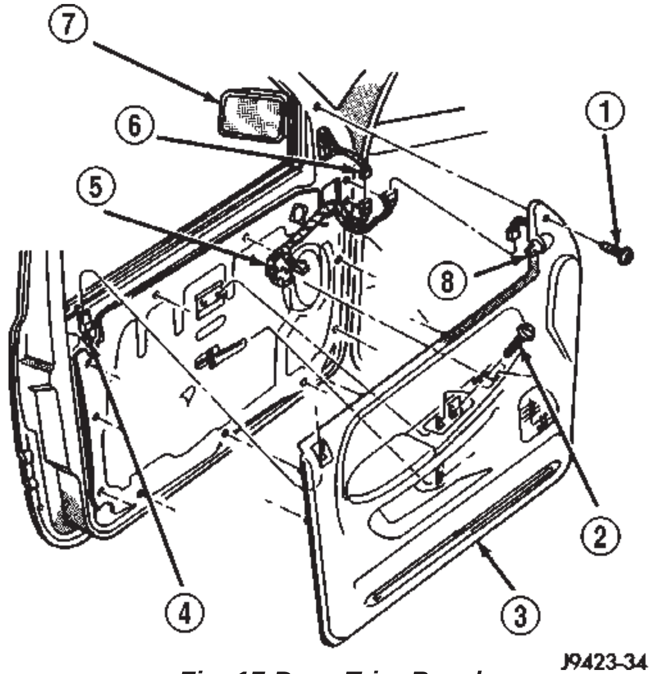

*Fig. 17 Door Trim Panel*

1 - SCREW
2 - SCREW
3 - TRIM PANEL
4 - DOOR LOCK BUTTON
5 - POWER WINDOW HARNESS
6 - POWER MIRROR HARNESS
7 - POWER MIRROR
8 - POWER MIRROR CONTROL

1 - ELECTRICAL CONNECTOR
2 - POWER WINDOW/LOCK SWITCH PANEL
3 - WIRE HARNESS

# WATERDAM

## REMOVAL

(1) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(2) Peel waterdam away from adhesive around perimeter of inner door panel (Fig. 19).

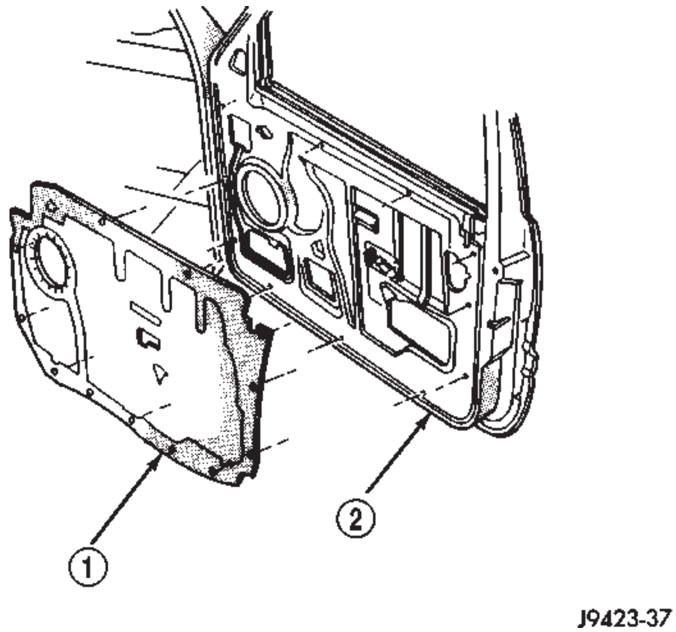

*Fig. 19 Door Water Dam*

1 - WATER DAM
2 - DOOR

## INSTALLATION

(1) Position and align water dam with adhesive around perimeter of inner door panel.

(2) Press water dam onto inner door panel to secure.

(3) Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

# WINDOW REGULATOR

## REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Remove nuts attaching door glass to window regulator.

(3) Remove glass from door or move glass to full up position and secure glass to door with tape.

(4) Disengage power window motor wire connector from door harness, if equipped.

(5) Remove bolts attaching window regulator to inner door panel.

WINDOW REGULATOR (Continued)

(6) Separate window regulator from door panel (Fig. 20).

(7) Extract window regulator through access hole in inner door panel.

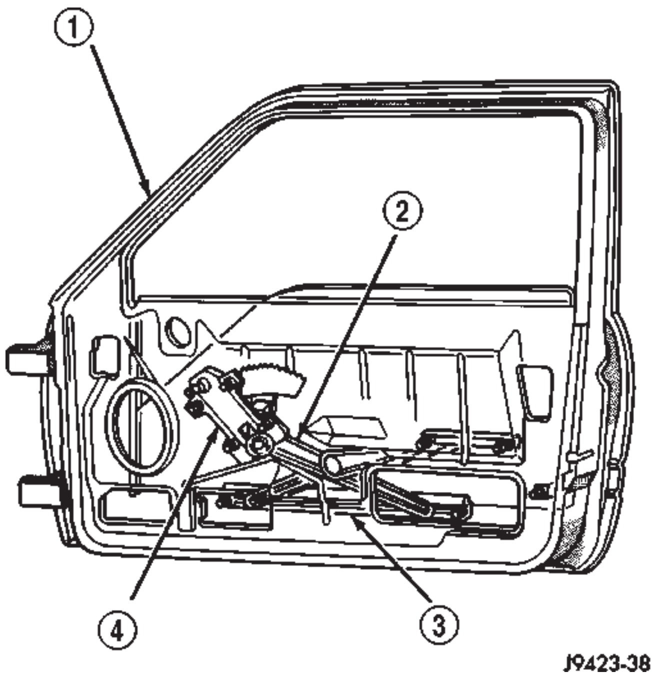

*Fig. 20 Door Glass Window Regulator*

1 - DOOR ASSEMBLY
2 - WINDOW REGULATOR ASSEMBLY
3 - DOOR GLASS ASSEMBLY
4 - WINDOW REGULATOR

## INSTALLATION

(1) Position window regulator in door through access hole.

(2) Install bolts attaching window regulator to inner door panel.

(3) Engage power window motor wire connector to door harness, if equipped.

(4) Install glass in lift plate.

(5) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

# DOOR - CARGO

### TABLE OF CONTENTS

## AIR EXHAUSTER

### REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).

(2) Peel back waterdam.

(3) Remove push-in fastener attaching air exhauster to cargo door inner panel (Fig. 1).

(4) Separate air exhauster from cargo door.

### INSTALLATION

(1) Position air exhauster in cargo door.

(2) Engage air exhauster upper tabs with cargo door inner panel.

(3) Install push-in fastener attaching air exhauster to cargo door inner panel (Fig. 1).

(4) Reposition waterdam.

(5) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

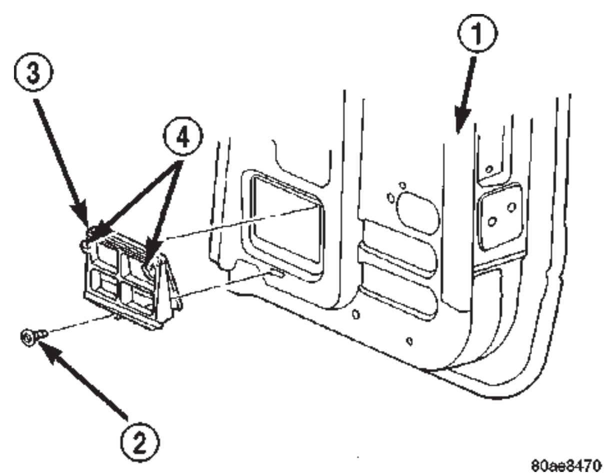

*Fig. 1 Cargo Door Air Exhauster*

1 - CARGO DOOR
2 - PUSH—IN FASTENER
3 - DOOR EXHAUSTER
4 - TAB

# CHECK

## REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).

(2) Remove the bolts attaching the door check to the cab C-pillar.

(3) Remove the nuts attaching the door check to the cargo door (Fig. 2).

(4) Remove the door check through the access hole in the cargo door.

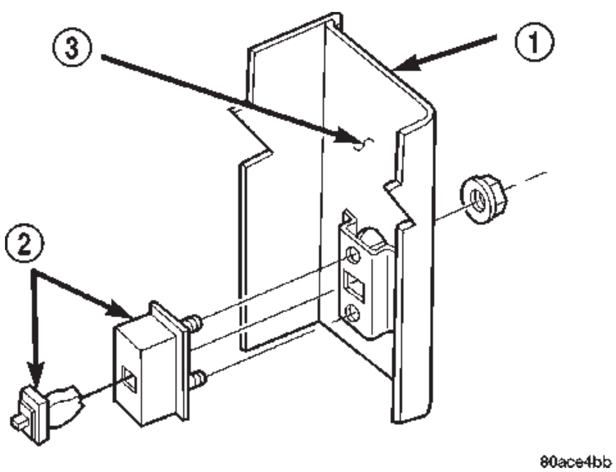

*Fig. 2 Door Check*

1 - CARGO DOOR
2 - DOOR CHECK
3 - CARGO DOOR INNER PANEL

## INSTALLATION

(1) Position the door check in the cargo door through the access hole.

(2) Install the nuts attaching the door check to the cargo door (Fig. 2).

(3) Install the bolts attaching the door check to the cab C-pillar.

(4) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

# DOOR

## REMOVAL

(1) Using a grease pencil or equivalent, mark the position of the hinge on the door.

(2) Remove the cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).

(3) Remove the cargo door check strap from the cab C-pillar (Refer to 23 - BODY/DOOR - CARGO/CHECK - REMOVAL).

(4) Using the access hole in the cargo door inner panel, disengage the speaker wire from the speaker and route the wire through the door.

(5) Support the cargo door on a suitable device.

(6) Remove the bolts attaching the hinges to the cargo door (Fig. 3).

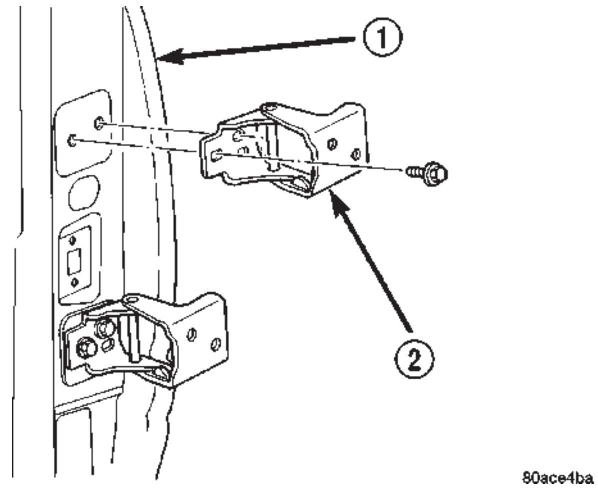

*Fig. 3 Cargo Door*

1 - CARGO DOOR
2 - CARGO DOOR HINGE

## INSTALLATION

(1) Support the cargo door on a suitable device.

(2) Using the alignment marks, position the door at the hinge.

(3) Install the bolts attaching the hinges to the cargo door (Fig. 3). Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(4) Route the speaker wire through the door and using the access hole in the cargo door inner panel, engage the speaker wire at the speaker.

(5) Install the cargo door check strap at the cab C-pillar (Refer to 23 - BODY/DOOR - CARGO/CHECK - INSTALLATION).

(6) Install the cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

## ADJUSTMENT – CARGO DOOR

### CARGO DOOR FORE/AFT AND UP/DOWN

(1) As applicable, remove the C-pillar trim to access the bolts attaching the cargo door to the C-pillar.

(2) Support the door with a padded floor jack.

(3) Loosen the applicable C-pillar to hinge bolts and move the door to the correct position.If necessary, loosen the other C-pillar to hinge bolts and move the door to the correct position.

(4) Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

DOOR (Continued)

(5) If necessary, loosen the bolts attaching the lower striker and move striker to the correct position.

(6)
If necessary, loosen the bolts attaching the upper latch to the cargo door and move to the correct position. (Fig. 4)

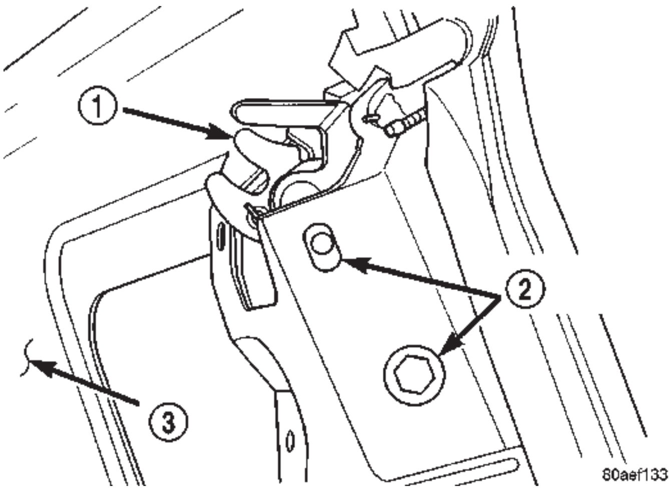

*Fig. 4 CARGO DOOR UPPER LATCH*

1 - UPPER LATCH
2 - ADJUSTMENT SLOTS
3 - CARGO DOOR

### CARGO DOOR IN/OUT

(1) Loosen the applicable hinge to door fasteners and move the door to the correct position.

(2) Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

## EXHAUST VENT

### REMOVAL

(1) Using a trim stick, carefully pry bottom of vent to disengage from door (Fig. 5).

(2) Separate vent from door.

### INSTALLATION

(1) Position upper side of vent in door opening.

(2) Slide upward until tabs on top edge are in place.

(3) Push the lower side of the vent towards the door until the tabs snap into place.

(4) Ensure vent is fully seated.

## HINGE

### REMOVAL

(1) Remove cargo door (Refer to 23 - BODY/DOOR - CARGO/DOOR - REMOVAL).

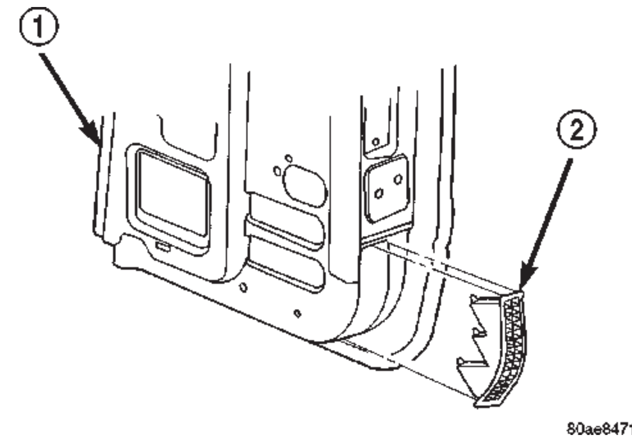

*Fig. 5 Cargo Door Exhaust Vent*

1 - CARGO DOOR
2 - EXHAUST VENT

(2) Remove quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Remove bolts attaching hinge to C-pillar (Fig. 6).

(4) Separate hinge from vehicle.

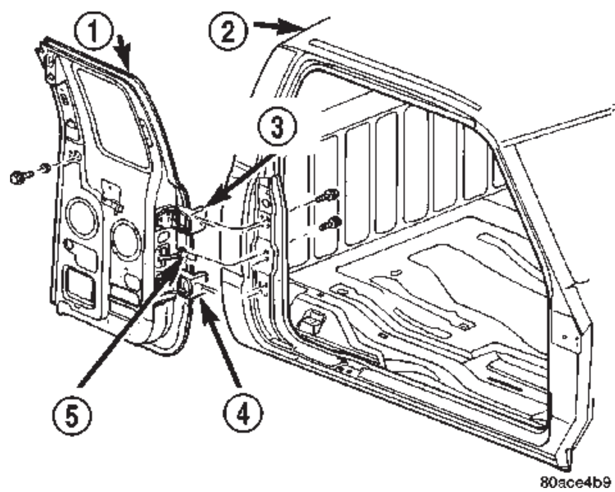

*Fig. 6 Cargo Door Hinge*

1 - CARGO DOOR
2 - CAB
3 - UPPER HINGE
4 - LOWER HINGE
5 - DOOR CHECK

### INSTALLATION

(1) Position hinge on vehicle.

(2) Install bolts attaching hinge to C-pillar (Fig. 6). Tighten bolts to 28 N·m (21 ft. lbs.) torque.

(3) Install quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

HINGE (Continued)

(4) Install cargo door (Refer to 23 - BODY/DOOR - CARGO/DOOR - INSTALLATION).

# INSIDE HANDLE ACTUATOR

## REMOVAL

**NOTE: The cargo door inside handle actuator is heat staked to the trim panel (Fig. 7).**

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
(2) Disengage release cable from inside handle.
(3) Using a small file, drummel tool or die grinder, remove the melted material securing the handle to the trim panel.
(4) Separate the handle from the trim panel.

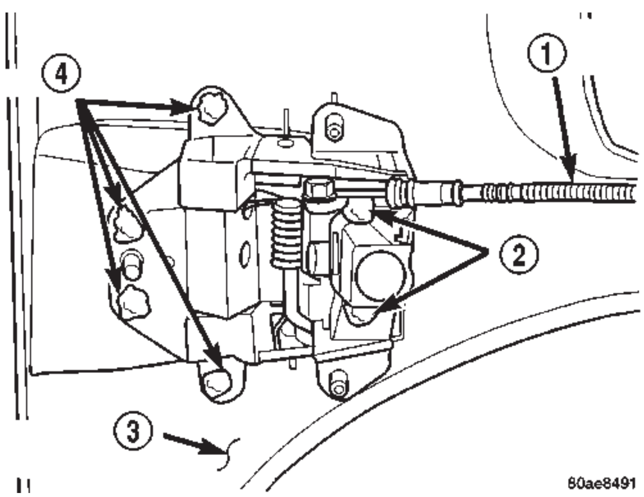

*Fig. 7 Heat Staked Locations*

1 - RELEASE CABLE
2 - HEAT STAKED LOCATIONS
3 - CARGO DOOR TRIM PANEL
4 - HEAT STAKED LOCATIONS

## INSTALLATION

(1) Position the handle in the trim panel.
(2) Using a soldering gun, and using the additional studs, heat stake the handle to the trim panel.
(3) Engage release cable to inside handle.
(4) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

# LATCH - LOWER

## REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
(2) Peel back waterdam to access air exhauster.
(3) Remove cargo door air exhauster (Refer to 23 - BODY/DOOR - CARGO/AIR EXHAUSTER - REMOVAL).
(4) Disengage lower latch to shutface handle rod at shutface handle (Fig. 8).
(5) Remove nuts attaching lower latch to cargo door.
(6) Separate lower latch and latch rod from cargo door.

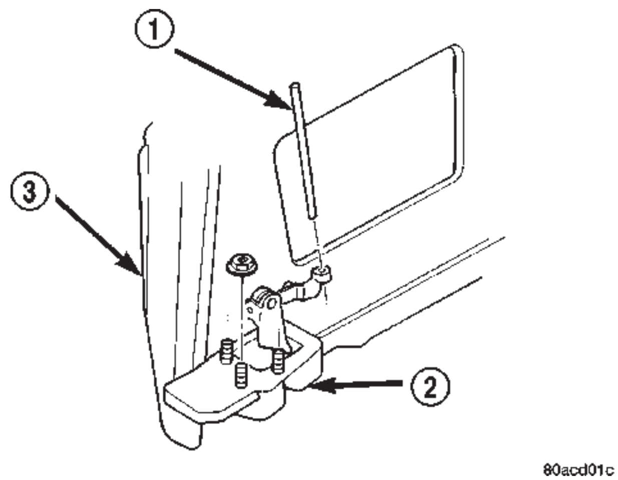

*Fig. 8 Cargo Door Lower Latch*

1 - LOWER LATCH TO HANDLE ROD
2 - LOWER CARGO DOOR LATCH
3 - CARGO DOOR

## INSTALLATION

(1) If installing a new replacement latch:
(a) Engage latch rod to latch rod retaining clip in lower latch. Ensure “white” latch installation pin is in the position closest to the latch release lever (Fig. 9).
(2) If the latch was not replaced and the existing latch is to be installed:
(a) Slide “white” latch installation pin to the position closest to the latch release lever.
(3) Position lower latch and latch rod in cargo door.
(4) Install nuts attaching lower latch to cargo door. Tighten nuts to 12 N·m (9 ft. lbs.) torque (Fig. 8).
(5) Engage latch rod to latch rod retaining clip in lower latch.

**CAUTION: When engaging lower latch release rod to shutface handle, ensure lower latch rod is pushed all the way down before engaging to the handle.**

(6) Engage lower latch rod to shutface handle
(7) Cycle the shutface handle and verify latch operation.

LATCH - LOWER (Continued)

(8) Install cargo door air exhauster (Refer to 23 - BODY/DOOR - CARGO/AIR EXHAUSTER - INSTALLATION).

(9) Reposition waterdam.

(10) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

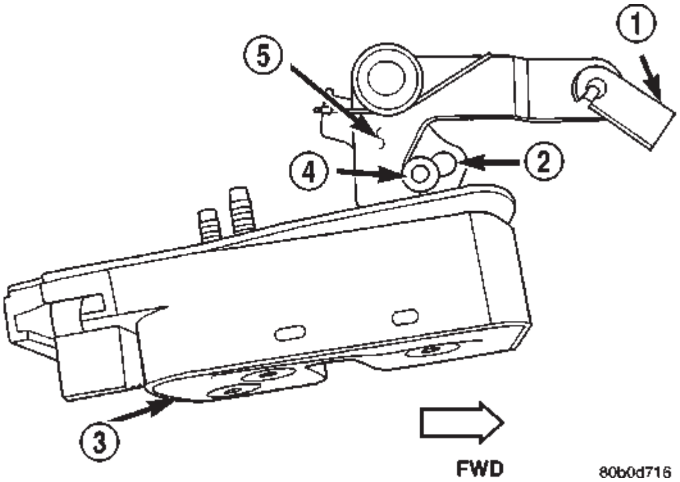

*Fig. 9 Cargo Door Lower Latch Installation Pin*

1 - LATCH ROD RETAINING CLIP
2 - SLOT
3 - CARGO DOOR LOWER LATCH
4 - INSTALLATION PIN
5 - LATCH RELEASE LEVER

# LATCH - UPPER

## REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).

(2) Using a grease pencil or equivalent, mark the position of the bolts.

(3) Disengage upper latch release rod from shutface handle.

(4) Remove the bolts attaching upper latch to cargo door (Fig. 10).

(5) Separate upper latch and latch rod from cargo door.

## INSTALLATION

(1) The new replacement latch is supplied with an alignment set screw located in the lower mounting hole of the upper cargo door latch. If a new is latch is being installed, use the following procedure:

(a) Verify alignment set screw is fully seated in latch.

(b) Engage latch rod to latch.

(c) Position latch in cargo door with alignment set screw located in the lower hole.

(d) Align bolt with reference mark.

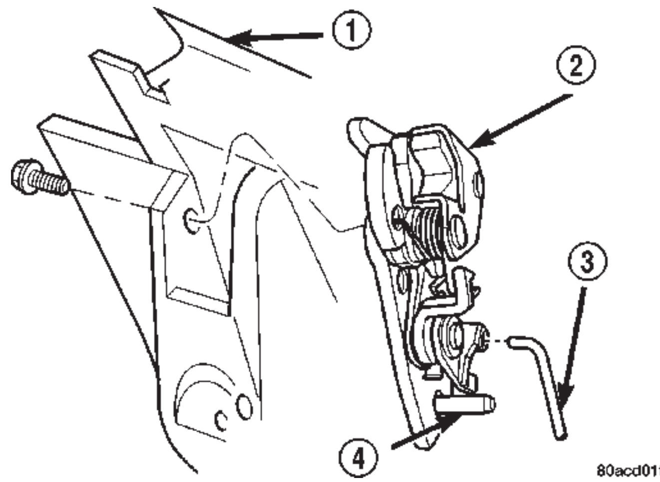

*Fig. 10 Cargo Door Upper Latch*

1 - CARGO DOOR
2 - UPPER CARGO DOOR LATCH
3 - UPPER LATCH TO HANDLE ROD
4 - ALIGNMENT SET SCREW

(e) Install upper bolt. Tighten bolt to 23 N·m (17 ft. lbs.) torque.

(f) Engage latch rod to shutface handle.

(g) Remove alignment set screw from lower hole.

(h) Align lower bolt with reference mark.

(i) Install bolt in lower hole. Tighten bolt to 23 N·m (17 ft. lbs.) torque.

**CAUTION: When engaging upper latch release rod to shutface handle, ensure the latch rod is pushed all the way up before engaging into the shutface handle.**

(2) If the latch was not replaced and the existing latch is to be installed:

(a) Engage latch rod to latch.

(b) Position upper latch and latch rod in cargo door.

(c) Align bolts with reference marks.

(d) Install the bolts attaching upper latch to cargo door (Fig. 10). Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(e) Engage upper latch release rod to shutface handle.

(3) Cycle the shutface handle and verify latch operation.

(4) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

# LATCH STRIKER - LOWER

## REMOVAL

(1) Using a grease pencil or equivalent, mark the position of the lower striker on the sill.

(2) Remove the torx screws attaching the striker to the sill (Fig. 11).

(3) Separate striker from sill.

## INSTALLATION

(1) Using the alignment marks, position striker on sill.

(2) Install the torx screws attaching the striker to the sill (Fig. 11). Tighten screws to 28 N·m (21 ft. lbs.) torque.

# LATCH STRIKER - UPPER

## REMOVAL

(1) Remove screws attaching striker trim cover to roof.

(2) Remove bolts attaching striker to roof (Fig. 11).

(3) Separate upper striker from roof.

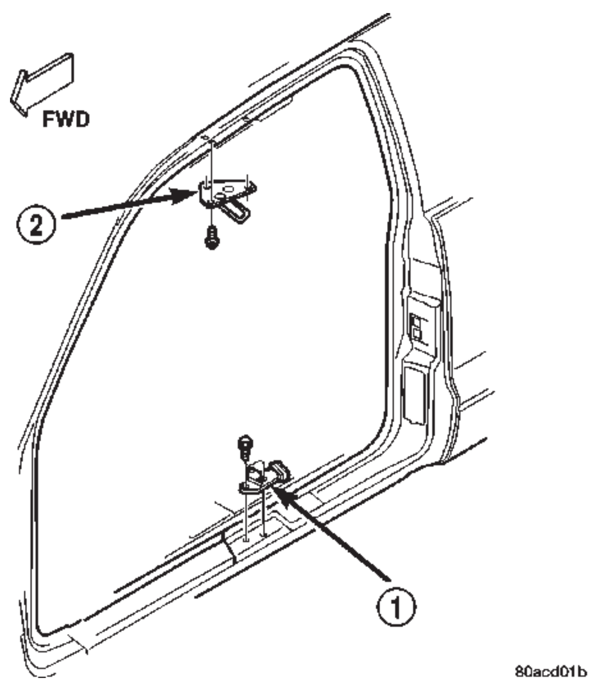

*Fig. 11 Cargo Door Strikers*

1 - UPPER STRIKER
2 - LOWER STRIKER

## INSTALLATION

(1) Position upper striker on roof.

(2) Install bolts attaching striker to roof (Fig. 11). Tighten bolts to 23 N·m (17 ft. lbs.) torque.

(3) Install the screws attaching striker trim cover to roof.

# RELEASE CABLE

## REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).

(2) Disengage release cable from inside release handle (Fig. 12).

(3) Peel back waterdam

(4) Disengage release cable from shutface door handle (Fig. 13).

(5) Separate release cable from cargo door.

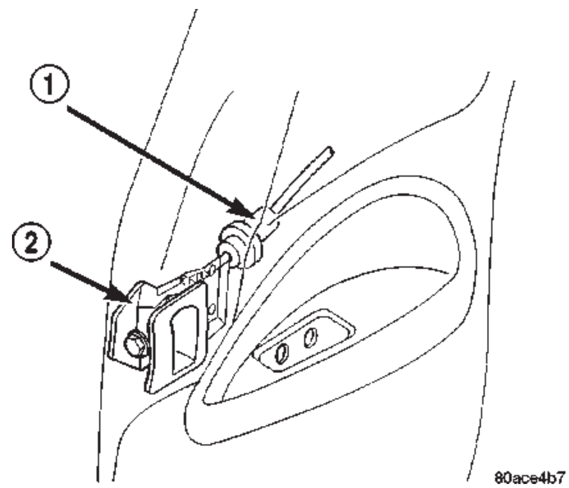

*Fig. 12 Cargo Door Release Handle*

1 - CARGO DOOR RELEASE CABLE
2 - CARGO DOOR RELEASE HANDLE

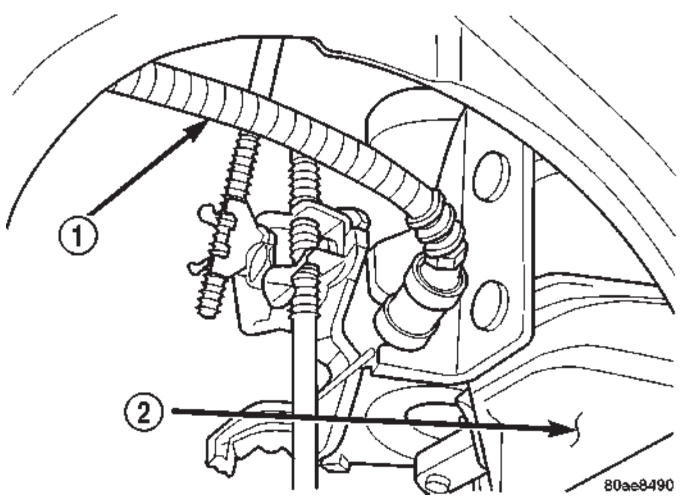

*Fig. 13 Shutface Door Handle*

1 - RELEASE CABLE
2 - SHUTFACE DOOR HANDLE

RELEASE CABLE (Continued)

### INSTALLATION

(1) Position release cable in cargo door.

(2) Engage release cable to shutface door handle.

(3) Reposition waterdam

(4) Engage release cable to inside release handle.

(5) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

## SHUTFACE HANDLE

### REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).

(2) Peel back waterdam.

(3) Disengage upper and lower latch release rods from shutface handle (Fig. 14).

(4) Disengage cargo door release cable.

(5) Remove screws attaching shutface handle to cargo door (Fig. 15).

(6) Separate handle from cargo door.

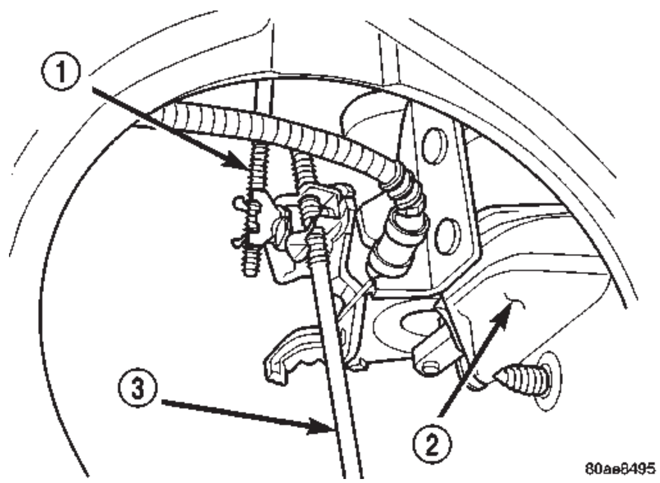

*Fig. 14 Cargo Door Latch Rods*

1 - UPPER LATCH ROD
2 - SHUTFACE HANDLE
3 - LOWER LATCH ROD

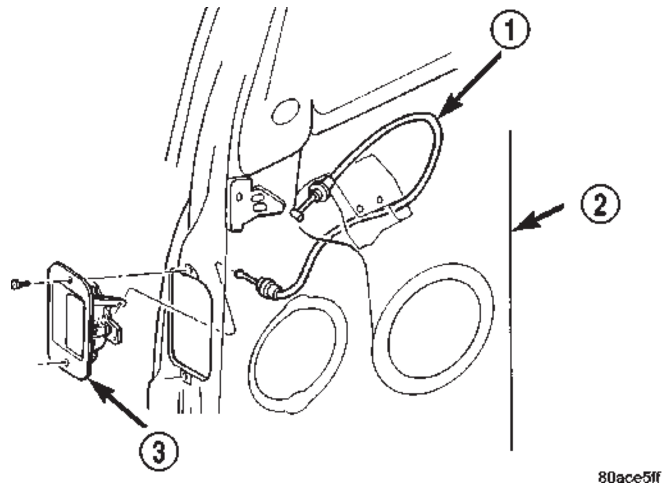

*Fig. 15 Shutface Handle*

1 - CARGO DOOR RELEASE CABLE
2 - CARGO DOOR
3 - SHUTFACE DOOR HANDLE

### INSTALLATION

(1) Position handle in cargo door.

(2) Install screws attaching shutface handle to cargo door (Fig. 15).

(3) Engage cargo door release cable.

**CAUTION: When engaging upper and lower latch release rods to shutface handle, ensure the upper latch rod is pushed all the way up and the lower latch rod is pushed all the way down before engaging into the shutface handle.**

(4) Engage upper and lower latch release rods to shutface handle.

(5) Cycle the shutface handle and verify operation.

(6) Reposition waterdam.

(7) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

# TRIM PANEL

## REMOVAL

(1) Remove the screws attaching the cargo door pull cup to the cargo door (Fig. 16).

(2) Remove the screw attaching the inside release handle to the cargo door.

**NOTE: The cargo door trim panel is secured to the cargo door with spring clips and push-in fasteners (Fig. 17).**

(3) Using a trim panel removal tool, remove the push-in fasteners attaching the trim panel to the cargo door.

(4) Pull the trim panel outward to disengage the spring clips.

(5) Separate the trim panel from the cargo door.

(6) Disengage the cargo door release cable from the inside release handle (Fig. 18).

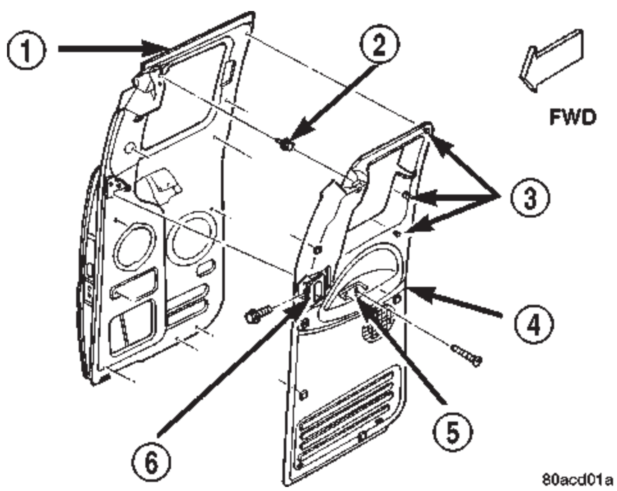

*Fig. 16 Cargo Door Trim Panel*

1 - CARGO DOOR
2 - PUSH-IN FASTENER
3 - SPRING CLIP
4 - CARGO DOOR TRIM
5 - PULL CUP
6 - INSIDE HANDLE

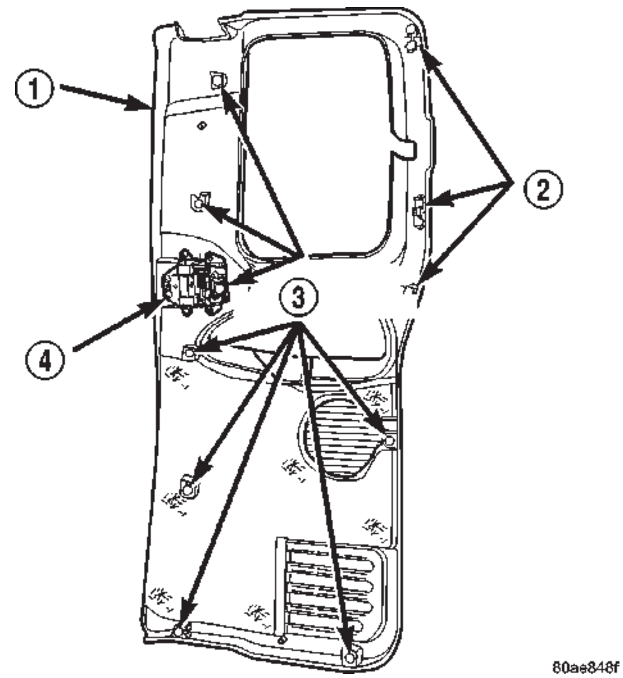

*Fig. 17 Cargo Door Trim Panel Fasteners*

1 - CARGO DOOR TRIM PANEL
2 - SPRING CLIPS
3 - PUSH-IN FASTENERS
4 - INSIDE RELEASE HANDLE

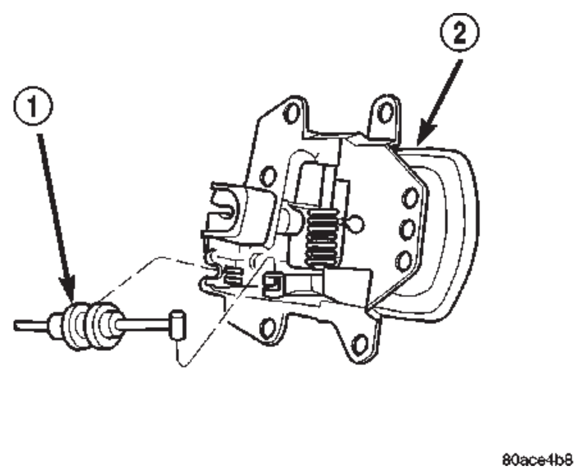

*Fig. 18 Cargo Door Release Cable*

1 - CARGO DOOR RELEASE CABLE
2 - CARGO DOOR RELEASE HANDLE

## INSTALLATION

**NOTE: When replacing door trim panel, installer must replace the X-mas tree style pin 6506878aa.**

(1) Engage the cargo door release cable to the inside release handle (Fig. 18).

(2) Position the trim panel on the cargo door.

(3) Align all fasteners and starting at the top of the panel, push into place to secure.

(4) Install the screw attaching the inside release handle to the cargo door.

(5) Install the screws attaching the cargo door pull cup to the cargo door (Fig. 16).

# VENT WINDOW

## REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
(2) Remove the screws attaching the latch to the cargo door (Fig. 19).
(3) Remove the bolts attaching the vent glass to the cargo door (Fig. 20).
(4) Remove the glass from the door.
(5) If necessary, remove the latch from the glass.

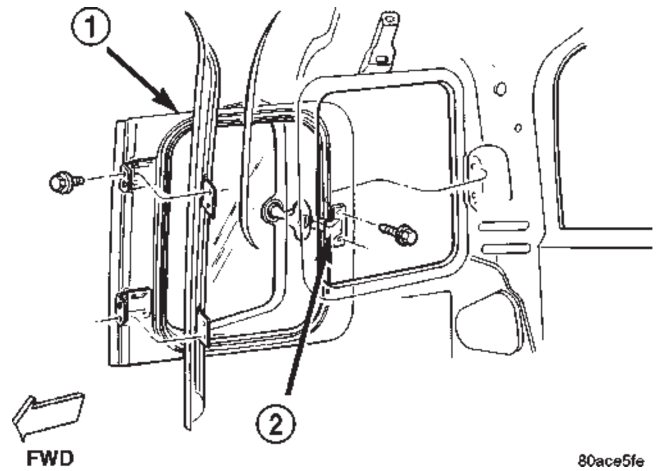

*Fig. 19 Cargo Door Quarter Glass Vent Window Latch*

1 - CARGO DOOR QUARTER GLASS
2 - LATCH

## INSTALLATION

(1) If removed, install the latch to the glass. Tighten the screw with 5 N·m (45 in. lbs.) torque.
(2) Center the glass in the cargo door opening.
(3) Install the bolts attaching the vent glass to the cargo door.
(4) Install the screws attaching the latch to the cargo door.
(5) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

# WATERDAM

## REMOVAL

(1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
(2) Carefully peel waterdam from door (Fig. 21).

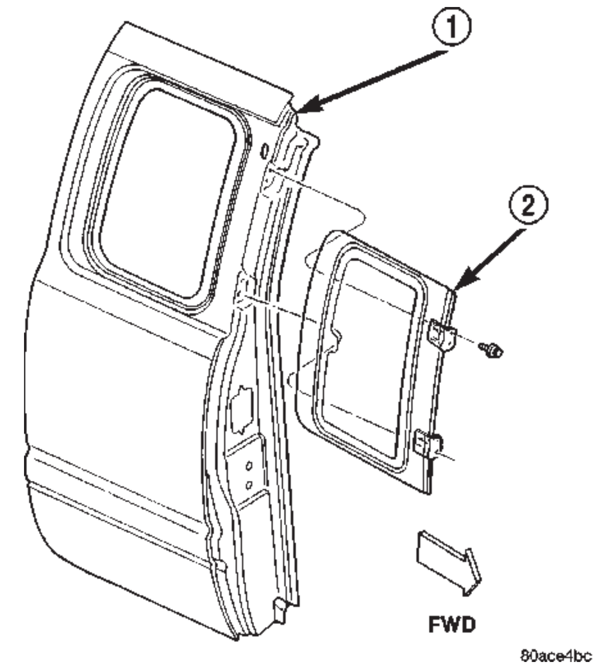

*Fig. 20 Cargo Door Quarter Glass Vent Window*

1 - CARGO DOOR
2 - CARGO DOOR QUARTER GLASS

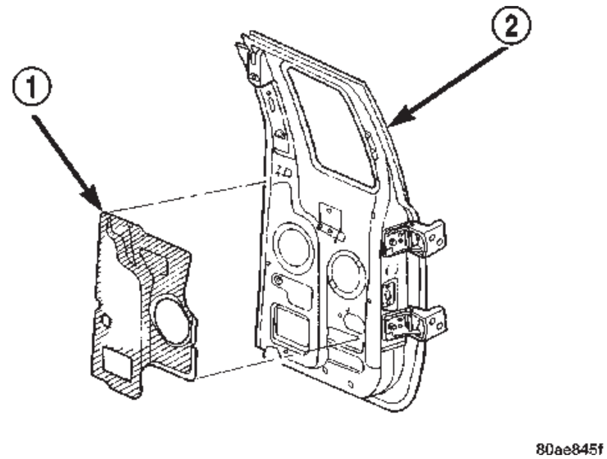

*Fig. 21 Cargo Door Waterdam*

1 - WATER DAM
2 - CARGO DOOR

## INSTALLATION

If a replacement waterdam is being applied, clean cargo door inner panel with Mopar Super Clean or equivalent.
(1) Position waterdam on cargo door and press into place.
(2) install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

# EXTERIOR

TABLE OF CONTENTS

# EXTERIOR

## DESCRIPTION

Exterior sheet metal components make up the exterior of the vehicle. Some exterior metal systems are welded assemblies, such as doors and hoods. Some exterior trim items are made of composite.

## OPERATION

The exterior is finished in various metal stampings and composite moldings. These assemblies give the vehicle a finished appearance and protect the occupants from the elements. Some components are part of the energy absorbing system used to protect the occupants in collisions. The exterior sheet metal is repairable and adjustable for fit and finish. Welded and bonded component systems are adjustable as a system. Trim components made of composite are stamped with the type of material used. DaimlerChrysler uses various fasteners to retain trim items. At times, it is not possible to remove trim items without damaging the fastener. If it is not possible to remove an item without damaging a component, cut or break the fasteners and use new ones when installing the component.

# BODY SIDE MOLDINGS

## REMOVAL

(1) Warm the effected stick-on molding and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull stick-on molding from painted surface (Fig. 1) and (Fig. 2).

## INSTALLATION

(1) Clean body surface with MOPAR® Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

(2) Apply a length of masking tape on the body, parallel to the top edge of the molding to use as a guide, if necessary.

(3) Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide (Fig. 1) and (Fig. 2).

(4) Remove masking tape guide and heat body and molding, see step one. Firmly press molding to body surface to assure adhesion.

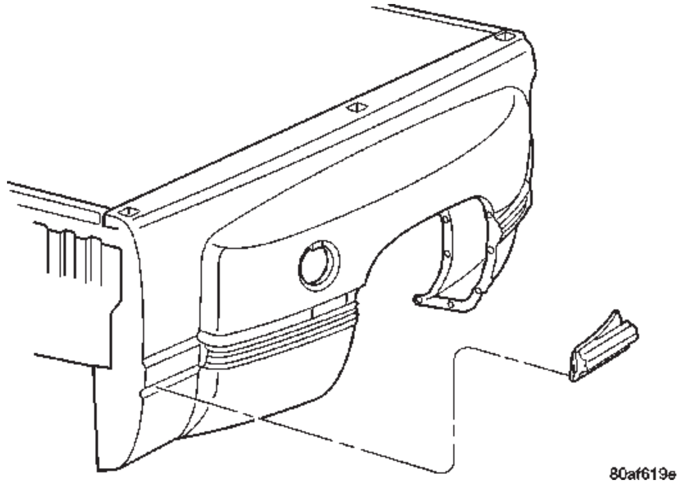

*Fig. 2 Body Side Moldings—Dual Wheel*

# BODY STRIPES AND DECALS

## REMOVAL

(1) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Peel decal from body panel using an even pressure pull.

(3) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

## INSTALLATION

The painted surface of the body panel to be covered by a decal must be smooth and completely cured before decal can be applied. Ripples and feather edging will read through if surface is not properly prepared. Clean all residue from surface.

(1) Peel paper backing away from decal exposing adhesive back of decal.

(2) Apply soap solution liberally to adhesive back of decal.

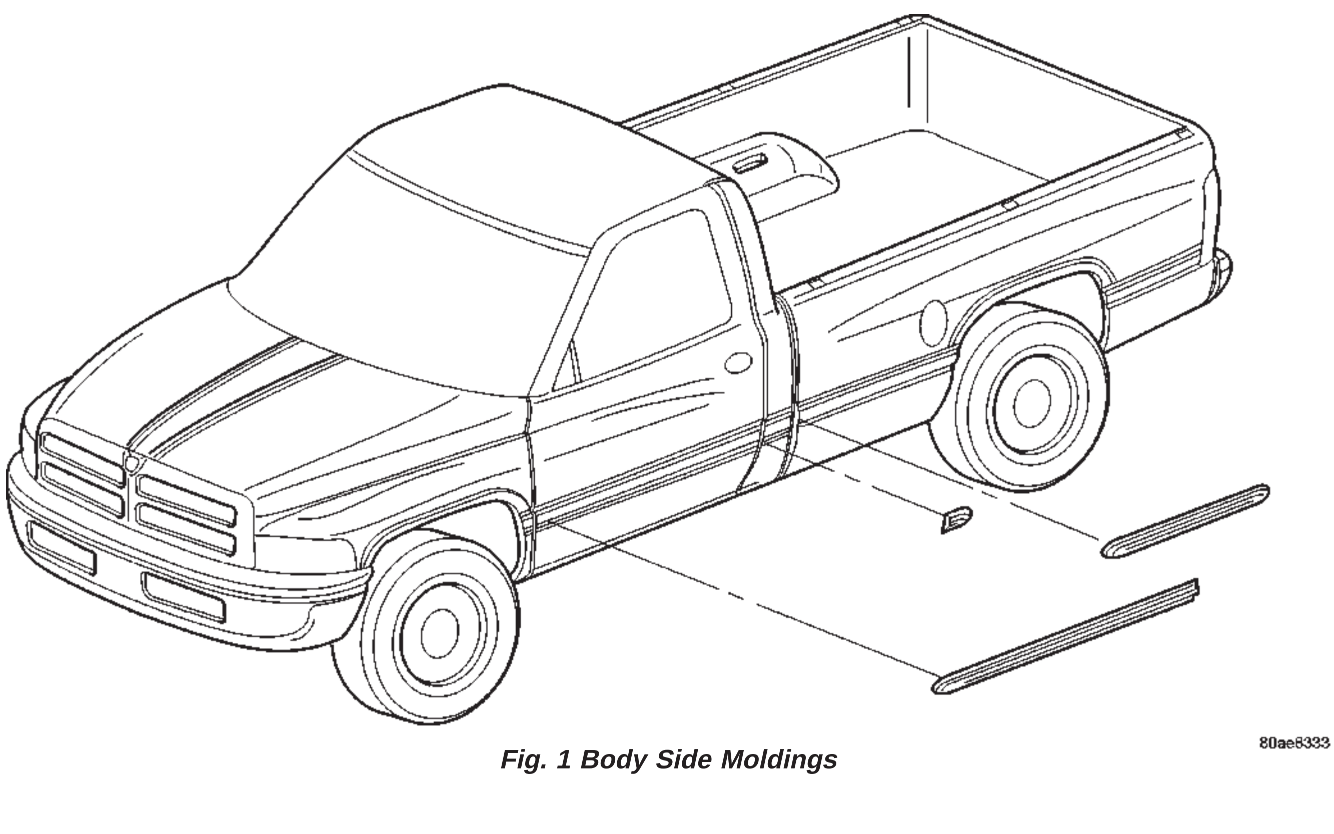

*Fig. 1 Body Side Moldings*

BODY STRIPES AND DECALS (Continued)

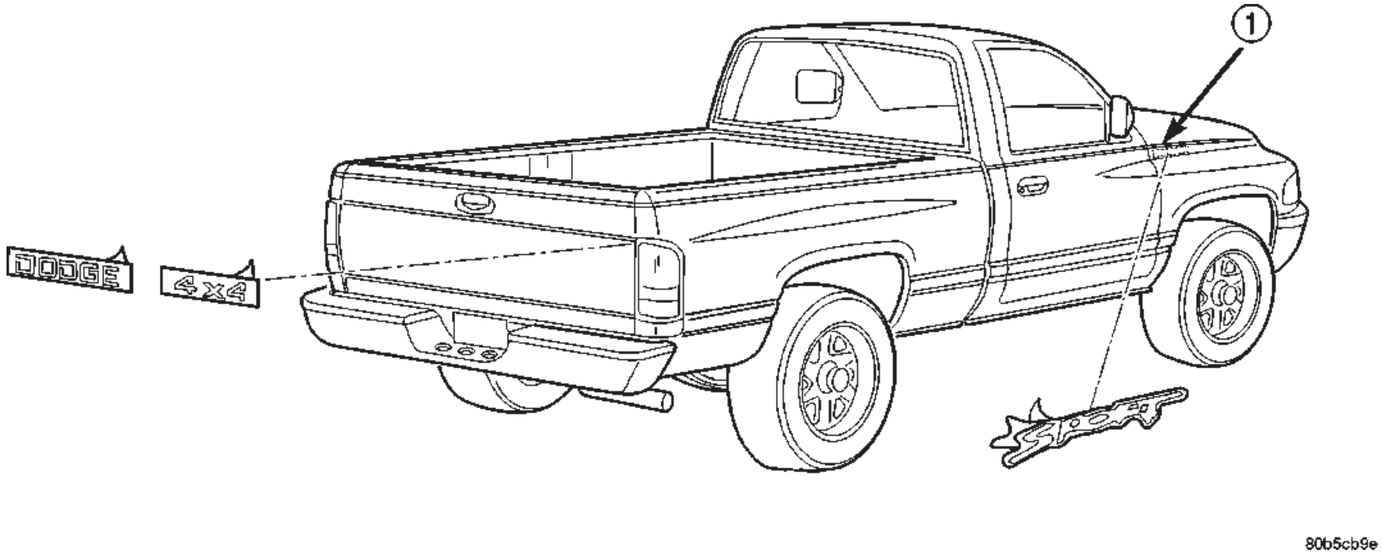

**Fig. 3 Decals**

1 - TAPE STRIPE

(3) Apply soap solution liberally to body panel surface.

(4) Place decal into position on body panel (Fig. 3) . Smooth out wrinkles by pulling lightly on edges of decal until it lays flat on painted surface.

(5) Push air pockets from under decal to the perimeter of the panel from the center of the decal out.

(6) Squeegee soap solution and air bubbles from behind decal from the center of the panel out using a body putty applicator squeegee.

(7) Apply heat to decal to evaporate residual moisture from edges of decal.

(8) Small air or water bubbles under decal can be pierced with a pin and smoothed out.

# TAPE STRIPE

## REMOVAL

(1) If the panel that is being serviced is not going to be refinished, apply a length of masking tape parallel to the edge of the original tape stripe to aid installation.

(2) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(3) Peel tape stripe (Fig. 4) from body panel using an even pressure pull.

(4) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

## INSTALLATION

The painted surface of the body panel to be covered by a tape stripe overlay must be smooth and com-

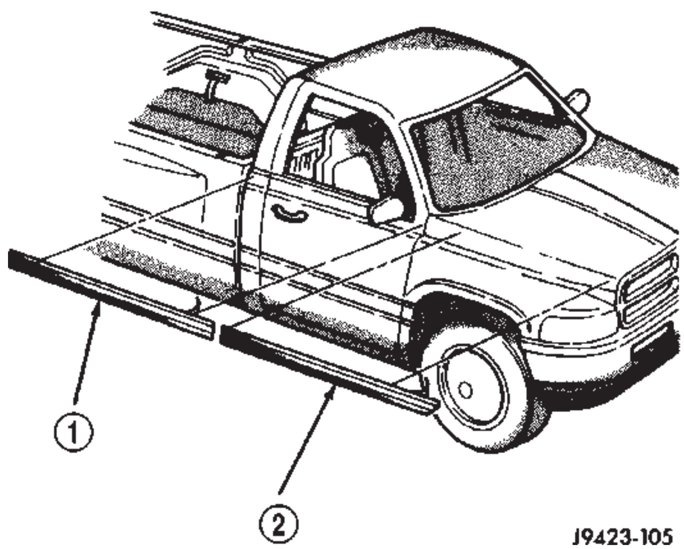

**Fig. 4 Tape Stripe Overlay**

1 - CAB/DOOR TAPE STRIPE
2 - HOOD TAPE STRIPE

pletely cured before overlay can be applied. If painted surface is not smooth, wet sand with 600 grit wet/dry sand paper until surface is smooth. Ripples and feather edging will read through overlay if surface is not properly prepared. Clean all residue from surface.

Installation equipment:

- Pail filled with mild dish soap solution.
- Lint free applicator cloth or sponge.
- Body putty applicator squeegee.
- Heat gun or sun lamp.
- Razor knife.

TAPE STRIPE (Continued)

(1) Spread replacement tape stripe overlay across a smooth flat work surface, finish side down.

(2) Peel paper backing away from overlay exposing adhesive back of overlay.

(3) Apply soap solution liberally to adhesive back of overlay.

(4) Apply soap solution liberally to body panel surface.

(5) Place overlay into position on body panel. Smooth out wrinkles by pulling lightly on edges of overlay until it lays flat on painted surface.

(6) Push air pockets from under overlay to the perimeter of the panel from the center of the overlay out.

(7) Squeegee soap solution and air bubbles from behind overlay from the center of the panel out using a body putty applicator squeegee (Fig. 5).

**CAUTION: Do not cut into painted surface of body panel when trimming overlay to size.**

(8) Trim overlay to size using a razor knife. Leave at least 13 mm (0.5 in.) for edges of doors and openings.

**CAUTION: Do not overheat overlay when performing step 9.**

(9) Apply heat to overlay to evaporate residual moisture from edges of overlay and to allow overlay to be stretched into concave surfaces.

(10) Edge turn overlay around doors or fenders.

(11) Install exterior trim if necessary.

(12) Small air or water bubbles under overlay can be pierced with a pin and smoothed out.

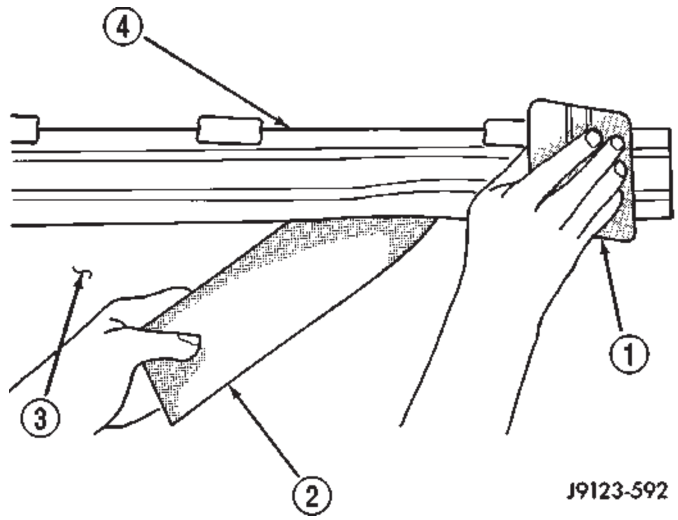

***Fig. 5 Tape Stripe Application***

1 - SQUEEGEE
2 - CARRIER
3 - BODY PANEL
4 - TAPE STRIPE

# EXTERIOR NAME PLATES

## REMOVAL

**NOTE: Exterior nameplates are attached to body panels with adhesive tape.**

(1) Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

(2) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.

(3) Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.

(4) Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

## INSTALLATION

(1) Remove protective cover from adhesive tape on back of emblem.

(2) Position emblem properly on body (Fig. 6).

(3) Press emblem firmly to body with palm of hand.

(4) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

EXTERIOR NAME PLATES (Continued)

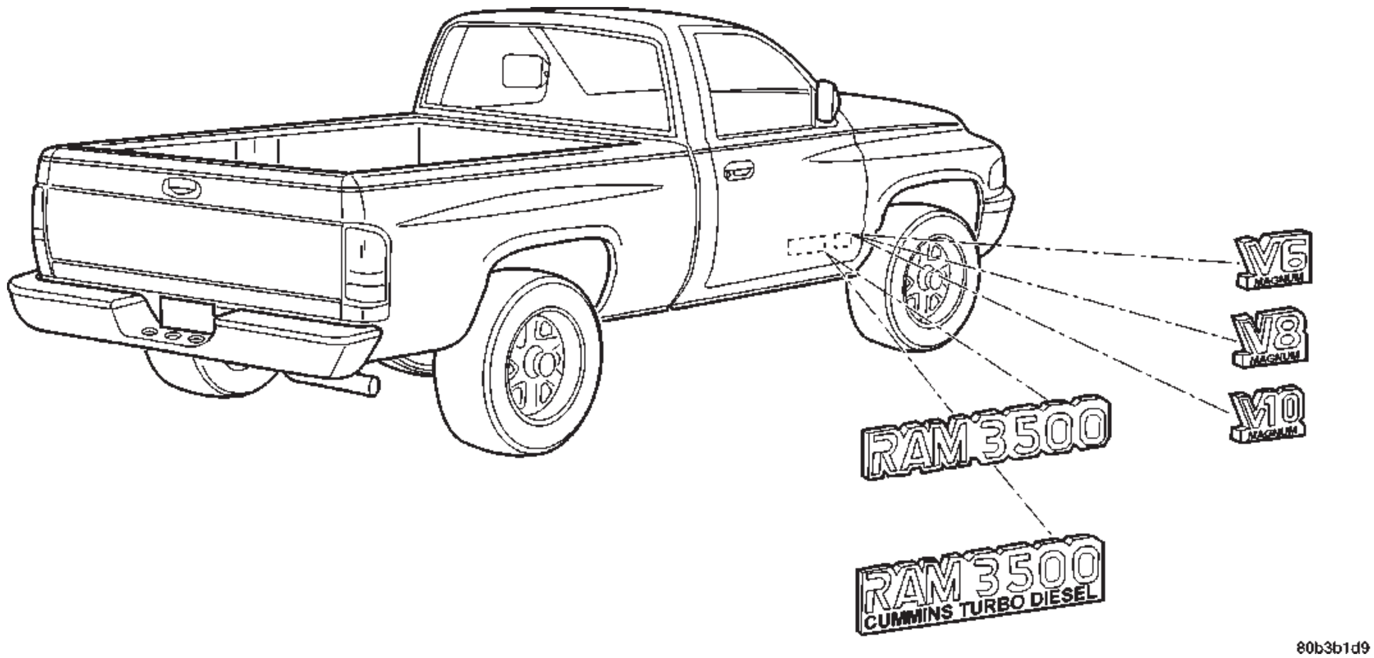

*Fig. 6 Exterior Nameplates*

## COWL GRILLE

### REMOVAL

(1) Open hood.

(2) Remove wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL AND INSTALLATION).

(3) Disconnect windshield washer tubing from coupling near left hood hinge.

(4) Remove plastic nuts attaching cowl cover to cowl (Fig. 7).

(5) Pull cowl seal from flange on front of cowl.

(6) Separate cowl cover from vehicle.

### INSTALLATION

(1) Position cowl cover on vehicle. Ensure end seals are positioned correctly and in good condition.

(2) Install cowl seal.

(3) Install plastic nuts attaching cowl cover to cow.

(4) Connect windshield washer tubing to coupling near left hood hinge.

(5) Install wiper arms.

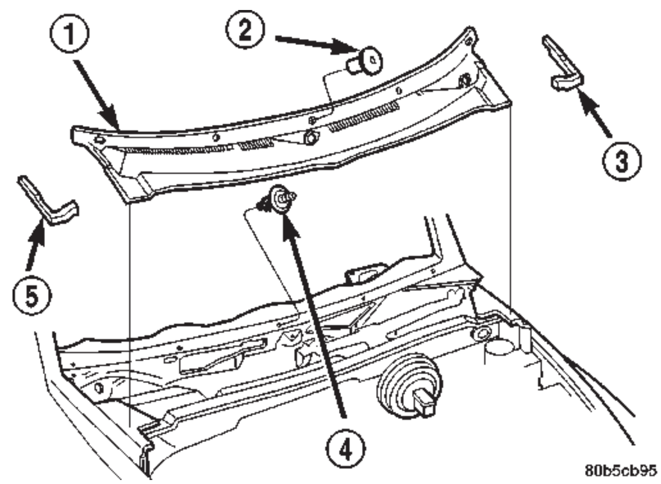

*Fig. 7 Cowl Cover*

1 - COWL COVER
2 - PLASTIC NUT

# ROOF JOINT MOLDING

## REMOVAL

(1) Warm the roof joint molding and roof panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull molding from roof joint (Fig. 8).

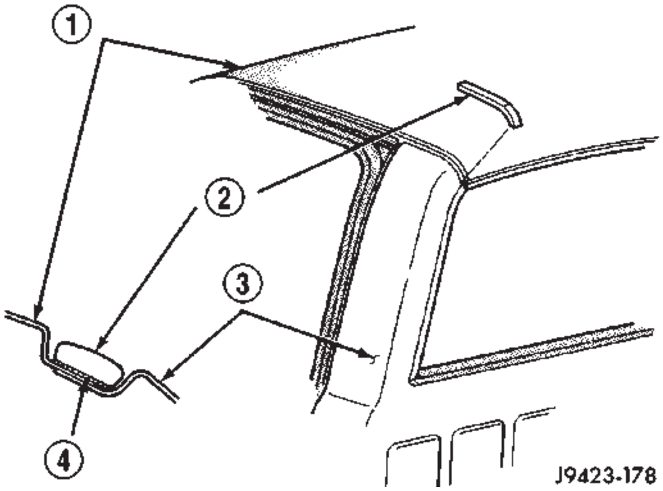

*Fig. 8 Roof Joint Molding*

1 - ROOF
2 - JOINT MOLDING
3 - B—PILLAR
4 - ADHESIVE TAPE

## INSTALLATION

(1) Remove adhesive tape residue from roof joint.

(2) If molding is to be reused, remove tape residue from back of molding. Clean molding with MOPAR® Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of molding.

(3) Clean roof joint with MOPAR® Super Kleen solvent or equivalent. Wipe dry with lint free cloth.

(4) Remove protective cover from tape on back of molding and apply molding to roof joint.

(5) Heat roof and molding, see step one. Firmly press molding into roof joint to assure adhesion.

# GRILLE

## REMOVAL

(1) Open hood.

(2) Remove bolts attaching bottom of grille to frame (Fig. 9).

(3) Remove bolts attaching sides of grille to frame.

(4) Remove nuts attaching grille to hood (Fig. 10).

(5) Separate grille from vehicle.

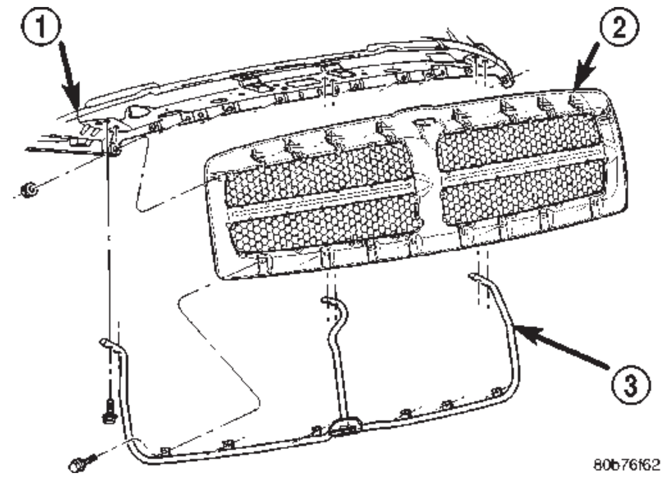

*Fig. 9 Grille — Sport*

1 - HOOD
2 - GRILLE
3 - GRILLE FRAME

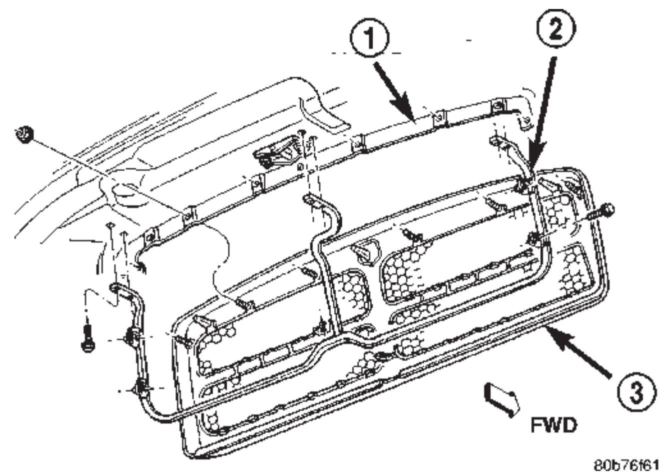

*Fig. 10 Grille — SLT*

1 - HOOD
2 - GRILLE FRAME
3 - GRILLE

## INSTALLATION

(1) Position grille on vehicle.

(2) Install nuts attaching grille to hood.

(3) Install bolts attaching sides of grille to frame.

(4) Install bolts attaching bottom of grille to frame.

# GRILLE FRAME

## REMOVAL

(1) Remove bolts attaching guide loop for hood safety catch release rod to grille frame.

(2) Remove grille.

GRILLE FRAME (Continued)

(3) Remove screws attaching grille frame to hood (Fig. 11)and (Fig. 12).

(4) Separate grille frame from hood.

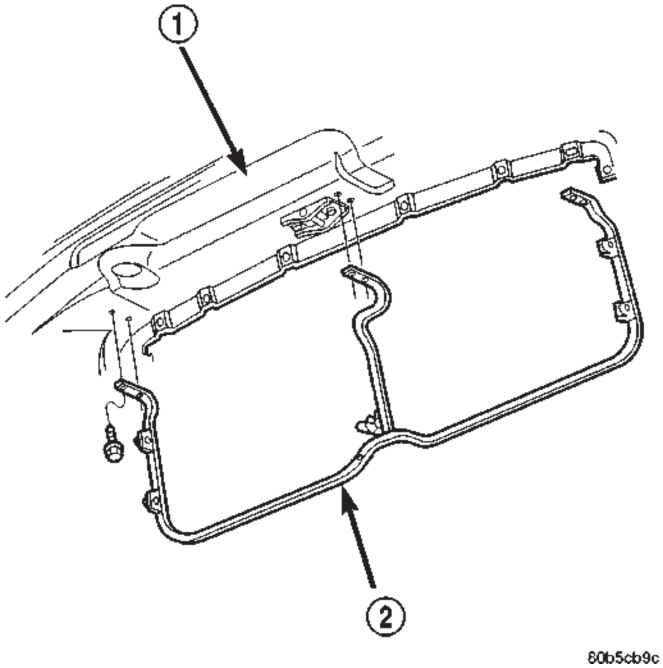

**Fig. 11 Grille Frame — SLT**

1 - HOOD
2 - GRILLE FRAME

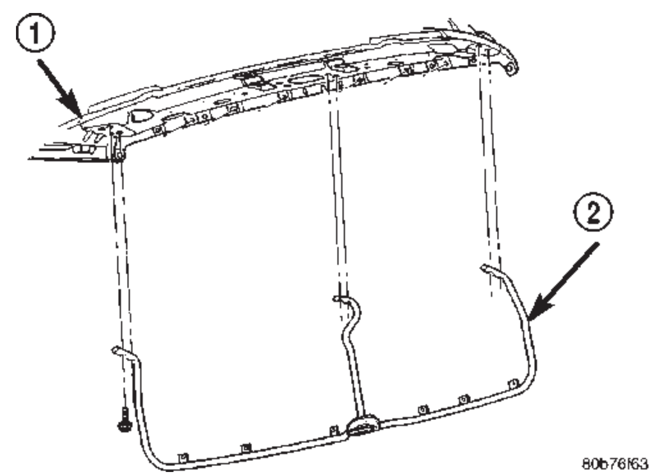

**Fig. 12 Grille Frame — Sport**

1 - HOOD
2 - GRILLE FRAME

## INSTALLATION

(1) Position grille frame on hood.

(2) Install screws attaching grille frame to hood.

(3) Install grille.

(4) Install bolts attaching guide loop for hood safety catch release rod to grille frame.

# FRONT END SPLASH SHIELDS

## REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Remove front wheel.

(3) Remove plastic rivets attaching wheelhouse liner to fender at the edge of wheel opening.

(4) Remove plastic rivets attaching liner to the wheelhouse (Fig. 13).

(5) Separate front wheelhouse liner from wheelhouse.

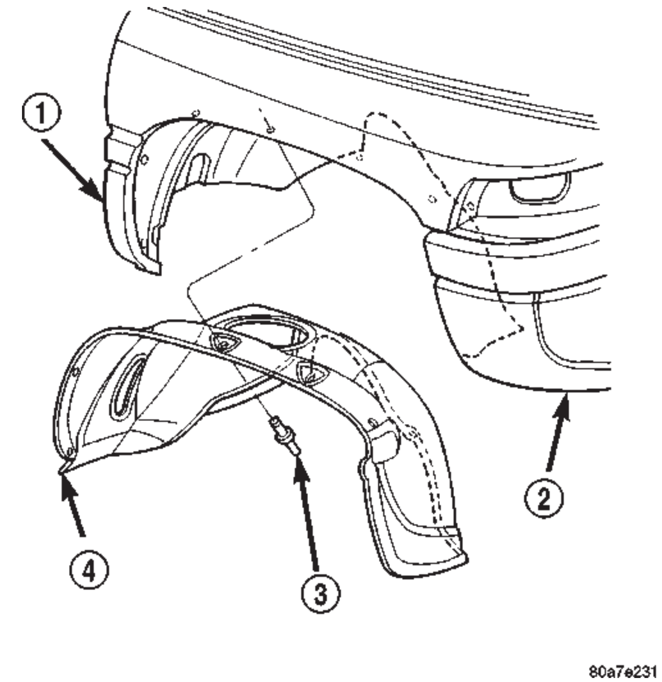

**Fig. 13 Front Wheelhouse Liner**

1 - FENDER
2 - BUMPER ASSEMBLY
3 - PLASTIC RIVET
4 - WHEELHOUSE LINER

## INSTALLATION

(1) Position front wheelhouse liner in wheelhouse.

(2) Install plastic rivets attaching liner to the wheelhouse.

(3) Install plastic rivets attaching wheelhouse liner to fender at the edge of wheel opening.

(4) Install front wheel.

(5) Remove safety stands and lower vehicle.

# LEFT FRONT FENDER

## REMOVAL

(1) Remove front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL).

LEFT FRONT FENDER (Continued)

(2) Remove air cleaner from wheelhouse (DIESEL ONLY).

(3) Remove coolant overflow bottle (V-10 ONLY).

(4) Remove battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(5) Remove screws attaching power distribution center to left wheelhouse (Fig. 14).

(6) Disengage wire harness tie-downs from wheelhouse.

(7) Disconnect wiring harness to headlamp connector.

(8) Disconnect wiring harness to airbag sensor and remove airbag sensor from wheelhouse.

(9) Remove bolts attaching anti-lock brake controller to wheelhouse (Fig. 14), if equipped.

(10) Disengage windshield washer tubing tie-downs from wheelhouse (Fig. 14).

(11) Remove bolts attaching front fender to cowl reinforcement (Fig. 15).

(12) Remove bolts attaching front fender to radiator closure panel (Fig. 16).

(13) Remove bolts attaching bottom of front fender to rocker panel lower flange.

(14) Open left door.

(15) Remove bolt attaching front fender to hinge pillar mounting bracket.

(16) Remove bolts attaching top of fender to radiator closure panel.

(17) Separate left front fender from vehicle.

## INSTALLATION

(1) Position left front fender on vehicle.

(2) Install bolts attaching top of fender to radiator closure panel.

(3) Install bolt attaching front fender to hinge pillar mounting bracket.

(4) Install bolts attaching bottom of front fender to rocker panel lower flange.

(5) Install bolts attaching front fender to radiator closure panel.

(6) Install bolts attaching front fender to cowl reinforcement.

(7) Secure windshield washer tubing tie-downs to wheelhouse.

(8) Install anti-lock brake controller to wheelhouse, if equipped.

(9) Install airbag sensor to wheelhouse and connect wiring harness to airbag sensor.

(10) Connect wiring harness to headlamp connector.

(11) Secure wire harness tie-downs to wheelhouse.

(12) Install power distribution center to wheelhouse.

(13) Install battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).

(14) Install coolant overflow bottle (V-10 ONLY).

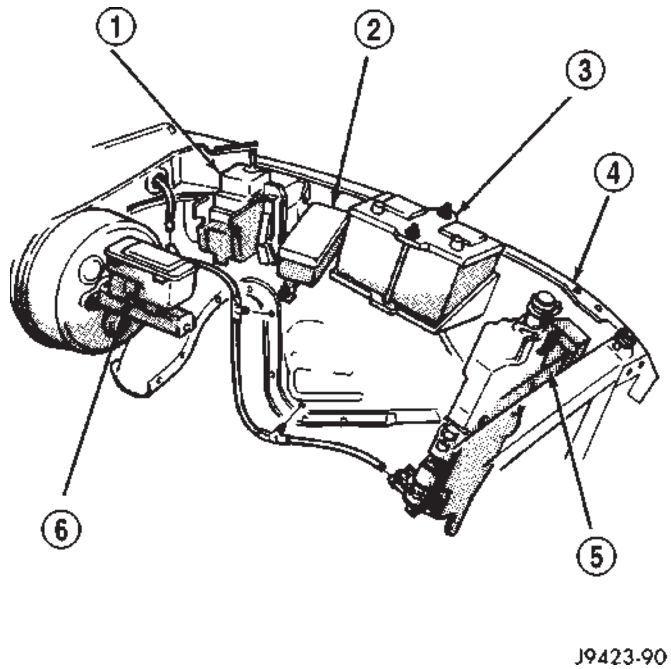

*Fig. 14 Left Front Fender Access Components*

LEFT FRONT FENDER (Continued)

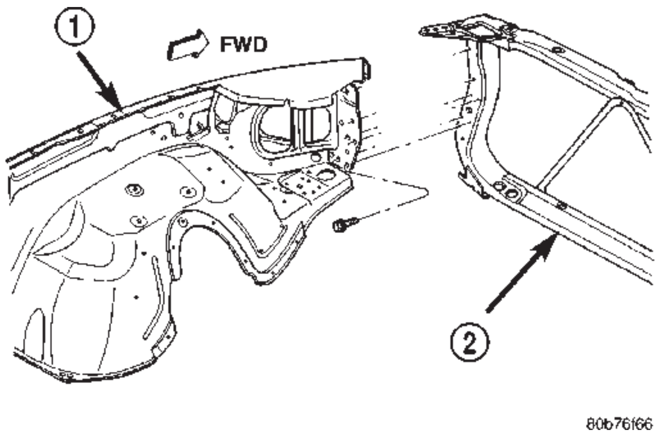

*Fig. 16 Left Fender to Radiator Closure Panel Fasteners*

1 - LEFT FENDER
2 - RADIATOR CLOSURE PANEL

(15) Install air cleaner (DIESEL ONLY).

(16) Install front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).

# RIGHT FRONT FENDER

## REMOVAL

(1) Remove front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL).

(2) Disconnect and isolate battery negative cable.

(3) Remove auxiliary battery and tray on right side, if equipped.

(4) Disengage wire harness tie-downs from wheelhouse.

(5) Disconnect wiring harness to headlamp connector.

(6) Disconnect wiring harness to airbag sensor and remove airbag sensor from wheelhouse.

(7) Remove front wheelhouse liner (Fig. 13) (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).

(8) Disengage air conditioning tubing from inner fender clips.

(9) Remove bolts attaching front fender to cowl reinforcement (Fig. 15).

(10) Remove bolts attaching front fender to radiator closure panel.

(11) Remove bolts attaching bottom of front fender to rocker panel lower flange (Fig. 17).

(12) Open right door.

(13) Remove bolt attaching front fender to hinge pillar mounting bracket (Fig. 17).

(14) Remove bolts attaching top of fender to radiator closure panel (Fig. 17).

(15) Separate right front fender from vehicle.

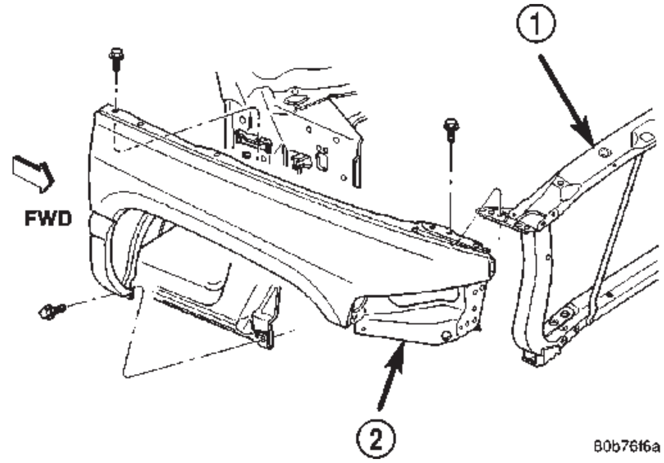

*Fig. 17 Right Front Fender*

1 - RADIATOR CLOSURE PANEL
2 - RIGHT FENDER

## INSTALLATION

(1) Position fender on vehicle.

(2) Install bolts attaching top of fender to radiator closure panel.

(3) Install bolt attaching front fender to hinge pillar mounting bracket.

(4) Install bolts attaching bottom of front fender to rocker panel lower flange.

(5) Install bolts attaching front fender to radiator closure panel.

(6) Install bolts attaching front fender to cowl reinforcement.

(7) Secure air conditioning tubing to inner fender clips.

(8) Install front wheelhouse liner (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).

(9) Install airbag sensor and connect wiring harness to airbag sensor.

(10) Connect wiring harness to headlamp connector.

(11) Secure wire harness tie-downs to wheelhouse.

(12) Install auxiliary battery tray and battery on right side, if equipped.

(13) Connect battery negative cable.

(14) Install front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).

# FUEL FILL DOOR

## REMOVAL

(1) Open fuel fill door.
(2) Remove bolts attaching fuel fill door to cargo box quarter panel (Fig. 18).
(3) Separate fuel fill door from vehicle.

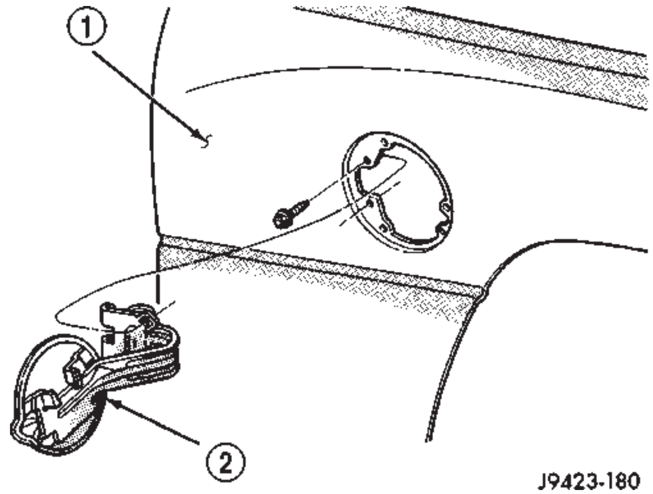

*Fig. 18 Fuel Fill Door*

1 - CARGO BOX
2 - FUEL FILL DOOR

## INSTALLATION

(1) Separate fuel fill door on cargo box.
(2) Install bolts attaching fuel fill door to cargo box quarter panel.

# REAR FENDER

## REMOVAL

(1) Open fuel fill door, left side only.
(2) Remove screws attaching fuel fill neck to rear fender opening.
(3) Remove tail lamp.
(4) Remove nuts attaching rear fender to cargo box side panel through tail lamp opening.
(5) Remove clearance lamps.
(6) Remove sockets from clearance lamps.
(7) Remove bolts attaching bottom of fender to cargo box forward of rear wheel.
(8) Remove bolts attaching bottom of fender to cargo box rearward of rear wheel.
(9) Remove rear wheelhouse splash shields (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL).
(10) Remove rear wheelhouse liner, if equipped (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL).
(11) Remove nuts attaching front of rear fender to cargo box from behind side panel forward of wheelhouse.
(12) Remove screws attaching access panel to top of wheelhouse.
(13) Remove nuts attaching rear fender to cargo box through access hole in top of wheelhouse.
(14) Separate rear fender from cargo box side panel (Fig. 19).

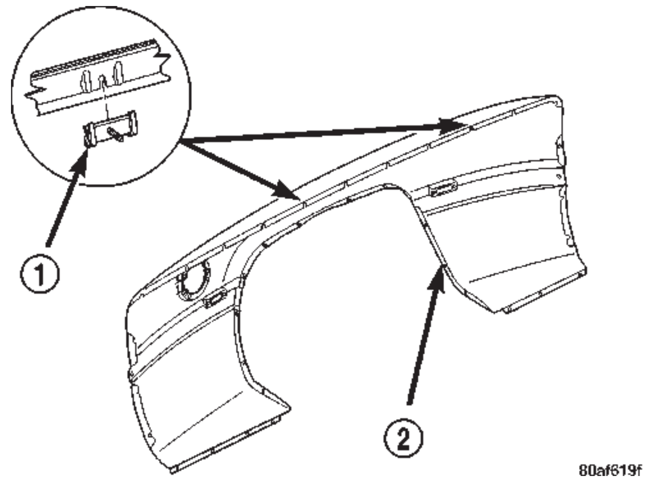

*Fig. 19 Rear Fender—Dual Wheels*

1 - RETAINER
2 - FENDER (DUAL WHEEL)

## INSTALLATION

Ensure the retainers are in good condition.
(1) Position rear fender on cargo box side panel.
(2) Using access hole in top of wheelhouse, install nuts attaching rear fender to cargo box.
(3) Install screws attaching access panel to top of wheelhouse.
(4) From behind side panel forward of wheelhouse, install nuts attaching front of rear fender to cargo box.
(5) Install rear wheelhouse liners if equipped, (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION).
(6) Install rear wheelhouse splash shields (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION).
(7) Install bolts attaching bottom of fender to cargo box rearward of rear wheel.
(8) Install bolts attaching bottom of fender to cargo box forward of rear wheel.
(9) Install sockets into clearance lamps.
(10) Install clearance lamps.
(11) Using tail lamp opening, install nuts attaching rear fender to cargo box side panel.
(12) Install tail lamp.
(13) Install screws attaching fuel fill neck to rear fender opening.

# REAR SPLASH SHIELD

## REMOVAL

(1) Remove screws holding rear splash shield to rear wheel opening lip (Fig. 20).
(2) Remove push in fasteners holding rear splash shield to rear wheelhouse.
(3) Separate splash shield from vehicle.

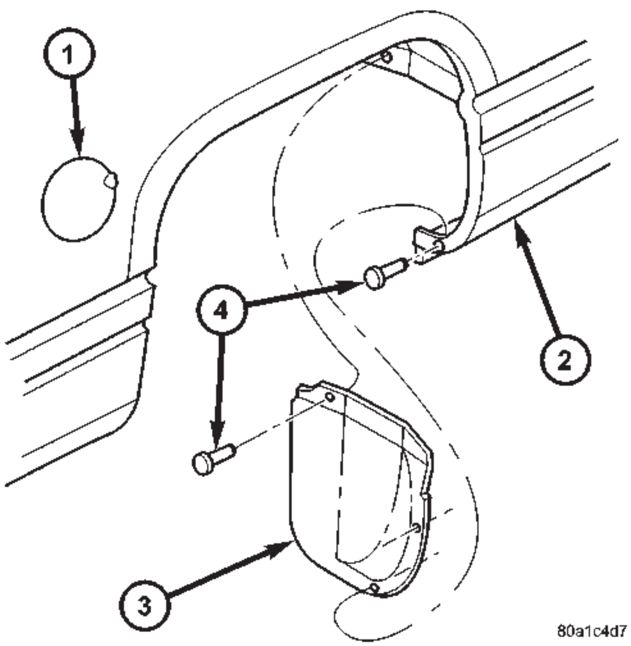

***Fig. 20 REAR SPLASH SHIELDS***

1 - FUEL FILLER DOOR
2 - REAR FENDER
3 - REAR SECTION REAR WHEEL HOUSE LINER
4 - PUSH IN FASTENERS

## INSTALLATION

(1) Position splash shield in wheelhouse opening.
(2) Install plastic rivets holding rear splash shield to rear wheelhouse.
(3) Install plastic rivets holding rear splash shield to rear wheel opening lip.

# REAR WHEELHOUSE LINER

## REMOVAL

(1) Remove plastic rivets attaching rear wheelhouse liner to rear wheel opening lip (Fig. 21).
(2) Remove plastic rivets attaching rear wheelhouse liner to rear wheelhouse.
(3) Separate rear wheelhouse liner form vehicle.

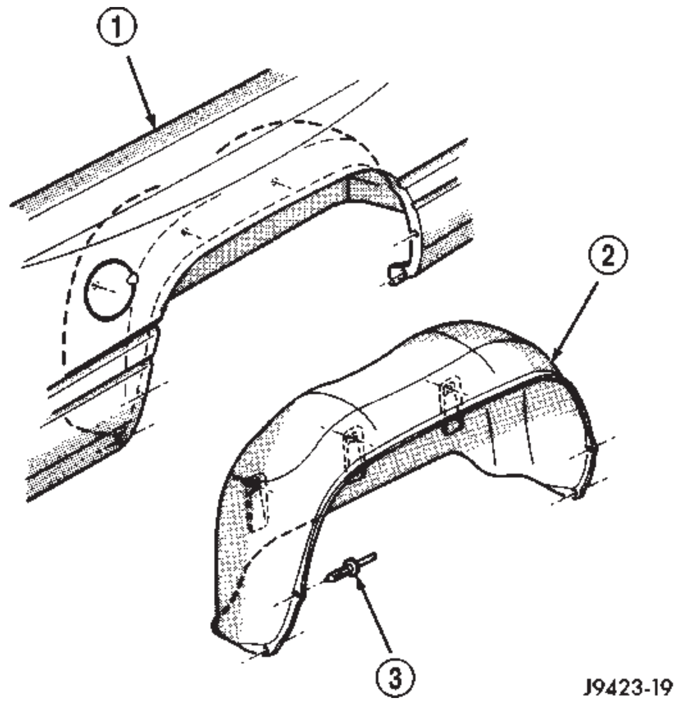

***Fig. 21 Rear Wheelhouse Liner***

1 - FENDER
2 - WHEEL HOUSELINER
3 - PLASTIC RIVET

## INSTALLATION

(1) Position rear wheelhouse liner in wheelhouse opening.
(2) Install plastic rivets attaching rear wheelhouse liner to rear wheelhouse.
(3) Working front to rear, install plastic rivets attaching rear wheelhouse liner to rear wheel opening lip.

# CARGO BOX

## REMOVAL

**CAUTION: The bolts attaching the cargo box to the frame are specially coated to provide a locking action. These bolts are not reusable and must be replaced each time the cargo box is removed or replaced.**

(1) Open fuel fill door.
(2) Remove screws attaching fuel fill neck adaptor to cargo box side wall.
(3) Separate fuel fill neck from cargo box.
(4) Disengage tail lamp wire connector from main body harness at left rear frame rail.
(5) Remove bolts attaching cargo box to frame rails (Fig. 22).

CARGO BOX (Continued)

(6) Using a suitable lifting device, separate cargo box from vehicle.

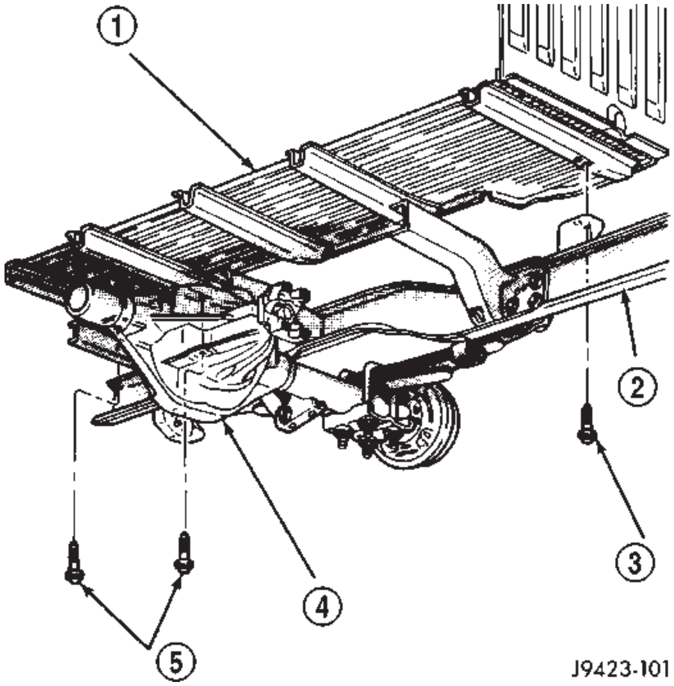

*Fig. 22 Cargo Box*

1 - CARGO BOX
2 - FRAME
3 - BOLT
4 - AXLE
5 - BOLT

## INSTALLATION

(1) Using a suitable lifting device, position cargo box on vehicle.

(2) Install **new** bolts attaching cargo box to frame rails. Tighten bolts to 54 N·m (40 ft. lbs.) torque.

(3) Engage tail lamp wire connector to main body harness at left rear frame rail.

(4) Install fuel fill neck.

# SIDE VIEW MIRROR

## REMOVAL

(1) Remove door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - REMOVAL).

(2) Remove mirror flag door seal (Fig. 23).

(3) Disengage power mirror wire connector from door harness, if equipped (Fig. 24).

(4) Remove nuts attaching sideview mirror to door frame (Fig. 25).

(5) Separate harness grommet form door frame, if equipped.

(6) Separate sideview mirror from vehicle.

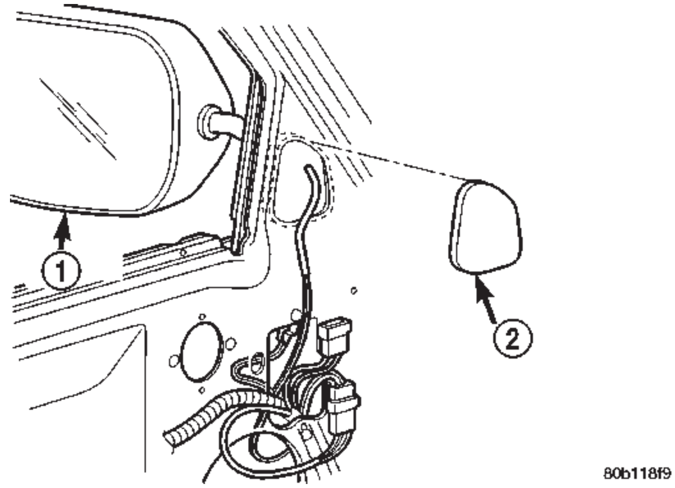

*Fig. 23 Mirror Flag Door Seal*

1 - MIRROR
2 - MIRROR FLAG SEAL

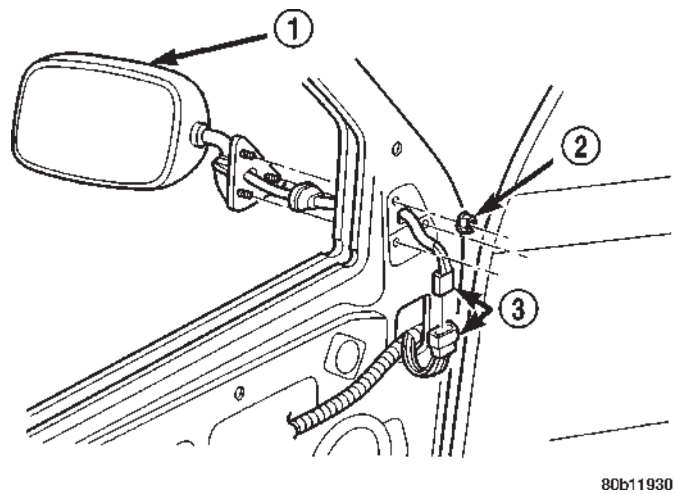

*Fig. 24 Sideview Mirror—Power*

1 - POWER MIRROR
2 - NUT
3 - CONNECTOR

## INSTALLATION

(1) Position sideview mirror on door.

(2) Install harness grommet in door frame, if equipped.

(3) Install nuts attaching sideview mirror to door (Fig. 25).

(4) Engage power mirror wire connector to harness, if equipped (Fig. 24).

(5) Install mirror flag door seal (Fig. 23).

(6) Install door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - INSTALLATION).

SIDE VIEW MIRROR (Continued)

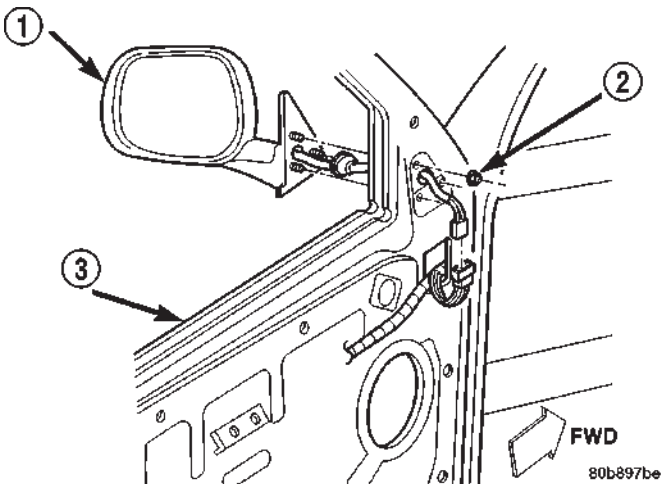

*Fig. 25 Sideview Mirror*

1 - MIRROR
2 - NUT
3 - DOOR

# SIDE VIEW MIRROR - LOW MOUNTED

## REMOVAL

(1) Remove bolts attaching lower support legs to outer door panel.

(2) Remove bolts attaching upper support arms to outer door panel (Fig. 26).

(3) Separate mirror from door.

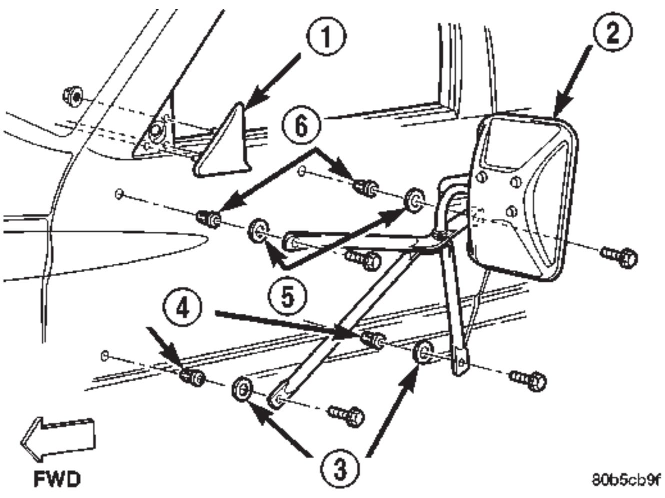

*Fig. 26 Low Mounted Side View Mirror*

1 - FLAG COVER
2 - MIRROR
3 - WASHER
4 - NUTSERT
5 - WASHER
6 - NUTSERT

## INSTALLATION

(1) Position mirror on door.

(2) Place insulation washers between support frame and door panel

(3) Install bolts attaching upper support arms to outer door panel.

(4) Install bolts attaching lower support legs to outer door panel.

# SIDE VIEW MIRROR GLASS

## REMOVAL

**WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.**

(1) Carefully pull/pry the broken glass holder from the mirror assembly.

(2) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

## INSTALLATION

(1) Position the new mirror glass holder to the mirror assembly.

(2) Align the mirror glass holder's attaching fingers to the mirror motor housing.

**NOTE: ENSURE THAT THE MOISTURE DRAIN HOLE ON THE MIRROR GLASS HOLDER ASSEMBLY IS FACING DOWNWARD.**

(3) Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

**NOTE: PRESSURE MUST BE APPLIED EQUALLY OVER THE CENTER PORTION OF THE MIRROR TO ENGAGE THE MIRROR GLASS HOLDER'S ATTACHING FINGERS TO THE CORRESPONDING FINGERS ON THE HOUSING ASSEMBLY. ONE OR MORE CLICKS MAY BE HEARD WHEN FINGER ENGAGEMENT TAKES PLACE.**

(4) Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

# HOOD

## TABLE OF CONTENTS

# HINGE

## REMOVAL

(1) Open hood and support the side that requires hinge replacement.

(2) Mark all bolt and hinge attachment locations with a grease pencil or equivalent to provide reference marks for installation.

(3) Remove nuts attaching hood to hinge (Fig. 1).

(4) Remove bolts attaching hood hinge to cowl.

(5) Separate hinge from vehicle.

## INSTALLATION

(1) If necessary, paint new hinge before installation.

(2) Position hinge on vehicle.

(3) Align all marks

(4) Install bolts attaching hood hinge to cowl.

(5) Install nuts attaching hood to hinge.

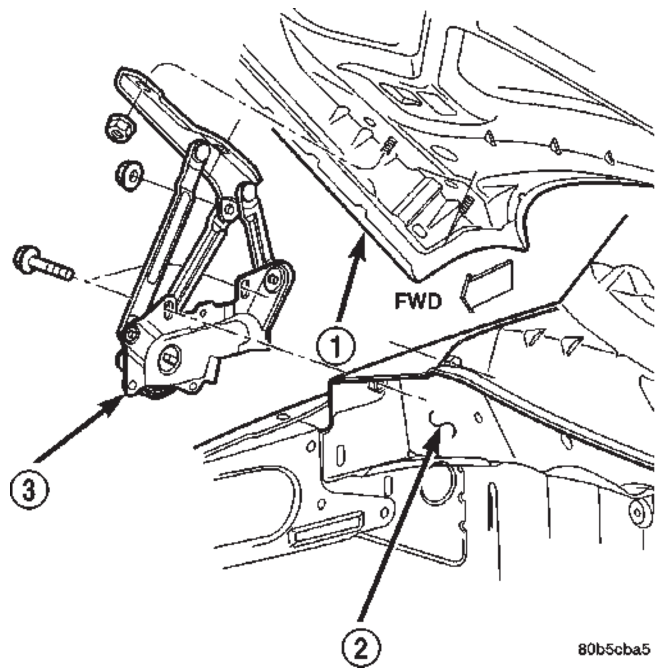

*Fig. 1 Hood Hinge*

1 - HOOD
2 - COWL
3 - HINGE

# HOOD

## REMOVAL

(1) Disconnect the under hood lamp wire connector.

(2) Disconnect the air temperature sensor wire connector, if equipped.

(3) Mark all bolt and hinge attachment locations with a grease pencil or equivalent to provide reference marks for installation.

(4) Remove top nuts attaching hood to hinge and loosen bottom nuts until they can be removed by hand (Fig. 2).

(5) With assistance of a helper at the opposite side of the vehicle to support the hood, remove the bottom nuts. Separate the hood from the vehicle.

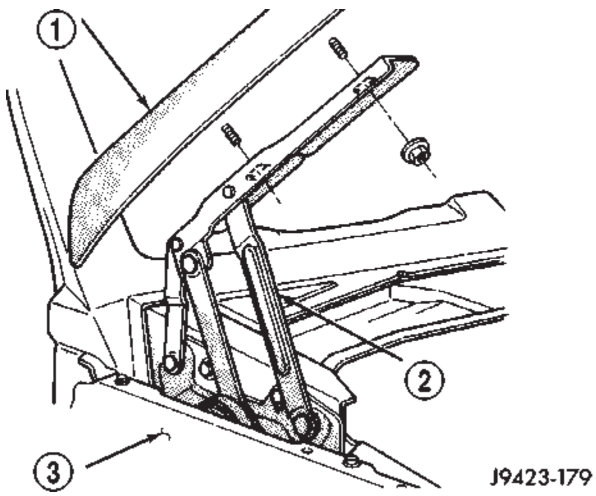

*Fig. 2 Hood*

1 - HOOD
2 - HOOD HINGE
3 - FENDER

## INSTALLATION

(1) With assistance of a helper, position hood on vehicle loosely install bottom nuts.

Align all marks, install top nuts and tighten bottom nuts. The hood should be aligned to 5 mm (0.2 in.) gap to the front fenders and flush across the top surfaces along fenders.

(2) Connect the air temperature sensor wire connector, if equipped.

(3) Connect the under hood lamp wire connector.

## ADJUSTMENT

(1) Loosen the hinge arm-to-hood panel bolts at each side of the vehicle.

(2) Loosen the hood latch screws.

(3) Close the hood. Adjust the fore/aft position.

(4) Raise the hood. Tighten the hinge arm-to-hood panel bolts.

(5) Tighten the latch screws.

(6) Lower the hood. Inspect clearance between the hood and the cowl cover.

# LATCH

## REMOVAL

(1) Remove bolts attaching hood latch to radiator closure panel crossmember (Fig. 3).

(2) Separate hood latch from crossmember.

(3) Disconnect release cable from hood latch.

## INSTALLATION

(1) Connect release cable to hood latch.

(2) Position hood latch on crossmember.

(3) Install bolts attaching hood latch to radiator closure panel crossmember.

## ADJUSTMENT

(1) Loosen the hood latch screws.

(2) Move the latch to the correct location and lightly tighten the screws.

(3) Close the hood slowly and observe the latching operation.

(4) As necessary, re-adjust the latch position and tighten the screws.

LATCH (Continued)

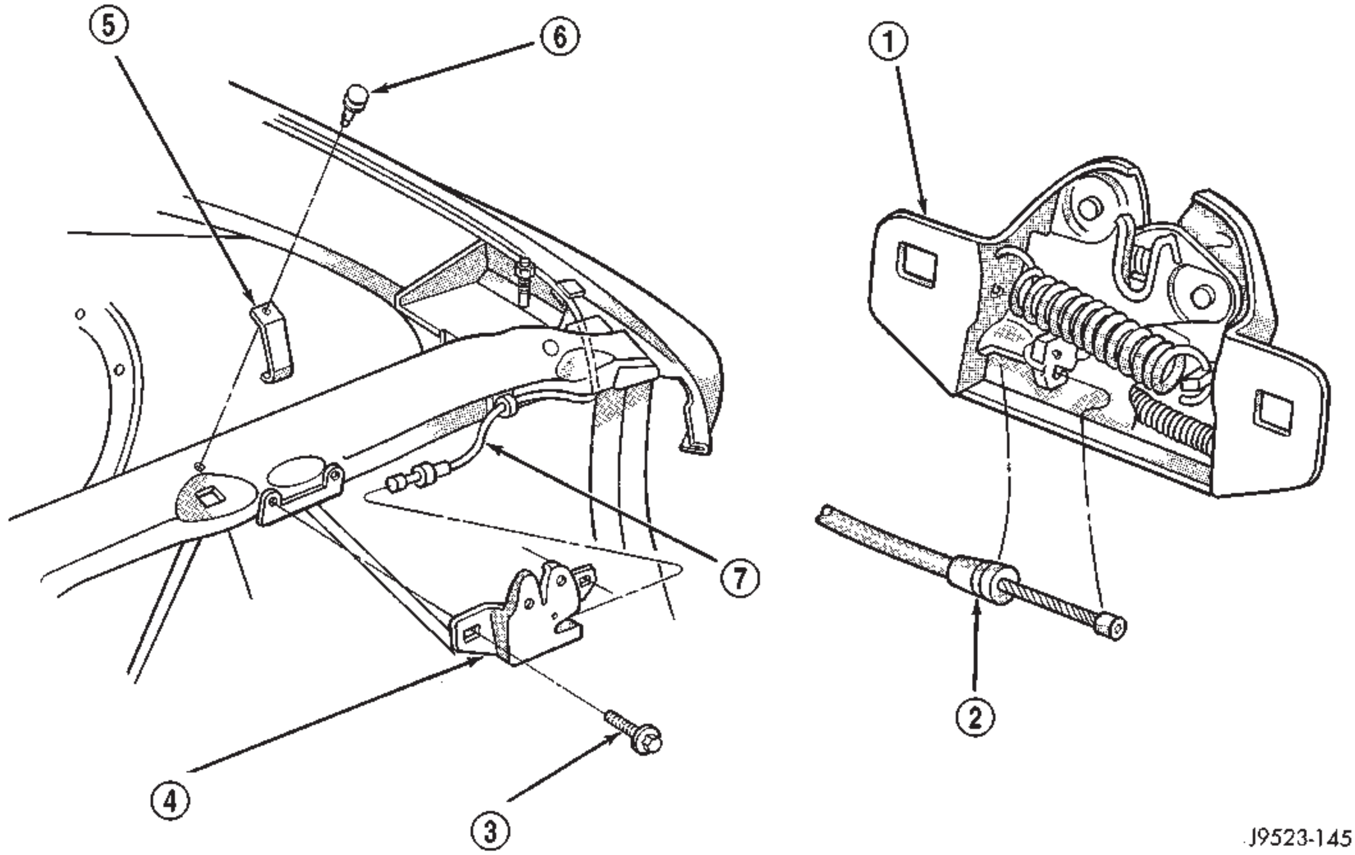

*Fig. 3 Hood Latch*

1 - LATCH ASSEMBLY
2 - CABLE
3 - SCREW
4 - LATCH ASSEMBLY
5 - HOOD SECONDARY SKID PLATE
6 - PUSH—IN FASTENER
7 - CABLE

# LATCH RELEASE CABLE

## REMOVAL

(1) Remove hood latch (Refer to 23 - BODY/HOOD/LATCH - REMOVAL).

(2) Disconnect release cable from hood latch.

(3) Detach the release cable from the retainer clips in the engine compartment.

(4) Separate the release cable grommet from the dash panel hole.

(5) From the inside of the vehicle, remove the screws attaching the hood release handle to the bottom of the instrument panel (Fig. 4).

(6) Pull/route the hood release cable through the dash panel hole and remove it via the inside of the vehicle.

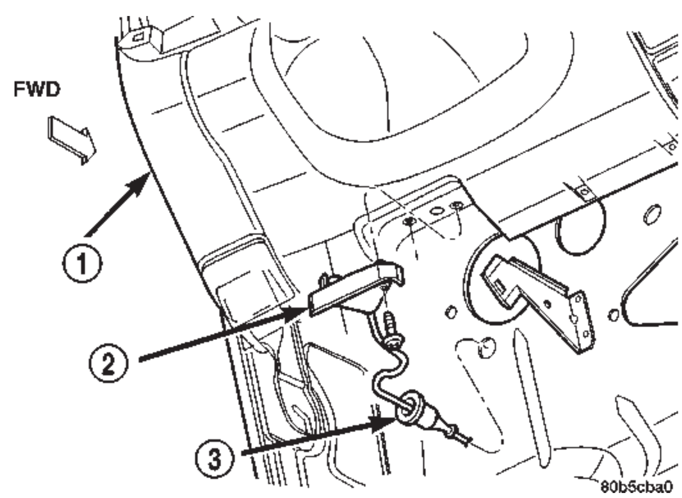

*Fig. 4 Hood Release Handle*

1 - INSTRUMENT PANEL
2 - HOOD RELEASE HANDLE
3 - HOOD RELEASE CABLE

## INSTALLATION

**NOTE: If replacement hood latch is also being installed, ensure that it is thoroughly lubricated.**

LATCH RELEASE CABLE (Continued)

(1) From inside the vehicle, pull/route the hood release cable through the dash panel hole and into the engine compartment.

(2) Install the hood release handle.

(3) Install the cable grommet in the dash panel hole.

(4) Attach the release cable to the retainer clips in the engine compartment.

(5) Attach release cable to hood latch.

(6) Install hood latch (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION).

(7) Test the hood latch release cable for proper operation.

## LATCH STRIKER

### REMOVAL

(1) Open hood.

(2) Remove bolts attaching hood latch striker to hood (Fig. 5).

(3) Separate hood latch striker from hood.

### INSTALLATION

(1) Position hood latch striker on hood.

(2) Install bolts attaching hood latch striker to hood.

### ADJUSTMENT

(1) Open the hood.

(2) Loosen the latch striker screws.

(3) Slowly close the hood and observe the latching operation.As necessary, re-adjust the striker position. Tighten the screws.

## SAFETY LATCH

### REMOVAL

(1) Open hood.

(2) Remove bolts attaching hood safety catch to hood (Fig. 5) and (Fig. 6).

(3) Separate safety catch from hood.

### INSTALLATION

(1) Position safety catch on hood.

(2) Engage catch rod to catch.

(3) Install bolts attaching hood safety catch to hood.

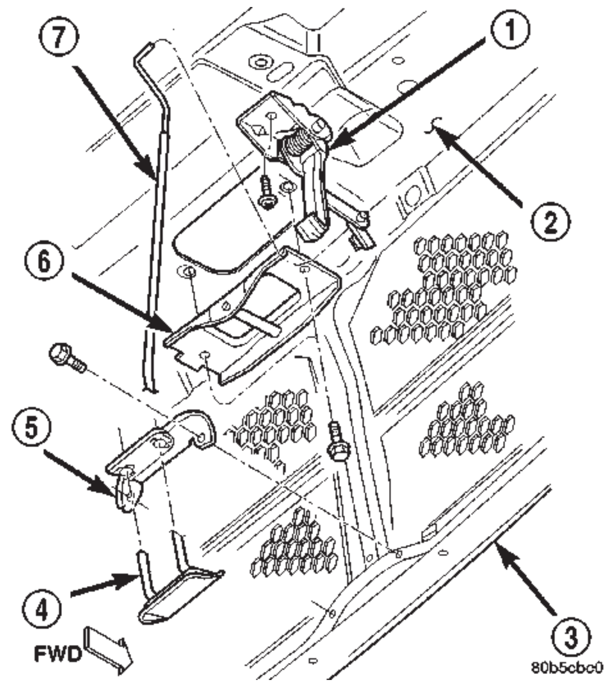

*Fig. 5 Hood Safety Catch and Latch Striker — SLT*

1 - SAFETY CATCH
2 - HOOD
3 - GRILLE
4 - SAFETY CATCH RELEASE HANDLE

# SILENCER PAD

## REMOVAL

(1) Disconnect underhood lamp wire connector.
(2) Disconnect air temperature sensor connector, if equipped.
(3) Remove push-in fasteners holding silencer to hood (Fig. 7).
(4) Separate hood silencer from hood.

## INSTALLATION

(1) Position hood silencer on hood.
(2) Install push-in fasteners holding silencer to hood.
(3) Connect air temperature sensor connector, if equipped.
(4) Connect underhood lamp wire connector.

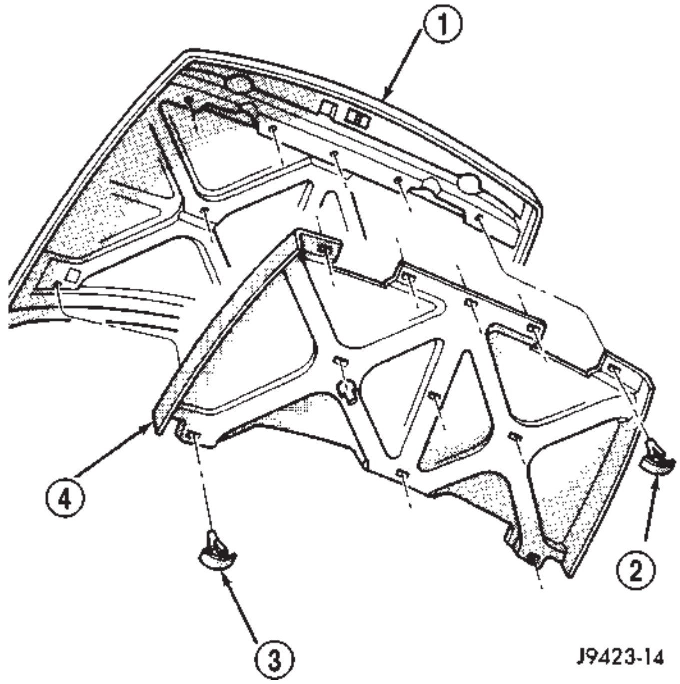

*Fig. 7 Hood Silencer*

1 - HOOD
2 - CLIP
3 - CLIP
4 - INSULATOR PAD

# INSTRUMENT PANEL SYSTEM

## TABLE OF CONTENTS

# INSTRUMENT PANEL SYSTEM

## DESCRIPTION

The instrument panel is located at the front of the passenger compartment. This instrument panel is molded from a blend of various plastics that are mechanically attached to the vehicle. Colors are molded into the plastic components to minimize appearance degradation from scratches or abrasions. The panel components are internally ribbed and riveted to steel reinforcements for additional structural integrity and dimensional stability. The instrument panel surface components are designed to deform upon impact without breaking. This type of construction provides improved energy absorption which, in conjunction with the dual airbags and seat belts, helps to improve occupant protection.

The top of the instrument panel is secured to the top of the dash panel near the base of the windshield using screws. An end bracket integral to each end of the instrument panel structure is secured to each cowl side inner panel with a screw. A stamped metal bracket supports the center of the instrument panel by securing it to the top of the floor panel transmission tunnel below the instrument panel with screws. The instrument cluster, radio, heater-air conditioner control, passenger airbag, glove box, electrical junction block, Central Timer Module (CTM), accessory switches, ash receiver, cigar lighter, accessory power outlet, park brake release handle, inside hood release handle, as well as numerous other components are secured to and supported by this unit.

The instrument panel for this vehicle includes the following major features:

- **Cluster Bezel -** This molded plastic bezel is secured with snap clips to the instrument panel supporting structure. It trims out the edges of the headlamp switch, instrument cluster, radio, heater-air conditioner controls, passenger airbag on-off switch, and the heated seat switches on vehicles so equipped. On vehicles without the heated seat option, a small storage cubby bin is provided in the cluster bezel. This bezel also incorporates three completely adjustable panel outlets for the climate control system, and fills the opening between the instrument cluster and the top of the steering column where it passes through the instrument panel.
- **Cup Holder/Storage Bin -** Vehicles equipped with an automatic transmission feature a latching fold-down, adjustable cup holder located on the lower instrument panel between the glove box and the ash receiver. Vehicles equipped with a manual transmission have a lighted storage bin on the instrument panel in place of the cup holder.
- **Glove Box -** The hinged bin-type glove box in the passenger side of the instrument panel features a recessed paddle-operated latch handle. Three molded

INSTRUMENT PANEL SYSTEM (Continued)

hook formations on the lower edge of the glove box door are engaged with and pivot on three hinge pins integral to the lower edge of the instrument panel support structure. The glove box door also serves as the passenger side knee blocker. A honeycomb structure between the inner and outer glove box door panels helps to absorb the impact load and distribute it to the instrument panel structure.

- **Steering Column Opening Cover** - The steering column opening cover serves as the driver side knee blocker. This molded plastic cover has an integral ribbed plastic liner concealed behind it, for increased strength and integrity. The steering column opening cover transfers impact loads to the instrument panel structural support.
- **Top Cover** - The instrument panel top cover or base trim is the molded, grained, and color impregnated plastic outer skin of the instrument panel structural support.

Hard wired circuitry connects the electrical components on the instrument panel to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the instrument panel components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes complete circuit diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

## OPERATION

The instrument panel serves as the command center of the vehicle, which necessarily makes it a very complex unit. The instrument panel is designed to house the controls and monitors for standard and optional powertrains, climate control systems, audio systems, safety systems, and many other comfort or convenience items. When the components of the instrument panel structural support are properly assembled and secured in the vehicle they provide superior instrument panel stiffness and integrity to help reduce buzzes, squeaks, and rattles. This type of construction also provides improved energy absorption which, in conjunction with the dual airbags and seat belts, helps to improve occupant protection.

The instrument panel is also designed so that all of the various controls can be safely reached and the monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access to each of these items for service. Modular instrument panel construction allows all of the gauges and controls to be serviced from the front of the panel. In addition, most of the instrument panel electrical components can be accessed without complete instrument panel removal. However, if necessary, the instrument panel can be removed from the vehicle as an assembly.

The steering column opening cover with its integral knee blocker located on the driver side of the instrument panel works in conjunction with the airbag system in a frontal vehicle impact to keep the driver properly positioned for an airbag deployment. In addition, removal of this component provides access to the steering column mounts, the steering column wiring, the Junction Block (JB) (removal of a snap-fit fuse access panel on the left end of the instrument panel allows access to the fuses and circuit breakers), the Central Timer Module (CTM), the Infinity speaker filter choke and relay unit, much of the instrument panel wiring, and the gear selector indicator cable (automatic transmission).

In a frontal collision, the glove box door on the passenger side of the instrument panel provides the same function for the front seat passenger as the knee blocker does for the driver. The glove box door also incorporates a recessed latch handle. Removal of the glove box provides access to the passenger airbag, the glove box lamp and switch, the radio antenna coaxial cable, the heating and air conditioning vacuum harness connector, and additional instrument panel wiring.

Removal of the instrument panel cluster bezel allows access to the headlamp switch, instrument cluster, radio, passenger airbag on-off switch, heated seat switches (if equipped), and the heating and air conditioning control. Removal of the instrument cluster allows access to the cluster illumination and indicator bulbs, and more of the instrument panel wiring. Complete instrument panel removal is required for service of most components internal to the heating and air conditioning system housing, including the heater core and the evaporator.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the components and systems mounted on or in the instrument panel.

INSTRUMENT PANEL SYSTEM (Continued)

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the Airbag Control Module (ACM) and bracket from the floor panel transmission tunnel. (Refer to 8 - ELECTRICAL/RESTRAINTS/AIRBAG CONTROL MODULE - REMOVAL).

(3) Remove the trim from the left and right cowl side inner panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).

(4) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(5) Remove the two screws that secure the inside hood latch release handle to the instrument panel lower reinforcement and lower the release handle to the floor.

(6) Disconnect the clockspring pigtail wire connector from the instrument panel wire harness connector located on the instrument panel lower reinforcement.

(7) If the vehicle is so equipped, disconnect the overdrive lockout switch pigtail wire connector from the instrument panel wire harness connector near the instrument panel lower reinforcement.

(8) Remove the steering column from the vehicle, but do not remove the driver airbag, the steering wheel, or the switches from the column. Be certain that the steering wheel is locked and secured from rotation to prevent the loss of clockspring centering. (Refer to 19 - STEERING/COLUMN - REMOVAL).

(9) From under the driver side of the instrument panel, perform the following:

(a) Disengage the park brake release handle linkage rod from the park brake mechanism on the left cowl side inner panel. (Refer to 5 - BRAKES/PARKING BRAKE/RELEASE - REMOVAL).

(b) Disconnect the instrument panel wire harness connector from the park brake switch on the park brake mechanism.

(c) Disconnect the three connectors (one from the body wire harness, and two from the headlamp and dash wire harness) from the three connector receptacles located closest to the dash panel on the back of the Junction Block (JB).

(d) Remove the screw from the center of the headlamp and dash wire harness to instrument panel wire harness bulkhead connector and disconnect the connector.

(e) Disconnect the instrument panel wire harness to door wire harness connector located directly below the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(f) If the vehicle is equipped with the Infinity sound system option, disconnect the Infinity wire harness connector from the instrument panel wire harness connector that is secured to the outboard side of the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(g) Disconnect the instrument panel wire harness connector from the stop lamp switch.

(h) Disconnect the heater-A/C housing vacuum harness connector from the heater-A/C control vacuum harness connector located near the left end of the heater-A/C housing.

(10) From under the passenger side of the instrument panel, disconnect the two halves of the radio antenna coaxial cable connector.

(11) Loosen the right and left instrument panel cowl side roll-down bracket screws about 13 mm (0.50 inch) (Fig. 1).

(12) Remove the five screws that secure the top of the instrument panel to the top of the dash panel, removing the center screw last.

(13) Roll down the instrument panel and install a temporary hook in the center hole on top of the instrument panel. Secure the other end of the hook to the center hole in the top of the dash panel. The hook should support the instrument panel in its rolled down position about 46 cm (18 inches) from the dash panel.

(14) With the instrument panel supported in the roll-down position, disconnect the instrument panel wire harness connectors from the heater-A/C housing wire harness connectors.

(15) With the aid of an assistant, remove the temporary hook and lift the instrument panel assembly off of the roll-down bracket screws and remove it from the vehicle.

INSTRUMENT PANEL SYSTEM (Continued)

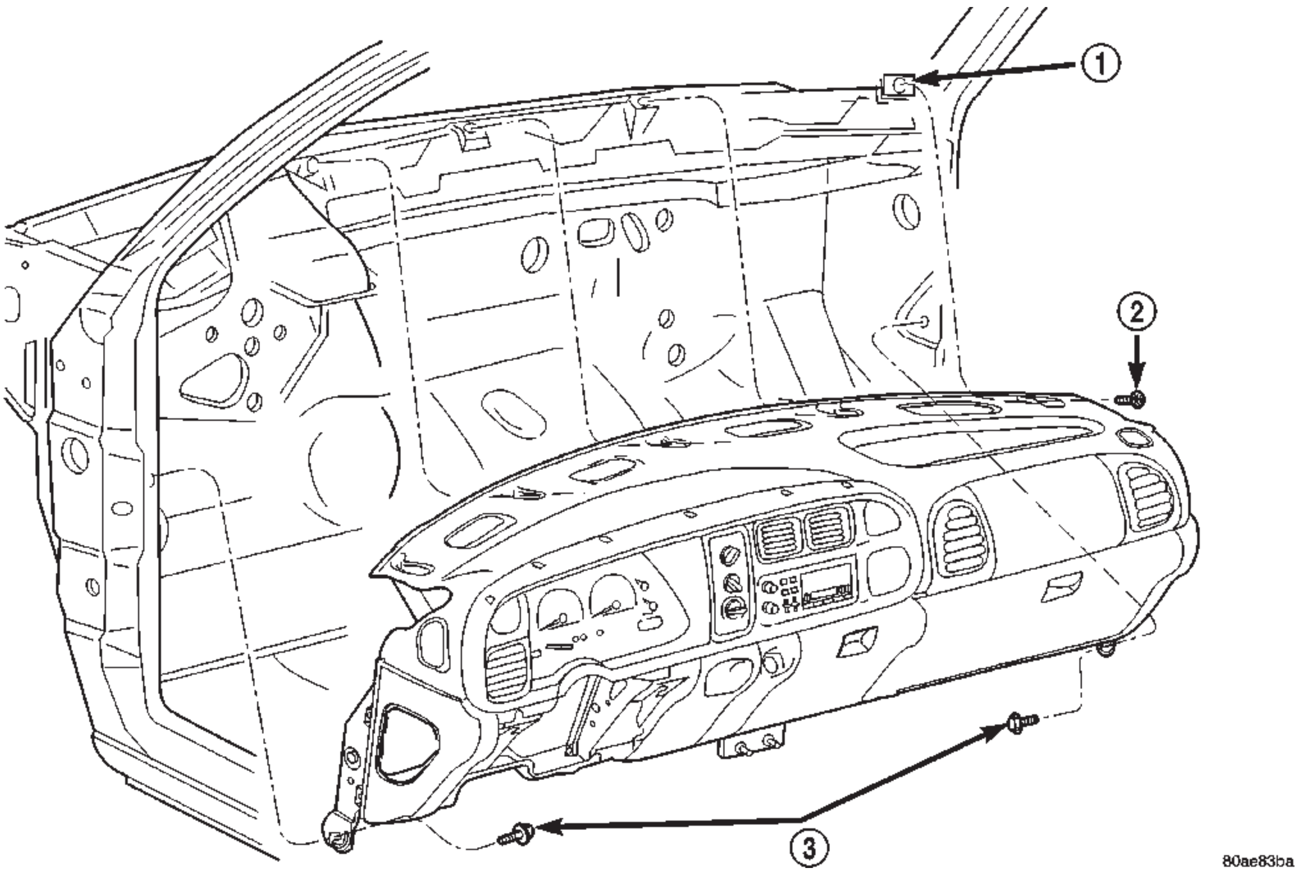

*Fig. 1 Instrument Panel Assembly Remove/Install*

1 - PLASTIC NUT
2 - SCREWS
3 - SCREWS

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) With the aid of an assistant, load the instrument panel assembly onto the roll-down bracket screws on the cowl side inner panels in the vehicle (Fig. 1). Install a temporary hook in the center hole on top of the instrument panel. Secure the other end of the hook to the center hole in the top of the dash panel. The hook should support the instrument panel in its rolled down position about 46 cm (18 inches) from the dash panel.

(2) With the instrument panel supported in the roll-down position, reconnect the instrument panel wire harness connectors to the heater-A/C housing wire harness connectors.

(3) Remove the temporary hook from the instrument panel and roll the instrument panel up to its installed position against the dash panel.

(4) Install and tighten the five screws that secure the top of the instrument panel to the top of the dash panel. Tighten the screws to 3.2 N·m (28 in. lbs.).

(5) Tighten the right and left instrument panel cowl side roll-down bracket screws. Tighten the screws to 11.9 N·m (105 in. lbs.).

(6) From under the passenger side of the instrument panel, reconnect the two halves of the radio antenna coaxial cable connector.

(7) From under the driver side of the instrument panel, perform the following:

(a) Engage the park brake release handle linkage rod with the park brake mechanism on the left

INSTRUMENT PANEL SYSTEM (Continued)

cowl side inner panel. (Refer to 5 - BRAKES/PARKING BRAKE/RELEASE - INSTALLATION).

(b) Reconnect the instrument panel wire harness connector to the park brake switch on the park brake mechanism.

(c) Reconnect the three connectors (one from the body wire harness, and two from the headlamp and dash wire harness) to the three connector receptacles located closest to the dash panel on the back of the Junction Block (JB).

(d) Reconnect the headlamp and dash wire harness to instrument panel wire harness bulkhead connector and tighten the screw in the center of the connector. Tighten the screw to 3.5 N·m (31 in. lbs.).

(e) Reconnect the instrument panel wire harness to door wire harness connector located directly below the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(f) If the vehicle is equipped with the Infinity sound system option, reconnect the Infinity wire harness connector to the instrument panel wire harness connector that is secured to the outboard side of the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(g) Reconnect the instrument panel wire harness connector to the stop lamp switch.

(h) Reconnect the heater-A/C housing vacuum harness connector to the heater-A/C control vacuum harness connector located near the left end of the heater-A/C housing.

(8) Reinstall the steering column into the vehicle. Be certain that the steering wheel was locked and secured from rotation to prevent the loss of clockspring centering. (Refer to 19 - STEERING/COLUMN - INSTALLATION).

(9) If the vehicle is so equipped, reconnect the overdrive lockout switch pigtail wire connector to the instrument panel wire harness connector near the instrument panel lower reinforcement.

(10) Reconnect the clockspring pigtail wire connector to the instrument panel wire harness connector at the instrument panel lower reinforcement.

(11) Position the inside hood latch release handle to the instrument panel lower reinforcement.

(12) Install and tighten the two screws that secure the inside hood latch release handle to the instrument panel lower reinforcement. Tighten the screws to 2.8 N·m (25 in. lbs.).

(13) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(14) Reinstall the trim onto the left and right cowl side inner panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

(15) Reinstall the Airbag Control Module (ACM) and bracket onto the floor panel transmission tunnel. (Refer to 8 - ELECTRICAL/RESTRAINTS/AIRBAG CONTROL MODULE - INSTALLATION).

(16) Reconnect the battery negative cable.

# ASH RECEIVER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Open the instrument panel ash receiver.

(3) From the open position, close the ash receiver slightly and pull it straight back far enough to disengage it from the pivot pins in the lower instrument panel.

(4) Remove the three screws that secure the ash receiver flame shield to the lower instrument panel (Fig. 2).

(5) Pull the ash receiver flame shield out from the instrument panel far enough to disengage the two retaining tabs on the top of the shield from the mounting holes in the instrument panel.

(6) Lower the flame shield from the instrument panel far enough to access the ash receiver lamp and hood.

(7) Squeeze the ash receiver lamp and hood bracket to disengage the unit from the mounting hole in the flame shield.

(8) Remove the ash receiver flame shield from the instrument panel.

ASH RECEIVER (Continued)

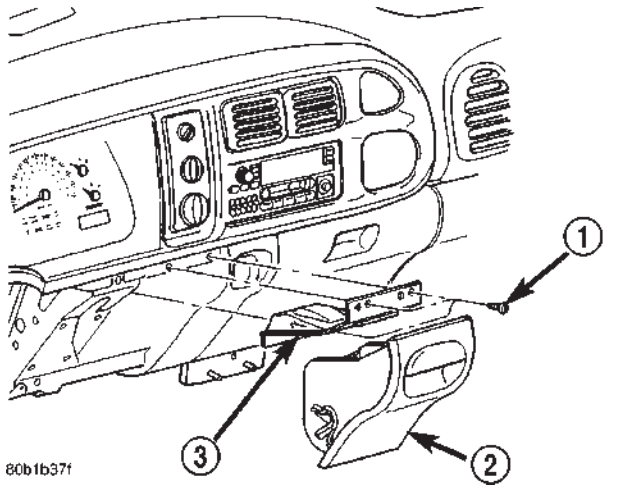

*Fig. 2 Instrument Panel Ash Receiver Remove/Install*

1 - SCREW
2 - ASH RECEIVER
3 - FLAME SHIELD

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the ash receiver flame shield to the instrument panel (Fig. 2).

(2) Squeeze the ash receiver lamp and hood bracket and engage the unit to the mounting hole in the flame shield.

(3) Insert the two retaining tabs on the top of the ash receiver flame shield into the mounting holes in the instrument panel, then push the shield forward to engage the tabs with the instrument panel.

(4) Install and tighten the three screws that secure the ash receiver flame shield to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Align the pivot receptacles on each side of the ash receiver with the pivot pins in the lower instrument panel.

(6) Push the ash receiver forward onto the pivot pins in the instrument panel until the open ash receiver snaps into place.

(7) Reconnect the battery negative cable.

# CLUSTER BEZEL

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) If the vehicle is equipped with an automatic transmission, turn the ignition switch to the Off position (not Lock), set the parking brake, and place the automatic transmission gear selector lever in the Low position.

(3) If the vehicle is so equipped, set the tilt steering column in its lowest position.

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry around the perimeter of the cluster bezel to disengage the snap clips from their receptacles in the instrument panel (Fig. 3).

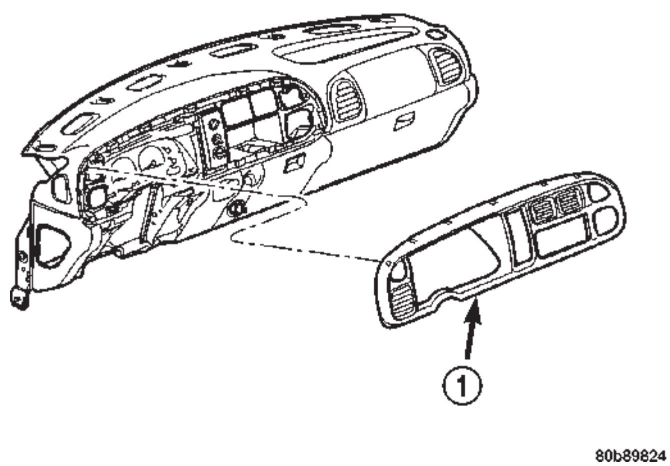

*Fig. 3 Cluster Bezel Remove/Install*

1 - CLUSTER BEZEL

CLUSTER BEZEL (Continued)

(5) Remove the cluster bezel from the instrument panel.

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the cluster bezel to the instrument panel (Fig. 3).
(2) Align the snap clips on the cluster bezel with the receptacles in the instrument panel.
(3) Press firmly on the cluster bezel over each of the snap clip locations until each of the snap clips is fully engaged in its receptacle.
(4) Reconnect the battery negative cable.

## CUBBY BIN

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.
(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
(3) Remove the three screws that secure the cubby bin to the instrument panel (Fig. 4).

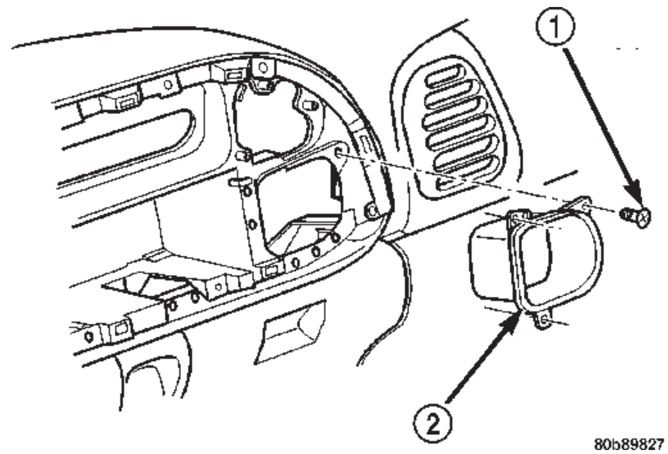

***Fig. 4 Instrument Panel Cubby Bin Remove/Install***

1 - SCREW (3)
2 - CUBBY BIN

(4) Remove the cubby bin from the instrument panel.

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the cubby bin to the instrument panel (Fig. 4).
(2) Install and tighten the three screws that secure the cubby bin to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
(3) Install the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
(4) Reconnect the battery negative cable.

## CUP HOLDER

### REMOVAL

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehi-

CUP HOLDER (Continued)

cles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Unlatch and fold the cup holder down from the instrument panel to its open position.

(4) Remove the six screws that secure the cup holder to the instrument panel (Fig. 5).

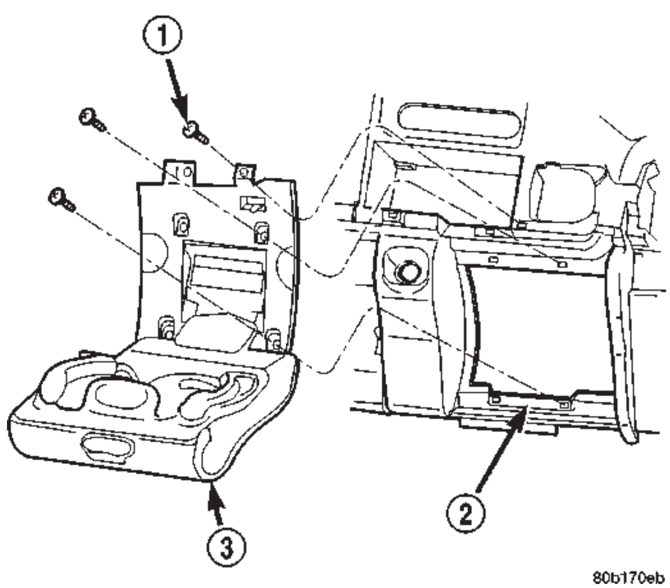

***Fig. 5 Instrument Panel Cup Holder***

1 - SCREW
2 - INSTRUMENT PANEL
3 - CUP HOLDER

(5) Pull the cup holder away from the instrument panel far enough to access the illumination lamp and hood unit.

(6) Disengage the illumination lamp and hood retainer clip from the back of the instrument panel cup holder unit.

(7) Remove the cup holder unit from the instrument panel.

## INSTALLATION

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the cup holder unit near the instrument panel.

(2) Engage the illumination lamp and hood retainer clip to the back of the instrument panel cup holder unit.

(3) Position the cup holder unit onto the instrument panel (Fig. 5).

(4) Install and tighten the six screws that secure the cup holder to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(6) Reconnect the battery negative cable.

# GLOVE BOX

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box.

(3) While holding the glove box door securely with one hand, push the center of the glove box bin towards the front of the vehicle (Fig. 6). Flex the center of the glove box bin far enough so that the glove box stops on each side of the bin will clear the sides of the instrument panel glove box opening.

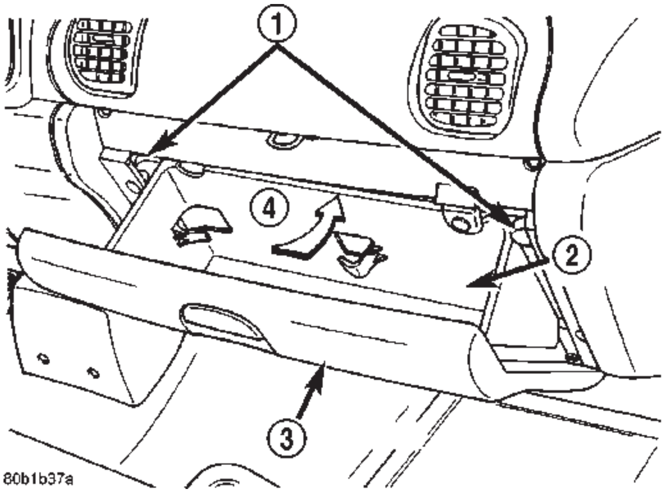

***Fig. 6 Glove Box***

1 - GLOVE BOX STOPS
2 - GLOVE BOX BIN
3 - GLOVE BOX DOOR
4 - PUSH

(4) Roll the glove box downward until the stop bumpers are beyond the sides of the instrument panel glove box opening, then release the bin.

(5) Lift the bottom of the glove box upward to disengage the three glove box hinge hooks from the three hinge pins on the instrument panel.

## DISASSEMBLY - GLOVE BOX

The only serviced component of the glove box is the glove box bin. If any other component of the glove box is faulty or damaged, the entire glove box assembly must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

(3) Remove the two screws that secure each outboard flange of the glove box bin to the glove box door (Fig. 7).

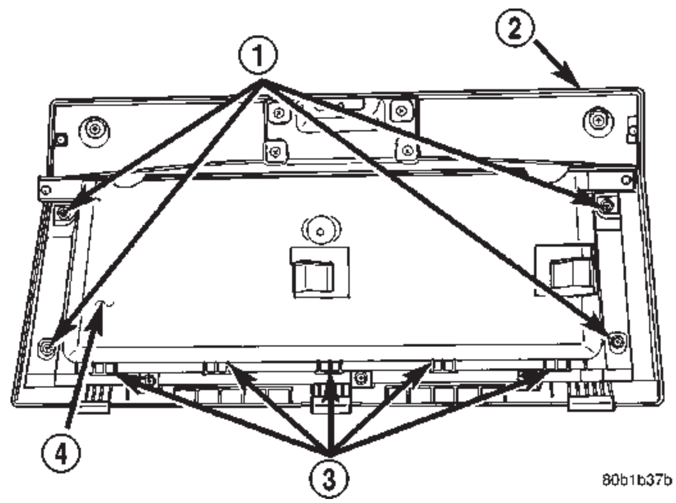

***Fig. 7 Glove Box Disassemble/Assemble***

1 - SCREWS
2 - GLOVE BOX DOOR
3 - HOOKS
4 - GLOVE BOX BIN

(4) Pull the top of the bin away from the top of the glove box door.

(5) Disengage the five hook formations on the bottom of the glove box bin from the slots near the bottom of the inner glove box door.

(6) Remove the glove box bin from the glove box door.

## ASSEMBLY - GLOVE BOX

(1) Position the glove box bin onto the glove box door.

(2) Engage the five hook formations on the bottom of the glove box bin with the slots near the bottom of the inner glove box door (Fig. 7).

(3) Position the top of the bin to the top of the glove box door.

GLOVE BOX (Continued)

(4) Install and tighten the two screws that secure each outboard flange of the glove box bin to the glove box door. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reinstall the glove box onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).

(6) Reconnect the battery negative cable.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the glove box to the instrument panel.

(2) Engage the three hinge hooks near the bottom of the glove box door with the three hinge pins on the instrument panel.

(3) While holding the glove box door securely with one hand, push the center of the glove box bin towards the front of the vehicle (Fig. 6). Flex the center of the glove box bin far enough so that the glove box stops on each side of the bin will clear the sides of the instrument panel glove box opening.

(4) Roll the glove box upward until the stop bumpers are beyond the sides of the instrument panel glove box opening, then release the bin.

(5) Close the glove box.

(6) Reconnect the battery negative cable.

# GLOVE BOX LATCH STRIKER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim from the upper glove box opening. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX OPENING UPPER TRIM - REMOVAL).

(3) Remove the two screws that secure the latch striker to the instrument panel glove box opening upper reinforcement (Fig. 8).

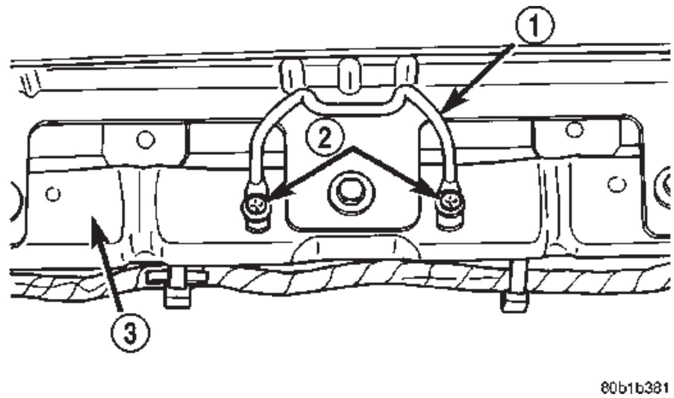

*Fig. 8 Glove Box Latch Striker Remove/Install*

1 - LATCH STRIKER
2 - SCREWS
3 - GLOVE BOX OPENING UPPER REINFORCEMENT

(4) Remove the latch striker from the instrument panel glove box opening upper reinforcement.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the latch striker onto the instrument panel glove box opening upper reinforcement (Fig. 8).

(2) Install and tighten the two screws that secure the latch striker to the instrument panel glove box

GLOVE BOX LATCH STRIKER (Continued)

opening upper reinforcement. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Reinstall the trim onto the upper glove box opening. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX OPENING UPPER TRIM - INSTALLATION).

(4) Reconnect the battery negative cable.

# GLOVE BOX OPENING UPPER TRIM

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box.

(3) Remove the three screws that secure the trim to the instrument panel glove box opening upper reinforcement (Fig. 9).

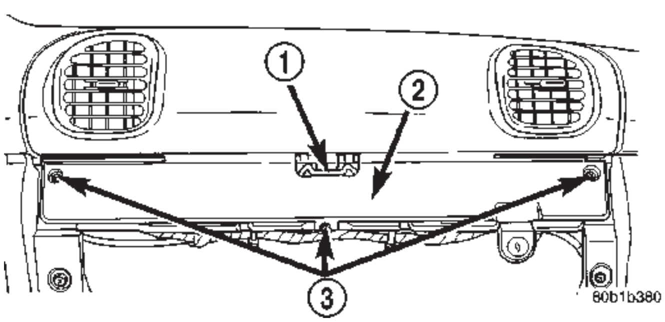

***Fig. 9 Glove Box Opening Upper Trim Remove/Install***

1 - LATCH STRIKER
2 - TRIM
3 - SCREWS

(4) Remove the trim from the instrument panel glove box opening upper reinforcement.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the trim onto the instrument panel glove box opening upper reinforcement (Fig. 9).

(2) Install and tighten the three screws that secure the trim to the instrument panel glove box opening upper reinforcement. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Close the glove box.

(4) Reconnect the battery negative cable.

# INSTRUMENT PANEL TOP COVER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the passenger airbag from the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL).

INSTRUMENT PANEL TOP COVER (Continued)

(4) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(5) Place the instrument panel on a suitable work surface. Be certain to take the proper precautions to protect the instrument panel from any possible cosmetic damage.

(6) Remove the screws around the perimeter of the top cover that secure it to the instrument panel structural support, the defroster duct, and the demister ducts.

(7) Lift the top cover off of the instrument panel.

## INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the top cover onto the instrument panel.

(2) Install and tighten the screws around the perimeter of the top cover that secure it to the instrument panel structural support, the defroster duct, and the demister ducts. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(4) Reinstall the passenger airbag into the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).

(5) Reinstall the cluster bezel onto the instrument panel.(Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(6) Reconnect the battery negative cable.

# STEERING COLUMN OPENING COVER

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the three screws that secure the lower edge of the steering column opening cover to the lower instrument panel reinforcement (Fig. 10).

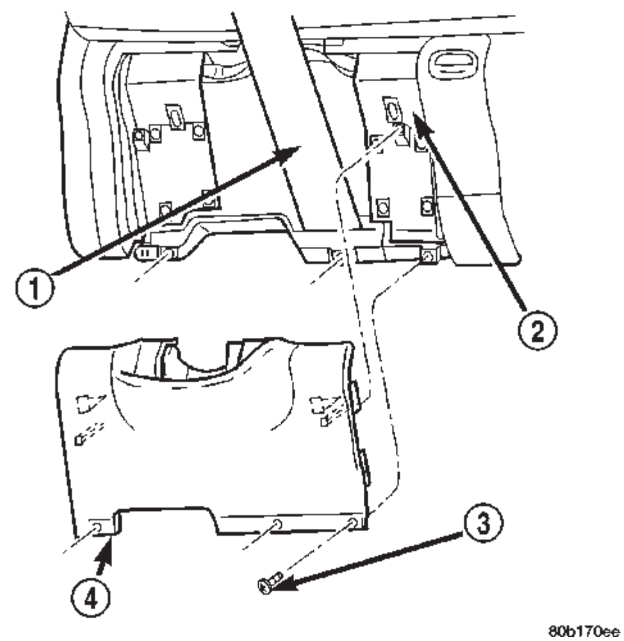

***Fig. 10 Steering Column Opening Cover Remove/Install***

1 - STEERING COLUMN
2 - INSTRUMENT PANEL
3 - SCREW
4 - STEERING COLUMN OPENING COVER

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the upper edge of the steering column opening cover just below the cluster

STEERING COLUMN OPENING COVER (Continued)

bezel on each side of the steering column away from the instrument panel far enough to disengage the snap clip retainers from their receptacles in the instrument panel.

(4) Remove the steering column opening cover from the instrument panel.

### INSTALLATION

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the steering column opening cover to the instrument panel (Fig. 10).

(2) Align the snap clip retainers on the steering column opening cover with their receptacles in the instrument panel.

(3) Press firmly and evenly on the steering column opening cover over the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Install and tighten the three screws that secure the lower edge of the steering column opening cover to the lower instrument panel reinforcement. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reconnect the battery negative cable.

## STORAGE BIN

### REMOVAL

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the two screws that secure the top of the storage bin to the instrument panel (Fig. 11).

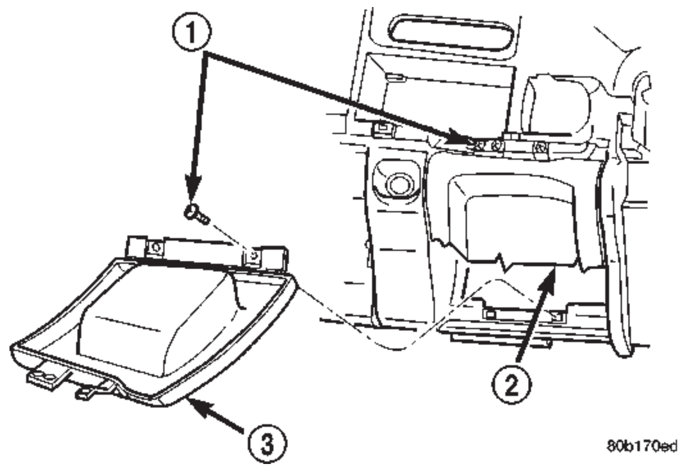

*Fig. 11 Instrument Panel Storage Bin Remove/Install*

1 - SCREWS
2 - STORAGE BIN (RAISED)
3 - STORAGE BIN (LOWERED)

(4) Lower the top of the storage bin away from the instrument panel far enough to access the illumination lamp and hood unit.

(5) Disengage the illumination lamp and hood retainer clip from the back of the instrument panel storage bin unit.

(6) Remove the storage bin unit from the instrument panel.

### INSTALLATION

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

STORAGE BIN (Continued)

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Position the storage bin unit onto the instrument panel (Fig. 11).

(2) Engage the illumination lamp and hood retainer clip to the back of the instrument panel storage bin unit.

(3) Raise and position the top of the storage bin to the instrument panel.

(4) Install and tighten the two screws that secure the top of the storage bin unit to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(6) Reconnect the battery negative cable.

# INTERIOR

## TABLE OF CONTENTS

# INTERIOR

## CAUTION

**CAUTION: Do not attempt to remove interior trim panels/moldings without first removing the necessary adjacent panels. To avoid damaging the panels, ensure that all the screws and clips are removed before attempting to remove an interior trim panel/molding. Trim panels are somewhat flexible but can be damaged if handled improperly.**

# A-PILLAR GRAB HANDLE

## REMOVAL

(1) Using a small flat blade screw driver, pry trim plugs from A-pillar grab handle.

(2) Remove screws attaching grab handle to A-pillar (Fig. 1).

(3) Separate A-pillar grab handle from vehicle.

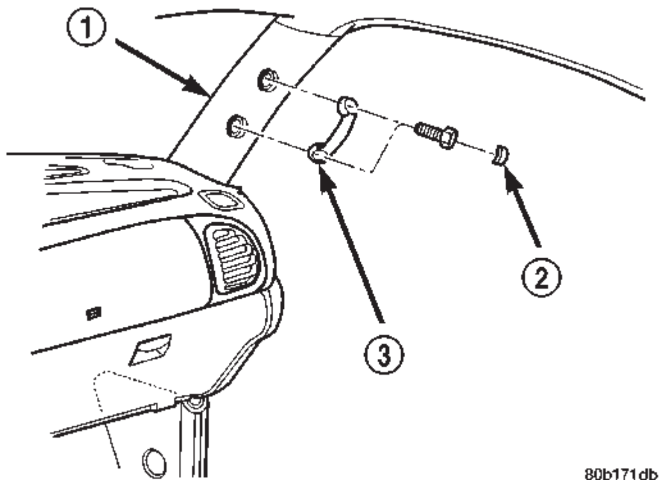

*Fig. 1 A-pillar Grab Handle (4X4)*

1 - A-PILLAR TRIM
2 - TRIM PLUG
3 - GRAB HANDLE

## INSTALLATION

(1) Position grab handle on A-pillar.

(2) Install screws attaching grab handle to A-pillar (Fig. 1).

(3) Install trim plugs in A-pillar grab handle.

# A-PILLAR TRIM

## REMOVAL

(1) Remove A-pillar grab handle, if equipped (Refer to 23 - BODY/INTERIOR/A-PILLAR GRAB HANDLE - REMOVAL).

(2) Grasp A-pillar trim at top and pull outward/downward to disengage upper spring clip (Fig. 2).

(3) Carefully pull bottom of A-pillar trim outward to disengage lower spring clip.

(4) Disengage speaker harness connector, if equipped.

(5) Separate A-pillar trim from vehicle.

## INSTALLATION

(1) Position A-pillar trim in vehicle.

(2) Engage speaker harness connector, if equipped.

(3) Align spring clips and press into place.

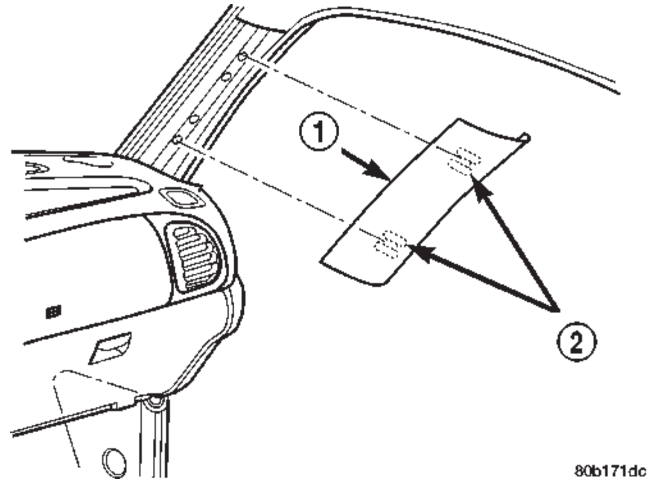

*Fig. 2 A-pillar Trim*

1 - A-PILLAR TRIM
2 - SPRING CLIPS

(4) Install A-pillar grab handle, if equipped (Refer to 23 - BODY/INTERIOR/A-PILLAR GRAB HANDLE - INSTALLATION).

# COWL TRIM COVER

## REMOVAL

(1) Remove front door sill trim cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(2) Grasp center upper edge of cowl trim cover (Fig. 3) and pull outward allowing cowl trim cover to bow in the center releasing trim cover retaining tab (Fig. 4).

(3) Separate cowl trim cover from lower cowl.

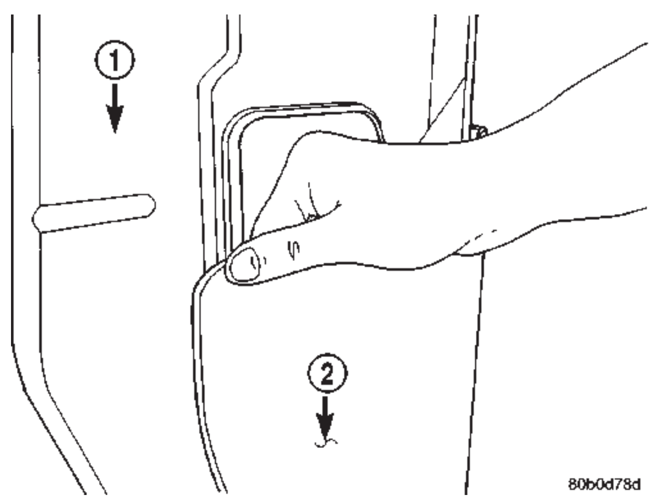

*Fig. 3 Lower Cowl Trim Cover*

1 - LOWER COWL
2 - LOWER COWL TRIM

COWL TRIM COVER (Continued)

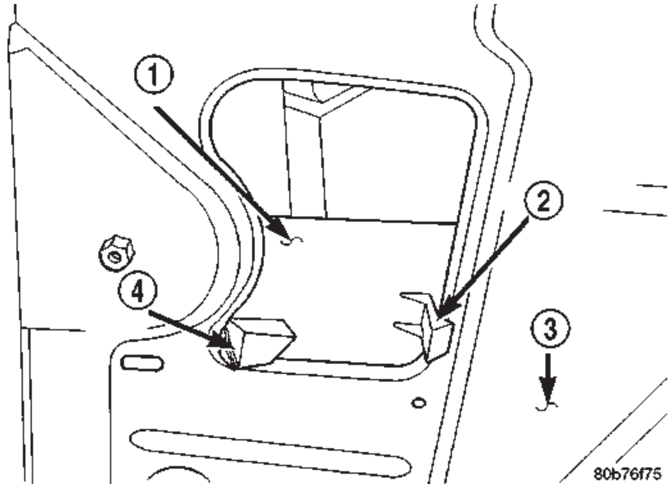

*Fig. 4 Lower Cowl Trim Cover Retaining Tab*

1 - LOWER COWL TRIM
2 - RETAINING TAB
3 - LOWER COWL
4 - LOCATOR TAB

### INSTALLATION

(1) Position cowl trim cover on lower cowl.

(2) Press into place.

(3) Install front door sill trim cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

## B-PILLAR TRIM

### REMOVAL

(1) Remove rear floor stowage tray, If equipped. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL).

(2) Remove door sill cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove bolt attaching seat belt anchor to floor.

(4) Snap turning loop cover up and remove bolt attaching turning loop to B-pillar.

(5) Remove seat belt exit plug (Fig. 5).

(6) Disengage clips attaching B-pillar trim to upper B-pillar.

(7) Separate B-pillar trim from B-pillar.

(8) Route seat belt webbing through opening in B-pillar trim.

### INSTALLATION

(1) Route seat belt webbing through opening in B-pillar trim.

(2) Position B-pillar trim at B-pillar.

(3) Starting at the top, engage clips attaching B-pillar trim to upper B-pillar.

(4) Install seat belt exit plug.

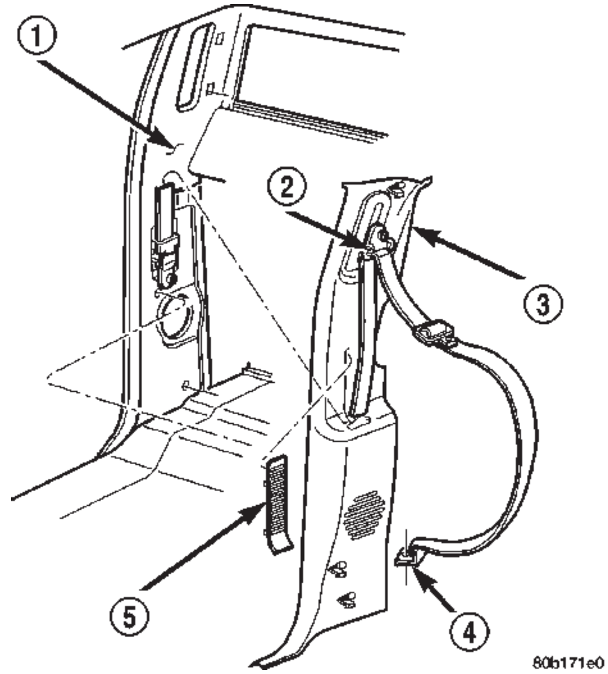

*Fig. 5 B-Pillar Trim*

1 - B-PILLAR
2 - TURNING LOOP
3 - B-PILLAR TRIM
4 - SEAT BELT ANCHOR
5 - EXIT PLUG

(5) Install bolt attaching turning loop to B-pillar and reposition turning loop cover.

(6) Install bolt attaching seat belt anchor to floor.

(7) Install door sill cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(8) Install rear floor stowage tray (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION).

## REAR CLOSURE PANEL TRIM

### REMOVAL

(1) Remove B-pillar trim panels (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

(2) Remove rear floor stowage tray, if equipped. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL).

(3) Remove screws attaching bottom of rear closure panel trim to floor pan (Fig. 6).

(4) Remove screws attaching rear closure panel trim to cab back panel.

(5) Disengage clips attaching top of rear closure panel trim to cab back panel.

(6) Separate rear closure panel trim from vehicle.

REAR CLOSURE PANEL TRIM (Continued)

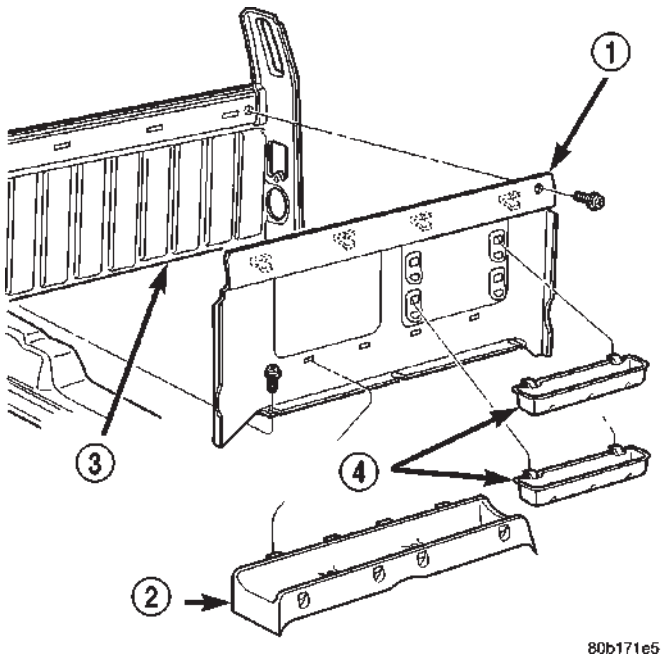

*Fig. 6 Rear Closure Panel Trim*

1 - REAR TRIM PANEL
2 - REAR FLOOR STORAGE TRAY
3 - CAB BACK PANEL
4 - STOWAGE BINS

### INSTALLATION

(1) Position rear closure panel trim in vehicle.

(2) Align and engage clips attaching top of rear closure panel trim to cab back panel.

(3) Install screws attaching rear closure panel trim to cab back panel.

(4) Install screws attaching bottom of rear closure panel trim to floor pan (Fig. 6).

(5) Install rear floor stowage tray, if equipped. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION).

(6) Install B-pillar trim panels (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

## REAR FLOOR STOWAGE TRAY

### REMOVAL

(1) Move seat tracks to forward position.

(2) Remove screws attaching rear floor stowage tray to floor (Fig. 7).

(3) Disengage hooks on stowage tray from slots in rear closure panel trim.

(4) Separate rear floor stowage tray from vehicle.

### INSTALLATION

(1) Position rear floor stowage tray in vehicle.

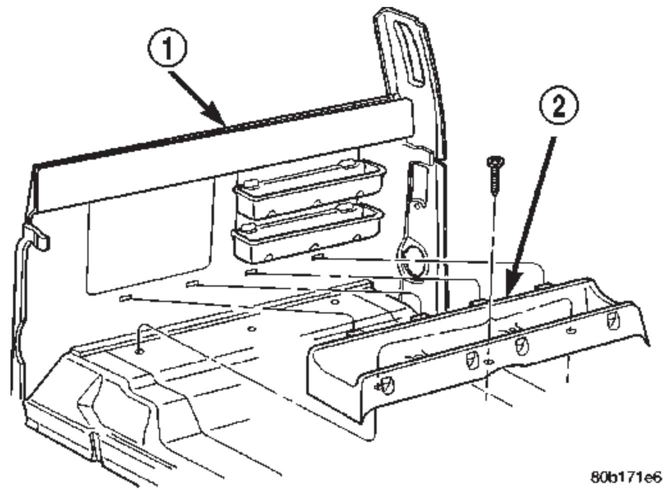

*Fig. 7 Rear Floor Stowage Tray*

1 - REAR CLOSURE PANEL TRIM
2 - REAR FLOOR STOWAGE TRAY

(2) Engage hooks on stowage tray into slots in rear closure panel trim.

(3) Install screws attaching rear floor stowage tray to floor.

## DOOR SILL TRIM

### REMOVAL

(1) Remove screws attaching door sill trim cover to door sill (Fig. 8).

(2) Separate door sill trim cover from door sill.

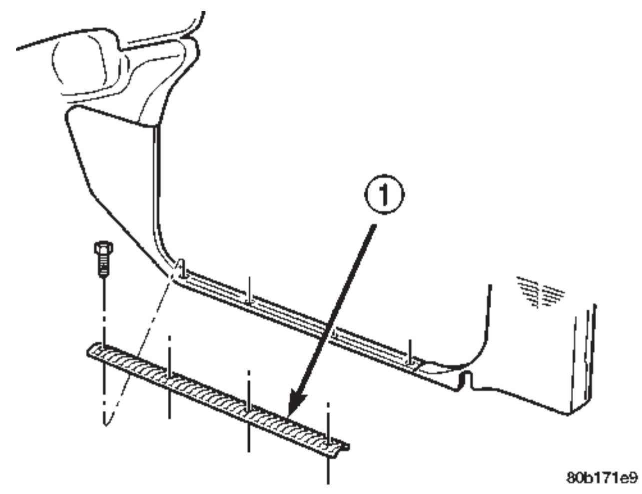

*Fig. 8 Door Sill Trim Cover*

1 - DOOR SILL TRIM

### INSTALLATION

(1) Position door sill trim cover on door sill.

(2) install screws attaching door sill trim cover to door sill.

# SHIFT BOOT - MANUAL TRANSMISSION

## REMOVAL

(1) Using a trim stick, pry the corner of the shift boot up expose the fasteners.
(2) Remove the screws attaching the shift boot to the console.
(3) Remove the insert from the shift knob, remove nut attaching knob to the lever, and remove the shift knob.
(4) Lift floor shift boot off shifter.

## INSTALLATION

(1) Install shift boot over the shift lever, position boot on console and install the fasteners attaching boot to concole.
(2) Install the shift knob, shift knob nut, and tighten to 27.1 N·m (20 ft.lbs) torque.
(3) Install the shift knob insert.

# 4WD FLOOR SHIFT BOOT

## REMOVAL

(1) Remove insert from shift knob.
(2) Remove nut attaching shift knob to shift lever.
(3) Remove shift knob.
(4) Using a trim stick, disengage retainers attaching boot to shifter base (Fig. 9). Automatic transmission vehicle shown, manual transmission similar.
(5) Lift floor shift boot off shift lever.

## INSTALLATION

(1) Place shift boot over shifter.
(2) Engage retainers attaching boot to shifter base.
(3) Position shift knob on shift lever.
(4) Install nut attaching shift knob to shift lever.
(5) Install insert on shift knob.

# CENTER CONSOLE

## REMOVAL

(1) Remove the transfer case shift boot, if equipped. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - REMOVAL).
(2) Remove the tranmission shifter boot. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT - REMOVAL).
(3) Remove the screws attaching the console to mounting brackets (Fig. 10).
(4) Lift the console upward.
(5) Disengage wire harness connector, if equipped.
(6) Separate console from vehicle.

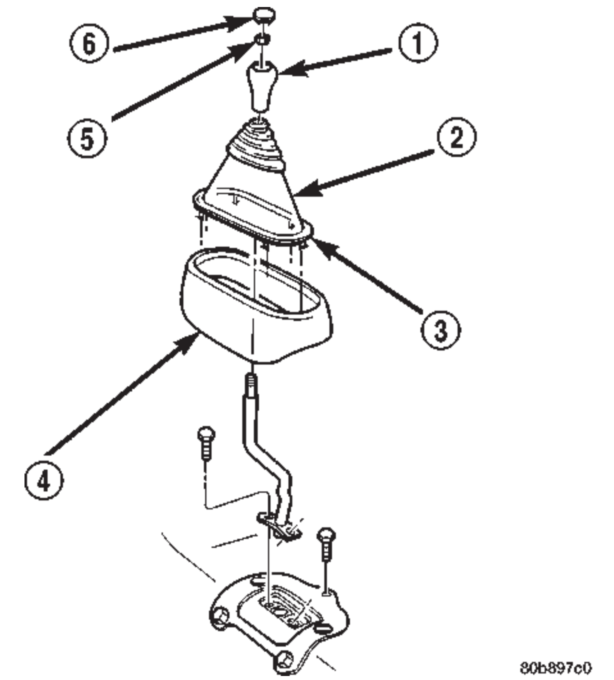

*Fig. 9 4WD Transfer Case Shift Boot—Automatic Transmission*

1 - KNOB
2 - BOOT
3 - RETAINER
4 - BASE
5 - NUT
6 - INSERT

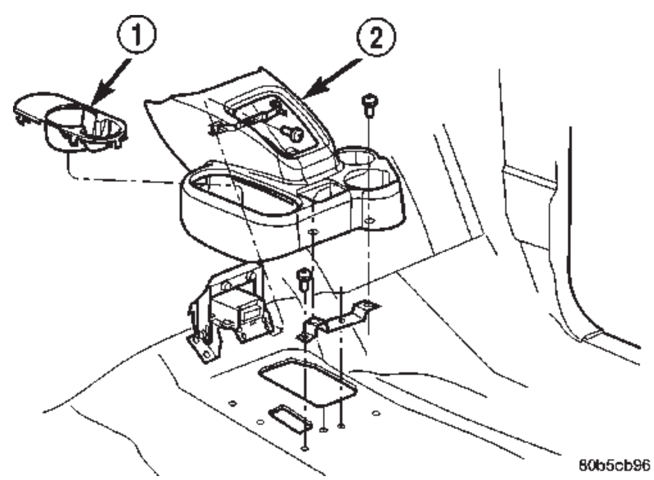

*Fig. 10 Floor Console W/Cup Holder*

1 - CUP HOLDER
2 - FLOOR CONSOLE

## INSTALLATION

(1) Position console in vehicle.
(2) Engage wire harness connector, if equipped.
(3) Position the console on the floor.

CENTER CONSOLE (Continued)

(4) Install the screws attaching the console to mounting brackets.

(5) Install the transmission shifter boot, (Refer to 23 - BODY/INTERIOR/SHIFT BOOT - INSTALLATION).

(6) Install the transfer case shifter boot, if equipped. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT - INSTALLATION).

(7) Install cup holder in console, if equipped.

# CARPETS AND FLOOR MATS

## REMOVAL

### STANDARD CAB

(1) Remove seat (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or(Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL).

(2) Remove door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove cowl trim covers (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).

(4) Remove center console, if equipped.(Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)

(5) If not equipped with a center console remove the transfer case shifter boot (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - REMOVAL).

(6) Remove rear stowage tray (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL).

(7) Remove rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(8) Fold carpet or mat toward center of cab.

(9) Remove carpet or mat through door opening (Fig. 11).

### QUAD/CLUB CABS

(1) Remove front and rear seats. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or(Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL) and (Refer to 23 - BODY/SEATS/REAR SEAT - REMOVAL)

(2) Remove door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove center console, if equipped.(Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)

(4) If not equipped with a center console remove the transfer case shifter boot (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - REMOVAL).

(5) Remove emergency jack tool kit.

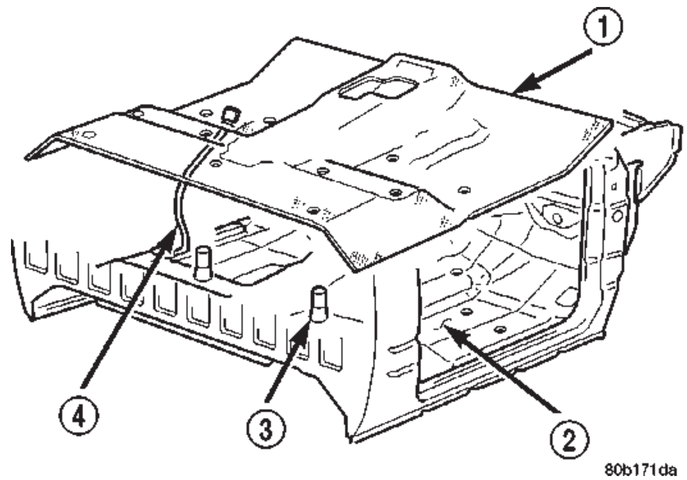

*Fig. 11 Floor Carpet or Mat*

1 - CARPET OR MAT
2 - FLOOR PAN
3 - REAR/INNER SEAT MOUNT
4 - POWER SEAT HARNESS

(6) Remove rear seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - REMOVAL)

(7) Remove rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(8) Remove C-pillar trim panels. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(9) Remove the quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)

(10) Fold carpet or mat toward center of cab.

(11) Remove carpet or mat through door opening.

## INSTALLATION

### STANDARD CAB

(1) Position carpet or mat in vehicle and align all holes (Fig. 11).

(2) Install rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

(3) Install rear stowage tray (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION).

(4) Install the transfer case shifter boot if not equipped with a center console. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - INSTALLATION)

(5) Install the center console, if equipped. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

(6) Install cowl trim covers (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

CARPETS AND FLOOR MATS (Continued)

(7) Install door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(8) Install seat, (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT/SPLIT BENCH - INSTALLATION).

### QUAD/CLUB CABS

(1) Position carpet or mat in vehicle.

(2) Install quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)

(3) Install rear seat belt buckles.

(4) Install the C-pillar trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(5) Install rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

(6) Install the rear seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)

(7) Install emergency jack tool kit.

(8) Install the transfer case shifter boot if not equipped with a center console. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - INSTALLATION)

(9) Install the center console, if equipped. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

(10) Install floor shift boot, if equipped.

(11) Install cowl trim covers (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

(12) Install door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(13) Install front and rear seats. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION) and (Refer to 23 - BODY/SEATS/REAR SEAT - INSTALLATION)

## ASSIST HANDLE

### REMOVAL

(1) Disengage tabs attaching assist handle end covers to assist handle.

(2) Remove screws attaching overhead assist handle to roof rail (Fig. 12).

(3) Separate overhead assist handle from vehicle.

### INSTALLATION

(1) Position assist handle on vehicle.

(2) Install screws attaching overhead assist handle to roof rail (Fig. 12).

(3) Install tabs attaching assist handle end covers to assist handle.

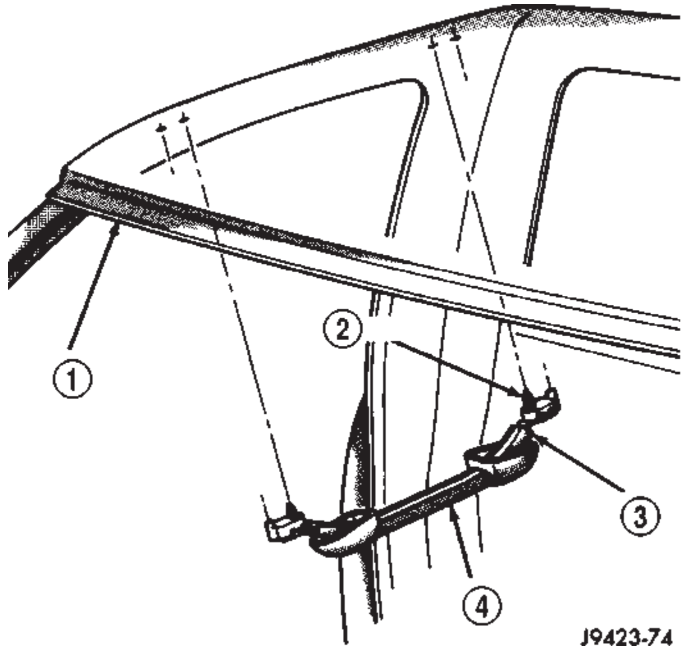

*Fig. 12 Overhead Assist Handle*

1 - CAB ASSEMBLY
2 - SCREW
3 - ASSIST HANDLE
4 - TRIM COVER

## COAT HOOK

### REMOVAL

(1) Insert a small flat blade into the tip of the hook.

(2) Carefully pry outward to separate the coat hook from coat hook base.

(3) Pull coat hook out of roof panel (Fig. 13). Extended cab shown, standard cab similar.

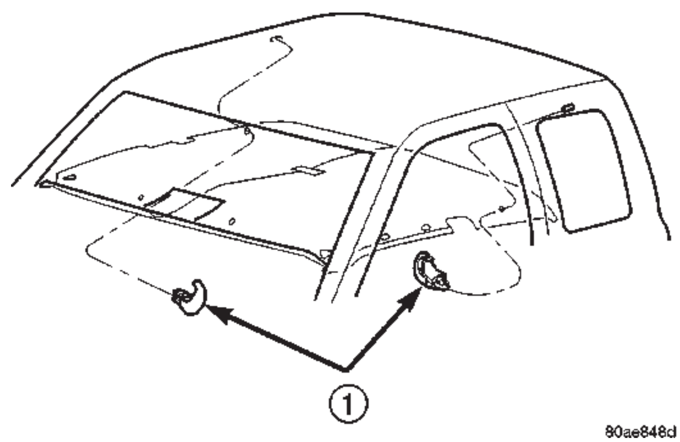

*Fig. 13 Coat Hook—Club/Quad Cab*

1 - COAT HOOK

COAT HOOK (Continued)

### INSTALLATION

(1) Position coat hook in roof panel.

(2) Push the coat hook cover inward and secure the coat hook to roof panel.

## HEADLINER

### REMOVAL

(1) Remove sun visors and visor hooks.(Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).

(2) Remove overhead assist handle.(Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL).

(3) Remove coat hook(s).(Refer to 23 - BODY/INTERIOR/COAT HOOK - REMOVAL)

(4) Remove overhead console, if equipped. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(5) Remove A-pillar trim.(Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

(6) Remove B-pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

(7) Remove the C-pillar trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(8) Remove the quarter trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)

(9) Remove dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL).

(10) If equipped, disengage push-in fasteners attaching headliner to roof panel (Fig. 15). Extended cab shown, standard cab similar.

(11) Separate headliner from roof panel (Fig. 14).

(12) Extract headliner through door opening.

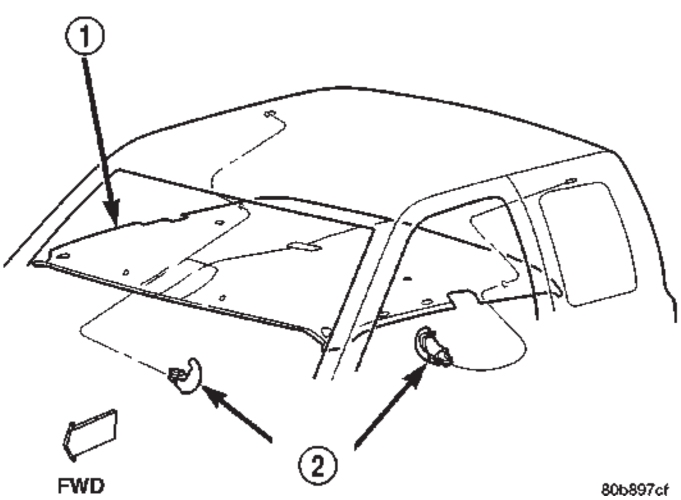

*Fig. 14 Headliner*

1 - HEADLINER
2 - COAT HOOK

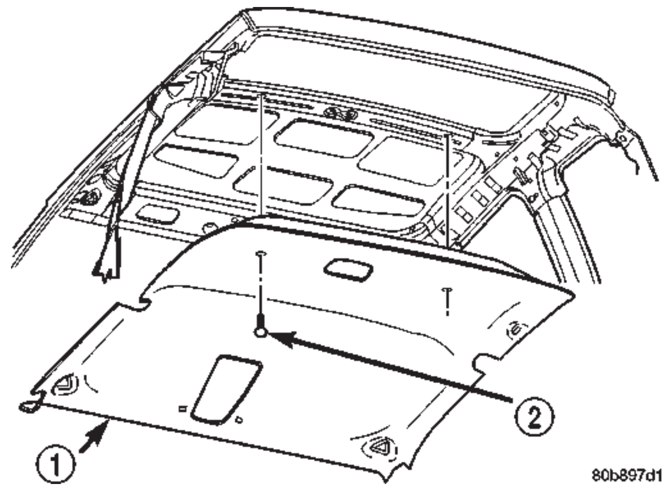

*Fig. 15 Headliner Push-In Fasteners*

1 - HEADLINER
2 - PUSH—IN FASTENER

### INSTALLATION

(1) Position headliner on roof panel (Fig. 14). Extended cab shown, standard cab similar.

(2) Install passenger side sun visor hook. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).

(3) Install driver's side coat hook. (Refer to 23 - BODY/INTERIOR/COAT HOOK - INSTALLATION).

(4) Install driver side sun visor hook.

(5) Install dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - INSTALLATION).

(6) Install the C-pillar trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(7) Install the quarter trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)

(8) Install B-pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

(9) Install A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(10) Install overhead console, if equipped. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

(11) Install overhead assist handle. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION).

(12) Install sun visors.

# BODY VENT

## REMOVAL

(1) Open door.

(2) Pull outward at top of vent to disengage clips attaching vent to door jamb (Fig. 16).

(3) Separate vent from door jamb.

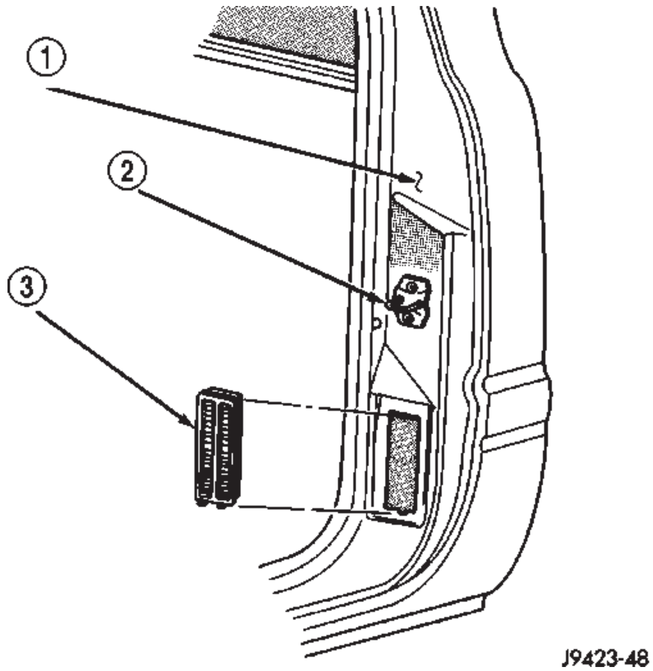

*Fig. 16 Body Vent*

1 - B—PILLAR
2 - DOOR STRIKER
3 - BODY VENT

## INSTALLATION

(1) Position vent from in jamb.

(2) Press vent inward to engage clips.

# REAR VIEW MIRROR

## REMOVAL

(1) If equipped, disconnect mirror harness wire connector (Fig. 17).

(2) Loosen the mirror base setscrew (Fig. 18).

(3) Slide the mirror base upward and off the bracket.

## INSTALLATION

(1) Position the mirror base at the bracket and slide it downward onto the support bracket.

(2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.

(3) If equipped, connect mirror harness wire connector.

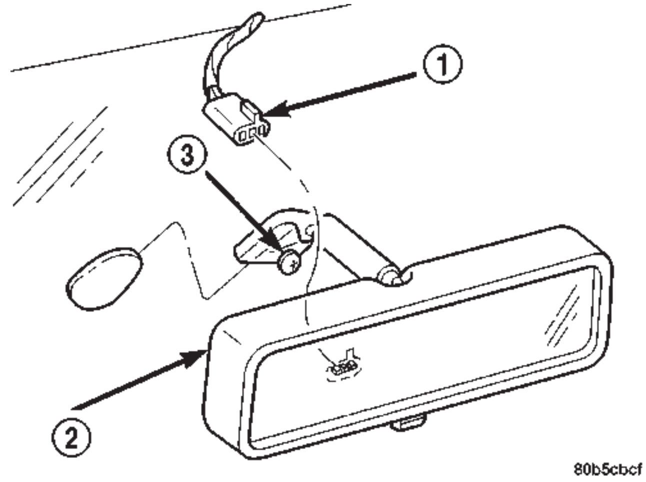

*Fig. 17 Rearview Mirror Connector*

1 - CONNECTOR
2 - MIRROR
3 - SCREW

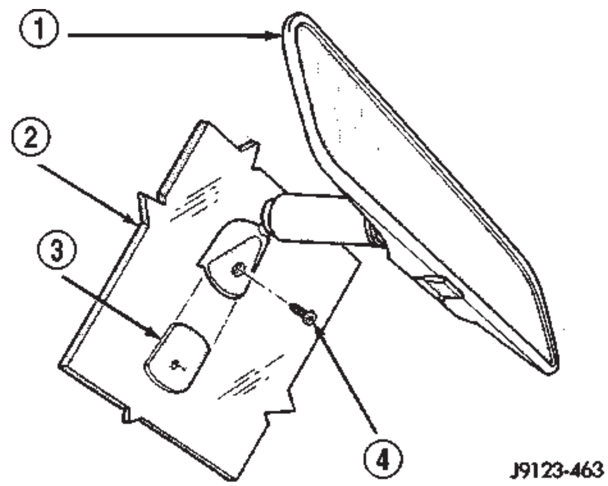

*Fig. 18 Rearview Mirror*

1 - REARVIEW MIRROR
2 - WINDSHIELD GLASS
3 - SUPPORT BRACKET
4 - SCREW

## INSTALLATION - REARVIEW MIRROR SUPPORT BRACKET

(1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.

(2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.

(3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.

REAR VIEW MIRROR (Continued)

(4) Apply accelerator to the surface on the bracket according to the following instructions:

(a) Crush the vial to saturate the felt applicator.

(b) Remove the paper sleeve.

(c) Apply accelerator to the contact surface on the bracket.

(d) Allow the accelerator to dry for five minutes.

(e) Do not touch the bracket contact surface after the accelerator has been applied.

(5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.

(6) Install the bracket according to the following instructions:

(a) Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.

(b) Apply an even coat of adhesive to the contact surface on the bracket.

(c) Align the bracket with the marked position on the windshield glass.

(d) Press and hold the bracket in place for at least one minute.

**NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.**

(7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

(8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

# SUN VISOR

## REMOVAL

(1) Remove screws attaching sunvisor to roof (Fig. 19).

(2) If equipped, disengage lighted vanity mirror connector.

(3) Separate sunvisor from roof.

(4) Remove screw attaching sun visor hook to roof.

(5) Separate sunvisor hook from roof.

## INSTALLATION

(1) Position sunvisor hook on roof.

(2) Install screw attaching sunvisor hook to roof.

(3) Position sunvisor on roof.

(4) If equipped, engage lighted vanity mirror connector.

(5) Install screws attaching sunvisor to roof (Fig. 19).

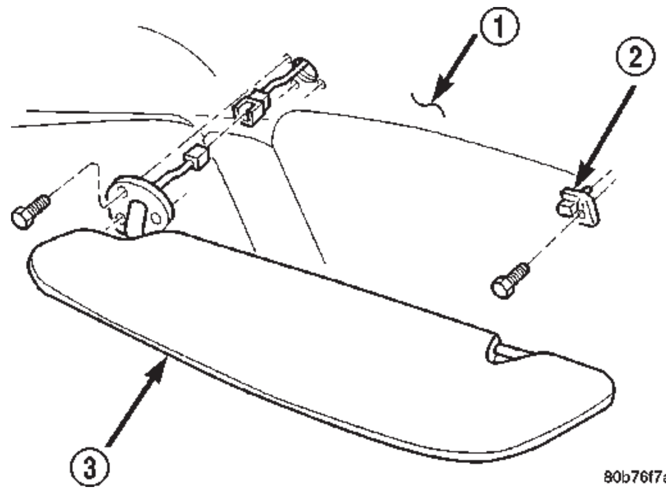

*Fig. 19 Sunvisor*

1 - BODY
2 - CLIP
3 - SUNVISOR

# QUARTER TRIM PANEL

## REMOVAL

(1) Remove rear seat. (Refer to 23 - BODY/SEATS/REAR SEAT - REMOVAL)

(2) Remove door sill cover as necessary to clear quarter trim.

(3) Remove lower seat belt anchor bolt (Fig. 20).

(4) Remove seat belt tuning loop anchor bolt.

(5) Disengage clips attaching quarter trim panel from quarter panel.

(6) Route seat belt webbing through opening in quarter trim panel and remove panel from vehicle.

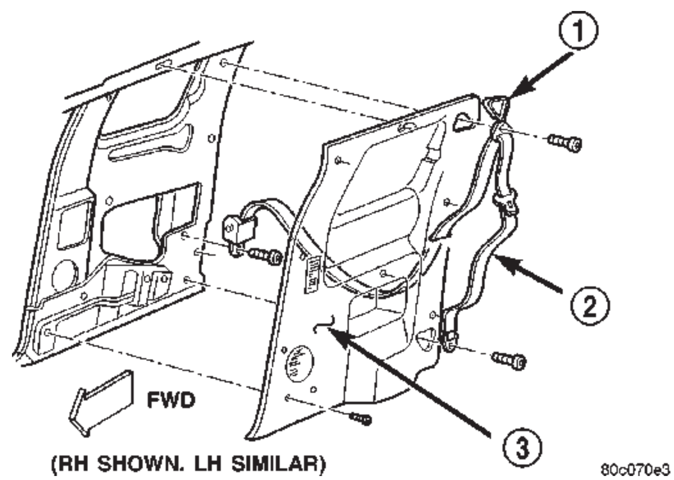

*Fig. 20 Quarter Trim Panel — Club Cab*

1 - TURNING LOOP COVER
2 - BELT ASSEMBLY
3 - TRIM PANEL

QUARTER TRIM PANEL (Continued)

### INSTALLATION

(1) Position trim panel in vehicle and route seat belt webbing through opening in quarter trim panel.

(2) Open quarter vent window.

(3) Position trim panel on quarter panel and engage clips on upper portion of panel.

(4) Engage clips attaching lower portion of quarter trim panel to quarter panel.

(5) Install lower seat belt anchor bolt.

(6) Install door sill cover as necessary.

(7) Install rear seat. (Refer to 23 - BODY/SEATS/ REAR SEAT - INSTALLATION)

## C-PILLAR TRIM

### REMOVAL

(1) Remove rear floor stowage tray. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL)

(2) Remove door sill cover as necessary to clear C-pillar trim.

(3) Remove bolt attaching seat belt anchor to floor.

(4) Unsnap turning loop, push cover up and remove bolt attaching turning loop to C-pillar.

(5) Remove seat belt exit plug.

(6) Disengage clips attaching C-pillar trim to upper C-pillar.

(7) Separate C-pillar trim from C-pillar.

(8) Route seat belt webbing through opening in C-pillar trim.

### INSTALLATION

(1) Route seat belt webbing through opening in C-pillar trim.

(2) Position C-pillar trim at C-pillar.

(3) Starting at the top, engage clips attaching C-pillar trim to upper C-pillar.

(4) Install seat belt exit plug.

(5) Install bolt attaching turning loop to C-pillar and position turning loop cover. Snap turning loop cover into place.

(6) Install bolt attaching seat belt anchor to floor.

(7) Install door sill cover.

(8) Install rear floor stowage tray. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION)

# BASE COAT/CLEAR COAT FINISH

### DESCRIPTION

The original equipment finish is a multi-step process that involves cleaning, electrodeposition (e-coat), base coat, and clear coat steps. Additionally, selected areas of the vehicle may be coated with an anti-chip finish.

### OPERATION

On most vehicles a two-part paint application (base coat/clear coat) is used. Color paint that is applied to primer is called base coat. The clear coat protects the base coat from ultraviolet light and provides a durable high-gloss finish.

**CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
**Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.**

# PAINT CODE

### DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. The plate is located on the floor pan under the passenger seat or attached to the front face of the radiator closure panel. Refer to the Introduction section at the front of this manual for body code plate description. The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers.

# PAINT TOUCH-UP

### DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar®

PAINT TOUCH-UP (Continued)

Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. Refer to Introduction group of this manual for Body Code Plate information.

**WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**

### OPERATION

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

(5) On vehicles without clear coat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clear coat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

**WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT. AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**

## WET SANDING/BUFFING & POLISHING

### DESCRIPTION

Minor acid etching, orange peel, or smudging in clear coat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

**CAUTION: Do not remove clear coat finish, if equipped. Base coat paint must retain clear coat for durability.**

# SEATS

## TABLE OF CONTENTS

# SEATS

## DESCRIPTION

Seat modules are made up of a seat frame, seat cushion, seat back cushion, a covering material, and the electrical components used for power operation, if equipped. Some seat systems also contain seat belt components and supplemental restraint systems.

## OPERATION

Seat assemblies transport the occupants in comfort and safety. Seat assemblies also help position occupants correctly in the event of airbag deployment. Seat cushions, coverings, and electrical components are serviceable. Refer to the appropriate group in this manual.

# CENTER CONSOLE LID

## REMOVAL

(1) Open console lid.

(2) Using a small flat blade screwdriver, disengage locking tabs located under the console lid trim bezel.

(3) Separate bezel from lid.

(4) Move driver and passenger seat to full forward position.

(5) Using a small drift and hammer, tap out console lid hinge pin.

(6) Separate lid from console.

CENTER CONSOLE LID (Continued)

### INSTALLATION

(1) Align console lid with console. Verify lid tension spring is in position.

(2) Install hinge pin.

(3) Position trim bezel on lid and snap into place.

## CENTER SEAT ARMREST/ CONSOLE

### REMOVAL

(1) Remove bolts on driver and passenger seat inboard seat tracks.

(2) Separate center section.

### INSTALLATION

(1) Position and align center section on driver and passenger seat inboard seat tracks.

(2) Install bolts. Tighten to 19.5 N·m (14 ft. lbs.) torque.

## CENTER SEAT ARMREST/ LATCH COVER

### REMOVAL

(1) With the seat back fully forward, move the driver's seat to a full forward position.

(2) Place the center arm rest in a full up position.

(3) Remove the fastener securing the cover to the inertia latch.

(4) Disengage the front edge of the cover, then lower the arm rest.

(5) Remove the inertia latch cover by pulling the cover rearwards (Fig. 1).

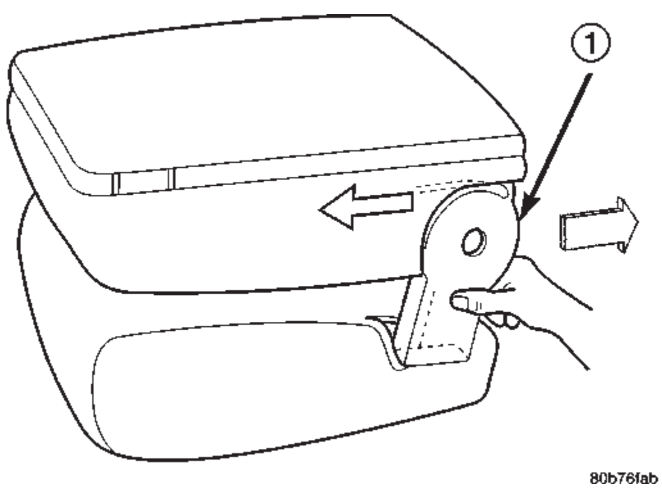

*Fig. 1 Armrest Inertia Latch Cover*

1 - INERTIA LATCH COVER

### INSTALLATION

(1) Slide the inertia latch cover onto the latch arm.

(2) Raise the armrest, then engage the front edge of the cover.

(3) Install the lower strap into the center armrest's lower track (Fig. 2).

(4) Slide back the armrest trim to visually ensure the lower strap is properly installed.

(5) Slowly cycle the armrest to ensure the strap moves freely in the track.

(6) Install the upper strap into the center armrest's upper track (Fig. 3).

(7) Slowly cycle the armrest to ensure the strap moves freely in the track.

(8) Secure the armrest inertia latch cover and tighten the fastener to 4N·m (35 in. lbs.).

*Fig. 2 Inertia Latch Cover Lower Strap Installation*

CENTER SEAT ARMREST/LATCH COVER (Continued)

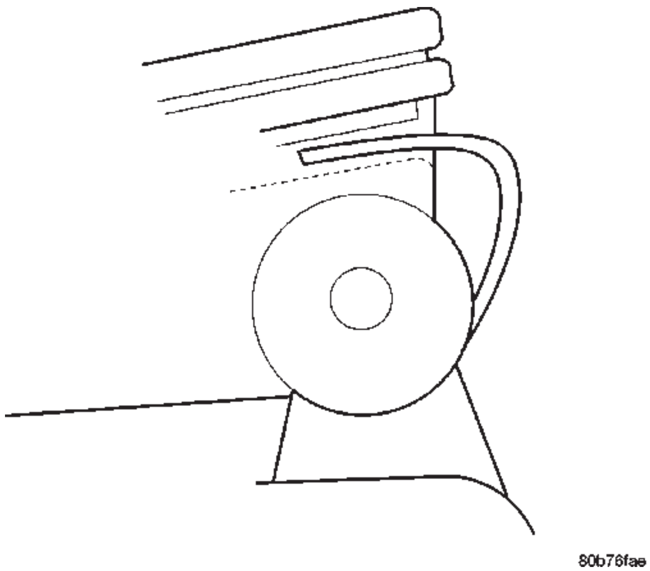

*Fig. 3 Inertia Latch Cover Upper Strap*

# LUMBAR SUPPORT

## REMOVAL

(1) Remove the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REMOVAL).
(2) Disengage the heated seat connectors.
(3) Partially separate the seat back foam to access the lumbar frame clips.
(4) Separate the lumbar assembly from the seat frame.

## INSTALLATION

(1) Position the lumbar assembly on the seat back frame.
(2) Engage the retaining clips on the seat frame.
(3) Route the lumbar wire harness through seat assembly.
(4) Engage the heated seat wire connectors.
(5) Install the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - INSTALLATION).
(6) Perform a function check on the seat operations.

# SEAT - BENCH SEAT

## REMOVAL

(1) Move seat track to forward position.
(2) Hinge seat backs forward.
(3) Remove nuts attaching rear of seat tracks to floor (Fig. 4).
(4) Move seat track to rearward position.
(5) Remove bolts attaching front of seat tracks to floor.
(6) Separate seat from vehicle.

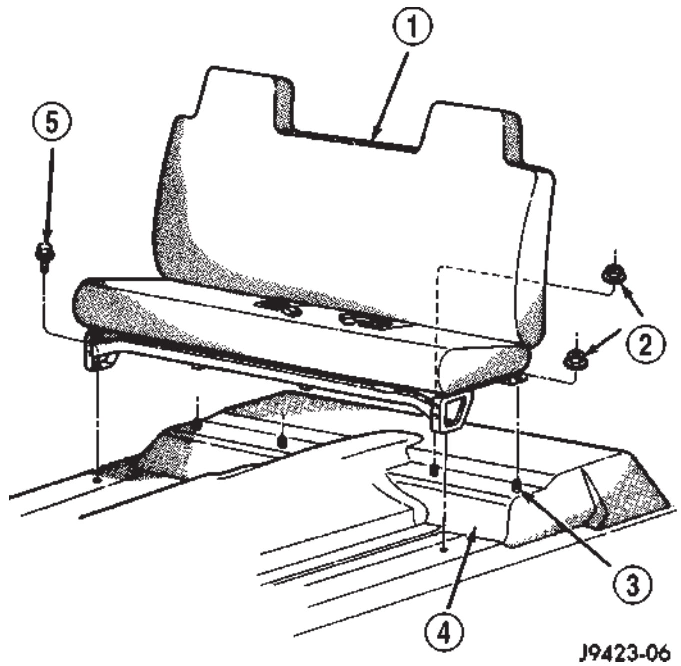

*Fig. 4 Bench Seat*

1 - BENCH SEAT
2 - NUT
3 - STUD
4 - FLOOR PAN
5 - SCREW

## INSTALLATION

**NOTE: Seat adjustment latch must be engaged and in equal positions prior to seat installation. Verify inboard and outboard seat latch operation.**

(1) Position seat in vehicle.
(2) Install bolts attaching front of seat tracks to floor. Tighten bolts to 54 N·m (40 ft. lbs.) torque.
(3) Move seat track to forward position.
(4) Hinge seat backs forward.
(5) Install nuts attaching rear of seat tracks to floor. Tighten inboard nuts to 40 N·m (30 ft. lbs.) torque. Tighten outboard nuts to 54 N·m (40 ft. lbs.) torque.

# SEAT - SPLIT BENCH

## REMOVAL

### STANDARD CAB

(1) Move seat track to forward position.
(2) Hinge seat back forward.
(3) Remove nuts holding outboard and inboard tracks to floor (Fig. 5).
(4) Move seat track to forward position.
(5) Remove bolt holding inboard seat track to bottom of center occupant seat.
(6) Remove bolts holding front of seat tracks to floor.
(7) Disengage power seat wire connector from body harness, if equipped (Fig. 5).
(8) Lift center occupant seat upward to clear rear attachment stud.
(9) Separate seat from vehicle.

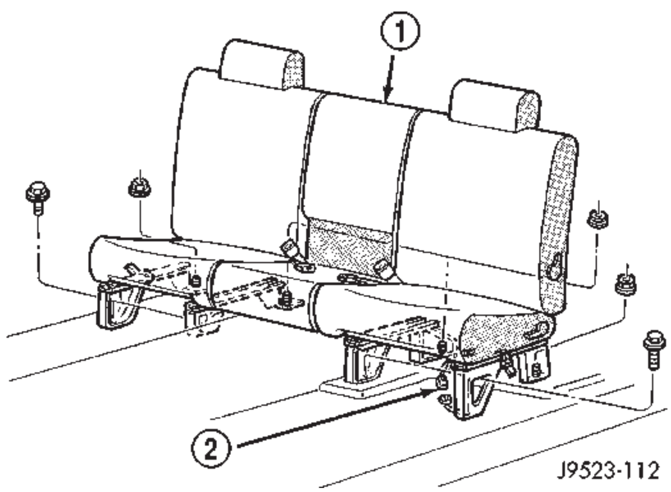

*Fig. 5 Split Bench Seat*

1 - SEAT
2 - POWER SEAT HARNESS CONNECTOR

### QUAD CAB

(1) Clamp seat belt to prevent belt from retracting.
(2) Move seats to full rearward position.
(3) Remove bolts attaching front of seat tracks to floor.
(4) Move seats to full forward position.
(5) Remove bolts attaching rear of outboard seat tracks to floor (Fig. 6).
(6) Remove nuts attaching inboard seat tracks to floor.
(7) Disengage wire connectors from body harness.
(8) Lift seats upward to clear rear studs.
(9) With the aid of a helper, separate seat from vehicle.

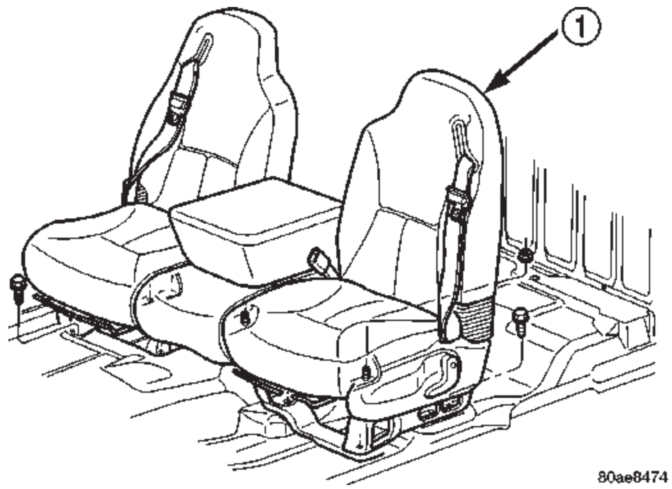

*Fig. 6 Split Bench Seat—Club/Quad Cab*

1 - SEAT

## INSTALLATION

### STANDARD CAB

(1) Position seat in vehicle.
(2) Connect power seat wire connector to body harness, if equipped.
(3) Install bolts holding front of seat tracks to floor. Tighten the bolts to 40 N·m (30 ft. lbs.) torque.
(4) Install bolt holding inboard seat track to bottom of center occupant seat. Tighten the bolt to 28 N·m (250 in- lbs) torque.
(5) Install nuts holding outboard and inboard tracks to floor. Tighten the inboard nuts to 40 N·m (30 ft. lbs.) torque. Tighten the outer nuts to 54 N·m (40 ft. lbs. torque).

### QUAD CAB

(1) Position seat in vehicle.

**CAUTION: Verify that power is not being supplied when engaging connector.**

(2) Engage driver's seat belt buckle wire connector. Engage power seat wire connector to body harness, if equipped.
(3) Ensure seats are in full forward position.
(4) Install outboard bolts attaching rear of seat tracks to floor (Fig. 6). Tighten the bolts to 54 N·m (40 ft. lbs.) torque.
(5) Install nuts attaching inboard seat tracks to floor. Tighten the nuts to 40 N·m (30 ft. lbs.) torque.
(6) Move seats to full forward position.
(7) Install bolts attaching front of seat tracks to floor. Tighten the bolts to 54 N·m (40 ft. lbs.) torque.

# SEAT BACK - BENCH SEAT

## REMOVAL

(1) Move seat to the full forward position.

(2) Release J-Strap and peel back side of cover (corner flap) (Fig. 8).

(3) Remove bolts attaching seat back to seat cushion and separate seat back from seat cushion (Fig. 7).

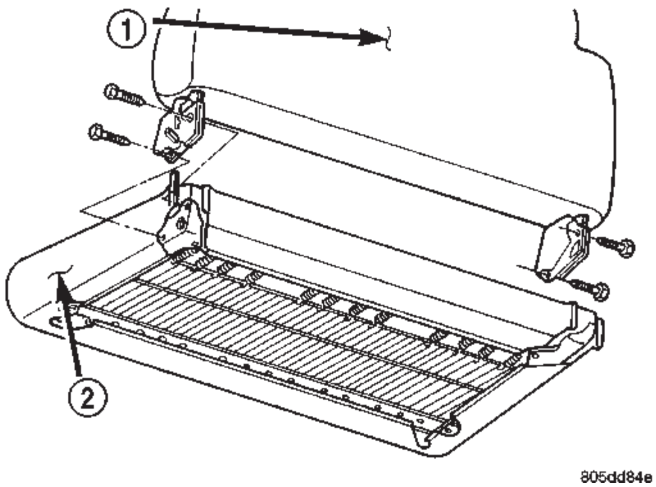

*Fig. 7 Seat Back Removal/Installation*

1 - SEAT BACK
2 - SEAT CUSHION

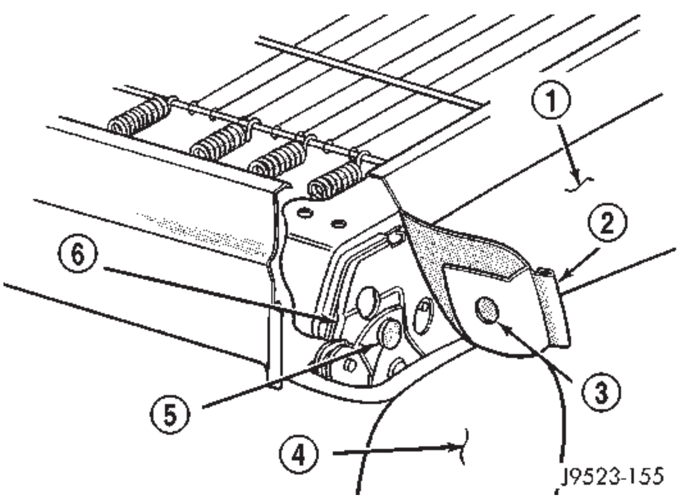

*Fig. 8 J-Strap Corner Removal/Installation*

1 - SEAT CUSHION
2 - J—STRAP
3 - PLASTIC COVER
4 - SEAT BACK
5 - PIN
6 - LATCH

## INSTALLATION

(1) Align seat cushion with seat back.

(2) Install bolts through seat back latch into seat cushion frame. Tighten bolts to 25 N·m (18 ft.lbs.) torque.

(3) Pull side of cover (corner flap) facing rear of the cushion over and secure J-Strap (Fig. 8).

(4) Plastic cover on side cover (corner flap) at rear of cushion must be over the pin on the inertia latches.

# SEAT BACK - SPLIT BENCH

## REMOVAL

### STANDARD CAB

(1) Disconnect power seat switch connector, if equipped.

(2) Remove center seat/console armrest. (Refer to 23 - BODY/SEATS/CENTER SEAT ARMREST / CONSOLE - REMOVAL).

(3) Disconnect rear end flap J-Straps and peel back rear J-Strap.

(4) Remove bolts attaching seat back to seat cushion frame.

(5) Separate seat back from seat cushion (Fig. 9).

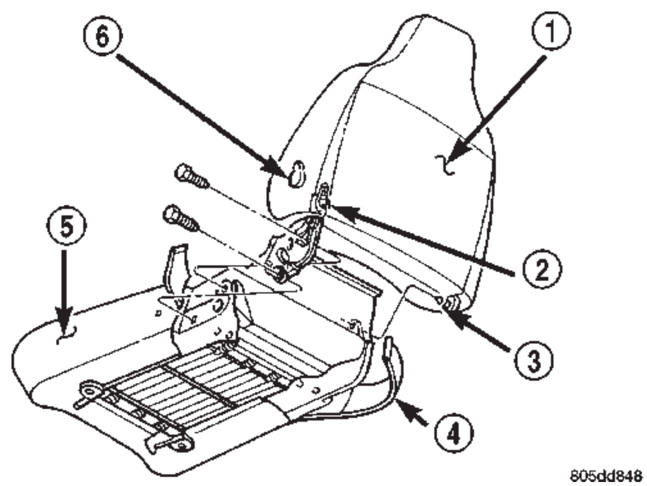

*Fig. 9 Seat Back Removal*

1 - SEAT BACK
2 - RELEASE LATCH KNOB
3 - SHOULDER BOLT
4 - END FLAP J—STRAP
5 - SEAT CUSHION
6 - LUMBAR HANDLE

### QUAD CAB

(1) Remove screw attaching recliner handle and pull handle to remove.

(2) Remove seat dump handle, 2–door “BE” vehicles only.

SEAT BACK - SPLIT BENCH (Continued)

(3) Remove screws attaching side shield to seat track adjuster.

(4) Remove seat dump handle.

(5) Pull shoulder belt out completely and clamp shoulder belt to prevent shoulder belt from retracting (Fig. 10).

(6) Remove shoulder belt anchor bolt.

(7) From the underside of the seat, remove the inboard pivot bolt (Fig. 11).

**WARNING: DO NOT REMOVE UPPER RECLINER HANDLE, PULL ON UPPER RECLINER HANDLE OR RECLINER CABLE END. THE RECLINER LEAD SCREW IS SPRING LOADED AND WILL EJECT IF EITHER THE HANDLE OR CABLE IS PULLED BEFORE THE LEAD SCREW IS REMOVED.**

(8) Remove clip attaching recliner cable (Fig. 12)to seat track adjuster and separate the cable from the seat track adjuster.

(9) Remove the inboard and outboard pivot bolts attaching the frame to the seat track adjuster (Fig. 13).

(10) Remove recliner lower bolt.

(11) Separate seat back from seat track adjuster.

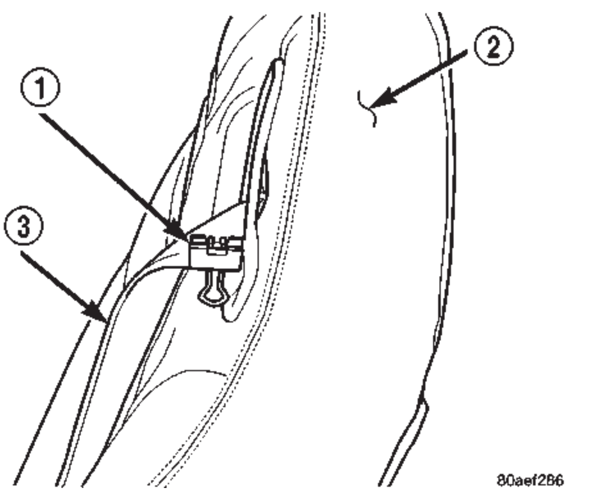

***Fig. 10 Shoulder Belt Clamp***

1 - CLAMP
2 - SEAT BACK
3 - SHOULDER BELT

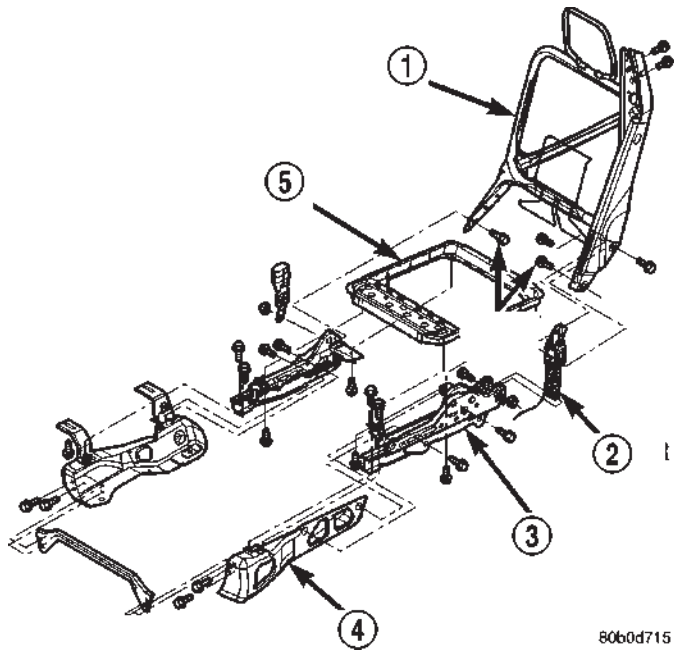

***Fig. 11 Pivot Bolt***

1 - SEAT BACK FRAME
2 - RECLINER
3 - SEAT TRACK ADJUSTER
4 - RISER

2 - PIVOT BOLT
3 - RECLINER CABLE
4 - LOWER RECLINER BOLT
5 - SEAT TRACK
6 - SEAT RISER
7 - SEAT TRACK ADJUSTER

## INSTALLATION

### STANDARD CAB

(1) Align seat cushion with seat back and install shoulder bolt through seat back into seat cushion frame on inboard side. Tighten bolt to 49 N·m (36 ft.lbs.) torque.

(2) Install bolts through seat back latch into seat cushion frame. Tighten bolts to 25 N·m (18 ft.lbs.) torque.

(3) Connect rear end flap J-Straps and pull rear J-Strap up and secure to frame.

(4) Install seat in vehicle.

(5) Connect power seat switch connector, if equipped.

SEAT BACK - SPLIT BENCH (Continued)

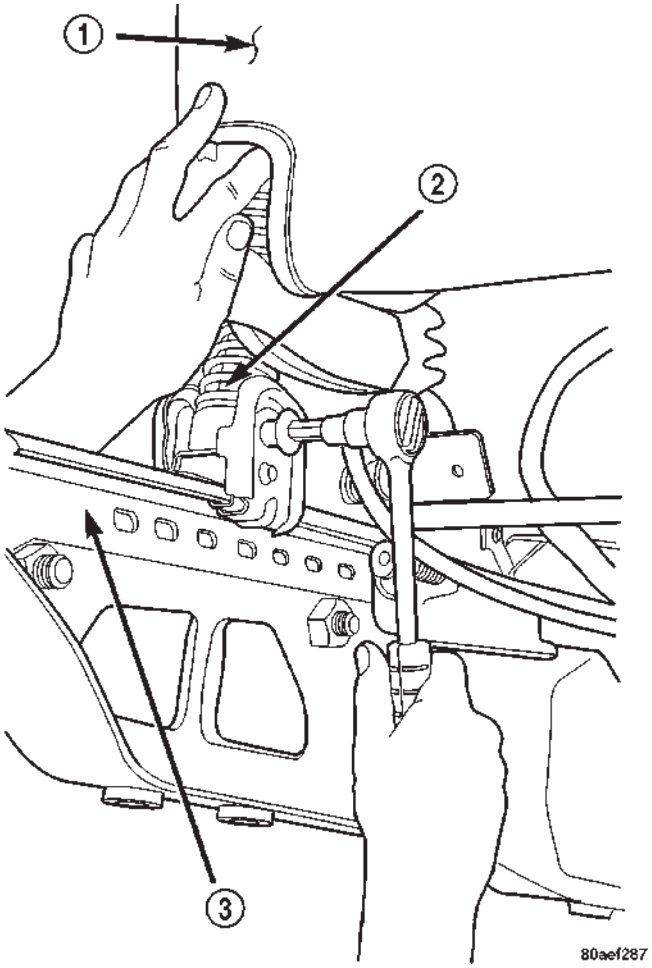

*Fig. 13 Recliner*

1 - SEAT BACK
2 - RECLINER
3 - SEAT TRACK

### QUAD CAB

(1) Position seat back on seat track adjuster.

(2) Install the inboard and outboard pivot bolts attaching the frame to the seat track adjuster (Fig. 11).

(3) Install the bolt attaching the lower recliner to the seat track adjuster.

(4) Position the recliner cable on seat track adjuster and install **new** clip.

(5) Install shoulder belt anchor bolt. Tighten bolt to 45 N·m (33 ft. lbs.) torque.

(6) Remove clamp (Fig. 10).

(7) Install side shield.

(8) Install recliner handle.

(9) Install seat dump handle, if removed.

## SEAT BACK COVER

### REMOVAL

(1) Remove seat back from vehicle.(Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - REMOVAL)

(2) Disengage J-Straps from base of seat back.

(3) Remove hogrings, if equipped.

(4) With seat back in a normal vertical position, roll cover upwards and remove.

### INSTALLATION

(1) With seat back in a normal vertical position, roll cover downwards over seat back.

(2) Install hogrings, if equipped.

(3) Secure J-Straps at base of seat back.

(4) Install seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - INSTALLATION)

## SEAT BACK COVER - SPLIT BENCH

### REMOVAL

(1) Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)

(2) Using a trim stick or equivalent tool, pry off lumbar handle, if equipped (Fig. 14). (Damage to lumbar handle may occur during removal, verify availability of replacement handle before removing.)

(3) Remove latch release knob (Fig. 14).

(4) Remove latch release bezel.

(5) Disengage J-Straps from base of seat back.

(6) Remove hog rings, if equipped.

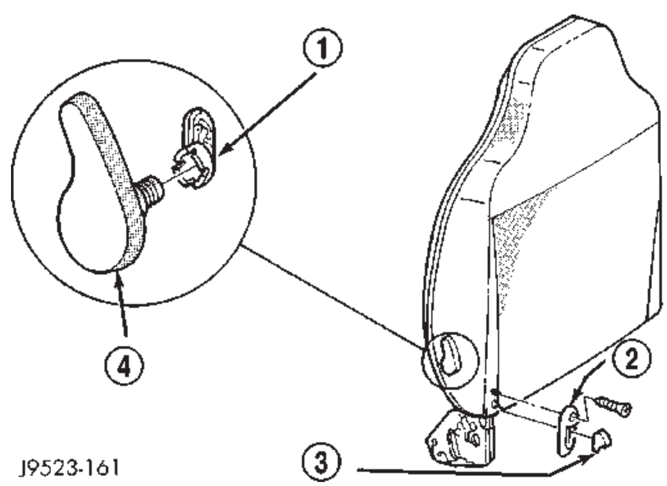

*Fig. 14 Lumbar Handle Removal*

1 - LUMBAR CAM
2 - BEZEL
3 - RELEASE LATCH KNOB
4 - LUMBAR HANDLE

SEAT BACK COVER - SPLIT BENCH (Continued)

(7) With seat back in a normal vertical position, roll cover upwards and remove.

### INSTALLATION

(1) With seat back in a normal vertical position, roll cover downwards over seat back.
(2) Install hog rings, if equipped.
(3) Engage J-Straps at base of seat back.
(4) Align lumbar handle with lumbar cam and tap on with rubber mallet until seated.
(5) Install latch release bezel.
(6) Install latch release knob.
(7) Install seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

## SEAT BACK RECLINER

### REMOVAL

(1) Remove seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)
(2) Disengage J-straps at base of seat back and roll seat back cover upward to access rubber bellows push-in fasteners.

**NOTE: Notice the routing of the recliner cable for installation.**

(3) Remove the push-in fasteners attaching upper rubber bellows to the seat back frame.
(4) Remove rubber bellows.
(5) Remove seat dump handle, 2–door “BE” vehicles only.

**WARNING: Do not pull on upper recliner handle or recliner cable end. The recliner lead screw is spring loaded and will eject if either the handle or cable is pulled before the lead screw is removed.**

(6) Remove the bolts attaching upper recliner to seat back frame (Fig. 15).
(7) Separate the recliner from the seat back.

### INSTALLATION

(1) Install seat dump handle, if removed.
(2) Position the recliner in the seat back.
(3) Install the bolts attaching upper recliner to seat back frame (Fig. 15).
(4) Install rubber bellows.
(5) Roll seat back cover upward and engage J-straps at base of seat back.
(6) Ensure recliner cable is correctly routed.
(7) Install seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

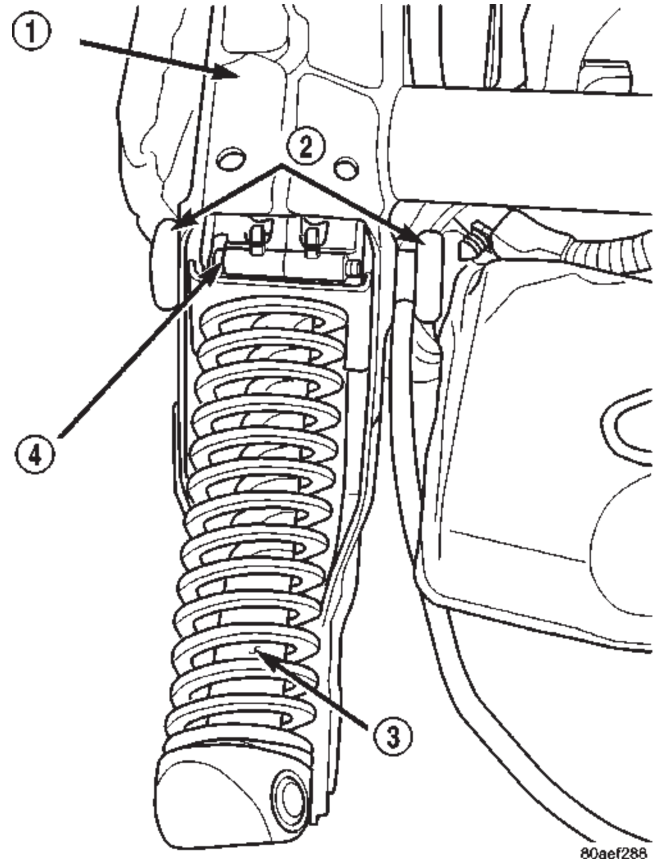

*Fig. 15 Seat Back Recliner*

1 - SEAT BACK FRAME
2 - BOLT
3 - LEAD SCREW
4 - SEAT BACK RECLINER

## SEAT CUSHION

### REMOVAL

(1) Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)
(2) Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - REMOVAL) or (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)
(3) From the underside of the seat, remove the bolts attaching the cushion frame to the mounting brackets.
(4) Disengage wire harness connector, if equipped.
(5) Remove the cushion from the seat tracks.

### INSTALLATION

(1) Position the cushion frame on the seat tracks.
(2) Ensure that the cushion frame is aligned with the mounting brackets (Fig. 16).
(3) Engage wire harness connector, if equipped.

SEAT CUSHION (Continued)

(4) Install the bolts attaching the seat cushion frame to the mounting brackets. Tighten bolts to 25 N·m (18 ft. lbs.) torque.

(5) Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

(6) Install the seat. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)

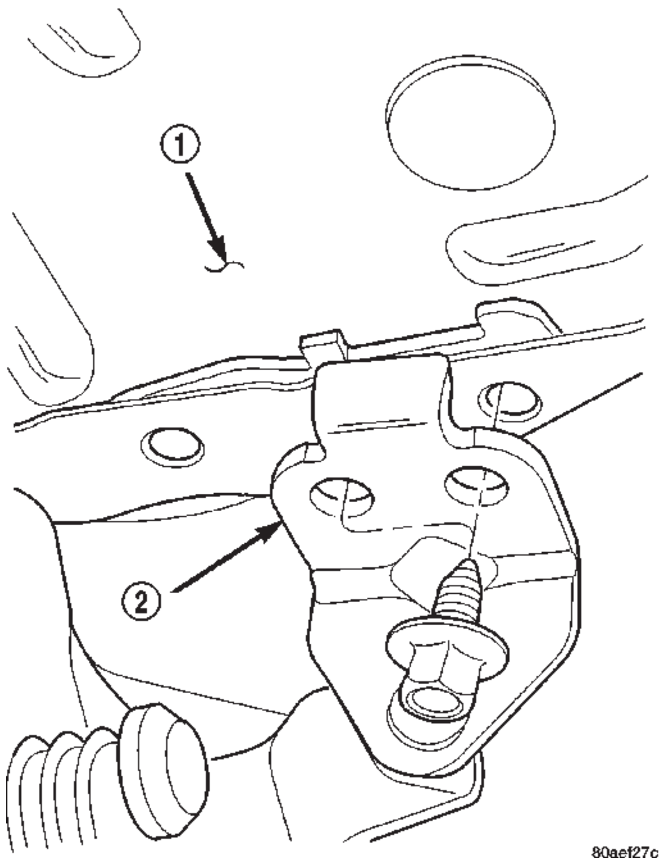

*Fig. 16 Seat Cushion Mounting Frame*

1 - SEAT CUSHION FRAME
2 - MOUNTING BRACKET

# SEAT CUSHION COVER

## REMOVAL

(1) Remove seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)

(2) Position seat cushion on a suitable work surface with frame side up.

(3) Remove seat track. (Refer to 23 - BODY/SEATS/SEAT TRACK - REMOVAL)

(4) Remove left and right side J-Straps.

(5) Remove rear J-Strap.

(6) Remove front J-Strap.

(7) Roll trim cover off of front and rear corners and separate from foam cushion.

## INSTALLATION

(1) Position cushion cover on cushion and roll cover over front and rear corners.

(2) Secure front J-Strap (Fig. 17).

(3) Secure rear J-Strap.

(4) Secure left and right side J-Straps.

(5) Verify stitching lines are straight, correct as necessary.

(6) Install the seat track. (Refer to 23 - BODY/SEATS/SEAT TRACK - INSTALLATION)

(7) Install seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

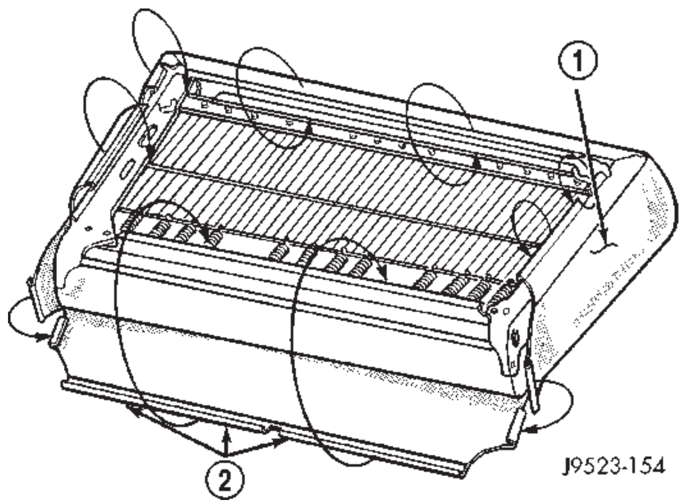

*Fig. 17 J-Strap Installation*

1 - SEAT CUSHION
2 - J—STRAPS

# SEAT CUSHION COVER - SPLIT BENCH

## REMOVAL

### STANDARD CAB

(1) Remove seat tracks. (Refer to 23 - BODY/SEATS/SEAT TRACK - SPLIT BENCH - REMOVAL)

(2) Remove seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)

(3) Remove left and right J-straps.

(4) Position seat cushion on a suitable work surface with frame side up.

(5) Remove rear J-strap.

(6) Remove front J-strap.

(7) Roll cushion cover off of foam cushion.

SEAT CUSHION COVER - SPLIT BENCH (Continued)

### QUAD CAB

(1) Remove seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)

(2) Disengage the J-straps attaching the cushion cover to the cushion frame (Fig. 18).

(3) Peel the cushion cover and disengage the hook and loop fasteners (Fig. 19).

(4) Disengage the electrical connectors for the heated seat grid, if equipped.

(5) Disengage the hog rings attaching the cushion cover to the cushion frame (Fig. 20).

(6) Separate the cover from the cushion.

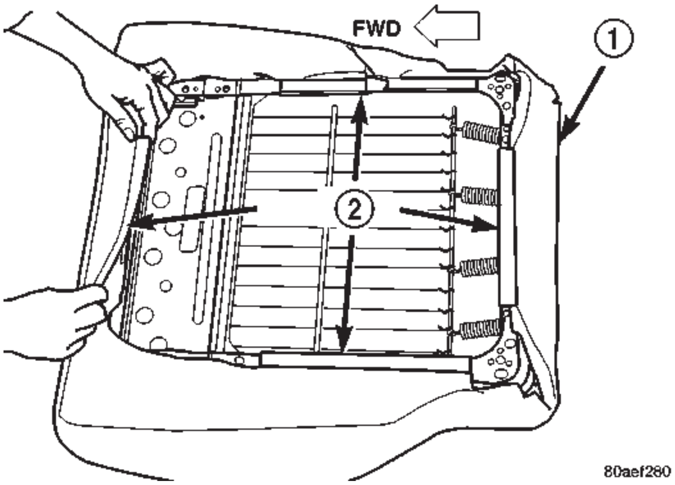

*Fig. 18 Seat Cushion J-Straps*

1 - SEAT CUSHION
2 - J—STRAPS

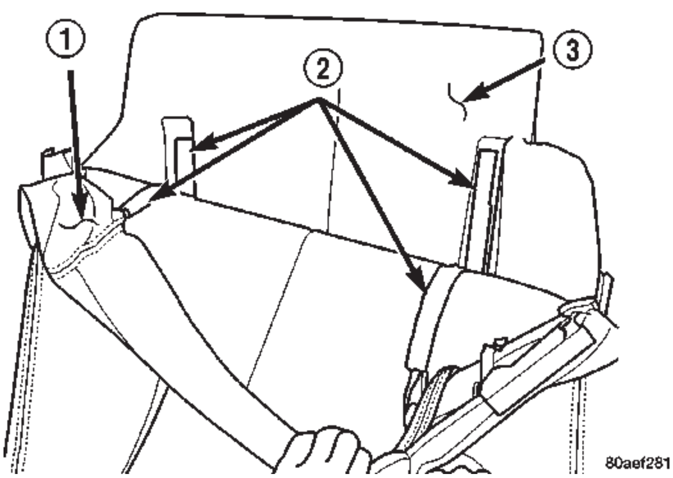

*Fig. 19 Seat Cushion Cover Hook and Loop*

1 - CUSHION COVER
2 - HOOK AND LOOP FASTENERS
3 - SEAT CUSHION

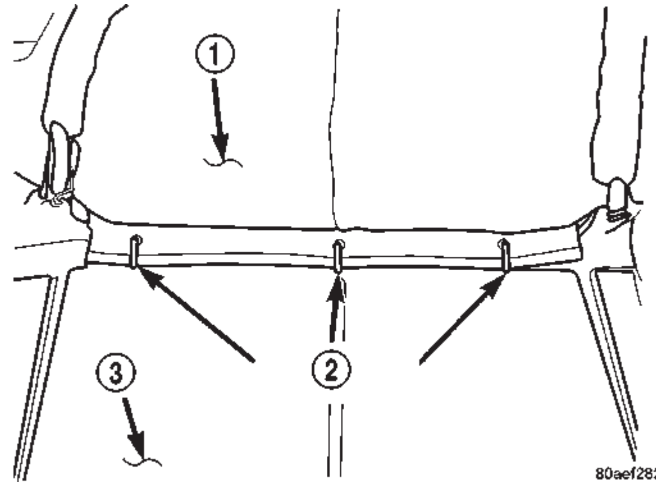

*Fig. 20 Seat Cushion Cover Hog Rings*

1 - CUSHION COVER
2 - HOG RINGS
3 - CUSHION

## INSTALLATION

### STANDARD CAB

(1) Position cushion cover on cushion and roll cover over front and rear corners. Verify stitching lines are straight, correct as necessary.

(2) Pull front J-strap up, align cover to foam notches and secure front J-strap to frame (Fig. 21).

(3) Install seat backs. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

(4) Pull the left J-strap up and secure to frame. Verify cover is straight.

(5) Pull the right side J-strap up and secure to frame.

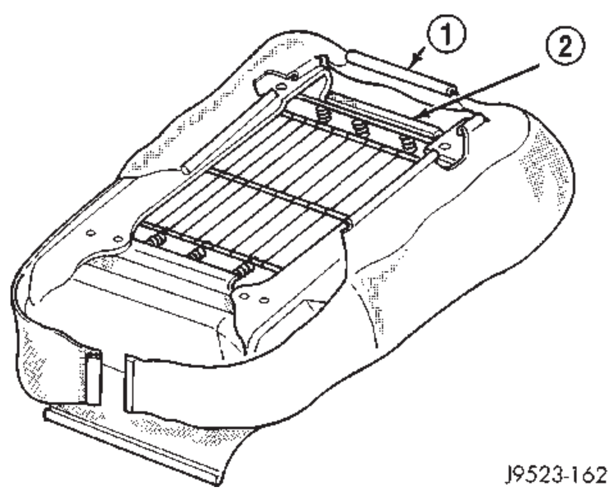

*Fig. 21 J-Strap Installation*

1 - J—STRAP
2 - FRAME

SEAT CUSHION COVER - SPLIT BENCH (Continued)

(6) Install seat tracks. (Refer to 23 - BODY/SEATS/SEAT TRACK - SPLIT BENCH - INSTALLATION)

### QUAD CAB

(1) Position the cover on the cushion.

(2) Engage the hog rings attaching the cushion cover to the cushion frame.

(3) Engage the hook and loop fasteners.

(4) Engage the electrical connectors for the heated seat grid, if equipped.

(5) Engage the J-straps attaching the cushion cover to the cushion frame.

(6) Install seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

## SEAT RISER

### REMOVAL

(1) Disconnect seat harness connector.

(2) Remove the seat from the vehicle. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)

(3) Remove the bolts attaching the seat track adjuster to the seat riser (Fig. 22).

(4) Separate the seat track adjuster from the riser.

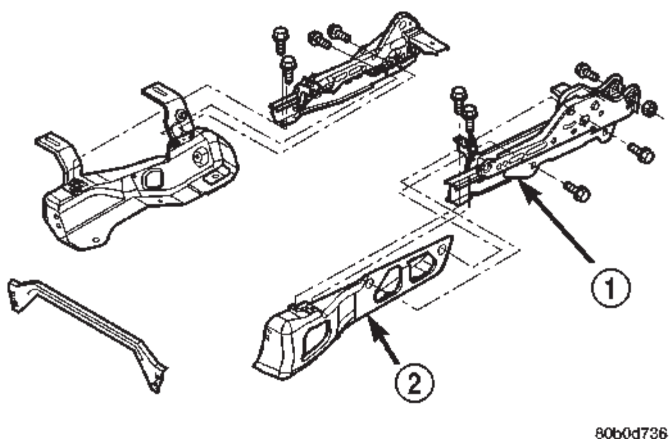

*Fig. 22 Seat Riser*

1 - SEAT TRACK ADJUSTER
2 - RISER

### INSTALLATION

(1) Position the seat track adjuster on the riser.

(2) Install the bolts attaching the seat track adjuster to the seat riser. Tighten front bolts to 17 N·m (12 ft. lbs.) torque. Tighten rear inboard bolt to 22 N·m (16 ft. lbs.) torque. Tighten rear outboard bolt to 45 N·m (33 ft. lbs.) torque.

(3) Install the seat in the vehicle. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)

(4) Connect seat harness connector.

## SEAT TRACK

### REMOVAL

(1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL)

(2) Remove inboard seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - REMOVAL)

(3) Remove bolts attaching seat track to seat cushion frame (Fig. 23).

(4) Separate seat track from seat cushion frame.

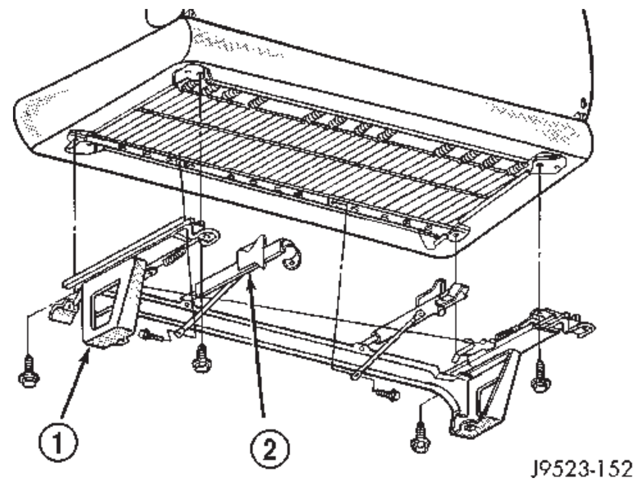

*Fig. 23 Seat Track Removal*

1 - SEAT TRACK
2 - SLIDER BAR

### INSTALLATION

(1) Position seat track on seat cushion frame.

(2) Ensure seat track and slider bar are aligned.

(3) Install rear seat track bolts. Tighten seat track bolts to 25 N·m (18 ft.lbs.) torque.

(4) Install inboard seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)

(5) Pull seat release and move track rearward.

(6) Install front seat track bolts. Tighten seat track bolts to 25 N·m (18 ft.lbs.) torque.

(7) Align slider bars and install bolts. Tighten slider bar bolts to 10.0 N·m (7 ft.lbs.) torque.

(8) Install seat. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION)

# SEAT TRACK - SPLIT BENCH

## REMOVAL

(1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)

(2) Remove bolts from crossbrace to seat cushion frame and power track (Fig. 24).

(3) Remove bolts attaching center seat to seat frame and remove center seat.

(4) Remove bolts attaching seat track to seat frame (Fig. 25)and (Fig. 26).

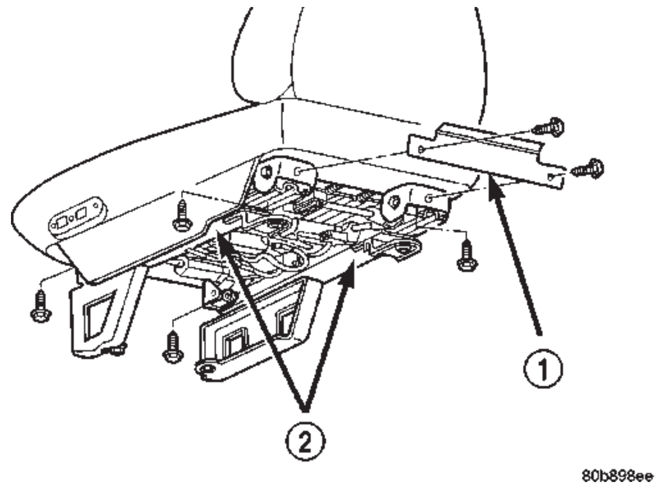

***Fig. 24 Cross Brace***

1 - CROSS BRACE
2 - SEAT TRACK

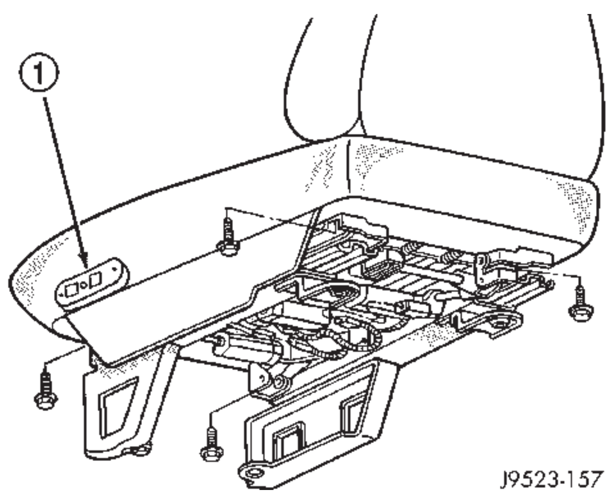

***Fig. 25 Power Seat Track***

1 - SEAT SWITCH

## INSTALLATION

(1) Install bolts attaching seat track to seat frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.

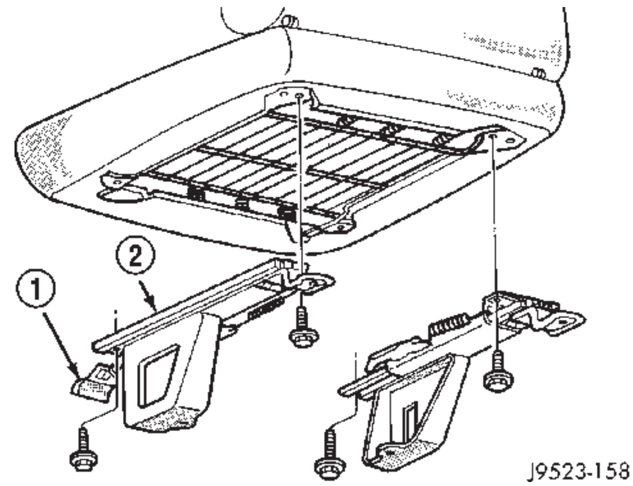

***Fig. 26 Seat Track Removal/Installation***

1 - RELEASE HANDLE
2 - SEAT TRACK

(2) Install bolts into crossbrace and seat cushion frame to power track and torque to 10N·m (8.5–11.5 ft. lbs.).

(3) Install bolts attaching center seat to seat frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.

(4) Install seat. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)

(5) Power adjuster on power seat must be cycled in all 6 functions to ensure the adjuster is working properly.

# EASY ENTRY SEAT TRACK

## REMOVAL

(1) Remove front passenger seat. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)

(2) Remove recliner handle.

(3) Remove side shield.

(4) Disengage seat track latch release cables.

(5) Remove bolts attaching seat adjuster track to easy entry seat track. (Fig. 27).

(6) Remove inboard seat back pivot bolt.

(7) Disengage latch release cable from pulley.

(8) Separate seat adjuster track from seat back.

## INSTALLATION

(1) Position inboard easy entry seat track at seat back.

(2) Engage latch release cable around pulley.

(3) Install inboard seat back pivot bolt. Tighten bolt to 50 N·m (36 ft. lbs.) torque.

(4) Install screws attaching seat adjuster track to seat cushion frame. Tighten screws to 25 N·m (18 ft. lbs.) torque.

EASY ENTRY SEAT TRACK (Continued)

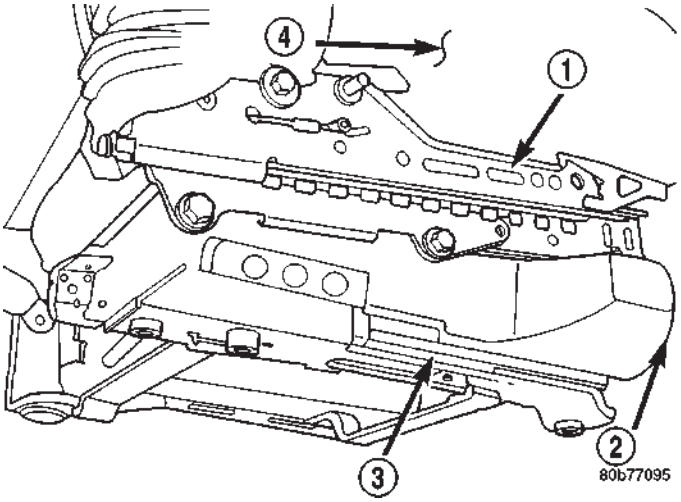

*Fig. 27 EASY ENTRY SEAT TRACK*

1 - SEAT ADJUSTER TRACK
2 - RISER
3 - EASY ENTRY SEAT TRACK
4 - SEAT CUSHION

(5) Install bolts attaching easy entry seat track to seat adjuster track. Tighten front bolts to 17 N·m (12 ft. lbs.) torque. Tighten rear inboard bolts to 21 N·m (16 ft. lbs.) torque. Tighten rear outboard bolts to 45 N·m (33 ft. lbs.) torque.
(6) Engage seat track latch release cables.
(7) Install front passenger seat. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)
(8) Install side shield.
(9) Install recliner handle.

# SEAT TRACK ADJUSTER

## REMOVAL

(1) Remove the seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)
(2) Unwind recliner spring from seat back. Use care not to lose upper spring seat.

**WARNING: DO NOT PULL THE RECLINER CABLE OR THE RECLINER HANDLE. THE RECLINER LEAD SCREW IS SPRING LOADED AND WILL EJECT IF EITHER THE HANDLE , CABLE, OR TOWEL BAR IS PULLED BEFORE THE LEAD SCREW IS REMOVED.**

(3) Remove right and left risers.

## INSTALLATION

(1) Install the left and right risers.
(2) Install the recliner lead screw and spring in the seat back.
(3) Install seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

# STANCHION COVER

## REMOVAL

(1) Remove push-in fasteners attaching stanchion cover to seat stanchion (Fig. 28).
(2) Separate cover from seat stanchion.

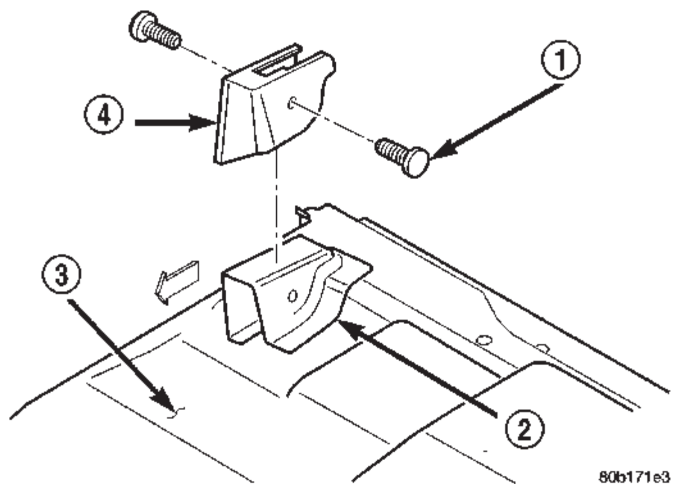

*Fig. 28 Stanchion Cover*

1 - PUSH—IN FASTENER
2 - SEAT STANCHION
3 - FLOOR PAN
4 - STANCHION COVER

## INSTALLATION

(1) Position cover on seat stanchion.
(2) Install push-in fasteners attaching stanchion cover to seat stanchion (Fig. 28).

# REAR SEAT

## REMOVAL

(1) Move front seat track to full forward position.

(2) Turn release handle on underside of rear seat (Fig. 29) to disengage seat cushion and move seat to the stowed position.

(3) Remove side support bracket screws and lift seat to disengage from cab (Fig. 30).

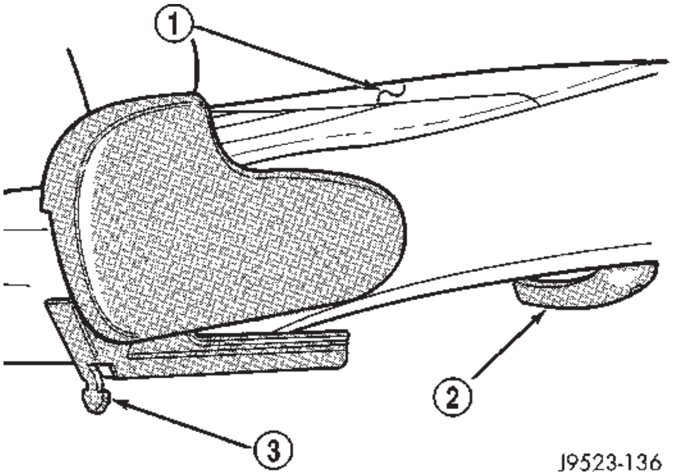

*Fig. 29 Rear Seat Release Handle*

1 - SEAT CUSHION
2 - RELEASE HANDLE
3 - ALIGNMENT TAB

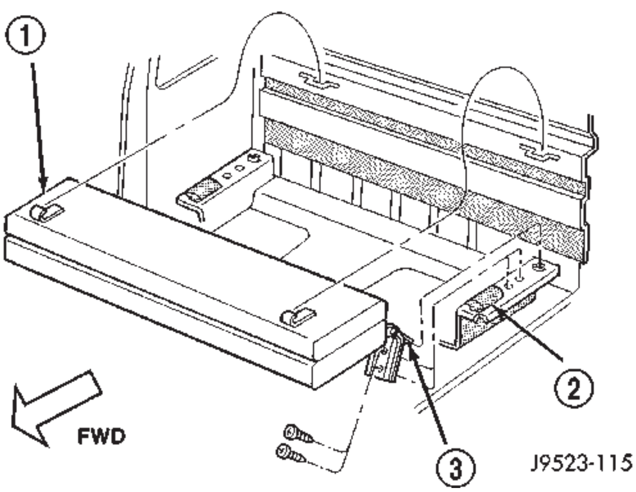

*Fig. 30 Rear Seat Removal/Installation*

1 - REAR SEAT
2 - BUMPER
3 - TAB

## INSTALLATION

(1) Position seat in vehicle.

(2) Align seatback hooks with loops on cab rear panel (Fig. 31).

(3) Align side support alignment tabs, and lower seat into place.

(4) Install side support bracket screws. Tighten the screws to 28 N·m (250 in-lbs) torque.

(5) Turn release handle to disengage seat from stowed position and push seat cushion downward to lock into place.

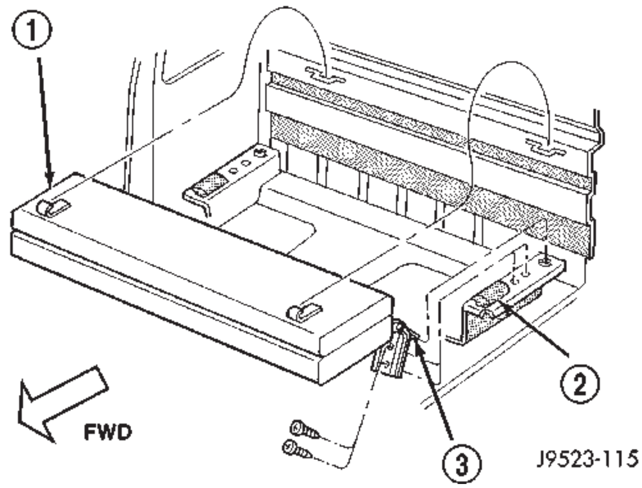

*Fig. 31 Rear Seat Removal/Installation*

1 - REAR SEAT
2 - BUMPER
3 - TAB

# STATIONARY GLASS

## TABLE OF CONTENTS

# STATIONARY GLASS

## DESCRIPTION

Windshields are made of two pieces of glass with a plastic inner layer. Windshields and selected stationary glass are structural members of the vehicle. The windshield glass is bonded to the windshield frame with urethane adhesive.

## OPERATION

Windshields and other stationary glass protect the occupants from the effects of the elements. Windshields are also used to retain some airbags in position during deployment. Urethane bonded glass is difficult to salvage during removal. The urethane bonding is difficult to cut or clean from any surface. Before removing the glass, check the availability of replacement components.

# BACKLITE

## REMOVAL

It is difficult to salvage the backlite during the removal operation. The backlite is part of the structural support for the roof. The urethane bonding used to secure the glass to the fence is difficult to cut or clean from any surface. Since the molding is set in urethane, it is unlikely it would be salvaged. Before removing the backlite, check the availability from the parts supplier.

The backlite is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the backlite.

(1) Roll down door glass.

(2) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(3) Remove rear closer panel trim. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(4) Bend backlite retaining tabs (Fig. 1) inward against glass.

(5) Using a suitable pneumatic knife from inside the vehicle, cut urethane holding backlite frame to opening fence.

(6) Separate glass from vehicle.

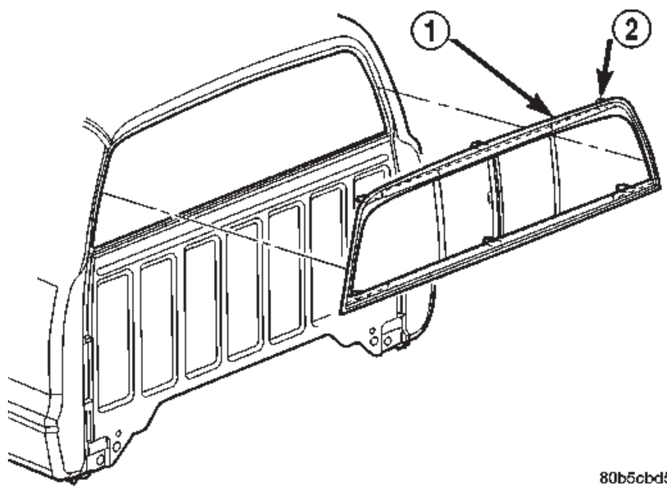

***Fig. 1 Backlite Tabs***

1 - BACKLITE
2 - TAB

## INSTALLATION

(1) Clean urethane adhesive from around backlite opening fence.

BACKLITE (Continued)

(2) If necessary, apply black-out primer to outer edge of replacement backlite frame.

(3) If black-out primer was pre-applied on backlite, clean bonding surface with Isopropyl alcohol and clean lint free cloth. Allow 3 minutes for drying time.

(4) Apply black-out primer to backlite opening fence.

(5) Apply a 13 mm (0.5 in.) bead of urethane around the perimeter of the window frame bonding surface (Fig. 2).

(6) Set glass on lower fence and move glass forward into opening (Fig. 3).

(7) Firmly push glass against rear window glass opening fence.

(8) Bend tabs around edges of backlite opening fence to retain glass.

(9) Clean excess urethane from exterior with MOPAR, Super Clean or equivalent.

(10) Allow urethane to cure at least 24 hours (full cure is 72 hours).

(11) Water test to verify repair before returning vehicle to service.

(12) Install rear closer panel trim. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

(13) Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

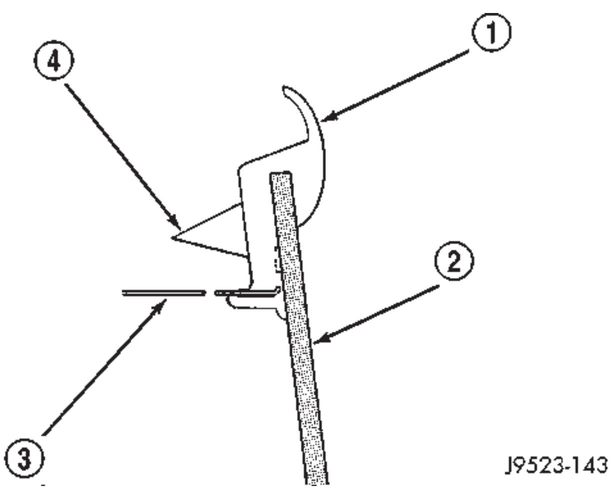

***Fig. 2 Urethane Adhesive Application***

1 - WINDOW FRAME
2 - GLASS
3 - RETAINER TAB
4 - URETHANE ADHESIVE

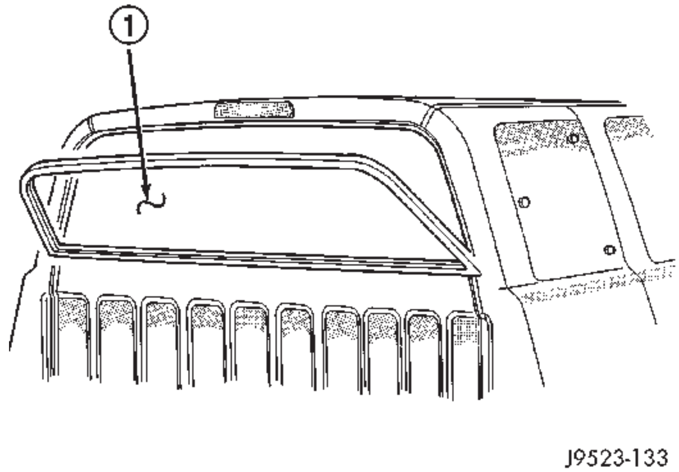

***Fig. 3 Backlite Installation***

1 - BACKLITE

# BACKLITE LATCH AND KEEPER

## REMOVAL

(1) Disengage latch and keeper.

(2) Remove latch/keeper screws.

(3) Separate Latch/keeper from glass panel.

## INSTALLATION

(1) Position Latch/keeper on glass panel.

(2) Install screws. Tighten the screws with 1.5 N·m (15 in. lbs.) torque.

(3) Engage latch and keeper to verify operation.

# BACKLITE VENT GLASS

## REMOVAL

(1) Close and latch sliding vent glass.

(2) Remove rear closure panel trim, if necessary. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(3) Grasp end of lower run channel.

(4) Roll corners of lower run channel outward (Fig. 4).

(5) Disengage enough of the lower run channel from the backlite frame lower rail and firmly pull/slide lower run channel outward (Fig. 5).

(6) Disengage vent glass from upper run channel.

(7) Separate vent glass from backlite frame.

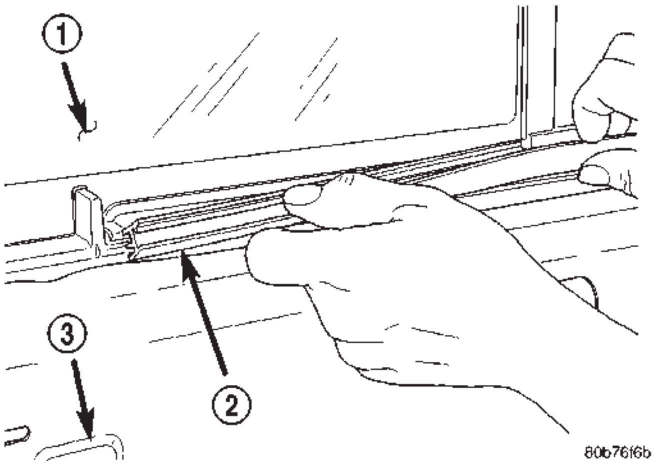

***Fig. 4 Lower Run Channel***

1 - SLIDING BACKLITE
2 - LOWER RUN CHANNEL
3 - CAB BACK PANEL

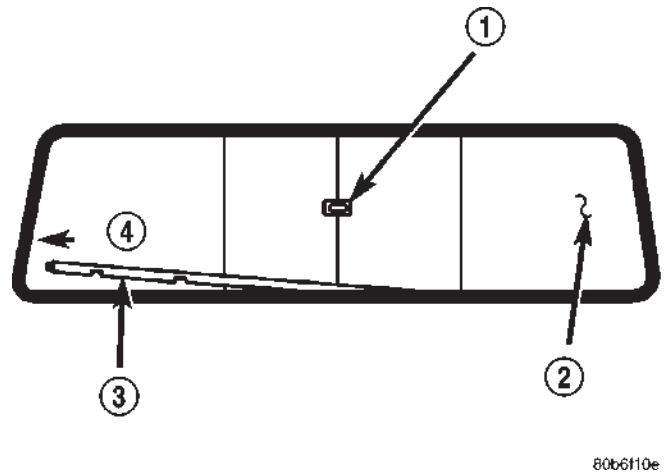

***Fig. 5 Lower Run Channel Removal***

1 - LATCH/KEEPER
2 - BACK LITE
3 - LOWER RUN CHANNEL
4 - SLIDE OUTWARD

## INSTALLATION

(1) Remove excess sealer from backlite frame lower rail.

(2) Clean bond area with hand scuff pad.

(3) Clean bond area with Mopar® Tar and Oil Remover or equivalent.

(4) Using a lint free cloth, clean bond area with 50/50 mixture of Isopropyl alcohol and water.

(5) Apply a 0.5 mm bead of pumpable grade butyl along entire length of the lip retainer in lower run channel (Fig. 6).

(6) Slide vent glass panels into lower run channel.

(7) Latch vent glass panels

(8) Insert upper ends of vent glass panels into upper run channel.

**NOTE: Aggressive clamp pressure is required to lock lower run channel into place.**

(9) Position lower run channel on backlite frame lower rail and roll lower run channel onto backlite frame rail.

(10) Fill the ends of the run channel with Mopar GEN II Silicone Rubber Adhesive Sealant or equivalent.

(11) Verify window and latch/keeper operation.

(12) Install rear closure panel trim. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

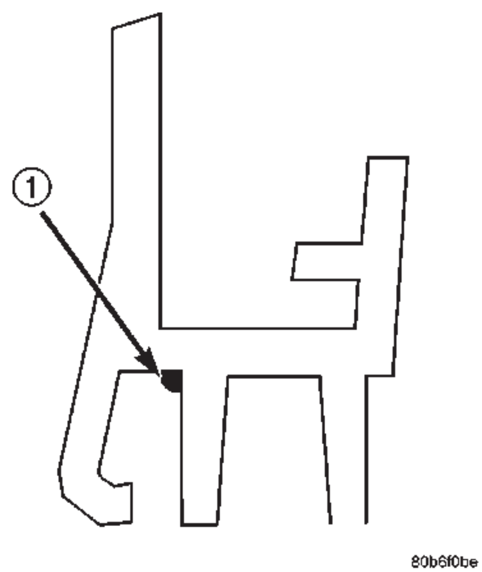

***Fig. 6 Glass Panel Installation***

1 - INSERT A 0.5mm DIA. BEAD OF PUMPABLE GRADE BUTYL ALONG THE ENTIRE LENGTH OF THE LOWER RUN WINDOW CHANNEL

# WINDSHIELD

## DESCRIPTION

**WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.**
**URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.**
**DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.**
**BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.**
**VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.**
**SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.**
**ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.**

**CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.**
**Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.**

## OPERATION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

## REMOVAL

(1) Remove inside rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).

(2) Remove cowl grill. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(3) With doors open, remove windshield molding (Fig. 7). Pull outward on molding beginning at the bottom of A-pillars using pliers.

(4) Cut urethane bonding from around windshield using a suitable sharp cold knife (C-4849). A pneumatic cutting device can be used but is not recommended (Fig. 8).

(5) Separate windshield from vehicle.

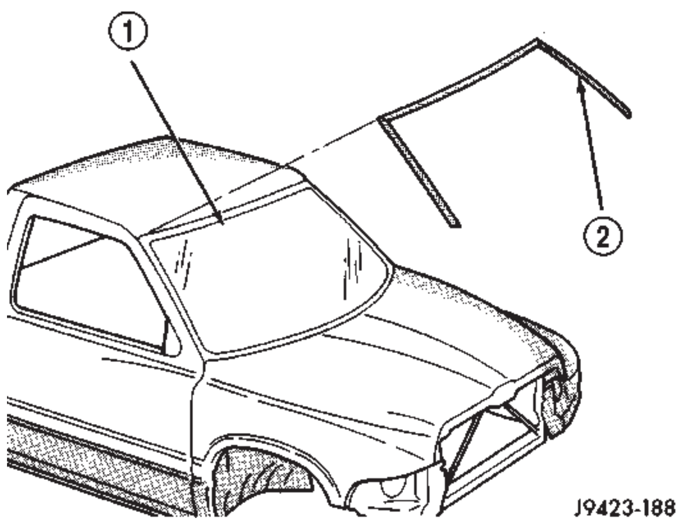

*Fig. 7 Windshield Moldings*

1 - WINDSHIELD
2 - WINDSHIELD MOLDING

## INSTALLATION

**WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.**

**CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.**

The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, WINDSHIELD (Continued)

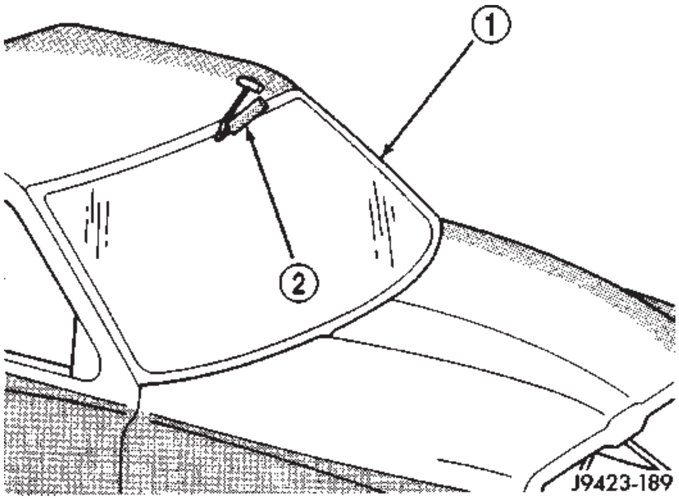

***Fig. 8 Cut Urethane Around Windshield***

1 - WINDSHIELD
2 - COLD KNIFE

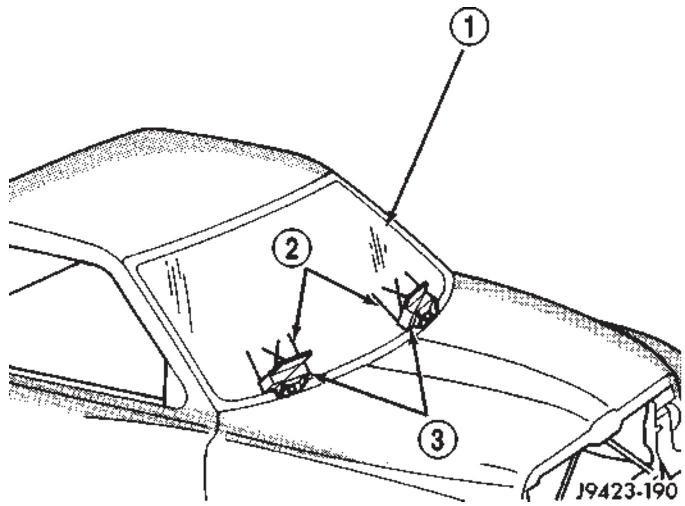

***Fig. 9 Center Windshield and Mark at Support***

1 - WINDSHIELD
2 - INDEX MARKS
3 - SUPPORT SPACERS

should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

(1) Place replacement windshield into windshield opening and position glass in the center of the opening against the support spacers. Mark the outside surface of the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening (Fig. 9).

(2) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 10).

(3) Clean inside of windshield with MOPAR Glass Cleaner and lint-free cloth.

(4) Apply clear glass primer 25 mm (1 in.) wide around perimeter of windshield and wipe with a new clean and dry lint- free cloth.

(5) Apply the molding to the windshield:

(a) Press the upper corners of the molding onto the windshield.

(b) Press the header section onto the windshield.

(c) Press the A-Pillar sections onto the windshield.

(6) Apply black-out primer onto the glass using the windshield molding as a guide. The primer should be 15 mm (5/8 in.) wide on the top and sides of the glass and 25 mm (1 in.) on the bottom of windshield. Allow at least three minutes drying time.

(7) Locate **new** support spacers on support brackets and adjust to lowest height.

(8) Position one 5 mm (3/16 in.) soft spacer (p/n 55028214) at the bottom of the windshield fence (Fig. 11).

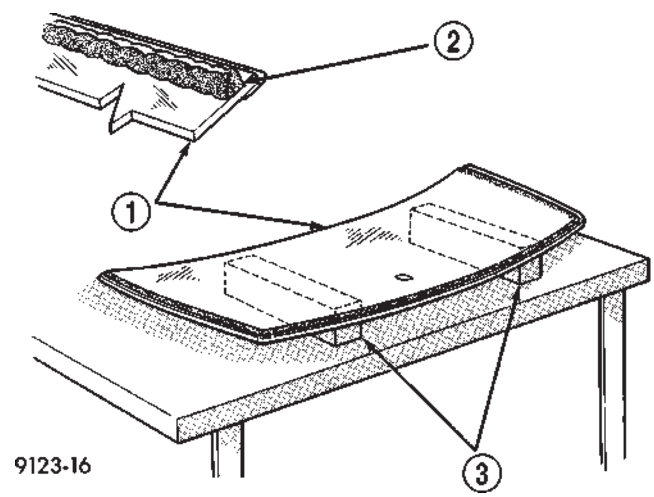

***Fig. 10 Work Surface Set up***

1 - WINDSHIELD AND MOULDINGS
2 - URETHANE BEAD AROUND GLASS 7mm (.3 in.) FROM EDGE
3 - BLOCKS

(9) Apply a 13mm (1/2 in.) high and 10mm (3/8 in.) wide bead of urethane around the perimeter of windshield. At the bottom, apply the bead 7 mm (1/4 in.) inboard from the glass edge. On the three sides where the molding is on the glass, follow the edge of molding. The urethane bead should be shaped in a triangular cross-section, this can be achieved by notching the tip of the applicator (Fig. 12).

(10) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

WINDSHIELD (Continued)

(11) Slowly lower windshield glass to the fence opening guiding the lower corners into proper position. Beginning at the bottom and continuing to the top, push glass onto fence along the A-Pillars. Push windshield inward to the fence at the bottom corners (Fig. 13).

(12) Push windshield upward, snug with roof and ratchet up the adjustable support brackets. Discard tab from support spacer.

(13) Using clean water, lightly mist the support spacers.

(14) Clean excess urethane from exterior with MOPAR® Super Clean or equivalent.

(15) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(16) Install cowl grill. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(17) Install rear view mirror support bracket. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(18) Install rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(19) After urethane has cured, remove tape strips and water test windshield to verify repair.

# QUARTER WINDOW

## REMOVAL

(1) Remove quarter trim panel.
(2) Remove the latch retaining screws from the cab rear side panel (Fig. 14).
(3) Remove the frame/hinge retaining nuts from the B-pillar.
(4) Remove the window glass from the cab.
(5) If necessary, remove the latch from the glass.

## INSTALLATION

(1) If removed, install the latch to the glass. Tighten the screw to 6 N·m (60 in. lbs.) torque.
(2) Center the window glass at the opening, insert the hinge studs in the B-pillar holes, and install the retaining nuts. Tighten the nuts to 11 N·m (95 in. lbs.) torque.
(3) Attach the latch to the rear side panel with the screws. Tighten the screws with the latch in the lock position and pushing rearward on the latch. Tighten the screws to 11 N·m (95 in. lbs.) torque.

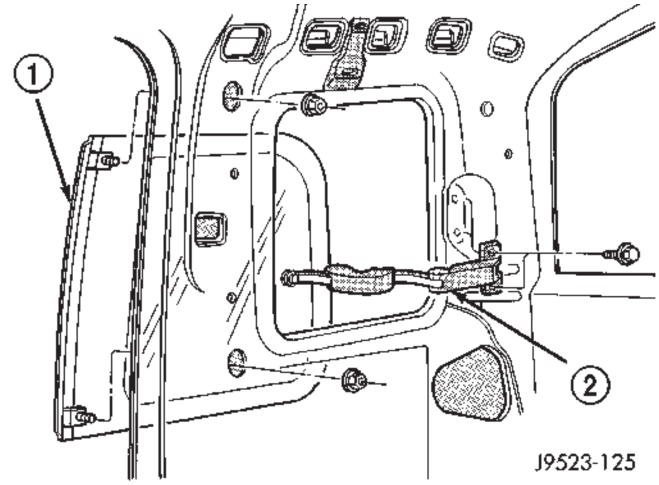

***Fig. 14 Vent Window—Club Cab***

1 - QUARTER GLASS
2 - LATCH

(4) Test the vent window for water leaks.
(5) Install quarter trim panel.

# WEATHERSTRIP/SEALS

TABLE OF CONTENTS

## B-PILLAR DOOR SEAL

### REMOVAL

(1) Warm the seal and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull seal from painted surface (Fig. 1).

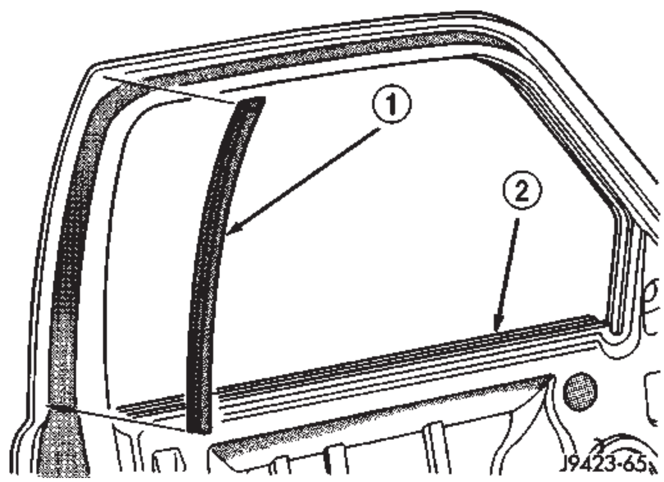

***Fig. 1 B-Pillar Secondary Seal***

1 - B—PILLAR SECONDARY SEAL
2 - DOOR

### INSTALLATION

(1) Remove adhesive tape residue from painted surface of vehicle.

(2) If seal is to be reused, remove tape residue from seal. Clean back of seal with MOPAR®, Super Kleen solvent or equivalent. Wipe seal dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of seal.

(3) Clean body surface with MOPAR®, Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

(4) Remove protective cover from tape on back of seal and apply seal to body.

(5) Heat body and seal, see step one. Firmly press seal to body surface to assure adhesion (Fig. 1).

# COWL WEATHERSTRIP

## REMOVAL

(1) Grasp cowl seal and pull from cowl flange.
(2) Separate cowl seal from vehicle (Fig. 2).

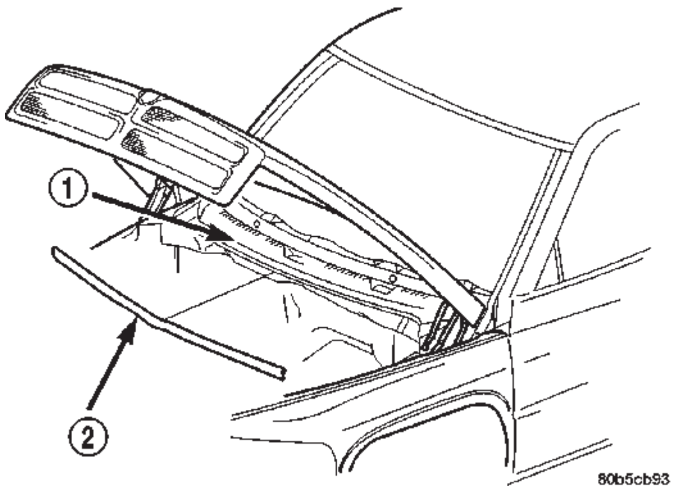

*Fig. 2 Cowl Seal*

1 - COWL
2 - COWL SEAL

## INSTALLATION

(1) Position cowl seal on flange and press into place.

# DOOR OPENING SEAL

## REMOVAL

(1) Remove A-pillar molding. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
(2) Remove cowl pane.(Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
(3) Remove sill cover. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL)
(4) Remove B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
(5) Pull seal from pinch flange around door opening (Fig. 3).

## INSTALLATION

(1) Press seal onto pinch flange around door opening (Fig. 3).
(2) Install B-pillar trim panel. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION)
(3) Install cowl panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION)
(4) Install sill cover. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION)

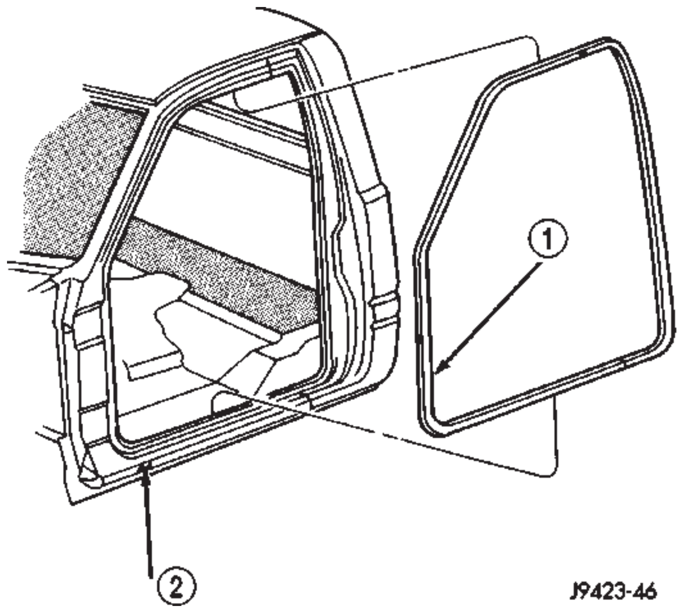

*Fig. 3 Door Opening Seal—Club Cab*

1 - DOOR SEAL
2 - BODY

(5) Install A-pillar molding. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

# FRONT DOOR GLASS RUN WEATHERSTRIP

## REMOVAL

(1) Remove inner door belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - REMOVAL)
(2) Pull door glass run weatherstrip from channel around window opening (Fig. 4).

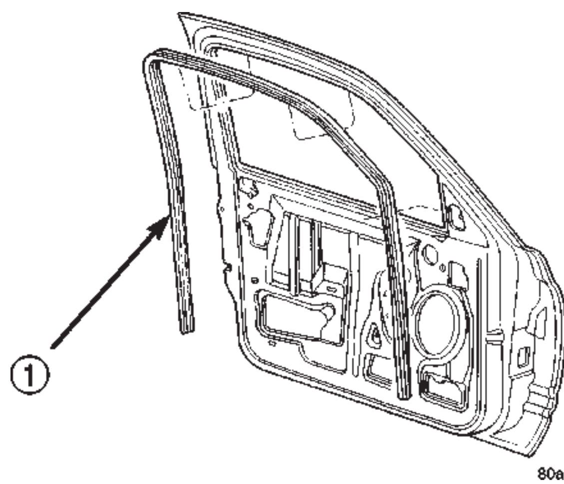

*Fig. 4 Door Glass Run Weatherstrip*

1 - GLASS RUN WEATHERSTRIP

FRONT DOOR GLASS RUN WEATHERSTRIP (Continued)

### INSTALLATION

(1) Press door glass run weatherstrip into channel around window opening (Fig. 4).

(2) Install inner door belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - INSTALLATION)

## FRONT DOOR INNER BELT WEATHERSTRIP

### REMOVAL

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)

(2) Lift inner door belt weatherstrip upward (Fig. 5).

(3) Separate inner door belt weatherstrip from door.

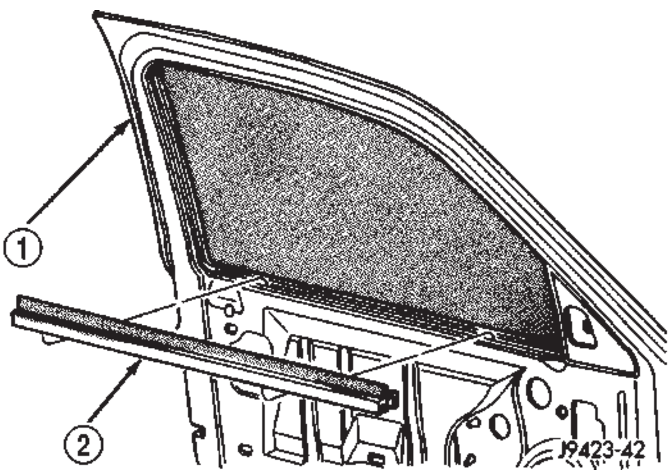

*Fig. 5 Inner Door Belt Weatherstrip*

1 - DOOR
2 - INNER BELTLINE WEATHERSEAL

### INSTALLATION

(1) Position inner door belt weatherstrip on door.

(2) Press inner door belt weatherstrip downward to seat.

(3) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

## FRONT DOOR OUTER BELT WEATHERSTRIP

### REMOVAL

(1) Roll door glass down.

(2) Remove mirror. (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL)

(3) Using a hook tool inserted into the end of the belt weatherstrip, lift upward.

(4) Separate outer door belt weatherstrip from door (Fig. 6).

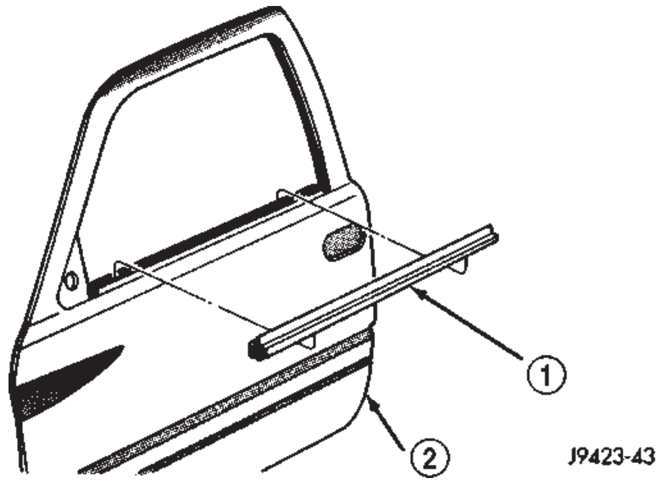

*Fig. 6 Outer Door Belt Weatherstrip*

1 - OUTER BELTLINE WATHERSTRIP
2 - DOOR

### INSTALLATION

(1) Position outer door belt weatherstrip on door.

(2) Press weatherstrip downward to seat.

(3) Install mirror. (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - INSTALLATION)

## FRONT DOOR UPPER CORNER SEAL

### REMOVAL

(1) Remove the push-in fasteners attaching the upper corner seal to the front door (Fig. 7).

(2) Separate the upper corner seal from the door.

### INSTALLATION

(1) Position the upper corner seal on the door.

(2) Install the push-in fasteners attaching the upper corner seal to the front door (Fig. 7).

## FRONT DOOR SECOND WEATHERSTRIP

### REMOVAL

(1) Remove the push-in fasteners attaching the secondary seal to the inner door panel.

(2) Separate the secondary seal from the inner door panel (Fig. 8).

FRONT DOOR 2ND WEATHERSTRIP (Continued)

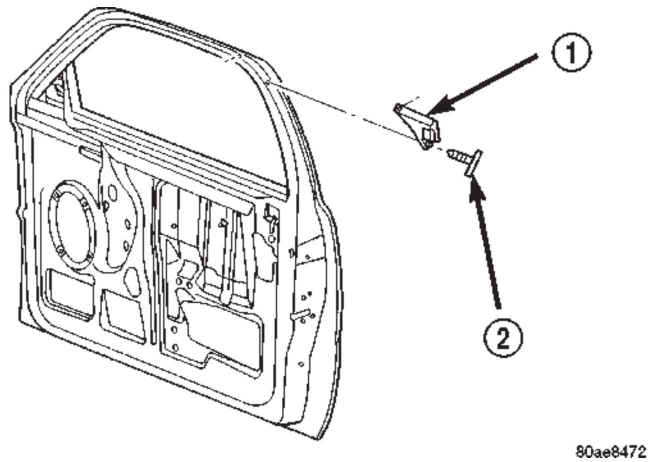

*Fig. 7 Upper Corner Seal—Quad Cab*

1 - UPPER CORNER SEAL
2 - PUSH—IN FASTENER

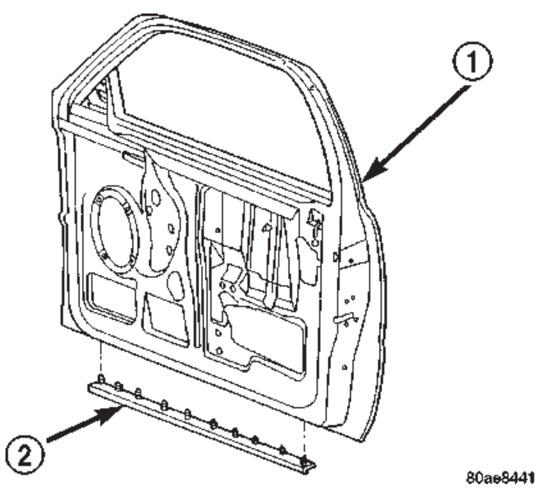

*Fig. 8 Front Door Secondary Seal—Quad Cab*

1 - FRONT DOOR
2 - SECONDARY SEAL

## INSTALLATION

(1) Position the secondary seal on the inner door panel.

(2) Install the push-in fasteners attaching the secondary seal to the inner door panel.

# HEATING & AIR CONDITIONING

TABLE OF CONTENTS

## HEATING & AIR CONDITIONING

### DESCRIPTION - HEATER AND AIR CONDITIONER

All vehicles are equipped with a common HVAC housing assembly (Fig. 1). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted under the instrument panel. On heater-only systems, the evaporator coil and recirculation door are omitted from the housing.

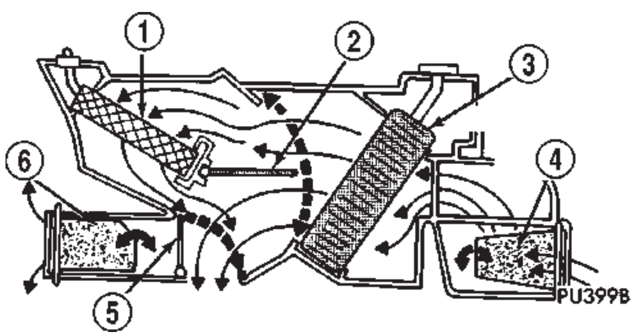

*Fig. 1 COMMON BLEND-AIR HEATER-AIR*

1 - HEATER CORE
2 - BLEND DOOR
3 - EVAPORATOR (A/C ONLY)
4 - RECIRCULATION DOOR (A/C ONLY)
5 - FLOOR/PANEL DOOR
6 - FLOOR/DEFROST DOOR

### DESCRIPTION - COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the HVAC system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Cooling for more information before the opening of, or attempting any service to the engine cooling system.

### DESCRIPTION - REFRIGERANT SYSTEM SERVICE PORT

The two refrigerant system service ports are used to charge, recover/recycle, evacuate, and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system, to ensure that the refrigerant system is not accidentally contaminated by the use of the wrong refrigerant (R-12), or refrigerant system service equipment.

### OPERATION - HEATER AND AIR CONDITIONER

The heater and optional air conditioner are blend-air type systems. In a blend-air system, a blend door controls the amount of unconditioned air (or cooled air from the evaporator on models with air conditioning) that is allowed to flow through, or around, the heater core. A temperature control knob on the A/C Heater control panel determines the discharge air temperature by controlling an electric actuator, which moves the blend door. This allows an almost immediate control of the output air temperature of the system.

The mode control knob on the heater-only or A/C Heater control panel is used to direct the conditioned air to the selected system outlets. Both mode control switches use engine vacuum to control the mode doors, which are operated by vacuum actuators.

On air conditioned vehicles, the outside air intake can be shut off by selecting the Recirculation Mode with the mode control knob. This will operate a vacuum actuated recirculation door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

The optional air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the

HEATING & AIR CONDITIONING (Continued)

heated air. This air conditioning system uses a fixed orifice tube in the middle of the liquid line to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, the a/c low pressure switch on the accumulator cycles the compressor clutch.

## OPERATION - REFRIGERANT SYSTEM SERVICE PORT

The high pressure service port is located on the liquid line between the condenser and the evaporator, near the front of the engine compartment. The low pressure service port is located on the suction line, near the accumulator outlet.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

## DIAGNOSIS AND TESTING - A/C PERFORMANCE

The air conditioning system is designed to provide the passenger compartment with low temperature and low humidity air. The evaporator, located in the HVAC housing on the dash panel below the instrument panel, is cooled to temperatures near the freezing point. As warm damp air passes through the cooled evaporator, the air transfers its heat to the refrigerant in the evaporator tubes and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an air conditioning system will be more effective in the recirculation mode (Max-A/C). With the system in the recirculation mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, the air conditioning system performance levels improve.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing. This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

Before proceeding, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). The air temperature in the test room and in the vehicle must be a minimum of 21° C (70° F) for this test.

(1) Connect a tachometer and a manifold gauge set.

(2) Set the a/c heater mode control switch knob to the recirculation mode (Max-A/C) position, the temperature control knob to the full cool position, and the blower motor switch to the highest speed position.

(3) Start the engine and hold the idle speed at 1,000 rpm with the compressor clutch engaged. If the compressor clutch does not engage, (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH COIL - DIAGNOSIS AND TESTING).

(4) The engine should be at operating temperature. The doors and windows must be closed and the hood must be mostly closed.

(5) Insert a thermometer in the driver side center A/C (panel) outlet. Operate the engine for five minutes.

(6) The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, unplug the a/c low pressure switch wire harness connector from the switch located on the accumulator (Fig. 2). Place a jumper wire between the two cavities of the a/c low pressure switch wire harness connector.

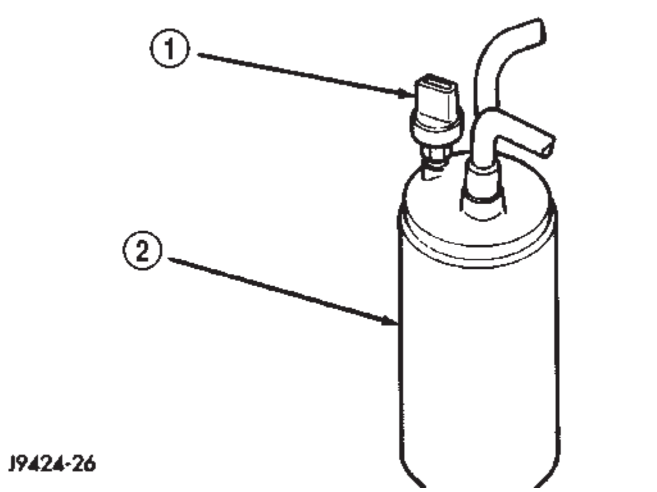

***Fig. 2 A/C LOW PRESSURE SWITCH***

1 - A/C LOW PRESSURE SWITCH
2 - ACCUMULATOR

HEATING & AIR CONDITIONING (Continued)

(7) With the compressor clutch engaged, record the panel outlet discharge air temperature, the discharge pressure (high side), and the suction pressure (low side).

(8) Compare the panel outlet discharge air temperature reading to the Performance Temperature and Pressure chart. If the temperature reading is high, clamp off both heater hoses (inlet and outlet), wait five minutes and record the temperature again. Compare the second reading to the Performance Temperature and Pressure chart. If the temperature reading is now OK, see Temperature Control Cable in the Removal and Installation section and in the Adjustments section of this group. If the temperature reading is still too high, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING), and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) in this group.

| Performance Temperature and Pressure | | | | | | |
|---|---|---|---|---|---|---|
| Ambient Temperature | 21° C (70° F) | 27° C (80° F) | 32° C (90° F) | 38° C (100° F) | 43° C (110° F) | 49° C (120° F) |
| Center Panel OutletDischarge Air Temperature | 5 to 7° C (40 to 45° F) | 13 to 16° C (55 to 60° F) | 16 to 21° C (60 to 70° F) | 21 to 24° C (70 to 75° F) | 27 to 29° C (80 to 85° F) | 29 to 32° C (85 to 90° F) |
| *Suction Pressure (Low Side) | 241 to 276 kPa (35 to 40 psi) | 276 to 345 kPa (40 to 50 psi) | 345 to 414 kPa (50 to 60 psi) | 414 to 483 kPa (60 to 70 psi) | 483 to 552 kPa (70 to 80 psi) | 552 to 586 kPa (85 to 90 psi) |
| *Discharge Pressure (High Side) | 931 to 1000 kPa (135 to 145 psi) | 1207 to 1482 kPa (175 to 215 psi) | 1482 to 1862 kPa (215 to 270 psi) | 1862 to 2275 kPa (270 to 330 psi) | 2344 to 2551 kPa (340 to 370 psi) | 2758 to 2965 kPa (400 to 430 psi) |
| *Note: If pressures are lower than shown, but center panel outlet discharge air temperatures are OK, then the A/C system is OK. | | | | | | |

(9) Compare the discharge (high side) and suction (low side) pressure readings to the Performance Temperature and Pressure chart. If the pressures are abnormal, see the A/C Diagnosis chart.

| A/C Diagnosis | | |
|---|---|---|
| Condition | Possible Causes | Correction |
| RAPID COMPRESSOR CLUTCH CYCLING (TEN OR MORE CYCLES PER MINUTE). | 1. Low refrigerant system charge. | 1. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 2. Faulty a/c low pressure switch. | 2. (Refer to Controls/A/C Low Pressure Switch/Diagnosis and Testing) in this group. Test the a/c low pressure switch and replace, if required. |
| | 3. Faulty Powertrain Control Module (PCM). | 3. (Refer to Appropriate Diagnostic Information) for testing the PCM. Test the PCM and replace, if required. |
| EQUAL PRESSURES, BUT THE COMPRESSOR CLUTCH DOES NOT ENGAGE. | 1. No refrigerant in the refrigerant system. | 1. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 2. Faulty fuse. | 2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. |

HEATING & AIR CONDITIONING (Continued)

| A/C Diagnosis | | |
|---|---|---|
| Condition | Possible Causes | Correction |
| | 3. Faulty a/c compressor clutch coil. | 3. (Refer to Controls/A/C Compressor Clutch Coil/ Diagnosis and Testing) in this group. Test the compressor clutch coil and replace, if required. |
| | 4. Faulty a/c compressor clutch relay. | 4. (Refer to Controls/A/C Compressor Clutch Relay/ Diagnosis and Testing) in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required. |
| | 5. Improperly installed or faulty a/c low pressure switch. | 5. (Refer to Controls/A/C Low Pressure Switch/Diagnosis and Testing) in this group. Test the a/c low pressure switch and tighten or replace, if required. |
| | 6. Faulty a/c high pressure switch. | 6. (Refer to Controls/A/C High Pressure Switch/Diagnosis and Testing) in this group. Test the a/c high pressure switch and replace, if required. |
| | 7. Faulty Powertrain Control Module (PCM). | 7. (Refer to Appropriate Diagnostic Information) for testing the PCM. Test the PCM and replace, if required. |
| | 8. Faulty a/c heater control. | 8. (Refer to Controls/A/C Heater Control/Diagnosis and Testing) in this group. Test the a/c heater control and replace, if required. |
| NORMAL PRESSURES, BUT A/C PERFORMANCE TEST AIR TEMPERATURES AT CENTER PANEL OUTLET ARE TOO HIGH. | 1. Excessive refrigerant oil in system. | 1. (Refer to Plumbing/Refrigerant Oil/Standard Procedure - Refrigerant Oil Level) in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required. |
| | 2. Blend door actuator inoperative or faulty. | 2. Check the Blend Door Actuator operation. Replace as required. |
| | 3. Blend door inoperative, obstructed or sealing improperly. | 3. (Refer to Distribution/Blend Door/Removal/Installation) in this group. Inspect the blend door for proper operation and sealing and correct, if required. |
| LOW SIDE PRESSURE IS NORMAL OR SLIGHTLY LOW, AND HIGH SIDE PRESSURE IS TOO LOW. | 1. Low refrigerant system charge. | 1. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 2. Refrigerant flow through the accumulator is restricted. | 2. (Refer to Plumbing/Accumulator/ Removal/Installation) in this group. Replace the restricted accumulator, if required. |
| | 3. Refrigerant flow through the a/c evaporator is restricted. | 3. (Refer to Plumbing/A/C Evaporator/ Removal/ Installation) in this group. Replace the restricted evaporator, if required. |
| | 4. Faulty compressor. | 4. (Refer to Plumbing/A/C Compressor/ Removal/ Installation) in this group. Replace the compressor, if required. |

HEATING & AIR CONDITIONING (Continued)

| A/C Diagnosis | | |
| --- | --- | --- |
| Condition | Possible Causes | Correction |
| LOW SIDE PRESSURE IS NORMAL OR SLIGHTLY HIGH, AND HIGH SIDE PRESSURE IS TOO HIGH. | 1. Condenser air flow restricted. | 1. Check the condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Refer to Cooling for more information on air seals. Clean, repair, or replace components as required. |
| | 2. Inoperative cooling fan. | 2. Refer to Cooling for more information. Test the cooling fan and replace, if required. |
| | 3. Refrigerant system overcharged. | 3. (Refer to Plumbing/Standard Procedure - Refrigerant System Charge) in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required. |
| | 4. Air in the refrigerant system. | 4. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. |
| | 5. Engine overheating. | 5. Refer to Cooling for more information. Test the cooling system and repair, if required. |
| LOW SIDE PRESSURE IS TOO HIGH, AND HIGH SIDE PRESSURE IS TOO LOW. | 1. Accessory drive belt slipping. | 1. Refer to Cooling for more information. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. |
| | 2. A/C orifice tube not installed. | 2. (Refer to Plumbing/A/C Orifice Tube/Diagnosis and Testing) in this group. Replace the liquid line, if required. |
| | 3. Faulty a/c compressor. | 3. (Refer to Plumbing/A/C Compressor/ Removal/ Installation) in this group. Replace the compressor, if required. |
| LOW SIDE PRESSURE IS TOO LOW, AND HIGH SIDE PRESSURE IS TOO HIGH. | 1. Restricted refrigerant flow through the refrigerant lines. | 1. (Refer to Plumbing/Caution - Refrigerant Hoses/Lines/ Tubes Precautions) in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required. |
| | 2. Restricted refrigerant flow through the a/c orifice tube. | 2. (Refer to Plumbing/A/C Orifice Tube/Diagnosis and Testing) in this group. Replace the liquid line, if required. |
| | 3. Restricted refrigerant flow through the a/c condenser. | 3. (Refer to Plumbing/A/C Condenser/ Removal/ Installation) in this group. Replace the restricted a/c condenser, if required. |

HEATING & AIR CONDITIONING (Continued)

## DIAGNOSIS AND TESTING - HEATER PERFORMANCE

Before performing the following tests, refer to Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Also be certain that the accessory vacuum supply line is connected at the engine vacuum source.

### MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control knob in the full hot position, the mode control switch knob in the floor position, and the blower motor switch knob in the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the HVAC housing floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

| Temperature Reference | | | | |
|---|---|---|---|---|
| Ambient Air Temperature | 15.5° C (60° F) | 21.1° C (70° F) | 26.6° C (80° F) | 32.2° C (90° F) |
| Minimum Air Temperature at Floor Outlet | 62.2° C (144° F) | 63.8° C (147° F) | 65.5° C (150° F) | 67.2° C (153° F) |

If the floor outlet air temperature is too low, refer to Cooling to check the engine coolant temperature specifications. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Cooling for the procedures.

An alternate method of checking heater performance is to use a DRBIII® scan tool to monitor the engine coolant temperature. The floor outlet air temperature reading should be no more than 4.5° C (40° F) lower than the engine coolant temperature reading.

OBSTRUCTED COOLANT FLOW Possible locations or causes of obstructed coolant flow:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

MECHANICAL PROBLEMS Possible locations or causes of insufficient heat:

- An obstructed cowl air intake.
- Obstructed heater system outlets.
- A faulty, obstructed or improperly installed blend door.
- A faulty blower system.
- A faulty a/c heater control.

### TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob on the a/c heater control panel, the following could require service:

- A faulty a/c heater control.
- A faulty blend door actuator.
- A faulty, obstructed or improperly installed blend door.
- An obstructed cowl air intake.
- The engine cooling system.

HEATING & AIR CONDITIONING (Continued)

| Heater Diagnosis | | |
|---|---|---|
| CONDITION | POSSIBLE CAUSE | CORRECTION |
| INSUFFICIENT HEATER OUTPUT. | 1. Incorrect engine coolant level. | 1. Check the engine coolant level. Refer to Cooling for the procedures. |
| | 2. Air trapped in engine cooling system. | 2. Check the operation of the coolant reserve/recovery system. Refer to Cooling for the procedures. |
| | 3. Incorrect engine coolant temperature. | 3. Check the performance and operation of the engine cooling system including: thermostat, water pump, fan drive, accessory drive belt, coolant flow (plugged radiator or heater core, plugged or kinked coolant hoses), air flow (missing or improperly installed radiator air seals or fan shroud). Refer to Cooling for the procedures. |
| | 4. Blend door actuator inoperative or defective. | 4. (Refer to Controls/Blend Door Actuator) in this group. |
| | 5. Blend door not operating properly. | 5. Check for a damaged, obstructed or improperly installed blend door or seals. (Refer to Controls/Blend Door Actuator) in this group. |
| | 6. Insufficient air flow through heater housing. | 6. Remove foreign material or obstructions from cowl air intake. |
| | 7. Improper blower motor operation. | 7. (Refer to Distribution/Blower Motor/ Diagnosis and Testing) in this group. |

## STANDARD PROCEDURE - DIODE REPLACEMENT

(1) Disconnect the battery.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 3).

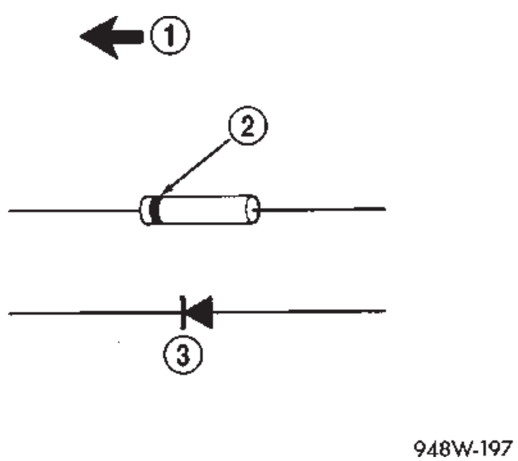

*Fig. 3 DIODE IDENTIFICATION*

1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

(4) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(5) Install the new diode in the harness, making sure current flow is correct. If necessary refer to the appropriate wiring diagram for current flow.

(6) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(7) Tape the diode to the harness using electrical tape making, sure the diode is completely sealed from the elements.

(8) Re-connect the battery, and test affected systems.

HEATING & AIR CONDITIONING (Continued)

## DIAGNOSIS AND TESTING - VACUUM SYSTEM

Vacuum control is used to operate the mode doors in the heater-only and HVAC housings. Testing of the heater-only and a/c heater mode control switch operation will determine if the vacuum, electrical, and mechanical controls are functioning. However, it is possible that a vacuum control system that operates perfectly at engine idle (high engine vacuum) may not function properly at high engine speeds or loads (low engine vacuum). This can be caused by leaks in the vacuum system, or by a faulty or improperly installed vacuum check valve.

A vacuum system test will help to identify the source of poor vacuum system performance or vacuum system leaks. Before starting this test, stop the engine and make certain that the problem is not a disconnected vacuum supply tube at the engine vacuum source or the vacuum reservoir.

Use an adjustable vacuum test set (Special Tool C-3707) and a suitable vacuum pump to test the HVAC vacuum control system. With a finger placed over the end of the vacuum test hose probe (Fig. 1), adjust the bleed valve on the test set gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

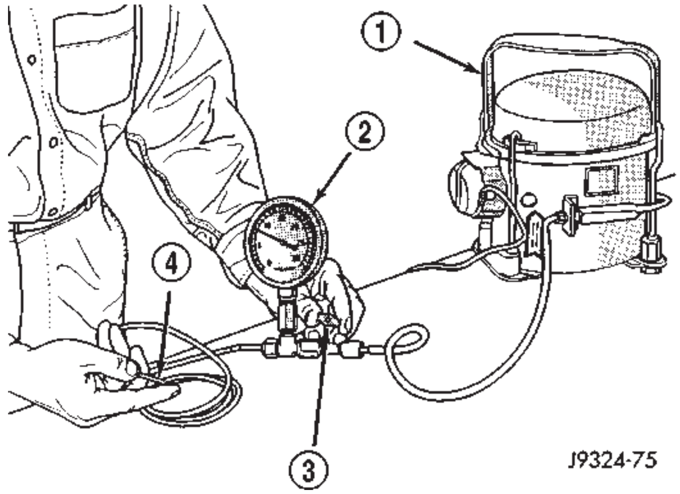

***Fig. 1 ADJUST VACUUM TEST BLEED VALVE***

1 - VACUUM PUMP TOOL C-4289
2 - VACUUM TEST SET C-3707
3 - BLEED VALVE
4 - PROBE

### VACUUM CHECK VALVE

(1) Remove the vacuum check valve. On gasoline engines, one valve is located in the vacuum supply tube (black) at the intake manifold tap on the right side of the engine. A second check valve is located next to the tee fitting in the vacuum supply tube (black) near the dash panel in the engine compartment. On diesel engines, the vacuum check valve is integral to the engine vacuum pump nipple and is threaded into the vacuum pump. The vacuum check valve must be removed in order to perform the following tests. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/VACUUM CHECK VALVE - REMOVAL)

(2) Connect the test set vacuum supply hose to the a/c heater control side of the valve. When connected to this side of the check valve, no vacuum should pass and the test set gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to step Step 3. If not OK, replace the faulty valve.

(3) Connect the test set vacuum supply hose to the engine vacuum side of the valve. When connected to this side of the check valve, vacuum should flow through the valve without restriction. If not OK, replace the faulty valve.

### A/C HEATER CONTROLS

(1) Connect the test set vacuum probe to the HVAC vacuum supply (black) tube in the engine compartment. Position the test set gauge so that it can be viewed from the passenger compartment.

(2) Place the a/c heater mode control switch knob to each mode position, one position at a time, and pause after each selection. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each selection is made. If not OK, a component or vacuum line in the vacuum circuit of the selected mode has a leak. See Locating Vacuum Leaks below.

**CAUTION: Do not use lubricant on the switch ports or in the holes in the plug, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector plug holes will help the connector slide onto the switch ports.**

CONTROLS (Continued)

## LOCATING VACUUM LEAKS

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect the vacuum harness connector located between the a/c heater control and the HVAC housing under the instrument panel.

(2) Connect the test set vacuum hose probe to each port in the HVAC housing half of the vacuum harness connector, one port at a time, and pause after each connection (Fig. 2). The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty a/c heater control. If not OK, go to step Step 3.

(3) Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, see the Vacuum Circuits chart (Fig. 3).

(4) Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components. Refer to Instrument Panel System for the procedures.

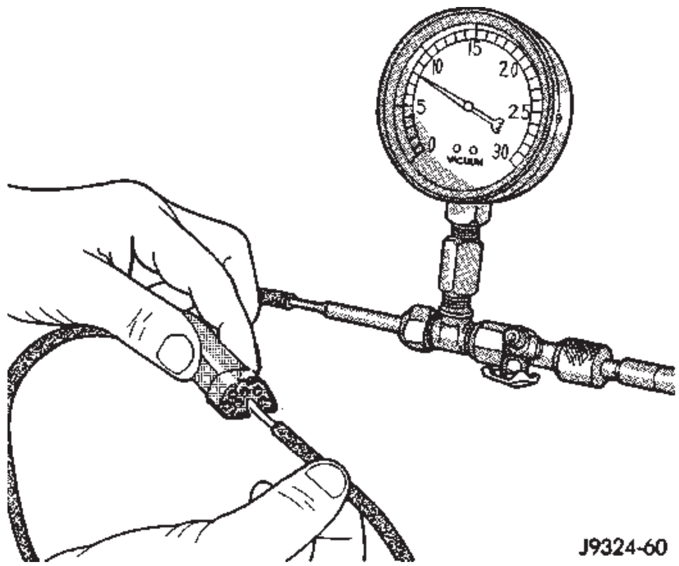

*Fig. 2 VACUUM CIRCUIT TEST*

(5) Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.

(6) To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end of the line. Run your fingers slowly along the line while watching the test set gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (0.125 inch) inside diameter rubber hose.

# A/C COMPRESSOR CLUTCH

## DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 4). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is mounted to the compressor shaft and secured with a nut.

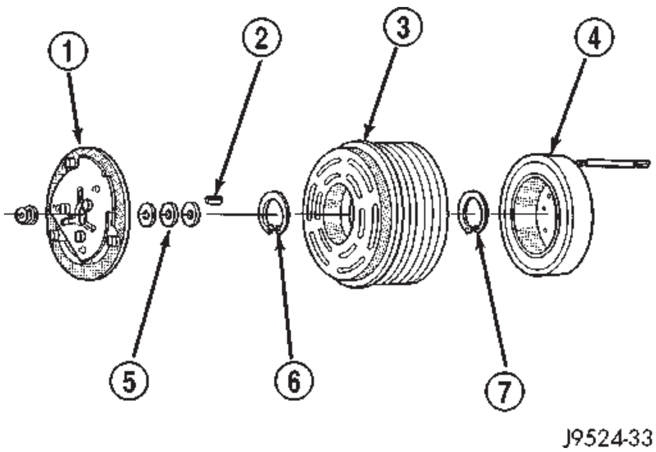

*Fig. 4 COMPRESSOR CLUTCH - TYPICAL*

1 - CLUTCH PLATE
2 - SHAFT KEY
3 - PULLEY
4 - COIL
5 - CLUTCH SHIMS
6 - SNAP RING
7 - SNAP RING

## OPERATION

The compressor clutch assembly provides the means to engage and disengage the compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the a/c heater mode control switch, the a/c low pressure switch, the a/c high pressure switch, the compressor clutch relay, and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds. Refer to Electronic Control Modules for more information on the PCM controls.

## DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). The battery must be fully-charged before performing the following tests. Refer to Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the a/c heater mode control switch in any A/C mode, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within 0.2 volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within 0.2 volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRB III® scan tool and (Refer to Appropriate Diagnostic Information) for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)
- A/C Heater mode control switch
- Compressor clutch relay
- A/C High Pressure Switch
- A/C Low Pressure Switch
- Powertrain Control Module (PCM).

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is 2.0 to 3.9 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

## STANDARD PROCEDURE - A/C COMPRESSOR CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C Heater control to the Recirculation Mode, the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

## REMOVAL

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) On models with the diesel engine option, remove the compressor from the engine. Do not remove the refrigerant lines or fittings. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL)

(3) Unplug the compressor clutch coil wire harness connector.

(4) Insert the two pins of the spanner wrench (Special Tool 6462 in Kit 6460) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 5).

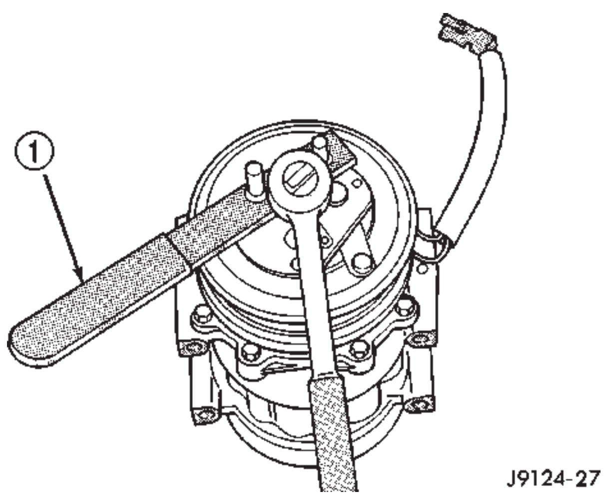

***Fig. 5 CLUTCH NUT REMOVE***

1 - FRONT PLATE SPANNER

(5) Remove the clutch plate and clutch shims. On models with the diesel engine option, a puller (Special Tool 6461 in Kit 6460) is used to remove the clutch plate (Fig. 6). This compressor also uses a shaft key, which must be removed.

(6) Remove the external front housing snap ring with snap ring pliers (Fig. 7).

(7) Install the lip of the rotor puller (Special Tool C-6141-1 in Kit 6460) into the snap ring groove exposed in Step 6, and install the shaft protector (Special Tool C-6141-2 in Kit 6460) (Fig. 8).

(8) Install the puller through-bolts (Special Tool C-6461) through the puller flange and into the jaws of the rotor puller and tighten (Fig. 9). Turn the puller center bolt clockwise until the rotor pulley is free.

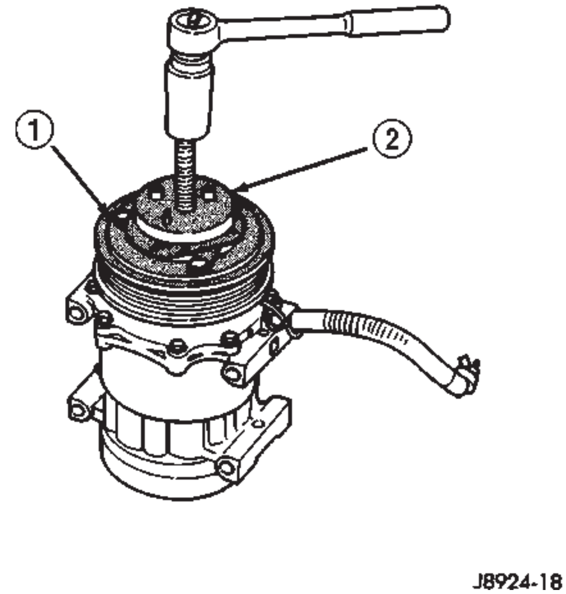

***Fig. 6 CLUTCH PULLER - DIESEL MODELS***

1 - FRONT PLATE
2 - PULLER

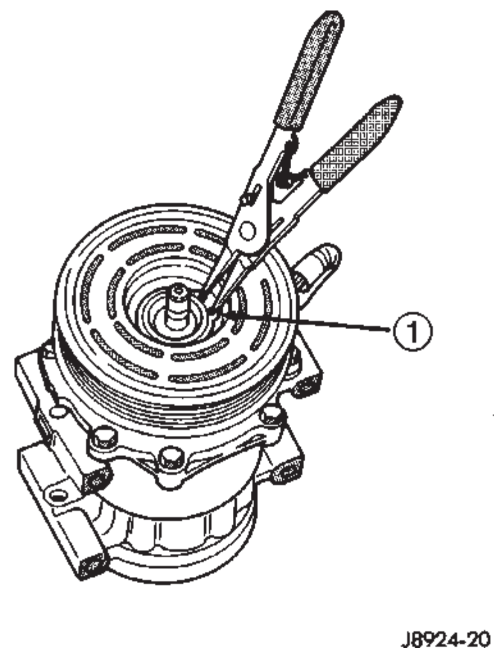

***Fig. 7 EXTERNAL SNAP RING REMOVE***

1 - EXTERNAL SNAP RING

(9) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing (Fig. 10).

(10) Remove the snap ring from the compressor hub and remove the clutch field coil (Fig. 11). Slide the clutch field coil off of the compressor hub.

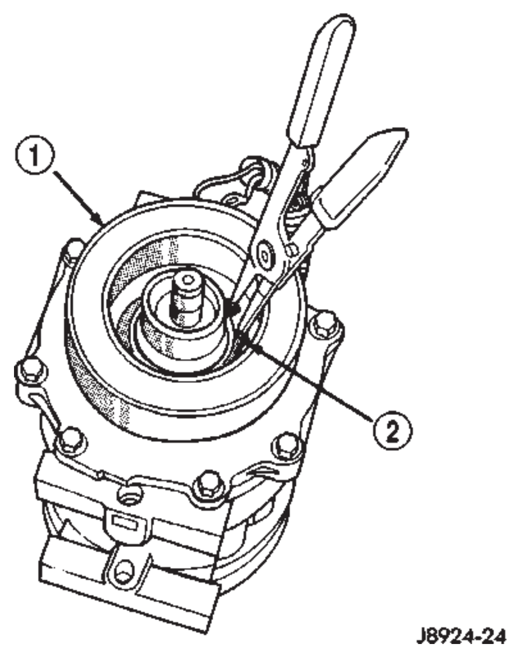

**Fig. 11 CLUTCH FIELD COIL SNAP RING REMOVE**

1 - FIELD COIL
2 - SNAP RING

A/C COMPRESSOR CLUTCH (Continued)

## INSPECTION

Examine the friction surfaces of the clutch pulley and the front plate for wear. The pulley and front plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for oil. Remove the felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

## INSTALLATION

(1) Install the clutch field coil and snap ring.

(2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.

(3) Align the rotor assembly squarely on the front compressor housing hub.

(4) Thread the handle (Special Tool 6464 in Kit 6460) into the driver (Special Tool 6143 in Kit 6460) (Fig. 12).

*Fig. 12 ROTOR INSTALLER SET*

(5) Place the driver tool assembly into the bearing cavity on the rotor. Make certain the outer edge of the tool rests firmly on the rotor bearing inner race (Fig. 13).

(6) Tap the end of the driver while guiding the rotor to prevent binding. Tap until the rotor bottoms against the compressor front housing hub. Listen for a distinct change of sound during the tapping process, to indicate the bottoming of the rotor.

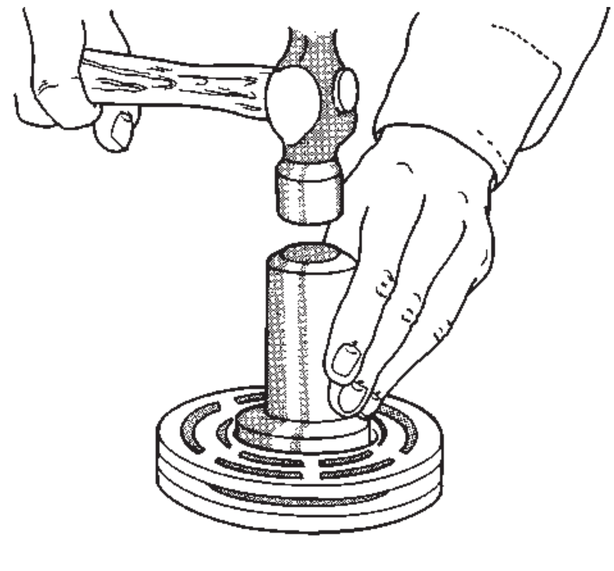

*Fig. 13 ROTOR INSTALL*

(7) Install the external front rotor snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

**CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.**

(8) Install the original clutch shims on the compressor shaft.

(9) Install the clutch plate. On models with the diesel engine option, install the shaft key. Use the shaft protector (Special Tool 6141-2 in Kit 6460) to install the clutch plate on the compressor shaft (Fig. 14). Tap the clutch plate over the compressor shaft until it has bottomed against the clutch shims. Listen for a distinct change of sound during the tapping process, to indicate the bottoming of the clutch plate.

(10) Install the compressor shaft hex nut. Tighten the nut to 14.4 N·m (10.5 ft. lbs.).

(11) Check the clutch air gap with a feeler gauge (Fig. 15). If the air gap does not meet the specification, add or subtract shims as required. The air gap specification is 0.41 to 0.79 millimeter (0.016 to 0.031 inch). If the air gap is not consistent around the circumference of the clutch, lightly pry up at the minimum variations. Lightly tap down at the points of maximum variation.

A/C COMPRESSOR CLUTCH (Continued)

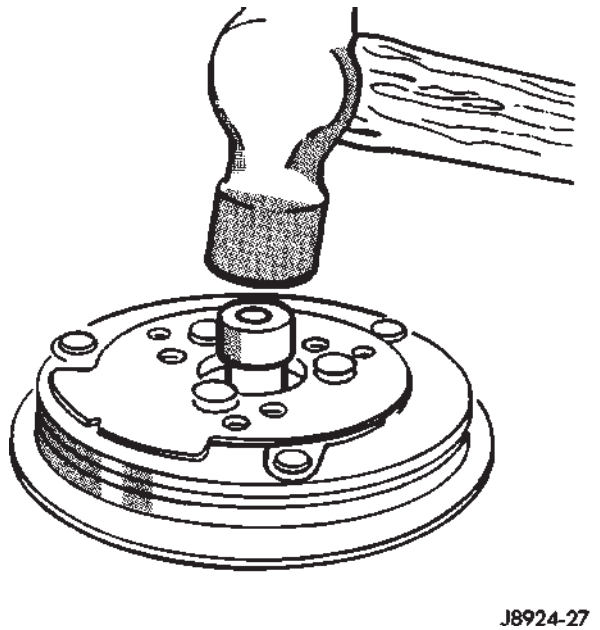

*Fig. 14 CLUTCH PLATE INSTALL*

**NOTE: The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch onto a compressor that previously did not have a clutch, use 1.0, 0.50, and 0.13 millimeter (0.040, 0.020, and 0.005 inch) shims from the clutch hardware package that is provided with the new clutch.**

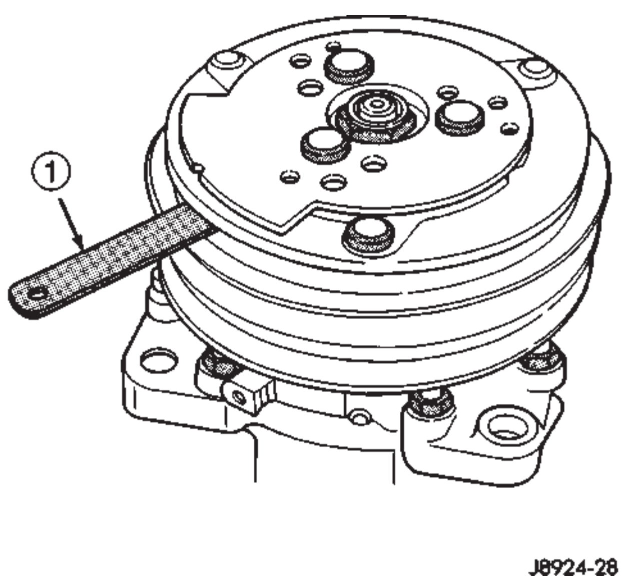

*Fig. 15 CHECK CLUTCH AIR GAP*

1 - FEELER GAUGE

(12) On models with the diesel engine option, install the compressor on the engine. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION)

(13) Connect the battery negative cable.

# A/C COMPRESSOR CLUTCH RELAY

## DESCRIPTION

The a/c compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

## OPERATION

The compressor clutch relay is a electromechanical device that switches battery current to the compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the a/c heater control, the a/c low pressure switch, and the a/c high pressure switch.

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH RELAY

### RELAY TEST

The compressor clutch relay (Fig. 16) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see the Relay Circuit Test below. If not OK, replace the faulty relay.

### RELAY CIRCUIT TEST

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

A/C COMPRESSOR CLUTCH RELAY (Continued)

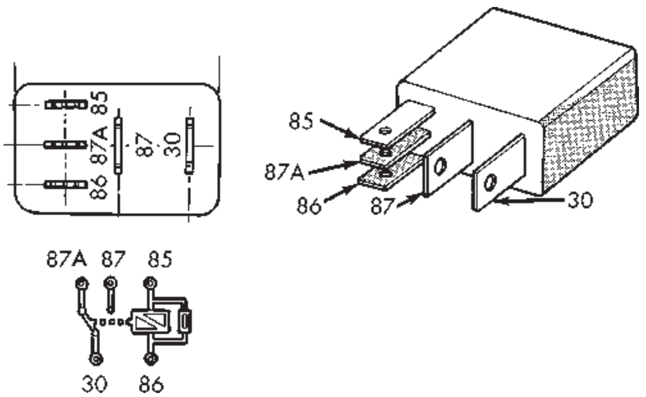

*Fig. 16 COMPRESSOR CLUTCH RELAY*

TERMINAL LEGEND

| NUMBER | IDENTIFICATION |
|---|---|
| 30 | COMMON FEED |
| 85 | COIL GROUND |
| 86 | COIL BATTERY |
| 87 | NORMALLY OPEN |
| 87A | NORMALLY CLOSED |

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C (gray) at all times. If not OK, repair the open circuit as required.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 17).

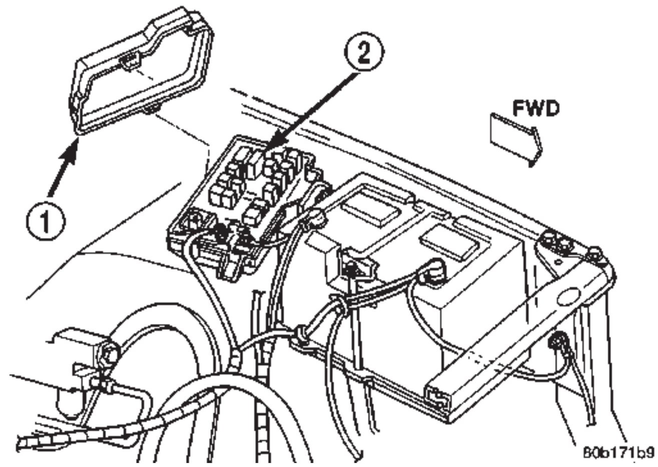

*Fig. 17 POWER DISTRIBUTION CENTER*

1 - COVER
2 - POWER DISTRIBUTION CENTER

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC.

## INSTALLATION

(1) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

# A/C HEATER CONTROL

## DESCRIPTION

Both the heater-only and a/c heater systems use a combination of electrical and vacuum controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. Refer to the owner's manual in the vehicle glove box for more information on the features, use, and suggested operation of these controls.

## OPERATION

The heater-only or a/c heater control panel is located to the right of the instrument cluster on the instrument panel. The control panel contains a rotary-type temperature control knob, a rotary-type mode control switch knob, and a rotary-type blower motor speed switch knob. On models with the optional heated mirror system, a momentary push button switch and indicator lamp are located near the bot-

A/C HEATER CONTROL (Continued)

tom of the a/c heater control panel. Refer to Heated Mirrors for more information on this feature.

The heater-only or a/c heater control panel cannot be repaired. If faulty or damaged, the entire unit must be replaced. The control knobs and the illumination lamps are available for service replacement.

## DIAGNOSIS AND TESTING - A/C HEATER CONTROL

Satisfactory heater and air conditioner performance depends upon proper operation and adjustment of all operating controls and refrigeration system components. For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). These inspections, tests, and adjustments should be used to locate the cause of a malfunction.

Operation must be tested as described in the following sequence:

(1) Inspect and adjust the serpentine drive belt. Refer to Cooling for the procedures.

(2) Start the engine and hold the idle speed at 1,300 rpm.

(3) On vehicles with air conditioning, turn the temperature control knob to the extreme counterclockwise (Cool) position, and set the mode control switch knob to the Bi-Level (A/C) position. The outside (recirculation) air door should be open to outside air. If not OK, (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - DIAGNOSIS AND TESTING - VACUUM SYSTEM).

(4) Open the vehicle windows. Test the blower motor operation in all speeds. If not OK, (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - DIAGNOSIS AND TESTING).

(5) On vehicles with air conditioning, the compressor should be running and the air conditioning system in operation unless the ambient air temperature is below about -1° C (30° F). If not OK, (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE).

(6) Check the mode control switch operation. The heater and air conditioner systems should respond as described in the owner's manual in the vehicle glove box to each mode selected. Reduce the engine speed to normal idle. The vacuum will be high at low idle and the vacuum actuators should respond quickly. If not OK, (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - DIAGNOSIS AND TESTING - VACUUM SYSTEM).

(7) If the vacuum tests, and the electrical component and circuit tests reveal no problems, disassemble the HVAC housing to inspect for mechanical misalignment or binding of the mode doors. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the instrument panel near the driver side of the floor panel transmission tunnel and unplug the a/c heater control to HVAC housing vacuum harness connector.

(3) While still reaching under the instrument panel, disengage the retainer on the a/c heater control half of the vacuum harness from the hole in the center distribution duct (Fig. 18).

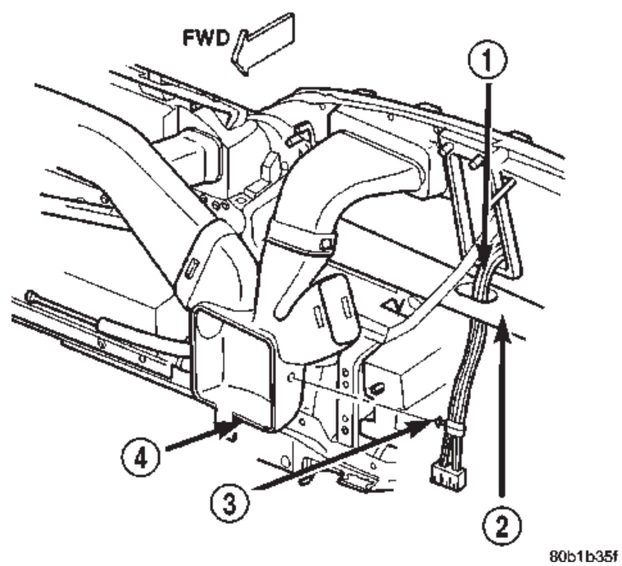

*Fig. 18 A/C HEATER CONTROL VACUUM HARNESS ROUTING*

1 - A/C HEATER CONTROL VACUUM HARNESS
2 - REINFORCEMENT
3 - RETAINER
4 - CENTER DISTRIBUTION DUCT

(4) Remove the cluster bezel from the instrument panel. Refer to Instrument Panel System for the procedures.

A/C HEATER CONTROL (Continued)

(5) Remove the four screws that secure the a/c heater control to the instrument panel (Fig. 19).

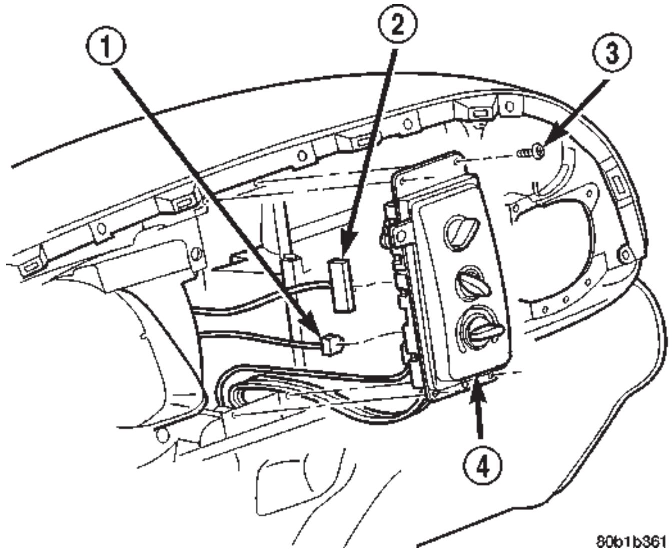

*Fig. 19 A/C HEATER CONTROL REMOVE/INSTALL*

1 - HEATED MIRROR WIRE HARNESS CONNECTOR
2 - WIRE HARNESS CONNECTOR
3 - SCREW
4 - HEATER-A/C CONTROL

(6) Pull the a/c heater control assembly away from the instrument panel far enough to access the connections on the back of the control.

(7) Unplug the wire harness connector from the back of the a/c heater control.

(8) On vehicles with heated mirrors, unplug the heated mirror wire harness connector from the back of the a/c heater control.

(9) Remove the a/c heater control from the instrument panel.

## INSTALLATION

(1) Plug the wire harness connector(s) into the receptacle(s) on the back of the a/c heater control.

(2) Route the HVAC vacuum harness through the hole in the reinforcement below the a/c heater control opening of the instrument panel.

(3) Position the a/c heater control in the instrument panel and secure it with four screws. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) Reinstall the cluster bezel to the instrument panel. Refer to Instrument Panel System for the procedures.

(5) Reach under the instrument panel to reinstall the a/c heater control vacuum harness retainer to the side of the center distribution duct.

(6) Plug in the two halves of the a/c heater control to HVAC housing vacuum harness connector.

(7) Connect the battery negative cable.

# A/C HIGH PRESSURE SWITCH

## DESCRIPTION

The a/c high pressure switch is located on the discharge line near the compressor. The switch is screwed onto a fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The discharge line fitting is equipped with an O-ring to seal the switch connection.

## OPERATION

The a/c high pressure switch is connected in series electrically with the a/c low pressure switch between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This prevents compressor operation when the discharge line pressure approaches high levels.

The a/c high pressure switch contacts are open when the discharge line pressure rises above about 3100 to 3375 kPa (450 to 490 psi). The switch contacts will close when the discharge line pressure drops to about 1860 to 2275 kPa (270 to 330 psi). When checking refrigerant system pressures with a manifold gauge set, keep in mind that the indicated pressures will be about 172 kpa (25 psi) below the actual switch pressure values due to the pressure drop that occurs in the refrigerant system between the switch and the high pressure service port.

The a/c high pressure switch is a factory-calibrated unit. The switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING - A/C HIGH PRESSURE SWITCH

Before performing diagnosis of the a/c high pressure switch, verify that the refrigerant system has the correct refrigerant charge. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING)

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the a/c high pressure switch wire harness connector from the switch on the refrigerant system fitting.

(3) On the four terminal high pressure switch, check for continuity between terminals C and D. On the two terminal switch, check for continuity between both terminals of the a/c high pressure switch. There should be continuity. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

A/C HIGH PRESSURE SWITCH (Continued)

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the a/c high pressure switch, which is mounted to a fitting on the discharge line between the compressor and the condenser inlet.

(3) Unscrew the a/c high pressure switch from the discharge line fitting.

(4) Remove the a/c high pressure switch from the vehicle.

(5) Remove the O-ring seal from the discharge line fitting and discard.

### INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

(2) Install and tighten the high pressure cut-off switch on the discharge line fitting. The switch should be hand-tightened onto the discharge line fitting.

(3) Plug the wire harness connector into the high pressure cut-off switch.

(4) Connect the battery negative cable.

## A/C LOW PRESSURE SWITCH

### DESCRIPTION

The a/c low pressure switch is located on the top of the accumulator. The switch is screwed onto an accumulator fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The accumulator fitting is equipped with an O-ring to seal the switch connection.

### OPERATION

The a/c low pressure switch is connected in series electrically with the a/c high pressure switch and the a/c heater control, between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This regulates the refrigerant system pressure and controls evaporator temperature. Controlling evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing air conditioning system air flow.

The a/c low pressure switch contacts are open when the suction pressure is about 152-165 kPa (22-24 psi) or lower. The switch contacts will close when the suction pressure rises to about 255-296 kPa (37-43 psi) or above. Lower ambient temperatures, below about -1° C (30° F), will also cause the switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The a/c low pressure switch is a factory-calibrated unit. It cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

### DIAGNOSIS AND TESTING - A/C LOW PRESSURE SWITCH

Before performing diagnosis of the a/c low pressure switch, be certain that the switch is properly installed on the accumulator fitting. If the switch is too loose it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure. Also verify that the refrigerant system has the correct refrigerant charge. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

Remember that lower ambient temperatures, below about -1° C (30° F), during cold weather will open the switch contacts and prevent compressor operation due to the pressure/temperature relationship of the refrigerant. For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the a/c low pressure switch wire harness connector from the switch on the accumulator fitting.

(3) Install a jumper wire between the two cavities of the a/c low pressure switch wire harness connector.

(4) Connect a manifold gauge set to the refrigerant system service ports. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT)

(5) Connect the battery negative cable.

(6) Place the a/c heater mode control switch knob in any A/C position and start the engine.

(7) Check for continuity between the two terminals of the low pressure cycling clutch switch. There should be continuity with a suction pressure reading of 296 kPa (43 psi) or above, and no continuity with a suction pressure reading of 172 kPa (25 psi) or below. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

A/C LOW PRESSURE SWITCH (Continued)

(2) Unplug the wire harness connector from the a/c low pressure switch on the top of the accumulator (Fig. 20).

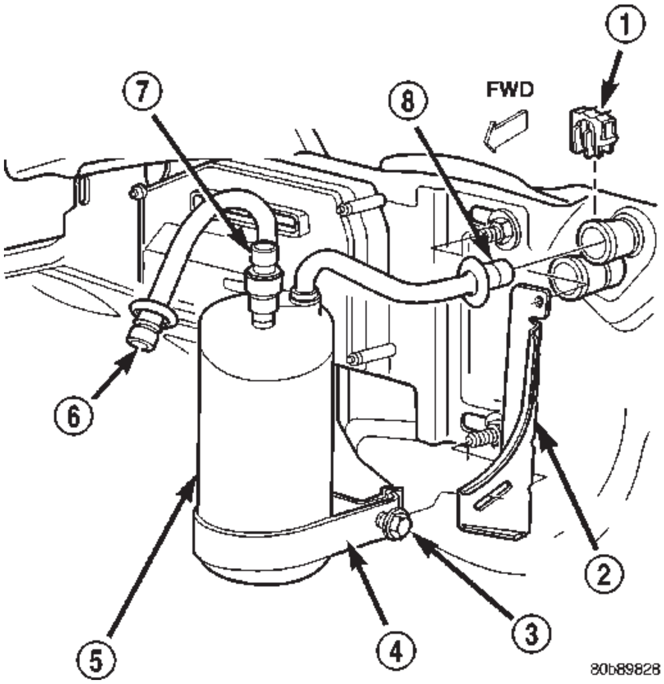

*Fig. 20 ACCUMULATOR AND A/C LOW PRESSURE SWITCH*

1 - CLIP
2 - BRACKET
3 - SCREW
4 - BAND
5 - ACCUMULATOR
6 - TO SUCTION LINE
7 - A/C LOW PRESSURE SWITCH
8 - FROM EVAPORATOR OUTLET

(3) Unscrew the a/c low pressure switch from the fitting on the top of the accumulator.

(4) Remove the O-ring seal from the accumulator fitting and discard.

## INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the accumulator fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

(2) Install and tighten the a/c low pressure switch on the accumulator fitting. The switch should be hand-tightened onto the accumulator fitting.

(3) Plug the wire harness connector into the a/c low pressure switch.

(4) Connect the battery negative cable.

# BLOWER MOTOR RELAY

## DESCRIPTION

The blower motor relay is an International Standards Organization (ISO)-type relay. The relay is an electromechanical device that switches battery current from a fuse in the Power Distribution Center (PDC) directly to the blower motor. The relay is energized when the relay coil is provided a voltage signal by the ignition switch. This arrangement reduces the amount of battery current that must flow through the ignition switch.

## OPERATION

The blower motor relay control circuit is protected by a fuse located in the junction block. When the relay is de-energized, the blower motor receives no battery current.

The blower motor relay is located in the PDC in the engine compartment. Refer to the PDC label for blower motor relay identification and location.

The blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING - BLOWER MOTOR RELAY

### RELAY TEST

The blower motor relay (Fig. 21) is located in the Power Distribution Center (PDC). Remove the blower motor relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test below. If not OK, replace the faulty relay.

### RELAY CIRCUIT TEST

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) The relay common feed terminal cavity (30) is connected to fused battery feed directly from a fuse in the Power Distribution Center (PDC), and should be hot at all times. Check for battery voltage at the PDC cavity for relay terminal 30. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

BLOWER MOTOR RELAY (Continued)

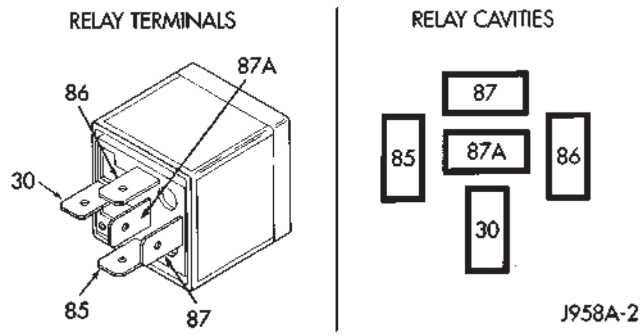

*Fig. 21 BLOWER MOTOR RELAY*

TERMINAL LEGEND

| NUMBER | IDENTIFICATION |
|---|---|
| 30 | COMMON FEED |
| 85 | COIL GROUND |
| 86 | COIL BATTERY |
| 87 | NORMALLY OPEN |
| 87A | NORMALLY CLOSED |

(2) The relay normally closed terminal cavity (87A) is not used for this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the blower motor. When the relay is energized, terminal 87 is connected to terminal 30 and provides full battery current to the blower motor feed circuit. There should be continuity between the PDC cavity for terminal 87 and the blower motor relay output circuit cavity of the blower motor wire harness connector at all times. If OK, go to Step 4. If not OK, repair the open circuit to the blower motor as required.

(4) The coil battery terminal cavity (86) is connected to the ignition switch. When the ignition switch is placed in the On position, fused ignition switch output is directed from a fuse in the junction block to the relay electromagnetic coil to energize the relay. There should be battery voltage at the PDC cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the junction block fuse as required.

(5) The coil ground terminal cavity (85) is connected to ground. This terminal supplies the ground for the relay electromagnetic coil. There should be continuity between the PDC cavity for relay terminal 85 and a good ground at all times. If not OK, repair the open circuit as required.

### REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 22).

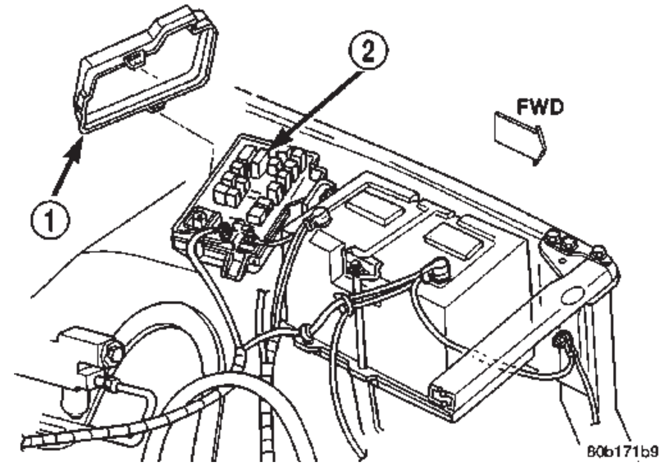

*Fig. 22 POWER DISTRIBUTION CENTER*

1 - COVER
2 - POWER DISTRIBUTION CENTER

(3) Refer to the label on the PDC for blower motor relay identification and location.

(4) Unplug the blower motor relay from the PDC.

### INSTALLATION

(1) Install the blower motor relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

## BLOWER MOTOR RESISTOR BLOCK

### DESCRIPTION

The blower motor resistor is mounted to the bottom of the HVAC housing, under the instrument panel and just inboard of the blower motor. It can be accessed without removing any other components.

### OPERATION

The resistor has multiple resistor wires, each of which will change the resistance in the blower motor ground path to change the blower motor speed. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected blower motor speed.

BLOWER MOTOR RESISTOR BLOCK (Continued)

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR BLOCK

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the passenger side end of the HVAC housing and unplug the wire harness connector from the blower motor resistor.

(3) Remove the screws that secure the blower motor resistor to the HVAC housing.

(4) Remove the blower motor resistor from the HVAC housing (Fig. 23).

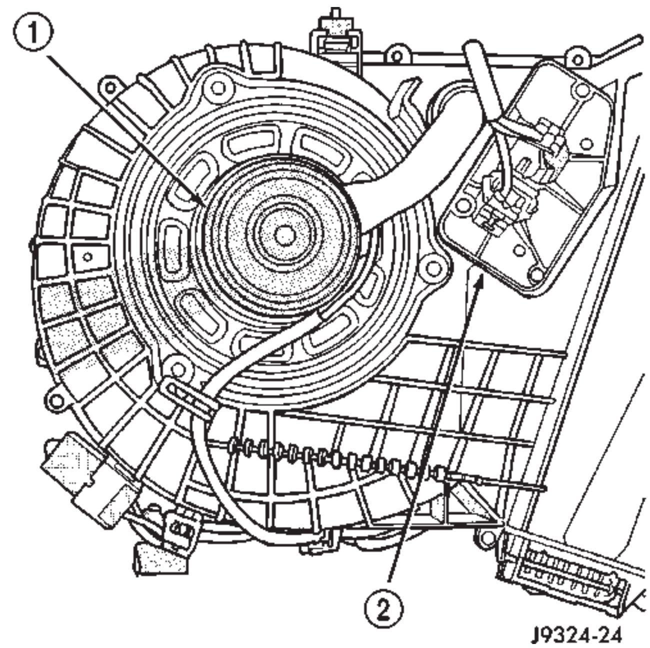

*Fig. 23 BLOWER MOTOR/RESISTOR*

1 - BLOWER MOTOR
2 - BLOWER MOTOR RESISTOR

## INSTALLATION

(1) Install the blower motor resistor into the HVAC housing and secure it with the mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug the wire harness connector into the blower motor resistor.

(3) Connect the battery negative cable.

# BLOWER MOTOR SWITCH

## DESCRIPTION

The heater-only or a/c heater blower motor is controlled by a four position rotary-type blower motor switch, mounted in the HVAC control panel. The switch allows the selection of one of four blower

BLOWER MOTOR SWITCH (Continued)

motor speeds, but can only be turned off by selecting the Off position with the heater-only or a/c heater control switch knob.

## OPERATION

The blower motor switch directs the blower motor ground path through the mode control switch to the blower motor resistor, or directly to ground, as required to achieve the selected blower motor speed.

The blower motor switch cannot be repaired and, if faulty or damaged, the entire heater-only or a/c heater control unit must be replaced. The blower motor switch knob is serviced separately.

## DIAGNOSIS AND TESTING - BLOWER MOTOR SWITCH

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the a/c heater control from the instrument panel. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL) Check for continuity between the ground circuit cavity of the a/c heater control wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) With the a/c heater control wire harness connector unplugged, place the a/c heater mode control switch knob in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the a/c heater control as you move the blower motor switch knob to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the a/c heater control connector and the blower motor resistor as required. If not OK, replace the faulty a/c heater control unit.

## REMOVAL

The blower motor switch cannot be repaired and, if faulty or damaged, the entire heater-only or a/c heater control unit must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL) The blower motor switch knob is serviced separately.

# BLEND DOOR ACTUATOR

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Turn the ignition switch to the run position.

(2) Locate the temperature control knob in the mid (12 o'clock) position.

(3) Turn the ignition switch to the off position.

(4) Disconnect and isolate the battery negative cable.

(5) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.

(6) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(7) Unplug the wire harness connector from the blend door actuator (Fig. 24).

(8) Remove the two mounting screws which secure the actuator to the housing.

(9) Slide the blend door actuator off the blend door shaft.

**NOTE: A black plastic coupler may be attached to the blend door shaft. Remove the coupler and inspect for damage. Reinstall if there is no damage found.**

BLEND DOOR ACTUATOR (Continued)

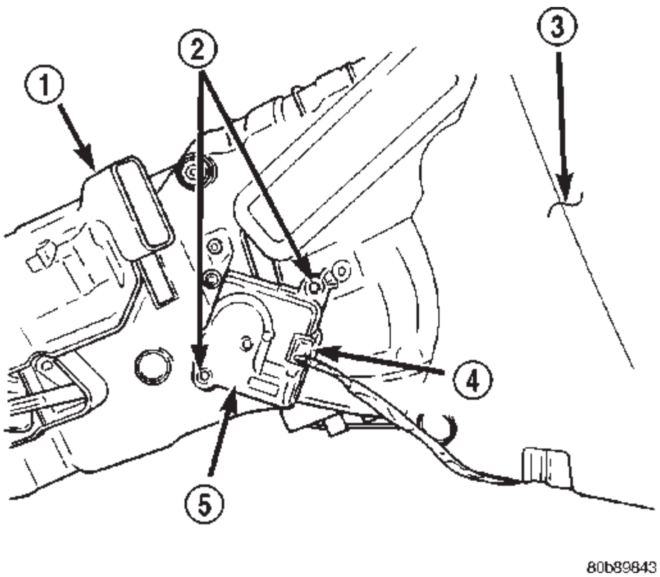

*Fig. 24 BLEND DOOR ACTUATOR REMOVE/ INSTALL*

1 - DUCT
2 - MOUNTING SCREWS
3 - UNIT HOUSING
4 - HARNESS AND CONNECTOR
5 - BLEND DOOR ACTUATOR

## INSTALLATION

**NOTE: Before installing the blend door actuator, be certain that the blend door is not binding and is capable of full travel in both directions.**

(1) Align the actuator with the blend door shaft and rotate the actuator to align it to the mounting bosses on the HVAC housing.

(2) Align and install the actuator screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Plug in the wire harness connector to the blend door actuator.

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

(5) Install the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

(6) Make sure the Temperature Control Knob is in the mid (12 o'clock) position to allow the actuator to automatically position itself in the mid position and come to a complete stop when powered up.

(7) Connect the battery negative cable.

# MODE DOOR ACTUATOR

## REMOVAL - HEAT/DEFROST DOOR ACTUATOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the HVAC housing from the vehicle and place it on a work bench. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(3) Unplug the two vacuum harness connectors from the heat/defrost door actuator (Fig. 25).

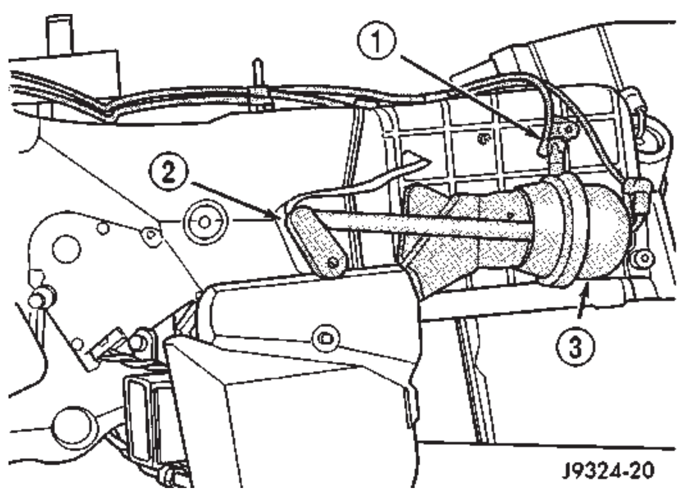

*Fig. 25 HEAT/DEFROST DOOR ACTUATOR*

1 - VACUUM LINE
2 - DOOR PIVOT CONNECTION
3 - HEAT/DEFROST DOOR ACTUATOR

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the heat/defrost door crank arm off the heat/defrost door pivot.

(5) Remove the two screws that secure the heat/defrost door actuator to the HVAC housing.

(6) Remove the heat/defrost door actuator from the HVAC housing.

MODE DOOR ACTUATOR (Continued)

## REMOVAL - PANEL/DEFROST DOOR ACTUATOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.
(2) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel System for the procedures.
(3) Unplug the vacuum harness connector from the panel/defrost door actuator (Fig. 26).

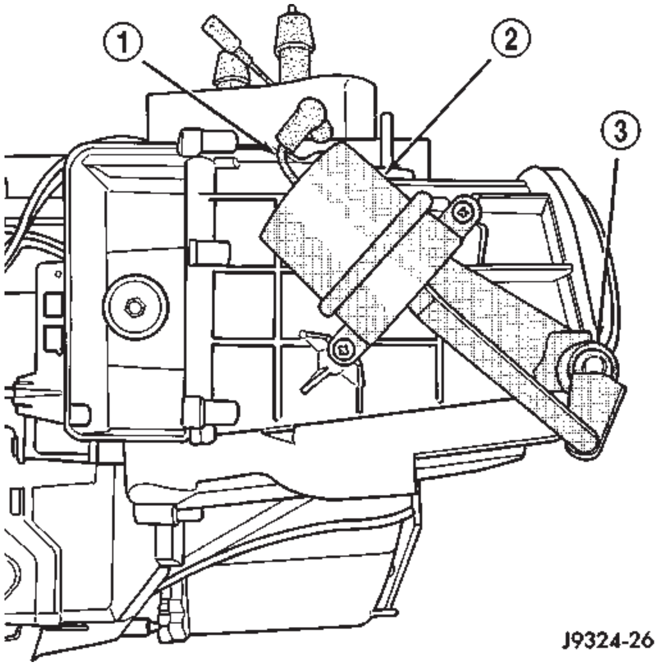

*Fig. 26 PANEL/DEFROST DOOR ACTUATOR*

1 - VACUUM LINE
2 - PANEL/DEFROST ACTUATOR
3 - SHAFT RETAINER

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel/defrost door crank arm off the panel/defrost door pivot.
(5) Remove the two screws that secure the panel/defrost door actuator to the HVAC housing.
(6) Remove the panel/defrost door actuator from the HVAC housing.

## INSTALLATION - HEAT/DEFROST DOOR ACTUATOR

**NOTE: Before installing the heat/defrost door actuator, be certain that the heat/defrost door is not binding.**

(1) Install the heat/defrost door actuator from the HVAC housing. Tighten the actuator mounting screws to 2.2 N·m (20 in. lbs.).
(2) Carefully snap the heat/defrost door crank arm on the heat/defrost door pivot.
(3) Plug in the two vacuum harness connectors to the heat/defrost door actuator.
(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)
(5) Connect the battery negative cable.

## INSTALLATION - PANEL/DEFROST DOOR ACTUATOR

**NOTE: Before installing the panel/defrost door actuator, be certain that the panel/defrost door is not binding.**

(1) Install the panel/defrost door actuator on the HVAC housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).
(2) Carefully snap the panel/defrost door crank arm on the panel/defrost door pivot.
(3) Plug the vacuum harness connector to the panel/defrost door actuator.
(4) Install the instrument panel assembly in the vehicle. Refer to Instrument Panel System for the procedures.
(5) Connect the battery negative cable.

# RECIRCULATION DOOR ACTUATOR

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

RECIRCULATION DOOR ACTUATOR (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel. Refer to Glove Box in Instrument Panel System for the procedures.

(3) Reach through the glove box opening to access and unplug the vacuum harness connector from the recirculation door actuator (Fig. 27).

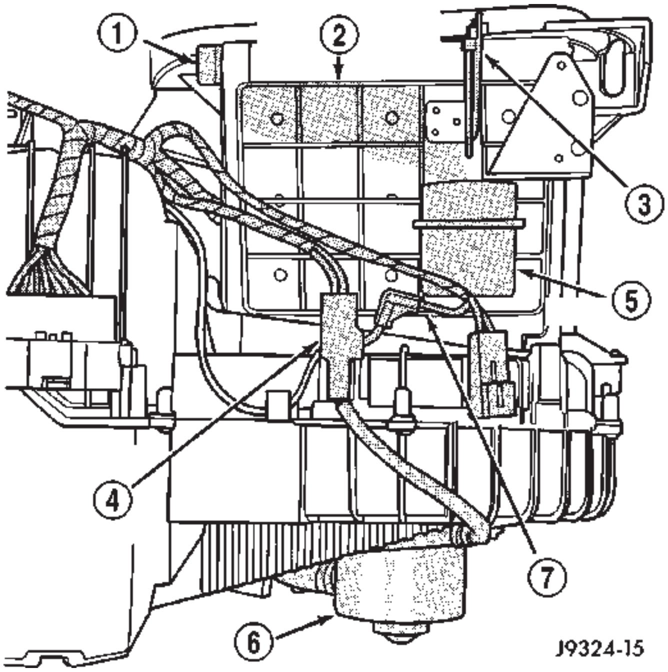

***Fig. 27 RECIRCULATION DOOR ACTUATOR***

1 - DOOR SHAFT RETAINER
2 - RECIRCULATION DOOR
3 - ROD CLIP
4 - BLOWER MOTOR ELECTRICAL CONNECTOR
5 - RECIRCULATION DOOR ACTUATOR
6 - BLOWER MOTOR
7 - VACUUM LINE

(4) Loosen the two nuts that secure the recirculation door actuator to the mounting bracket on the HVAC housing.

(5) Slide the two actuator mounting studs out of the slots in the actuator mounting bracket.

(6) Pull the recirculation door actuator downward far enough to access the clip that retains the actuator link to the recirculation door lever.

(7) Unsnap the clip from the recirculation door actuator link and disengage the link from the recirculation door lever.

(8) Remove the recirculation door actuator from the HVAC housing.

### INSTALLATION

**NOTE: When reinstalling the recirculation door actuator, insert a screwdriver or another suitable tool through the recirculation air intake grille to prop the recirculation air door up in the open position far enough to access the recirculation air door lever through the instrument panel glove box opening.**

**NOTE: Before installing the blend door actuator, be certain that the blend door is not binding.**

(1) Snap the clip on the recirculation door actuator link to engage the link to the recirculation door lever.

(2) Slide the two actuator mounting studs into the slots in the actuator mounting bracket.

(3) Install the two nuts that secure the recirculation door actuator to the mounting bracket on the HVAC housing. Tighten the mounting nuts until the recirculation air door actuator is seated to the mounting bracket.

(4) Plug in the vacuum harness connector to the recirculation door actuator.

(5) Install the glove box in the instrument panel. Refer to Glove Box in Instrument Panel System for the procedures.

(6) Connect the battery negative cable.

## VACUUM CHECK VALVE

### DESCRIPTION

On models with a gasoline engine, a vacuum check valve is installed in the accessory vacuum supply line near the vacuum tap on the right side of the engine intake manifold. On models with a diesel engine, a vacuum check valve is installed on the engine vacuum pump. The vacuum check valve is designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits.

### OPERATION

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected HVAC mode and vehicle speed control settings. On gasoline engine models, it prevents the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation. On diesel engine models, it prevents oil from contaminating the vacuum supply system by maintaining vacuum in the pump after the engine is shut-off.

On gasoline engine models, a second vacuum check valve is installed in the accessory vacuum supply line at the tee fitting near the dash panel in the engine

VACUUM CHECK VALVE (Continued)

compartment. This check valve also helps to maintain the system vacuum needed to retain the selected HVAC mode settings, but isolates the HVAC vacuum circuit from the vehicle speed control vacuum circuit. It prevents the vehicle speed control servo from bleeding down the HVAC system vacuum during extended heavy engine load operation.

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

(1) On models with a gasoline engine, unplug the vacuum supply line connector at the vacuum check valve (Fig. 28). On models with a diesel engine, remove the clamp from the vacuum supply line connector and unplug the connector from the vacuum check valve (Fig. 29).

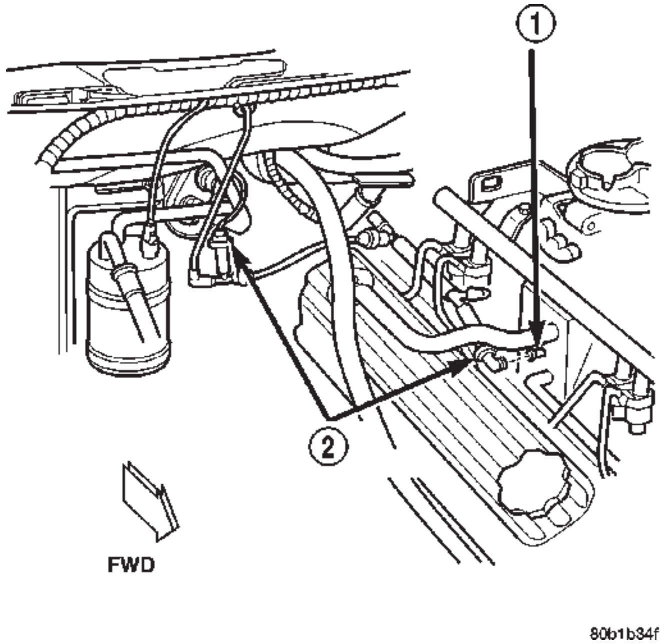

***Fig. 28 VACUUM CHECK VALVES - GASOLINE ENGINE***

1 - INTAKE MANIFOLD VACUUM TAP
2 - VACUUM CHECK VALVES

(2) On models with a gasoline engine, note the orientation of the check valve in the vacuum supply line for correct reinstallation.

(3) On models with a gasoline engine, unplug the remaining line on the vacuum check valve from the vacuum supply line fitting. On models with a diesel engine, unscrew the check valve and nipple unit from the engine vacuum pump.

### INSTALLATION

(1) On models with a gasoline engine, plug in the vacuum check valve to the vacuum line fittings, not-

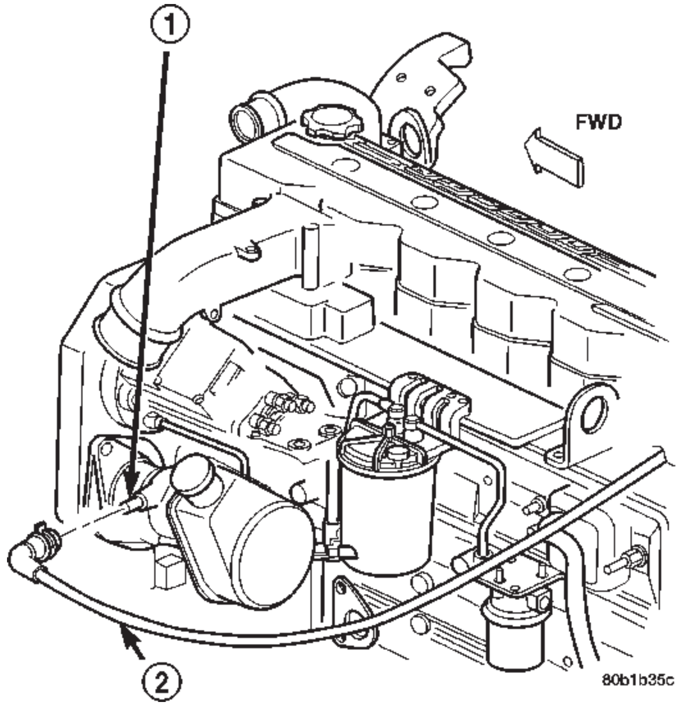

***Fig. 29 VACUUM CHECK VALVE - DIESEL ENGINE***

1 - VACUUM CHECK VALVE
2 - VACUUM SUPPLY LINE

ing the proper orientation of the check valve in the line. On models with a diesel engine, screw the check valve and nipple unit into the engine vacuum pump. Tighten the check valve and nipple unit to 24 N·m (18 ft. lbs.).

(2) On models with a diesel engine, plug in the connector to the vacuum check valve and install the clamp from the vacuum supply line connector.

## VACUUM RESERVOIR

### DESCRIPTION

Models equipped with a gasoline engine have a vacuum reservoir. The vacuum reservoir is mounted in the passenger side cowl plenum area, under the cowl plenum cover/grille panel. The cowl plenum cover/grille panel must be removed from the vehicle to access the vacuum reservoir for service.

### OPERATION

Engine vacuum is stored in the vacuum reservoir. The stored vacuum is used to operate the vacuum-controlled vehicle accessories during periods of low engine vacuum such as when the vehicle is climbing a steep grade, or under other high engine load operating conditions.

The vacuum reservoir cannot be repaired and, if faulty or damaged, it must be replaced.

VACUUM RESERVOIR (Continued)

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the wiper arms from the wiper pivots. Refer to Wipers/Washers for the procedures.

(3) Remove the weatherstrip along the front edge of the cowl plenum cover/grille panel and the cowl plenum panel (Fig. 30).

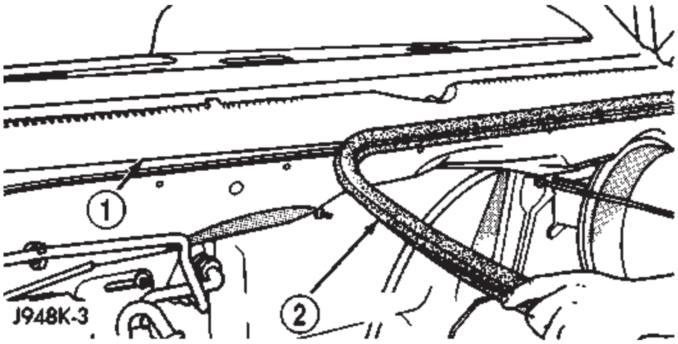

*Fig. 30 COWL PLENUM COVER/GRILLE PANEL WEATHERSTRIP*

1 - COWL GRILLE
2 - WEATHERSTRIP

(4) Remove the plastic screws that secure the cowl plenum cover/grille panel to the studs on the cowl top panel near the base of the windshield (Fig. 31).

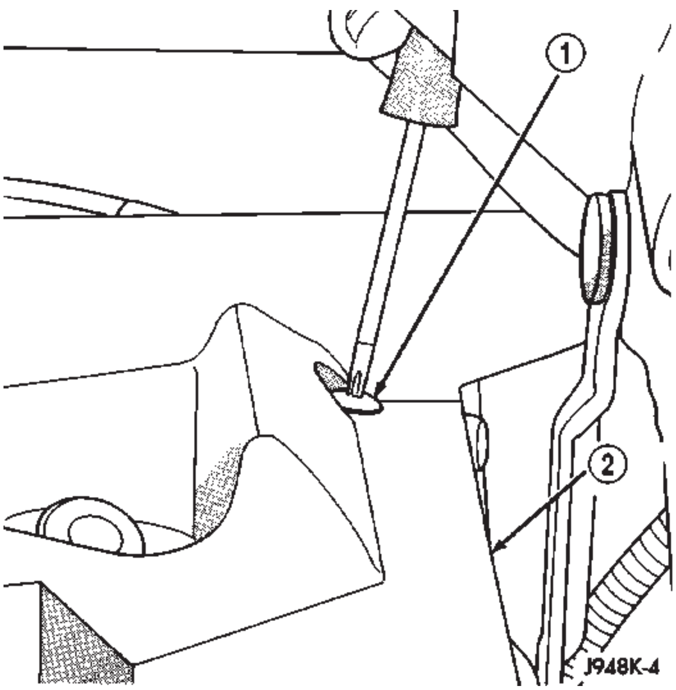

*Fig. 31 COWL PLENUM PLASTIC SCREWS REMOVAL*

1 - PLASTIC SCREW ANCHOR
2 - COWL GRILLE

(5) Lift the cowl plenum cover/grille panel from the cowl top far enough to access the vacuum reservoir near the right end of the cowl plenum.

(6) Disconnect the vacuum supply hose from the vacuum reservoir, which is secured to the dash panel near the right end of the cowl plenum (Fig. 32).

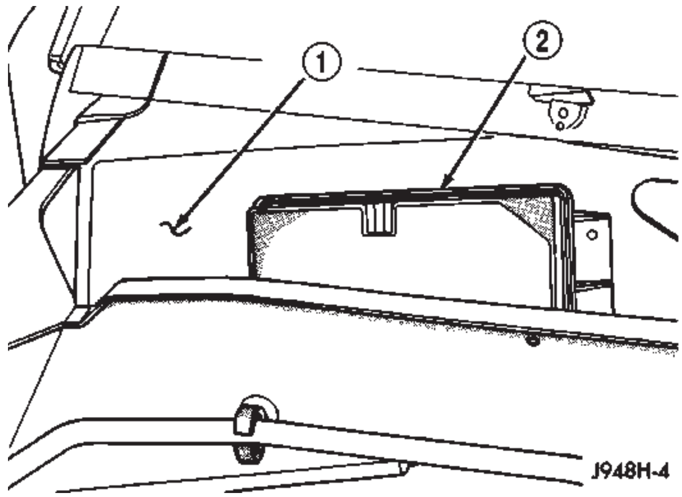

*Fig. 32 VACUUM RESERVOIR REMOVE/INSTALL*

1 - COWL PLENUM
2 - VACUUM RESERVOIR

(7) Remove the two nuts that secure the reservoir to the studs on the dash panel near the right end of the cowl plenum.

(8) Remove the vacuum reservoir from the dash panel studs.

## INSTALLATION

(1) Install the vacuum reservoir on the dash panel studs. Tighten the mounting nuts to 2.8 N·m (25 in. lbs.).

(2) Connect the vacuum supply hose to the vacuum reservoir.

(3) Install the plastic screws that secure the cowl plenum cover/grille panel to the studs on the cowl top panel.

(4) Install the weatherstrip along the front edge of the cowl plenum cover/grille panel and the cowl plenum panel.

(5) Install the wiper arms on the wiper pivots. Refer to Wipers/Washers for the procedures.

(6) Connect the battery negative cable.

# DISTRIBUTION

## TABLE OF CONTENTS

# DISTRIBUTION

## DESCRIPTION - HVAC SYSTEM AIRFLOW

Outside air enters the vehicle through the cowl top opening at the base of the windshield, and passes through a plenum chamber to the HVAC system blower housing (Fig. 1). Air flow velocity can then be adjusted with the blower motor switch on the a/c heater control panel. The air intake openings must be kept free of snow, ice, leaves, and other obstructions for the HVAC system to receive a sufficient volume of outside air.

It is also important to keep the air intake openings clear of debris because leaf particles and other debris that is small enough to pass through the cowl plenum screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the HVAC housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during HVAC system operation.

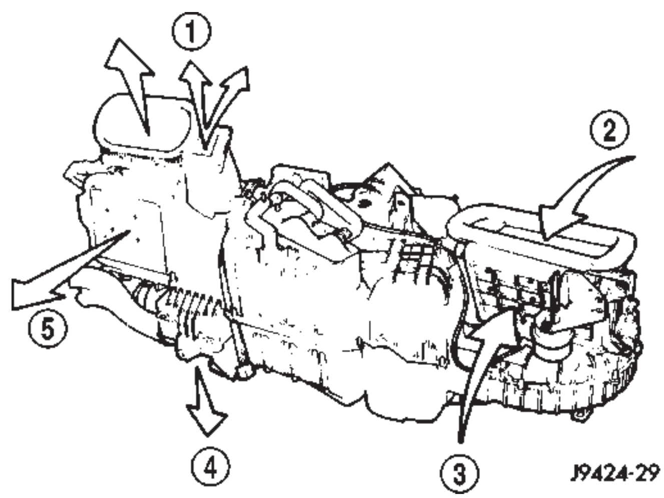

*Fig. 1 HVAC SYSTEM AIRFLOW*

1 - DEFROST OUTLET
2 - OUTSIDE AIR INLET
3 - RECIRCULATION INLET
4 - FLOOR OUTLET
5 - PANEL OUTLET

# AIR OUTLETS

## REMOVAL - DEMISTER GRILLES

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the perimeter edges of the demister grille to release the snap features from the instrument panel top cover.

(2) Remove the demister grille from the instrument panel.

AIR OUTLETS (Continued)

## REMOVAL - PANEL OUTLET BARRELS

**WARNING: THE PANEL OUTLET BARRELS INSTALLED IN THE PASSENGER SIDE AIRBAG DOOR PANEL OUTLET HOUSINGS MUST NEVER BE REINSTALLED FOLLOWING REMOVAL FOR ANY REASON. THEY MUST BE REPLACED WITH NEW BARRELS. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry near the center of either side of the panel outlet barrel to release the snap-fit pivots on the barrel from the pivot pins in the outlet housing of the passenger side airbag module or the instrument cluster bezel (Fig. 2).

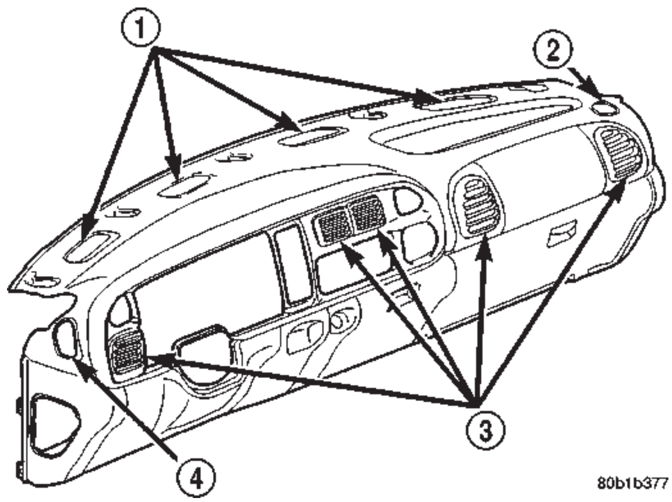

*Fig. 2 PANEL OUTLET BARRELS*

1 - DEFROSTER OUTLETS
2 - DEMISTER OUTLET GRILLE
3 - PANEL OUTLET BARRELS
4 - DEMISTER OUTLET GRILLE

(2) Remove the barrel from the panel outlet housing.

## INSTALLATION - DEMISTER GRILLES

(1) To install the demister grille, position the grille in the opening of the instrument panel top cover and press inwards firmly and evenly near the center of both sides of the grille until it snaps into place.

## INSTALLATION - PANEL OUTLET BARRELS

**WARNING: THE PANEL OUTLET BARRELS INSTALLED IN THE PASSENGER SIDE AIRBAG DOOR PANEL OUTLET HOUSINGS MUST NEVER BE REINSTALLED FOLLOWING REMOVAL FOR ANY REASON. THEY MUST BE REPLACED WITH NEW BARRELS. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.**

(1) To install a new panel outlet barrel, position the barrel in the outlet housing and press inwards firmly and evenly near the center of both sides of the panel outlet barrel until the pivots snap into place.

# BLOWER MOTOR

## DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the HVAC housing, below the glove box. The blower motor controls the velocity of the air flowing through the HVAC housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and blower wheel can be serviced from the passenger compartment side of the housing.

## OPERATION

The blower motor will only operate when the ignition switch is in the On position, and the a/c heater mode control switch knob is in any position, except Off. The blower motor receives a fused battery feed through the blower motor relay whenever the ignition switch is in the On position.

The blower motor battery feed circuit is protected by a fuse in the Power Distribution Center (PDC). The blower motor relay control circuit is protected by a fuse in the junction block. Blower motor speed is controlled by regulating the ground path through the a/c heater mode control switch, the blower motor switch, and the blower motor resistor.

The blower motor and blower wheel cannot be repaired and, if faulty or damaged, they must be replaced. The blower motor and blower wheel may be serviced separately, although if the motor is to be replaced, a blower wheel will come as part of a pre-balanced assembly.

BLOWER MOTOR (Continued)

## DIAGNOSIS AND TESTING - BLOWER MOTOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor switch
- Faulty a/c heater mode control switch
- Faulty blower motor.

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor switch
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor circuit wiring or wire harness connectors.

### VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Blower wheel out of balance or deformed
- Blower motor faulty.

### NOISE

To verify that the blower is the source of the noise, unplug the blower motor wire harness connector and operate the HVAC system. If the noise goes away, possible causes include:

- Foreign material in the HVAC housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Blower motor faulty.

## REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the blower motor cooling tube from the nipple on the blower motor housing (Fig. 3).

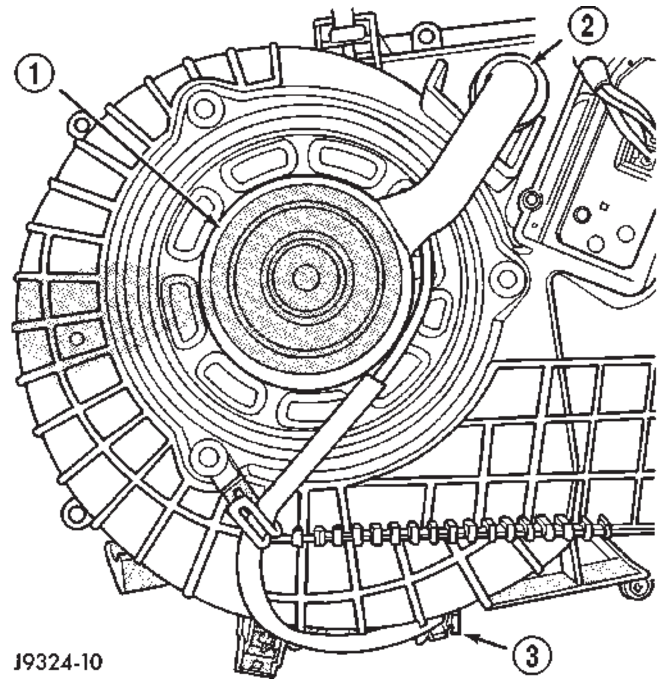

*Fig. 3 BLOWER MOTOR REMOVE/INSTALL*

1 - BLOWER MOTOR HOUSING
2 - COOLING TUBE
3 - ELECTRICAL CONNECTOR

(3) Disengage the blower motor wire harness from the wire harness retainer.

(4) Unplug the blower motor wire harness connector from the HVAC housing wire harness.

(5) Remove the three screws that secure the blower motor and blower wheel assembly to the HVAC housing.

(6) Lower the blower motor and wheel assembly, and cover, from the HVAC housing.

(7) Remove the blower wheel retainer clip and remove the wheel from the blower motor shaft (Fig. 4).

## INSTALLATION

(1) If installing the blower motor wheel only, press the blower wheel hub onto the blower motor shaft. Be sure the flat on the blower motor shaft is indexed to the flat on the inside of the blower wheel hub.

(2) Install the retainer clip over the blower wheel hub. The ears of the retainer clip must be indexed over the flats on the blower motor shaft and blower wheel hub.

(3) Be certain that the blower motor seal is installed on the blower motor housing (Fig. 5).

(4) Install the blower motor and wheel assembly, and cover in the HVAC housing with three mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

BLOWER MOTOR (Continued)

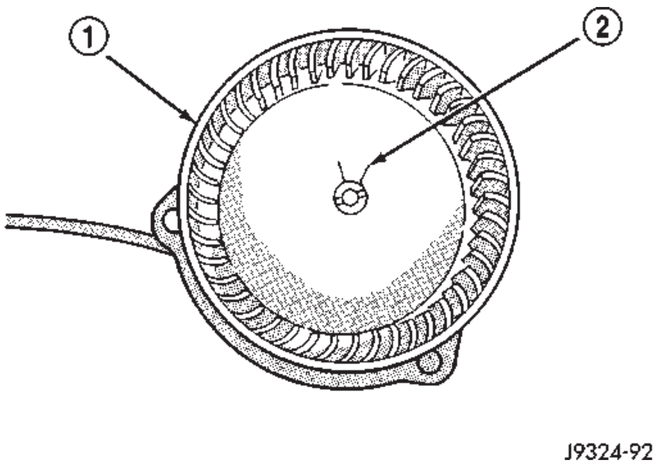

*Fig. 4 BLOWER MOTOR WHEEL REMOVE/INSTALL*

1 - BLOWER MOTOR WHEEL
2 - RETAINER CLIP

(5) Plug the blower motor wire harness connector into the HVAC housing wire harness.

(6) Install the blower motor wire harness into the wire harness retainer.

(7) Connect the blower motor cooling tube to the nipple on the blower motor housing.

(8) Connect the battery negative cable.

# DEFROSTER DUCTS

## REMOVAL - DEFROSTER AND DEMISTER DUCTS

The defroster duct and the main demister duct are a single molded plastic unit. The defroster outlet grilles are heat-staked to the defroster outlets and cannot be serviced separately. The demister tubes on each end of the main demister duct are only serviced in the instrument panel assembly.

(1) Remove the instrument panel top cover from the instrument panel. Refer to Instrument System for the procedures.

(2) Remove the screws that secure the defroster and demister ducts to the instrument panel brackets (Fig. 6).

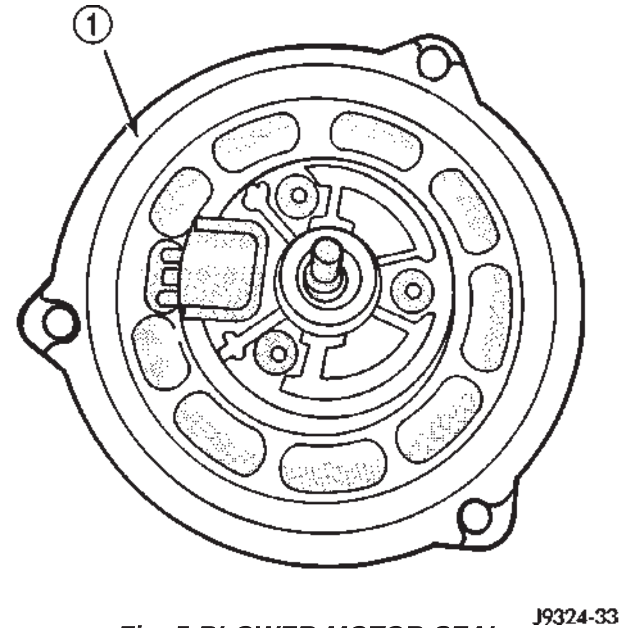

*Fig. 5 BLOWER MOTOR SEAL*

1 - BLOWER MOTOR SEAL

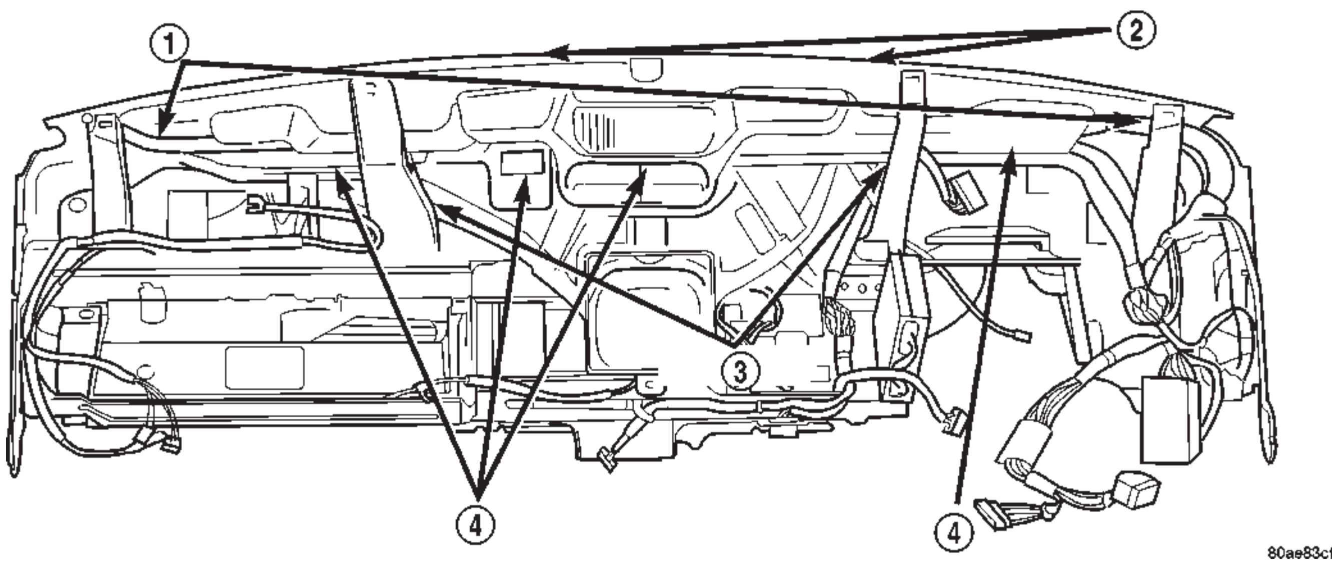

*Fig. 6 DEFROSTER AND DEMISTER DUCT*

1 - DEMISTER TUBE
2 - INSTRUMENT PANEL TOP COVER
3 - BRACKETS
4 - DEFROSTER AND DEMISTER DUCT

DEFROSTER DUCTS (Continued)

(3) Disengage the demister tubes from each end of the main demister duct.

(4) Remove the defroster and demister duct unit from the instrument panel.

## REMOVAL - DEFROSTER AND DEMISTER DUCT ADAPTER

(1) Roll the instrument panel assembly down, but do not remove it from the vehicle. Refer to Instrument Panel System for the procedures.

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the perimeter edges of the defroster and demister duct adapter to release the snap features from the top of the HVAC housing (Fig. 7).

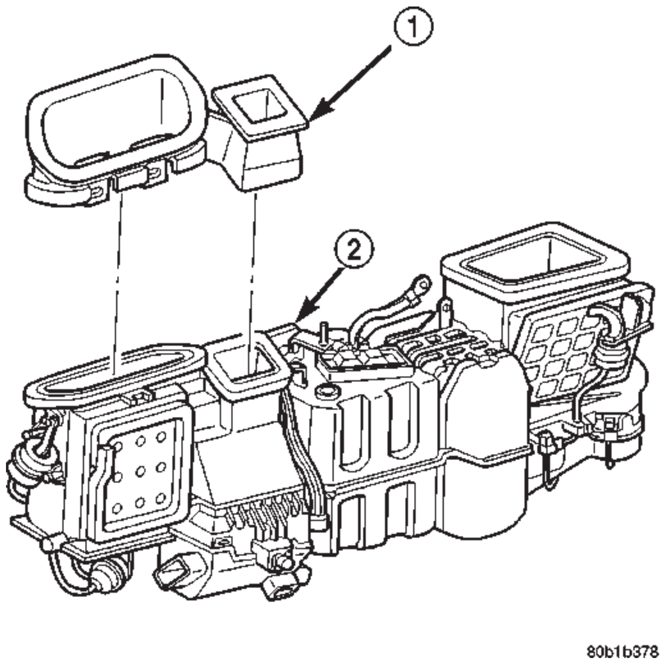

***Fig. 7 DEFROSTER AND DEMISTER DUCT ADAPTER REMOVE/INSTALL***

1 - DEFROSTER AND DEMISTER DUCT ADAPTER
2 - HVAC HOUSING

(3) Remove the defroster and demister duct adapter from the top of the HVAC housing.

## INSTALLATION - DEFROSTER AND DEMISTER DUCTS

(1) Place the defroster and demister duct unit in position.

(2) Engage the demister tubes with each end of the main demister duct.

(3) Install the screws that secure the defroster and demister ducts to the instrument panel brackets. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(4) Install the instrument panel top cover on the instrument panel. Refer to Instrument System for the procedures.

## INSTALLATION - DEFROSTER AND DEMISTER DUCT ADAPTER

(1) Snap the defroster and demister duct adapter from the top of the HVAC housing.

(2) Roll the instrument panel assembly up, and fasten it properly to the vehicle. Refer to Instrument Panel System for the procedures.

# HVAC HOUSING

## REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - CAUTION)**

The HVAC housing assembly must be removed from the vehicle and disassembled for service access of the heater core, a/c evaporator, and each of the various mode control doors.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.

(3) If the vehicle is not equipped with air conditioning, go to Step 6. If the vehicle is equipped with air conditioning, recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(4) Disconnect the liquid line refrigerant line fitting from the evaporator inlet tube. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS) Install plugs in, or tape over all of the opened refrigerant line fittings.

HVAC HOUSING (Continued)

(5) Remove the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL) Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Drain the engine cooling system. Refer to Cooling for the procedures.

(7) Disconnect the heater hoses from the heater core tubes. Refer to Cooling for the procedures. Install plugs in, or tape over the opened heater core tubes.

(8) Remove the Powertrain Control Module (PCM) from the dash panel and set it aside, but do not unplug the PCM wire harness connectors. Refer to Electronic Control Modules for the procedures.

(9) Remove the nuts from the HVAC housing mounting studs on the engine compartment side of the dash panel.

(10) Remove the nuts that secure the HVAC housing to the mounting studs on the passenger compartment side of the dash panel (Fig. 8).

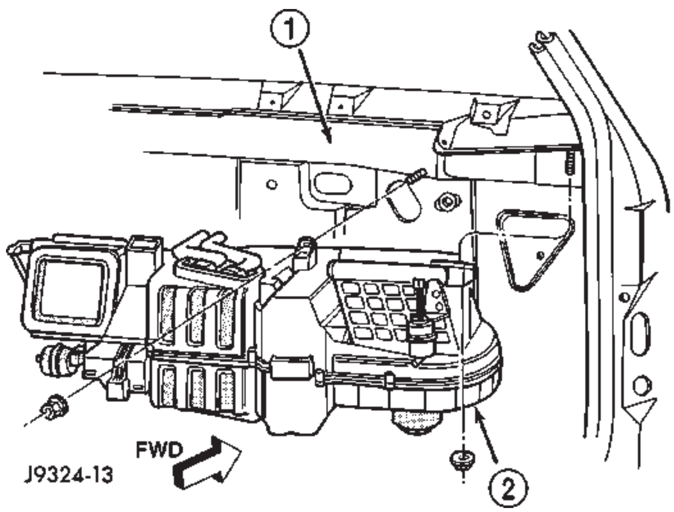

*Fig. 8 HVAC HOUSING REMOVE/INSTALL*

1 - BODY ASSEMBLY
2 - HVAC HOUSING

(11) Pull the HVAC housing rearward far enough for the mounting studs and the evaporator condensate drain tube to clear the dash panel holes.

(12) Remove the HVAC housing from the vehicle.

## REMOVAL - HVAC HOUSING INLET BAFFLE

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Slide the HVAC housing inlet baffle (Fig. 9) all the way to one side of the cowl plenum opening.

(3) Pull downwards sharply and firmly on the opposite side of the HVAC housing inlet baffle to disengage the snap features from the cowl plenum opening.

(4) Remove the HVAC housing inlet baffle from the cowl plenum panel.

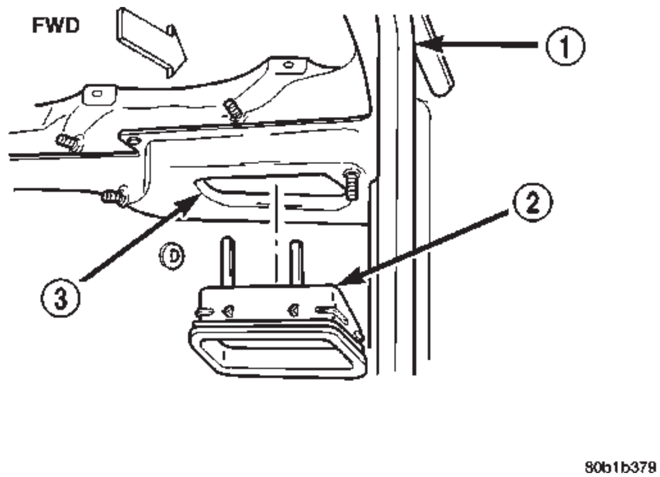

*Fig. 9 HVAC HOUSING INLET BAFFLE REMOVE/INSTALL*

1 - RIGHT A-PILLAR
2 - INLET BAFFLE
3 - COWL PLENUM OPENING

## DISASSEMBLY

(1) Place the HVAC housing upside down on a work bench.

(2) Remove the screw that secures the floor duct to the bottom of the HVAC housing and slide the floor duct off of the center heat duct adaptor.

(3) Unsnap the center heat duct adaptor from the bottom of the HVAC housing and remove the screw that was hidden by the adaptor.

(4) Remove the remaining screws on the bottom of the HVAC housing that secure the two housing halves together.

(5) Place the HVAC housing right side up on the work bench.

(6) Separate the top half of the HVAC housing from the bottom half and set it aside.

## ASSEMBLY

(1) Position the top half of the HVAC housing over the bottom half. Be certain that the mode door pivot pins are properly inserted in their pivot holes.

(2) Place the HVAC housing upside down on the work bench.

(3) Install and tighten the screws on the bottom of the HVAC housing that secure the two housing halves together. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) Snap the center heat duct adaptor onto the bottom of the HVAC housing.

(5) Slide the floor duct onto the center heat duct adaptor and secure it with a screw to the bottom of the HVAC housing. Tighten the mounting screw to 2.2 N·m (20 in. lbs.).

HVAC HOUSING (Continued)

## INSTALLATION

(1) Position the HVAC housing to the dash panel. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct mounting holes.

(2) Install the nuts that secure the HVAC housing to the mounting studs on the passenger compartment side of the dash panel. Tighten the nuts to 4.5 N·m (40 in. lbs.).

(3) Install and tighten the nuts onto the HVAC housing mounting studs on the engine compartment side of the dash panel. Tighten the nuts to 7 N·m (60 in. lbs.).

(4) Unplug or remove the tape from the heater core tubes. Connect the heater hoses to the heater core tubes and fill the engine cooling system. Refer Cooling for the procedures.

(5) If the vehicle is not equipped with air conditioning, go to Step 10. If the vehicle is equipped with air conditioning, install the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - INSTALLATION) Connect the accumulator inlet tube coupler to the evaporator outlet tube. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(6) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line coupler to the evaporator inlet tube. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(9) Reinstall the PCM to the dash panel. Refer to Electronic Control Modules for the procedures.

(10) Reinstall the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

(11) Connect the battery negative cable.

(12) Start the engine and check for proper operation of the heating and air conditioning systems.

## INSTALLATION - HVAC HOUSING INLET BAFFLE

(1) Install the HVAC housing inlet baffle in the cowl plenum panel.

(2) Slide the HVAC housing inlet baffle to engage the snap features.

(3) Make certain that the snap features on each side of the adapter are fully engaged with the sides of the plenum panel opening. This must be a water tight connection to prevent leaks.

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

# INSTRUMENT PANEL DEMISTER DUCTS

## REMOVAL

The defroster duct and the main demister duct are a single molded plastic unit. The defroster outlet grilles are heat-staked to the defroster outlets and cannot be serviced separately. The demister tubes on each end of the main demister duct are only serviced in the instrument panel assembly. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - REMOVAL)

# INSTRUMENT PANEL DUCTS

## REMOVAL

The panel and center distribution ducts (Fig. 10) are only serviced as part of the instrument panel assembly. Refer to Instrument Panel System for the service procedures.

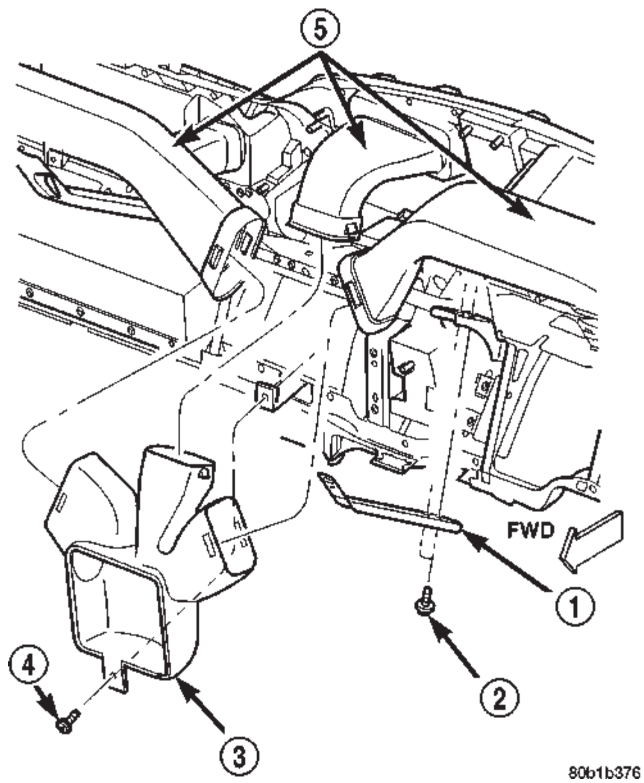

*Fig. 10 PANEL AND CENTER DISTRIBUTION DUCTS*

1 - BRACKET
2 - SCREW
3 - CENTER DISTRIBUTION DUCT
4 - SCREW
5 - PANEL DUCTS

# BLEND DOOR

## REMOVAL

(1) Remove the HVAC housing from the vehicle, and disassemble the housing halves. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Lift the blend door pivot shaft out of the pivot hole in the bottom of the HVAC housing (Fig. 11).

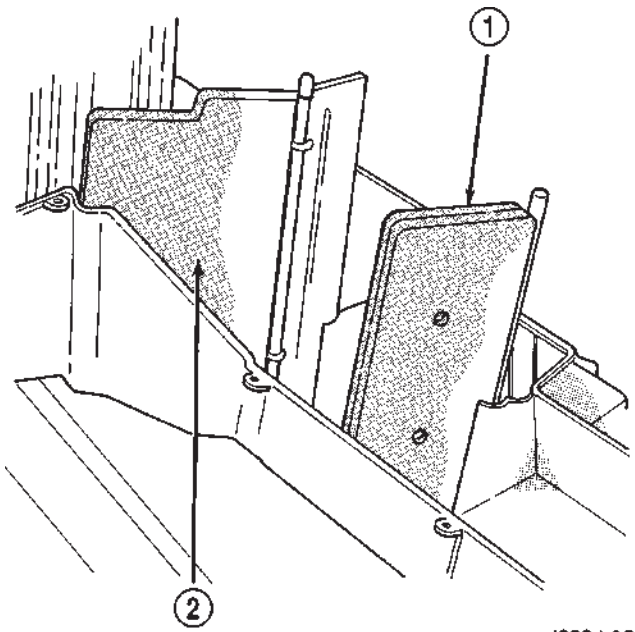

***Fig. 11 BLEND DOOR***

1 - HEAT/DEFROST DOOR
2 - BLEND DOOR

## INSTALLATION

(1) Install the blend door pivot shaft in the bottom of the HVAC housing.

(2) Assemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY)

(3) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

# MODE DOOR

## REMOVAL - HEAT/DEFROST DOOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Remove and disassemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Remove the heat/defrost door actuator from the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)

(3) Remove the heat/defrost door from the HVAC housing.

## REMOVAL - PANEL/DEFROST DOOR

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel System for the procedures.

(3) Remove the panel/defrost door actuator from the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)

(4) Remove the defroster and demister duct adapter from the HVAC housing. ***L***

MODE DOOR (Continued)

(5) Lift the panel/defrost door out of the top opening of the HVAC housing.

### INSTALLATION - HEAT/DEFROST DOOR

(1) Install the heat/defrost door in the HVAC housing.

(2) Assemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HVAC HOUSING - ASSEMBLY)

(3) Install the heat/defrost door actuator on the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - INSTALLATION)

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

### INSTALLATION - PANEL/DEFROST DOOR

(1) Install the panel/defrost door through the top opening of the HVAC housing.

(2) Install the defroster and demister duct adapter on the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - INSTALLATION)

(3) Install the panel/defrost door actuator on the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)

(4) Install the instrument panel assembly in the vehicle. Refer to Instrument Panel System for the procedures.

(5) Connect the battery negative cable.

## RECIRCULATION DOOR

### REMOVAL

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - CAUTION)**

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/ DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Unsnap the recirculation door vacuum actuator link clip and disengage the link from the recirculation door lever. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - REMOVAL)

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the retainer off of the recirculation door pivot shaft.

(4) Remove the recirculation door through the outside air intake opening on the top of the HVAC housing.

### INSTALLATION

(1) Install the recirculation door through the outside air intake opening on the top of the HVAC housing.

(2) Install the retainer on the recirculation door pivot shaft.

(3) Engage the recirculation door vacuum actuator link clip with the recirculation door lever. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ RECIRCULATION DOOR ACTUATOR - INSTALLATION)

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

# PLUMBING

## TABLE OF CONTENTS

# PLUMBING

## DESCRIPTION - A/C LINE COUPLERS

Spring-lock type refrigerant line couplers are used to connect many of the refrigerant lines and other components to the refrigerant system. These couplers require a special tool for disengaging the two coupler halves.

## DESCRIPTION

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

PLUMBING (Continued)

## OPERATION - A/C LINE COUPLERS

The spring-lock coupler is held together by a garter spring inside a circular cage on the male half of the fitting (Fig. 1). When the two coupler halves are connected, the flared end of the female fitting slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage.

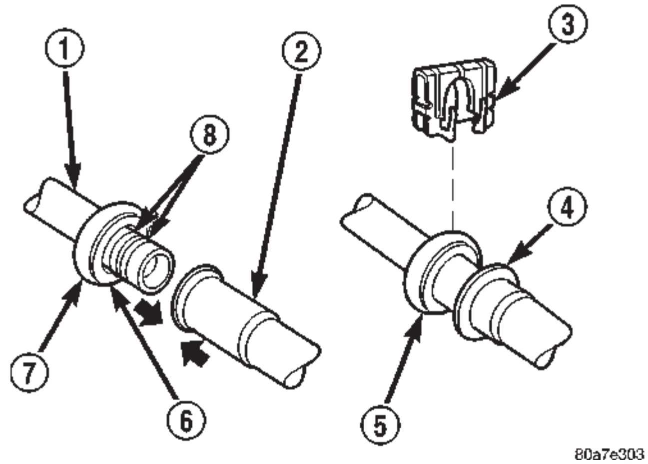

***Fig. 1 SPRING-LOCK COUPLER - TYPICAL***

1 - MALE HALF SPRING-LOCK COUPLER
2 - FEMALE HALF SPRING-LOCK COUPLER
3 - SECONDARY CLIP
4 - CONNECTION INDICATOR RING
5 - COUPLER CAGE
6 - GARTER SPRING
7 - COUPLER CAGE
8 - ″O″ RINGS

Two O-rings on the male half of the fitting are used to seal the connection. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

Secondary clips are installed over the two connected coupler halves at the factory for added blowoff protection. In addition, some models have a plastic ring that is used at the factory as a visual indicator to confirm that these couplers are connected. After the coupler is connected, the plastic indicator ring is no longer needed; however, it will remain on the refrigerant line near the coupler cage.

## OPERATION

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled with other components of the HVAC system with peanut-block style fittings. A stat-O seal type flat steel gasket with a captured compressible O-ring, is used to mate plumbing lines with A/C components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

**WARNING:**
**THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.**
**AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.**
**DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.**
**IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.**
**THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.**
**THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.**

PLUMBING (Continued)

**CAUTION:**
**Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.**
**Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.**
**R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.**
**Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.**
**Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.**
**Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.**
**Do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.**
**The refrigerant system must always be evacuated before charging.**
**Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.**
**Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.**
**Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.**
**Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.**
**Do not remove the sealing caps from a replacement component until it is to be installed.**
**When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.**
**Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.**
**When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.**
**Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.**
**Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.**

## CAUTION - REFRIGERANT HOSES/LINES/ TUBES PRECAUTIONS

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.
- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

PLUMBING (Continued)

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

## DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

If the air conditioning system is not cooling properly, determine if the refrigerant system is fully-charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE) If the refrigerant system is low or empty; a leak at a refrigerant line, connector fitting, component, or component seal is likely.

An electronic leak detector designed for R-134a refrigerant, or a fluorescent R-134a leak detection dye and a black light are recommended for locating and confirming refrigerant system leaks. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

An oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general location of a possible refrigerant leak. However, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement.

To detect a leak in the refrigerant system with an electronic leak detector, perform one of the following procedures:

### SYSTEM EMPTY

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(3) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(4) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(5) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode.

### SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run with the air conditioning system turned on for five minutes.

(3) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode.

## STANDARD PROCEDURE - A/C LINE COUPLERS

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

### REMOVAL

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDI-

PLUMBING (Continued)

TIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Remove the secondary clip from the spring-lock coupler.

(3) Fit the proper size A/C line disconnect tool (Special Tool Kit 7193) over the spring-lock coupler cage (Fig. 2).

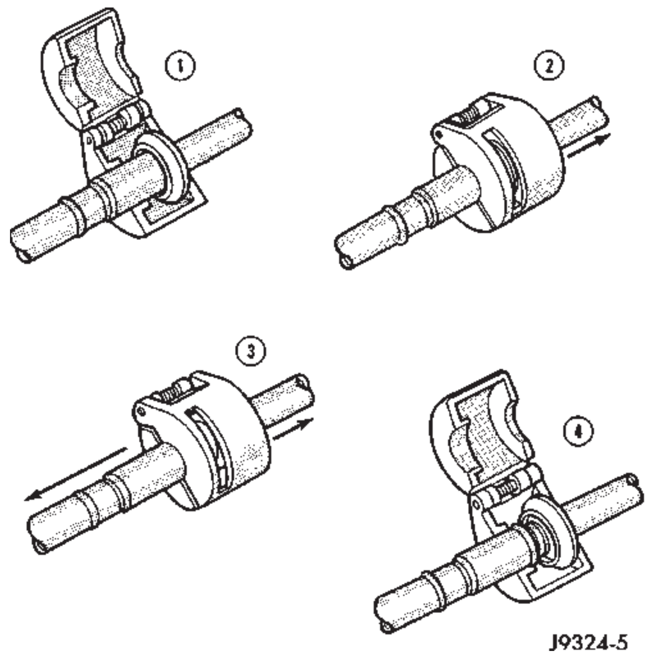

***Fig. 2 REFRIGERANT LINE SPRING-LOCK COUPLER DISCONNECT***

(4) Close the two halves of the A/C line disconnect tool around the spring-lock coupler.

(5) Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring. Once the garter spring is expanded and while still pushing the disconnect tool into the open side of the coupler cage, pull on the refrigerant line attached to the female half of the coupler fitting until the flange on the female fitting is separated from the garter spring and cage on the male fitting within the disconnect tool.

## INSTALLATION

(1) Check to ensure that the garter spring is located within the cage of the male coupler fitting, and that the garter spring is not damaged.

(a) If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.

(b) If the garter spring is damaged, remove it from the coupler cage with a small wire hook (DO NOT use a screwdriver) and install a new garter spring.

(2) Clean any dirt or foreign material from both halves of the coupler fitting.

(3) Install new O-rings on the male half of the coupler fitting.

**CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak intermittently during vehicle operation.**

(4) Lubricate the male fitting and O-rings, and the inside of the female fitting with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(5) Fit the female half of the coupler fitting over the male half of the fitting.

(6) Push together firmly on the two halves of the coupler fitting until the garter spring in the cage on the male half of the fitting snaps over the flanged end on the female half of the fitting.

(7) Ensure that the spring-lock coupler is fully engaged by trying to separate the two coupler halves. This is done by pulling the refrigerant lines on either side of the coupler away from each other.

(8) Reinstall the secondary clip over the spring-lock coupler cage.

## STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 3). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

### MANIFOLD GAUGE SET CONNECTIONS

**CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.**

PLUMBING (Continued)

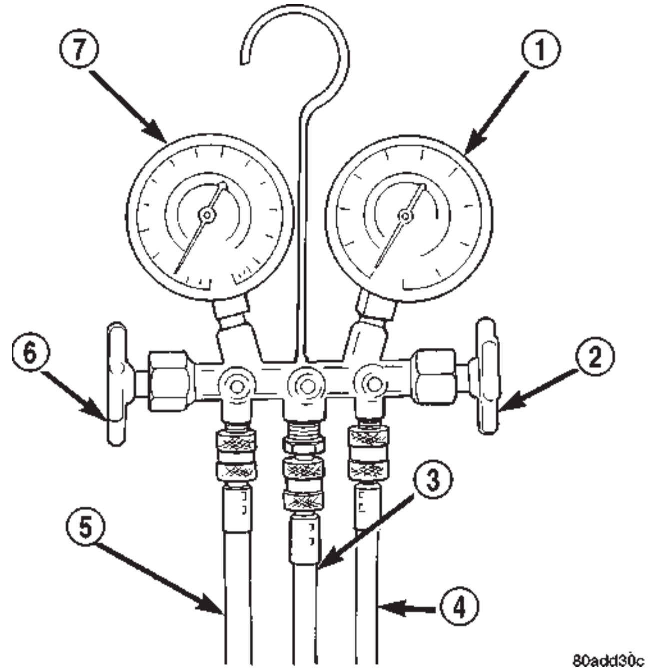

*Fig. 3 MANIFOLD GAUGE SET - TYPICAL*

1 - HIGH PRESSURE GAUGE
2 - VALVE
3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
6 - VALVE
7 - LOW PRESSURE GAUGE

LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line between the accumulator outlet and the compressor.

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the discharge line between the compressor and the condenser inlet.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

## STANDARD PROCEDURE - REFRIGERANT RECOVERY

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

## STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. To evacuate the refrigerant system, use the following procedure:

(1) Connect a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 and a manifold gauge set to the refrigerant system of the vehicle.

(2) Open the low and high side valves and start the charging station vacuum pump. When the suction gauge reads 88 kPa (26 in. Hg.) vacuum or greater, close all of the valves and turn off the vacuum pump.

(a) If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS)

(b) If the refrigerant system maintains the specified vacuum for five minutes, restart the vacuum pump, open the suction and discharge valves and evacuate the system for an additional ten minutes.

(3) Close all of the valves, and turn off the charging station vacuum pump.

(4) The refrigerant system is now ready to be charged with R-134a refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

PLUMBING (Continued)

### STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

## SPECIFICATIONS

### SPECIFICATIONS

The R-134a refrigerant system charge capacity for this vehicle is: 0.907 kilograms (32 ounces).

## A/C COMPRESSOR

### DESCRIPTION - A/C COMPRESSOR

The air conditioning system uses a Sanden SD7H15 seven cylinder, reciprocating wobble plate-type compressor on all models. This compressor has a fixed displacement of 150 cubic centimeters (9.375 cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

### DESCRIPTION - HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components, caused by condenser air flow restriction or an overcharge of refrigerant.

### OPERATION - A/C COMPRESSOR

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley and clutch coil are available for service.

### OPERATION - HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

### DIAGNOSIS AND TESTING - A/C COMPRESSOR

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension as described in Cooling before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe

A/C COMPRESSOR (Continued)

the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - INSTALLATION)

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(5) If the noise is from opening and closing of the high pressure relief valve, recover, evacuate, and recharge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) If the high pressure relief valve still does not seat properly, replace the compressor.

(6) If the noise is from liquid slugging on the suction line, replace the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL) Check the refrigerant oil level and the refrigerant system charge. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY) If the liquid slugging condition continues following accumulator replacement, replace the compressor.

(7) If the noise continues, replace the compressor and repeat Step 1.

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

The compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch or clutch coil, the engine, the cylinder head, or the generator.

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt. Refer to Cooling for the procedures.

(4) Unplug the compressor clutch coil wire harness connector.

(5) Remove the bolt that secures the refrigerant line manifold to the compressor. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the four bolts that secure the compressor to the mounting bracket (Fig. 4) or (Fig. 5).

(7) Remove the a/c compressor from the mounting bracket.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)**

**NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)**

(1) Install the compressor to the mounting bracket. Tighten the four mounting bolts to 24 N·m (210 in. lbs.).

(2) Remove the tape or plugs from all of the opened refrigerant line fittings. Install the suction and discharge line manifold to the compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C SUCTION AND DISCHARGE LINE - INSTALLATION)

A/C COMPRESSOR (Continued)

3 - BOLT AND WASHER
4 - BRACE
5 - BOLT

(3) Install the serpentine drive belt. Refer to Cooling for the procedures.

(4) Plug in the compressor clutch coil wire harness connector.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

# A/C CONDENSER

## DESCRIPTION

The condenser is located in the air flow in front of the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins, thus causing the refrigerant to change to a liquid state.

## OPERATION

When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or condenser service.

The condenser cannot be repaired and, if faulty or damaged, it must be replaced.

A/C CONDENSER (Continued)

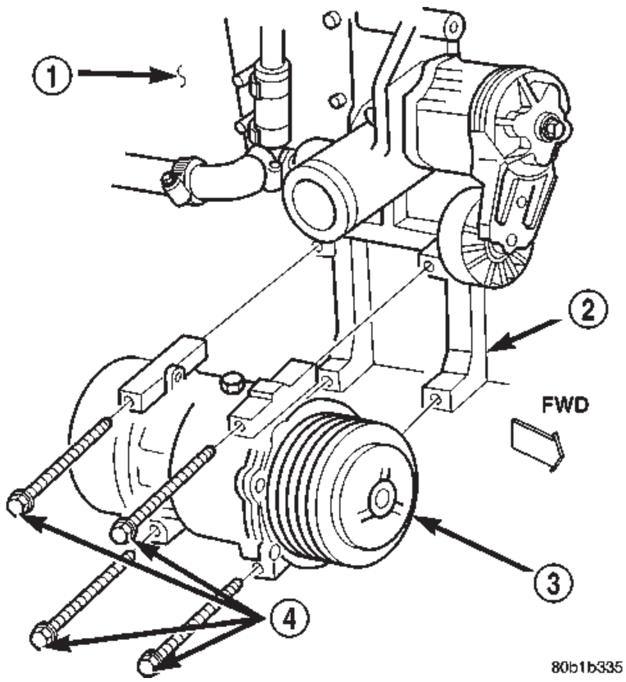

*Fig. 5 COMPRESSOR REMOVE/INSTALL - DIESEL ENGINE*

1 - ENGINE
2 - BRACKET
3 - A/C COMPRESSOR
4 - BOLTS

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the nut that secures the block fitting to the stud on the condenser inlet, and disconnect the discharge line from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(4) Disconnect the refrigerant line fitting that secures the liquid line to the condenser outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLER) Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) On gasoline engine models:

(a) Remove the two screws that secure the condenser upper mounting brackets to the outside of the upper radiator crossmember (Fig. 6).

(b) Tilt the condenser away from the engine compartment far enough to grasp the top of the condenser with both hands.

(c) Lift the condenser far enough to remove the two lower condenser locators from the isolators in the holes of the lower crossmember.

(d) Remove the condenser from the vehicle.

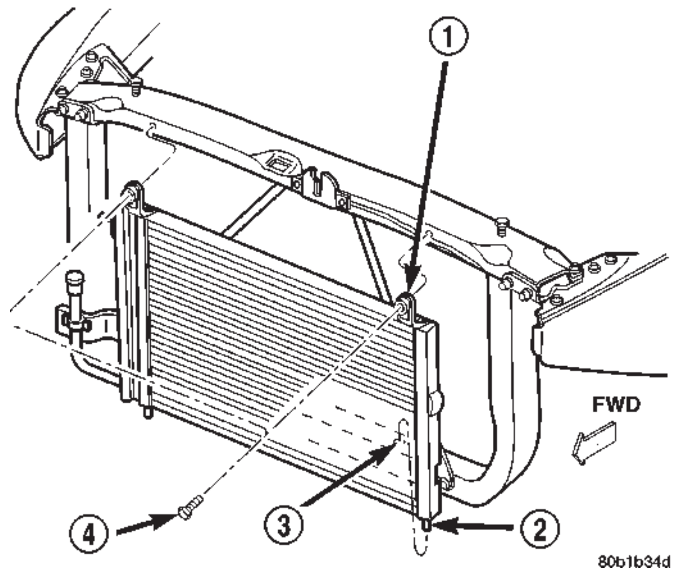

*Fig. 6 CONDENSER REMOVE/INSTALL - GASOLINE ENGINE*

1 - CONDENSER
2 - LOCATOR
3 - ISOLATOR
4 - SCREW

(6) On diesel engine models:

(a) Remove the two screws that secure the brackets on the passenger side end of the condenser to the charge air cooler (Fig. 7).

(b) Remove the two nuts that secure the driver side end of the condenser to the studs on the charge air cooler.

(c) Remove the condenser from the vehicle.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)**

A/C CONDENSER (Continued)

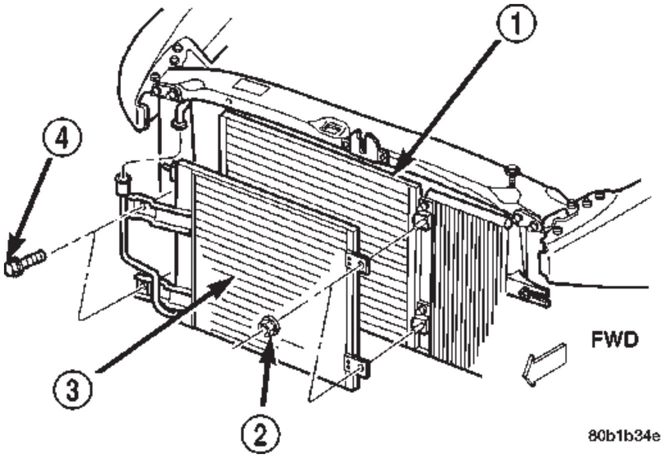

*Fig. 7 CONDENSER REMOVE/INSTALL - DIESEL ENGINE*

1 - CHARGE AIR COOLER
2 - NUT
3 - CONDENSER
4 - SCREW

(1) On gasoline engine models:

(a) Insert the two lower condenser locators into the isolators in the holes of the lower crossmember.

(b) Tilt the condenser up towards the engine compartment far enough to align the upper mounting bracket holes with the holes in the upper radiator crossmember.

(c) Install the two screws that secure the condenser upper mounting brackets to the outside of the upper radiator crossmember. Tighten the mounting screws to 10.5 N·m (95 in. lbs.).

(2) On diesel engine models:

(a) Install the driver side condenser mounting brackets over the two studs on the charge air cooler.

(b) Install the two screws that secure the brackets on the passenger side end of the condenser to the charge air cooler. Tighten the mounting screws to 10.5 N·m (95 in. lbs.).

(c) Install the two nuts that secure the driver side end of the condenser to the studs on the charge air cooler. Tighten the mounting nuts to 10.5 N·m (95 in. lbs.).

(3) Remove the plugs or tape from the refrigerant line fittings on the liquid line and the condenser outlet. Connect the liquid line to the condenser outlet. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(4) Install a new gasket and the discharge line block fitting over the stud on the condenser inlet. Tighten the mounting nut to 20 N·m (180 in. lbs.).

(5) Check that all of the condenser and radiator air seals are in their proper locations.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

**NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING/REFRIGERANT OIL - DESCRIPTION)**

# SUCTION AND DISCHARGE LINE

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Unplug the wire harness connector from the a/c high pressure switch.

(4) Disconnect the suction line refrigerant line coupler at the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLER) Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the nut that secures the block fitting to the stud on the condenser inlet and disconnect the discharge line from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) On models with a gasoline engine, remove the nut that secures the refrigerant line support bracket to the stud on the compressor mounting bracket.

(7) Remove the bolt that secures the refrigerant line manifold to the compressor (Fig. 8) or (Fig. 9). Install plugs in, or tape over all of the opened refrigerant line fittings.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)**

(1) Remove the tape or plugs from all of the refrigerant line fittings. Connect the suction line refrigerant line coupler to the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(2) Install a new gasket and the discharge line block fitting over the stud on the condenser inlet. Tighten the mounting nut to 20 N·m (180 in. lbs.).

SUCTION AND DISCHARGE LINE (Continued)

(3) Install the refrigerant line manifold to the compressor. Tighten the mounting bolt to 22 N·m (200 in. lbs.).

(4) On models with a gasoline engine, install the nut that secures the refrigerant line support bracket to the stud on the compressor mounting bracket. Tighten the mounting nut to 22 N·m (200 in. lbs.).

(5) Plug in the wire harness connector to the a/c high pressure switch.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

# LIQUID LINE

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Disconnect the liquid line refrigerant line couplers at the condenser outlet and the evaporator inlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS) Install plugs in, or tape over all of the opened refrigerant line fittings.

(4) Disengage any clips that secure the liquid line to the inner fender shield and the dash panel (Fig. 10).

(5) Remove the liquid line from the vehicle.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)**

(1) Install the liquid line into any clips on the inner fender shield and the dash panel.

(2) Remove the tape or plugs from the refrigerant line fittings on the liquid line, the condenser outlet, and the evaporator inlet. Connect the liquid line to the condenser and the evaporator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(3) Connect the battery negative cable.

(4) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(5) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

# A/C EVAPORATOR

## DESCRIPTION

The a/c evaporator is located in the HVAC housing, under the instrument panel. The evaporator coil is positioned in the HVAC housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator coil fins will only be conditioned when the

A/C EVAPORATOR (Continued)

compressor is engaged and circulating refrigerant through the evaporator coil tubes.

## OPERATION

Refrigerant enters the evaporator from the fixed orifice tube as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the evaporator.

The evaporator coil cannot be repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Remove the HVAC housing from the vehicle, and disassemble the housing halves. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Lift the a/c evaporator out of the HVAC housing (Fig. 11).

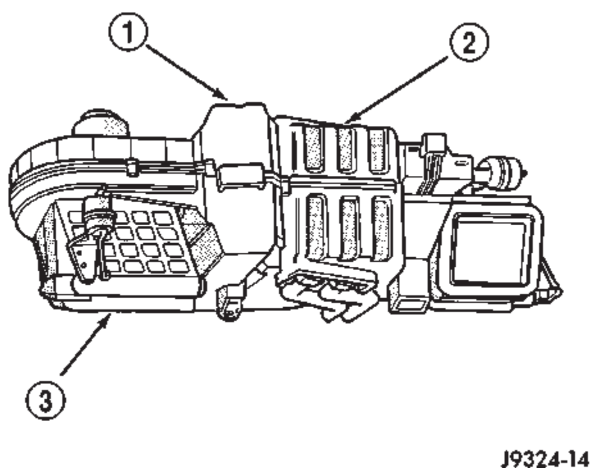

***Fig. 11 A/C EVAPORATOR LOCATION IN HVAC HOUSING (UPSIDE DOWN)***

1 - EVAPORATOR LOCATION
2 - BOTTOM HALF OF HVAC HOUSING
3 - TOP HALF OF HVAC HOUSING

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)**

(1) Insert the evaporator coil into the bottom of the HVAC housing.

(2) Reassemble and reinstall the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

**NOTE: If the evaporator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.**

# A/C ORIFICE TUBE

## DESCRIPTION

The fixed orifice tube is installed in the liquid line between the outlet of the condenser and the inlet of the evaporator. The fixed orifice tube is only serviced as an integral part of the liquid line.

## OPERATION

The inlet end of the fixed orifice tube has a nylon mesh filter screen, which filters the refrigerant and helps to reduce the potential for blockage of the metering orifice by refrigerant system contaminants (Fig. 12). The outlet end of the tube has a nylon mesh diffuser screen. The O-rings on the plastic body of the fixed orifice tube seal the tube to the inside of the liquid line and prevent the refrigerant from bypassing the fixed metering orifice.

The fixed orifice tube is used to meter the flow of liquid refrigerant into the evaporator coil. The high-pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the fixed orifice tube.

The fixed orifice tube cannot be repaired and, if faulty or plugged, the liquid line assembly must be replaced.

A/C ORIFICE TUBE (Continued)

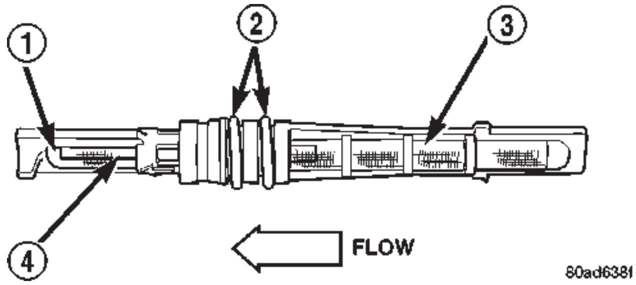

*Fig. 12 FIXED ORIFICE TUBE - TYPICAL*

1 - DIFFUSER SCREEN
2 - "O" RINGS
3 - INLET FILTER SCREEN
4 - ORIFICE

### DIAGNOSIS AND TESTING - FIXED ORIFICE TUBE

The fixed orifice tube can be checked for proper operation using the following procedure. However, the fixed orifice tube is only serviced as a part of the liquid line unit. If the results of this test indicate that the fixed orifice tube is obstructed or missing, the entire liquid line unit must be replaced.

**WARNING: THE LIQUID LINE BETWEEN THE CONDENSER OUTLET AND THE FIXED ORIFICE TUBE CAN BECOME HOT ENOUGH TO BURN THE SKIN. USE EXTREME CAUTION WHEN PERFORMING THE FOLLOWING TEST.**

(1) Confirm that the refrigerant system is properly charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

(2) Start the engine. Turn on the air conditioning system and confirm that the compressor clutch is engaged.

(3) Allow the air conditioning system to operate for five minutes.

(4) Lightly and cautiously touch the liquid line near the condenser outlet at the front of the engine compartment. The liquid line should be hot to the touch.

(5) Touch the liquid line near the evaporator inlet at the rear of the engine compartment. The liquid line should be cold to the touch.

(6) If there is a distinct temperature differential between the two ends of the liquid line, the orifice tube is in good condition. If there is little or no detectable temperature differential between the two ends of the liquid line, the orifice tube is obstructed or missing and the liquid line must be replaced.

### REMOVAL

The fixed orifice tube is located in the liquid line, between the condenser and the evaporator coil. If the fixed orifice tube is faulty or plugged, the liquid line assembly must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL)

## ACCUMULATOR

### DESCRIPTION

The accumulator is mounted in the engine compartment between the a/c evaporator outlet tube and the compressor inlet.

### OPERATION

Refrigerant enters the accumulator canister as a low pressure vapor through the inlet tube. Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system (Fig. 13).

### REMOVAL

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)**

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the a/c low pressure switch from the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C LOW PRESSURE SWITCH - REMOVAL)

(4) Loosen the screw that secures the accumulator retaining band to the support bracket on the dash panel (Fig. 20).

(5) Disconnect the suction line refrigerant line fitting from the accumulator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS) Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Disconnect the accumulator inlet refrigerant line fitting from the evaporator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

ACCUMULATOR (Continued)

8 - ACCUMULATOR DOME
9 - O-RING SEAL
10 - INLET FROM EVAPORATOR

STANDARD PROCEDURE) Install plugs in, or tape over all of the opened refrigerant line fittings.

(7) Pull the accumulator out of the retaining band.

(8) Remove the accumulator from the engine compartment.

## INSTALLATION

**WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)**

(1) Install the accumulator in the retaining band.

(2) Remove the tape or plugs from the refrigerant line fittings on the accumulator inlet and the evaporator outlet. Connect the accumulator inlet refrigerant line coupler to the evaporator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(3) Tighten the accumulator retaining band screw to 4.5 N·m (40 in. lbs.).

(4) Remove the tape or plugs from the refrigerant line fittings on the suction line and the accumulator outlet. Connect the suction line refrigerant line coupler to the accumulator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(5) Reinstall the a/c low pressure switch on the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C LOW PRESSURE SWITCH - INSTALLATION)

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

**NOTE: If the accumulator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.**

# HEATER CORE

## DESCRIPTION

The heater core is located in the HVAC housing, under the instrument panel. It is a heat exchanger made of rows of tubes and fins.

## OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend door allows control of the heater output air temperature by controlling how much of the air flowing through the HVAC housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced. Refer to Cooling for

HEATER CORE (Continued)

more information on the engine cooling system, the engine coolant and the heater hoses.

### REMOVAL

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Remove the screws and retainers that secure the heater core to the HVAC housing.

(3) Lift the heater core straight up and out of the heater-A/C housing (Fig. 14).

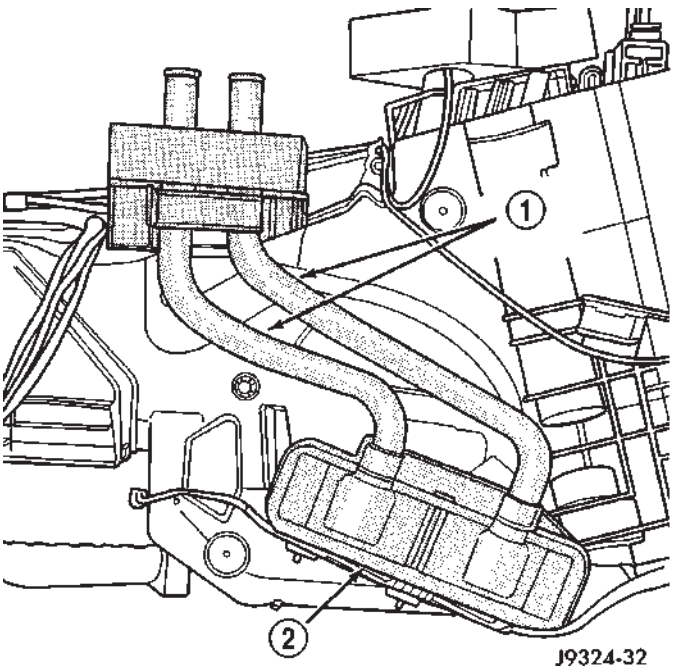

*Fig. 14 HEATER CORE REMOVE/INSTALL*

1 - HEATER CORE LINES
2 - HEATER CORE

### INSTALLATION

(1) Lower the heater core into the HVAC housing.

(2) Position the retainers over the heater core tubes. Install and tighten the screws that secure the heater core and retainers to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Reinstall the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

## REFRIGERANT

### DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

### OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

## REFRIGERANT OIL

### DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The SD7H15 compressor used in this vehicle is designed to use an SP-20 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

### OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil

REFRIGERANT OIL (Continued)

container immediately to prevent moisture contamination.

## STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The accumulator, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a accumulator, evaporator coil, or condenser are replaced. See the Refrigerant Oil Capacities chart. When a compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

| Refrigerant Oil Capacities | | |
|---|---|---|
| Component | ml | fl oz |
| A/C System | 210 | 6.2 |
| Accumulator | 60 | 2 |
| Condenser | 30 | 1 |
| Evaporator | 60 | 2 |
| Compressor | drain and measure the oil from the old compressor - see text. | |

# EMISSIONS CONTROL

TABLE OF CONTENTS

## EMISSIONS CONTROL

### DESCRIPTION - DIESEL

Two different modules are used for powertrain control with the diesel engine. The Powertrain Control Module (PCM) is used primarily for charging system, transmission, A/C compressor clutch operation and speed control functions. The Engine Control Module (ECM) is used to control the **fuel and emissions systems.** The PCM is located in the right/rear of engine compartment (Fig. 1). The ECM is bolted to the left side of the engine cylinder block (Fig. 2).

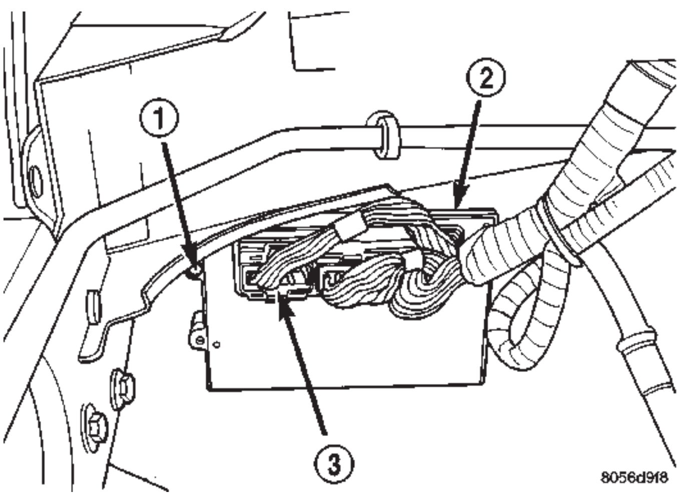

*Fig. 1 Powertrain Control Module (PCM) Location*

1 - PCM MOUNTING BOLTS (3)
2 - POWERTRAIN CONTROL MODULE (PCM)
3 - (3) 32–WAY CONNECTORS

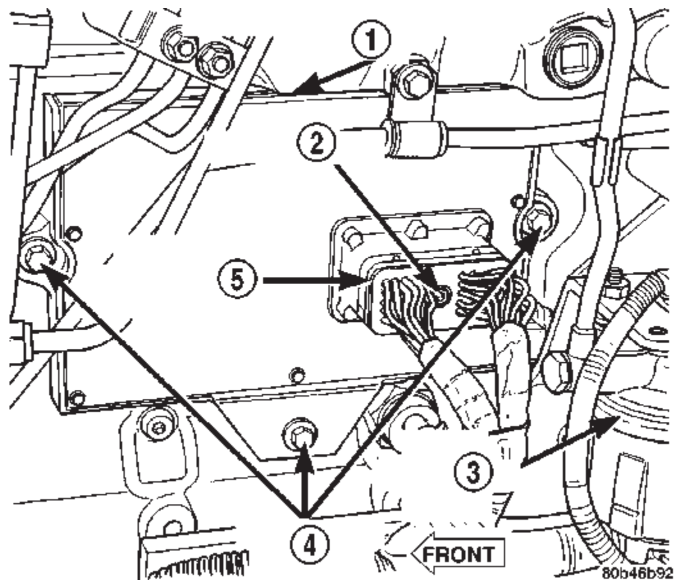

*Fig. 2 Engine Control Module (ECM) Location*

1 - ENGINE CONTROL MODULE (ECM)
2 - HEX HEADED BOLT
3 - FUEL TRANSFER PUMP
4 - MOUNTING BOLTS (3)
5 - 50–WAY CONNECTOR

### DESCRIPTION - STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

### DESCRIPTION - CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

EMISSIONS CONTROL (Continued)

## DESCRIPTION - DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

**Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.**

**NOTE: For a list of DTC's, refer to the charts in this section.**

### BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

### OBTAINING DTC'S USING DRB SCAN TOOL

(1) Connect the DRB scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

(2) Turn the ignition switch on and access the "Read Fault" screen.

(3) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(4) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

| (M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |

| P0217 | Decreased Engine Performance Due To Engine Overheat Condition | Engine overheating. ECM will derate engine performance. |
| P0219 | Crankshaft Position Sensor Overspeed Signal | Engine has exceeded rpm limits. |
| P0222 (M) | Idle Validation Signals Both Low | Problem detected with idle validation circuits within APPS. |
| P0223 (M) | Idle Validation Signals Both High (Above 5 Volts) | Problem detected with idle validation circuits within APPS. |
| P0230 | Transfer Pump (Lift Pump) Circuit Out of Range | Problem detected in fuel transfer pump circuits. |
| P0232 | Fuel Shutoff Signal Voltage Too High | Fuel shut-off signal voltage too high from ECM to fuel injection pump. |
| P0234 (M) | Turbo Boost Limit Exceeded | Problem detected in turbocharger wastegate. |
| P0236 (M) | Map Sensor Too High Too Long | Problem detected in turbocharger wastegate. |
| P0237 (M) | Map Sensor Voltage Too Low | MAP sensor voltage input below the minimum acceptable voltage. |
| P0238 (M) | Map Sensor Voltage Too High | MAP sensor voltage input above the maximum acceptable voltage. |
| P0251 (M) | Fuel Inj. Pump Mech. Failure Fuel Valve Feedback Circuit | Problem sensed with fuel circuit internal to fuel injection pump. |
| P0253 (M) | Fuel Injection Pump Fuel Valve Open Circuit | Problem sensed with fuel circuit internal to fuel injection pump. |
| P0254 | Fuel Injection Pump Fuel Valve Current Too High | Problem caused by internal fuel injection pump failure. |
| P0300 (M) | Multiple Cylinder Mis-fire | Misfire detected in multiple cylinders. |
| P0301 (M) | CYLINDER #1 MISFIRE | Misfire detected in cylinder #1. |
| P0302 (M) | CYLINDER #2 MISFIRE | Misfire detected in cylinder #2. |
| P0303 (M) | CYLINDER #3 MISFIRE | Misfire detected in cylinder #3. |
| P0304 (M) | CYLINDER #4 MISFIRE | Misfire detected in cylinder #4. |
| P0305 (M) | CYLINDER #5 MISFIRE | Misfire detected in cylinder #5. |

EMISSIONS CONTROL (Continued)

|---|---|---|
| (G) Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P0306 (M) | CYLINDER #6 MISFIRE | Misfire detected in cylinder #6. |
| P0307 (M) | CYLINDER #7 MISFIRE | Misfire detected in cylinder #7 |
| P0308 (M) | CYLINDER #8 MISFIRE | Misfire detected in cylinder #8. |
| P0309 (M) | CYLINDER #9 MISFIRE | Misfire detected in cylinder #9. |
| P0310 (M) | CYLINDER #10 MISFIRE | Misfire detected in cylinder #10. |
| P0320 (M) | No Crank Referance Signal at PCM | No reference signal (crankshaft position sensor) detected during engine cranking. |
| P0320 (M) | No RPM Signal to PCM (Crankshaft Position Sensor Signal to JTEC) | A CKP signal has not been detected at the PCM. |
| P0325 | Knock Sensor #1 Circuit | Knock sensor (#1) signal above or below minimum acceptable threshold voltage at particular engine speeds. |
| P0330 | Knock Sensor #2 Circuit | Knock sensor (#2) signal above or below minimum acceptable threshold voltage at particular engine speeds. |
| P0336 (M) | Crankshaft Position (CKP) Sensor Signal | Problem with voltage signal from CKP. |
| P0340 (M) | No Cam Signal At PCM | No fuel sync |
| P0341 (M) | Camshaft Position (CMP) Sensor Signal | Problem with voltage signal from CMP. |
| P0350 | Ignition Coil Draws Too Much Current | A coil (1-5) is drawing too much current. |
| P0351 (M) | Ignition Coil # 1 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time. |
| P0352 (M) | Ignition Coil # 2 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time. |
| P0353 (M) | Ignition Coil # 3 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time. |
| P0354 (M) | Ignition Coil # 4 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time (High Impedance). |
| P0355 (M) | Ignition Coil # 5 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time (High Impedance). |
| P0356 (M) | Ignition Coil # 6 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time (high impedance). |
| P0357 (M) | Ignition Coil # 7 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time (high impedance). |
| P0358 (M) | Ignition Coil # 8 Primary Circuit | Peak primary circuit current not achieved with maximum dwell time (high impedance). |
| P0370 | Fuel Injection Pump Speed/Position Sensor Sig Lost | Problem caused by internal fuel injection pump failure. |
| P0380 (M) | Intake Air Heater Relay #1 Control Circuit | Problem detected in #1 air heater solenoid/relay circuit (not heater element) |
| P0381 (M) | Wait To Start Lamp Inoperative | Problem detected in wait-to-start bulb circuit. |
| P0382 (M) | Intake Air Heater Relay #2 Control Circuit | Problem detected in #2 air heater solenoid/relay circuit (not heater element) |

EMISSIONS CONTROL (Continued)

| | | |
|---|---|---|
| **(M)** Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
| **(G)** Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P0387 | Crankshaft Position Sensor Supply Voltage Too Low | CKP sensor voltage input below the minimum acceptable voltage. |
| P0388 | Crankshaft Position Sensor Supply Voltage Too High | CKP sensor voltage input above the maximum acceptable voltage. |
| P0401 | EGR System Failure | Required change in air/fuel ration not detected during diagnostic test. |
| P0403 | EGR Solenoid Circuit | An open or shorted condition detected in the EGR solenoid control circuit. |
| P0404 | EGR Position Sensor Rationality | EGR position sensor signal does not correlate to EGR duty cycle. |
| P0405 | EGR Position Sensor Volts Too Low | EGR position sensor input below the acceptable voltage range. |
| P0406 | EGR Position Sensor Volts Too High | EGR position sensor input above the acceptable voltage range. |
| P0412 | Secondary Air Solenoid Circuit | An open or shorted condition detected in the secondary air (air switching/aspirator) solenoid control circuit. |
| P0420 (M) | 1/1 Catalytic Converter Efficiency | Catalyst 1/1 efficiency below required level. |
| P0432 (M) | 1/2 Catalytic Converter Efficiency | Catalyst 2/1 efficiency below required level. |
| P0441 (M) | Evap Purge Flow Monitor | Insufficient or excessive vapor flow detected during evaporative emission system operation. |
| P0442 (M) | Evap Leak Monitor Medium Leak Detected | A small leak has been detected in the evaporative system. |
| P0443 (M) | Evap Purge Solenoid Circuit | An open or shorted condition detected in the EVAP purge solenoid control circuit. |
| P0455 (M) | Evap Leak Monitor Large Leak Detected | A large leak has been detected in the evaporative system. |
| P0456 (M) | Evap Leak Monitor Small Leak Detected | Leak has been detected in the evaporative system. |
| P0460 | Fuel Level Unit No Change Over Miles | During low fuel |
| P0460 | Fuel Level Unit No Change Over Miles | Fuel level sending unit voltage does not change for more than 40 miles. |
| P0462 | Fuel Level Sending Unit Volts Too Low | Fuel level sensor input below acceptable voltage. |
| P0462 (M) | Fuel Level Sending Unit Volts Too Low | Open circuit between PCM and fuel gauge sending unit. |
| P0463 | Fuel Level Sending Unit Volts Too High | Fuel level sensor input above acceptable voltage. |
| P0463 (M) | Fuel Level Sending Unit Volts Too High | Circuit shorted to voltage between PCM and fuel gauge sending unit. |
| P0500 (M) | No Vehicle Speed Sensor Signal | No vehicle speed sensor signal detected during road load conditions. |
| P0500 (M) | No Vehicle Speed Sensor Signal | A vehicle speed signal was not detected. |

EMISSIONS CONTROL (Continued)

| **(M)** Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
|---|---|---|
| **(G)** Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P0505 (M) | Idle Air Control Motor Circuits | SBEC II |
| P0522 | Oil Pressure Voltage Too Low | Oil pressure sending unit (sensor) voltage input below the minimum acceptable voltage. |
| P0523 | Oil Pressure Voltage Too High | Oil pressure sending unit (sensor) voltage input above the maximum acceptable voltage. |
| P0524 | Oil Pressure Too Low | Engine oil pressure is low. Engine power derated. |
| P0545 | A/C Clutch Relay Circuit | Problem detected in air conditioning clutch relay control circuit. |
| P0551 | Power Steering Switch Failure | Incorrect input state detected for the power steering switch circuit. PL: High pressure seen at high speed. |
| P0562 | Charging System Voltage Too Low | Supply voltage sensed at ECM too low. |
| P0563 | Charging System Voltage Too High | Supply voltage sensed at ECM too high. |
| P0600 | PCM Failure SPI Communications | No communication detected between co-processors in the control module. |
| P0601 (M) | Internal Controller Failure | Internal control module fault condition (check sum) detected. |
| P0602 (M) | ECM Fueling Calibration Error | ECM Internal fault condition detected. |
| P0604 | RAM Check Failure | Transmission control module RAM self test fault detected. -Aisin transmission |
| P0605 | ROM Check Falure | Transmission control module ROM self test fault detected -Aisin transmission |
| P0606 (M) | ECM Failure | ECM Internal fault condition detected. |
| P0615 | Starter Relay Control Circuit | An open or shorted condition detected in the starter relay control circuit. |
| P0622 (G) | Generator Field Not Switching Properly | An open or shorted condition detected in the generator field control circuit. |
| P0645 | A/C Clutch Relay Circuit | An open or shorted condition detected in the A/C clutch relay control circuit. |
| P0700 | EATX Controller DTC Present | This SBEC III or JTEC DTC indicates that the EATX or Aisin controller has an active fault and has illuminated the MIL via a CCD (EATX) or SCI (Aisin) message. The specific fault must be acquired from the EATX via CCD or from the Aisin via ISO-9141. |
| P0703 | Brake Switch Stuck Pressed or Released | Incorrect input state detected in the brake switch circuit. (Changed from P1595) |
| P0711 (M) | Trans Temp Sensor, No Temp Rise After Start | Relationship between the transmission temperature and overdrive operation and/or TCC operation indicates a failure of the Transmission Temperature Sensor. OBD II Rationality. Was MIL code 37. |
| P0712 | Trans Temp Sensor Voltage Too Low | Transmission fluid temperature sensor input below acceptable voltage. Was MIL code 37. |
| P0712 (M) | Trans Temp Sensor Voltage Too Low | Voltage less than 1.55 volts (4-speed auto. trans. only). |

EMISSIONS CONTROL (Continued)

| | | |
|---|---|---|
| **(M)** Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
| **(G)** Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P0713 | Trans Temp Sensor Voltage Too High | Transmission fluid temperature sensor input above acceptable voltage. Was MIL code 37. |
| P0713 (M) | Trans Temp Sensor Voltage Too High | Voltage greater than 3.76 volts (4-speed auto. trans. only). |
| P0720 (M) | Low Output SPD Sensor RPM, Above 15 MPH | The relationship between the Output Shaft Speed Sensor and vehicle speed is not within acceptable limits. |
| P0720 (M) | Low Output Spd Sensor RPM Above 15 mph | Output shaft speed is less than 60 rpm with vehicle speed above 15 mph (4-speed auto. trans. only). |
| P0740 (M) | Torq Con Clu, No RPM Drop at Lockup | Relationship between engine and vehicle speeds indicated failure of torque convertor clutch lock-up system (TCC/PTU solenoid) |
| P0743 (M) | Torque Converter Clutch Solenoid/ Trans Relay Circuits | An open or shorted condition detected in the torque converter clutch (part throttle unlock) solenoid control circuit. Shift solenoid C electrical fault - Aisin transmission |
| P0743 (M) | Torque Converter Clutch Solenoid/ Trans Relay Circuits | An open or shorted condition detected in the torque converter part throttle unlock solenoid control circuit (3 or 4-speed auto. trans. only). |
| P0748 (M) | Governor Pressur Sol Control/Trans Relay Circuits | An open or shorted condition detected in the Governor Pressure Solenoid circuit or Trans Relay Circuit in JTEC RE transmissions. |
| P0748 (M) | Governor Pressure Sol Control/Trans Relay Circuits | An open or shorted condition detected in the governor pressure solenoid or relay circuits (4-speed auto. trans. only). |
| P0751 (M) | O/D Switch Pressed (Lo) More Than 5 Minutes | Overdrive override switch input is in a prolonged depressed state. |
| P0751 (M) | O/D Switch Pressed (LO) More Than 5 Min | Overdrive Off switch input too low for more than 5 minutes (4-speed auto. trans. only). |
| P0753 (M) | Trans 3-4 Shift Sol/Trans Relay Circuits | An open or shorted condition detected in the overdrive solenoid control circuit or Trans Relay Circuit in JTEC RE transmissions. Was MIL code 45. |
| P0753 (M) | Trans 3-4 Shift Sol/Trans Relay Circuits | An open or shorted condition detected in the transmission 2-4 shift solenoid circuit (4-speed auto. trans. only). |
| P0756 | AW4 Shift Sol B (2-3) Functional Failure | Shift solenoid B (2-3) functional fault - Aisin transmission |
| P0783 (M) | 3-4 Shift Sol, No RPM Drop at Lockup | The overdrive solenoid is unable to engage the gear change from 3rd gear to the overdrive gear. |
| P0801 | Reverse Gear Lockout Circuit Open or Short | An open or shorted condition detected in the transmission reverse gear lock-out solenoid control circuit. |
| P0830 | Clutch Depressed Switch Circuit | Problem detected in clutch switch circuit. |
| P0833 | Clutch Released Switch Circuit | Problem detected in clutch switch circuit. |
| P1110 | Decrease Engine Performance Due To High Intake Air Temperature | Intake manifold air temperature is above the engine protection limit. Engine power will be derated. |
| P1180 | Decreased Engine Performance Due To High Injection Pump Fuel Temp | Fuel temperature is above the engine protection limit. Engine power will be derated. |

EMISSIONS CONTROL (Continued)

| (M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
|---|---|---|
| (G) Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P1195 (M) | 1/1 O2 Sensor Slow During Catalyst Monitor | A slow switching oxygen sensor has been detected in bank 1/1 during catalyst monitor test. (Also see SCI DTC $66) (was P0133) |
| P1196 (M) | 2/1 O2 Sensor Slow During Catalyst Monitor | A slow switching oxygen sensor has been detected in bank 2/1 during catalyst monitor test. (Also see SCI DTC $7A) (was P0153) |
| P1197 | 1/2 O2 Sensor Slow During Catalyst Monitor | A slow switching oxygen sensor has been detected in bank 1/2 during catalyst monitor test. (Also see SCI DTC $68) (was P0139) |
| P1198 | Radiator Temperature Sensor Volts Too High | Radiator coolant temperature sensor input above the maximum acceptable voltage. |
| P1199 | Radiator Temperature Sensor Volts Too Low | Radiator coolant temperature sensor input below the minimum acceptable voltage. |
| P1281 | Engine is Cold Too Long | Engine coolant temperature remains below normal operating temperatures during vehicle travel (Thermostat). |
| P1282 | Fuel Pump Relay Control Circuit | An open or shorted condition detected in the fuel pump relay control circuit. |
| P1283 | Idle Select Signal Invalid | ECM or fuel injection pump module internal fault condition detected. |
| P1284 (M) | Fuel Injection Pump Battery Voltage Out-Of-Range | Fuel injection pump module internal fault condition detected. Engine power will be derated. |
| P1285 (M) | Fuel Injection Pump Controller Always On | Fuel injection pump module relay circuit failure detected. Engine power will be derated. |
| P1286 | Accelerator Position Sensor (APPS) Supply Voltage Too High | High voltage detected at APPS. |
| P1287 | Fuel Injection Pump Controller Supply Voltage Low | ECM or fuel injection pump module internal fault condition detected. Engine power will be derated. |
| P1288 | Intake Manifold Short Runner Solenoid Circuit | An open or shorted condition detected in the short runner tuning valve circuit. |
| P1289 | Manifold Tune Valve Solenoid Circuit | An open or shorted condition detected in the manifold tuning valve solenoid control circuit. |
| P1290 | CNG Fuel System Pressure Too High | Compressed natural gas system pressure above normal operating range. |
| P1291 | No Temp Rise Seen From Intake Heaters | Energizing Heated Air Intake does not change intake air temperature sensor an acceptable amount. |
| P1291 (M) | No Temperature Rise Seen From Intake Air Heaters | Problem detected in intake manifold air heating system. |
| P1292 | CNG Pressure Sensor Voltage Too High | Compressed natural gas pressure sensor reading above acceptable voltage. |
| P1293 | CNG Pressure Sensor Voltage Too Low | Compressed natural gas pressure sensor reading below acceptable voltage. |
| P1294 (M) | Target Idle Not Reached | Target RPM not achieved during drive idle condition. Possible vacuum leak or IAC (AIS) lost steps. |

EMISSIONS CONTROL (Continued)

| (M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
|---|---|---|
| (G) Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P1295 (M) | No 5 Volts to TP Sensor | Loss of a 5 volt feed to the Throttle Position Sensor has been detected. |
| P1295 (M) | Accelerator Position Sensor (APPS) Supply Voltage Too Low | APPS supply voltage input below the minimum acceptable voltage. |
| P1296 | No 5 Volts to MAP Sensor | Loss of a 5 volt feed to the MAP Sensor has been detected. |
| P1297 (M) | No Change in MAP From Start To Run | No difference is recognized between the MAP reading at engine idle and the stored barometric pressure reading. |
| P1298 | Lean Operation at Wide Open Throttle | A prolonged lean condition is detected during Wide Open Throttle |
| P1299 | Vacuum Leak Found (IAC Fully Seated) | MAP Sensor signal does not correlate to Throttle Position Sensor signal. Possible vacuum leak. |
| P1388 | Auto Shutdown Relay Control Circuit | An open or shorted condition detected in the ASD or CNG shutoff relay control ckt. |
| P1388 | Auto Shutdown Relay Control Circuit | An open or shorted condition detected in the auto shutdown relay circuit. |
| P1389 | No ASD Relay Output Voltage At PCM | No Z1 or Z2 voltage sensed when the auto shutdown relay is energized. |
| P1389 (M) | No ASD Relay Output Voltage at PCM | An open condition detected In the ASD relay output circuit. |
| P1390 | Timing Belt Skipped 1 Tooth or More | Relationship between Cam and Crank signals not correct |
| P1391 (M) | Intermittent Loss of CMP or CKP | Loss of the Cam Position Sensor or Crank Position sensor has occurred. For PL 2.0L |
| P1398 (M) | Mis-Fire Adaptive Numerator at Limit | PCM is unable to learn the Crank Sensor's signal in preparation for Misfire Diagnostics. Probable defective Crank Sensor |
| P1399 | Wait To Start Lamp Cicuit | An open or shorted condition detected in the Wait to Start Lamp circuit. |
| P1403 | No 5V to EGR Sens | Loss of 5v feed to the EGR position sensor. |
| P01475 | Aux 5 Volt Supply Voltage High | Sensor supply voltage for ECM sensors is too high. |
| P1476 | Too Little Secondary Air | Insufficient flow of secondary air injection detected during aspirator test (was P0411) |
| P1477 | Too Much Secondary Air | Excessive flow of secondary air injection detected during aspirator test (was P0411). |
| P1478 | Battery Temp Sensor Volts Out of Limit | Internal temperature sensor input voltage out of an acceptable range. |
| P1479 | Transmission Fan Relay Circuit | An open or shorted condition detected in the transmission fan relay circuit. |
| P1480 | PCV Solenoid Circuit | An open or shorted condition detected in the PCV solenoid circuit. |
| P1481 | EATX RPM Pulse Perf | EATX RPM pulse generator signal for misfire detection does not correlate with expected value. |

EMISSIONS CONTROL (Continued)

| (M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
|---|---|---|
| (G) Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P1482 | Catalyst Temperature Sensor Circuit Shorted Low | Catalyst temperature sensor circuit shorted low. |
| P1483 | Catalyst Temperature Sensor Circuit Shorted High. | Catalyst temperature sensor circuit shorted high. |
| P1484 | Catalytic Converter Overheat Detected | A catalyst overheat condition has been detected by the catalyst temperature sensor. |
| P1485 | Air Injection Solenoid Circuit | An open or shorted condition detected in the air assist solenoid circuit. |
| P1486 | Evap Leak Monitor Pinched Hose Found | LDP has detected a pinched hose in the evaporative hose system. |
| P1487 | Hi Speed Rad Fan CTRL Relay Circuit | An open or shorted condition detected in the control circuit of the #2 high speed radiator fan control relay. |
| P1488 | Auxiliary 5 Volt Supply Output Too Low | Auxiliary 5 volt sensor feed is sensed to be below an acceptable limit. |
| P1488 | 5 Volt Supply Voltage Low | Sensor supply voltage for ECM sensors is too low. |
| P1489 | High Speed Fan CTRL Relay Circuit | An open or shorted condition detected in the control circuit of the high speed radiator fan control relay. |
| P1490 | Low Speed Fan CTRL Relay Circuit | An open or shorted condition detected in control circuit of the low speed radiator fan control relay. |
| P1491 | Rad Fan Control Relay Circuit | An open or shorted condition detected in the radiator fan control relay control circuit. This includes PWM solid state relays. |
| P1492 | Ambient/Batt Temp Sen Volts Too High | External temperature sensor input above acceptable voltage. |
| P1492 (M) | Ambient/Batt Temp Sensor Volts Too High | Battery temperature sensor input voltage above an acceptable range. |
| P1493 (M) | Ambient/Batt Temp Sen Volts Too Low | External temperature sensor input below acceptable voltage. |
| P1493 (M) | Ambient/Batt Temp Sen Volts Too Low | Battery temperature sensor input voltage below an acceptable range. |
| P1494 (M) | Leak Detection Pump Sw or Mechanical Fault | Incorrect input state detected for the Leak Detection Pump (LDP) pressure switch. |
| P1495 | Leak Detection Pump Solenoid Circuit | An open or shorted condition detected in the Leak Detection Pump (LDP) solenoid circuit. |
| P1496 | 5 Volt Supply, Output Too Low | 5 volt sensor feed is sensed to be below an acceptable limit. ( less than 4v for 4 sec ) |
| P1498 | High Speed Rad Fan Ground CTRL Rly Circuit | An open or shorted condition detected in the control circuit of the #3 high speed radiator fan control relay. |
| P1499 | Hydraulic cooling fan solenoid circuit | An open or shorted condition detected in the cooling fan control solenoid circuit. |
| P1594 (G) | Charging System Voltage Too High | Battery voltage sense input above target charging voltage during engine operation. |
| P1594 | Charging System Voltage Too High | Battery voltage sense input above target charging voltage during engine operation. |

|---|---|---|
| **(M)** Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
| **(G)** Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P1595 | Speed Control Solenoid Circuits | An open or shorted condition detected in either of the speed control vacuum or vent solenoid control circuits. |
| P1595 | Speed Control Solenoid Circuits | An open or shorted condition detected in the speed control vacuum or vent solenoid circuits. |
| P1596 | Speed Control Switch Always High | Speed control switch input above maximum acceptable voltage. |
| P1597 | Speed Control Switch Always Low | Speed control switch input below minimum acceptable voltage. |
| P1597 | Speed Control Switch Always Low | Speed control switch input below the minimum acceptable voltage. |
| P1598 | A/C Pressure Sensor Volts Too High | A/C pressure sensor input above maximum acceptable voltage. |
| P1598 | A/C Sensor Input Hi | Problem detected in air conditioning electrical circuit. |
| P1599 | A/C Pressure Sensor Volts Too Low | A/C pressure sensor input below minimum acceptable voltage. |
| P1599 | A/C Sensor Input Lo | Problem detected in air conditioning electrical circuit. |
| P1680 | Clutch Released Switch Circuit | Problem detected in clutch switch electrical circuit. |
| P1681 | No I/P Cluster CCD/J1850 Messages Received | No CCD/J1850 messages received from the cluster control module. |
| P1682 (G) | Charging System Voltage Too Low | Battery voltage sense input below target charging voltage during engine operation and no significant change in voltage detected during active test of generator output circuit. |
| P1682 | Charging System Voltage Too Low | Charging system output voltage low. |
| P1683 | SPD CTRL PWR Relay; or S/C 12v Driver CKT | An open or shorted condition detected in the speed control servo power control circuit. |
| P1683 | Spd ctrl pwr rly, or s/c 12v driver circuit | An open or shorted condition detected in the speed control servo power control circuit. |
| P1684 | Batt Loss in 50 Star | The battery has been disconnected within the last 50 starts |
| P1685 | SKIM Invalid Key | The engine controler has received an invalid key from the SKIM. |
| P1686 | No SKIM BUS Messages Received | No CCD/J1850 messages received from the Smart Key Immobilizer Module (SKIM). |
| P1687 | No MIC BUS Message | No CCD/J1850 messages received from the Mechanical Instrument Cluster (MIC) module. |
| P1688 (M) | Internal Fuel Injection Pump Controller Failure | Internal problem within the fuel injection pump. Low power, engine derated, or engine stops. |
| P1689 (M) | No Communication Between ECM and Injection Pump Module | Data link circuit failure between ECM and fuel injection pump. Low power, engine derated, or engine stops. |
| P1690 (M) | Fuel Injection Pump CKP Sensor Does Not Agree With ECM CKP Sensor | Problem in fuel sync signal. Possible injection pump timing problem. Low power, engine derated, or engine stops. |

EMISSIONS CONTROL (Continued)

| **(M)** Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel. | | |
|---|---|---|
| **(G)** Generator lamp illuminated | | |
| Generic Scan Tool P-Code | DRB Scan Tool Display | Brief Description of DTC |
| P1691 | Fuel Injection Pump Controller Calibration Error | Internal fuel injection pump failure. Low power, engine derated, or engine stops. |
| P1692 | DTC Set In ECM | A ″Companion DTC″ was set in both the ECM and PCM. |
| P1693 (M) | DTC Detected in Companion Module | A fault has been generated in the companion engine control module. |
| P1693 (M) | DTC Detected in PCM/ECM or DTC Detected in ECM | A ″Companion DTC″ was set in both the ECM and PCM. |
| P1694 | Fault In Companion Module | No CCD/J1850 messages received from the powertrain control module-Aisin transmission |
| P1694 (M) | No CCD Messages received from ECM | Bus communication failure to PCM. |
| P1695 | No CCD/J1850 Message From Body Control Module | No CCD/J1850 messages received from the body control module. |
| P1696 | PCM Failure EEPROM Write Denied | Unsuccessful attempt to write to an EEPROM location by the control module. |
| P1697 | PCM Failure SRI Mile Not Stored | Unsuccessful attempt to update Service Reminder Indicator (SRI or EMR) mileage in the control module EEPROM. |
| P1698 | No CCD/J1850 Message From TCM | No CCD/J1850 messages received from the electronic transmission control module (EATX) or the Aisin transmission controller. |
| P1698 | No CCD Messages received from PCM | Bus communication failure to PCM. A ″Companion DTC″ was set in both the ECM and PCM. |
| P1719 | Skip Shift Solenoid Circuit | An open or shorted condition detected in the transmission 2-3 gear lock-out solenoid control circuit. |
| P1740 | TCC or OD Sol Perf | A rationality error has been detected in either the TCC solenoid or overdrive solenoid systems. |
| P1740 (M) | TCC OR O/D Solenoid Performance | Problem detected in transmission convertor clutch and/or overdrive circuits (diesel engine with 4-speed auto. trans. only). |
| P1756 (M) | GOV Press Not Equal to Target @ 15-20 PSI | The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear. (Mid Pressure Malfunction) |
| P1756 (M) | Governor Pressure Not Equal to Target @ 15-20 PSI | Governor sensor input not between 10 and 25 psi when requested (4-speed auto. trans. only). |
| P1757 | GOV Press Not Equal to Target @ 15-20 PSI | The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear (Zero Pressure Malfunction) |
| P1757 (M) | Governor Pressure Above 3 PSI In Gear With 0 MPH | Governor pressure greater than 3 psi when requested to be 0 psi (4-speed auto. trans. only). |

| P1899 (M) | P/N Switch Stuck in Park or in Gear | Incorrect input state detected for the Park/Neutral switch. |
| P1899 (M) | P/N Switch Stuck in Park or in Gear | Incorrect input state detected for the Park/Neutral switch (3 or 4-speed auto. trans. only). |

## DESCRIPTION - TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the 'Task Manager'.

## DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

**Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.**

The following is an operation and description of each system monitor:

## OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely propor-

EMISSIONS CONTROL (Continued)

tional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

## OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault MUST be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

## LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5” H20. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040” orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

EMISSIONS CONTROL (Continued)

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the 02 control system. If fuel vapor, indicated by a shift in the 02 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

## MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

## FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O2S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O2S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

## CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

EMISSIONS CONTROL (Continued)

## DESCRIPTION - TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Contiuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

## DESCRIPTION - COMPONENT MONITORS - GAS ENGINES

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater, and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks, or any component that has an associated limp-in, will set a fault after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

## DESCRIPTION - COMPONENT MONITORS - DIESEL ENGINES

There are several electrical components that will affect vehicle emissions if they malfunction. If one of these components is malfunctioning, a Diagnostic Trouble Code (DTC) will be set by either the Powertrain Control Module (PCM) or the Engine Control Module (ECM). The Malfunction Indicator Lamp (MIL) will then be illuminated when the engine is running.

These electrically operated components have input (rationality) and output (functionality) checks. A check is done by one or more components to check the operation of another component.

**Example:** The Intake Manifold Air Temperature (IAT) sensor is used to monitor intake manifold air temperature over a period of time after a cold start. If the temperature has not risen to a certain specification during a specified time, a Diagnostic Trouble Code (DTC) will be set for a problem in the manifold air heater system.

All open/short circuit checks, or any component that has an associated limp-in will set a DTC and trigger the MIL after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

## OPERATION - GAS ENGINES

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon (graphic) on the instrument panel. Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a spe-

EMISSIONS CONTROL (Continued)

cific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16–way data link connector (Fig. 3).

**NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16–way data link connector to erase all DTC's and extinguish the MIL.**

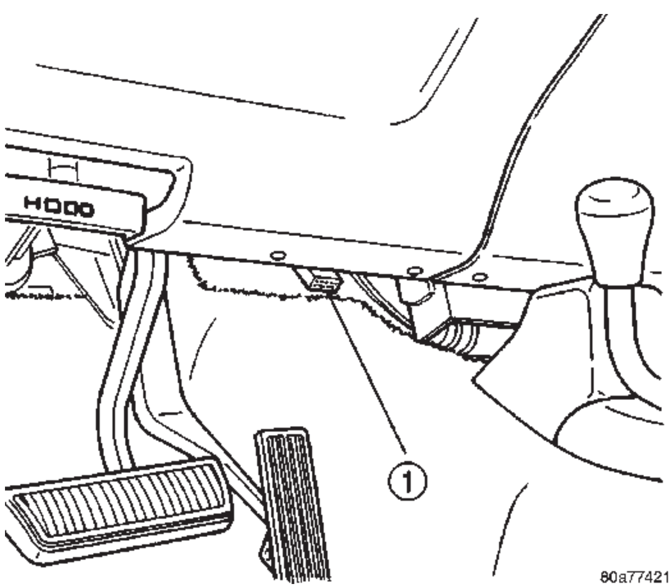

***Fig. 3 16-WAY DATA LINK CONNECTOR***

1 - DATA LINK CONNECTOR

## OPERATION - DIESEL

The PCM and ECM monitor many different circuits in the powertrain system. If the ECM or PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the ECM's or PCM's memory. With certain DTC's, if the problem is repaired or ceases to exist, the ECM or PCM cancels the code after 40 warm-up cycles. Certain other DTC's may be cancelled after 1 or 2 good "trips". Refer to Trip Definition. DTC's that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon (graphic) on the instrument panel. Refer to Malfunction Indicator Lamp.

Certain DTC's will set a "companion DTC" in the opposite control module. This means that after repair, the DTC must be erased from **both** modules.

Certain criteria must be met before the ECM or PCM will store a DTC in memory. The criteria may be a specific range of engine RPM, throttle opening, engine temperature or input voltage.

The ECM or PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example,** assume the DTC criteria requires the ECM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the ECM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the ECM will not store a DTC.

There are several operating conditions for which the ECM and PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16–way data link connector (Fig. 3). Refer to the Diagnostic Trouble Code chart (list). **Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.**

Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, disconnecting a relay or removing an electrical connector while the engine is running. When a repair is completed and verified, connect the DRB scan tool to the 16–way data link connector to erase all ECM and PCM DTC's and extinguish the MIL.

## OPERATION - TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to

EMISSIONS CONTROL (Continued)

determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

## Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are know as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precis diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

## MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MILL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

## Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

### *Priorities*

- Priority 0 —Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

EMISSIONS CONTROL (Continued)

### DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±10% of when the fault occurred.

**NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.**

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

### Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

**Good Trip**

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)
- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

**Specific Good Trip**

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.
- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

**Fuel System Good Trip**

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

**Misfire Good Trip**

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

**Warm-Up Cycles**

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

### Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

**CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.**

## Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

**FUEL SYSTEM**

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

**MISFIRE**

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.
- **Misfire Data**— Data collected during test.
- **Test Done This Trip**— Indicates YES when the test is done.

## OPERATION - NON-MONITORED CIRCUITS - GAS ENGINES

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. **EXAMPLE:** a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

EMISSIONS CONTROL (Continued)

#### FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

#### SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

#### CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

#### EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

#### FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

#### EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

#### THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

#### VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

#### PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

#### PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

### OPERATION - NON-MONITORED CIRCUITS - DIESEL

The PCM and/or the ECM will not monitor certain malfunctioning circuits or components that could cause driveability problems. Also, a Diagnostic Trouble Code (DTC) might not be stored for these malfunctions. However, problems with these circuits or components may cause the PCM/ECM to store DTC's for other circuits or components. **EXAMPLES:** A cylinder with low compression will not set a DTC directly, but may cause an engine misfire. This in turn may cause the ECM to set a DTC for an engine misfire. Or, a dirty or plugged air filter will not set a DTC directly, but may cause lack of turbocharger boost. This in turn may cause the ECM to set a DTC for a boost pressure malfunction.

#### FUEL PRESSURE

Primary fuel pressure from the fuel tank to the fuel injection pump is supplied by the low-pressure fuel transfer pump. High-pressure to the fuel injectors is supplied by the fuel injection pump. The ECM cannot detect actual fuel pressure, a clogged fuel filter, clogged fuel screen, or a pinched fuel supply or return line. However, a DTC may be set due to an engine misfire.

#### CYLINDER COMPRESSION

The ECM cannot detect uneven, low, or high engine cylinder compression. However, these could result in a possible misfire which may set a DTC.

#### EXHAUST SYSTEM

The ECM cannot detect a plugged, restricted or leaking exhaust system. However, DTC's may be set for engine misfire, high intake manifold temperature, high engine coolant temperature, turbocharger overboost or turbocharger underboost.

#### FUEL INJECTOR MECHANICAL MALFUNCTIONS

The ECM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a possible misfire which may set a DTC.

#### EXCESSIVE OIL CONSUMPTION

The ECM cannot determine excessive oil consumption. However, if excess oil consumption is high enough, it could result in a possible engine misfire which may set a DTC.

EMISSIONS CONTROL (Continued)

### AIR FLOW

The ECM cannot detect a clogged, restricted or dirty air filter element, or a restriction in the air inlet system. However, these could result in a possible misfire which may set a DTC.

### AIR PRESSURE LEAKS

The ECM cannot detect leaks or restrictions in the air intake system. However, these could cause the ECM to store a Manifold Air Pressure (MAP) sensor DTC (boost pressure problem detected).

### PCM/ECM SYSTEM GROUNDS

The PCM/ECM cannot directly determine poor system grounds. However, one or more DTC's may be generated as a result of poor grounds.

### PCM/ECM CONNECTOR ENGAGEMENT

The PCM/ECM may not be able to determine spread, damaged or corroded connector pins. However, it might store DTC's as a result of spread connector pins (circuits that are open).

# AIR INJECTION

## TABLE OF CONTENTS

## AIR INJECTION

### DESCRIPTION - AIR INJECTION SYSTEM

The air injection system (Fig. 1), (Fig. 2) or (Fig. 3) is used on 5.9L V-8 and 8.0L V-10 heavy duty cycle (HDC) gas powered engines only. The air injection system consists of:

- A belt-driven air injection (AIR) pump
- Two air pressure relief valves
- Rubber connecting air injection hoses with clamps
- Metal connecting air tubes
- Two one-way check valves
- A replaceable injection pump air filter (8.0L V-10 engine only)

## OPERATION - AIR INJECTION SYSTEM

The air injection system adds a controlled amount of air to the exhaust gases aiding oxidation of hydrocarbons and carbon monoxide in the exhaust stream. The system does not interfere with the ability of the EGR system (if used) to control nitrous oxide (NOx) emissions.

**5.9L HDC ENGINE:** Air is drawn into the pump through a rubber tube that is connected to a fitting on the air cleaner housing (Fig. 2).

**8.0L V-10 ENGINE:** Air is drawn into the pump through a rubber tube that is connected to a fitting on the air injection pump filter housing (Fig. 3). Air is drawn into the filter housing from the front of the vehicle with rubber tube. This tube is used as a silencer to help prevent air intake noise at the opening to the pump filter housing. An air filter is located within the air pump filter housing (Fig. 3).

Air is then compressed by the air injector pump. It is expelled from the pump and routed into a rubber tube where it reaches the air pressure relief valve (Fig. 1). Pressure relief holes in the relief valve will prevent excess downstream pressure. If excess downstream pressure occurs at the relief valve, it will be vented into the atmosphere.

Air is then routed (Fig. 1) from the relief valve, through a tube, down to a ″Y″ connector, through the two one-way check valves and injected at both of the catalytic convertors (referred to as downstream).

The two one-way check valves (Fig. 1) protect the hoses, air pump and injection tubes from hot exhaust gases backing up into the system. Air is allowed to flow through these valves in one direction only (towards the catalytic convertors).

Downstream air flow assists the oxidation process in the catalyst, but does not interfere with EGR operation (if EGR system is used).

## AIR INJECTION PUMP

### DESCRIPTION

The air pump is mounted on the front of the engine and driven by a belt connected to the crankshaft pulley (Fig. 4).

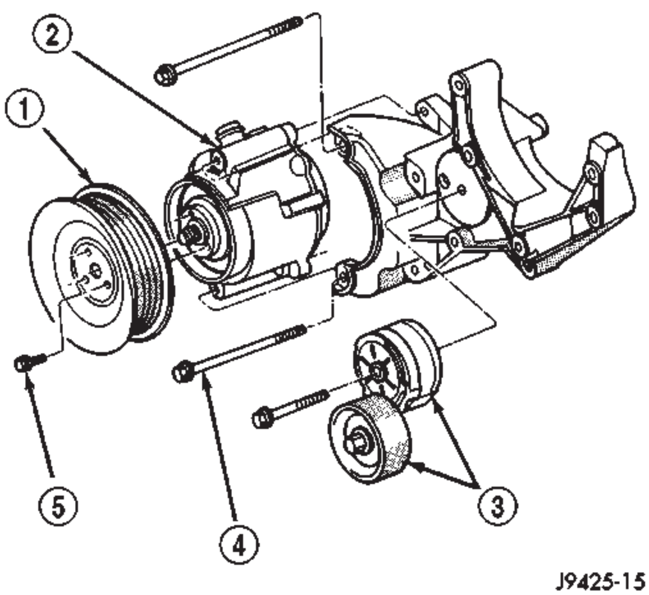

***Fig. 4 Air Injection Pump Mounting—Typical***

1 - PUMP PULLEY
2 - AIR PUMP
3 - AUTOMATIC BELT TENSIONER
4 - PUMP MOUNTING BOLTS (2)
5 - PULLEY BOLTS

### OPERATION

Refer to Air Injection System Description and Operation for information.

### DIAGNOSIS AND TESTING - AIR INJECTION PUMP

**The air injection system and air injection pump is not completely noiseless.** Under normal conditions, noise rises in pitch as engine speed increases. To determine if excessive noise is fault of air injection system, disconnect accessory drive belt and temporarily operate engine. **Do not allow engine to overheat when operating without drive belt.**

**CAUTION: Do not attempt to lubricate the air injection pump. Oil in the pump will cause rapid deterioration and failure.**

AIR INJECTION PUMP (Continued)

| | | |
|---|---|---|
| EXCESSIVE BELT NOISE | 1. Loose belt or defective automatic belt tensioner. | 1. Refer to Cooling System. |
| | 2. Seized pump. | 2. Replace pump. |
| EXCESSIVE PUMP NOISE CHIRPING | 1. Insufficient break-in. | 1. Recheck for noise after 1600 km (1,000 miles) of operation. |
| EXCESSIVE PUMP NOISE CHIRPING, RUMBLING, OR KNOCKING | 1. Leak in hose. | 1. Locate source of leak using soap solution and correct. |
| | 2. Loose hose. | 2. Reassemble and replace or tighten hose clamp. |
| | 3. Hose touching other engine parts. | 3. Adjust hose position. |
| | 4. Relief valve inoperative. | 4. Replace relief valve. |
| | 5. Check valve inoperative. | 5. Replace check valve. |
| | 6. Pump mounting fasteners loose. | 6. Tighten mounting screws as specified. |
| | 7. Pump failure. | 7. Replace pump. |
| NO AIR SUPPLY. ACCELERATE ENGINE TO 1500 RPM AND OBSERVE AIR FLOW FROM HOSES. IF FLOW INCREASES AS RPM'S INCREASE, PUMP IS FUNCTIONING NORMALLY. IF NOT, CHECK POSSIBLE CAUSE. | 1. Loose drive belt. | 1. Refer to Cooling System. |
| | 2. Leaks in supply hose. | 2. Locate leak and repair or replace as required. |
| | 3. Leak at fitting(s). | 3. Tighten and replace clamps. |
| | 4. Check valve inoperative. | 4. Replace check valve. |
| | 5. Plugged inlet air filter (8.0L). | 5. Replace filter |

### REMOVAL

The air injection pump does not have any internal serviceable parts.

(1) Disconnect both of the hoses (tubes) at the air injection pump.

(2) Loosen, but do not remove at this time, the three air pump pulley mounting bolts (Fig. 4).

(3) Relax the automatic belt tensioner and remove the engine accessory drive belt. Refer to Cooling System. See Belt Removal/Installation.

(4) Remove the three air pump pulley bolts and remove pulley from pump.

(5) Remove the two air pump mounting bolts (Fig. 4) and remove pump from mounting bracket.

### INSTALLATION

(1) Position air injection pump to mounting bracket.

(2) Install two pump mounting bolts to mounting bracket. Tighten bolts to 40 N·m (30 ft. lbs.) torque.

(3) Install pump pulley and three mounting bolts. Tighten bolts finger tight.

(4) Relax tension from automatic belt tensioner and install drive belt. Refer to Cooling System. See Belt Removal/Installation.

(5) Tighten pump pulley bolts to 11 N·m (105 in. lbs.) torque.

(6) Install hoses and hose clamps at pump.

## AIR PUMP FILTER

### REMOVAL

The air filter for the air injection pump is located inside a housing located in right-front side of engine compartment (Fig. 3). A rubber hose connects the filter housing to air injection pump. The filter is used with 8.0L V-10 engines only.

(1) Remove rubber tubes at filter housing.

(2) Remove filter housing mounting nut and remove housing.

(3) Remove lid from filter housing (snaps off).

(4) Remove filter from housing.

### INSTALLATION

The air filter for the air injection pump is located inside a housing located in right-front side of engine compartment (Fig. 3). A rubber hose connects the filter housing to air injection pump. The filter is used with 8.0L V-10 engines only.

AIR PUMP FILTER (Continued)

(1) Clean inside of housing and lid before installing new filter.
(2) Install filter into housing.
(3) Install lid to filter housing (snaps on).
(4) Position filter housing to fender.
(5) Install mounting nut and tighten to 11 N·m (8 ft. lbs.) torque.
(6) Install rubber tubes and cap at filter housing.

# ONE WAY CHECK VALVE

## DESCRIPTION

**For air injection systems:** A pair of one-way check valves is used with the air injection system. The check valves (Fig. 1) are located on each of the air injection downstream tubes.

## OPERATION

Each one-way check valve has a one-way diaphragm which prevents hot exhaust gases from backing up into the air injection hose and air injection pump. The check valve will protect the system if the air injection pump belt fails, an air hose ruptures or exhaust system pressure becomes abnormally high.

## DIAGNOSIS AND TESTING - ONE-WAY CHECK VALVE

The one-way check valves are not repairable. To determine condition of valve, remove the rubber air tube from the inlet side of each check valve. Start the engine. If exhaust gas is escaping through the inlet side of check valve, it must be replaced.

## REMOVAL

(1) Remove the hose clamp at inlet side of valve.
(2) Remove hose from valve.
(3) Remove valve from catalyst tube (unscrew). **To prevent damage to catalyst tube, a backup wrench must be used on the tube.**

## INSTALLATION

(1) Install valve to catalyst tube. Tighten to 33 N·m (25 ft. lbs.) torque.
(2) Install hose and hose clamp to valve.

# EVAPORATIVE EMISSIONS

## TABLE OF CONTENTS

# EVAPORATIVE EMISSIONS

## DESCRIPTION - EVAP SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes into the two charcoal filled evaporative canisters. The canisters temporarily hold the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

All 3.9L/5.2L/5.9L/8.0L gasoline powered engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid for additional information.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system. This pump is used as part of OBD II requirements. Refer to Leak Detection Pump in this group for additional information.

**NOTE: The hoses used in this system are specially manufactured. If replacement becomes necessary, it is important to use only fuel resistant hose.**

# SPECIFICATIONS

# CCV HOSE

## DESCRIPTION - 8.0L

The 8.0L V-10 engine is equipped with a Crankcase Ventilation (CCV) system. The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled valve (PCV valve).

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 1) of a calibrated size 2.6 mm (0.10 inches).

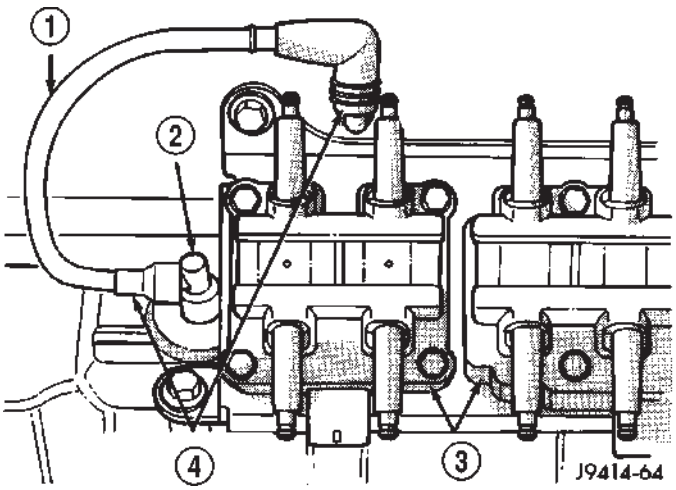

***Fig. 1 Fixed Orifice Fitting—8.0L V-10 Engine—Typical***

1 - VACUUM TUBE
2 - FIXED ORIFICE FITTING
3 - COIL PACKS
4 - ORIFICE FITTING HOSE CONNECTIONS

## OPERATION - 8.0L

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 1) of a calibrated size 2.6 mm (0.10 inches). The fitting meters the amount of crankcase vapors drawn out of the engine. **The fixed orifice fitting is grey in color.** A similar fitting (but does not contain a fixed orifice) is used on the left cylinder head (valve) cover. This fitting is black in color. Do not interchange these two fittings.

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Manifold vacuum draws the vapor/air mixture through the fixed orifice and into the intake manifold. The vapors are then consumed during engine combustion.

# CRANKCASE VENT HOSE

## OPERATION

The crankcase breather/filter is no longer used with the 3.9L, 5.2L or 5.9L engine.

# EVAP/PURGE SOLENOID

## DESCRIPTION

All 3.9L/5.2L/5.9L/8.0L gasoline powered engines use a duty cycle EVAP canister purge solenoid. The solenoid regulates the rate of vapor flow from the EVAP canister to the throttle body. The Powertrain Control Module (PCM) operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM energizes and de-energizes the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time the solenoid energizes. The PCM adjusts solenoid pulse width based on engine operating condition.

## REMOVAL

The duty cycle solenoid is attached to a bracket mounted to the right inner fender (Fig. 2).

(1) Disconnect electrical wiring connector at solenoid (Fig. 2).
(2) Disconnect vacuum harness at solenoid.
(3) Remove solenoid from support bracket.

## INSTALLATION

(1) Install solenoid assembly to support bracket.
(2) Connect vacuum harness.
(3) Connect wiring connector.

# FUEL FILLER CAP

## DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

## OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

**CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a Leak Detection Pump (LDP), the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.**

## REMOVAL/INSTALLATION

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

**CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.**

# LEAK DETECTION PUMP

## DESCRIPTION

The Leak Detection Pump (LDP) is used only with certain emission packages.

The LDP is a device used to detect a leak in the evaporative system.

The pump contains a 3 port solenoid, a pump that contains a switch, a spring loaded canister vent valve seal, 2 check valves and a spring/diaphragm.

Immediately after a cold start, engine temperature between 40°F and 86°F, the 3 port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non-test test conditions, the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling. This is due to the operation of the 3 port solenoid which prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized, allowing atmospheric pressure to enter the pump cavity. This permits the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de-energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

**PUMP MODE:** The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test time.

**TEST MODE:** The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5 inches of water.

When the pump starts, the cycle rate is quite high. As the system becomes pressurized pump rate drops. If there is no leak the pump will quit. If there is a leak, the test is terminated at the end of the test mode.

If there is no leak, the purge monitor is run. If the cycle rate increases due to the flow through the purge system, the test is passed and the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

A typical system schematic is shown in (Fig. 3).

## REMOVAL

The LDP and LDP filter are attached to a bracket mounted to the right-inner fender (Fig. 2). The LDP and LDP filter are replaced (serviced) as one unit.

(1) Carefully remove hose at LDP filter.

(2) Remove LDP filter mounting bolt and remove from vehicle.

(3) Carefully remove vapor/vacuum lines at LDP.

(4) Disconnect electrical connector at LDP (Fig. 2).

(5) Remove LDP mounting screws and remove LDP from vehicle.

## INSTALLATION

The LDP and LDP filter are attached to a bracket mounted to the right-inner fender (Fig. 2). The LDP and LDP filter are replaced (serviced) as one unit.

(1) Install LDP to mounting bracket. Tighten screws to 1 N·m (11 in. lbs.) torque.

(2) Install LDP filter to mounting bracket. Tighten bolt to 7 N·m (65 in. lbs.) torque.

(3) Carefully install vapor/vacuum lines to LDP, and install hose to LDP filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

(4) Connect electrical connector to LDP.

# PCV FILTER

## DESCRIPTION

The crankcase breather/filter is no longer used with the 3.9L, 5.2L or 5.9L engine.

# PCV VALVE

## DESCRIPTION - V-6/V-8 ENGINES

All 3.9L V-6 and 5.2L/5.9L V-8 gas powered engines are equipped with a closed crankcase ventilation system and a positive crankcase ventilation (PCV) valve. The 8.0L V-10 engine is not equipped with a PCV valve. Refer to Crankcase Ventilation System—8.0L V-10 Engine for information.

This system consists of a PCV valve mounted on the cylinder head (valve) cover with a hose extending from the valve to the intake manifold (Fig. 4). Another hose connects the opposite cylinder head (valve) cover to the air cleaner housing to provide a source of clean air for the system. A separate crankcase breather/filter is not used.

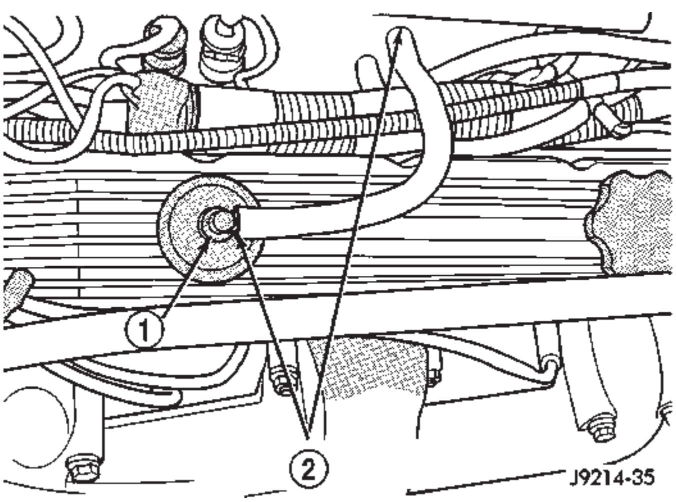

*Fig. 4 Typical PCV Valve/Hose (Non–California Shown)*

1 - PCV VALVE
2 - PCV VALVE HOSE CONNECTIONS

## OPERATION - V-6/V-8 ENGINES

The PCV system operates by engine intake manifold vacuum (Fig. 5). Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

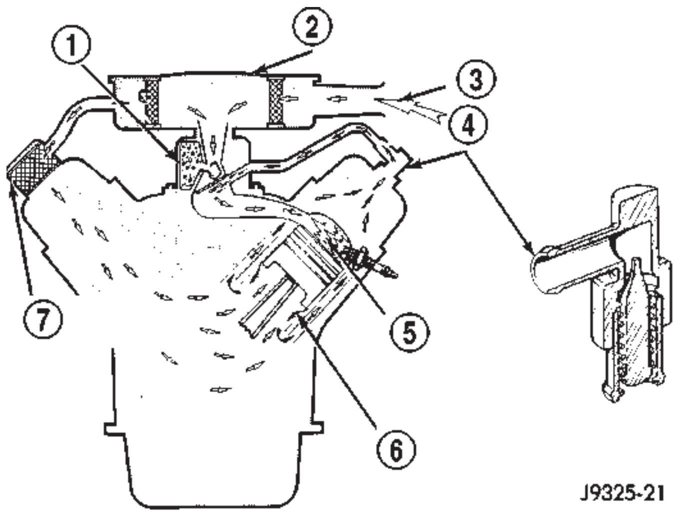

*Fig. 5 Typical Closed Crankcase Ventilation System*

1 - THROTTLE BODY
2 - AIR CLEANER
3 - AIR INTAKE
4 - PCV VALVE
5 - COMBUSTION CHAMBER
6 - BLOW-BY GASES
7 - CRANKCASE BREATHER/FILTER

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat (Fig 6). This will prevent vapors from flowing through the valve.

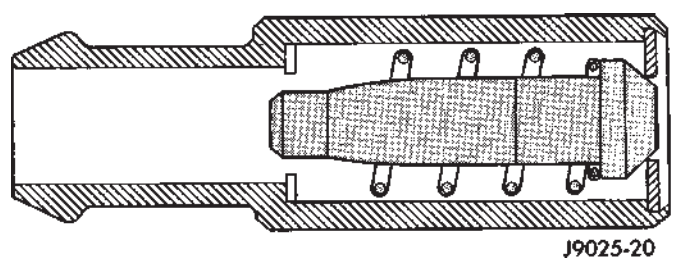

*Fig. 6 Engine Off or Engine Pop-Back—No Vapor Flow*

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve (Fig. 7). In this position there is minimal vapor flow through the valve.

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve (Fig. 8).

PCV VALVE (Continued)

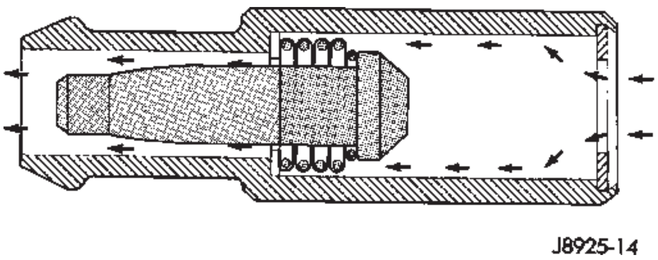

*Fig. 7 High Intake Manifold Vacuum—Minimal Vapor Flow*

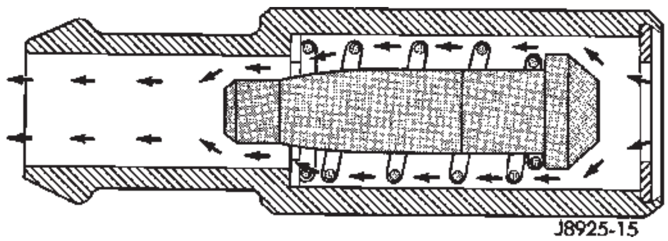

*Fig. 8 Moderate Intake Manifold Vacuum—Maximum Vapor Flow*

## DIAGNOSIS AND TESTING - PCV VALVE - V–6/V–8 ENGINES

(1) With engine idling, remove the PCV valve from cylinder head (valve) cover. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. Also, a strong vacuum should be felt at the valve inlet (Fig. 9).

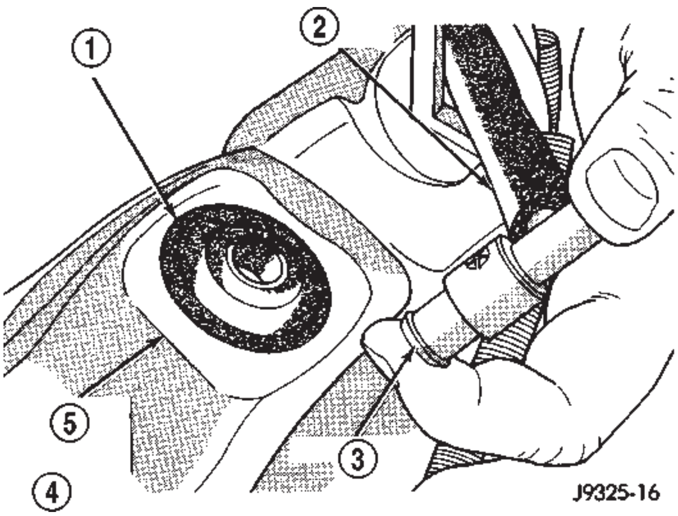

*Fig. 9 Vacuum Check at PCV*

1 - PCV VALVE GROMMET
2 - PCV HOSE
3 - PCV VALVE
4 - VACUUM MUST BE FELT AGAINST FINGER
5 - ENGINE VALVE COVER

(2) Return the PCV valve into the valve cover. Remove the fitting and air hose at the opposite valve cover. Loosely hold a piece of stiff paper, such as a parts tag, over the opening (rubber grommet) at the valve cover (Fig. 10).

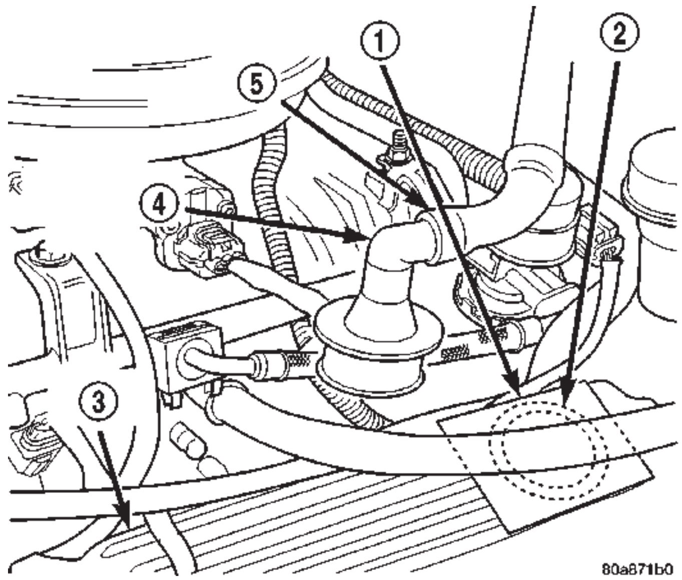

*Fig. 10 Vacuum Check at Valve Cover Opening*

1 - STIFF PAPER PLACED OVER RUBBER GROMMET
2 - RUBBER GROMMET
3 - VALVE COVER
4 - FITTING REMOVED FROM VALVE COVER
5 - AIR TUBE

(3) The paper should be drawn against the opening in the valve cover with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

(4) Turn engine off and remove PCV valve from valve cover. The valve should rattle when shaken (Fig. 11).

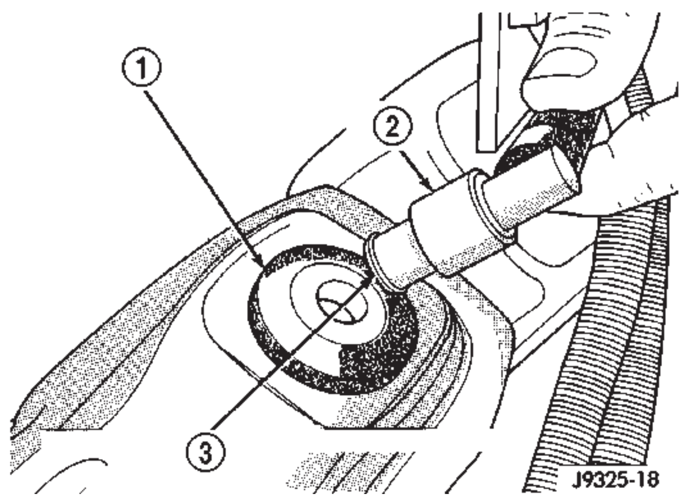

*Fig. 11 Shake PCV*

1 - PCV VALVE GROMMET
2 - PCV VALVE
3 - PCV VALVE MUST RATTLE WHEN SHAKEN

PCV VALVE (Continued)

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.**

(6) If the paper is not held against the opening in valve cover after new valve is installed, the PCV valve hose may be restricted and must be replaced. The passage in the intake manifold must also be checked and cleaned.

(7) To clean the intake manifold fitting, turn a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

# VACUUM LINES

## DIAGNOSIS AND TESTING - VACUUM SCHEMATICS

A vacuum schematic for emission related items can be found on the VECI label. Refer to Vehicle Emission Control Information (VECI) Label in this group for label location.

# VAPOR CANISTER

## DESCRIPTION

Two, maintenance free, EVAP canisters are used with all 3.9L/5.2L/5.9L/8.0L gasoline powered engines. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 12).

## OPERATION

Two, maintenance free, EVAP canisters are used with all 3.9L/5.2L/5.9L/8.0L gasoline powered engines.The EVAP canisters are filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canisters are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canisters. Fuel vapors are temporarily held in the canisters until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canisters to be purged at predetermined times and at certain engine operating conditions.

## REMOVAL

Two EVAP canisters are used. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 13).

(1) Remove fuel tubes/lines at each EVAP canister. Note location of tubes/lines before removal for easier installation.

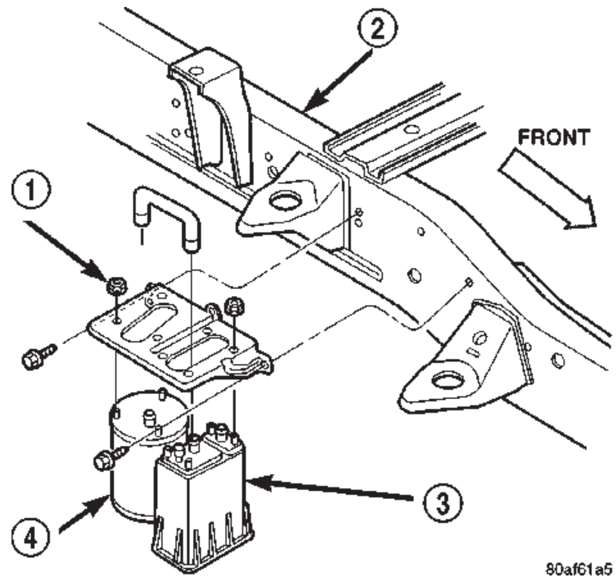

*Fig. 12 Location of EVAP Canisters*

2 - FRAME RAIL (RIGHT)
3 - FRONT EVAP CANISTER
4 - REAR EVAP CANISTER

(2) Remove mounting nuts at each canister (Fig. 13).

(3) Remove each canister from mounting bracket.

VAPOR CANISTER (Continued)

## INSTALLATION

Two EVAP canisters are used. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 13).

(1) Place each canister to mounting bracket (Fig. 13).

(2) Install nuts and tighten to 9 N·m (80 in. lbs.) torque.

(3) Install fuel tubes/lines to each canister.

# NEW VEHICLE PREPARATION

TABLE OF CONTENTS

## INTRODUCTION

### DESCRIPTION - THE IMPORTANCE OF CAREFUL NEW VEHICLE PREPARATION

Today, the automobile industry is more competitive than it has been for decades. Automakers around the world, including DaimlerChrysler, have made tremendous improvements in the quality of their vehicles.

As a result, customer expectations have also risen. Today's customers are more particular about their vehicles than ever before. The result is that problems once regarded as insignificant (such as a squeak or rattle) can now make the difference between a repeat customer and one who never purchases another vehicle from you dealership or another DaimlerChrysler Corporation product.

As a technician preparing a new car or truck for delivery, you are the final step in the entire quality process. Your inspection is the final opportunity to detect any flaws that would disappoint the customer. Your efforts will reflect upon the thousands of men and women who design, engineer and build DaimlerChrysler products as well as upon your dealership and on yourself as a competent, conscientious technician.

As manufacturing quality has improved, prep procedures have come to serve as additional quality checks. However, there are several compelling reasons for careful new vehicle preparation.

- Safety-You assure the customer that his or her new vehicle meets all federal safety standards.
- Emissions Controls-When your customers are assured that their new cars meet emissions standards, they will know that they are contributing to cleaner air and helping control pollution.
- Customer Satisfaction-First impressions are very important on a new vehicle. Careful new vehicle preparation will impress your customer.
- Competition-It is common knowledge in the industry that the availability of efficient service is one of the decisive factors in determining which cars will sell. A vehicle delivered to your customers in first class condition, inside and out, will bring them back to the dealership for the kind of service you have led them to expect and for their next new car.

This information outlines service procedures which will ensure that DaimlerChrysler Corporation vehicles are ready for delivery to the customer when they are complete. These procedures follow a logical order, from a careful underhood inspection, to the moment when you complete the warranty certificate and turn the keys over to your customer.

When you have completed the procedures described in this information, both you and your customer will be assured that his or her new vehicle will perform as expected.

### USING THE MANUAL

This guide to new vehicle preparation covers all items on the New Vehicle Preparation Form (Fig. 1).

INTRODUCTION (Continued)

DAIMLERCHRYSLER

# NEW VEHICLE PREPARATION

**Inspection and Road Test - Passenger Cars and Trucks**

| REPAIR ORDER NUMBER | DEALER STOCK NUMBER | KEY CODES | MAKE & YEAR | MODEL | DATE PERFORMED | TECHNICIAN NUMBER |
|---|---|---|---|---|---|---|
| | | | | | | |

| VEHICLE IDENTIFICATION NUMBER | MILEAGE (EXCLUDING 10THS) | CUSTOMER NAME | |
|---|---|---|---|
| | | | XXXXX |

**PERFORM THE INSPECTION AND ADJUSTMENTS AS LISTED BELOW**

**NOTE:** Refer To The New Vehicle Preparation Manual For Proper Preparation Procedures. Refer To The Appropriate Service Manual For Specifications And Service Procedures. Conditions Which Can Be Corrected By The Minor Adjustments Specified Below Are Considered Part Of Normal New Vehicle Preparation. Items That Require Correction Beyond The Minor Adjustments Specified Are Eligible For Warranty Reimbursement.

### A. UNDER HOOD

1. **Hood Latch/Safety Catch (Adjust As Required)**
   - ☐ Check For Proper Operation
2. **Fluid Levels (Check For Proper Level And Top Off As Required)**
   - ☐ Engine Oil
   - ☐ Automatic Transmission
   - ☐ Clutch Master Cylinder
   - ☐ Brake Master Cylinder
   - ☐ Power Steering
   - ☐ Windshield Washer
   - ☐ Rear Washer
   - ☐ Cooling System
3. **Lines/Hoses (Check Clearance From Moving And Hot Objects; Reroute And Tighten As Required)**
   - ☐ Brake Lines
   - ☐ Fuel Lines
   - ☐ Power Steering Hoses
   - ☐ Vacuum Hoses
   - ☐ Coolant Hoses
   - ☐ Clutch Lines
   - ☐ Refrigerant Lines
4. **Battery (Check State Of Charge)**
   - ☐ Inspect Battery Test Indicator When Easily Visible (Recharge To Assure "Green Dot"); Use Voltmeter When Indicator Is Not Visible (Min. 12.4V)
5. **Wiring (Check Routing And Connections; Reroute And Connect As Required)**
   - ☐ Starter, Generator, A/C Clutch And Ignition, Secondary Wires Installed Correctly
   - ☐ Connect Ignition Off Draw (I.O.D.), Or Install Fuse On Applicable Vehicles
   - ☐ Other ______

### B. UNDER VEHICLE

1. **Visually Inspect For Loose Attachments, Proper Keying, Leakage, Clearance & Routing**
   - ☐ Engine
   - ☐ Oil Cooler
   - ☐ Cooling System
   - ☐ Transmission
   - ☐ Driveshaft Boots
   - ☐ Differential
   - ☐ Transmission Cooler
   - ☐ Brake System
   - ☐ Fuel System
   - ☐ Exhaust System
   - ☐ Steering And Suspension Components
   - ☐ Other ______
2. **Tire Pressures (Adjust To Specifications)**
   - ☐ Check All Tire Pressures, Including Spare Tire
3. **Tie-Down Brackets**
   - ☐ Remove Where Applicable

### C. BODY - EXTERIOR

1. **Operation Of Doors & Locks (Adjust Strikers & Latches As Required)**
   - ☐ All Exterior Door Locks Work Easily With All Keys
   - ☐ All Doors Open/Close Easily (With All Windows Up)
   - ☐ Keyless Entry System Works Properly (Both Transmitters)
   - ☐ Security Alarm Works Properly
   - ☐ Deck Lid/Tailgate/Liftgate Operates Easily
2. **Fit & Finish (Visually Inspect; Touch Up As Required)**
   - ☐ Remove Protective Coatings/Covers
   - ☐ Free From Paint Chips, Scratches, Sags, Runs, Dirt Or Corrosion
   - ☐ Paint Colors Match On All Panels
   - ☐ Moldings/Stripes Are Aligned Properly
   - ☐ Moldings/Stripes Are All Present And Securely Fastened
   - ☐ Door Panels Have Even Gaps And Fit Well With Adjacent Panels
   - ☐ Deck Lid/Liftgate/Tailgate Has Even Gaps And Fit Well With Adjacent Panels
   - ☐ Hood Panel Has Even Gaps And Fits Well With Adjacent Panels
   - ☐ Body Free From Dents And Dings
   - ☐ Other ______
3. **Body Sealing (Visually Inspect)**
   - ☐ Door And Window Seals
   - ☐ Windshield
   - ☐ Backlight
   - ☐ Deck Lid/Liftgate/Tailgate
   - ☐ Sunroof/Convertible Top
   - ☐ Check For Water Leaks During Normal Recommended Wash
   - ☐ Other ______
4. **Convertible Top (Cycle Top)**
   - ☐ Check And Adjust Alignment Pins As Required

### D. BODY - INTERIOR

1. **Windows, Doors & Locks (Check Operation)**
   - ☐ All Manual Windows Open/Close Easily
   - ☐ All Power Windows Operate Correctly
   - ☐ All Power/Manual Door Locks Operate Correctly
   - ☐ All Doors Open/Close Easily
   - ☐ Remote Deck Lid/Liftgate/Tailgate Release (If Equipped)
   - ☐ Glove Box Door Opens/Closes Easily
   - ☐ Console Door Opens/Closes Easily
   - ☐ Sunroof Opens/Closes Easily
   - ☐ Other ______
2. **Seats (Check Operation)**
   - ☐ Manual/Power Seat Adjustments Work Properly For All Seats
   - ☐ Securely Located In Track
   - ☐ Check Heated Seat Operation
3. **Seat And Shoulder Belts, Retractors And Head Restraints (Check Operation)**
   - ☐ Check All Seat And Shoulder Belts, Including Retractors, For Proper Latching And Ease Of Operation
   - ☐ Check All Head Restraints For Ease Of Operation
   - ☐ Child Seats
4. **Lights/Switches (Check Operation)**
   - ☐ Check All Interior Lights And Switches (Visually Inspect And Operate)
   - ☐ Check All Exterior Lights And Switches (Visually Inspect And Operate)
   - ☐ Check Ignition Switch For Proper Operation
5. **Fit & Finish (Visually Inspect)**
   - ☐ Remove Interior Covers
   - ☐ Instrument Panel, Glove Box Door And Interior Moldings Have Even Gaps
   - ☐ Door Panel Material Is Clean, Free From Wrinkles And Installed Correctly
   - ☐ Seat Material Is Clean, Secure And Free Of Wrinkles
   - ☐ Carpet Is Clean, Secure And Free Of Wrinkles
   - ☐ Other ______
6. **Compass**
   - ☐ Calibrate & Set Variance
7. **"Shipped Loose"**
   - ☐ Install Any Items

### E. ROAD TEST

1. **Neutral Safety Switch**
   - ☐ Check For Proper Operation
2. **Shift/Clutch Interlock System**
   - ☐ Check For Proper Operation
3. **Gauges/Warning Lights**
   - ☐ Check Operation Of All Gauges
   - ☐ Check Operation Of All Warning Lights
4. **Horn (Check Operation)**
   - ☐ Check For Proper Sound Quality
5. **Turn & Emergency Signals (Check Operation)**
   - ☐ Ease Of Operation And Proper Cancelling
6. **Mirrors (Check Operation)**
   - ☐ Check Day/Night Function (If Equipped)
   - ☐ Ease Of Adjustment (Power Or Manual)
7. **Windshield Wipers & Washers (Check Operation)**
   - ☐ Check Washer Pattern (Adjust As Necessary)
   - ☐ Check Intermittent Wipe Feature
   - ☐ Check For Proper Wiping Pattern
8. **Heater/Air Conditioner (Check Operation)**
   - ☐ Heater/Defroster Works Properly
   - ☐ Turn On Rear Defroster During Drive, Then Feel Window For Warmth After Drive
   - ☐ A/C Cools Properly
   - ☐ Fan Operation Is Quiet
9. **Radio (Check Operation)**
   - ☐ Good AM/FM Reception
   - ☐ Cassette/CD Works Properly
   - ☐ Good Sound Quality
   - ☐ Displays Correct Time
10. **Trip Computer/Maintenance Reminder (Check Operation)**
    - ☐ Check That All Modes Operate
11. **Speed Control (Check Operation)**
    - ☐ Check On/Off Switch
    - ☐ Check "Set" Operation
    - ☐ Check "Resume"
    - ☐ Check "Accel/Decel"
    - ☐ Check Brake Release
12. **Service Brakes (Check Operation)**
    - ☐ Vehicle Stops In A Straight Line - No Pulling To One Side
    - ☐ Quiet Operation - Free From Noise
    - ☐ Free From Shudder Or Vibration
    - ☐ Check Brake Warning Light
13. **Parking Brake (Check Operation)**
    - ☐ Easy To Operate
    - ☐ Free From Drag
    - ☐ Able To Hold
    - ☐ Check Warning Light
14. **Engine Performance**
    - ☐ Starts Promptly
    - ☐ Free From Stalling
    - ☐ Idles Smoothly And At Proper Speed
    - ☐ Free From Stumbling Or Hesitation
    - ☐ Produces Sufficient Power
    - ☐ Free From Unusual Noises
    - ☐ Operates Within Proper Temperature Range
    - ☐ Stops When Key Is Shut Off
15. **Transmission/Transfer Case Performance**
    - ☐ Park Lock Holds Vehicle (Automatic)
    - ☐ Shifter (Manual) Or Shift Lever (Automatic) Operates Easily
    - ☐ Shifts Smoothly (Automatic)
    - ☐ Upshifts And Downshifts Properly (Automatic)
    - ☐ Proper Synchronization - Gears Do Not Grind (Manual)
    - ☐ Clutch Operates Smoothly (Manual)
    - ☐ Transfer Case Shifts Easily Among Ranges (4x4 Vehicles)
16. **Steering & Handling**
    - ☐ Power Assist Works Properly - Steering Does Not Require Excessive Effort
    - ☐ Steering Wheel Does Not Vibrate At Idle Or Road Speed
    - ☐ Steering Wheel Centered When Traveling Straight Ahead
    - ☐ Does Not Pull To One Side
    - ☐ Vehicle Does Not Vibrate
17. **Squeaks, Rattles And Wind Noise**
    - ☐ Instrument Panel, Glove Box Seats, Steering Wheel And Column Are Free From Squeaks And Rattles
    - ☐ Windows And Doors Are Free From Squeaks, Rattles And Wind Noise
    - ☐ Vehicle Exterior Free From Squeaks, Rattles And Noise, Front And Rear
    - ☐ Interior Panels Free From Squeaks And Rattles
18. **Other** ______
19. **Fuel**
    - ☐ Fill Fuel Tank (Use Specified Grade)

### F. PREDELIVERY STORAGE

- ☐ Always Unplug I.O.D. Connector, Or Pull Fuse That Activates Accessories

### G. PROGRAMMABLE ELECTRONIC FEATURES

**Program Per Customer Request (If Equipped)**

- ☐ Rolling Power Door Locks
- ☐ Horn Chirp When Doors Locked With RKE
- ☐ Low Fuel Chime
- ☐ RKE Door Unlock Sequence (One Push Unlocks All Doors)
- ☐ Headlights On Automatically With Wipers
- ☐ Remote Key Fobs Linked To Memory
- ☐ Headlamp Delay Variable Interval
- ☐ Easy Exit Driver's Seat
- ☐ Service Interval Reminder

FOLD HERE

**EPA CERTIFICATION OF CONFORMITY**

The selling Dealer hereby certifies that (1) this vehicle is covered by an EPA Certificate of Conformity indicating that it conforms to all applicable emission standards of the U.S. Environmental Protection Agency; (2) a visual inspection of this vehicle and engine has been conducted to assure that all emission-related components have been properly installed; (3) all emission-related preparation required by the manufacturer prior to the sale of this vehicle has been properly performed.

If the vehicle has been maintained and used in accordance with the applicable DaimlerChrysler Corporation instructions, and if the vehicle fails an EPA-approved emission test prior to the expiration of 3 months or 4,000 miles (whichever comes first), DaimlerChrysler Corporation through its authorized dealers, will remedy the nonconformity under the emission warranty.

**DEALER CERTIFICATION**

I CERTIFY THAT THIS VEHICLE HAS BEEN INSPECTED AND ROAD TESTED, AND THAT ADJUSTMENTS WERE PERFORMED, AS INDICATED BY THE CHECK MARKS IN THE BOXES.

DEALER, SERVICE MANAGER OR TECHNICIAN SIGNATURE

*Fig. 1 NEW VEHICLE PREPARATION FORM*

INTRODUCTION (Continued)

Items found requiring adjustment and/or repair should be corrected before delivery of the vehicle.

**NOTE: It is the dealer's responsibility to protect new vehicles from damage and deterioration prior to retail delivery both before and after new vehicle preparation.**

The information includes the following features:

Inspection points are cross-referenced to the New Vehicle Preparation Form as follows:

- Titles indicate the general area being inspected or the types of checks being made (i.e., underhood, body-exterior, road test, etc.).
- Sub-Titles identify the types of items to be inspected in that area (i.e., lines/hoses, wiring, etc.).

Procedures follow a logical order to prevent duplication and wasted effort.

Tips to help you do a better job are found as **NOTES**.

# RECEIVING

## INSPECTION

The following procedures are recommended for your own protection upon receipt of new vehicles. When a new car is delivered by the carrier, it should be inspected to ensure that it is in good condition and to determine if there is any shortage or transportation damage.

## EXTERIOR

Upon receipt of a new vehicle, check immediately for:

- Under carriage damage
- Chipped or cracked windshield, broken windows, and loose or missing moldings and name-plates
- Dents, scrapes, scratches, chips, dirt in paints or other damage to the body exterior
- Damaged or missing side view mirror(s)
- Missing wheel nuts
- Broken or missing lenses
- Chafing, bruises, cuts, or scrapes on tire sidewalls or tread
- Missing underhood items
- Missing fuel filler cap
- Shipped loose items-license plate bracket, spare tire, jack and tire wrench, radio antenna, floor mats, wheel covers, cargo nets, fuses and other items
- Ensure that IOD fuse is removed
- Check battery test indicator when easily visible, or use voltmeter (battery must be at 12.4 volts or greater). Charge to ensure green dot-visibility, permanent damage may occur if battery remains in a discharged state for any length of time.

## INTERIOR

Check interior items such as:

- Rearview mirror
- Accessory control knobs
- Smokers package items
- Keys
- Radio
- Special equipment items listed on shipper
- Owner's Manual and Consumer information Brochures (normally stored in the glove box).
- Cuts, abrasions or stains on interior trim.

**NOTE: Remember a careful look at new vehicles when they are received may prevent problems when preparing vehicles for delivery to your customers.**

## MAJOR INSPECTION POINTS

(1) Check operation of hood latch and safety catch-adjust as required.

(2) Check all fluids for proper level and top off with the proper fluid as required-engine oil, automatic transmission fluid, brake master cylinder, clutch master cylinder, power steering, windshield washer, and cooling system. (Vehicle must be at normal operating temperature for some of these checks.)

(3) Check brake, clutch, fuel, and power steering lines and hoses for leaks and clearance from moving and hot objects-reroute to the proper location and tighten as required.

(4) Check battery state of charge-recharge if necessary, to ensure green dot is visible or instrument panel voltmeter indicates 12.4 volts or greater.

(5) Check routing and connections of underhood wiring, vacuum hoses, refrigerant lines and coolant hoses for leaks, loose connections and clearance from moving objects reroute and tighten connections as required. Install IOD fuse on applicable vehicles.

**NOTE: Reset radio, clock, compass, etc., after installing, if vehicle is being delivered.**

# UNDER HOOD

## INSPECTION - HOOD LATCH/SAFETY CATCH

(1) Check operation of hood latch (Fig. 2) and safety catch (Fig. 3) adjust as required.

**NOTE: The safety catch prevents the hood from going to full open position until it is manually released. To test the safety catch, unlock the hood with the interior release, then try to raise the hood without operating the safety catch.**

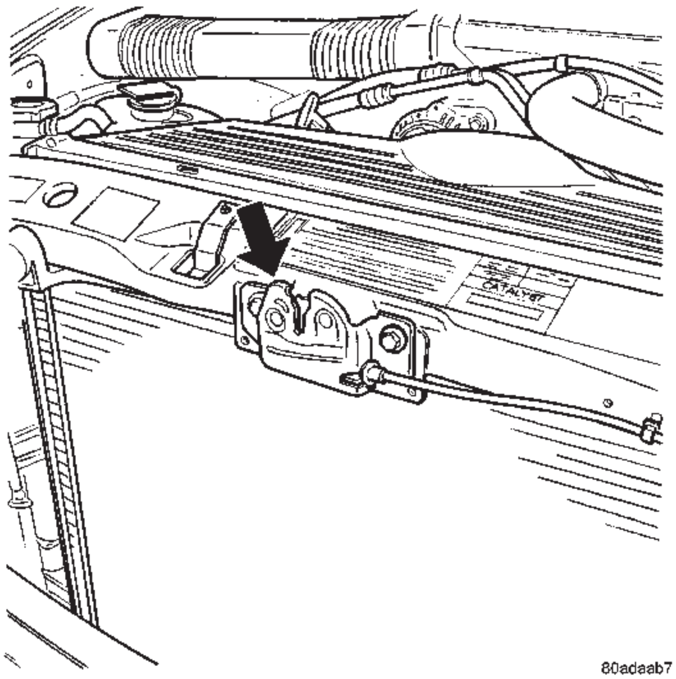

*Fig. 2 HOOD LATCH*

## INSPECTION - FLUID LEVELS

### ENGINE OIL

**CAUTION: Use only oil that meets the specified requirements.**

**NOTE: If oil level is low, inspect for oil leaks.**

(1) Check engine oil level. The oil should be in the safe range or between the minimum and maximum marks.

• If the oil level is at the minimum mark, add oil that meets specifications, (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

• The best time to check the oil is about 5 minutes after a fully warmed-up engine is turned off, or before starting the engine after it has been off overnight.

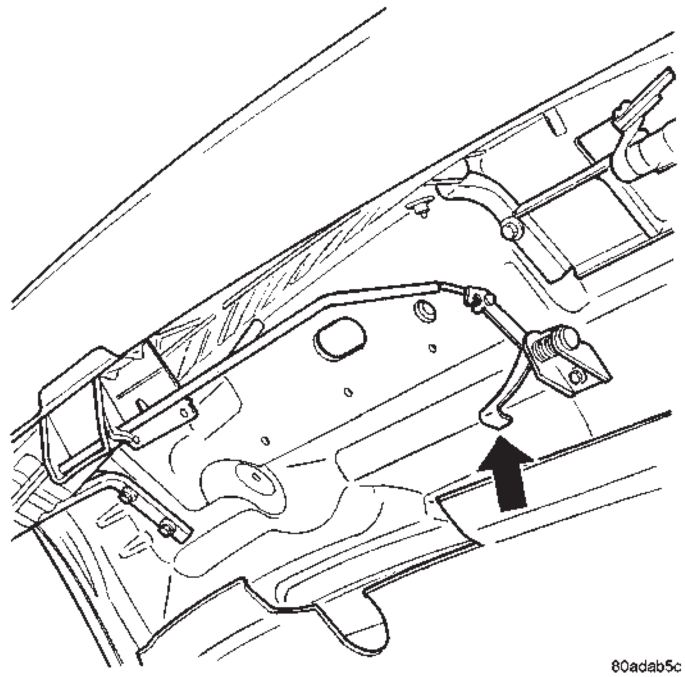

*Fig. 3 HOOD SAFETY CATCH*

• For the most accurate readings, the vehicle should be on level ground.

• Wipe up any excess oil that may have spilled, or the customer could mistakenly perceive this as the result of a leak.

### AUTOMATIC TRANSMISSION

**CAUTION: Only use fluid that meets the vehicle's specific requirement.**

**NOTE: Mopar ATF Plus contains special additives not found in Mercon and Dexron II fLuids. Use of fluid other than Mopar Plus (when specified) could result in an upshift shudder in some applications.**

Transmission fluid check procedures are specific to each vehicle line. Refer to the appropriate service information for correct procedure.

### CLUTCH MASTER CYLINDER

**CAUTION: only use brake fluid that meets specified requirements (DOT 3 and MVSS 116).**

Check the clutch master cylinder fluid level. Add fluid to the proper level if necessary.

UNDER HOOD (Continued)

## BRAKE MASTER CYLINDER

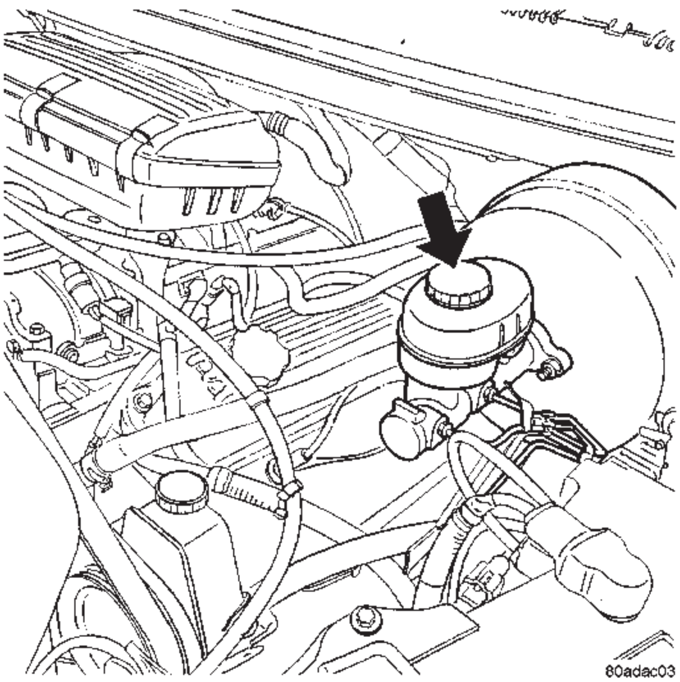

*Fig. 4 BRAKE MASTER CYLINDER FLUID RESERVOIR*

**CAUTION: Only use fluid that meets specified requirements (DOT 3).**

**NOTE: Wipe the master cylinder cover to remove any dirt.**

**NOTE: On vehicles equipped with remote antilock brakes, the fluid level check is the same as for a normal system.**

Check the brake master cylinder fluid level (Fig. 4). Add fluid to bring the level to the full line on the side of the reservoir (or above the bottom of the split ring in the primary filler hole). Be sure both primary and secondary cavities are full to the maximum level as indicated.

## POWER STEERING RESERVOIR

**CAUTION: Only use fluid that meets specified requirements. Petroleum fluids, such as Mopar Power Steering Fluid, are specially formulated for use with power steering hoses and seals.**

Check the fluid level; it should be maintained at the proper level indicated on the dipstick, or as viewed through the translucent reservoir. If fluid is required, fill to the proper level. With the engine running at normal operating temperature, turn the steering wheel from stop to stop to expel air from within the system Stop the engine, remove the cap, and recheck the fluid level, making sure that foaming is not present (Fig. 5).

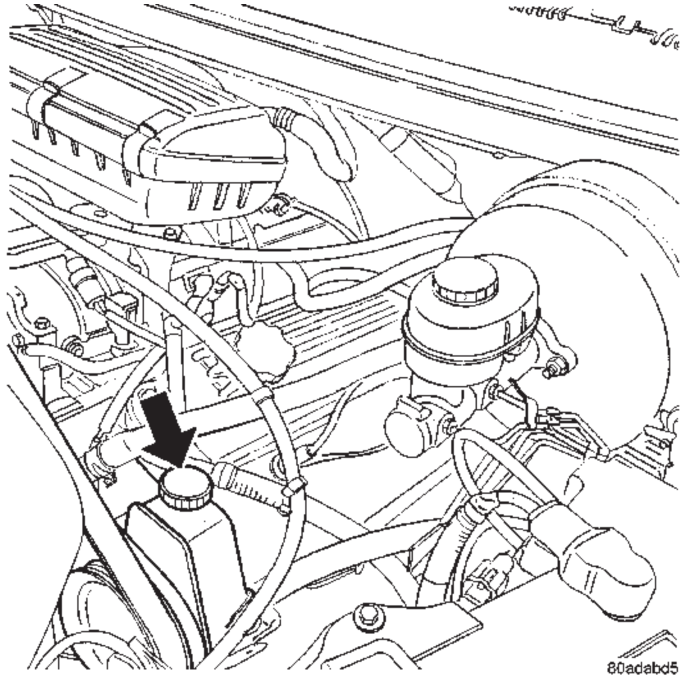

*Fig. 5 POWER STEERING RESERVOIR*

## WINDSHIELD WASHER RESERVOIR

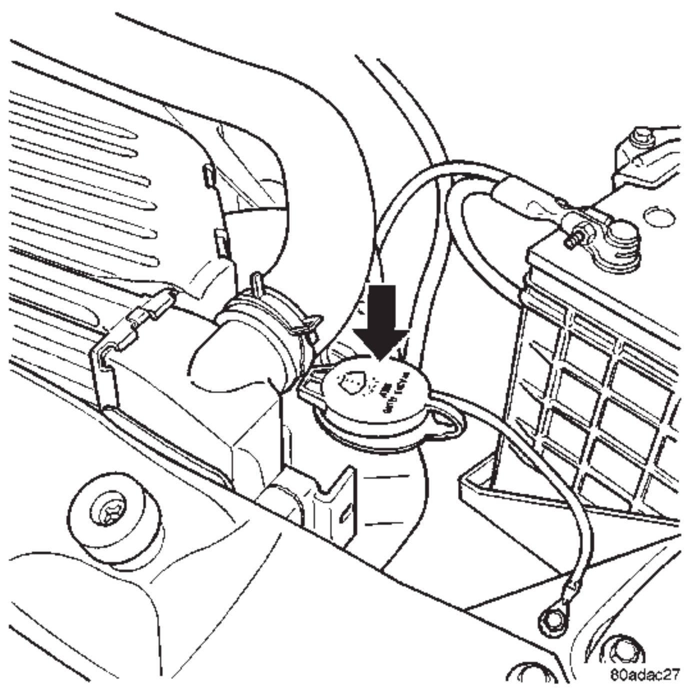

*Fig. 6 WINDSHIELD WASHER FLUID RESERVOIR*

**CAUTION: Do not add engine coolant (antifreeze) to this reservoir.**

**CAUTION: Avoid spilling washer solvent on the vehicles paint; it could harm the finish.**

UNDER HOOD (Continued)

Check windshield washer solvent reservoir and fill as necessary (Fig. 6).

**NOTE: When using concentrated solvent such as Mopar® All-Weather Windshield Washer Solution, dilute per container directions.**

## COOLING SYSTEM RESERVOIR

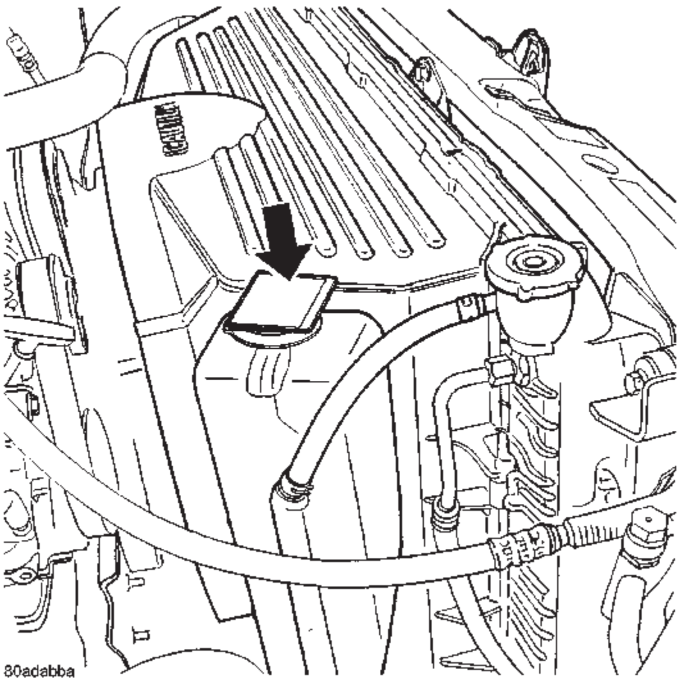

*Fig. 7 ENGINE COOLANT RESERVOIR*

**WARNING: DO NOT REMOVE RADIATOR CAP WHILE COOLING SYSTEM IS UNDER PRESSURE.**

**NOTE: Add coolant only to plastic reserve tank if it is required. Engine must be at normal operating temperature before adding coolant to reserve tank. In cold climates, coolant in reserve tank may appear low; do not add coolant until normal temperature is reached.**

Check coolant level with engine idling at normal operating temperature. Coolant level in plastic reserve tank must be between the minimum and maximun marks (Fig. 7).

If coolant is added, use a 50/50 (-30″F protection) concentration of the recommended (Refer to the Service Information for specificate Mopar® antifreeze recommendation ) antifreeze and distilled water. Use a higher concentration (up to 65%) if a lower freeze point is required. Do not use recycled coolant in new vehicles.

## INSPECTION - LINES/HOSES

Inspect the following for line and hose leaks. Also inspect routing and connections and reroute and tighten as required.

- Brake Lines (Fig. 8)
- Fuel Lines (Fig. 9)
- Power Steering Hoses
- Vacuum Hoses
- Heating/Coolant Hoses
- Clutch Lines
- Refrigerant Lines
- Transmission oil cooler lines (Fig. 10)

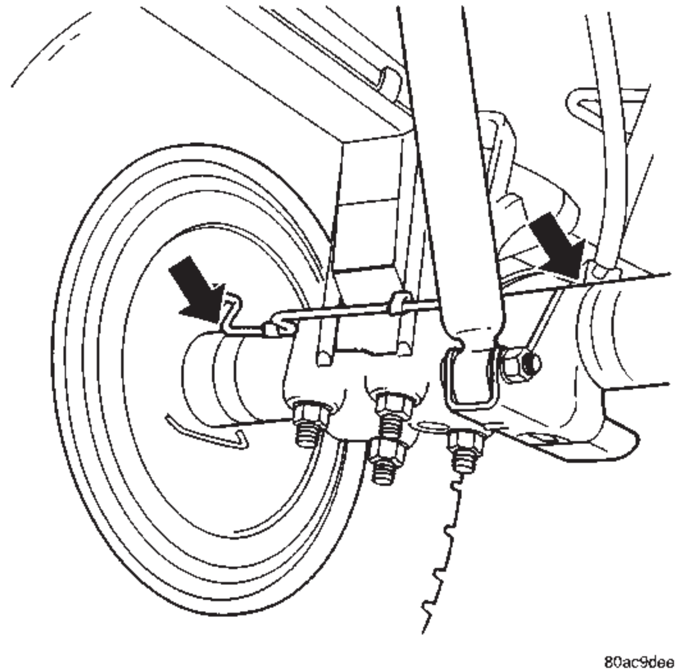

*Fig. 8 PARKING BRAKE CABLE AND BRAKE LINE*

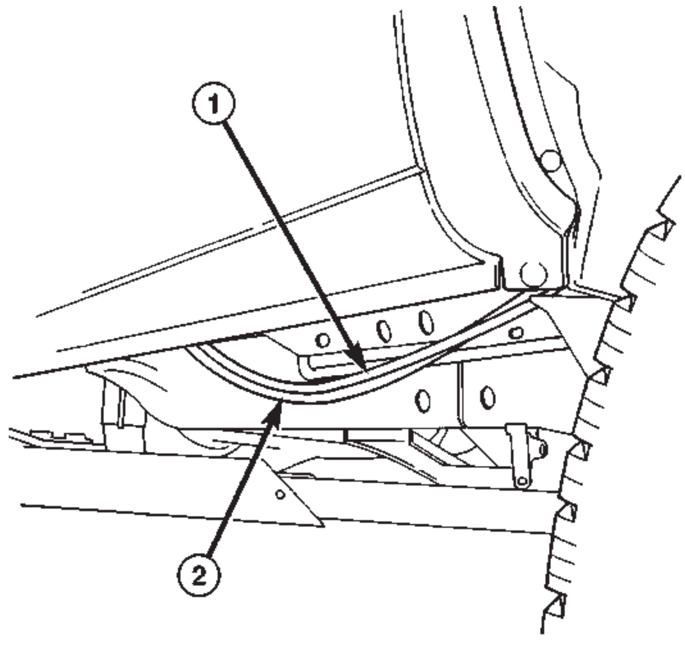

*Fig. 9 BRAKE LINES AND FUEL LINES*

1 - FUEL LINE
2 - BRAKE LINE

UNDER HOOD (Continued)

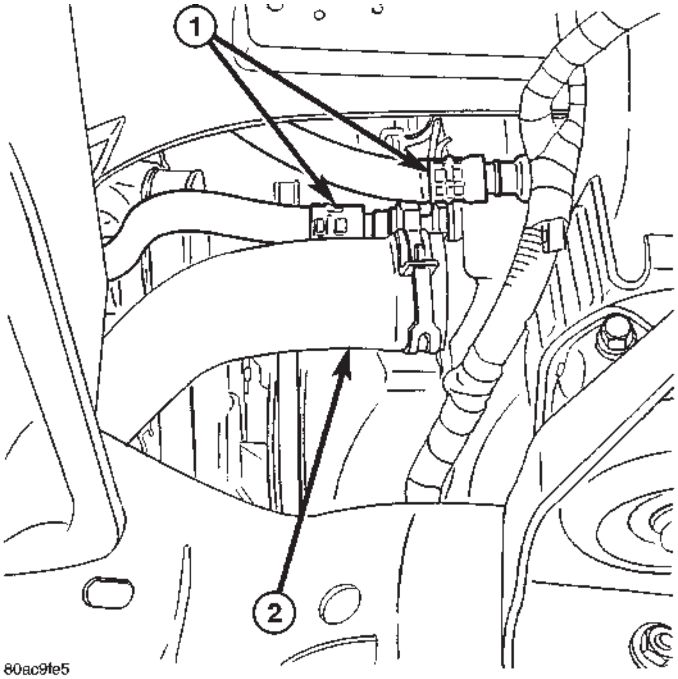

*Fig. 10 TRANSMISSION COOLER LINES AND RADIATOR HOSE*

1 - TRANSMISSION OIL COOLER LINES
2 - RADIATOR LOWER HOSE

## INSPECTION - BATTERY

When battery is easily accessible, check the test indicator (green dot), terminal tightness and felt (grease) washer on battery posts. Recharge battery as required to assure that the green dot is visible.

When battery is not easily accessible check battery condition with a voltmeter at the jump start locations, or check the voltmeter on the instrument panel (Fig. 11) or (Fig. 12). The reading should be at least 12.4 volts. Recharge battery as required.

**NOTE: Refer to service information for proper battery charging rates and times.**

## INSPECTION - WIRING

The assembly plant has shipped all vehicles with the interior lights and most electronic memories nonfunctional by way of an Ignition Off Draw (IOD) fuse removed. The purpose is to reduce the possibility of battery run-down during shipping and storage.

Vehicles stored after prep should have the IOD fuse that activates the accessories pulled to prevent battery drain.

**NOTE: Ensure that the IOD fuse is removed to prevent battery drain and possible damage. Vehicles stored for extended periods after prep should be washed frequently, to prevent environmental damage, and reinspected for storage-related problems before delivery.**

(1) Install the IOD fuse as equipped. (ON vehicles being delivered, remember to reset radio, clock, compass, etc., as required.)

(2) Check routing and connections of all underhood wiring-reroute and connect as required.

(3) Make sure the starter, generator and air conditioning clutch wiring are correctly installed, routed, and in the clips where provided.

(4) For predelivery storage, always pull the IOD fuse that activates accessories.

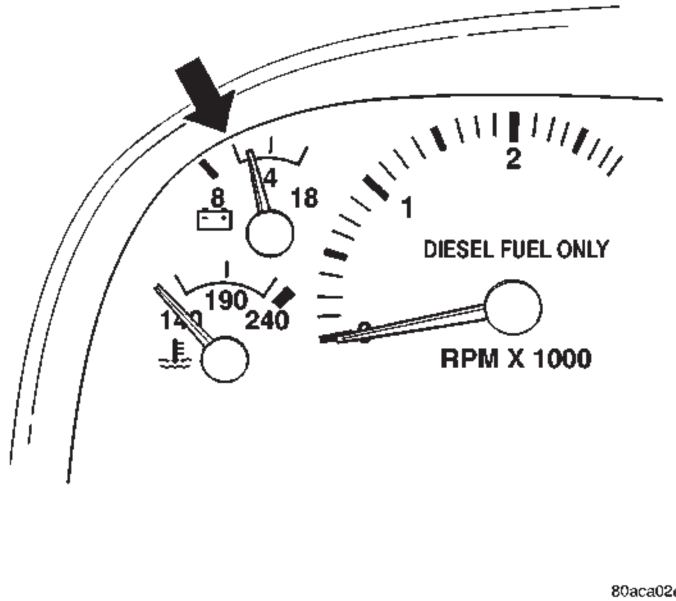

*Fig. 11 BATTERY VOLTAGE GAUGE DIESEL ENGINE*

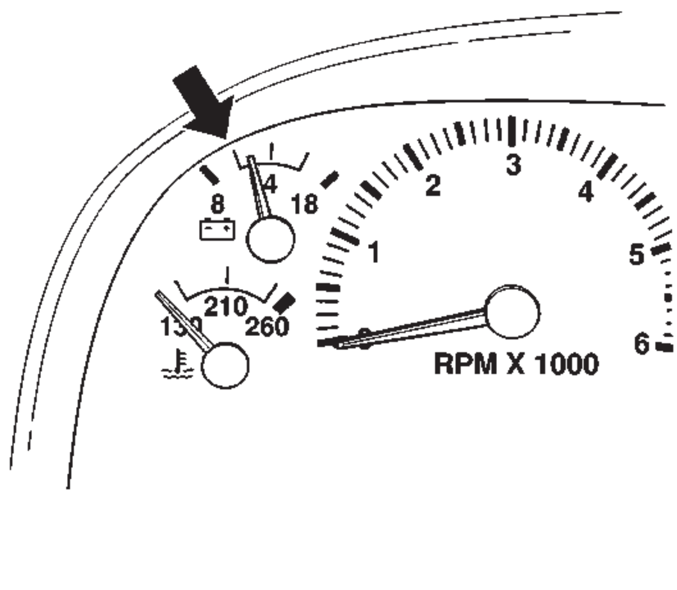

*Fig. 12 BATTERY VOLTAGE GAUGE GAS ENGINE*

# UNDER VEHICLE

## INSPECTION - TIRE PRESSURES

(1) Using the tire placard or the Safety Certification Label, check that the correct tires are mounted on the vehicle.

(2) Install valve stem extensions as required.

(3) Using the tire placard or the Safety Certification Label, check tire pressure (including spare) and adjust as required to recommended pressure.

(4) Inspect the spare tire for correct pressure and proper mounting (Fig. 13).

**NOTE: Tire pressure may have been set above normal during manufacturing in order to properly seat the tire bead. Be sure to adjust to proper specification.**

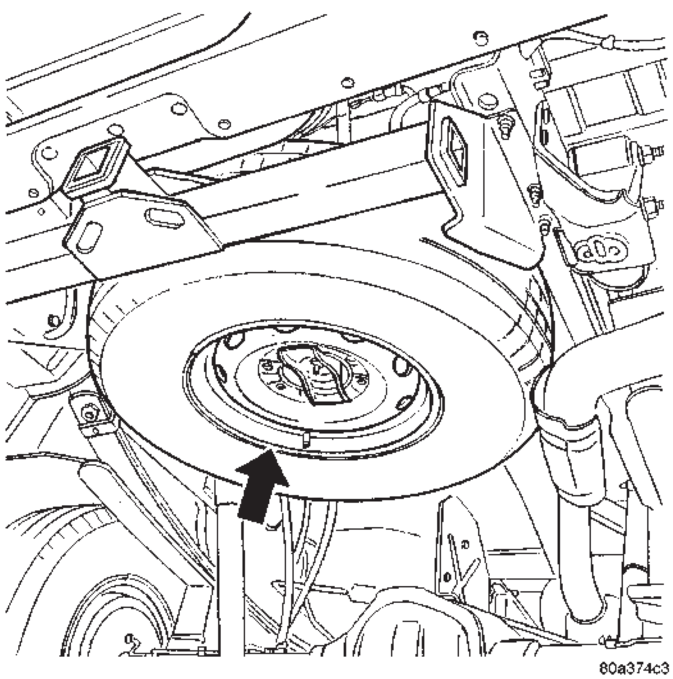

*Fig. 13 SPARE TIRE INSPECTION*

## INSPECTION - VISUAL

**CAUTION: Before raising the vehicle on a hoist, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE) for the proper lifting points.**

(1) Visually inspect the following for loose attachment, leakage, clearance and routing, and tighten connections and clamps as required:

- Engine
- Oil Cooler
- Cooling System
- Transmission
- Driveshaft Boots
- Differential
- Transfer Case (Fig. 19)
- Transmission Cooler and Lines (Fig. 18)
- Brake System and Lines (Fig. 14)
- Fuel System
- Exhaust System (Fig. 15), (Fig. 16) and (Fig. 17)
- Steering and Suspension Components

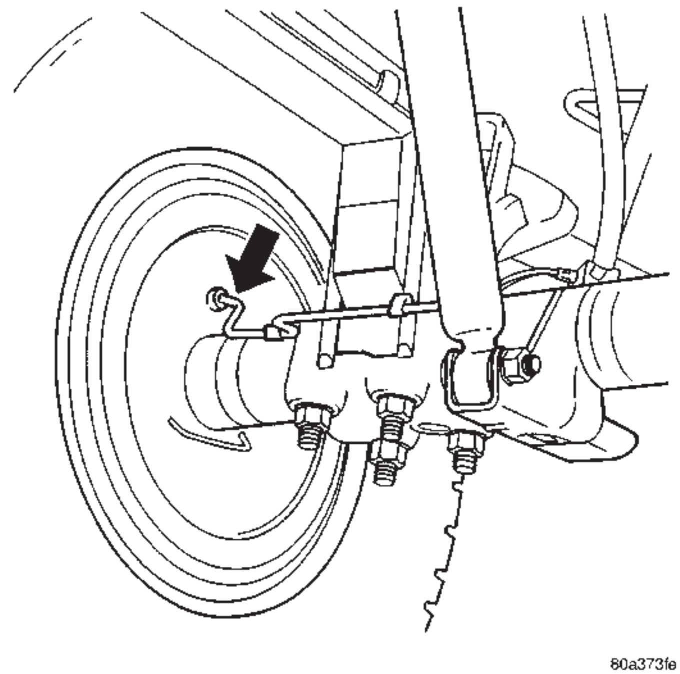

*Fig. 14 BRAKE LINES TO CALIPERS (REAR)*

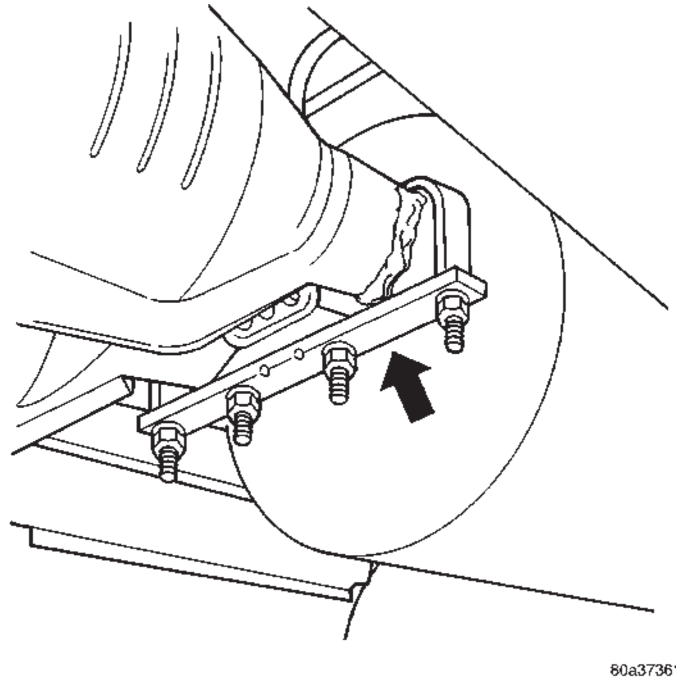

*Fig. 15 EXHAUST CLAMPS*

UNDER VEHICLE (Continued)

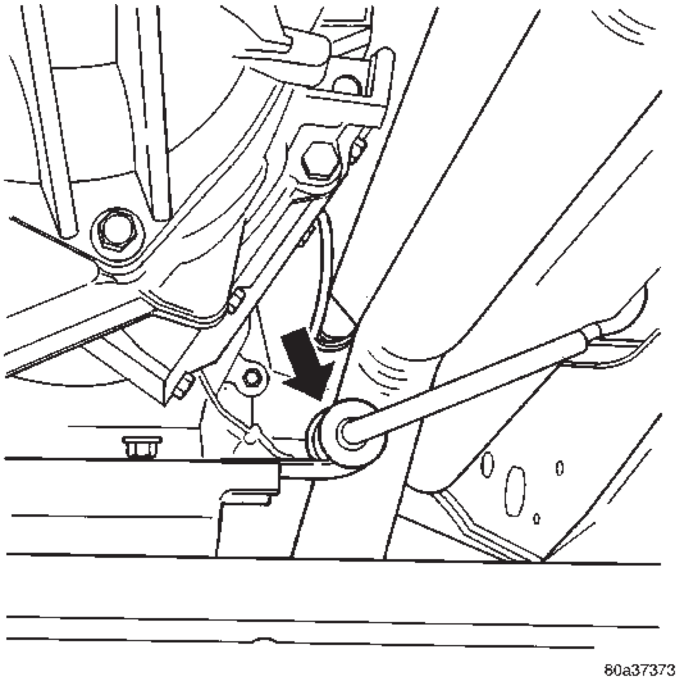

Fig. 16 EXHAUST HANGERS

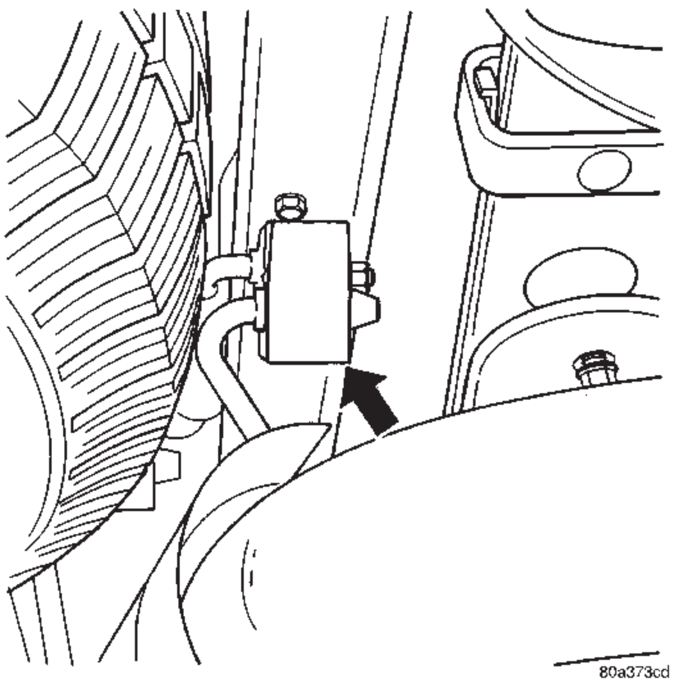

Fig. 17 TAILPIPE HANGERS

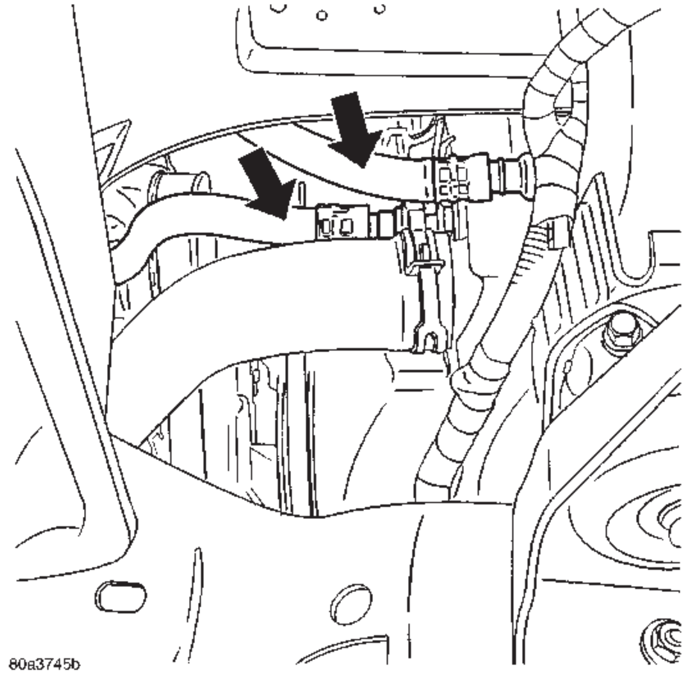

Fig. 18 TRANSMISSION COOLER LINES

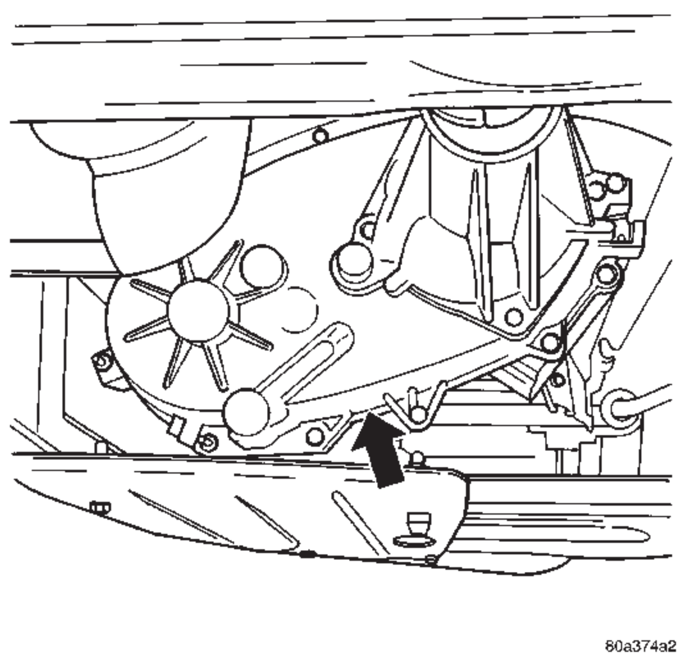

Fig. 19 TRANSFER CASE INSPECTION

UNDER VEHICLE (Continued)

### INSTALLATION - WHEEL COVERS

(1) Install cover on wheel by hand only (Fig. 20).

(2) Install and torque wheel nuts to 135 N·m (100 lb. ft.).

(3) Install nut caps, if equipped using lug wrench, do not over tighten.

(4) Remove release liner from removal instructions label and install label next to jacking instructions label. Surface must be clean and flat for proper adhesion of label.

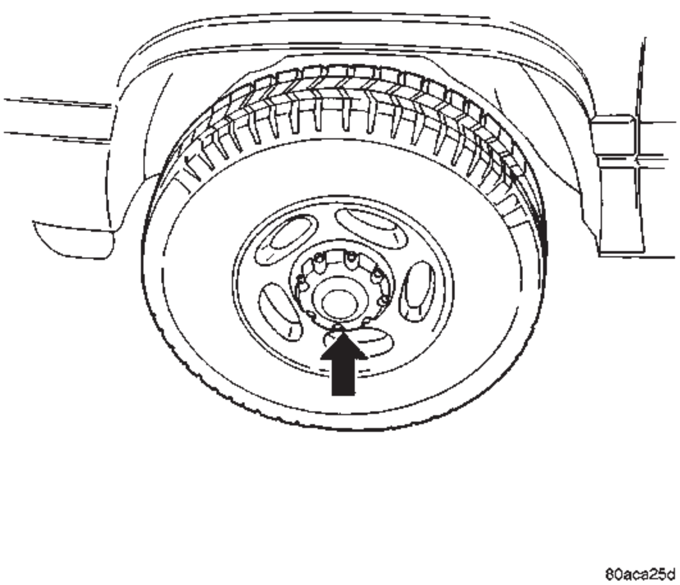

*Fig. 20 WHEEL COVER*

## EXTERIOR

### INSPECTION—BODY SEALING

Visually inspect the following seals during the normal recommended wash. Look for areas where water may have entered the vehicle.

- Door and window seals
- Windshield
- Backlight

### INSPECTION - FIT AND FINISH

(1) Remove all protective coatings/covers.

- Remove protective film from body moldings.

(2) Make sure body is free from paint chips, scratches, sags, run, dirt or corrosion. Touch up any minor paint chips and scratches as required.

(3) Ensure that moldings and stripes are aligned properly.

- Ensure that moldings and stripes are present and securely fastened to the body.

**NOTE: Painted-on accent strips require a unique paint for touch-ups.**

(4) Check that the door panels have even gaps and fit well with adjacent body panels (Fig. 21).

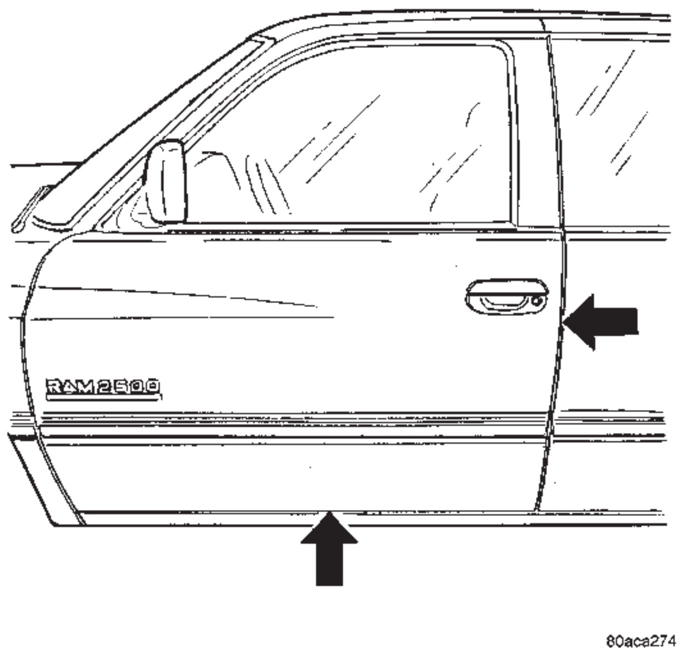

*Fig. 21 DOOR ALIGNMENT*

(5) Check that the tailgate has even gaps and fits well with adjacent panels (Fig. 22).

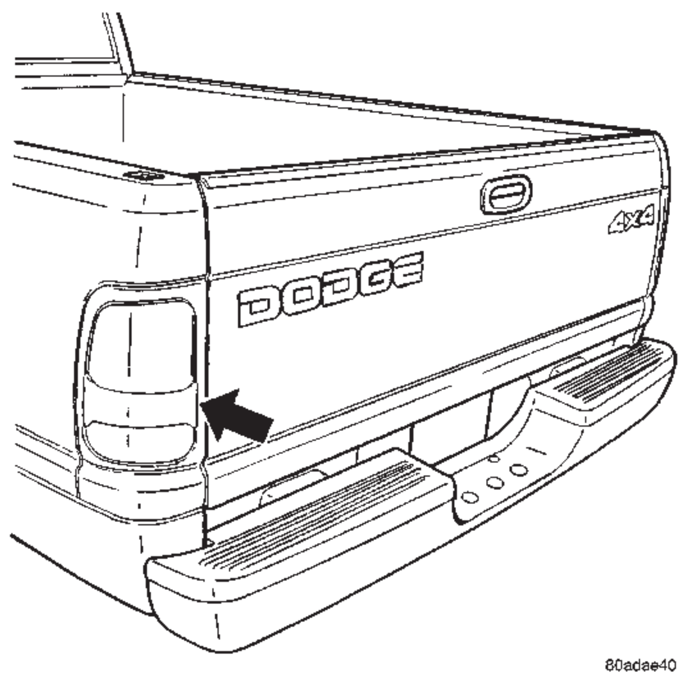

*Fig. 22 TAILGATE ALIGNMENT*

EXTERIOR (Continued)

(6) Check that the hood panel has even gaps and fits well with adjacent panels (Fig. 23).

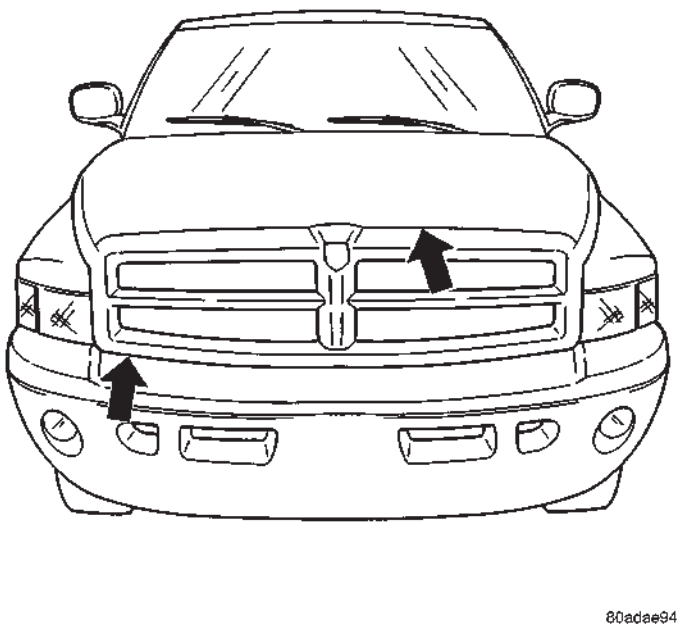

*Fig. 23 HOOD ALIGNMENT*

(7) Ensure that the body is free from dents and dings.

## INSPECTION - KEYLESS ENTRY

Check operation of keyless entry system and program the transmitter/receiver if necessary.

## INSPECTION - DOORS AND DOOR LOCKS

(1) Check operation of doors and locks, keyless entry, security alarm, and tailgate. Adjust strikers (Fig. 24) and latches (Fig. 25) as required.

(2) Remove any protective covers from the door sills.

**NOTE: Windows should be in the full up position during these tests (except for the lock tests).**

- Open each door (inside and out) to check the release mechanism and ease of operation.
- Partially close the door to check the open-door detent.
- Close the door to check the latches and striker.
- Open the door, lower the window depress the lock plunger and close the door to check the lock.
- Unlock each door (using both keys) to check lock and key operation.

**NOTE: Child proof door locks should be disabled when delivered to the customer.**

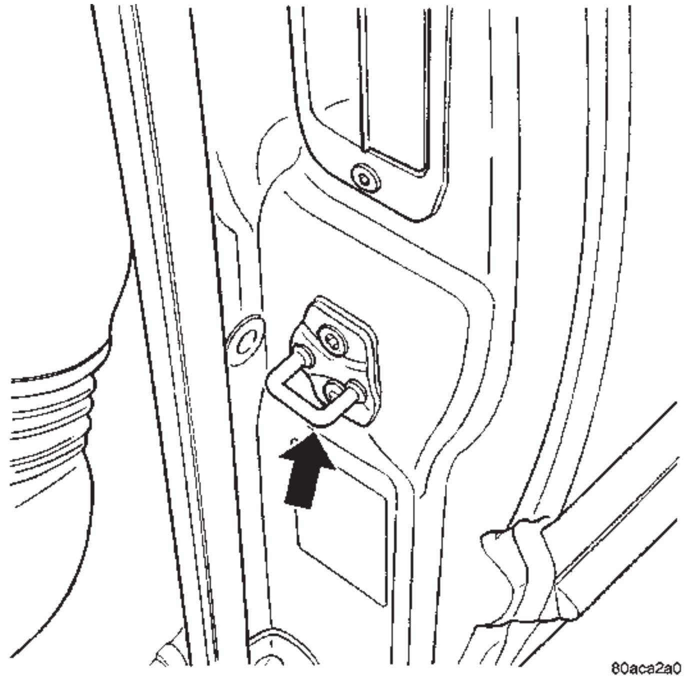

*Fig. 24 DOOR STRIKER*

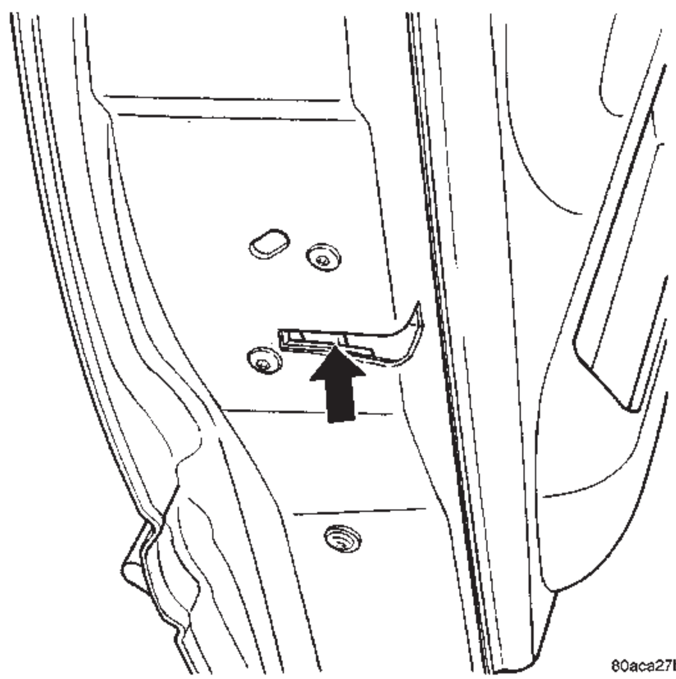

*Fig. 25 DOOR LATCH*

# BODY INTERIOR

## INSPECTION - COMPASS

**NOTE: Set variance after calibration.**

(1) Calibrate and set compass variance (Fig. 26), if so equipped (use appropriate procedures in service information).

(2) Remove protective film from overhead console, if equipped.

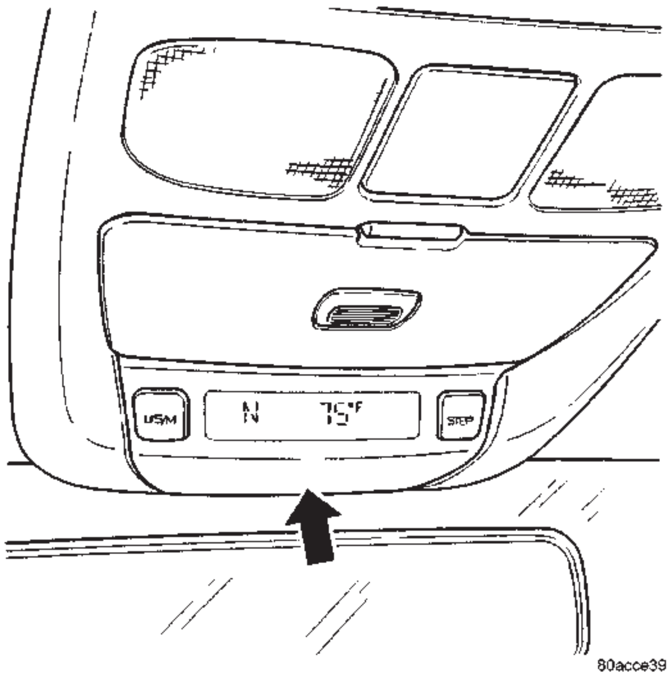

*Fig. 26 COMPASS OPERATION*

## INSPECTION - FIT AND FINISH

(1) Remove any interior covers.

(2) Inspect the instrument panel, glove box door (Fig. 27) and interior moldings for even gaps and alignments.

(3) Check that the door panel material is clean, free from wrinkles and installed correctly.

(4) Check that the seat material is clean, secure and free of wrinkles.

(5) Check that the carpet is clean, secure and free of wrinkles.

(6) Check that the headliner is clean, free of lint and dirt smudges.

## INSPECTION - LIGHTS AND SWITCHES

(1) Remove protective film from all switch bezels.

(2) Operate and visually inspect all interior lights and switches, including:

- Dome/map lamps
- Vanity mirror lamps
- Glove box light

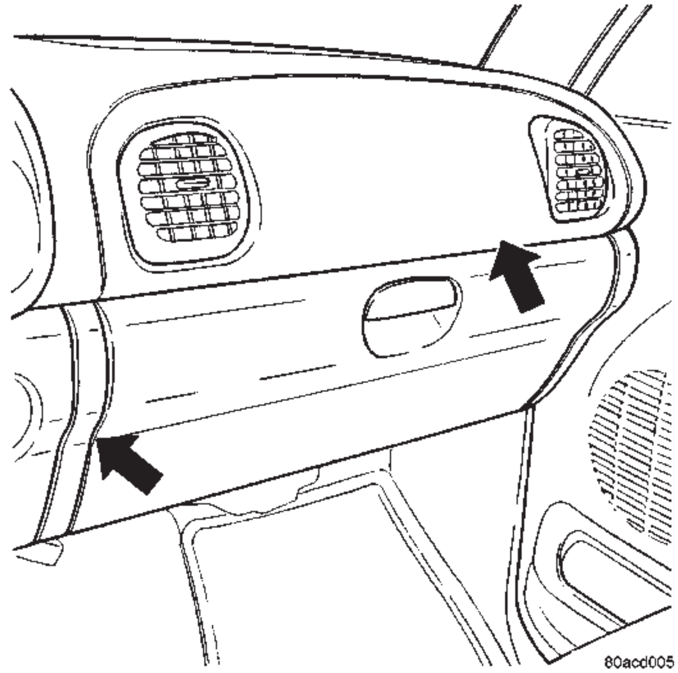

*Fig. 27 GLOVE BOX DOOR*

- Ashtray light
- Cigar lighter light
- All gauge lights
- Radio display
- Door-mounted lights, if equipped
- Illuminated entry system, if equipped

(3) Visually inspect and operate all exterior lights and their switches, including:

**NOTE: Headlamp aim is preset during vehicle assembly.**

- Headlights, including high beam, optical horn (“flash to pass”) and daylight running lamps (DRL’s) (Fig. 28)
- Tail/stop lamps (including center high-mounted stop lamp)
- Parking lights Turn signals Brake lights (including center high mounted stop lamp)
- Emergency flashers (Fig. 29)
- Fog/driving lights, if equipped
- Off-road or other lights, if equipped
- Cargo bed lights, if equipped

(4) Check ignition switch for proper operation in all positions (accessory, lock, on, start and off).

## INSPECTION - SEAT BELTS, SHOULDER BELTS, RETRACTORS AND HEAD RESTRAINTS

(1) Inspect all seat belts and harnesses to ensure that they connect and hold properly.

(2) Inspect the condition of the belts and anchors.

(3) Inspect for proper seat belt retraction.

BODY INTERIOR (Continued)

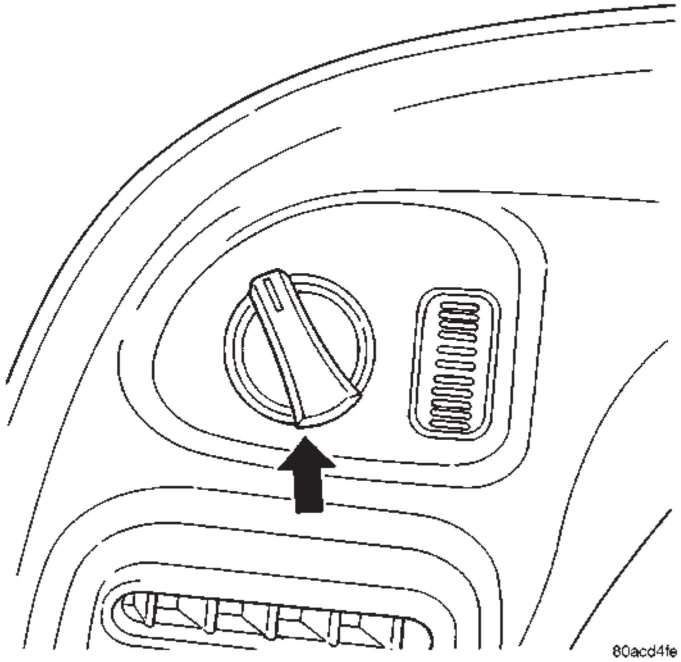

*Fig. 28 HEADLAMP SWITCH*

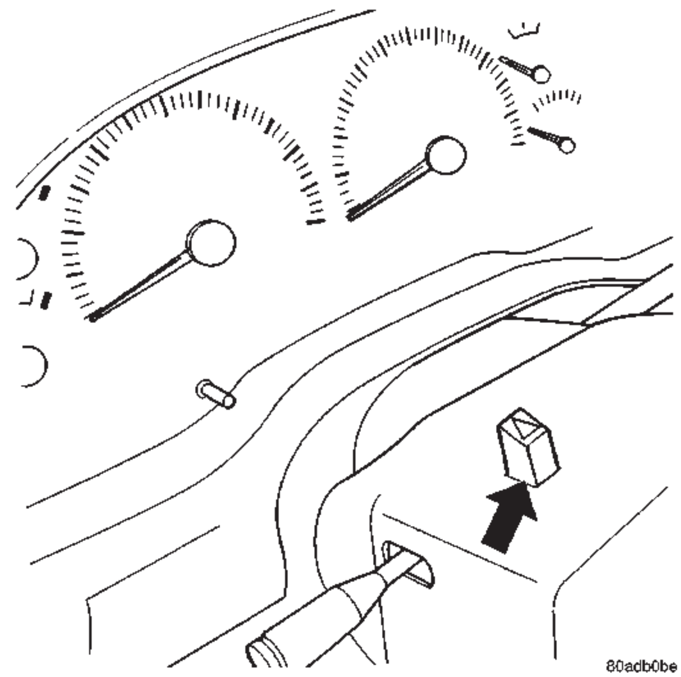

*Fig. 29 EMERGENCY FLASHER SWITCH*

(4) Check that safety labels regarding the use of seat belts and air bags are in place (such as on the sun visors) (Fig. 30).

(5) Ensure head restraints are properly installed. Inspect the height adjustment for ease of operation.

## INSPECTION - SEATS

(1) Remove protective seat, carpet and door covers (if being delivered) where applicable.

(2) Check that manual/power seat adjustments work properly for all seats (Fig. 31).

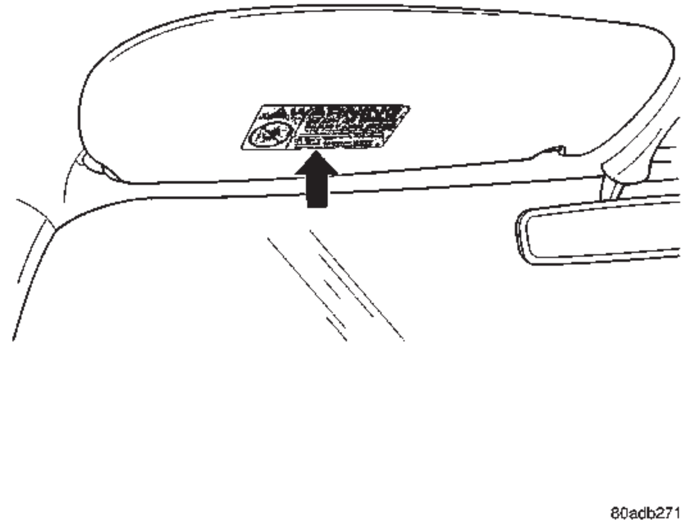

*Fig. 30 SEAT BELT LABELS*

- Inspect the operation of front seat mechanical slides and power adjusters (Fig. 31)
- Check the seatback recliner for ease of release and operation
- Check the rear seatback latches for ease of release
- On fold-down rear seats, latch the rear seats and pull forward on the seats to check that the latches hold

(3) Check the seat heaters on vehicles equipped with heated seats.

(4) Check that all seats are securely located in their adjustable tracks (Fig. 31).

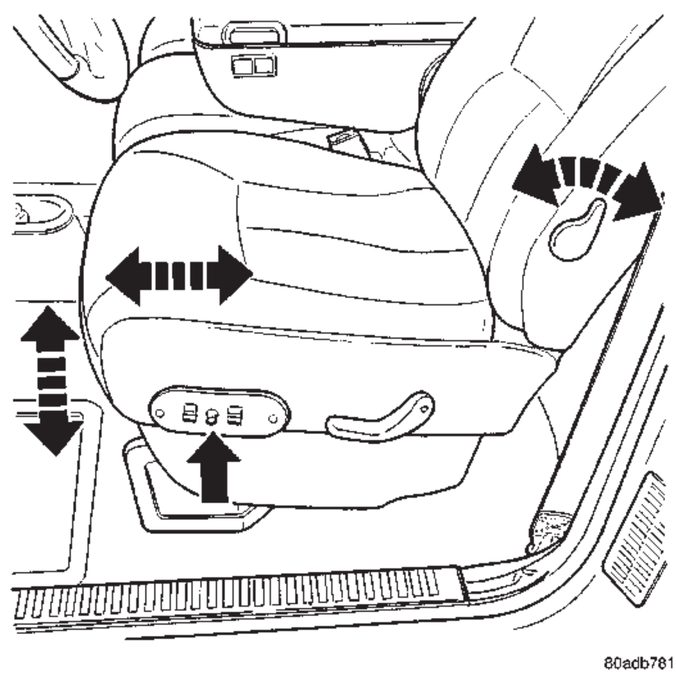

*Fig. 31 SEAT CONTROLS*

BODY INTERIOR (Continued)

## INSPECTION - WINDOWS, DOORS AND LOCKS

(1) Check all power window switches for proper operation (Fig. 32).

(2) Run all power or manually operated door, quarter and vent windows to the fully closed position to check operation and sealing.

(3)

(4) Check all power/manual door locks for correct operation (Fig. 32).

(5) Ensure that all doors open/close easily (Fig. 33).

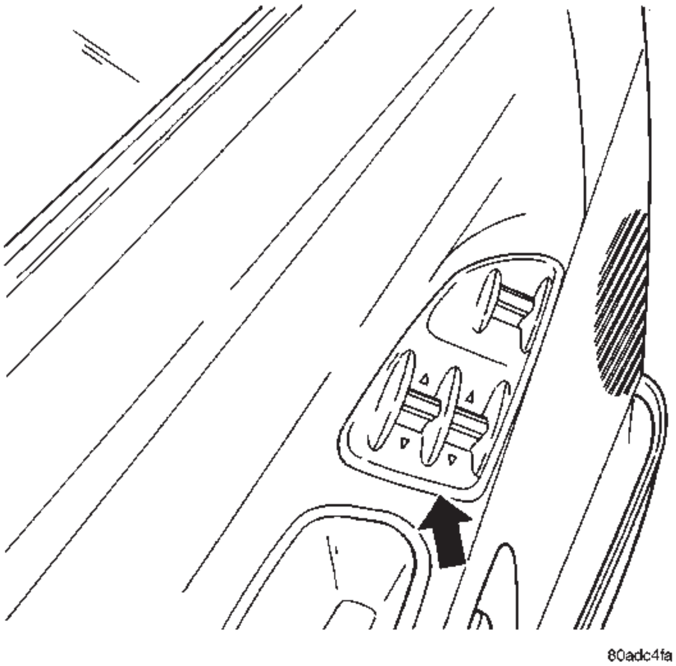

Fig. 32 POWER WINDOW AND LOCK SWITCHES

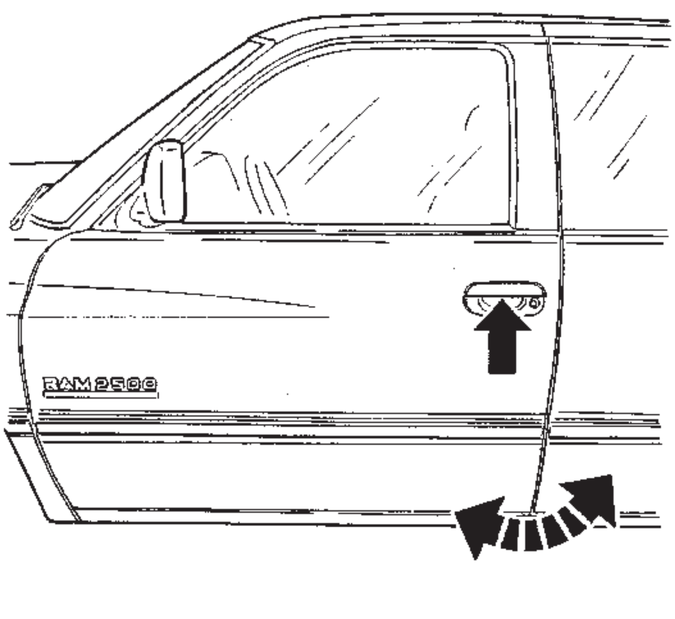

Fig. 33 DOOR OPERATION

(6) Check that the glove box door opens/closes easily (Fig. 34).

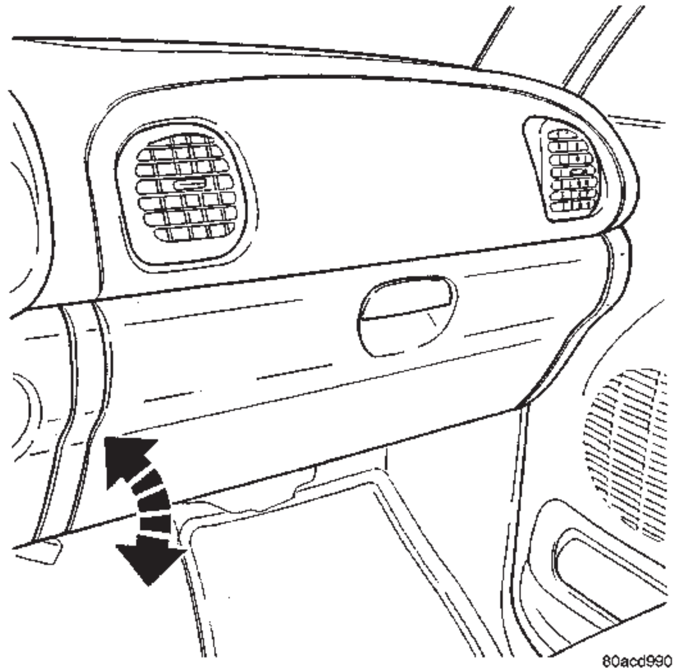

Fig. 34 GLOVE BOX DOOR

(7) Check that the console door opens/closes easily (Fig. 35).

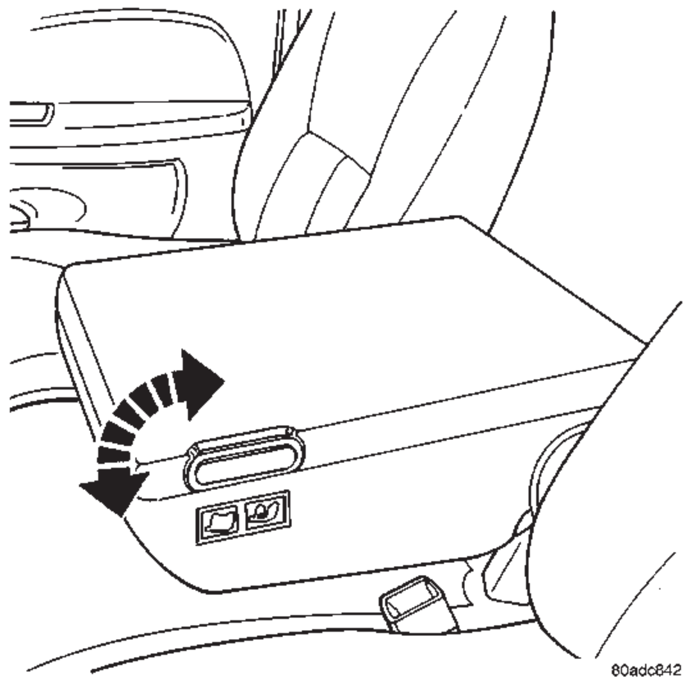

Fig. 35 CENTER CONSOLE

## INSTALLATION - SHIPPED LOOSE ITEMS

(1) Install the antenna mast.

(2) Install rear license plate holder and front license plate holder (if required).

(3) Install wheel covers (if required).

# ROAD TEST

## DESCRIPTION - ROAD TEST INSPECTION

The following items must be inspected during the road test portion of the new vehicle inspection.

- Check neutral safety switch operation
- Check operation of shift/clutch interlock system
- Check operation of gauges and warning lights
- Check horn operation
- Check operation of turn signals and emergency flashers
- Check all mirror adjustments, including day/night function
- Check windshield wipers for proper wipe pattern and intermittent mode (if equipped)
- Check washer spray pattern
- Check heater, defroster and air conditioning for proper operation
- Check that the fan operates quietly
- Check the rear window defroster (if equipped)
- Leave air selection lever in the fresh air position
- Check the rear heater and air conditioning for proper operation
- Check the rear air register locations
- Check that the indicator lamps operate properly
- Check the operation of the radio, cassette and/or compact disc player, and that sound quality is good
- Ensure that the clock displays the correct time
- Check that the trip computer/maintenance reminder operates in all modes
- Check all speed control functions
- Check the service brakes to ensure that they stop the vehicle in a straight line, without noise, shudder or vibration
- Check the brake warning light
- Check the parking brake operation
- Check the engine's performance
- Check the transmission's performance for smooth, quiet operation. If the vehicle is a 4x4, check that the transfer case shifts easily among all ranges
- Check Autostick function (if equipped)
- Check the vehicle's steering and handling
- The steering wheel should be centered when traveling in a straight line
- The vehicle should not pull or vibrate
- Check for squeaks, rattles and wind noise
- Check any other vehicle aspects you believe are important, but that may not be included on the New Vehicle Preparation Form
- Fill fuel tank with specified grade of fuel

## INSPECTION - FUEL

Fill fuel tank with specified grade of gasoline (regular, midgrade or premium).

## INSPECTION - OTHER

As part of DaimlerChrysler's Customer One philosophy, the "Other" blank is provided on the New Vehicle Preparation Form. This is designed to encourage you to check any aspects of vehicle operation that you believe are important to your customers, but that do not appear elsewhere on the form.

## INSPECTION - SQUEAKS, RATTLES AND WIND NOISE

(1) Make sure that the instrument panel, glove box, seats, steering wheel and column are free from squeaks and rattles. Tighten any obvious loose fasteners.

(2) Check that the windows and doors are free from squeaks, rattles and wind noise.

(3) Check that the vehicle exterior is free from squeaks, rattles and noise, front and rear.

(4) Make sure that all interior panels are free from squeaks and rattles.

## INSPECTION - STEERING AND HANDLING

(1) Check that the power assist works properly (if equipped). Steering should not require excessive effort.

(2) Make sure the steering wheel does not vibrate at idle or road speed.

(3) Ensure that the steering wheel is centered when traveling straight ahead.

(4) Check that the vehicle does not drift to one side.

(5) Make sure that the vehicle does not vibrate/shake.

## INSPECTION - TRANSMISSION/TRANSFER CASE

### AUTOMATIC TRANSMISSION

(1) Make sure that the park lock holds the vehicle

With the vehicle on a grade, put automatic transmission in PARK and slowly release the service brake to see if park lock holds. If it does not hold, the transmission requires further service.

(2) Make sure shift lever operates easily/ smoothly (Fig. 36).

Check for smooth shifting. Check for proper upshifting and downshifting.

### MANUAL TRANSMISSION

(1) Check that the shifter operates easily (Fig. 38).

(2) Make sure that the clutch operates smoothly (Fig. 37).

(3) Look for proper synchronization.

The gears should not grind.

ROAD TEST (Continued)

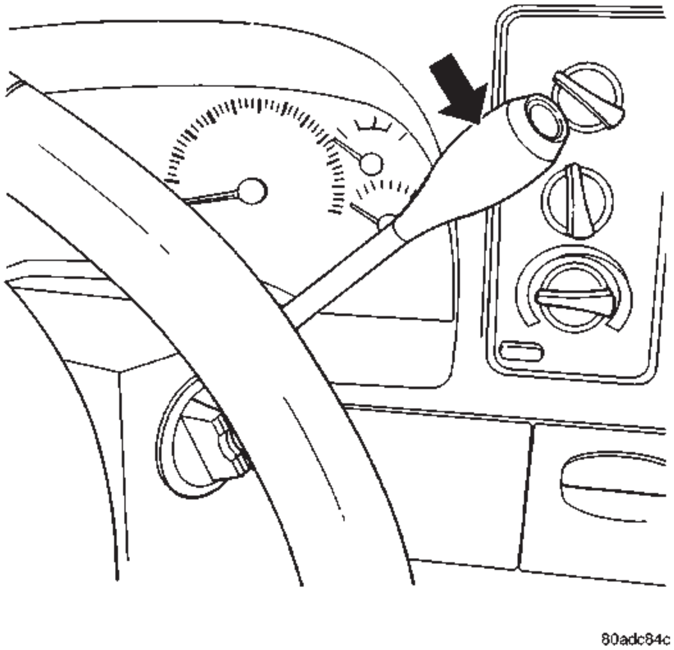

*Fig. 36 AUTOMATIC TRANSMISSION RANGE SELECTOR*

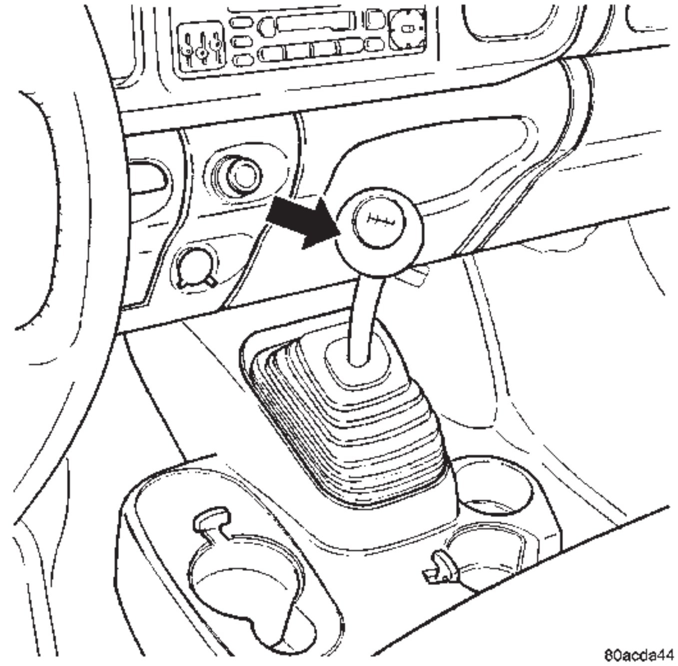

*Fig. 38 MANUAL TRANSMISSION RANGE SELECTOR*

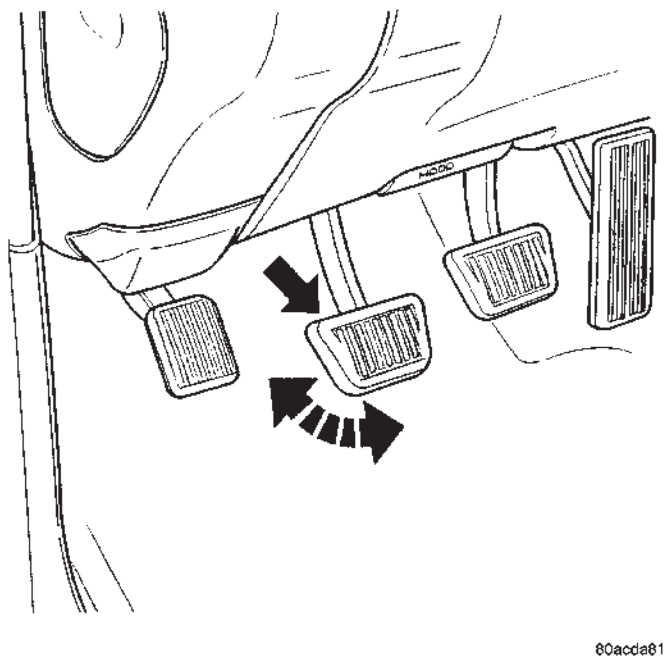

*Fig. 37 CLUTCH PEDAL OPERATION*

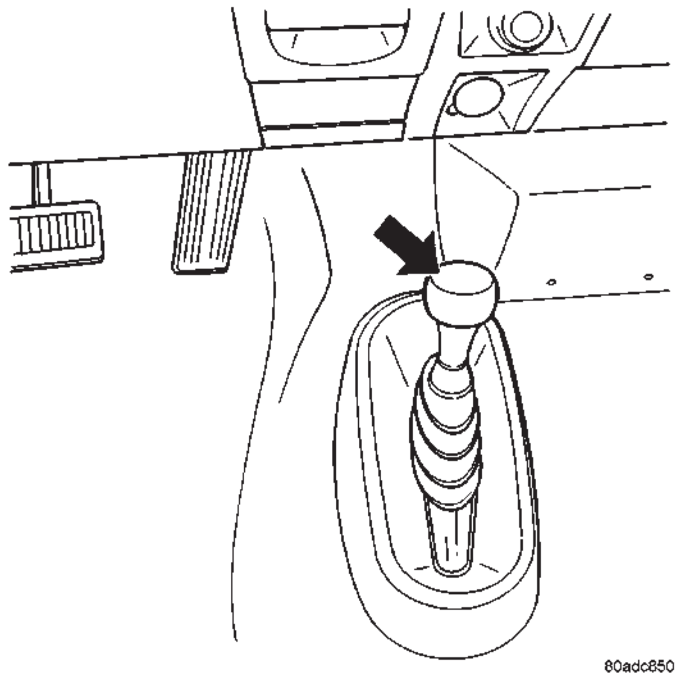

*Fig. 39 TRANSFER CASE SELECTOR*

## 4X4 TRANSFER CASE

(1) Shift the transfer case through all ranges to make sure shifting is smooth and all gear positions respond accordingly (Fig. 39).

## INSPECTION - ENGINE PERFORMANCE

Check the engine for proper performance. It should:

- Start promptly
- Be free from stalling
- Idle smoothly and at proper speed
- Be free from stumbling or hesitation
- Produce sufficient power
- Be free from unusual noises
- Operate within the proper temperature range
- Stop when the ignition key is shut off

ROAD TEST (Continued)

## INSPECTION - PARKING BRAKE

(1) Ensure that the parking brake is easy to operate (Fig. 40).

(2) Make sure the parking brake does not drag.

(3) With the vehicle stopped on a grade, firmly apply the service brakes, place the transmission in NEUTRAL and set the parking brake. Slowly release the service brakes to see if the parking brake will hold.

(4) Check that the parking brake warning light comes on when the parking brake is applied, and is off when the brake is released.

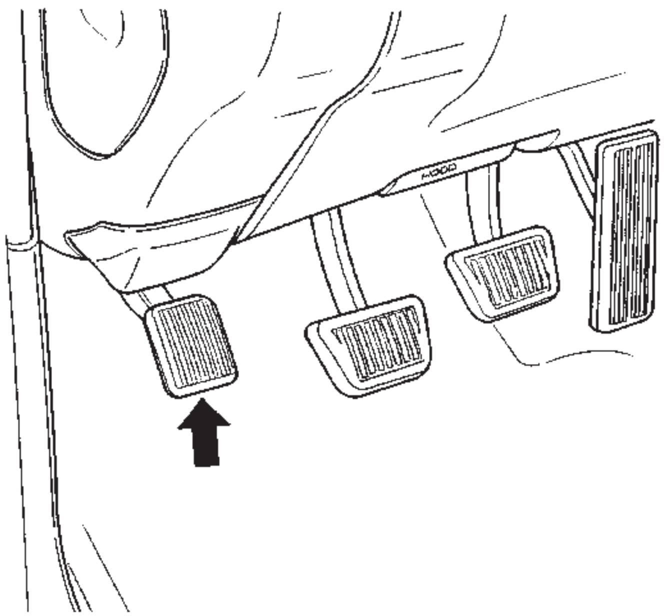

*Fig. 40 PARKING BRAKE OPERATION*

## INSPECTION - SERVICE BRAKES

(1) Check brake warning light operation at vehicle startup.

(2) Check ABS warning light operation at vehicle startup.

(3) Inspect service brake pedal travel and feel (Fig. 41).

(4) Put the vehicle in gear and apply the brakes while the car is in motion. Be sure brake operation is smooth and positive.

(5) Make sure that the vehicle stops in a straight line, without pulling to one side.

(6) Check that the brakes operate quietly, without noise.

(7) Ensure there is no shudder or vibration when braking.

## INSPECTION - SPEED CONTROL

Check the following speed control functions (Fig. 42):

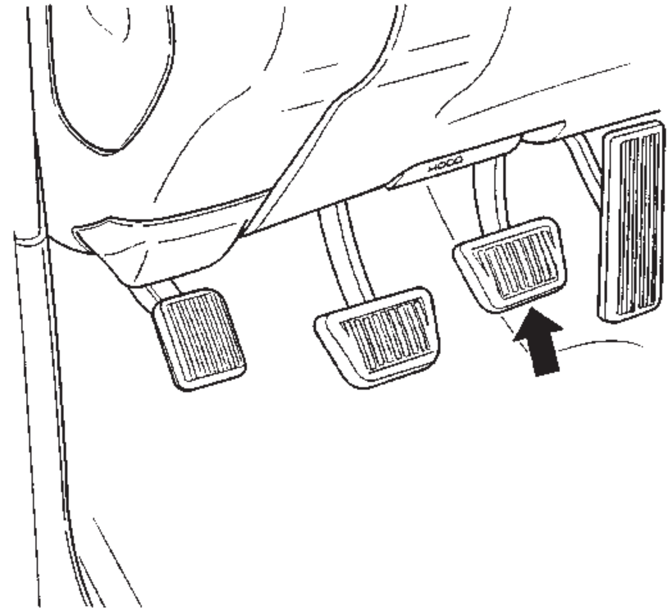

*Fig. 41 SERVICE BRAKE PEDAL*

- Check on/off switch
- Check “set” operation
- Check “resume” function
- Check “accelerate” and “decelerate” functions
- Check brake release function
- Check “cancel” function

## INSPECTION - TRIP COMPUTER/ MAINTENANCE REMINDER

**NOTE: Reset the average fuel economy when the road test is complete.**

Check that all modes operate correctly (Fig. 43).

## INSPECTION - RADIO

(1) Check for good AM/FM reception, ensure that the cassette and/or compact disc (CD) player works properly (Fig. 44).

(2) Check for good sound quality from all speakers.

(3) Ensure that the radio displays the correct time.

(4) Check the steering wheel controls (if equipped).

## INSPECTION - HEATER/AIR CONDITIONER

(1) Check that heater/defroster works properly (Fig. 45).

(2) Turn on the heater when the engine reaches operating temperature.

(3) Operate the blower motor in all speeds.

(4) Operate system in all modes (heat, defrost, etc.).

(5) Operate the rear heater (if equipped).

(6) Check for hot air output at all outlets.

ROAD TEST (Continued)

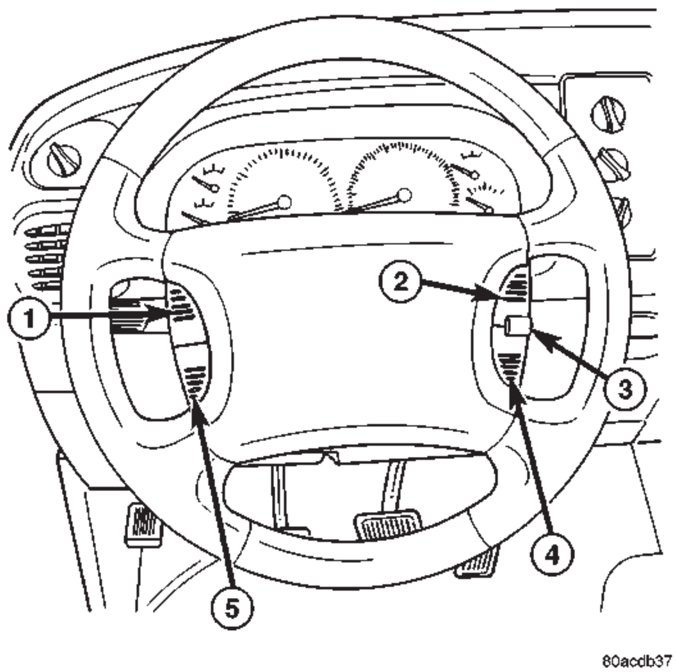

*Fig. 42 SPEED CONTROL SWITCHES*

1 - ON/OFF SWITCH
2 - ACCELERATE/RESUME SWITCH
3 - CANCEL SWITCH
4 - COAST SWITCH
5 - SET SWITCH

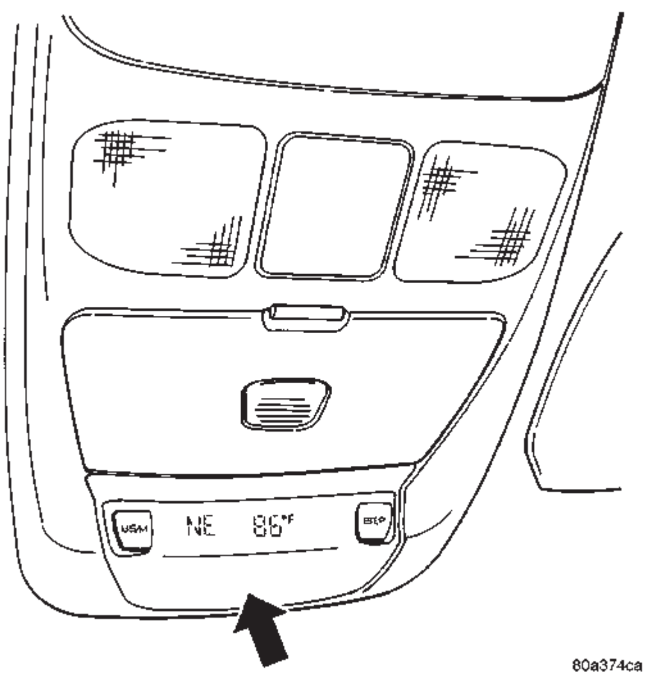

*Fig. 43 TRIP COMPUTER*

(7) Operate temperature levers.
(8) Ensure that rear defroster works.

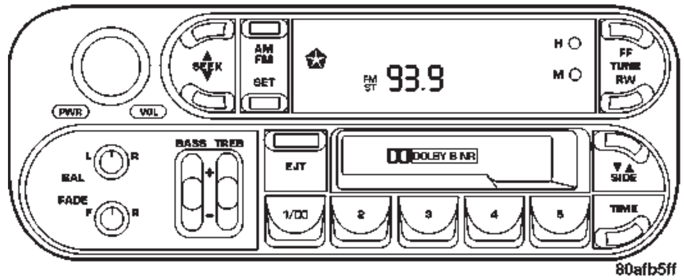

*Fig. 44 RADIO OPERATION*

(9) Turn on rear defroster during drive, then feel window for warmth after drive.
(10) Check that the air conditioner cools properly.
(11) Turn on air conditioning system.
(12) Activate the A/C in all modes. (Make sure all modes work properly including rear unit if equipped.).
(13) Operate blower motor switch at all speeds.
(14) Check for cold output at outlets.
(15) Check that fan operation is quiet.

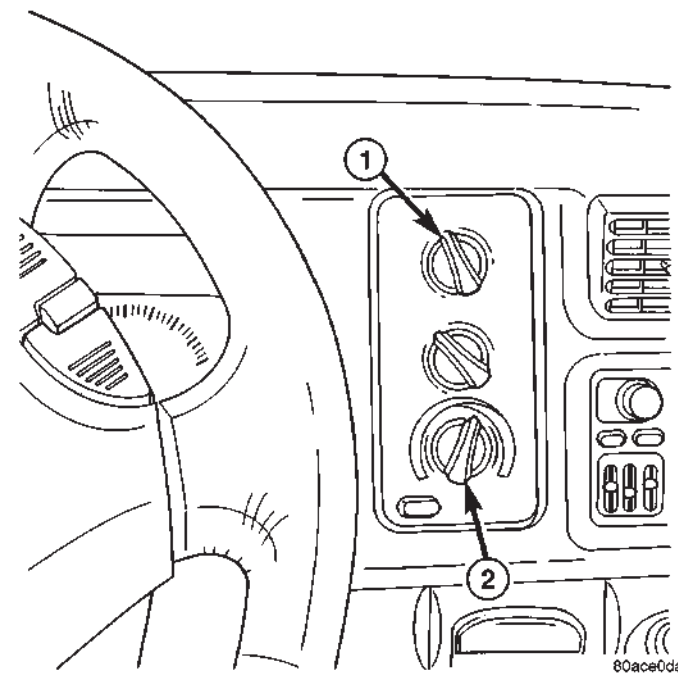

*Fig. 45 HEATER AND A/C CONTROLS*

1 - MODE CONTROL SWITCH
2 - TEMPERATURE SWITCH

## INSPECTION WINDSHIELD WIPERS/WASHERS

(1) Check washer spray pattern for proper operation and aim.
(2) Check intermittent wipe feature for proper operation.
(3) Inspect wiper blades, check for proper wiping pattern-no streaking or missed areas.

ROAD TEST (Continued)

### INSPECTION - MIRROR

(1) Check operation of rearview mirror's day/night function (if equipped).

(2) Check ease of adjustment for all mirrors (power or manual) (Fig. 46) and (Fig. 47).

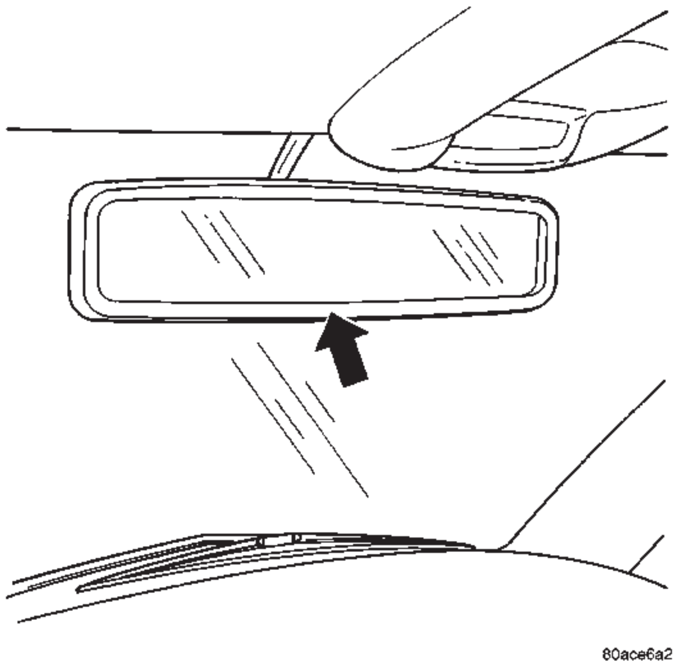

*Fig. 46 INSIDE REAR VIEW MIRROR*

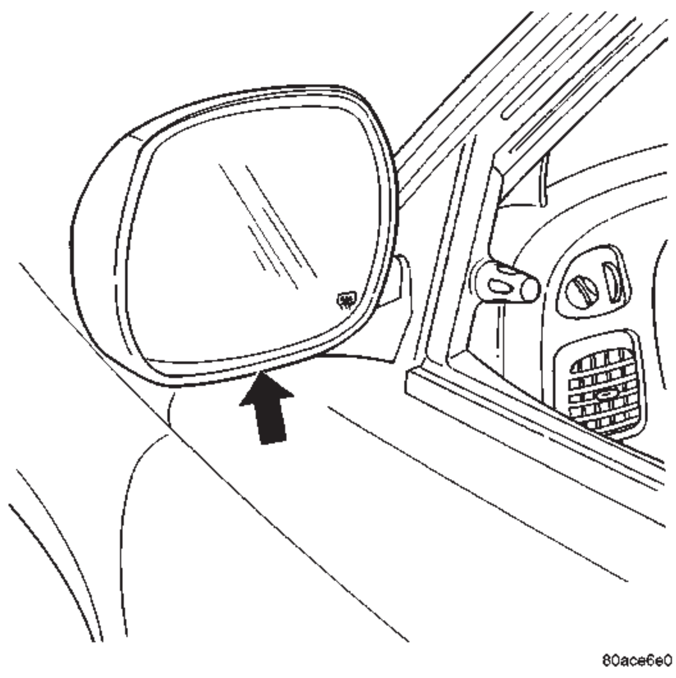

*Fig. 47 OUTSIDE REAR VIEW MIRROR*

### INSPECTION - TURN AND EMERGENCY SIGNALS

(1) Ensure that the turn signals work properly (including canceling after completing a turn).

(2) Ensure that the emergency flashers work properly.

### INSPECTION - HORN

Ensure that the horn works properly.

### INSPECTION - GAUGES/WARNING LIGHTS

(1) Ensure that all gauges, instrument indicator lights, warning lights and instrument panel lights are functioning properly.

(2) Inspect operation of message center (if equipped).

### INSPECTION - SHIFT/CLUTCH INTERLOCK SYSTEM

(1) On vehicles with a manual transmission or transaxle, be sure engine starts only when clutch is depressed.

(2) Some vehicles equipped with an automatic transmission also have a brake interlock system. On these vehicles, be sure that you cannot shift out of PARK without pressing the brake pedal.

### INSPECTION - NEUTRAL SAFETY SWITCH

(1) On vehicles with an automatic transmission or transaxle, check shift indicator alignment in all ranges.

(2) Be sure the engine starts in both PARK and NEUTRAL.

(3) Verify that the engine does not start in any REVERSE/DRIVE positions.

## PRE DELIVERY STORAGE

### DESCRIPTION

Pre Delivery Storage information is provided to recommend practices to use when storing new vehicles prior to delivery to the customer.

If you have prepared a vehicle that will not be immediately delivered to the customer, store the vehicle according to guidelines outlined in (Refer to 30 - NEW VEHICLE PREP/PREDELIVERY STORAGE - STANDARD PROCEDURE) to prevent unnecessary wear and tear on the vehicles electrical systems, paint and finish and damage due to pilferage and vandalism.

PRE DELIVERY STORAGE (Continued)

### STANDARD PROCEDURE - PRE DELIVERY STORAGE

(1) If possible, store vehicles indoors, in clean, dry places. If vehicles must be stored outdoors:

- Try to avoid storage locations that are near any obvious sources of industrial or environmental contamination (e.g., trees, factories, steam or vapor vents, railroad tracks, etc.)
- Maintain tight security to help prevent pilferage and vandalism, and inspect each vehicle regularly to check for such damage
- If the vehicle must be parked on an incline, park it with the front end higher than the rear; this will prevent “hydrostatic lock” caused by fuel draining into the engine
- Rinse the vehicle at least once a week. Snow should be washed away more often, since it can trap harmful contaminants. Dry all horizontal surfaces

(2) The IOD fuse should be removed in order to prevent battery drain and possible damage.

(3) Check the vehicle’s coolant and anti-freeze protection.

(4) Check the vehicle’s battery at least once a month for a proper charge (at least 12.4 volts). Charge the battery if necessary. This will help prevent freezing and deterioration.

(5) Check the vehicle’s tires and inflate them to their maximum recommended levels. Move the vehicles periodically to avoid “flatspotting” the tires.

(6) Do not engage the parking brake; keep it in the OFF position.

(7) Keep all windows closed, all doors locked, and all trim covers intact and in place.

(8) Do not use chalks, crayons or any marker containing abrasives on painted, plated or glass surfaces.

(9) Always use seat covers when moving a vehicle.

## PROGRAMMABLE ELECTRONIC FEATURES

### DESCRIPTION

The programming of electronic features applies to specific DaimlerChrysler Corporation vehicles. Not all vehicles are equipped with these electronic features, and not all vehicles equipped with electronic features have all the available features. Programmable electronic features are subject to change and may be added or deleted from specific vehicle models.

(1) The programmable electronic features that may be provided on the vehicle are:

- Rolling Power Door Locks
- Horn Chirp (When Doors Locked With Remote Keyless Entry)
- Headlamp Flash (When Doors Locked or Unlocked With Remote Keyless Entry)
- Low Fuel Chime
- Remote Keyless Entry Door Unlock Sequence
- Headlights On Automatically With Wipers
- Turn Signal Chime
- 12V Power Outlet
- Remote Unlock
- Remote Linked To Memory
- Headlamp Delay
- Service Interval
- Easy Exit Seat

(2) Programming any of the above features is to be performed prior to vehicle delivery to the customer, depending on customer preference.

**NOTE: For all vehicles except Caravan/Town and Country, the programming must be performed using the DRB III® scan tool. On Caravan/Town and Country vehicles the features can be programmed using the DRB III® scan tool or by button pushing sequences. The customer can perform programming, if desired, by following the instructions outlined in the owner manual.**

### OPERATION

**NOTE: The programmable features provided on vehicles need to be explained to the customer at the time of sale. The customer’s preferences concerning the features should be noted and programmed accordingly during predelivery.**

**NOTE: When using the DRB III® scan tool to enable/disable any programmable electronic features, go to the main menu item #9 on the DRB III® scan tool. This is “Customer Preferences”. You must choose “Customer Preferences” on the main menu to program the desired features.**

#### ROLLING POWER DOOR LOCKS

With this feature enabled, the vehicle’s door locking mechanisms automatically lock when the vehicle reaches approximately 24 Km/h (15 mph).

#### HORN CHIRP

**NOTE: This feature can be enabled with or without the headlamp flash feature.**

The horn chirp function is a feature that can be enabled or disabled on vehicles equipped with

PROGRAMMABLE ELECTRONIC FEATURES (Continued)

Remote Keyless Entry (RKE). The horn chirps when the vehicle is locked with the RKE transmitter.

### HEADLAMP FLASH

**NOTE: This feature can be enabled with or without the horn chirp feature.**

The headlamp flash function is a feature that can be enabled or disabled on vehicles equipped with Remote Keyless Entry (RKE). The headlamps flash once when the vehicle is locked with the RKE transmitter, and flash twice when the vehicle is unlocked with the RKE transmitter.

### LOW FUEL CHIME

All vehicles equipped with the audible low fuel chime are shipped with this feature enabled.

### REMOTE KEYLESS ENTRY (RKE) DOOR UNLOCK SEQUENCE

Two door unlock sequences are provided on vehicles equipped with this feature. When using the RKE transmitter to unlock the doors, pressing the unlock button once when the feature is enabled unlocks only the driver's door. Pushing the RKE transmitter unlock button a second time unlocks the remaining doors. When the RKE door unlock feature is disabled, all doors unlock with one press of the RKE transmitter unlock button.

### HEADLIGHTS ON AUTOMATICALLY WITH WIPERS

This feature appears on vehicles that have, as an option, automatic headlights. When the windshield wipers are turned on, the headlights automatically turn on.

### 12V POWER OUTLET

This feature currently appears on Caravan/Voyager/Town and Country vehicles. The vehicles are shipped with the 12V power outlets turned off with the ignition key. The relay can be changed to make the outlets powered at all times. This feature may be of interest to customers with cell phones.

### TURN SIGNAL CHIME

This feature is an audible turn signal warning chime. The chime sounds if the turn signal is on, the vehicle has traveled one mile and vehicle speed has exceeded 40 Km/h (25 mph).

### REMOTE UNLOCK

The remote unlock function is a feature that can be enabled or disabled on vehicles equipped with Remote Keyless Entry (RKE). With the first press of the RKE transmitter to unlock the doors, the driver's door only unlocks. With the second press of the RKE transmitter, the remaining doors and the liftgate unlock. With the remote unlock feature enabled, the first press of the RKE transmitter unlocks all doors.

### REMOTE LINKED TO MEMORY

The remote linked to memory function is currently only available only on Jeep Grand Cherokee Limited vehicles. When enabled, this feature recalls a memory of seats, mirror and radio presets and positions when unlocking the vehicle with the RKE transmitter.

### HEADLAMP DELAY

Currently available only on Jeep Grand Cherokee vehicles, the headlamp delay timeout can be set to 30, 60 or 90 seconds. This timeout only occurs when the ignition is turned off prior to turning the headlamps off, or when leaving the headlamps in AUTO mode.

### SERVICE INTERVAL

Currently available only on Jeep Grand Cherokee vehicles, the interval for the service reminder message can be set from 3,219 kilometers to 12,070 kilometers (2,000 miles to 7,500 miles).

### EASY EXIT SEAT

Currently available only on Jeep Grand Cherokee Limited vehicles, the driver's seat will reposition 55mm (2.1 inches) rearward, or the end of travel if less than 55mm (2.1 inches) and full downward when the key is removed from the ignition. This feature allows ease of exiting the vehicle. The seat will reposition itself to the memory location when the vehicle is unlocked using the RKE transmitter or by pressing the memory buttons on the door panel.

## APPEARANCE TIPS

### CLEANING

(1) Before delivering the new vehicle to the customer, the following checks on appearance details are recommended:

- Wash the vehicle to remove all traces of road grime and other dirt on the car from new vehicle preparation operations
- Clean the tire sidewalls
- Clean exterior and interior glass surfaces
- Remove all protective covers
- Remove undercoat overspray, excess window sealer, and excess weatherstrip adhesive
- Inspect interior trim, seats, carpeting, and moldings. Clean as necessary
- Remove shipping and inspection stickers

APPEARANCE TIPS (Continued)

• After the vehicle is clean, inspect the paint again

(2) Mopar® offers a wide variety of car care products, developed to meet your dealership's requirements. All are specifically formulated for DaimlerChrysler vehicles

# FINAL STEPS

## STANDARD PROCEDURE - OWNER CHECK OUT

The last step in the new vehicle preparation procedure is to help the customer become familiar with the features on their new vehicle. Show the new owner where the controls and gauges are and explain how they operate.

## STANDARD PROCEDURE - INSPECTION - INFORMATION LABELS

Verify that the following labels are installed and legible.

- Emission control labels
- Monroney label
- Tire pressure label
- Vehicle certification label

## NEW VEHICLE PREPARATION FORM

Complete the Emission Certification Of Conformity Statement on the bottom of the New Vehicle Preparation Form (Fig. 1) in the glove box or storage box after it has been completed and signed by the designated individual.
