CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION 1

**CONNECTOR/GROUND/SPLICE
LOCATION****DESCRIPTION**

This section provides illustrations identifying connector, ground, and splice locations in the vehicle.

Connector, ground, and splice indexes are provided. Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

CONNECTORS

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
4WD Switch	BK	On Front Axle	N/S
A/C Compressor Clutch	BK	Rear of A/C Compressor	7, 8, 11
A/C Heater Control	BK	Center of Instrument Panel	33
A/C Heater Temperature Select	NAT	Center of Instrument Panel	33
A/C High Pressure Switch	BK	At A/C Compressor	7, 8, 11
A/C Low Pressure Switch	BK	Top of A/C Accumulator	1, 3
Accelerator Pedal Position Sensor (Diesel)		Left Front of Engine	13, 14
Aftermarket Trailer Tow Connector		Rear of Vehicle	N/S
Airbag Control Module		Center of I.P. at Airbag Control Module	30
Ambient Temperature Sensor	BK	Radiator Left Support	N/S
Ash Receiver Lamp	BK	Center of Instrument Panel	34
Back-up Lamp Switch (M/T)	BK	Top of Transmission	16
Battery Temperature Sensor	BK	Below Battery Tray	21
Blend Door Actuator		Center of Instrument Panel	N/S
Blower Motor	BK	Bottom Right of Instrument Panel	30
Blower Motor Resistor Block	BK	Bottom Right of Instrument Panel	34
Brake Lamp Switch		Brake Pedal Arm	30, 32
Brake Pressure Switch	BK	At Master Cylinder	18
Bypass Jumper (A/T)	GN	Top Of Clutch Pedal	35
C105		Rear of Front Bumper	N/S
C106	BK	Rear of Front Bumper	22
C114	BK	Radiator Left Support	20
C125 (Diesel)	BK	Left Rear of Engine Compartment	3

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
C126 (Diesel)	GY	Left Rear of Engine Compartment	3
C129	BK	Above Left Front Body Cushion	20, 29
C130		At Power Distribution Center	1, 3
C134	BK	Left Cowl	30, 33, 35
C203		Left Cowl	30, 33
C205		Instrument Panel Center Support	N/S
C206		Left Cowl	25, 30, 33
C237		Bottom Right of Instrument Panel	30, 34
C303	BK	Below Driver's Seat	23
C308		Center Rear of Headliner	N/S
C329	BK	Below Right Tail Lamp	27
C333	BK	Below Left Tail Lamp	27
C342	BK	Left Rear of Frame	27
C343	BK	Left Rear of Frame	27
C344 (Dual Rear Wheels)	BK	Left Rear of Frame	N/S
C345		Right Door	N/S
C346		Right Door	N/S
C347		Left Door	25
C348		Left Door	25
C352	WT	Left A-Pillar	25
C353	WT	Right A-Pillar	25
C358	NAT	Left Side Instrument Panel	25, 30, 33, 35
C359		Heated Seat To Body Wiring	23
C360		Below Driver's Seat	23
C361		Left Rear Speaker Wiring	N/S
C364		Right Rear Speaker Wiring	N/S
C365		Under Passenger Power Seat	N/S
Camshaft Position Sensor (V8)	GY	Near of Distributor	5
Camshaft Position Sensor (V10)	GY	Front of Engine	8
Camshaft Position Sensor (Diesel)		Left Front of Engine	13
Cargo Lamp No. 1	BK	Rear of Lamp	N/S
Cargo Lamp No. 2	BK	Rear of Lamp	N/S
Center High Mounted Stop Lamp No. 1	BK	Rear of Cab	23
Center High Mounted Stop Lamp No. 2	BK	Rear of Cab	23
Center Identification Lamp	BK	Behind Front of Headliner	25
Central Timer Module C1		Left Side Under Instrument Panel	30, 32
Central Timer Module C2		Left Side Under Instrument Panel	30, 32
Cigar Lighter	NAT	Center of Instrument Panel	33

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Clockspring C1		Steering Column	32
Clockspring C2		Steering Column	32
Clockspring C3		Steering Column	32
Clutch Pedal Position Switch (M/T)	BK	Top of Clutch Pedal	35
Controller Anti-Lock Brake C1	BK	Left Fender Side Shield	18
Controller Anti-Lock Brake C2 (ABS)	BK	Left Fender Side Shield	18
Crankshaft Position Sensor (V8)	BK	Rear of Engine Block	5
Crankshaft Position Sensor (V10)	GY	Right Side of Engine Block	8
Cummins Bus (-)		Left Front of Engine	13
Cup Holder Lamp	BK	Center of Instrument Panel	30, 34
Data Link Connector	BK	Left Bottom of Instrument Panel	30, 32
Day/Night Mirror	BK	Day/Night Mirror	N/S
Daytime Running Lamp Module	BK	Left Fender Side Shield	18
Dome Lamp	BK	Rear of Cab	23
Driver Airbag	YL	Steering Wheel	N/S
Driver Cylinder Lock Switch	BK	In Door	24
Driver Door Ajar Switch	NAT	Door Jamb	N/S
Driver Door Lock Motor	BK	In Door	24
Driver Door Window/Lock Switch	BL	In Door	24
Driver Heated Seat Cushion	BL	Under Seat	N/S
Driver Heated Seat Switch	RD	Center of Instrument Panel	N/S
Driver Lumbar Motor		Under Seat	N/S
Driver Power Seat Front Vertical Motor	BK	Under Seat	N/S
Driver Power Seat Horizontal Motor	BK	Under Seat	N/S
Driver Power Seat Rear Vertical Motor	BK	Under Seat	N/S
Driver Power Seat Switch		At Seat	N/S
Driver Power Window Motor		In Door	24
EVAP/Purge Solenoid	BK	Right Fender Side Shield	22
Electric Brake Provision		Bottom Left of Instrument Panel	N/S
Engine Control Module (Diesel)		Left Side Engine	15
Engine Coolant Temperature Sensor (Diesel)	BK	Left Front of Cylinder Head (Diesel)	13
Engine Coolant Temperature Sensor (Gas)	BK	On Thermostat Housing	5, 8

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Engine Oil Pressure Sensor (V8)	BK	Near Distributor	5
Engine Oil Pressure Sensor (V10)		Near Oil Filter	8
Engine Oil Pressure Sensor (Diesel)		Left Side of Engine	15
Fuel Heater (Diesel)		Left Side of Engine	13
Fuel Injection Pump (Diesel)		Left Side of Engine, Below ECM	13

POWER DISTRIBUTION

DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Junction Block (JB).

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses

- Cartridge fuses
- Circuit splice blocks
- Flashers
- Relays.

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components. Refer to **Wiring Diagrams** for complete circuit diagrams for the various power distribution system components.

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized dis-

POWER DISTRIBUTION (Continued)

tribution points for the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate many accessories that the vehicle owner may choose to have installed in the aftermarket.

CIGAR LIGHTER OUTLET

DESCRIPTION

A cigar lighter is standard equipment on this model. The cigar lighter is installed in the instrument panel next to the ash receiver, which is located near the center of the instrument panel, below the radio. The cigar lighter base is secured by a snap fit within the instrument panel.

The cigar lighter knob and heating element unit, and the cigar lighter receptacle unit are available for service. These components cannot be repaired and, if faulty or damaged, they must be replaced.

OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or receptacle shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The cigar lighter receives battery voltage from a

fuse in the junction block only when the ignition switch is in the Accessory or On positions.

The knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the receptacle shell, the heating element resistor coil is grounded through its housing to the receptacle shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the receptacle shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the receptacle shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the receptacle shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

DIAGNOSIS AND TESTING - CIGAR LIGHTER OUTLET

For complete circuit diagrams, refer to **Cigar Lighter** in Wiring Diagrams.

WARNING: REFER TO THE PASSIVE RESTRAINT SECTION OF THE SERVICE MANUAL BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused ignition switch output (run/accessory) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/accessory) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused

CIGAR LIGHTER OUTLET (Continued)

ignition switch output (run/accessory) circuit to the ignition switch as required.

(3) Turn the ignition switch to the Off position. Remove the cigar lighter knob and element from the cigar lighter receptacle. Check for continuity between the inside circumference of the cigar lighter receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Turn the ignition switch to the On position. Check for battery voltage at the insulated contact located at the back of the cigar lighter receptacle. If OK, replace the faulty cigar lighter knob and element. If not OK, go to Step 5.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the cigar lighter receptacle from the instrument panel and disconnect the wire harness connector. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/accessory) circuit cavity of the cigar lighter wire harness connector. If OK, replace the faulty cigar lighter receptacle. If not OK, repair the open fused ignition switch output (run/accessory) circuit to the junction block fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the cigar lighter knob and element out of the cigar lighter receptacle base, or unsnap the protective cap from the power outlet receptacle base (Fig. 1).

(3) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the instrument panel (Fig. 2).

(4) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

(6) Pull the receptacle base away from the instrument panel far enough to access the instrument panel wire harness connector.

(7) Disconnect the instrument panel wire harness connector from the cigar lighter or power outlet receptacle base connector receptacle.

CIGAR LIGHTER OUTLET (Continued)

(8) Remove the cigar lighter or power outlet mount from the instrument panel.

INSTALLATION

(1) Reconnect the instrument panel wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.

(2) Install the cigar lighter or power outlet mount into the instrument panel.

(3) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(4) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(5) Install the cigar lighter knob and element into the cigar lighter receptacle base, or the protective cap into the power outlet receptacle base.

(6) Reconnect the battery negative cable.

CIRCUIT BREAKER

DESCRIPTION

Automatic resetting circuit breakers are used to protect a system circuit from a short circuit or overload. Some examples of this condition can be caused by an obstructed or stuck seat adjuster or power window motor.

The circuit breaker cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - CIRCUIT BREAKER

For circuit descriptions and diagrams, refer to Wiring Diagrams.

(1) Locate the correct circuit breaker in the junction block. Pull out the circuit breaker slightly, but be certain that the circuit breaker terminals still contact the terminals in the junction block cavities.

(2) Connect the negative lead of a 12-volt DC voltmeter to a good ground.

(3) With the voltmeter positive lead, check both terminals of the circuit breaker for battery voltage.

If only one terminal has battery voltage, the circuit breaker is faulty and must be replaced. If neither terminal has battery voltage, repair the open circuit from the Power Distribution Center (PDC) as required.

GENERATOR CARTRIDGE FUSE

DESCRIPTION

A 140 ampere generator cartridge fuse is used on this model. The generator cartridge fuse is similar to other cartridge fuses found in the Power Distribution Center (PDC). This fuse has a color-coded plastic housing and a clear plastic fuse conductor inspection cover like other cartridge fuses, but has a higher current rating and is connected and secured with screws instead of being pushed onto male spade-type terminals. The generator cartridge fuse cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

The generator cartridge fuse is secured between the two B(+) terminal stud connection bus bars within the Power Distribution Center (PDC). This fuse protects the vehicle electrical system from damage that could be caused by excessive charging system output and/or excessive electrical system current levels resulting from a faulty generator or faulty charging system control circuits. If the current rating of the fuse is exceeded, the fuse conductor melts to open the generator output circuit connection to the PDC. If a generator cartridge fuse fails, be certain to completely inspect and test the vehicle charging system before replacing the fuse and returning the vehicle to service. Refer to **Charging System** for the charging system diagnostic procedures. Refer to **Wiring Diagrams** for the location of complete PDC circuit diagrams.

REMOVAL

If a generator cartridge fuse fails, be certain to inspect and test the vehicle charging system before replacing the cartridge fuse and returning the vehicle to service. Refer to **Charging System** in the index of this service manual for the charging system diagnostic procedures.

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and remove the cover from the Power Distribution Center (PDC).

(3) Remove the two screws that secure the generator cartridge fuse to the two B(+) terminal stud bus bars within the PDC.

(4) Remove the generator cartridge fuse from the PDC.

INSTALLATION

If a generator cartridge fuse fails, be certain to inspect and test the vehicle charging system before replacing the cartridge fuse and returning the vehicle

GENERATOR CARTRIDGE FUSE (Continued)

to service. Refer to **Charging System** in the index of this service manual for the charging system diagnostic procedures.

(1) Position the generator cartridge fuse onto the two B(+) terminal stud bus bars within the PDC.

(2) Install and tighten the two screws that secure the generator cartridge fuse to the two B(+) terminal stud bus bars within the PDC. Tighten the screws to 3.4 N·m (30 in. lbs.). **Be certain that both screws are tightened to the proper torque value.**

(3) Install and latch the cover onto the PDC.

(4) Reconnect the battery negative cable.

IOD FUSE

DESCRIPTION

Fig. 3 Ignition-Off Draw Fuse

- 1 - JUNCTION BLOCK
2 - IGNITION-OFF DRAW FUSE AND HOLDER
3 - LEFT INSTRUMENT PANEL END BRACKET

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse (Fig. 3) that is disconnected within the Junction Block when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the junction block as part of the preparation procedures performed just prior to new vehicle delivery.

The left end of the instrument panel cover has a snap-fit fuse access panel that can be removed to provide service access to the fuses in the junction block. A finger recess is molded into the access panel for easy removal. An adhesive-backed fuse layout map is

secured to the instrument panel side of the access panel to ensure proper fuse identification. The IOD fuse is a 10 ampere mini blade-type fuse. The fuse is secured within a black molded plastic fuse holder and puller unit that serves both as a tool for disconnecting and reconnecting the fuse in its junction block cavity, and as a fuse holder that conveniently stores the fuse in the same junction block cavity after it has been disconnected.

CIRCUITS INCLUDED WITH IOD FUSE

- Cargo Lamp
- CHMSL
- Diagnostic Connector
- Dome Lamp
- Glove Box Lamp
- Map/Reading Lamps
- Power Mirrors
- Radio
- Under Hood Lamp

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from JB fuse cavity 12 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition.

IOD FUSE (Continued)

If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to the **Battery** section of the service manual for the location of additional service information covering the battery.

REMOVAL

The Ignition-Off Draw (IOD) fuse is disconnected from Junction Block (JB) fuse cavity 12 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

Fig. 4 Ignition-Off Draw Fuse

- 1 - JUNCTION BLOCK
- 2 - IGNITION-OFF DRAW FUSE AND HOLDER
- 3 - LEFT INSTRUMENT PANEL END BRACKET

- (1) Turn the ignition switch to the Off position.
- (2) Remove the fuse access panel by unsnapping it from the left outboard end of the instrument panel.
- (3) Grasp the upper and lower tabs of the IOD fuse holder unit in fuse cavity 12 (Fig. 4) of the JB between the thumb and forefinger and pull the unit firmly outward.
- (4) Install the fuse access panel by snapping it onto the left outboard end of the instrument panel.

INSTALLATION

The Ignition-Off Draw (IOD) fuse is disconnected from Junction Block (JB) fuse cavity 12 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

- (1) Turn the ignition switch to the Off position.
- (2) To install the IOD fuse, use a thumb to press the IOD fuse holder unit in fuse cavity 12 firmly into the JB.
- (3) Install the fuse access panel by snapping it onto the left outboard end of the instrument panel.

JUNCTION BLOCK

DESCRIPTION

Fig. 5 Junction Block Location

- 1 - JUNCTION BLOCK
- 2 - FUSE ACCESS PANEL

An electrical Junction Block (JB) is concealed behind the left outboard end of the instrument panel cover (Fig. 5). The JB combines the functions previously provided by a separate fuseblock module and relay center, serves to simplify and centralize numerous electrical components, and to distribute electrical current to many of the accessory systems in the vehicle. It also eliminates the need for numerous splice connections and serves in place of a bulkhead connec-

JUNCTION BLOCK (Continued)

tor between many of the engine compartment, instrument panel, and body wire harnesses. The JB houses up to nineteen blade-type fuses (two standard-type and seventeen mini-type), up to two blade-type automatic resetting circuit breakers, the electronic combination turn signal and hazard warning flasher, and one International Standards Organization (ISO) micro-relay.

The molded plastic JB housing has integral mounting brackets that are secured with two screws to the left instrument panel end bracket. The left end of the instrument panel cover has a snap-fit fuse access panel that can be removed for service of the JB. A fuse puller and spare fuse holders are located on the back of the fuse access cover, as well as an adhesive-backed fuse layout map to ensure proper fuse identification.

The JB unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the JB housing is faulty or damaged, the entire JB unit must be replaced.

OPERATION

All of the circuits entering and leaving the JB do so through up to nine wire harness connectors, which are connected to the JB through integral connector receptacles molded into the JB housing. Internal connection of all of the JB circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Wiring Diagrams** for the location of complete JB circuit diagrams.

DIAGNOSIS AND TESTING - JUNCTION BLOCK

The junction block does not incorporate any self diagnostic capability. Most of the electrical circuits incorporated into the vehicle must pass through the junction block at one point or another. The most efficient means of diagnosing a suspected junction block problem involves a simple continuity tester or ohm meter. Using the Wiring Diagrams as a guide trace the problem circuit to the proper junction block cavity and test all circuits in the effected circuit for proper continuity. A open or high resistance circuit is a sign of a problem. Some other possible junction block problems to look for are:

- Loose fuse receptacle terminals.
- Loose relay / circuit breaker receptacle terminals.
- Bent or distorted electrical circuit pins.
- Incorrect size fuse installed in junction block fuse cavity.
- Dark areas identifying a source of excess heat.
- Defective fuse, relay or circuit breaker installed in junction block cavity.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the fuse access bezel from the instrument panel.
- (3) Remove the steering column cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
- (4) Remove the hood release handle retaining screws and position the handle assembly out of the way.
- (5) Remove the lower knee blocker from the instrument panel.
- (6) Pull drivers side carpet down, out of the way.
- (7) Remove the parking brake switch connector, release linkage and retaining fasteners and position the assembly out the drivers door opening.
- (8) Remove the electrical ground connections, located behind park brake mounting location.
- (9) Remove the two junction block retaining screws. To access the upper retaining screw a 15 inch long #2 Phillips screwdriver will be required. Access the upper screw through hole in dash support brace.
- (10) Reach through the outboard side of the instrument panel steering column opening to access and disconnect all of the wire harness connectors from the Junction Block (JB) connector receptacles (Fig. 6).

Fig. 6 Junction Block Remove/Install

- 1 - I.P. End Bracket
- 2 - Junction Block
- 3 - Screws

JUNCTION BLOCK (Continued)

(11) Remove the junction block from under the instrument panel.

INSTALLATION

NOTE: If the Junction Block (JB) is being replaced with a new unit, be certain to transfer each of the fuses, circuit breakers and relays from the faulty JB to the proper cavities of the replacement JB. Refer to Junction Block in the index of this service manual for the location of complete circuit diagrams and cavity assignments for the JB.

- (1) Position the junction block under the instrument panel.
- (2) Connect all of the wire harness connectors on the Junction Block (JB) connector receptacles.
- (3) Install the two junction block retaining screws.
- (4) Install the electrical ground connections, located behind park brake mounting location.
- (5) Install the parking brake switch connector, release linkage and retaining fasteners.
- (6) Reposition drivers side carpet.
- (7) Install the lower knee blocker on the instrument panel.
- (8) Install the hood release handle retaining screws.
- (9) Install the steering column cover.
- (10) Install the fuse access bezel on the instrument panel.
- (11) Connect the battery negative cable.

POWER DISTRIBUTION CENTER

DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC) (Fig. 7). The molded plastic PDC housing is located in the left front corner of the engine compartment, just behind the battery. The PDC houses the generator cartridge fuse and up to twelve maxi-type cartridge fuses, which replace all in-line fusible links. The PDC also houses up to thirteen blade-type fuses (two standard-type and eleven mini-type), up to seventeen International Standards Organization (ISO) relays (five standard-type and twelve micro-type), two joint connectors (one eighteen-way and one twenty-eight-way), a forty-three-way engine wire harness in-line connector and a fuse puller.

The PDC housing is secured in the engine compartment on the outboard side with two screws to the left front inner fender shield, and with a screw on the inboard side to the left front inner wheel house. The

80b9a53c

Fig. 7 Power Distribution Center Location

1 - POWER DISTRIBUTION CENTER

PDC housing has a molded plastic cover that includes two integral latches, one on each side. The PDC cover is easily opened and removed for service access and has a convenient adhesive-backed fuse and relay layout map affixed to the inside surface of the cover to ensure proper component identification.

The PDC unit cannot be repaired and is only serviced as a unit with the headlamp and dash wire harness. If the internal circuits or the PDC housing are faulty or damaged, the headlamp and dash wire harness unit must be replaced.

OPERATION

All of the current from the battery and the generator output enters the PDC through two cables with eyelets that are secured with nuts to the two B(+) terminal studs located just inside the inboard end of the PDC housing. The PDC cover is unlatched and removed to access the battery and generator output connection B(+) terminal studs, the fuses, the relays, the joint connectors and the engine wire harness in-line connector. Internal connection of all of the PDC circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Wiring Diagrams** for the location of complete PDC circuit diagrams.

REMOVAL

The Power Distribution Center (PDC) is serviced as a unit with the headlamp and dash wire harness. If any internal circuit of the PDC or the PDC hous-

POWER DISTRIBUTION CENTER (Continued)

ing is faulty or damaged, the entire PDC and headlamp and dash wire harness unit must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect each of the headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring for the location of more information on the headlamp and dash wire harness connector locations.

(3) Remove all of the fasteners that secure each of the headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring for the location of more information on the ground eyelet locations.

(4) Disengage each of the retainers that secure the headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring for the location of more information on the headlamp and dash wire harness retainer locations.

(5) Unlatch and remove the cover from the PDC.

(6) Remove the screw that secures the engine wire harness in-line connector to the PDC and disconnect the connector (Fig. 8).

Fig. 8 Engine Wire Harness In-Line Connector

- 1 - LEFT FENDER
- 2 - POWER DISTRIBUTION CENTER
- 3 - ENGINE WIRE HARNESS IN-LINE CONNECTOR
- 4 - SCREW

(7) Remove the nut that secures the eyelet of the battery negative cable generator output take out to the rearward B(+) terminal stud in the PDC and remove the eyelet from the stud (Fig. 9).

(8) Remove the nut that secures the eyelet of the battery positive cable PDC take out to the forward B(+) terminal stud in the PDC and remove the eyelet from the stud.

(9) Remove the screw that secures the PDC housing to the left front fender wheel housing (Fig. 10).

Fig. 9 Battery and Generator Connections to PDC

Fig. 10 Power Distribution Center

- 1 - FENDER INNER SHIELD
- 2 - INNER WHEEL HOUSE
- 3 - SCREW
- 4 - SCREW
- 5 - POWER DISTRIBUTION CENTER

(10) Remove the two screws that secure the PDC housing to the left front fender inner shield.

(11) Remove the PDC and the headlamp and dash wire harness from the engine compartment as a unit.

POWER DISTRIBUTION CENTER (Continued)

INSTALLATION

The Power Distribution Center (PDC) is serviced as a unit with the headlamp and dash wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and headlamp and dash wire harness unit must be replaced.

NOTE: If the PDC is being replaced with a new unit, be certain to transfer each of the blade-type fuses, cartridge fuses and relays from the faulty PDC to the proper cavities of the replacement PDC. Refer to Power Distribution in the index of this service manual for the location of complete PDC circuit diagrams and cavity assignments.

(1) Position the PDC and the headlamp and dash wire harness unit in the engine compartment.

(2) Install and tighten the two screws that secure the PDC housing to the left front fender inner shield. Tighten the screws to 8.4 N·m (75 in. lbs.).

(3) Install and tighten the screw that secures the PDC housing to the left front fender wheel housing. Tighten the screw to 2.2 N·m (20 in. lbs.).

(4) Install the eyelet of the battery positive cable PDC take out onto the forward B(+) terminal stud in the PDC.

(5) Install and tighten the nut that secures the eyelet of the battery positive cable PDC take out to the forward B(+) terminal stud in the PDC. Tighten the nut to 8.4 N·m (75 in. lbs.).

(6) Install the eyelet of the battery negative cable generator output take out onto the rearward B(+) terminal stud in the PDC.

(7) Install and tighten the nut that secures the eyelet of the battery negative cable generator output take out to the rearward B(+) terminal stud in the PDC. Tighten the nut to 75 in. lbs.

(8) Reconnect the engine wire harness in-line connector to the PDC.

(9) Install and tighten the screw that secures the engine wire harness in-line connector to the PDC. Tighten the screw until a distinct audible click is heard.

(10) Install and latch the cover onto the PDC.

(11) Engage each of the retainers that secure the headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring for the location of more information on the headlamp and dash wire harness retainer locations.

(12) Install all of the fasteners that secure each of the headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring for the location of more information on the ground eyelet locations.

(13) Reconnect each of the headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring for the location of more information on the headlamp and dash wire harness connector locations.

(14) Reconnect the battery negative cable.

POWER OUTLET

DESCRIPTION

Two power outlets are installed in the vehicle. One in the instrument panel next to the cigar lighter and the other in the right rear quarter trim panel. The power outlet bases are secured by a snap fit within the instrument panel or trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Junction Block at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

DIAGNOSIS AND TESTING - POWER OUTLET

For complete circuit diagrams, refer to **Power Outlet** in Wiring Diagrams.

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.

(3) Remove the plastic protective cap from the power outlet receptacle. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.

POWER OUTLET (Continued)

(5) Disconnect and isolate the battery negative cable. Remove the power outlet receptacle from the instrument panel. Disconnect the wire harness connector from the power outlet receptacle. Check for continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the cigar lighter knob and element out of the cigar lighter receptacle base, or unsnap the protective cap from the power outlet receptacle base (Fig. 11).

80b89821

Fig. 11 Cigar Lighter and Power Outlet - Typical

- 1 - RECEPTACLE BASE
- 2 - KNOB & ELEMENT
- 3 - MOUNT
- 4 - WIRE HARNESS CONNECTOR
- 5 - POWER OUTLET

(3) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the instrument panel (Fig. 12).

(4) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

80a95367

Fig. 12 Cigar Lighter and Power Outlet Remove/Install

- 3 - BASE
- 4 - PARTIALLY REMOVED
- 5 - EXTERNAL SNAP-RING PLIERS
- 6 - MOUNT
- 7 - BASE

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

(6) Pull the receptacle base away from the instrument panel far enough to access the instrument panel wire harness connector.

(7) Disconnect the instrument panel wire harness connector from the cigar lighter or power outlet receptacle base connector receptacle.

(8) Remove the cigar lighter or power outlet mount from the instrument panel.

INSTALLATION

(1) Reconnect the instrument panel wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.

(2) Install the cigar lighter or power outlet mount into the instrument panel.

(3) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

POWER OUTLET (Continued)

(4) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(5) Install the cigar lighter knob and element into the cigar lighter receptacle base, or the protective cap into the power outlet receptacle base.

(6) Reconnect the battery negative cable.

HORN RELAY

DESCRIPTION

The horn relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (or footprint) is different, current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

The horn relay is a electromechanical device that switches battery current to the horn when the horn switch or when the high-line or premium Central Timer Module (CTM) grounds the relay coil. See Horn Relay in the Diagnosis and Testing section of this group for more information.

The horn relay is located in the Power Distribution Center (PDC), in the engine compartment. Refer to the PDC label for relay identification and location.

If a problem is encountered with a continuously sounding horn, it can usually be quickly resolved by removing the horn relay from the PDC until further diagnosis is completed.

The horn relay cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - HORN RELAY

The headlamp (or security) relay and the horn relay are located in the Power Distribution Center (PDC) in the engine compartment. Each of these relays can be tested as described in the following procedure, however the circuits they are used in do vary. To test the relay circuits, refer to the circuit descriptions and diagrams in Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE RESTRAINTS SECTION OF THE SERVICE MANUAL BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Remove the relay (Fig. 13) from the PDC as described in this group to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, test the relay circuits. If not OK, replace the faulty relay.

Fig. 13 Relay Terminals

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the cover from the Power Distribution Center (PDC) (Fig. 14).
- (3) Refer to the label on the PDC for horn relay identification and location.
- (4) Unplug the horn relay from the PDC.

INSTALLATION

- (1) Install the horn relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.
- (2) Install the PDC cover.
- (3) Connect the battery negative cable.
- (4) Test the relay operation.

HORN RELAY (Continued)

HEADLAMP RELAY

DESCRIPTION

The headlamp (or security) relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (or footprint) is different, current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

The headlamp relay is an electromechanical device that switches battery current to the headlamps when the high-line or premium Central Timer Module (CTM) grounds the relay coil. See Headlamp Relay in the Diagnosis and Testing section of this group for more information.

The headlamp (or security) relay is located in the Power Distribution Center (PDC), in the engine compartment. Refer to the PDC label for relay identification and location.

The headlamp relay cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the cover from the Power Distribution Center (PDC) (Fig. 15).
- (3) Refer to the label on the PDC for headlamp (or security) relay identification and location.
- (4) Unplug the headlamp relay from the PDC.

INSTALLATION

- (1) Install the headlamp relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

- (2) Install the PDC cover.
- (3) Connect the battery negative cable.
- (4) Test the relay operation.

MICRO-RELAY

DESCRIPTION

80ce807b

Fig. 16 ISO MICRO RELAY

- 30 - COMMON FEED
85 - COIL GROUND
86 - COIL BATTERY
87 - NORMALLY OPEN
87A - NORMALLY CLOSED

A micro-relay is a conventional International Standards Organization (ISO) micro relay (Fig. 16). Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is

MICRO-RELAY (Continued)

contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs by five integral male spade-type terminals that extend from the bottom of the relay base.

Relays cannot be adjusted or repaired and, if faulty or damaged, the unit must be replaced.

OPERATION

A micro-relay is an electromechanical switch that uses a low current input from one source to control a high current output to another device. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

DIAGNOSIS AND TESTING - MICRO-RELAY

- (1) Remove the relay from its mounting location.
- (2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.
- (3) Resistance between terminals 85 and 86 (electromagnet) should be 67.5 - 82.5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.
- (4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, reinstall the relay and use a DRBIII® scan tool to perform further testing. Refer to the appropriate diagnostic information.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

- (1) Remove the relay by grasping it firmly and pulling it straight out from its receptacle.

INSTALLATION

- (1) Align the micro-relay terminals with the terminal cavities in the receptacle.

- (2) Push firmly and evenly on the top of the relay until the terminals are fully seated in the terminal cavities in the receptacle.

RELAY

DESCRIPTION

Fig. 17 TYPE 1 RELAY

A relay is an electromechanical device that switches fused battery current to a electrical component when the ignition switch is turned to the Accessory or Run positions, or when controlled by a electronic module. The relays are located in the junction block or power distribution center (Fig. 17).

The relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

A relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

RELAY (Continued)

DIAGNOSIS AND TESTING - RELAY

The relays are located in the junction block or power distribution center. For complete circuit diagrams, refer to **Wiring Diagrams**.

- (1) Remove the relay from its mounting location.
- (2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.
- (3) Resistance between terminals 85 and 86 (electromagnet) should be 60.7 - 80.3 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.
- (4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.

DIAGNOSIS AND TESTING - RELAY CIRCUIT TEST

- (1) The relay common feed terminal cavity (30) of the junction block or power distribution center is connected to battery voltage and should be hot at all times. Check for battery voltage at the fused B(+) circuit cavity in the junction block receptacle for the relay. If OK, go to Step 2. If not OK, repair the fused B(+) circuit to the Power Distribution Center (PDC) fuse as required.
- (2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.
- (3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the fused B(+) fuse in the junction block that feeds

the accessory when the relay is energized by the ignition switch. There should be continuity between the junction block cavity for relay terminal 87 and the fused B(+) fuse in the junction block at all times. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

(4) The coil ground terminal (85) is connected to the electromagnet in the relay. It receives battery feed to energize the relay when the ignition switch is in the Accessory or Run positions. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) circuit cavity for relay terminal 85 in the junction block receptacle for the relay. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (acc/run) circuit to the ignition switch as required.

(5) The coil battery terminal (86) is connected to the electromagnet in the relay. The junction block cavity for this terminal should have continuity to ground at all times. If not OK, repair the open ground circuit to ground as required.

REMOVAL

- (1) Remove the relay by grasping it firmly and pulling it straight out from its receptacle.

INSTALLATION

- (1) Position the relay to the proper receptacle.
- (2) Align the relay terminals with the terminal cavities in the receptacle.
- (3) Push firmly and evenly on the top of the relay until the terminals are fully seated in the terminal cavities in the receptacle.

ENGINE 5.9L

DESCRIPTION

The 5.9 Liter (360 CID) eight-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

The engine lubrication system consists of a rotor type oil pump and a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2 (Fig. 1).

Fig. 1 Firing Order

The engine serial number is stamped into a machined pad located on the left, front corner of the cylinder block. When component part replacement is necessary, use the engine type and serial number for reference (Fig. 2).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

1NK 5.9L XXXY S PPPPP NNNN

1 = 2001 Model

NK = Toluca Engine

5.9L = Displacement In Liters

XXX = Engine Build Day (e.g., 027 = 27th Day of the Year)

Y = Last Digit of Year Engine Build (0 = 2000)

S = Shift Engine Built

PPPPP = Last 5 Digits of Engine Assembly Part Number

NNNN = Engine Serial Code (1263 = The 1263rd engine built that day)

Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART .

ENGINE 5.9L (Continued)

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

STANDARD PROCEDURE

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce

tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier then using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All

ENGINE 5.9L (Continued)

mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

STANDARD PROCEDURE - CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 40° to 60° for proper seating of rings (Fig. 3).

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40° to 60° angle. Faster up and down strokes increase the cross-hatch angle.

ENGINE 5.9L (Continued)

**Fig. 3 Cylinder Bore Crosshatch Pattern**

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Recover refrigerant from a/c system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (4) Remove the a/c condenser, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).
- (5) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).
- (6) Remove the washer bottle from the fan shroud.
- (7) Remove the viscous fan/drive (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (8) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
- (9) Remove the upper crossmember and top core support.
- (10) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(11) Remove the A/C compressor with the lines attached. Secure compressor out of the way.

(12) Remove generator assembly (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(13) Remove the air cleaner resonator and duct work as an assembly.

(14) Disconnect the throttle linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL).

(15) Remove throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(16) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(17) Remove the distributor cap and wiring.

(18) Disconnect the heater hoses.

(19) Disconnect the power steering hoses, if equipped.

(20) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(21) Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(22) On Manual Transmission vehicles, remove the shift lever (Refer to 21 - TRANSMISSION/TRANS-AXLE/MANUAL/SHIFT COVER - REMOVAL).

(23) Raise and support the vehicle on a hoist and drain the engine oil.

(24) Remove engine front mount thru-bolt nuts.

(25) Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.

(26) Disconnect exhaust pipe at manifolds.

(27) Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(28) Remove the dust shield and transmission inspection cover.

(29) Remove drive plate to converter bolts (Automatic transmission equipped vehicles).

(30) Remove transmission bell housing to engine block bolts.

(31) Lower the vehicle.

(32) Install an engine lifting fixture.

(33) Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install engine lifting device.

ENGINE 5.9L (Continued)

(3) Lower engine into compartment and align engine with transmission:

- Manual Transmission: Align clutch disc assembly (if disturbed). Install transmission input shaft into clutch disc while mating engine and transmission surfaces. Install two transmission to engine block mounting bolts finger tight.

- Automatic Transmission: Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.

(4) Lower engine assembly until engine mount through bolts rest in mount perches.

(5) Install remaining transmission to engine block mounting bolts and tighten.

(6) Tighten engine mount through bolts.

(7) Install drive plate to torque converter bolts. (Automatic transmission models)

(8) Install the dust shield and transmission cover.

(9) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(10) Install exhaust pipe to manifold.

(11) Install the transmission cooler line brackets to the oil pan.

(12) Install the drain plug and tighten to 34 N-m (25 ft. lbs.) torque.

(13) Lower the vehicle.

(14) Remove engine lifting fixture.

(15) On Manual Transmission vehicles, install the shift lever (Refer to 21 - TRANSMISSION/TRANS-AXLE/MANUAL/SHIFT COVER - INSTALLATION).

(16) Connect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Connect the power steering hoses, if equipped.

(18) Connect the heater hoses.

(19) Install the distributor cap and wiring.

(20) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(21) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(22) Connect the throttle linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION).

(23) Install the air cleaner resonator and duct work..

(24) Install the generator and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(25) Install a/c compressor and lines (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(26) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(27) Install upper radiator support crossmember.

(28) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(29) Connect the radiator lower hose.

(30) Connect the transmission oil cooler lines to the radiator.

(31) Install the fan shroud.

(32) Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(33) Connect the radiator upper hose.

(34) Install the washer bottle.

(35) Install the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(36) Connect the transmission cooler lines.

(37) If equipped, install the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(38) Evacuate and charge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(39) Add engine oil to crankcase (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(40) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(41) Connect battery negative cable.

(42) Start engine and inspect for leaks.

(43) Road test vehicle.

CYLINDER HEAD

DESCRIPTION

DESCRIPTION—CYLINDER HEAD

The cast iron cylinder heads (Fig. 4) are mounted to the cylinder block using ten bolts. The spark plugs are located in the peak of the wedge between the valves.

J9309-37

Fig. 4 Cylinder Head Assembly—V-8 Gas Engines

- 1 - EXHAUST VALVE
- 2 - SPARK PLUGS
- 3 - EXHAUST VALVES
- 4 - SPARK PLUGS
- 5 - EXHAUST VALVE
- 6 - INTAKE VALVES
- 7 - INTAKE VALVES

DESCRIPTION - CYLINDER HEAD COVER GASKET

The cylinder head cover gasket (Fig. 5) is a steel-backed silicone gasket, designed for long life usage.

J9209-105

Fig. 5 Cylinder Head Cover Gasket V-8 Gas Engines

- 1 - CYLINDER HEAD COVER GASKET

CYLINDER HEAD (Continued)

OPERATION

OPERATION—CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

OPERATION - CYLINDER HEAD COVER GASKET

The steel-backed silicone gasket is designed to seal the cylinder head cover for long periods of time through extensive heat and cold, without failure. The gasket is designed to be reusable.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

• Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the air cleaner resonator and duct work.
- (4) Remove the intake manifold-to-generator bracket support rod. Remove the generator.
- (5) Remove closed crankcase ventilation system.
- (6) Disconnect the evaporation control system.
- (7) Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (8) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.
- (9) Remove distributor cap and wires.
- (10) Disconnect the coil wires.
- (11) Disconnect heat indicator sending unit wire.
- (12) Disconnect heater hoses and bypass hose.
- (13) Remove cylinder head covers and gaskets (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (14) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL) and throttle body as an assembly. Discard the flange side gaskets and the front and rear cross-over gaskets.

CYLINDER HEAD (Continued)

(15) Remove exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).

(16) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.

(17) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(18) Remove spark plugs.

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. If out-of-flatness exceeds 0.00075mm/mm (0.0001in/in.) times the span length in any direction, either replace head or lightly machine the head surface.

FOR EXAMPLE:—A 305 mm (12 in.) span is 0.102 mm (0.004 in.) out-of-flat. The allowable out-of-flat is 305×0.00075 (12 x 0.00075) equals 0.23 mm (0.009 in.). This amount of out-of-flat is acceptable.

The cylinder head surface finish should be 1.78-3.00 microns (70-125 microinches).

Inspect push rods. Replace worn or bent rods.

INSTALLATION

(1) Clean all surfaces of cylinder block and cylinder heads.

(2) Clean cylinder block front and rear gasket surfaces using a suitable solvent.

(3) Position new cylinder head gaskets onto the cylinder block.

(4) Position cylinder heads onto head gaskets and cylinder block.

(5) Starting at top center, tighten all cylinder head bolts, in sequence (Fig. 6).

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

(6) Install push rods and rocker arm assemblies in their original position. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(7) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION) and throttle body assembly.

(8) Install exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).

Fig. 6 Cylinder Head Bolt Tightening Sequence

(9) If required, adjust spark plugs to specifications. Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(10) Install coil wire.

(11) Connect heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(15) Install the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(16) Install the generator and drive belt (Refer to 9 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque. Tighten the adjusting strap bolt to 23 N·m (200 in. lbs.) torque.

(17) Install the intake manifold-to-generator bracket support rod. Tighten the bolts.

(18) Place the cylinder head cover gaskets in position and install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(19) Install closed crankcase ventilation system.

(20) Connect the evaporation control system.

(21) Install the air cleaner.

(22) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(23) Connect the negative cable to the battery.

(24) Start engine check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

NOTE: A steel backed silicon gasket is used with the cylinder head cover (Fig. 7). This gasket can be used again.

J9209-105

Fig. 7 Cylinder Head Cover Gasket

1 - CYLINDER HEAD COVER GASKET

- (1) Disconnect the negative cable from the battery.
- (2) Disconnect the spark plug wires from the spark plugs and set aside.
- (3) Disconnect closed ventilation system and evaporation control system from cylinder head cover.
- (4) Remove cylinder head cover and gasket.

CLEANING

Clean cylinder head cover gasket surface.
Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.

Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

- (1) The cylinder head cover gasket can be used again. Install the gasket onto the head rail.
- (2) Position the cylinder head cover onto the gasket. Tighten the bolts to 11 N·m (95 in. lbs.) torque.
- (3) Install closed crankcase ventilation system and evaporation control system.
- (4) Connect the spark plug wires to the spark plugs.
- (5) Connect the negative cable to the battery.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

Both the intake and exhaust valves are made of steel. The intake valve is 48.768 mm (1.92 inches) in diameter and the exhaust valve is 41.148 mm (1.62 inches) in diameter and has a 2.032 mm (0.080 inch) wafer intertia welded to the tip for durability. These valves are not splayed.

STANDARD PROCEDURE—VALVES, GUIDES AND SPRINGS

VALVE CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

VALVE GUIDES

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

- (1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 8). The special sleeve places the valve at the correct height for checking with a dial indicator.

J9509-49

Fig. 8 Positioning Valve with Tool C-3973

1 - VALVE
2 - SPACER TOOL

- (2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 9).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

INTAKE/EXHAUST VALVES & SEATS (Continued)

Fig. 9 Measuring Valve Guide Wear

- 1 - VALVE
2 - SPECIAL TOOL C-3339

VALVE GUIDES

Service valves with oversize stems are available.
Refer to REAMER SIZES CHART

REAMER SIZES CHART

REAMER O/S	VALVE GUIDE SIZE
0.076 mm (0.003 in.)	8.026 - 8.052 mm (0.316 - 0.317 in.)
0.381 mm (0.015 in.)	8.331 - 8.357 mm (0.328 - 0.329 in.)

(1) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 in.). Use a two step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a $43\frac{1}{4}^{\circ}$ to $43\frac{3}{4}^{\circ}$ face angle and a $44\frac{1}{4}^{\circ}$ to $44\frac{3}{4}^{\circ}$ seat angle (Fig. 10).

Fig. 10 Valve Face and Seat Angles

- 1 - CONTACT POINT

80ba7a5f

VALVE FACE AND VALVE SEAT ANGLE CHART

ITEM	DESCRIPTION	SPECIFICATION
A	SEAT WIDTH INTAKE	1.016 - 1.524 mm (0.040 - 0.060 in.)
	EXHAUST	1.524 - 2.032 mm (0.060 - 0.080 in.)
B	FACE ANGLE (INT. AND EXT.)	$43\frac{1}{4}^{\circ}$ - $43\frac{3}{4}^{\circ}$
C	SEAT ANGLE (INT. AND EXT.)	$44\frac{1}{4}^{\circ}$ - $44\frac{3}{4}^{\circ}$
D	CONTACT SURFACE	—

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 11). Valves with less than 1.190 mm (0.047 in.) margin should be discarded.

VALVE SEATS

CAUTION: DO NOT un-shroud valves during valve seat refacing (Fig. 12).

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 11 Intake and Exhaust Valves**

- 1 - MARGIN
- 2 - VALVE SPRING RETAINER LOCK GROOVE
- 3 - STEM
- 4 - FACE

**Fig. 12 Refacing Valve Seats**

- 1 - STONE
- 2 - PILOT
- 3 - VALVE SEAT
- 4 - SHROUD

ing stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 in.) total indicator reading.

(3) Inspect the valve seat with Prussian blue, to determine where the valve contacts the seat. To do this, coat valve seat LIGHTLY with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of

valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of intake seats should be 1.016-1.524 mm (0.040-0.060 in.). The width of the exhaust seats should be 1.524-2.032 mm (0.060-0.080 in.).

VALVE SPRINGS

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 in.. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 in. mark on the threaded stud. Be sure the zero mark is to the front (Fig. 13). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

**Fig. 13 Testing Valve Spring for Compressed Length**

- 1 - TORQUE WRENCH
- 2 - VALVE SPRING TESTER

REMOVAL

(1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Compress valve springs using Valve Spring Compressor Tool MD- 998772A and adapter 6716A.

(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the

INTAKE/EXHAUST VALVES & SEATS (Continued)

valve guides. Identify valves to ensure installation in original location.

CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 14). The special sleeve places the valve at the correct height for checking with a dial indicator.

Fig. 14 Positioning Valve with Tool C-3973

- 1 - VALVE
2 - SPACER TOOL

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 15).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Coat valve stems with lubrication oil and insert them in cylinder head.

(5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.

(6) Install new seals on all valve guides. Install valve springs and valve retainers.

Fig. 15 Measuring Valve Guide Wear

- 1 - VALVE
2 - SPECIAL TOOL C-3339

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. This should bring spring height back to normal 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

(8) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

ROCKER ARM / ADJUSTER ASSEMBLY

REMOVAL

(1) Remove cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove the rocker arm bolts and pivots (Fig. 16). Place them on a bench in the same order as removed.

(3) Remove the push rods and place them on a bench in the same order as removed.

INSTALLATION

(1) Rotate the crankshaft until the "V8" mark lines up with the TDC mark on the timing chain case cover. This mark is located 147° ATDC from the No.1 firing position.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

**Fig. 16 Rocker Arms**

- 1 - ROCKER ARMS
2 - CYLINDER HEAD

(2) Install the push rods in the same order as removed.

(3) Install rocker arm and pivot assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(4) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ENGINE BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leakage.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper. Refer to Honing Cylinder Bores in the Service Procedures portion of this Section.

Inspect the oil line plug, the oil line plug is located in the vertical passage at the rear of the block between the oil-to-filter and oil-from-filter passages (Fig. 17). Improper installation or missing plug could cause erratic, low, or no oil pressure.

The oil plug must come out the bottom. Use flat dowel, down the oil pressure sending unit hole from the top, to remove oil plug.

(1) Remove oil pressure sending unit from back of block.

(2) Insert a 3.175 mm (1/8 in.) finish wire, or equivalent, into passage.

(3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 in.) from machined surface of block (Fig. 17).

If plug is too high, use a suitable flat dowel to position properly.

**Fig. 17 Oil Line Plug**

- 1 - RIGHT OIL GALLERY
2 - CYLINDER BLOCK
3 - OIL FROM FILTER TO SYSTEM
4 - OIL TO FILTER
5 - FROM OIL PUMP
6 - CRANKSHAFT
7 - PLUG

(4) If plug is too low, remove oil pan and No. 4 main bearing cap. Use suitable flat dowel to position properly. Coat outside diameter of plug with Mopar® Stud and Bearing Mount Adhesive. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 in.) from bottom of the block.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL

REMOVAL—CAMSHAFT BEARINGS

NOTE: This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 18).

Fig. 18 Camshaft Bearings

- 1 - SPECIAL TOOL C-3132-A
- 2 - MAIN BEARING OIL HOLE

REMOVAL—CAMSHAFT

NOTE: The camshaft has an integral oil pump and distributor drive gear (Fig. 19).

Fig. 19 Camshaft and Sprocket Assembly

- 1 - THRUST PLATE
- 2 - OIL PUMP AND DISTRIBUTOR DRIVE GEAR INTEGRAL WITH CAMSHAFT
- 3 - CAMSHAFT SPROCKET

- (1) Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
- (2) Remove the A/C Condenser (if equipped)
- (3) Remove the engine cover.
- (4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- (5) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (6) Remove timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL) and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
- (7) Remove rocker arms.
- (8) Remove push rods and tappets. Identify each part so it can be installed in its original location.

(9) Remove distributor and lift out the oil pump and distributor drive shaft.

(10) Remove camshaft thrust plate, note location of oil tab (Fig. 20).

Fig. 20 Timing Chain Oil

- 1 - THRUST PLATE FRONT SIDE
- 2 - CHAIN OIL TAB
- 3 - THRUST PLATE REAR SIDE

(11) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSTALLATION

INSTALLATION—CAMSHAFT BEARINGS

(1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.

(2) Position rear bearing in the tool. Install horse-shoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

INSTALLATION—CAMSHAFT

(1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft to within 51 mm (2 inches) of its final position in cylinder block.

(2) Install Camshaft Holder Tool C-3509 with tongue back of distributor drive gear (Fig. 21).

Fig. 21 Camshaft Holding Tool C-3509 (Installed Position)

- 1 - SPECIAL TOOL C-3509
- 2 - DRIVE GEAR
- 3 - DISTRIBUTOR LOCK BOLT

(3) Hold tool in position with a distributor lock-plate bolt. This tool will restrict camshaft from being pushed in too far and prevent knocking out the welch plug in rear of cylinder block. **Tool should remain installed until the camshaft and crankshaft sprockets and timing chain have been installed.**

(4) Install camshaft thrust plate and chain oil tab. **Make sure tang enters lower right hole in thrust plate.** Tighten bolts to 24 N·m (210 in. lbs.) torque. Top edge of tab should be flat against thrust plate in order to catch oil for chain lubrication.

(5) Install timing chain and gears (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Measure camshaft end play (Refer to 9 - ENGINE - SPECIFICATIONS). If not within limits install a new thrust plate.

(7) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

(8) Install distributor and distributor drive shaft.

(9) Install push rods and tappets.

(10) Install rocker arms.

(11) Install timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(14) Install the engine cover.

(15) Install the A/C Condenser (if equipped)

(16) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(17) Start engine check for leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING ROD BEARING FITTING

Fit all rods on a bank until completed. **DO NOT** alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, be certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Bearings are available in 0.025 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 22) is of a cast nodular steel splayed type design, with five main bearing journals. The crankshaft is located at the bottom of the engine block and is held in place with five main bearing caps. The number 3 counterweight is the location for journal size identification.

OPERATION

The crankshaft transfers force generated by combustion within the cylinder bores to the flywheel or flexplate.

CRANKSHAFT (Continued)

Undersize Journal	Identification Stamp
0.025 mm (0.001 inch) (Rod)	R1-R2-R3 or R4
0.025 mm (0.001 inch) (Main)	M1-M2-M3-M4 or M5

Fig. 22 Crankshaft with Journal Size Identification

REMOVAL

NOTE: This procedure can be done in vehicle. However the transmission must be removed first.

- (1) If crankshaft is to be removed while engine is in vehicle remove the transmission. Refer to 21 - TRANSMISSION/TRANSAXLE.
- (2) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (3) Remove the oil pump from the rear main bearing cap (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
- (4) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (5) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- (6) Identify rod bearing caps before removal. Remove rod bearing caps with bearings.

CAUTION: Support crankshaft before removing main bearing caps. Failure to do so will allow the crankshaft to fall damaging the crankshaft.

- (7) Using a suitable jack, support the crankshaft.
- (8) Identify main bearing caps before removal. Remove main bearing caps and bearings one at a time.
- (9) Lower the crankshaft out of the block.
- (10) Remove and discard the crankshaft rear oil seals.
- (11) Remove and discard the front crankshaft oil seal.

INSTALLATION

- (1) Clean Gasket Maker residue and sealant from the cylinder block and rear cap mating surface. Do

this before applying the Mopar® Gasket Maker and the installation of rear cap.

- (2) Lightly oil the new upper seal lips with engine oil.
- (3) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.
- (4) Position the crankshaft into the cylinder block.
- (5) Lightly oil the new lower seal lips with engine oil.
- (6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.
- (7) Apply 5 mm (0.20 in) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 23). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

J9509-75

Fig. 23 Sealant Application to Bearing Cap

1 - MOPAR® GASKET MAKER 5 mm (0.20 IN.) ON BOTH SIDES OF REAR MAIN CAP

- (8) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.
- (9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.
- (10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
- (11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- (12) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
- (13) Position the connecting rods onto the crankshaft and install the rod bearing caps. Tighten the nuts to 61 N·m (45 ft. lbs.).

CRANKSHAFT (Continued)

(14) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 24). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(15) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(16) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

Fig. 24 Apply Sealant to Bearing Cap to Block Joint

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP
- 2 - SEALANT APPLIED
- 3 - CYLINDER BLOCK
- 4 - REAR MAIN BEARING CAP

(17) If the transmission was removed, install the transmission. Refer to 21 - TRANSMISSION/TRANSA-
AXLE.

CRANKSHAFT MAIN BEARINGS

DESCRIPTION

Main bearings (Fig. 25) are located in the cylinder block. One half of the main bearing is located in the crankshaft main bore the other half of the matching bearing is located in the main bearing cap. there are five main bearings. Number three main bearing is flanged, this flange controls crankshaft thrust.

OPERATION

The main bearings encircle the crankshaft main bearing journals, this aligns the crankshaft to the centerline of the engine and allows the crankshaft to turn without wobbling or shaking therefore eliminat-

Fig. 25 Main Bearing Orientation

ing vibration. The main bearings are available in standard and undersizes.

STANDARD PROCEDURE—CRANKSHAFT MAIN BEARING FITTING

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of No.2 and 4 are interchangeable.

Upper and lower No.3 bearing halves are flanged to carry the crankshaft thrust loads. They are NOT interchangeable with any other bearing halves in the engine (Fig. 26). Bearing shells are available in standard and the following undersizes: Never install an undersize bearing that will reduce clearance below specifications.

Main Bearing Undersize Availability List

- 0.25 mm (0.001 inch)
- 0.051 mm (0.002 inch)
- 0.076 mm (0.003 inch)
- 0.254 mm (0.010 inch)
- 0.305 mm (0.012 inch)

REMOVAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump from the rear main bearing cap (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Identify bearing caps before removal. Remove bearing caps one at a time.

(4) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 27).

(5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

CRANKSHAFT MAIN BEARINGS (Continued)

Fig. 26 Main Bearing

Fig. 27 Upper Main Bearing Removal and Installation with Tool C-3059

- 1 - SPECIAL TOOL C-3059
- 2 - BEARING
- 3 - SPECIAL TOOL C-3059
- 4 - BEARING

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 27).

(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.

(3) Install the bearing caps. Clean and oil the bolts. Tighten the capbolts to 115 N·m (85 ft. lbs.) torque.

(4) Install the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(5) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(6) Start engine check for leaks.

CRANKSHAFT OIL SEAL - FRONT

DESCRIPTION

The crankshaft front seal is a one piece viton seal with a steel housing. The front seal is located in the engine front cover.

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

REMOVAL

The oil seal can be replaced without removing the timing chain cover, provided that the cover is not misaligned.

(1) Disconnect the negative cable from the battery.

(2) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) If front seal is suspected of leaking, check front oil seal alignment to crankshaft. The seal installation/alignment Tool 6635, should fit with minimum interference. If tool does not fit, the cover must be removed and installed properly.

(4) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal bore of cover.

INSTALLATION

(1) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 28). Seat the oil seal in the groove of the tool.

(2) Position the seal and tool onto the crankshaft (Fig. 29).

(3) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 30).

(4) Remove the vibration damper bolt and seal installation tool.

(5) Inspect the seal flange on the vibration damper.

(6) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT (Continued)

(7) Connect the negative cable to the battery.

CRANKSHAFT OIL SEAL - REAR

DESCRIPTION

The crankshaft rear seal is a two piece viton seal. One part of the two piece rear seal is located in a slot in the cylinder block opposite the crankshaft main

J9309-46

Fig. 30 Installing Oil Seal

- 1 - SPECIAL TOOL 6635
2 - TIMING CHAIN COVER

bearing cap, the second part of the two piece seal is located in the main bearing cap itself.

OPERATION

The crankshaft seals prevent oil from leaking from around the crankshaft, either from the rear of the engine or from the engine front cover.

REMOVAL

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Remove the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL). Discard the old upper seal.

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap. Remove and discard the old lower oil seal.

(4) Carefully remove and discard the old upper oil seal.

CRANKSHAFT OIL SEAL - REAR (Continued)

LOWER SEAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(3) Remove the rear main bearing cap and discard the old lower seal.

INSTALLATION

The service seal is a two piece, Viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal. The lower seal half can be installed only with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

(1) Clean the cylinder block rear cap mating surface. Be sure the seal groove is free of debris. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing toward the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(8) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(11) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing (Fig. 32). Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(12) Install new front crankshaft oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

Fig. 31 Sealant Application to Bearing Cap

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT SLOTS
- 2 - MOPAR® GASKET MAKER (OR EQUIVALENT)
- 3 - CAP ALIGNMENT SLOT
- 4 - REAR MAIN BEARING CAP

(13) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

Fig. 32 Apply Sealant to Bearing Cap-to-Block Joint

- 1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT NOZZLE TIP
- 2 - SEALANT APPLIED
- 3 - CYLINDER BLOCK
- 4 - REAR MAIN BEARING CAP

UPPER SEAL—CRANKSHAFT INSTALLED

(1) Clean the cylinder block mating surfaces before oil seal installation. Check for burrs at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil. To allow ease of installation of the seal, loosen at least the two main bearing caps forward of the rear bearing cap.

CRANKSHAFT OIL SEAL - REAR (Continued)

(3) Rotate the new upper seal into the cylinder block, being careful not to shave or cut the outer surface of the seal. To ensure proper installation, use the installation tool provided with the kit. Install the new seal with the white paint facing toward the rear of the engine.

(4) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing toward the rear of the engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application. Be sure the white paint faces toward the rear of the engine.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten ALL cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap-to-block and oil pan sealing (Fig. 32). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

LOWER SEAL

(1) Clean the rear main cap mating surfaces including the oil pan gasket groove.

(2) Carefully install a new upper seal. Refer to UPPER SEAL—CRANKSHAFT INSTALLED .

(3) Lightly oil the new lower seal lips with engine oil.

(4) Install a new lower seal in bearing cap with the white paint facing the rear of engine.

(5) Apply 5 mm (0.20 in.) drop of Mopar® Gasket Maker, or equivalent, on each side of the rear main bearing cap (Fig. 31). DO NOT over-apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(6) To align the bearing cap, use cap slot, alignment dowel, and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than two times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten the cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(9) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap-to-block joint to provide cap to block and oil pan sealing. Apply enough sealant so that a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

DISTRIBUTOR BUSHING

REMOVAL

(1) Remove distributor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/DISTRIBUTOR - REMOVAL).

(2) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(3) Insert Distributor Drive Shaft Bushing Puller Tool C-3052 into old bushing and thread down until a tight fit is obtained (Fig. 33).

(4) Hold puller screw and tighten puller nut until bushing is removed.

Fig. 33 Distributor Driveshaft Bushing Removal

- 1 - SPECIAL TOOL C-3052
2 - BUSHING

INSTALLATION

(1) Slide new bushing over burnishing end of Distributor Drive Shaft Bushing Driver/Burnisher Tool C-3053. Insert the tool and bushing into the bore.

(2) Drive bushing and tool into position, using a hammer (Fig. 34).

(3) As the burnisher is pulled through the bushing, the bushing is expanded tight in the block and burnished to correct size (Fig. 35). **DO NOT ream this bushing.**

DISTRIBUTOR BUSHING (Continued)

**Fig. 34 Distributor Driveshaft Bushing Installation**

1 - SPECIAL TOOL C-3053

2 - BUSHING

CAUTION: This procedure **MUST** be followed when installing a new bushing or seizure to shaft may occur.

**Fig. 35 Burnishing Distributor Driveshaft Bushing**

1 - SPECIAL TOOL C-3053

2 - BUSHING

(4) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD INSTALLATION).

(5) Install the distributor (Refer to 8 - ELECTRICAL/IGNITION CONTROL/DISTRIBUTOR INSTALLATION).

HYDRAULIC LIFTERS

DIAGNOSIS AND TESTING—HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.

(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are mak-

HYDRAULIC LIFTERS (Continued)

ing the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

LEAK-DOWN TEST

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 36).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Universal Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

REMOVAL

(1) Remove the air cleaner assembly and air in-let hose.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove rocker assembly and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify push rods to ensure installation in original locations.

(4) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(5) Remove yoke retainer and aligning yokes.

(6) Slide Hydraulic Tappet Remover/Installer Tool C-4129-A through opening in cylinder head and seat tool firmly in the head of tappet.

Fig. 36 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

(7) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(8) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSTALLATION

(1) Lubricate tappets with Mopar® Engine Oil Supplement or equivalent.

(2) Install tappets and push rods in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).

(3) Install aligning yokes with ARROW toward camshaft.

(4) Install yoke retainer. Tighten the bolts to 23 N·m (200 in. lbs.) torque. Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(5) Install rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(6) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(7) Install air cleaner assembly and air in-let hose.

HYDRAULIC LIFTERS (Continued)

(8) Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of aluminum and have three ring grooves, the top two grooves are for the compression rings and the bottom groove is for the oil control ring. The connecting rods are forged steel and are coined prior to heat treat. The piston pins are press fit.

STANDARD PROCEDURE - PISTON FITTING

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch) at 21°C (70°F).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 37).

Fig. 37 Piston Measurements

1 - 49.53 mm
(1.95 IN.)

PISTON MEASUREMENT CHART

PISTON SIZE	A DIA = PISTON DIAMETER		BORE DIAMETER

D	101.605 (4.0002)	101.618 (4.0007)	101.630 (4.0012)	101.643 (4.0017)
E	—	—	—	—
DESCRIPTION		SPECIFICATION		
PISTON PIN BORE		25.007 - 25.015 mm (.9845 - .9848 in.)		
RING GROOVE HEIGHT OIL RAIL COMPRESSION RAIL		4.033 - 4.058 mm (.1588 - .1598 in.) 1.529 - 1.554 mm (.0602 - .0612 in.)		
TOTAL FINISHED WEIGHT		470.8 ± 2 grams (16.607 ± .0706 ounces)		

REMOVAL

(1) Remove the engine from the vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(3) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.

(5) Be sure each connecting rod and connecting rod cap is identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

PISTON & CONNECTING ROD (Continued)

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing the assemblies from the engine, rotate crankshaft so that the connecting rod is centered in cylinder bore and at BDC. **Be careful not to nick crankshaft journals.**

(7) After removal, install bearing cap on the mating rod.

CLEANING

Clean the piston and connecting rod assembly using a suitable solvent.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(2) Before installing the ring compressor, be sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 38).

J9309-80

Fig. 38 Proper Ring Installation

- 1 - OIL RING SPACER GAP
- 2 - SECOND COMPRESSION RING GAP OIL RING RAIL GAP (TOP)
- 3 - OIL RING RAIL GAP (BOTTOM)
- 4 - TOP COMPRESSION RING GAP

(3) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385). **Be sure position of rings does not change during this operation.**

(4) Install connecting rod bolt protectors on rod bolts. The long protector should be installed on the numbered side of the connecting rod.

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on crankshaft journal.

(7) The notch, or groove, on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(8) Install rod caps. Be sure connecting rod, connecting rod cap, and cylinder bore number are the same. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(9) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(10) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(11) Install the engine into the vehicle (Refer to 9 - ENGINE - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 in. from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler gauge in the gap. The top compression ring gap should be between 0.254-0.508 mm (0.010-0.020 in.). The second compression ring gap should be between 0.508-0.762 mm (0.020-0.030 in.). The oil ring gap should be 0.254-1.270 mm (0.010-0.050 in.).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Rings with excess gaps should not be used.

(2) Install rings, and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and

PISTON RINGS (Continued)

lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter "O", an oval depression, or the word "TOP" (Fig. 39) (Fig. 41).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 40) (Fig. 41). An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word "TOP" facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 in.) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 in.) side clearance.

(e) Pistons with insufficient, or excessive, side clearance should be replaced.

Fig. 39 Second Compression Ring Identification (Typical)

- 1 - SECOND COMPRESSION RING (BLACK CAST IRON)
- 2 - CHAMFER
- 3 - TWO DOTS

(3) Orient the rings:

(a) Arrange top compression ring 90° counter-clockwise from the oil ring rail gap (Fig. 42).

(b) Arrange second compression ring 90° clockwise from the oil ring rail gap (Fig. 42).

VIBRATION DAMPER

REMOVAL

(1) Disconnect the battery negative cable.

(2) Remove the cooling system fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).

Fig. 40 Top Compression Ring Identification (Typical)

- 1 - TOP COMPRESSION RING (GRAY IN COLOR)
- 2 - CHAMFER
- 3 - ONE DOT

Fig. 41 Compression Ring Chamfer Location (Typical)

- 1 - CHAMFER
- 2 - TOP COMPRESSION RING
- 3 - SECOND COMPRESSION RING
- 4 - PISTON
- 5 - CHAMFER

(3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove vibration damper bolt and washer from end of crankshaft.

(5) Position Special Tool 8513 Insert into the crankshaft nose.

(6) Install Special Tool 1026 Three Jaw Puller onto the vibration damper (Fig. 43).

(7) Pull vibration damper off of the crankshaft.

INSTALLATION

CAUTION: Thoroughly remove any contaminants from the crankshaft nose and the vibration damper bore. Failure to do so can cause severe damage to the crankshaft.

(1) Position the vibration damper onto the crankshaft.

(2) Place installing tool, part of Puller Tool Set C-3688 in position and press the vibration damper onto the crankshaft (Fig. 44).

(3) Install the crankshaft bolt and washer. Tighten the bolt to 244 N·m (180 ft. lbs.) torque.

(4) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(5) Position the fan shroud and install the bolts. Tighten the retainer bolts to 11 N·m (95 in. lbs.) torque.

(6) Install the cooling fan (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - INSTALLATION).

(7) Connect the battery negative cable.

80c0722e

Fig. 44 Vibration Damper Installation

- 1 - SPECIAL TOOL C-3688

FRONT MOUNT

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Position fan to ensure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

- (3) Install engine support/lifting fixture.
- (4) Raise vehicle on hoist.
- (5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 45).

- (6) Remove engine support bracket/cushion bolts (Fig. 45). Remove the support bracket/cushion and heat shields.

J9409-144

Fig. 45 Engine Front Mounts

- 1 - ENGINE MOUNT HEAT SHIELD
- 2 - THRU-BOLT
- 3 - RESTRICTION PADS
- 4 - ENGINE SUPPORT BRACKET/CUSHION

FRONT MOUNT (Continued)

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the through-bolt into the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and through-bolt into support cushion brackets (Fig. 46) .

J9409-54

Fig. 46 Positioning Engine Front Mounts

- 1 - ENGINE SUPPORT BRACKET/CUSHION
2 - SUPPORT CUSHION BRACKET

(4) Install through-bolt nuts and tighten the nuts to 102 N·m (75 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 47).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 88 N·m (65 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 41 N·m (30 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 47) .

(4) Install the support cushion bolts and tighten to 41 N·m (30 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

LUBRICATION

DESCRIPTION

A gear-type positive displacement pump (Fig. 48) is mounted at the underside of the rear main bearing cap. The pump uses a pick-up tube and screen assembly to gather engine oil from the oil pan.

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery, which extends the entire length on the right side of the block. The oil then goes down to the No. 1 main bearing, back up to the left side of the block, and into the oil gallery on the left side of the engine.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the No. 1 main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve

LUBRICATION (Continued)

tappets, which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components.

The oil then passes down through the push rod guide holes and the oil drain-back passages in the cylinder head, past the valve tappet area, and then returns to the oil pan (Fig. 49).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING—ENGINE OIL LEAKS

Begin with a through visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil-soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to be sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light source.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

LUBRICATION (Continued)

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat previous step.

(5) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method as follows:

(6) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(7) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(8) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(9) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(10) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(11) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose. Proceed to next step.

(12) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL

STANDARD PROCEDURE - ENGINE OIL

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located at the right front of the engine, left of the generator (Fig. 50).

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

Fig. 50 Oil Level Indicator Location

- 1 - CYLINDER HEAD COVER
- 2 - ENGINE OIL FILL CAP
- 3 - DIPSTICK
- 4 - ENGINE OIL FILTER
- 5 - FILTER BOSS

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading.
- (6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. This information can be found in the owner's manual.

TO CHANGE ENGINE OIL

Run engine until achieving normal operating temperature.

- (1) Position the vehicle on a level surface and turn engine off.
- (2) Hoist vehicle.
- (3) Remove oil fill cap.
- (4) Place a suitable drain pan under crankcase drain.
- (5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for

OIL (Continued)

stretching or other damage. Replace drain plug and gasket if damaged.

(6) Install drain plug in crankcase.

(7) Change oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(9) Install oil fill cap.

(10) Start engine and inspect for leaks.

(11) Stop engine and inspect oil level.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.

(2) Using a suitable oil filter wrench loosen filter.

(3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 51).

Fig. 51 Oil Filter Removal—Typical

1 - ENGINE OIL FILTER

2 - OIL FILTER WRENCH

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 52) of oil and grime.

(6) Install new filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 52) hand tighten filter one full turn, do not over tighten.

(3) Add oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

Fig. 52 Oil Filter Sealing Surface—Typical

1 - SEALING SURFACE

2 - RUBBER GASKET

3 - OIL FILTER

OIL PAN

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove engine oil dipstick.

(3) Raise vehicle.

(4) Drain engine oil.

(5) Remove exhaust pipe.

(6) Remove left engine to transmission strut.

(7) Loosen the right side engine support bracket cushion thru-bolt nut and raise the engine slightly. Remove oil pan by sliding backward and out.

(8) Remove the one-piece gasket.

CLEANING

Clean the block and pan gasket surfaces.

Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

OIL PAN (Continued)

(2) Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

(3) If present, trim excess sealant from inside the engine.

(4) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 53).

Fig. 53 Fabrication of Alignment Dowels

1 - 5/16" X 1 1/2" BOLT

2 - DOWEL

3 - SLOT

(5) Install the dowels in the cylinder block (Fig. 54).

(6) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent in the corner of the cap and the cylinder block.

(7) Slide the one-piece gasket over the dowels and onto the block.

(8) Position the oil pan over the dowels and onto the gasket.

(9) Install the oil pan bolts. Tighten the bolts to 24 N·m (215 in. lbs.) torque.

(10) Remove the dowels. Install the remaining oil pan bolts. Tighten these bolts to 24 N·m (215 in. lbs.) torque.

(11) Lower the engine into the support cushion brackets and tighten the thru bolt nut to the proper torque.

(12) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.

(13) Install the engine to transmission strut.

(14) Install exhaust pipe.

(15) Lower vehicle.

(16) Install dipstick.

(17) Connect the negative cable to the battery.

(18) Fill crankcase with oil to proper level.

Fig. 54 Position of Dowels in Cylinder Block

1 - DOWEL

2 - DOWEL

3 - DOWEL

4 - DOWEL

OIL PUMP

REMOVAL

(1) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove the oil pump from rear main bearing cap.

DISASSEMBLY

(1) Remove the relief valve as follows:

(a) Remove cotter pin. Drill a 3.175 mm (1/8 inch) hole into the relief valve retainer cap and insert a self-threading sheet metal screw.

(b) Clamp screw into a vise and while supporting oil pump, remove cap by tapping pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 55).

(2) Remove oil pump cover (Fig. 56).

(3) Remove pump outer rotor and inner rotor with shaft (Fig. 56).

(4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump assembly if cover is scratched or grooved.

OIL PUMP (Continued)

RH174

Fig. 55 Oil Pressure Relief Valve

- 10 - COVER
- 11 - OUTER ROTOR

Lay a straightedge across the pump cover surface (Fig. 57). If a 0.038 mm (0.0015 inch) feeler gauge can be inserted between cover and straightedge, pump assembly should be replaced.

Measure thickness and diameter of OUTER rotor. If outer rotor thickness measures 20.9 mm (0.825

8020cd6e

Fig. 57 Checking Oil Pump Cover Flatness

- 1 - COVER
- 2 - STRAIGHT EDGE
- 3 - FEELER GAUGE

inch) or less or if the diameter is 62.7 mm (2.469 inches) or less, replace outer rotor (Fig. 58).

RH176

Fig. 58 Measuring Outer Rotor Thickness

If inner rotor measures 20.9 mm (0.825 inch) or less, replace inner rotor and shaft assembly (Fig. 59).

Slide outer rotor into pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 60). If clearance is 0.356 mm (0.014 inch) or more, replace oil pump assembly.

Install inner rotor and shaft into pump body. If clearance between inner and outer rotors is 0.203 mm (0.008 inch) or more, replace shaft and both rotors (Fig. 61).

Place a straightedge across the face of the pump, between bolt holes. If a feeler gauge of 0.102 mm (0.004 inch) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 62).

OIL PUMP (Continued)

Fig. 62 Measuring Clearance Over Rotors

- 1 - STRAIGHT EDGE
- 2 - FEELER GAUGE

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications (Fig. 63).

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

Fig. 63 Proper Installation of Retainer Cap

- 1 - RETAINER CAP
- 2 - CHAMFER
- 3 - COTTER KEY

ASSEMBLY

(1) Install pump rotors and shaft, using new parts as required.

OIL PUMP (Continued)

(2) Position the oil pump cover onto the pump body. Tighten cover bolts to 11 N·m (95 in. lbs.) torque.

(3) Install the relief valve and spring. Insert the cotter pin.

(4) Tap on a new retainer cap.

(5) Prime oil pump before installation by filling rotor cavity with engine oil.

INSTALLATION

(1) Install oil pump. During installation slowly rotate pump body to ensure driveshaft-to-pump rotor shaft engagement.

(2) Hold the oil pump base flush against mating surface on No.5 main bearing cap. Finger tighten pump attaching bolts. Tighten attaching bolts to 41 N·m (30 ft. lbs.) torque.

(3) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

90c071af

Fig. 64 Intake Manifold and Throttle Body—V-8 Gas Engines Typical

- 1 - FUEL RAIL ASSEMBLY
- 2 - FUEL RAIL MOUNTING BOLTS
- 3 - FUEL RAIL CONNECTING HOSES

INTAKE MANIFOLD

DESCRIPTION

The aluminum intake manifold (Fig. 64) is a single plane design with equal length runners and uses a separate plenum, therefore the manifold does have a plenum gasket. It also uses separate flange gaskets and front and rear cross-over gaskets. Extreme care must be used when sealing the gaskets to ensure that excess sealant does not enter the intake runners causing a restriction. Whenever the intake manifold is removed inspect the plenum pan for evidence of excess oil buildup, this condition indicates that the plenum pan gasket is leaking.

OPERATION

The intake manifold, meters and delivers air to the combustion chambers allowing the fuel delivered by the fuel injectors to ignite, thus producing power.

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS, OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.

- (3) If a change in RPMs occur, the area of the suspected leak has been found.
- (4) Repair as required.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).
- (4) Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
- (5) Remove the accessory drive bracket.
- (6) Remove the air cleaner.
- (7) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
- (8) Disconnect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - REMOVAL) and if so equipped, the speed control and transmission kickdown cables.
- (9) Remove the return spring.
- (10) Remove the distributor cap and wires.
- (11) Disconnect the coil wires.
- (12) Disconnect the heat indicator sending unit wire.

INTAKE MANIFOLD (Continued)

- (13) Disconnect the heater hoses and bypass hose.
- (14) Remove the closed crankcase ventilation and evaporation control systems.
- (15) Remove intake manifold bolts.
- (16) Lift the intake manifold and throttle body out of the engine compartment as an assembly.
- (17) Remove and discard the flange side gaskets and the front and rear end seals.
- (18) Remove the throttle body bolts and lift the throttle body off the intake manifold (Fig. 65). Discard the gasket.

80c071af

Fig. 65 Throttle Body Assembly

- 1 - FUEL RAIL ASSEMBLY
- 2 - FUEL RAIL MOUNTING BOLTS
- 3 - FUEL RAIL CONNECTING HOSES

- (19) If required, remove the plenum pan and gasket. Discard gasket.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INSTALLATION

- (1) If removed, position new plenum gasket and install plenum pan (Fig. 66).
- (2) Tighten plenum pan mounting bolts as follows:

- Step 1. Tighten bolts to 5.4 N·m (48 in. lbs.)
- Step 2. Tighten bolts to 9.5 N·m (84 in. lbs.)
- Step 3. Check all bolts are at 9.5 N·m (84 in. lbs.)

80c071eb

Fig. 66 Plenum Pan Bolt Tightening Sequence

- (3) Install the flange gaskets. Ensure that the vertical port alignment tab is resting on the deck face of the block. Also the horizontal alignment tabs must be in position with the mating cylinder head gasket tabs (Fig. 68). The words MANIFOLD SIDE should be visible on the center of each flange gasket.

- (4) Apply Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, to the four corner joints. An excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket. The sealant should be approximately 5 mm (0.2 in) in diameter and 15 mm (0.6 in.) long.

- (5) Install the front and rear end seals (Fig. 67). Make sure the molded dowel pins on the end seals fully enter the corresponding holes in the cylinder block.

- (6) Carefully lower intake manifold into position on the cylinder block and cylinder heads. After intake manifold is in place, inspect to make sure seals are in place.

- (7) Using a new gasket, install the throttle body onto the intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

- (8) Install the intake manifold bolts and tighten as follows (Fig. 69):

INTAKE MANIFOLD (Continued)

80c071ad

Fig. 67 Front and Rear End Seals

- 1 - FRONT CROSS-OVER GASKET
- 2 - REAR CROSS-OVER GASKET

- Step 1. Tighten bolts 1 through 4 to 8 N·m (72 in. lbs.) Tighten in alternating steps 1.4 N·m (12 in. lbs.) at a time
- Step 2. Tighten bolts 5 through 12 to 8 N·m (72 in. lbs.)
- Step 3. Check all bolts are torqued to 8 N·m (72 in. lbs.)
- Step 4. Tighten all bolts in sequence to 16 N·m (12 ft. lbs.)
- Step 5. Check all bolts are torqued to 16 N·m (12 ft. lbs.)

(9) Install closed crankcase ventilation and evaporation control systems.

(10) Connect the coil wires.

(11) Connect the heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Hook up the return spring.

(15) Connect the accelerator linkage (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE CONTROL CABLE - INSTALLATION) and if so equipped, the speed control and transmission kick-down cables.

(16) Install the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Install the accessory drive bracket and A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

80c071ae

Fig. 68 Intake Manifold Flange Gasket Alignment

- 1 - FLANGE GASKET

J9209-60

Fig. 69 Intake Manifold Bolt Tightening Sequence

(18) Install the generator and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque.

(19) Install the air cleaner.

(20) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Connect the negative cable to the battery.

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds (Fig. 70) are constructed of cast iron and are LOG type with balanced flow. One exhaust manifold is attached to each cylinder head.

J9311-11

Fig. 70 Exhaust Manifolds—V-8 Gas Engines Typical

- 1 - EXHAUST MANIFOLD (LEFT)
- 2 - BOLTS & WASHERS
- 3 - NUTS & WASHERS
- 4 - EXHAUST MANIFOLD (RIGHT)
- 5 - BOLTS & WASHERS

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise and support the vehicle.
- (3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
- (4) Lower the vehicle.
- (5) Remove the exhaust heat shields.
- (6) Remove bolts, nuts and washers attaching manifold to cylinder head.
- (7) Remove manifold from the cylinder head.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

(1) Position the engine exhaust manifolds on the two studs located on the cylinder head. Install conical washers and nuts on these studs (Fig. 71) .

(2) Install two bolts and conical washers at the inner ends of the engine exhaust manifold outboard arms. Install two bolts **WITHOUT** washers on the center arm of engine exhaust manifold (Fig. 71) . Starting at the center arm and working outward, tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(3) Install the exhaust heat shields.

(4) Raise and support the vehicle.

(5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(6) Lower the vehicle.

(7) Connect the negative cable to the battery.

J9311-11

TIMING BELT / CHAIN COVER(S)

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Remove water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).

TIMING BELT / CHAIN COVER(S) (Continued)

(3) Remove power steering pump (Refer to 19 - STEERING/PUMP - REMOVAL).

(4) Remove vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(5) Loosen oil pan bolts and remove the front bolt at each side.

(6) Remove the cover bolts.

(7) Remove chain case cover and gasket using extreme caution to avoid damaging oil pan gasket.

INSTALLATION

(1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.

(2) The water pump mounting surface must be cleaned.

(3) Using a new cover gasket, carefully install chain case cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

NOTE: Special Tool 6635 must be used to align the front cover and seal with the crankshaft.

(4) Position the special tool 6635 onto the crankshaft (Fig. 72).

Fig. 72 Position Special Tool 6635 onto Crankshaft

1 - SPECIAL TOOL 6635

2 - OIL SEAL

3 - TIMING CHAIN COVER

(5) Tighten chain case cover bolts to 41 N·m (30 ft.lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

(6) Remove special tool 6635.

(7) Inspect the seal flange on the vibration damper.

(8) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(9) Install water pump and housing assembly using new gaskets (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

(10) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

(11) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install the cooling system fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(13) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(14) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(15) Connect the negative cable to the battery.

(16) Start engine check for leaks.

TIMING BELT/CHAIN AND SPROCKETS**REMOVAL**

(1) Disconnect battery negative cable.

(2) Remove Timing Chain Cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(3) Re-install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align timing marks as shown in (Fig. 73).

(4) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

INSPECTION—MEASURING TIMING CHAIN STRETCH

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to

TIMING BELT/CHAIN AND SPROCKETS (Continued)

**Fig. 73 Alignment of Timing Marks**

1 - TIMING MARKS

move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 74).

**Fig. 74 Measuring Timing Chain Stretch**

1 - TORQUE WRENCH

2 - 3.175 MM
(0.125 IN.)

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

INSTALLATION

(1) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(2) Place timing chain around both sprockets.

(3) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(4) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(5) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 75).

**Fig. 75 Alignment of Timing Marks**

1 - TIMING MARKS

(6) Install the camshaft bolt. Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(7) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

(8) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

ENGINE 8.0L

DESCRIPTION

The 8.0 Liter (488 CID) ten-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

Engine lubrication system consists of a gerotor type oil pump mounted in the timing chain cover and driven by the crankshaft. The V-10 uses a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7, 9 on the left bank and 2, 4, 6, 8, 10 on the right bank. The firing order is 1-10-9-4-3-6-5-8-7-2 (Fig. 1).

The engine serial number is located on the lower left front of the cylinder block in front of the engine mount (Fig. 2). When component part replacement is necessary, use the engine type and serial number for reference.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to 14 - FUEL SYSTEM for fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
- Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING)
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING)
- Lash Adjuster (Tappet) Noise Diagnosis (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - DIAGNOSIS AND TESTING)
- Engine Oil Leak Inspection (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Clean or replace relief valve. 9. Replace as necessary.

ENGINE 8.0L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> 1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals. 	<ol style="list-style-type: none"> 1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket

- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.

ENGINE 8.0L (Continued)

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

STANDARD PROCEDURE

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 3).

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper cross-

8086td41

Fig. 3 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

hatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

ENGINE 8.0L (Continued)

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

ENGINE 8.0L (Continued)

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

REMOVAL

(1) Remove the battery.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Discharge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(4) Remove the upper crossmember.

(5) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

(6) Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove the A/C compressor with the lines attached (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL). Set aside.

(8) If equipped, remove the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

(9) Remove the washer fluid reservoir bottle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - REMOVAL AND INSTALLATION).

(10) Disconnect the top radiator hose.

(11) Remove the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(12) Remove the fan shroud.

(13) Disconnect the lower radiator hose.

(14) Disconnect the transmission cooler lines.

(15) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(16) Remove the generator with the wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(17) Remove the air cleaner.

(18) Disconnect the throttle linkage.

(19) Remove throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - REMOVAL).

(20) Remove the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(21) Remove the coil assemblies with the ignition cables.

(22) Disconnect the heater hoses.

(23) Disconnect the power steering hoses, if equipped.

(24) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(25) On Manual Transmission vehicles, remove the shift lever.

(26) Raise and support the vehicle on a hoist.

(27) Remove the drain plug and drain the engine oil.

(28) Loosen front engine mount thru-bolt nuts.

(29) Remove the transmission cooler line brackets from oil pan.

(30) Disconnect exhaust pipe at manifold.

(31) Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(32) Remove transmission.

(33) Lower vehicle.

CAUTION: DO NOT lift the engine by the intake manifold.

(34) Install an engine lifting fixture.

(35) Remove engine from vehicle and install engine assembly on a repair stand.

ENGINE 8.0L (Continued)

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install an engine support fixture.

(3) Raise and support the vehicle on a hoist.

(4) Install Transmission.

(5) Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(6) Install exhaust pipe to manifold.

(7) Install the transmission cooler line brackets from oil pan.

(8) Tighten the Front mount thru-bolts and nuts to 102N·m (75 ft. lbs.).

(9) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(10) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(11) Lower the vehicle.

(12) Remove engine lifting fixture.

(13) On Manual Transmission vehicles, install the shift lever.

(14) Connect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(15) Connect the heater hoses.

(16) Install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(17) Install the coil assemblies with the ignition cables.

(18) Using a new gasket, install throttle body (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/THROTTLE BODY - INSTALLATION).

(19) Connect the throttle linkage.

(20) Install the air cleaner box.

(21) Install the generator and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(22) Install the upper crossmember.

(23) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(24) Connect the lower radiator hose.

(25) Install the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(26) Connect the transmission cooler lines.

(27) Connect the power steering hoses, if equipped.

(28) Install the fan shroud.

(29) Install the fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(30) Connect the top radiator hose.

(31) Install the washer fluid reservoir bottle (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSTALLATION).

(32) If equipped, install the condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(33) Install the A/C compressor with the lines attached (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(34) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(35) Evacuate (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) and charge the air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(36) Add coolant to the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(37) Install the battery.

(38) Warm engine and adjust as required.

(39) Road test vehicle.

AIR CLEANER ELEMENT

REMOVAL - 8.0L

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to 0, Lubrication and Maintenance.

A small amount of engine oil wetting the inside of the air cleaner housing is normal. When servicing, wipe out oil from air cleaner housing.

(1) Loosen clamp (Fig. 4) and remove air inlet tube (Fig. 5) at front of air cleaner housing cover.

Fig. 4 Clamp Removal—8.0L Engine

- 1 - CLAMP
- 2 - ADJUSTABLE PLIERS
- 3 - REMOVAL

(2) The air cleaner housing and air cleaner element cover are equipped with spring clips to seal cover to housing (Fig. 5). Unlatch clips from air cleaner cover and remove cover from air cleaner housing.

(3) Remove air cleaner element from air cleaner cover.

(4) Before installing a new air cleaner element, clean inside of air cleaner housing.

(5) If housing removal is necessary, disconnect crankcase vent hose and remove 4 housing-to-throttle body nuts.

INSTALLATION - 8.0L

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to Group 0, Lubrication and Maintenance.

(1) After installing housing, tighten 4 nuts to 11 N·m (96 in. lbs.) torque and connect crankcase vent hose.

(2) Position air cleaner element (filter) into air cleaner cover. Latch spring clips to seal cover to housing.

Fig. 5 Air Cleaner Housing—8.0L V-10 Engine

- 3 - AIR INLET TUBE
- 4 - CLAMP
- 5 - SPRING CLIPS

Fig. 6 Clamp Installation—8.0L Engine

- 1 - CLAMP
- 2 - ADJUSTABLE PLIERS

(3) Install air inlet tube at air cleaner housing inlet.

(4) Install and tighten clamp at air inlet tube (Fig. 6).

CYLINDER HEAD

DESCRIPTION

The alloy cast iron cylinder heads (Fig. 7) are held in place by 12 bolts. The spark plugs are located in the peak of the wedge between the valves.

J9409-1

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

• Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

• Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust

- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the heat shields (Fig. 8).
- (4) Remove the intake manifold-to-generator bracket support rod. Remove the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
- (5) Remove closed crankcase ventilation system.
- (6) Disconnect the evaporation control system.
- (7) Remove the air cleaner.
- (8) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIV-

CYLINDER HEAD (Continued)

Fig. 8 Spark Plug Wire Heat Shields (Left Side Shown)

- 1 - EXHAUST MANIFOLD
2 - HEAT SHIELD

ERY - STANDARD PROCEDURE). Disconnect the fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(9) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(10) Remove coil pack and bracket (Fig. 9).

Fig. 9 Coil Pack and Bracket

- 1 - COIL PACKS AND BRACKET
2 - MOUNTING BOLTS (4)

(11) Disconnect the coil wires.

(12) Disconnect heat indicator sending unit wire.

(13) Disconnect heater hoses and bypass hose.

(14) Remove upper intake manifold and throttle body as an assembly (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(15) Remove cylinder head covers and gaskets (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(16) Remove the EGR tube. Discard the gasket, for right side only.

(17) Remove lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL). Discard the flange side gaskets and the front and rear cross-over gaskets.

(18) Disconnect exhaust pipe from exhaust manifold.

(19) Remove exhaust manifolds and gaskets (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).

(20) Remove rocker arm assemblies and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify to ensure installation in original locations.

(21) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(22) Remove spark plugs.

CLEANING

Clean all surfaces of cylinder block and cylinder heads. Be sure material does not fall into the lifters and surrounding valley.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

Clean the exhaust manifold to cylinder head mating areas.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. The out-of-flatness specifications are 0.0007 mm/mm (0.0004 inch/inch), 0.127 mm/152 mm (0.005 inch/6 inches) any direction or 0.254 mm (0.010 inch) overall across head. If exceeded, either replace head or lightly machine the head surface.

The cylinder head surface finish should be 1.78-4.57 microns (15-80 microinches).

Inspect push rods. Replace worn or bent rods.

Inspect rocker arms. Replace if worn or scored.

INSTALLATION

(1) Position the new cylinder head gaskets onto the cylinder block.

(2) Position the cylinder heads onto head gaskets and cylinder block.

CYLINDER HEAD (Continued)

(3) Tighten the cylinder head bolts in two steps (Fig. 10):

- Step 1—Tighten all cylinder head bolts, in sequence, to 58 N·m (43 ft. lbs.) torque.
- Step 2—Tighten all cylinder head bolts, in sequence, to 143 N·m (105 ft. lbs.) torque.

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

Fig. 10 Cylinder Head Bolt Tightening Sequence

(4) Install push rods and rocker arm assemblies in their original position (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(5) Install lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(6) Install the upper intake manifold onto the lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(7) Install the exhaust manifolds and new gaskets (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).

(8) Install exhaust pipe to the exhaust manifold. Tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(9) Using a new gasket, position the EGR tube to the intake manifold and the exhaust manifold. Tighten the EGR tube nut to 34 N·m (25 ft. lbs.) torque. Tighten the bolts to 20 N·m (174 in. lbs.) torque.

(10) Install the heat shields and the washers. **Make sure that heat shields tabs hook over the exhaust gasket.** Tighten the nuts to 15 N·m (132 in. lbs.) torque.

(11) Adjust and Install the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - INSTALLATION).

(12) Install coil packs and bracket. Tighten the bracket bolts to 21 N·m (190 in. lbs.) torque. Connect the coil wires.

(13) Connect heat indicator sending unit wire.

(14) Connect the heater hoses and bypass hose.

(15) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(16) Install the fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(17) Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION) and drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(18) Install the intake manifold-to-generator bracket support rod. Tighten the bolts to 41 N·m (30 ft. lbs.) torque.

(19) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(20) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(21) Install closed crankcase ventilation system.

(22) Connect the evaporation control system.

(23) Install the air cleaner.

(24) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(25) Connect the negative cable to the battery.

(26) Check for leaks (fuel, oil, antifreeze, etc.).

CYLINDER HEAD COVER(S)

DESCRIPTION

Die-cast magnesium cylinder head covers (Fig. 11) reduce noise and provide a good sealing surface. A steel backed silicon gasket is used with the cylinder head cover. This gasket can be used again.

REMOVAL

Die-cast magnesium cylinder head covers (Fig. 13) reduce noise and provide a good sealing surface. A steel backed silicon gasket is used with the cylinder head cover (Fig. 12).

(1) Disconnect the negative cable from the battery.

(2) Disconnect closed ventilation system and evaporation control system from cylinder head cover. Identify each system for installation.

(3) Remove the upper intake manifold to remove the right side head cover (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

CYLINDER HEAD COVER(S) (Continued)

**Fig. 11 Cylinder Head Cover**

1 - CYLINDER HEAD COVER

(4) Remove cylinder head cover bolts and stud bolts. Remove the covers and gaskets (Fig. 12). The gasket may be used again.

**Fig. 12 Cylinder Head Cover Gaskets**

1 - CYLINDER HEAD COVER GASKETS
2 - TAB WITH NUMBER UP

CLEANING

Clean cylinder head cover gasket surface.
Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.

Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

(1) Check the gasket for use in head cover installation. If damaged, use a new gasket.

(2) Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(3) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 13). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

**Fig. 13 Cylinder Head Covers**

1 - CYLINDER HEAD COVER
2 - CYLINDER HEAD COVER GASKET

(4) If removed, install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(5) Install closed crankcase ventilation system and evaporation control system onto the proper head cover. **DO NOT** switch the systems.

(6) Connect the negative cable to the battery.

(7) Start engine and check for leaks.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves (Fig. 14) are arranged in-line and inclined 18°. The rocker pivot support and the valve guides are cast integral with the heads.

Fig. 14 Intake and Exhaust Valves—8.0L Engine

- 1 - MARGIN
- 2 - VALVE SPRING RETAINER LOCK GROOVE

- 4 - FACE

Fig. 15 Positioning Valve Spacer Tool (Typical)

- 1 - VALVE
- 2 - SPACER TOOL

Fig. 16 Measuring Valve Guide Wear

- 1 - VALVE
- 2 - SPECIAL TOOL C-3339

STANDARD PROCEDURE

VALVE SERVICE

VALVE GUIDES

Measure valve stem guide clearance as follows:

(1) Install Black Valve Guide Sleeve Tool C-6819 over valve stem for the **INTAKE** valve and install valve (Fig. 15). The special sleeve places the valve at the correct height for checking with a dial indicator.

(2) Install Silver Valve Guide Sleeve Tool C-6818 over valve stem for the **EXHAUST** valve and install valve. The special sleeve places the valve at the correct height for checking with a dial indicator.

(3) Attach Dial Indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 16).

(4) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 inch). Ream the guides for valves with over-size stems if dial indicator reading is excessive or if the stems are scuffed or scored.

Service valves with oversize stems are available as shown below

REAMER SIZE CHART

REAMER O/S	VALVE GUIDE SIZE
0.076 mm (0.003 in.)	8.026 - 8.052 mm (0.316 - 0.317 in.)
0.381 mm (0.015 in.)	8.331 - 8.357 mm (0.316 - 0.329 in.)

(5) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 inch). Use a 2 step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

INTAKE/EXHAUST VALVES & SEATS (Continued)

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a 45° face angle and a 44 1/2° seat angle (Fig. 17).

Fig. 17 Valve Face and Seat Angles

1 - CONTACT POINT

VALVE FACE AND SEAT ANGLES CHART

ITEM	DESCRIPTION	SPECIFICATION
A	SEAT WIDTH	1.016 - 1.524 mm
	INTAKE	(0.040 - 0.060 in.)
B	SEAT WIDTH	1.016 - 1.524 mm
	EXHAUST	(0.040 - 0.060 in.)
C	FACE ANGLE (INT. and EXT.)	45°
D	SEAT ANGLE (INT. and EXT.)	44½°
D	CONTACT SURFACE	—

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 18). Valves with less than 1.190 mm (0.047 inch) margin should be discarded.

VALVE SEATS

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating.

Fig. 18 Intake and Exhaust Valves

- 1 - MARGIN
- 2 - VALVE SPRING RETAINER LOCK GROOVE
- 3 - STEM
- 4 - FACE

ing stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.038 mm (0.0015 inch) total indicator reading.

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat LIGHTLY with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of valve seats should be 1.016-1.524 mm (0.040-0.060 inch).

VALVE SPRING INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 inch. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 inch mark on the threaded stud. Be sure the zero mark is to the front (Fig. 19). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and

INTAKE/EXHAUST VALVES & SEATS (Continued)

allowable tensions. Discard the springs that do not meet specifications.

Fig. 19 Testing Valve Spring for Compressed

- 1 - TORQUE WRENCH
2 - VALVE SPRING TESTER

REMOVAL

REMOVAL—VALVE STEM SEALS

NOTE: This procedure is done with the cylinder head installed.

- (1) Disconnect the negative cable from the battery.
- (2) Set engine basic timing to Top Dead Center (TDC) and remove air cleaner.
- (3) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).
- (4) Using suitable socket and flex handle at crankshaft retaining bolt, turn engine so that the piston of the cylinder to be worked on, is at TDC on the compression stroke.
- (5) Remove rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
- (6) With air hose attached to an adapter installed in the spark plug hole, apply 620-689 kPa (90-100 psi) air pressure.
- (7) Using Valve Spring Compressor Tool MD-998772A with adapter 6716A (Fig. 20), compress valve spring and remove retainer valve locks and valve spring.
- (8) Remove the valve stem seal.

REMOVAL—VALVES AND VALVE SPRINGS

- (1) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

Fig. 20 Valve Spring Compressor MD-998772A with Adaptor 6716-A and Screw 6765

- 1 - SPECIAL TOOL MD 998772A
2 - SPECIAL TOOL 6765
3 - SPECIAL TOOL 6716A
4 - AIR HOSE

- (2) Special studs must be used to adapt the Valve Spring Compressor Tool to the V-10 cylinder head (Fig. 21). Install the metric end into the Special Tool MD998772A and the 5/16 end into the cylinder head.

FITS INTO TOOL MD 998772A

FITS INTO CYLINDER HEAD

J9409-95

Fig. 21 Special Studs 6715 for V-10 Engine

- 1 - SPECIAL TOOL 6715

- (3) Compress valve springs using Valve Spring Compressor Tool MD-998772A with Adapter 6716A and Screw 6765 (Fig. 22). Tap the retainer using a brass drift and ball peen hammer to loosen locks away from retainer.

INTAKE/EXHAUST VALVES & SEATS (Continued)

Fig. 22 Valve Spring Compressor MD-998772A with Adaptor 6716-A and Screw 6765

- 1 - SPECIAL TOOL MD 998772A
- 2 - SPECIAL TOOL 6765
- 3 - SPECIAL TOOL 6716A
- 4 - AIR HOSE

(4) Remove valve retaining locks, valve spring retainers and valve springs. Check for abnormal wear, replace as required.

(5) Remove the valve stem seals.

(6) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

CLEANING

Clean valves thoroughly. Discard burned, warped, or cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 in.), replace the valve.

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 23). The special sleeve places the valve at the correct height for checking with a dial indicator.

(2) Attach dial indicator Tool C-3339 to cylinder head and set it at right angles to valve stem being measured (Fig. 24).

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 in.). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

Fig. 23 Positioning Valve with Tool C-3973

- 1 - VALVE
- 2 - SPACER TOOL

Fig. 24 Measuring Valve Guide Wear

- 1 - VALVE
- 2 - SPECIAL TOOL C-3339

INSTALLATION

INSTALLATION—VALVE STEM SEAL

- (1) Install new seal onto valve stem.
- (2) Position valve spring onto valve stem.
- (3) Position Valve Spring Compressor with Adapter Studs onto cylinder head
- (4) Compress valve spring and install retainer valve locks.
- (5) Remove air hose and adapter from spark plug hole.
- (6) Remove Valve Spring Compressor and Adapter Studs.

(7) Install rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(8) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of**

INTAKE/EXHAUST VALVES & SEATS (Continued)

engine with the number up. For the right side the number tab is at the rear of engine with the number up.

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(9) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION) (Fig. 25).

Fig. 25 Cylinder Head Covers

1 - CYLINDER HEAD COVER

2 - CYLINDER HEAD COVER GASKET

- (10) Install closed crankcase ventilation system.
- (11) Connect the evaporation control system.
- (12) Install air cleaner.
- (13) Connect the negative cable to the battery.
- (14) Road test vehicle and check for leaks.

INSTALLATION—VALVES AND VALVE SPRINGS

- (1) Clean valves thoroughly. Discard burned, warped and cracked valves.
- (2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
- (3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
- (4) Make sure there are no burrs on valve stems.

(5) Coat valve stems with lubrication oil. Insert valves into valve guides in cylinder head.

(6) Install new seals on all valve guides (**BLACK on intake and BROWN on exhaust**). Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. Tap the retainer with a brass or heavy plastic hammer to ensure locks have been seated.

(8) If valves and/or seats were ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. Ensure this brings spring height back to normal, 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

(9) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

ROCKER ARM / ADJUSTER ASSY

REMOVAL

- (1) Disconnect spark plug wires by pulling the boot straight out in line with plug.
- (2) Remove cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (3) Remove the rocker arm bolts and the rocker arm assembly (Fig. 26). Place rocker arm assemblies on a bench in the same order as removed.
- (4) Remove the push rods and place them on a bench in the same order as removed.

INSTALLATION

CAUTION: **DO NOT** rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

- (1) Install the push rods in the same order as removed.
- (2) Install rocker arm assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.
- (3) Install cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- (4) Connect spark plug wires.

ROCKER ARM / ADJUSTER ASSY (Continued)

**Fig. 26 Rocker Arm**

- 1 - ROCKER ARMS
- 2 - ROCKER ARM PEDESTALS
- 3 - RETAINER

ENGINE BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper with Cylinder Bore Indicator Tool, Special tool 6879 or equivalent. The cylinder block should be bored and honed with new pistons and rings fitted if:

- The cylinder bores show more than 0.127 mm (0.005 inch) out-of-round.
- The cylinder bores show a taper of more than 0.254 mm (0.010 inch).
- The cylinder walls are badly scuffed or scored.

Boring and honing operation should be closely coordinated with the fitting of pistons and rings so specified clearances may be maintained.

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL

REMOVAL—CAMSHAFT BEARINGS

This procedure requires that the engine is removed from the vehicle.

- (1) With engine completely disassembled, drive out rear cam bearing core hole plug.

NOTE: It is not advisable to attempt to replace camshaft bearings unless special removal and installation tools are available, such as recommended tool 8544 Camshaft Bushing Remover Installer.

- (2) Using recommended tool 8544 Camshaft Bushing Remover Installer, Drive out bearing shells.

REMOVAL—CAMSHAFT

- (1) Remove rocker arms and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify each part so it can be installed in its original location.

NOTE: The 4 corner tappets can not be removed without removing the cylinder heads and gaskets. However, they can be lifted and retained for camshaft removal.

- (2) Remove the Bolts retaining the yoke retaining spider. Remove the yoke retaining spider, tappet aligning yokes and tappets.

- (3) Remove upper and lower intake manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

- (4) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL) and timing chain and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

- (5) Remove camshaft thrust plate (Fig. 27).

**Fig. 27 Camshaft**

- 1 - CAMSHAFT
- 2 - THRUST PLATE

- (6) Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

INSTALLATION

INSTALLATION—CAMSHAFT BEARINGS

(1) Install new camshaft bearings using recommended Tool 8544 Camshaft Bushing Remover Installer, by sliding the new camshaft bearing shell over proper adapter.

(2) Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

INSTALLATION—CAMSHAFT

(1) Lubricate camshaft lobes and camshaft bearing journals. Using a long bolt, insert the camshaft into the cylinder block.

NOTE: Whenever an engine has been rebuilt, a new camshaft and/or new tappets installed, add 1 pint of Mopar® Crankcase Conditioner, or equivalent. The oil mixture should be left in engine for a minimum of 805 km (500 miles). Drain at the next normal oil change.

(2) Install camshaft thrust plate. Tighten the torx bolts to 22 N·m (16 ft. lbs.) torque.

(3) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

(4) Line up key with keyway in sprocket, then using Special Tools C-3688, C-3718 and MB990799 install crankshaft timing sprocket. Make sure the sprocket seats against the crankshaft shoulder (Fig. 28).

(5) Install timing chain and sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) Install the crankshaft pulley/damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(9) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

J9409-140

Fig. 28 Crankshaft Sprocket Installation

- 1 - SPECIAL TOOL C-3688
- 2 - SPECIAL TOOL C-3718
- 3 - SPECIAL TOOL MD990799

(10) Install tappets and push rods in their original location.

(11) Position the tappet aligning yokes and yoke retaining spider.

(12) Install the retaining spider mounting bolts. Tighten bolts to 22 N·m (16 ft. lbs.).

(13) Install the rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(14) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. **DO NOT** use alternative fasteners.

(15) Install cylinder head cover (Fig. 29) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(16) Install the intake manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(17) Start engine and check for leaks.

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

**Fig. 29 Cylinder Head Cover**

- 1 - CYLINDER HEAD COVER
2 - CYLINDER HEAD COVER GASKET

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING ROD BEARING FITTING

Fit all rods on a bank until completed. **DO NOT** alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, be certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Bearings are available in 0.025 mm (0.001 in.), 0.051 mm (0.002 in.), 0.076 mm (0.003 in.), 0.254 mm (0.010 in.) and 0.305 mm (0.012 in.) undersize.

Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.

CRANKSHAFT

REMOVAL

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

(1) Remove the oil pan and oil pickup tube (refer to Oil Pan in this section for correct procedure).

(2) Remove the timing chain cover and gasket. Remove and discard the front crankshaft oil seal and cover gasket.

(3) Remove Transmission (refer to Group 21, Transmission).

(4) Remove the rear seal retainer (refer to Crankshaft Rear Seal Retainer in this section for correct procedure).

(5) Identify main bearing caps before removal (Fig. 30). Remove bearing caps and lower bearings one at a time.

**Fig. 30 Main Bearing Identification**

- 1 - MAIN BEARING CAP
2 - UPPER MAIN BEARINGS
3 - CRANKSHAFT
4 - LOWER MAIN BEARINGS

- (6) Remove the connecting rod bearing caps.
(7) Lift the crankshaft straight out of the block.

CRANKSHAFT (Continued)

(8) Remove the upper main bearings from the block.

INSTALLATION

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

NOTE: Lubricate crankshaft main bearings with clean engine oil.

- (1) Position upper main bearings into block.
- (2) Position the crankshaft into the cylinder block.
- (3) Lubricate the main journals with clean engine oil. Install upper main bearings, caps and bolts. Follow the 2 step tightening sequence, starting with main bearing cap 1.
- (4) Lubricate the connecting rod bearings and journals with clean engine oil. Carefully install connecting rods to the crankshaft.
- (5) Using Special Tool 8359 Seal Installer install new oil into oil seal retainer.
- (6) Using Special Tool 6687 Guide, install the rear seal retainer with a new gasket.
- (7) Install the timing chain cover with a new gasket and oil seal.
- (8) Prime oil pump by squirt oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.
- (9) Apply a rearward axial load of 667 N (150 lbs-f) on crankshaft centerline, driving No.3 main cap and thrust bearing against No.3 bulkhead. Repeat procedure, driving crankshaft forward to align rear flange of thrust bearings in a common plane. Front face of No.1 main cap must not extend forward in front of face of No.1 bulkhead.
- (10) Install the oil pickup tube. Tighten the bolts to 16 N·m (144 in. lbs.) torque.
- (11) Install the oil pan.

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE—FITTING CRANKSHAFT MAIN BEARINGS

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. All lower main bearing halves are interchangeable. Upper main bearing halves of No. 2, 4, and 5 are interchangeable. Upper main bearing

halves of No. 1 and 6 are interchangeable, this also applies to the lower bearing halves.

The No.3 main bearing is flanged to carry the crankshaft thrust loads. This bearing is NOT interchangeable with any other bearing halves in the engine. Bearing shells are available in standard and the following undersizes: 0.25 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch). Never install an undersize bearing that will reduce clearance below specifications.

REMOVAL

- (1) Remove the oil pan and oil pump pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Identify bearing caps before removal. Remove bearing caps one at a time.
- (3) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 31).
- (4) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

Fig. 31 Upper Main Bearing Removal and Installation with Tool C-3059

- 1 - SPECIAL TOOL C-3059
- 2 - BEARING
- 3 - SPECIAL TOOL C-3059
- 4 - BEARING

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

CRANKSHAFT MAIN BEARINGS (Continued)

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 31).

(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.

(3) Lubricate the main journals with clean engine oil. Install main bearing caps and bolts. Follow the 2 step tightening sequence, starting with No. 1 main bearing cap.

(4) Apply a rearward axial load of 667 N (150 lbs-f) on crankshaft centerline, driving No.3 main cap and thrust bearing against No.3 bulkhead. Repeat procedure, driving crankshaft forward to align rear flange of thrust bearings in a common plane. Front face of No.1 main cap must not extend forward in front of face of No.1 bulkhead.

(5) Install the oil pump pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

REMOVAL—FRONT OIL SEAL - FRONT COVER INSTALLED

(1) Disconnect the negative cable from the battery.

(2) Remove vibration damper from the crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of the cover (Fig. 32).

J9409-68

Fig. 32 Timing Chain Cover and Oil Seal

1 - TIMING CHAIN COVER
2 - OIL SEAL

REMOVAL—FRONT OIL SEAL - FRONT COVER REMOVED

(1) Remove engine front cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of the cover.

INSTALLATION

INSTALLATION—FRONT OIL SEAL - FRONT COVER INSTALLED

(1) Position the crankshaft front oil seal onto seal installer special tool 6806 and C-3688 (Fig. 33). Install seal.

J9409-136

Fig. 33 Timing Chain Cover and Oil Seal

1 - SPECIAL TOOL C-3688

2 - SPECIAL TOOL 6806

(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(3) Install serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Install cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(5) Connect negative cable to the battery.

(6) Start engine and check for leaks.

CRANKSHAFT OIL SEAL - FRONT (Continued)

INSTALLATION—FRONT OIL SEAL - FRONT COVER REMOVED

(1) Position the crankshaft front oil seal onto seal installer special tool 6806.

(2) Use tool 6761 to support timing chain cover when installing oil seal with tool 6806 (Fig. 34), install seal (Fig. 35).

Fig. 34 Oil Seal, Tools—6806 and 6761

- 1 - FRONT COVER
- 2 - SPECIAL TOOL 6761
- 3 - FRONT OIL SEAL
- 4 - SPECIAL TOOL 6806

(3) Install engine front cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

CRANKSHAFT OIL SEAL - REAR**REMOVAL**

NOTE: This procedure does not require the removal of the seal retainer from the engine block.

- (1) Remove the transmission.
- (2) Carefully, remove the rear seal from the retainer. Discard the oil seal.

INSTALLATION

(1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

J9409-143

Fig. 35 Oil Seal Installed

- 1 - SPECIAL TOOL 6806
- 2 - SPECIAL TOOL 6761

(2) Position Special Tool 6687 Seal Guide, onto the crankshaft.

(3) Position the oil seal onto the Seal guide, then using Special Tool 8359 Seal Installer and C-4171 Driver Handle, Install the oil seal.

(4) The seal face surface must be countersunk into the retainer .762–1.27mm (0.030–0.050 in.).

- (5) Install the transmission.
- (6) Check and verify engine oil is at correct level.
- (7) Start engine and check for leaks.

CRANKSHAFT REAR OIL SEAL RETAINER**REMOVAL**

- (1) Disconnect negative cable from battery.
- (2) Remove the transmission.
- (3) Remove the drive plate / flywheel.
- (4) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (5) Remove the rear oil seal retainer mounting bolts.
- (6) Carefully remove the retainer from the engine block.

INSTALLATION

(1) Thoroughly clean all gasket residue from the engine block.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

(2) Use extreme care and clean all gasket residue from the retainer.

(3) Apply a small amount of Mopar® Silicone Rubber Adhesive Sealant to the retainer gasket. Position the gasket onto the retainer.

(4) Position Special Tool 6687 Seal Guide onto the crankshaft.

(5) Position the retainer and seal over the guide and onto the engine block.

(6) Install the retainer mounting bolts. Tighten the bolts to 22 N·m (16 ft. lbs.).

(7) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(8) Install the drive plate / flywheel.

(9) Install the transmission.

(10) Check and verify engine oil level.

(11) Start engine and check for leaks.

HYDRAULIC LIFTERS

DIAGNOSIS AND TESTING—HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have

been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.

(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

(4) The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

LEAK-DOWN TEST

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 36).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Universal Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

HYDRAULIC LIFTERS (Continued)

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

Fig. 36 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

REMOVAL

(1) Disconnect the negative cable from the battery.
 (2) Remove the air cleaner.
 (3) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(4) Remove rocker arm assembly and push rods (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify push rods to ensure installation in original location.

(5) Remove upper and lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(6) Cut the cylinder head gasket for accessibility if the end tappets are to be removed.

(7) Remove yoke retainer spider and tappet aligning yokes (Fig. 37).

Fig. 37 Tappets, Aligning Yoke and Yoke Retaining Spider

- 1 - TAPPET ALIGNING YOLK
- 2 - YOKE RETAINING SPIDER
- 3 - TAPPET

(8) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(9) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

(10) Check camshaft lobes for abnormal wear.

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSTALLATION

(1) Lubricate tappets.

(2) Install tappets in their original positions. **Ensure that the oil bleed hole (if so equipped) faces forward.**

(3) Install tappet aligning yokes. Position the yoke retainer spider over the tappet aligning yokes (Fig.

HYDRAULIC LIFTERS (Continued)

37). Install the yoke retaining spider bolts and tighten to 22 N·m (16 ft. lbs.) torque.

(4) Install the push rods in their original location.

(5) Install the rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(6) Install lower and upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(7) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

(8) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(9) Install the air cleaner.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

(10) Connect the negative cable to the battery.

(11) Road test vehicle and check for leaks.

J9409-78

PISTON & CONNECTING ROD

DESCRIPTION

The pistons (Fig. 38) are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

The pistons have a unique dry-film lubricant coating baked onto the skirts to reduce friction. The lubricant is particularly effective during engine break-in, but with time, the material becomes embedded into cylinder bore walls and continues to reduce friction.

The pistons are LH and RH bank specific.

STANDARD PROCEDURE—PISTON FITTING

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch). The max. allowable clearance is 0.0762 mm (0.003 in.).

Fig. 38 Piston and Connecting Rod—8.0L Engine

(L.H. ONLY)
1, 3, 5, 7, 9

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in .0001" INCREMENTS is required (Fig. 39). If a bore gauge is not available, do not use an inside micrometer. The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in .0001" increments is required. Piston installation into the cylinder bore require slightly more pressure than that required for non-coated pistons. The bonded

PISTON & CONNECTING ROD (Continued)

coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

Fig. 39 Bore Gauge

- 1 - BORE GAUGE
- 2 - CYLINDER BORE
- 3 - 2-5/16 in.

REMOVAL

- (1) Remove the engine from the vehicle (Refer to 9 - ENGINE - REMOVAL).
- (2) Remove cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).
- (3) Remove the oil pan and oil pump pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.
- (5) Be sure the connecting rod and connecting rod cap are identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.
- (6) Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies, rotate crankshaft center the connecting rod in the cylinder bore and at BDC. **Be careful not to nick crankshaft journals. DO NOT try to remove black coating on skirt. This is the dry film lubricant.**
- (7) After removal, install bearing cap on the mating rod.

CLEANING

Clean the piston and connecting rod assembly using a suitable solvent.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

- (1) Check the crankshaft connecting rod journal for excessive wear, taper and scoring.
- (2) Check the cylinder block bore for out-of-round, taper, scoring and scuffing.
- (3) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.
- (4) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 40).

NOTE: Be sure position of rings does not change during the following step.

- (5) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385).
- (6) Install connecting rod bolt protectors on rod bolts, a long protector should be installed on the numbered side of the connecting rod.
- (7) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore in the bottom dead center (BDC) position. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore. Be sure the piston and rod assemblies are installed in the proper orientation (Fig. 41).
- (8) The notch, groove or arrow on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.
- (9) While tapping the piston down in cylinder bore with the handle of a hammer, guide the connecting rod over the crankshaft journal.

PISTON & CONNECTING ROD (Continued)

J9409-77

Fig. 40 Proper Ring Installation

- 1 - TOP COMPRESSION RING GAP
UPPER OIL RING GAP
- 2 - 2ND COMPRESSION RING GAP
LOWER OIL RAIL GAP
- 3 - SPACER GAP

(10) Install rod caps. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(11) Install the oil pump pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(12) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION) and cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(13) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(14) Install the engine into the vehicle (Refer to 9 - ENGINE - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE—FITTING PISTON RINGS

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 inches from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler stock in the gap. Gap for compression rings should be between 0.254-0.508 mm (0.010-0.020 inch). The oil ring gap should be 0.381- 1.397 mm (0.015-0.055 inch).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Ends should be

J9409-78

Fig. 41 Piston and Rod Orientation

- 1 - FRONT I.D. TOWARDS THIS SIDE
- 2 - ORIENTATION BUTTON TOWARDS REAR (R.H. ONLY)

- 3 - ORIENTATION BUTTON TOWARDS FRONT (L.H. ONLY)
1, 3, 5, 7, 9

stoned smooth after filing with Arkansas White Stone. Rings with excess gaps should not be used.

(2) Install rings and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter O, an oval depression or the word TOP (Fig. 42) (Fig. 44).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 44). An identification mark on the ring is a drill point,

PISTON RINGS (Continued)

a stamped letter O, an oval depression or the word TOP facing up (Fig. 43).

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 inch) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 inch) side clearance.

(e) Pistons with insufficient or excessive side clearance should be replaced.

VIBRATION DAMPER

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Remove the following:
 - Radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)
 - Accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
 - Radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL)
- (3) Remove crankshaft pulley/damper bolt and washer from end of crankshaft.

VIBRATION DAMPER (Continued)

(4) Using Special Tool, 1026 3 Jaw Puller and Special Tool 8513 Insert, remove pulley—damper from the crankshaft (Fig. 46).

J9409-138

Fig. 46 Crankshaft Pulley—Damper Removal

1 - 3 JAW PULLER

(5) Inspect crankshaft oil seal. If damaged or worn, replace the front oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - REMOVAL).

INSTALLATION

(1) Position the crankshaft pulley/damper onto the crankshaft.

(2) Use Special Tool, C-3688 Crankshaft Pulley/Damper Installer to press the pulley—damper onto the crankshaft. Install crankshaft bolt and washer and tighten to 312 N·m (230 ft. lbs.) torque (Fig. 47).

(3) Install the following:

- Radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION)
- Accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
- Radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(4) Connect the negative cable to the battery.

FRONT MOUNT

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Position fan to assure clearance for radiator top tank and hose.

J9409-142

Fig. 47 Installing Crankshaft Pulley—Damper

1 - SPECIAL TOOL C-3688

CAUTION: DO NOT lift the engine by the intake manifold.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 48).

(6) Remove engine support bracket/cushion bolts (Fig. 48). Remove the support bracket/cushion and heat shields.

J9409-144

Fig. 48 Engine Front Mounts

1 - ENGINE MOUNT HEAT SHIELD

2 - THRU-BOLT

3 - RESTRICTION PADS

4 - ENGINE SUPPORT BRACKET/CUSHION

FRONT MOUNT (Continued)

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the thru-bolt and 2 piece rubber engine rubber restrictors onto the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and thru-bolt into support cushion brackets (Fig. 49) .

J9409-54

Fig. 49 Positioning Engine Mounts—Front

1 - ENGINE SUPPORT BRACKET/CUSHION

2 - SUPPORT CUSHION BRACKET

(4) Install thru-bolt nuts and tighten the nuts to 68 N·m (50 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 50).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 50) .

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

LUBRICATION

DESCRIPTION

A pressure feed type (gerotor) oil pump is located in the engine front cover. The pump uses a pick-up tube and screen assembly to gather engine oil from the oil pan (Fig. 51).

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the inner and outer gears of the oil pump, then forced through the outlet in the engine front cover. An oil gallery in the front cover channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the tappet galleries, which extends the entire length of block.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the No. 1 main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets, which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide

holes and the oil drain-back passages in the cylinder head, past the valve tappet area, and then returns to the oil pan (Fig. 52).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING—ENGINE OIL LEAKS

Begin with a through visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil-soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to be sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light source.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat previous step.

(5) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method as follows:

(6) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(7) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(8) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(9) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(10) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(11) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose. Proceed to next step.

(12) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS).

OIL

STANDARD PROCEDURE - ENGINE OIL

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located at the right front of the engine, left of the generator (Fig. 53).

Fig. 53 Oil Level Indicator Location

- 1 - CYLINDER HEAD COVER
- 2 - ENGINE OIL FILL CAP
- 3 - DIPSTICK
- 4 - ENGINE OIL FILTER
- 5 - FILTER BOSS

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level.

OIL (Continued)

The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading.
- (6) Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. This information can be found in the owner's manual.

TO CHANGE ENGINE OIL

Run engine until achieving normal operating temperature.

- (1) Position the vehicle on a level surface and turn engine off.
- (2) Hoist vehicle.
- (3) Remove oil fill cap.
- (4) Place a suitable drain pan under crankcase drain.
- (5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
- (6) Install drain plug in crankcase.
- (7) Change oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
- (8) Lower vehicle and fill crankcase with specified type (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).
- (9) Install oil fill cap.
- (10) Start engine and inspect for leaks.
- (11) Stop engine and inspect oil level.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

- (1) Position a drain pan under the oil filter.
- (2) Using a suitable oil filter wrench loosen filter.
- (3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 54).

Fig. 54 Oil Filter Removal—Typical

- 1 - ENGINE OIL FILTER
- 2 - OIL FILTER WRENCH

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 52) of oil and grime.

(6) Install new filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

INSTALLATION

- (1) Lightly lubricate oil filter gasket with engine oil or chassis grease.
- (2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 55) hand tighten filter one full turn, do not over tighten.
- (3) Add oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

Fig. 55 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
- 2 - RUBBER GASKET
- 3 - OIL FILTER

OIL PAN

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise vehicle.

OIL PAN (Continued)

- (3) Drain engine oil.
- (4) Remove left engine to transmission strut.
- (5) Remove oil pan mounting bolts, pan and one-piece gasket. The engine may have to be raised slightly on 2WD vehicles.
- (6) Remove the oil pick-up tube assembly (Fig. 56).
- Discard the gasket.

Fig. 56 Oil Pick-Up Tube

- 1 - PICK-UP TUBE
- 2 - SEALANT AT SPLIT-LINES
- 3 - SEALANT AT SPLIT-LINE

CLEANING

Clean the block and pan gasket surfaces.

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

(1) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 57).

(2) Install the dowels in the cylinder block at the four corners.

(3) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent at the split lines. The split lines are between the cylinder block, the timing chain cover and the rear crankshaft seal assembly (Fig. 56). **After the sealant is applied**

Fig. 57 Fabrication of Alignment Dowels

- 1 - 5/16" X 1 1/2" BOLT
- 2 - DOWEL
- 3 - SLOT

you have 3 minutes to install the gasket and oil pan.

(4) Slide the one-piece gasket over the dowels and onto the block.

(5) Position the oil pan over the dowels and onto the gasket. The engine may have to be slightly raised on 2WD vehicles.

(6) Install the oil pan bolts (Fig. 58). Tighten the bolts to as shown in Oil Pan Bolts Torque Chart.

Fig. 58 Oil Pan Bolt Location

- 1 - OIL PAN
- 2 - OIL FILTER
- 3 - STUD BOLTS
- 4 - DRAIN PLUG

(7) Remove the dowels. Install the remaining 5/16 inch oil pan bolts. Torque these bolts as shown in Oil Pan Bolts Torque Chart.

(8) Install the drain plug. Tighten drain plug to 34 N-m (25 ft. lbs.) torque.

(9) Install the engine to transmission strut.

(10) Lower vehicle.

(11) Connect the negative cable to the battery.

(12) Fill crankcase with oil to proper level.

(13) Start engine and check for leaks.

OIL PUMP

REMOVAL

(1) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) Remove the relief valve plug, gasket, spring and valve (Fig. 59). Discard the gasket.

Fig. 59 Oil Pressure Relief Valve

- 1 - TIMING CHAIN COVER
- 2 - OIL PUMP RELIEF VALVE
- 3 - SPRING
- 4 - GASKET
- 5 - PLUG

(3) Remove mounting screws and oil pump cover (Fig. 60).

(4) Remove oil pump inner and outer rotors (Fig. 60).

(5) Inspect oil pump for wear (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION).

CLEANING

Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump cover if scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 61). If a 0.076 mm (0.003 inch) feeler gauge can be inserted between cover and straightedge, cover should be replaced.

Measure thickness (Fig. 62) (Fig. 63) and diameter of rotors. If either rotor thickness measures 14.956 mm (0.5876 inch) or less, or if the diameter is 82.45 mm (3.246 inches) or less, replace rotor set.

Fig. 60 Oil Pump

- 1 - OUTER ROTOR
- 2 - INNER ROTOR
- 3 - OIL PUMP COVER
- 4 - TIMING CHAIN COVER

Fig. 61 Checking Oil Pump Cover Flatness

- 1 - FEELER GAUGE
- 2 - STRAIGHT EDGE
- 3 - OIL PUMP COVER

Slide outer rotor into timing chain cover pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 64). If clearance is 0.19 mm (0.007 inch) or more, and outer rotor is within specifications, replace timing chain cover.

Install inner rotor into timing chain cover pump body (Fig. 65). Inner rotor should be positioned with

OIL PUMP (Continued)

Fig. 62 Measuring Outer Rotor Thickness

Fig. 63 Measuring Inner Rotor Thickness

Fig. 64 Measuring Outer Rotor Clearance in Cover

- 1 - FEELER GAUGE
- 2 - OUTER ROTOR

chamfer up or toward engine when cover is installed. This allows easy installation over crankshaft. If

clearance between inner and outer rotors is 0.150 mm (0.006 inch) or more, replace both rotors.

Fig. 65 Measuring Inner Rotor Clearance in Cover

- 1 - FEELER GAUGE
- 2 - OUTER ROTOR
- 3 - INNER ROTOR

Place a straightedge across the face of the timing chain cover pump body, between bolt holes (Fig. 66) . If a feeler gauge of 0.077 mm (0.003 inch) or more can be inserted between rotors and the straightedge, and the rotors are within specifications, replace timing chain cover.

Fig. 66 Measuring Clearance Over Rotors

- 1 - FEELER GAUGE
- 2 - STRAIGHT EDGE

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 100 and 109 N (22.5 and 24.5 pounds)

OIL PUMP (Continued)

when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications.

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

INSTALLATION

(1) Lubricate both oil pump rotors using petroleum jelly or lubriplate and install in the timing chain cover. Use new parts as required (Fig. 67).

Fig. 67 Priming Oil Pump.

1 - FILL WITH PETROLEUM JELLY OR LUBER PLATE

(2) Position the oil pump cover onto the timing chain cover. Tighten cover screws to 14 N·m (125 in. lbs.) torque.

(3) Make sure that inner ring moves freely after cover is installed.

(4) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(5) Squirt oil into relief valve hole until oil runs out.

(6) Install the relief valve and spring.

(7) Using a new pressure relief valve gasket, install the relief valve plug. Tighten the plug to 20 N·m (15 ft. lbs.) torque.

(8) Install oil filter that has been filled with oil.

INTAKE MANIFOLD

DESCRIPTION

The aluminum intake manifold (Fig. 68) has two plenum chambers an upper and lower which supply air to five runners each. Passages across the longitudinal center of the manifold feed air from the throttle body to the plenum chambers.

80be46d7

Fig. 68 Upper and Lower Intake Manifold—8.0L Engine

1 - UPPER INTAKE MANIFOLD

2 - THROTTLE BODY (MPI)

3 - LOWER INTAKE MANIFOLD

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS, OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.

(2) Spray a small stream of water at the suspected leak area.

(3) If a change in RPMs occur, the area of the suspected leak has been found.

(4) Repair as required.

INTAKE MANIFOLD (Continued)

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (4) Remove the generator brace and generator (Fig. 69).
- (5) Remove the A/C compressor brace (Fig. 69). Remove the compressor and set aside.

**Fig. 69 Generator and A/C Compressor Braces**

- 1 - GENERATOR
- 2 - INTAKE MANIFOLD TO GENERATOR BRACE
- 3 - A/C COMPRESSOR
- 4 - INTAKE MANIFOLD TO A/C COMPRESSOR BRACE

- (6) Remove the air cleaner cover and filter. Remove the air cleaner housing (Fig. 70). Discard the gasket.

**Fig. 70 Air Intake Housing**

- 1 - AIR INTAKE HOUSING

- (7) Perform the Fuel System Pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

- (8) Disconnect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

- (9) Remove the coil assemblies with the ignition wires.

- (10) Disconnect the vacuum lines.

- (11) Disconnect the heater hoses and bypass hose.

- (12) Remove the closed crankcase ventilation and evaporation control systems.

- (13) Remove the throttle body bolts and lift the throttle body off the upper intake manifold (Fig. 71). Discard the gasket.

- (14) Remove upper intake manifold bolts.

- (15) Lift the upper intake manifold out of the engine compartment (Fig. 71). Discard the gasket.

**Fig. 71 Upper Intake Manifold and Throttle Body**

- 1 - UPPER INTAKE MANIFOLD
- 2 - THROTTLE BODY (MPI)
- 3 - LOWER INTAKE MANIFOLD

- (16) Remove the lower intake manifold bolts and remove the manifold (Fig. 72).

- (17) Discard the lower intake manifold gaskets (Fig. 73).

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INTAKE MANIFOLD (Continued)

Fig. 72 Lower Intake Manifold

Fig. 73 Lower Intake Manifold Gaskets

- 1 - INTAKE MANIFOLD GASKET
- 2 - SEALANT
- 3 - CROSS-OVER GASKETS
- 4 - SEALANT
- 5 - LOCATOR DOWELS

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INSTALLATION

(1) Install the intake manifold side gaskets. Be sure that the locator dowels are positioned in the head (Fig. 74).

Fig. 74 Intake Manifold Flange

- 1 - LOCATOR DOWELS
- 2 - INTAKE MANIFOLD GASKETS
- 3 - LOCATOR DOWELS

(2) Insert Mopar® GEN II Silicone Rubber Adhesive Sealant, or equivalent, into the four corner joints an excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket. The sealant should be approximately 5 mm (0.2 in.) in diameter. (Fig. 73).

(3) Position the cross-over gaskets and press firmly onto the block (Fig. 73). **BE SURE THE BLOCK IS OIL FREE.**

(4) The lower intake manifold **MUST** be installed within 3 minutes of sealant application. Carefully lower intake manifold into position on the cylinder block and heads. After intake manifold is in place, inspect to make sure seals and gaskets are in place. Finger start all the lower intake bolts.

(5) Tighten the lower intake manifold bolts in sequence to 54 N·m (40 ft. lbs.) torque (Fig. 72). Recheck all bolts are tightened to 54 N·m (40 ft. lbs.) torque.

(6) Using a new gasket, position the upper intake manifold onto the lower intake manifold.

(7) Finger start all bolts, alternate one side to the other.

(8) Tighten upper intake manifold bolts in sequence to 22 N·m (16 ft. lbs.) torque (Fig. 71).

(9) Using a new gasket, install the throttle body onto the upper intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

(10) Install closed crankcase ventilation and evaporation control systems.

(11) Connect the heater hoses and bypass hose.

(12) Connect the vacuum lines.

(13) Install the coil assemblies and the ignition wires.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

INTAKE MANIFOLD (Continued)

(15) Install the fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(16) Using a new gasket, install the air cleaner housing. Tighten the nuts to 11 N·m (96 in. lbs.) torque. Install the air cleaner filter and cover.

(17) Install the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION). Position the compressor brace and install the bolts. Tighten the brace bolts to 41 N·m (30 ft. lbs.) torque.

(18) Install the generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION). Position the generator brace and install the bolts. Tighten the brace bolts to 41 N·m (30 ft. lbs.) torque.

(19) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(20) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(21) Connect the negative cable to the battery.

(22) Start engine check for leaks.

EXHAUST MANIFOLD

DESCRIPTION

Engine exhaust manifolds (Fig. 75) are made of high molybdenum ductile cast iron. A special ribbed design helps control permanent dimensional changes during heat cycles.

Fig. 75 Exhaust Manifold—8.0L Engine

1 - EXHAUST MANIFOLD

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise and support the vehicle.
- (3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold..
- (4) Lower the vehicle.
- (5) Remove the exhaust heat shields (Fig. 76).

Fig. 76 8.0L Engine Exhaust Manifold—Typical

1 - EXHAUST MANIFOLD
2 - HEAT SHIELD

(6) Remove the dipstick bracket from the exhaust manifold (right side only).

(7) Remove bolts attaching manifold to cylinder head.

(8) Remove manifold from the cylinder head. Discard the gasket.

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

INSTALLATION

(1) Using a new gasket position the engine exhaust manifold onto the cylinder head. Install bolts and stud bolts in the proper position (Fig. 76). Tighten the bolts to 22 N·m (16 ft. lbs.) torque.

EXHAUST MANIFOLD (Continued)

(2) Install the dipstick bracket on to the exhaust manifold (right side only).

(3) Position washers and exhaust heat shields onto the manifold stud bolts (Fig. 76). Be sure the tabs on the heat shields are hooked over the top of the exhaust gasket. Install the nuts and tighten to 20 N·m (175 in. lbs.) torque.

(4) Raise and support the vehicle.

(5) Assemble exhaust pipe to manifold.

(6) Lower the vehicle.

(7) Connect the negative cable to the battery.

(8) Start engine check for leaks.

TIMING BELT / CHAIN COVER(S)

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove fan and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(5) Unbolt A/C compressor and set on top of engine.

(6) Remove generator, air pump, and bracket assembly.

(7) Remove water pump (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).

(8) Remove damper bolt and washer.

(9) Using Special Tool 1026 3-Jaw Puller remove pulley/damper from the crankshaft. (Fig. 77)

(10) Loosen oil pan bolts and remove the front oil pan bolts that mount the pan to the timing chain cover.

(11) Remove the cover bolts.

(12) Remove timing chain cover and gasket using extreme caution to avoid damaging oil pan gasket.

(13) Inspect surface of cover. Remove any burrs or high spots.

INSTALLATION

(1) Be sure mating surfaces of timing chain cover and cylinder block are clean and free from burrs.

(2) Lubricate the pump rotors using petroleum jelly or lubriplate (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(3) Using a new cover gasket, carefully install timing chain cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

J9409-138

Fig. 77 Pulley—Damper Removal

1 - 3 JAW PULLER

(4) Tighten timing chain cover bolts to 47 N·m (35 ft. lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

(5) Using Special Tool C-3688 Crankshaft Pulley/Damper Installer Install pulley/vibration damper (Fig. 78)

J9409-142

Fig. 78 Installing Crankshaft

1 - SPECIAL TOOL C-3688

TIMING BELT / CHAIN COVER(S) (Continued)

(6) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(7) Install water pump and housing assembly using new o-ring (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

(8) Install generator, air pump, and bracket assembly.

(9) Install A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

(10) (10) Install the radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(11) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(12) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect the negative cable to the battery.

(15) Road test vehicle and check for leaks.

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

(1) Remove timing chain cover and gasket using extreme caution to avoid damaging oil pan gasket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) Align camshaft and crankshaft centerline. Remove camshaft sprocket attaching bolt and remove timing chain and camshaft sprockets.

(3) Use puller 6444 and jaws 6820 to remove crankshaft sprocket (Fig. 79).

INSPECTION—MEASURING TIMING CHAIN STRETCH

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the

J9409-139

Fig. 79 Crankshaft Sprocket Removal.

1 - SPECIAL TOOL 6444

2 - SPECIAL TOOL 6820

reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 80).

J9409-96

Fig. 80 Measuring Timing Chain Stretch

1 - TORQUE WRENCH

2 - 3.175 MM
(0.125 IN.)

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

INSTALLATION

(1) Line up key in crankshaft with keyway in sprocket, press on crankshaft timing sprocket, use tools C-3688, C-3718 and MB-990799, seat sprocket against crankshaft shoulder (Fig. 81).

TIMING BELT/CHAIN AND SPROCKETS (Continued)

J9409-140

Fig. 81 Crankshaft Sprocket Installation

- 1 - SPECIAL TOOL C-3688
- 2 - SPECIAL TOOL C-3718
- 3 - SPECIAL TOOL MD990799

(2) Turn crankshaft to line up the timing mark with the crankshaft and camshaft centerline.

(3) Put chain on camshaft sprocket.

(4) Align timing marks and install chain and camshaft sprocket onto crankshaft sprocket. Check to see

that timing marks are on the centerline of the crankshaft and camshaft centerline (Fig. 82).

J9409-69

Fig. 82 Alignment of Timing Marks

- 1 - CAMSHAFT SPROCKET
- 2 - CRANKSHAFT SPROCKET
- 3 - TIMING MARKS

(5) Install the camshaft bolt. Tighten the bolt to 61 N·m (45 ft. lbs.) torque.

(6) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

(7) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

ENGINE 5.9L DIESEL

DESCRIPTION

80c06e38

Cummins® 24 Valve Turbo Diesel Engine

The cylinder block is constructed of cast iron. The casting is a skirted design which incorporates longitudinal ribs for superior strength and noise reduction. The block incorporates metric straight thread o-ring fittings at lubrication oil access points. The engine is

manufactured with the cylinders being a non-sleeved type cylinder. However, one approved service method is to bore out the cylinders and add cylinder sleeves to the cylinder block.

ENGINE 5.9L DIESEL (Continued)

The cylinders are numbered front front to rear (Fig. 1) ; 1 to 6. The firing order is 1-5-3-6-2-4.

1-5-3-6-2-4

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE LOW	<ol style="list-style-type: none"> Low oil level. Oil viscosity thin, diluted or wrong specification. Improperly operating pressure switch/gauge. Relief valve stuck open. Plugged oil filter. If cooler was replaced, shipping plugs may have been left in cooler Worn oil pump. Suction tube loose or seal leaking. Loose main bearing cap. Worn bearings or wrong bearings installed. Oil jet under piston bad fit into main carrier. 	<ol style="list-style-type: none"> (a) Check and fill with clean engine oil. (b) Check for a severe external oil leak that could reduce the pressure. Verify the correct engine oil is being used. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Verify the pressure switch is functioning correctly. If not, replace switch/gauge. Check/replace valve. Change oil filter. Check/remove shipping plugs. Check and replace oil pump. Check and replace seal. Check and install new bearing. Tighten cap to proper torque. Inspect and replace connecting rod or main bearings. Check and replace piston cooling nozzles. Check oil jet position.

ENGINE 5.9L DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE TOO HIGH	<ol style="list-style-type: none"> 1. Pressure switch/gauge not operating properly. 2. Engine running too cold. 3. Oil viscosity too thick. 4. Oil pressure relief valve stuck closed or binding 	<ol style="list-style-type: none"> 1. Verify pressure switch is functioning correctly. If not, replace switch/gauge. 2. Refer to Coolant Temperature Below Normal (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). 3. Make sure the correct oil is being used. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). 4. Check and replace valve.
LUBRICATING OIL LOSS	<ol style="list-style-type: none"> 1. External leaks. 2. Crankcase being overfilled. 3. Incorrect oil specification or viscosity. 4. Oil cooler leak 5. High blow-by forcing oil out the breather. 6. Turbocharger leaking oil to the air intake. 7. Piston rings not sealing (oil being consumed by the engine). 	<ol style="list-style-type: none"> 1. Visually inspect for oil leaks. Repair as required. 2. Verify that the correct dipstick is being used. 3. (a) Make sure the correct oil is being used (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). (b) Look for reduced viscosity from dilution with fuel. (c) Review/reduce oil change intervals. 4. Check and replace the oil cooler. 5. Check the breather tube area for signs of oil loss. Perform the required repairs. 6. Inspect the air ducts for evidence of oil transfer. Repair as required. 7. Perform blow-by check. Repair as required.
COMPRESSION KNOCKS	<ol style="list-style-type: none"> 1. Air in the fuel system. 2. Poor quality fuel or water/gasoline contaminated fuel. 3. Engine overloaded. 4. Incorrect injection pump timing. 5. Improperly operating injectors. 	<ol style="list-style-type: none"> 1. Bleed the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). 2. Verify by operating from a temporary tank with good fuel. Clean and flush the fuel tank. Replace fuel/water separator filter. 3. Verify the engine load rating is not being exceeded. 4. Check injection pump for proper installation. 5. Check and replace inoperative injectors.
EXCESSIVE VIBRATION	<ol style="list-style-type: none"> 1. Loose or broken engine mounts. 2. Damaged fan or improperly operating accessories. 3. Improperly operating vibration damper 	<ol style="list-style-type: none"> 1. Replace engine mounts. 2. Check and replace the vibrating components. 3. Inspect/replace vibration damper.

ENGINE 5.9L DIESEL (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Improperly operating viscous fan drive. 5. Worn or damaged generator bearing. 6. Flywheel housing misaligned. 7. Loose or broken power component. 8. Worn or unbalanced driveline components.	4. Inspect/replace fan drive. 5. Check/replace generator. 6. Check/correct flywheel alignment. 7. Inspect the crankshaft and rods for damage that causes an unbalance condition. Repair/replace as required. 8. Check/repair driveline components.
EXCESSIVE ENGINE NOISES	1. Drive belt squeal, insufficient tension or abnormally high loading. 2. Intake air or exhaust leaks. 3. Excessive valve lash. 4. Turbocharger noise. 5. Gear train noise. 6. Power function knock.	1. Check the automatic tensioner and inspect the drive belt. Make sure water pump, tensioner pulley, fan hub and generator turn freely. 2. Refer to Excessive Exhaust Smoke (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). 3. Adjust valves. Make sure the push rods are not bent and rocker arms, adjusting screws, crossheads, are not severely worn. Replace bent or severely worn components. 4. Check turbocharger impeller and turbine wheel for housing contact. Repair/replace as required. 5. Visually inspect and measure gear backlash. Replace gears as required. 6. Check/replace rod and main bearings.

DIAGNOSIS AND TESTING—SMOKE

DIAGNOSIS CHARTS

The following charts include possible causes and corrections for **excess or abnormal** exhaust smoke.

Small amounts of exhaust smoke (at certain times) are to be considered normal for a diesel powered engine.

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	CORRECTION
Air filter dirty or plugged.	Check Filter Minder® at air filter (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
Air intake system restricted.	Check entire air intake system including all hoses and tubes for restrictions, collapsed parts or damage. Repair/replace as necessary.
Air Leak in Intake System.	Check entire air intake system including all hoses and tubes for cracks, loose clamps and/or holes in rubber ducts. Also check intake manifold for loose mounting hardware.
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures Information.

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	CORRECTION
Engine Control Module (ECM) not calibrated or ECM has incorrect calibration.	Refer to Powertrain Diagnostic Procedures Information.
Exhaust system restriction is above specifications.	Check exhaust pipes for damage/restrictions. Repair as necessary.
Fuel grade is not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel injection pump malfunctioning.	A DTC should have been set. If so, refer to Powertrain Diagnostic Procedures Information.
Fuel injector malfunctioning.	A DTC should have been set. Perform "Cylinder Balance Test" using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures Information and, to (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Fuel return system restricted.	Check fuel return line by checking overflow valve (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).
Intake manifold restricted.	Remove restriction.
Manifold Air Pressure (Boost) Sensor or sensor circuit malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Raw fuel in intake manifold.	Fuel injectors leaking on engine shutdown. Do Fuel Injector Test (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Static timing not correct.	A DTC should have been set. If so, refer to Powertrain Diagnostic Procedures Information. Also (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - DIAGNOSIS AND TESTING).
Turbocharger air intake restriction.	Remove restriction.
Turbocharger damaged.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).
Turbocharger has excess build up on compressor wheel and/or diffuser vanes.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - CLEANING).
Turbocharger wheel clearance out of specification.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	CORRECTION
Air in fuel supply: Possible leak in fuel supply side (between transfer pump and fuel tank module).	(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Coolant leaking into combustion chamber.	Do pressure test of cooling system (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures Information.
In very cold ambient temperatures, engine block heater is malfunctioning (if equipped).	(Refer to 7 - COOLING/ENGINE/ENGINE BLOCK HEATER - REMOVAL).

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	CORRECTION
Engine coolant temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also check thermostat operation (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING).
Engine Control Module (ECM) not calibrated or has incorrect calibration.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Fuel filter plugged.	Perform Fuel Pressure Drop Test (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Fuel grade not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel heater element or fuel heater temperature sensor malfunctioning. This will cause wax type build-up in fuel filter.	Refer to Fuel Heater Testing (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL HEATER - DIAGNOSIS AND TESTING).
Fuel injector malfunctioning.	A DTC should have been set. Perform "Cylinder Balance Test" using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures Information and, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - DIAGNOSIS AND TESTING).
Fuel injector hold-downs loose.	Torque to specifications.
Fuel injector protrusion not correct.	Check washer (shim) at bottom of fuel injector for correct thickness. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION)
Fuel injection pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Fuel supply side restriction to transfer pump.	Refer to Fuel Transfer Pump Pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING)
Fuel transfer (lift) pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also refer to Fuel Transfer Pump Pressure Testing (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Intake/Exhaust valve adjustments not correct (too tight).	(Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
Intake manifold air temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information.
Intake manifold heater circuit not functioning correctly in cold weather.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures Information. Also check heater elements for correct operation.
Intake manifold heater elements not functioning correctly in cold weather.	A diagnostic trouble code WILL NOT BE SET if heater elements are malfunctioning. Refer to NTC tests in Powertrain Diagnostic Procedures Information.
Internal engine damage (scuffed cylinder).	Analyze engine oil and inspect oil filter to locate area of probable damage.

ENGINE 5.9L DIESEL (Continued)

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	CORRECTION
Restriction in fuel supply side of fuel system.	Refer to Fuel Transfer Pump Pressure Testing (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TRANSFER PUMP - DIAGNOSIS AND TESTING).
Static timing incorrect.	A DTC should have been set. If so, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - DIAGNOSIS AND TESTING).

EXCESSIVE BLUE SMOKE	
POSSIBLE CAUSE	CORRECTION
Dirty air cleaner or restricted turbocharger intake duct.	Check Filter Minder® at air filter housing. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
Air leak in boost system between turbocharger compressor outlet and intake manifold.	Service air charge system..
Obstruction in exhaust manifold.	Remove exhaust manifold and inspect for blockage (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL).
Restricted turbocharger drain tube.	Remove turbocharger drain tube and remove obstruction.
Crankcase ventilation system plugged.	Inspect crankcase breather and vent tube for sludge formation or obstructions.
Valve seals are worn, brittle, or improperly installed.	Replace valve stem oil seals (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - REMOVAL).
Valve stems and/or guides are worn.	Remove valves and inspect valves and guides. (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).
Broken or Improperly installed piston rings.	Tear down engine and inspect piston rings.
Excessive piston ring end gap.	Remove pistons and measure piston ring end gap (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).
Excessive cylinder bore wear and taper.	Remove pistons and measure cylinder bore wear and taper (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).
Cylinder damage.	Remove pistons and inspect cylinder bore for cracks or porosity. Repair with cylinder liner if necessary. (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).
Piston damage.	Remove pistons and inspect for cracks, holes. Measure piston for out-of-round and taper (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSPECTION).
Turbocharger failure.	(Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION).

STANDARD PROCEDURE

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

ENGINE 5.9L DIESEL (Continued)

(1) Disconnect the negative cable(s) from the battery.

(2) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(3) Place a shop towel around the fuel injectors to catch any fluid that may possibly be under pressure in the cylinder head. Remove the fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - REMOVAL).

(4) With all injectors removed, rotate the crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(6) Be sure all fluid has been removed from the cylinders.

(7) Repair engine or components as necessary to prevent this problem from occurring again.

(8) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(9) Install new fuel injectors (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).

(10) Drain engine oil. Remove and discard the oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(11) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(12) Install a new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

(13) Fill engine crankcase with the specified amount and grade of oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(14) Connect the negative cable(s) to the battery.

(15) Start the engine and check for any leaks.

REMOVAL

REMOVAL—ENGINE

(1) Disconnect both battery negative cables.

(2) Recover A/C refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(3) Raise vehicle on hoist.

(4) Drain engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Remove engine oil drain plug and drain engine oil.

(6) Lower vehicle.

(7) Remove radiator upper hose.

(8) Remove the cooling fan shroud-to-radiator mounting bolts.

(9) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL). Remove the cooling fan and shroud together.

(10) Disconnect the coolant recovery bottle hose from the radiator filler neck and remove bottle from fan shroud (Fig. 2).

J9407-36

Fig. 2 Coolant Recovery Bottle

1 - T-SLOTS

2 - ALIGNMENT PIN

3 - FAN SHROUD

4 - COOLANT RESERVE/OVERFLOW TANK

(11) Disconnect heater core supply and return hoses from the cylinder head fitting and coolant pipe.

(12) Raise vehicle on hoist.

(13) Remove transmission and transfer case (if equipped.).

(14) Disconnect exhaust pipe from turbocharger extension pipe (Fig. 3).

(15) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(16) Disconnect A/C suction/discharge hose from the rear of the A/C compressor.

(17) Lower vehicle.

(18) Disconnect lower radiator hose from radiator outlet.

(19) **Automatic Transmission models:** Disconnect transmission oil cooler lines from radiator using special tool #6931.

(20) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(21) Remove upper radiator support panel.

ENGINE 5.9L DIESEL (Continued)

J9411-18

Fig. 3 Exhaust Pipe Connection at Turbocharger

- 1 - EXHAUST PIPE
2 - TURBOCHARGER EXHAUST PIPE

(22) Remove front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL).

(23) If A/C equipped, disconnect A/C condenser refrigerant lines.

(24) Disconnect charge air cooler piping.

(25) Remove the two charge air cooler mounting bolts.

(26) Remove charge air cooler (and A/C condenser if equipped) from vehicle.

(27) Disconnect engine block heater connector.

(28) Disconnect A/C compressor electrical connectors.

(29) Remove the passenger battery ground cable from the engine block.

(30) Disconnect power steering pump pressure and return lines.

(31) Remove accelerator linkage cover.

(32) Leaving all cables attached, remove accelerator pedal position sensor assy. (APPS) (Fig. 4) from cylinder head bracket and secure out of the way.

(33) Disconnect APPS connector (Fig. 5).

(34) Disconnect vacuum pump supply hose (Fig. 6).

(35) Disconnect the engine harness and ground cable from the PDC.

(36) Disconnect the fuel supply and return hoses (Fig. 7).

(37) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(38) Remove the #5 and #6 cylinder intake and exhaust rocker arms and pedestals (Fig. 8). Note the original location for re-assembly.

(39) Loosen but do not remove engine mount through bolts and nuts.

(40) Attach chain across engine lift brackets.

80b46b88

- 2 - VACUUM SUPPLY LINE

**Fig. 8 Rocker Arm and Pedestal—Removal/Installation**

- 1 - ROCKER ARM
- 2 - PEDESTAL

REMOVAL—CRANKCASE BREATHER VAPOR CANISTER

NOTE: It is recommended to empty the contents of the vapor canister at each oil and filter service interval.

- (1) Loosen cap from top of vapor canister.
- (2) Remove nut retaining canister to engine front cover.
- (3) Slide clamp upwards on hose, then remove hose from crankcase breather.

INSTALLATION**INSTALLATION—ENGINE**

- (1) Install the engine with the cylinder head cover and the #5 and 6 rocker arm assemblies removed.
- (2) Lower the engine into the compartment and install the engine mount through bolts and nuts.
- (3) Tighten the mount through bolts and nuts to 88 N·m (65 ft. lbs.) torque.
- (4) Remove the engine lifting device.
- (5) Install the #5 and #6 rocker arms and pedestals in their original locations (Fig. 8). Torque the mounting bolts to 36 N·m (27 ft. lbs.) torque.
- (6) Install the cylinder head cover and gasket (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- (7) Connect the fuel supply and return hoses (Fig. 7).

**Fig. 7 Fuel Return and Supply Line Quick-Connect Locations**

- 1 - FUEL RETURN LINE
- 2 - QUICK-CONNECT FITTINGS
- 3 - FUEL SUPPLY LINE

ENGINE 5.9L DIESEL (Continued)

- 2 - STRAP
- 3 - VAPOR CANISTER
- 4 - NUT
- 5 - CAP
- 6 - CRANKCASE BREATHER
- 7 - CLAMP
- 8 - HOSE

(8) Connect the engine harness connector and ground cable to the PDC.

(9) Connect the vacuum pump supply hose.

(10) Connect the APPS connector (Fig. 5).

(11) Install the APPS assembly bracket to the cylinder head bracket.

(12) Install the throttle linkage cover.

(13) Connect the power steering pressure and return lines.

(14) Connect the passenger battery ground cable to the engine block. Tighten the bolt to 77 N·m (57 ft. lbs.) torque.

(15) Connect the engine block heater connector.

(16) Connect the a/c compressor electrical connectors.

(17) Install the charge air cooler and a/c condenser (if a/c equipped). Install and tighten the charge air cooler mounting bolts to 2 N·m (17 in. lbs.) torque.

(18) Connect the charge air cooler piping. Torque all clamps to 8 N·m (72 in. lbs.) torque.

(19) Connect the a/c refrigerant lines to the a/c condenser (if equipped).

(20) Install the front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front BUMPER - INSTALLATION).

(21) Install the radiator upper support panel.

(22) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(23) Connect the transmission quick-connect oil cooler lines to the radiator. Push together until an audible "click" is heard. Verify connection by pulling apart.

(24) Raise vehicle.

(25) Connect a/c compressor suction/discharge hose (if a/c equipped).

(26) Install the radiator lower hose and clamps.

(27) Install the starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(28) Install the transmission and transfer case (if equipped).

(29) Connect the exhaust pipe to the turbocharger elbow (Fig. 3). Torque the bolts to 34 N·m (25 ft. lbs.) torque.

(30) Connect the transmission auxiliary oil cooler lines (if equipped).

(31) Lower the vehicle

(32) Connect the heater core supply and return hoses.

(33) Install the cooling fan and shroud at the same time (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(34) Install the coolant recovery bottle to the fan shroud (Fig. 2) and connect the hose to the radiator filler neck.

(35) Install the windshield washer bottle to the fan shroud and connect the pump supply hose and electrical connections.

(36) Install the radiator upper hose and clamps.

(37) Change oil filter and install new engine oil.

(38) Fill cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(39) Connect battery negative cables.

(40) Perform the fuel line air bleed procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(41) Start engine and inspect for engine oil, coolant, and fuel leaks.

INSTALLATION—CRANKCASE BREATHER VAPOR CANISTER

(1) Position vapor canister with strap over stud on engine front cover. Install retaining nut. Tighten nut 10 N·m (89 in. lbs.).

(2) If removed, position hose onto crankcase breather, then position clamp.

(3) Position lower portion of hose into vapor canister, then install and tighten cap.

ENGINE 5.9L DIESEL (Continued)

SPECIFICATIONS

5.9L DIESEL

DESCRIPTION	SPECIFICATION
Engine Type	In-Line 6 Cyl. Turbo Diesel
Bore and Stroke	102.0 X 120.0 mm (4.02 X 4.72 in.)
Displacement	5.9L (359 cu. in.)
Compression Ratio	
245 H.P. Version	17.0:1
235 H.P. Version	16.3:1
Horsepower (A/T and 5 Speed M/T)	235 @ 2700 rpm
Horsepower (6 Speed M/T Only)	245 @ 2700 rpm
Torque Rating (A/T and 5 Speed M/T)	460 ft. lbs. @ 1600 rpm
Torque Rating (6 Speed M/T Only)	505 ft. lbs. @ 1600 rpm
Firing Order	1-5-3-6-2-4
Lubrication System	Pressure Feed-Full Flow With Bypass Valve
Cylinder Block	Cast Iron
Crankshaft	Induction Hardened Forged Steel
Cylinder Head	Cast Iron With Valve Seat Inserts
Combustion Chambers	High Swirl Bowl
Camshaft	Chilled Ductile Iron

ENGINE 5.9L DIESEL (Continued)

**TEST PLUG - 8442****ADAPTER - 8462****ENGINE DATA PLATE****DESCRIPTION**

The engine data plate contains specific information that is helpful to servicing and obtaining parts for the engine. The data plate is located on the left side of the engine, affixed to the gear housing. Information that can be found on the data plate includes:

- Date of Engine Manufacture
- Engine Serial Number
- Control Parts List (CPL)
- Engine Rated Horsepower
- Engine Firing Order
- Engine Displacement
- Valve Lash Reset Specifications

If the engine data plate is missing or not legible, the engine serial number is used for engine identification. The engine serial number is stamped on the right side of the block, on top of the oil cooler cavity (Fig. 10).

AIR CLEANER ELEMENT**REMOVAL**

Testing Air Cleaner Element using Filter Minder

Do not attempt to unnecessarily remove the top of the air cleaner housing for air cleaner element inspection on diesel engines.

The air cleaner (filter) housing is equipped with an air Filter Minder™ gauge (Fig. 11). This air flow

80b4fb42

Fig. 10 Engine Serial Number Location

restriction gauge will determine when the air cleaner element is restricted and should be replaced.

J9425-3

Fig. 11 Filter Minder™—Location—Diesel Engine

- 1 - AIR FILTER HOUSING COVER
- 2 - TURBOCHARGER
- 3 - AIR INLET TUBE
- 4 - HOSE CLAMP
- 5 - HINGE TABS
- 6 - FILTER MINDER
- 7 - CLIPS (4)
- 8 - TUBE ALIGNMENT NOTCHES

The Filter Minder™ consists of a diaphragm and calibrated spring sealed inside of a plastic housing (Fig. 12). A yellow colored disc attached to the diaphragm moves along a graduated scale on the side of the Filter Minder. After the engine has been shut off, a ratcheting device located within the Filter Minder will hold the yellow disc at the highest restriction that the air cleaner element has experienced. A drop in air pressure due to an air cleaner element restriction moves the diaphragm and the yellow disc will indicate the size of the air drop.

AIR CLEANER ELEMENT (Continued)

CAUTION: Certain engine degreasers or cleaners may discolor or damage the plastic housing of the Filter Minder. Cover and tape the Filter Minder if any engine degreasers or cleaners are to be used.

J9425-4

Fig. 12 Filter Minder™—Diesel Engine

- 1 - PRESS BUTTON TO RESET
- 2 - YELLOW DISC
- 3 - RED ZONE
- 4 - TO AIR FILTER HOUSING
- 5 - FILTER MINDER

To test, turn the engine off. If the yellow disc (Fig. 12) has reached the red colored zone on the graduated scale, the air cleaner element should be replaced. Refer to the proceeding removal/installation paragraphs.

Resetting the Filter Minder: After the air cleaner (filter) element has been replaced, press the rubber button on the top of the Filter Minder (Fig. 12). This will allow the yellow colored disc to reset. After the button has been pressed, the yellow disc should spring back to the UP position.

If the Filter Minder gauge has reached the red colored zone, and after an examination of the air cleaner (filter) element, the element appears to be clean, the high reading may be due to a temporary condition such as snow build-up at the air intake. Temporary high restrictions may also occur if the air cleaner (filter) element has gotten wet such as during a heavy rain or snow. If this occurs, allow the element to dry out during normal engine operation. Reset the rubber button on the top of the Filter Minder and retest after the element has dried.

Removal

(1) Loosen air inlet tube clamp at air cleaner housing inlet (Fig. 11). Remove this tube at air cleaner housing cover.

(2) The housing cover is equipped with four (4) spring clips (Fig. 11) and is hinged at front with plastic tabs. Unlatch clips from top of air cleaner housing and tilt housing cover up and forward for cover removal.

(3) Remove air cleaner element from air cleaner housing.

INSTALLATION

(1) Before installing a new air cleaner element, clean inside of air cleaner housing.

(2) Position air cleaner cover to tabs on front of air cleaner housing. Latch four spring clips to seal cover to housing.

(3) Install air inlet tube at air cleaner housing inlet. Note hose alignment notches at both inlet hose and air cleaner cover (Fig. 11).

(4) Position tube clamp to inlet tube and tighten to 3 N·m (25 in. lbs.) torque.

CYLINDER HEAD

DESCRIPTION

The cylinder head (Fig. 13) is constructed of cast iron and is a one piece cross flow design with four valves per cylinder. The arrangement of two intake and two exhaust valves per cylinder allows for a centrally located injector. The cylinder head also includes an integral intake manifold, an integral thermostat housing, and a longitudinal fuel return rifle, which exits at the rear of the head. The 24 valve design also includes integrally cast valve guides and hardened intake and exhaust valve seat inserts.

REMOVAL

- (1) Disconnect battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Drain engine coolant.
- (4) Disconnect exhaust pipe from turbocharger elbow (Fig. 14).
- (5) Lower vehicle.
- (6) Remove air cleaner housing and snorkel from the vehicle. Cap off turbocharger air inlet to prevent intrusion of dirt or foreign material.
- (7) Disconnect cab heater core supply and return hoses from the cylinder head and heater pipe.
- (8) Disconnect turbocharger oil drain tube at rubber hose connection. Cap off open ports to prevent intrusion of dirt or foreign material.

CYLINDER HEAD (Continued)

80c41fb7

Fig. 13 Cylinder Head and Gasket

- 1 - THERMOSTAT BORE
- 2 - INTAKE RUNNER
- 3 - CYLINDER HEAD
- 4 - CYLINDER HEAD GASKET
- 5 - CYLINDER BLOCK

(9) Disconnect turbocharger oil supply line at the turbocharger end. Cap off open ports to prevent intrusion of dirt or foreign material.

(10) Remove exhaust manifold-to-cylinder head bolts and spacers. Remove exhaust manifold and turbocharger from the vehicle as an assembly.

(11) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(12) Remove generator upper bracket.

(13) Disconnect radiator upper hose from the thermostat housing.

(14) Disconnect the coolant temperature sensor connector.

(15) Remove the engine harness to cylinder head attaching bolt at front of head.

(16) Remove the engine harness ground fastener at front of head below the thermostat housing.

J9411-18

- 2 - PUSH UP LOWER TAB
- 3 - SCREWS/CLIPS (2)
- 4 - TAB PUSH HERE

(18) Remove the six (6) accelerator pedal position sensor assembly-to-cylinder head bracket bolts (Fig. 16) and secure the entire assembly out of the way. Disconnect the APPS connector (Fig. 17). **It is not necessary to disconnect the cables from the throttle control assembly.**

(19) Remove the intake air grid heater wires from the grid heater.

(20) Remove engine oil level indicator tube attaching bolt from the air inlet housing.

CYLINDER HEAD (Continued)

- 3 - PUSH FOR REMOVAL
- 4 - APPS CONNECTOR

(21) Remove the charge air cooler-to-air inlet housing pipe.

(22) Remove the air inlet housing and intake grid heater from the intake manifold cover.

(23) Remove the engine lift bracket from the rear of the cylinder head.

**Fig. 18 High-Pressure Lines at Cylinder Head****Fig. 19 High-Pressure Lines at Fuel Injection Pump**

- 1 - HIGH-PRESSURE LINES AT INJECTION PUMP
- 2 - FITTINGS
- 3 - FUEL INJECTION PUMP

(24) Remove the high pressure fuel lines (Fig. 18) (Fig. 19) from the engine as follows:

(a) Remove all injection line-to-intake manifold cover support bracket bolts.

(b) Loosen the #1, 2, and 4 cylinder high pressure lines at the injection pump.

(c) Loosen the #1, 2, and 4 cylinder high pressure lines at the cylinder head.

(d) Remove the #1, 2, and 4 cylinder high pressure line bundle from the engine.

CYLINDER HEAD (Continued)

(e) Loosen the #3, 5, and 6 cylinder high pressure lines at the injection pump.

(f) Loosen the #3, 5, and 6 cylinder high pressure lines at the cylinder head.

(g) Remove the #3, 5, and 6 cylinder high pressure line bundle from the engine.

(25) Remove the lift pump-to-fuel filter low pressure line.

(26) Remove the fuel filter-to-injection pump low pressure line.

(27) Disconnect the water-in-fuel and fuel heater connectors.

(28) Remove the fuel filter assembly-to-manifold cover bolts and remove filter assembly from vehicle.

(29) Disconnect the Intake Air Temperature and Manifold Air Pressure sensor connectors (Fig. 20).

(30) Remove the cylinder head cover (Fig. 21) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(31) Remove the rocker levers (Fig. 22), cross heads and push rods (Fig. 23). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder exhaust and the #6 cylinder intake and exhaust push rods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

Fig. 23 Push Rod Removal

80b4faaa

Fig. 24 Fuel Drain Fitting at Rear of Head

- 1 - LINE
- 2 - WASHERS
- 3 - BANJO BOLT

(32) Remove the fuel return line banjo bolt at the rear of the cylinder head (Fig. 24). Be careful not to drop the two (2) sealing washers.

(33) Reinstall the engine lift bracket at the rear of cylinder head.

(34) Remove twenty six (26) cylinder head-to-block bolts.

(35) Attach an engine lift crane to engine lift brackets and lift cylinder head off engine and out of vehicle.

(36) Remove the head gasket and inspect for failure.

CLEANING

CLEANING—CYLINDER HEAD

CAUTION: Do not wire brush head surface while fuel injectors are still installed. Fuel injector damage can result.

Clean the carbon from the injector nozzle seat with a nylon or brass brush.

Scrape the gasket residue from all gasket surfaces.

Wash the cylinder head in hot soapy water solution (88°C or 140°F).

After rinsing, use compressed air to dry the cylinder head.

Polish the gasket surface with 400 grit paper. Use an orbital sander or sanding block to maintain a flat surface.

CLEANING—CROSSHEADS

Clean all crossheads in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air.

CLEANING—PUSHRODS

Clean the pushrods in a suitable solvent. Rinse in hot water and blow dry with compressed air. If necessary, use a wire brush or wheel to remove stubborn deposits.

INSPECTION

INSPECTION—CYLINDER HEAD

Inspect the cylinder head for cracks in the combustion surface. Pressure test any cylinder head that is visibly cracked. A cylinder head that is cracked between the injector bore and valve seat can be pressure tested and reused if OK; however, if the crack extends **into** the valve seat, the valve seat **must** be replaced.

Visually inspect the cylinder block and head combustion surfaces for localized dips or imperfections. Check the cylinder head and block combustion surfaces for overall out-of-flatness. If either the visual or manual inspection exceeds the limits, then the head or block must be surfaced.

Check the top surface for damage caused by the cylinder head gasket leaking between cylinders.

Inspect the block and head surface for nicks, erosion, etc.

Check the head distortion (Fig. 25). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.8 mm (2.00 inch) diame-

CYLINDER HEAD (Continued)

ter. Overall variation end to end or side to side 0.30 mm (0.012 inch).

DO NOT proceed with the in-chassis overhaul if the cylinder head or block surface is damaged or not flat (within specifications).

Fig. 25 Cylinder Head Combustion Deck Face

- 1 - STRAIGHT EDGE
2 - FEELER GAUGE

Visually inspect the cylinder head bolts for damaged threads, corroded/pitted surfaces, or a reduced diameter due to bolt stretching.

If the bolts are not damaged, their "free length" should be measured using the cap screw stretch gauge provided with the replacement head gasket. Place the head of the bolt against the base of the slot and align the bolt with the straight edge of gauge (Fig. 26). If the end of the bolt touches the foot of the gauge, the bolt **must** be discarded. **The maximum bolt free length is 132.1 mm (5.200 in.).**

Fig. 26 Head Bolt Stretch Gauge

INSPECTION—CROSSHEADS

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 27). Replace any crossheads that exhibit abnormal wear or cracks.

Fig. 27 Inspecting Crosshead for Cracks

INSPECTION—PUSHRODS

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 28).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 29). Replace any push rod that appears to be bent.

Fig. 28 Inspecting Push Rod for Cracks

Fig. 29 Inspecting Push Rod for Flatness

CYLINDER HEAD (Continued)

INSTALLATION

WARNING: THE OUTSIDE EDGE OF THE HEAD GASKET IS VERY SHARP. WHEN HANDLING THE NEW HEAD GASKET, USE CARE NOT TO INJURE YOURSELF.

(1) Install a new gasket with the part number side up, and locate the gasket over the dowel sleeves.

(2) Using an engine lifting crane, lower the cylinder head onto the engine.

(3) Lightly lubricate head bolts with engine oil and install. Using the sequence shown in (Fig. 30), tighten bolts in the following steps:

- (a) Torque bolts to 80 N·m (59 ft. lbs.)
- (b) Torque bolts to 105 N·m (77 ft. lbs.)
- (c) Re-check all bolts to 105 N·m (77 ft. lbs.)
- (d) Tighten all bolts an additional $\frac{1}{4}$ turn (90°)

Fig. 30 Cylinder Head Bolt Torque Sequence

(4) Connect fuel return line at rear of head (Fig. 24). Install both sealing washers and torque banjo bolt to 24 N·m (18 ft. lbs.).

(5) Install push rods into their original locations (Fig. 31). **Verify that they are seated in the tappets.**

(6) Lubricate valve stem tips and install the cross-heads in their original locations.

(7) Lubricate the rocker arms and pedestals and install them in their original locations (Fig. 32). Install the bolts and torque them to 36 N·m (27 ft. lbs.).

(8) Verify that the valve lash settings are maintained (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).

(9) Install cylinder head cover (Fig. 33) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

80b4fa25

Fig. 31 Push Rod Installation

80b46d23

Fig. 32 Rocker Arms and Pedestal Installation

- 1 - ROCKER ARM
- 2 - PEDESTAL

(10) Connect the IAT and MAP sensor connectors.
(11) Install the fuel filter canister assembly and torque mounting bolts to 24 N·m (18 ft. lbs.).

(12) Connect the lift pump to fuel filter low pressure line. Torque fittings to 24 N·m (18 ft. lbs.).

(13) Connect the Water-in-Fuel and Fuel Heater Element connectors at the filter assembly.

(14) Remove the engine lift bracket at rear of cylinder head.

(15) **Install the high pressure fuel lines (Fig. 18) (Fig. 19) as follows:**

- (a) Lubricate the threads (both ends) of the high pressure line nuts with diesel fuel or engine oil.

CYLINDER HEAD (Continued)

Fig. 33 Cylinder Head Cover Installation

- 1 - BOLT (5)
- 2 - GASKET
- 3 - "TOP FRONT"
- 4 - ISOLATOR (5)

(b) Install the rear line bundle (cyls. #3, 5, and 6), and tighten the threads at the head and pump by hand.

(c) Torque the connections at the cylinder head first. Torque connections to 38 N·m (28 ft. lbs.).

(d) Torque the line connections at the injection pump to 24 N·m (18 ft. lbs.).

(e) Install the front line bundle (cyls. #1, 2, and 4) following the same procedure used for the rear line bundle.

(f) Torque the connections at the cylinder head first. Torque connections to 38 N·m (28 ft. lbs.).

(g) Torque the line connections at the injection pump to 24 N·m (18 ft. lbs.).

(h) Install the injection line support bracket to intake cover/cylinder head bolts and torque to 24 N·m (18 ft. lbs.).

(16) Install the engine lift bracket at the rear of cylinder head. Torque to 77 N·m (57 ft. lbs.).

(17) Install the fuel filter to injection pump low pressure line. Inspect and replace sealing washers if necessary. Torque banjo bolts to 24 N·m (18 ft. lbs.).

(18) Using new gaskets, install the intake grid heater and air inlet housing. Torque bolts to 24 N·m (18 ft. lbs.).

(19) Connect the APPS connector (Fig. 17).

(20) Install the APPS assembly to the cylinder head bracket and torque bolts to 12 N·m (105 in. lbs.).

(21) Install the throttle linkage cover (Fig. 15).

(22) Install the charge air cooler-to-air inlet housing duct assembly. Torque all clamps to 11 N·m (100 in. lbs.).

(23) Connect intake grid heater wires.

(24) Fasten engine harness to front of cylinder head with bolt.

(25) Install engine harness ground wire and torque bolt to 24 N·m (18 ft. lbs.).

(26) Connect engine coolant temperature sensor connector.

(27) Connect radiator upper hose to thermostat housing.

(28) Install generator upper bracket and torque bolts to 41 N·m (31 ft. lbs.).

(29) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(30) Install exhaust manifold/turbocharger assembly and start all bolts/spacers by hand. Torque bolts to 43 N·m (32 ft. lbs.).

(31) Connect turbocharger oil drain tube.

(32) Perform the turbocharger pre-lube procedure. Refer to Group 11, Exhaust System and Turbocharger for the correct procedure.

(33) Connect the turbocharger oil supply line.

(34) Install air cleaner housing and duct.

(35) Raise vehicle on hoist.

(36) Install exhaust pipe to turbocharger elbow (Fig. 14). Torque bolts to 34 N·m (25 ft. lbs.).

(37) Lower vehicle.

(38) Fill engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(39) Start engine and check for leaks.

CYLINDER HEAD COVER(S)

REMOVAL

(1) Disconnect both battery negative cables.

(2) Loosen the five (5) cylinder head cover bolts (Fig. 34). Remove the front three bolts and leave the rear two bolts in the cover.

(3) Lift cover off of cylinder head.

CLEANING

Using a suitable solvent, Clean and dry gasket mating surfaces on cylinder head and cover. Wipe gasket dry and inspect for re-use.

CYLINDER HEAD COVER(S) (Continued)

**Fig. 34 Cylinder Head Cover and Gasket**

- 1 - BOLT (5)
- 2 - GASKET
- 3 - "TOP FRONT"
- 4 - ISOLATOR (5)

INSPECTION

The cylinder head cover gasket and isolators are reusable. However, should cracks be present in the rubber/silicone construction, the defective components should be replaced.

INSTALLATION

(1) Install the gasket as shown in (Fig. 34). Make sure the gasket is properly located around the cylinder head bolts, with the words "top front" facing up and towards front of engine.

(2) Place two bolts and isolators into the rear two mounting holes and install the cover.

(3) Install the remaining bolts and isolators. Starting with the center bolt, torque in a circular pattern to 24 N·m (18 ft. lbs.).

(4) Connect both battery negative cables.

INTAKE/EXHAUST VALVES & SEATS**DESCRIPTION**

The valves are made of heat resistant steel, and have chrome plated stems to prevent scuffing. The

intake and exhaust valves are both similar in head diameter and overall length, but they have unique face angles which makes them non-interchangeable. The valves are distinguished by unique dimples on the exhaust valve head (Fig. 35).

The exhaust valve springs are made from high strength, chrome silicon steel. The exhaust valve springs are also exhaust brake compatible.

**Fig. 35 Valve Identification**

- 1 - INTAKE VALVES
- 2 - EXHAUST VALVES

STANDARD PROCEDURE**STANDARD PROCEDURE - VALVES, GUIDES AND SPRINGS****REMOVAL**

(1) Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(2) Support cylinder head on stands, or install head bolts upside down (through combustion surface side) to protect injector tips from damage from work bench.

(3) Remove the injector clamp (Fig. 36) from the cylinder(s) to be serviced. **Do not remove the bolt shown in (Fig. 36).**

(4) Install the valve spring compressor mounting base (special tool 8319-A) as shown in (Fig. 37). Reinstall the injector clamp bolt finger tight.

(5) Install the compressor top plate, washer, and nut. Using a suitable wrench, tighten the nut (clockwise) to compress the valve springs (Fig. 38) and remove the locks.

(6) Rotate the compressor nut counter-clockwise to relieve tension on the springs. Remove the spring compressor.

(7) Remove the retainers, springs, valve seals (if necessary), and valves (Fig. 39). Arrange or number

INTAKE/EXHAUST VALVES & SEATS (Continued)

all components so they can be installed in their original locations.

(8) Repeat the procedure on all cylinders to be serviced.

80b46d22

5 - RETAINER

INSPECTION

Visually inspect the valves for abnormal wear on the heads, stems, and tips. Replace any valve that is worn out or bent (Fig. 40).

Measure the valve stem diameter in three places as shown in (Fig. 41). Measure the cylinder head valve guide bore (Fig. 42). Subtract the corresponding

MAX INCLINATION
 1.5 mm (.059 in.)

INSTALLATION

(1) Install new valve seals. The yellow springs are for the intake valves and the green seals are for the exhaust valves.

(2) Install the valves in their original position. The exhaust valves are identified by a dimple on the valve head (Fig. 46).

(3) Install the valve springs and retainer.

(4) Install the valve spring compressor tool 8319-A as shown in (Fig. 37) and (Fig. 38).

(5) Compress the valve springs and install the valve retaining locks (Fig. 39).

(6) Remove the compressor and repeat the procedure on the remaining cylinders.

(7) Install the injector clamp and hold down bolts and tighten to 10 N·m (89 in. lbs.) torque.

80b5cb50

Fig. 46 Valve Identification

1 - INTAKE VALVES

2 - EXHAUST VALVES

(8) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

STANDARD PROCEDURE—VALVE LASH ADJUSTMENT AND VERIFICATION

NOTE: To obtain accurate readings, valve lash measurements AND adjustments should only be performed when the engine coolant temperature is less than 60° C (140° F).

The 24-valve overhead system is a "low-maintenance" design. Routine adjustments are no longer necessary, however, measurement should still take place when trouble-shooting performance problems,

or upon completion of a repair that includes removal and installation of the valve train components.

(1) Disconnect battery negative cables.

(2) Remove cylinder head cover (Fig. 47) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the crankcase breather and vapor canister (Fig. 48).

80b46cd20

Fig. 47 Cylinder Head Cover and Gasket

1 - BOLT (5)

2 - GASKET

3 - "TOP FRONT"

4 - ISOLATOR (5)

(4) Using the crankshaft barring tool #7471-B, rotate the engine and align the pump gear mark with the top dead center (TDC) mark on the gear housing cover (Fig. 49).

(5) With the engine in this position (pump gear mark at 12 o'clock), valve lash can be measured at the following rocker arms: **INTAKE 1-2-4 / EXHAUST 1-3-5**. Measure the valve lash by inserting a feeler gauge between the rocker arm socket and crosshead (Fig. 50). Refer to VALVE LASH LIMIT CHART for the correct specifications. If the measurement falls **within** the limits, adjustment/resetting is **not** necessary. If measurement finds the lash **outside** of the limits, adjustment/resetting is required.

- 2 - MEASURE/ADJUST
INTAKE 3, 5, 6
EXHAUST 2, 4, 6

VALVE LASH LIMIT CHART

INTAKE	EXHAUST
0.152 mm (0.006 in.) MIN.	0.381 mm (0.015 in.) MIN.
0.381 mm (0.015 in.) MAX.	0.762 mm (0.030 in.) MAX.

note:
If measured valve lash falls within these specifications, no adjustment/reset is necessary. Engine operation within these ranges has no adverse affect on performance, emissions, fuel economy or level of engine noise.

(6) If adjustment/resetting is required, loosen the lock nut on rocker arms and turn the adjusting screw until the desired lash is obtained:

- **INTAKE** 0.254 mm (0.010 in.)
- **EXHAUST** 0.508 mm (0.020 in.) Tighten the lock nut and re-check the valve lash.

(7) Using the crankshaft barring tool, rotate the **crankshaft** one revolution (360°) to align the pump gear mark to the 6 o'clock position in relation to the TDC mark on the gear housing cover (Fig. 49).

80ba7775

Fig. 50 Measuring Valve Lash

- 1 - INTAKE
- 2 - FEELER GAUGE
- 3 - EXHAUST

(8) With the engine in this position (pump gear mark at 6 o'clock), valve lash can be measured at the remaining rocker arms: **INTAKE 3-5-6 / EXHAUST 2-4-6**. Use the same method as above for determining whether adjustment is necessary, and adjust those that are found to be outside of the limits.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(9) Install the cylinder head cover (Fig. 47) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(10) Install the fuel pump gear access cover.

(11) Connect the battery negative cables.

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the cylinder head cover (Fig. 52) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the rocker arms and crossheads (Fig. 53) from the cylinder(s) to be serviced. Mark each component so they can be installed in their original position.

(4) Remove the crankcase breather vapor canister and breather housing (Fig. 55).

(5) Using the crankshaft barring tool #7471-B (Fig. 51), rotate the engine to line up the mark on the pump gear with the TDC mark on the cover. **At this engine position, cylinders #1 and #6 can be serviced.**

(6) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) With the fuel injection pump gear mark aligned at TDC, add a paint mark anywhere on the gear housing cover next to the crankshaft damper. Place another mark on the vibration damper in alignment with the mark you just made on the cover.

(8) Divide the crankshaft damper into three equally sized segments as follows:

(a) Using a tape measure, measure the circumference of the crankshaft damper and divide the measurement by three (3).

(b) Measure that distance in a counter-clockwise direction from the first balancer mark and place another mark on the balancer.

(c) From the second damper mark, again measure in a counter-clockwise direction and place a mark on the damper at the same distance you measured when placing the second damper mark. The damper should now be marked in three equally spaced locations and the fuel pump gear mark should still be aligned with the TDC mark on the cover.

(9) Compress the valve springs at cyls. #1 and #6 as follows:

(a) Remove the injector clamp (Fig. 54) from the cylinder(s) to be serviced. **Do not remove the bolt shown in (Fig. 54).**

(b) Install the valve spring compressor mounting base as shown in (Fig. 56). Reinstall the injector clamp bolt finger tight.

(c) Install the top plate, washer, and nut. Using a suitable wrench tighten the nut (clock-wise) (Fig.

Fig. 51 Rotating Engine with Barring Tool

- 1 - REAR FLANGE
2 - BARRING TOOL

57) to compress the valve springs and remove the collets.

(d) Rotate the compressor nut counter-clockwise to relieve tension on springs. Remove spring compressor.

(e) Remove and replace retainers, springs, and seals as necessary.

(f) **Do not rotate the engine until the springs and retainers are re-installed.**

(g) Install seals, springs and retainers. Install spring compressor, compress valve springs and install the collets.

(h) Release the spring tension and remove the compressor. Verify that the collets are seated by tapping on the valve stem with a plastic hammer.

(10) Using the crankshaft barring tool, rotate the engine until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #2 and #5 can be serviced.**

(11) Repeat the valve spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

(12) Using the crankshaft barring tool, rotate the engine until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #3 and #4 can be serviced.**

(13) Repeat the spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

INSTALLATION

(1) Install all injector clamps into their original location (Fig. 54). Tighten the hold down bolt to 10 N·m (89 in. lbs.) torque.

(2) Lubricate the valve tips and install the cross-heads in their original locations.

INTAKE/EXHAUST VALVES & SEATS (Continued)

original locations (Fig. 53). Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(4) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(5) Install cylinder head cover and reusable gasket (Fig. 52) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(7) Connect battery negative cables.

ROCKER ARM / ADJUSTER ASSY

DESCRIPTION

The 24-valve overhead system incorporates rocker arms that are designed to allow fuel injector service without removing the rocker arms and pedestals. The unique intake and exhaust rocker arms have their own rocker shafts and are lubricated by passages intersecting the cylinder block main oil rifle. Cross-heads are used (Fig. 58), which allow each rocker arm to operate two valves.

The solid push rods are hardened at the rocker arm and tappet contact areas for superior strength and durability.

Fig. 58 Overhead System Components

- 3 - ROCKER SHAFT
- 4 - SOCKET
- 5 - ADJUSTING SCREW LOCK NUT
- 6 - PUSH ROD
- 7 - PEDESTAL
- 8 - CROSSHEAD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove cylinder head cover (Fig. 59) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove the rocker arm/pedestal fasteners (Fig. 60) and remove rocker arm and pedestal from cylinder head. Mark the arms and pedestals so they can be installed in their original position.

CAUTION: When removing the rocker arms, the sockets (Fig. 61) may come loose and fall into the engine. Make sure they stay with the arm upon removal/installation.

ROCKER ARM / ADJUSTER ASSY (Continued)

(4) Lift the push rod(s) up and out of the engine (Fig. 62). Mark them so they can be installed in their original position.

NOTE: The #5 cyl. exhaust and #6 cyl. intake and exhaust push rods must be raised through the provided cowl panel access holes.

(5) Lift the crosshead(s) off of the valve stems. Mark them so they can be installed in their original position.

Fig. 59 Cylinder Head Cover—Removal/Installation

- 1 - BOLT (5)
- 2 - GASKET
- 3 - "TOP FRONT"
- 4 - ISOLATOR (5)

CLEANING

Clean all components in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air. Inspect oil passages in rocker arms and pedestals. Apply compressed air to lubrication orifices to purge contaminants.

INSPECTION

Rocker Arms

(1) Remove rocker shaft and inspect for cracks and excessive wear in the bore or shaft. Remove socket

Fig. 60 Rocker Arms and Pedestals—Removal/Installation

- 1 - ROCKER ARM

- 4 - RETAINER
- 5 - SOCKET

and inspect ball insert and socket for signs of wear. Replace retainer if necessary.

Measure the rocker arm bore and shaft (Fig. 63) (Fig. 64).

Push Rods

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 65).

ROCKER ARM / ADJUSTER ASSY (Continued)

INSTALLATION

(1) If previously removed, install the push rods in their original location (Fig. 62). **Verify that they are seated in the tappets.**

(2) Lubricate the valve tips and install the cross-heads in their original locations.

(3) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals (Fig. 60) in their original locations. Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(4) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

(5) Install cylinder head cover and reusable gasket (Fig. 59) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Connect battery negative cables.

2nd Reface	322.50 mm ± 0.10 mm	(12.6968 in. ± 0.0039 in.)

ENGINE BLOCK

STANDARD PROCEDURE

STANDARD PROCEDURE - CYLINDER BLOCK REFACING

(1) The combustion deck can be refaced twice. The first reface should be 0.25 mm (0.0098 inch). If additional refacing is required, an additional 0.25 mm (0.0098 inch) can be removed. Total allowed refacing is 0.50 mm (0.0197 inch) - (Fig. 68).

(2) The upper right corner of the rear face of the block must be stamped with a X when the block is refaced to 0.25 mm (0.0098 inch). A second X must be stamped beside the first when the block is refaced to 0.50 mm (0.0197 inch) - (Fig. 69).

(3) Consult the parts catalog for the proper head gaskets which must be used with refaced blocks to ensure proper piston-to-valve clearance.

STANDARD PROCEDURE - CYLINDER BORE - DE-GLAZE

(1) New piston rings may not seat in glazed cylinder bores.

(2) De-glazing gives the bore the correct surface finish required to seat the rings. The size of the bore is not changed by proper de-glazing.

(3) Cover the lube holes in the top of the block with waterproof tape.

(4) A correctly honed surface will have a cross-hatch appearance with the lines at 15° to 25° angles (Fig. 70). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

(5) Use a drill, a fine grit Flex-hone and a mixture of equal parts of mineral spirits and SAE 30W engine oil to de-glaze the bores.

J9109-116

Fig. 69 Stamp Block after Reface

(6) The crosshatch angle is a function of drill speed and how fast the hone is moved vertically (Fig. 71).

(7) Vertical strokes **MUST** be smooth continuous passes along the full length of the bore (Fig. 71).

(8) Inspect the bore after 10 strokes.

(9) Use a strong solution of hot water and laundry detergent to clean the bores. Clean the cylinder bores immediately after de-glazing.

ENGINE BLOCK (Continued)

Fig. 70 Cylinder Bore Crosshatch Pattern

Fig. 71 De-Glazing Drill Speed and Vertical Speed

(10) Rinse the bores until the detergent is removed and blow the block dry with compressed air.

(11) Check the bore cleanliness by wiping with a white, lint free, lightly oiled cloth. If grit residue is still present, repeat the cleaning process until all residue is removed. Wash the bores and the complete block assembly with solvent and dry with compressed air.

(12) Be sure to remove the tape covering the lube holes after the cleaning process is complete.

STANDARD PROCEDURE—CYLINDER BORE REPAIR

Cylinder bore(s) can be repaired by one of two methods:

- Method 1:—Over boring and using oversize pistons and rings.
- Method 2:—Boring and installing a repair sleeve to return the bore to standard dimensions.

METHOD 1—OVERSIZE BORE

Cylinder bore(s) can be repaired by one of two methods:

Oversize pistons and rings are available in two sizes - 0.50 mm (0.0197 inch) and 1.00 mm (0.0393 inch).

Any combination of standard, 0.50 mm (0.0197 inch) or 1.00 mm (0.0393 inch) overbore may be used in the same engine.

If more than 1.00 mm (0.0393 inch) overbore is needed, a repair sleeve can be installed (refer to Method 2—Repair Sleeve).

Cylinder block bores may be bored twice before use of a repair sleeve is required (Fig. 72). The first bore is 0.50 mm (0.0197 inch) oversize. The second bore is 1.00 mm (0.0393 inch) oversize.

After boring to size, use a honing stone to chamfer the edge of the bore (Fig. 72).

Fig. 72 Cylinder Bore Dimensions

1 - CHAMFER

CYLINDER BORE DIMENSION CHART

DESCRIPTION	MEASUREMENT
BORING DIAMETER DIMENSION	1st. REBORE - 102.469 mm (4.0342 in.)
	2nd. REBORE - 102.969 mm (4.0539 in.)
HONING DIAMETER DIMENSIONS	STANDARD - 102.020 ± 0.020 mm (4.0165 ± 0.0008 in.)
	1st. REBORE - 102.520 ± 0.020 mm (4.0362 ± 0.0008 in.)
	2nd. REBORE - 103.020 ± 0.020 mm (4.0559 ± 0.0008 in.)
CHAMFER DIMENSIONS	Approx. 1.25 mm (0.049 in.) by 15°

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block (Fig. 73). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

ENGINE BLOCK (Continued)

**Fig. 73 Crosshatch Pattern of Repaired Sleeve(s)**

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry.

Check the bore cleanliness by wiping with a white, lint-free, lightly-oiled cloth. There should be no grit residue present.

If the block is not to be used right away, coat it with a rust-preventing compound.

METHOD 2—REPAIR SLEEVE

If more than a 1.00 mm (0.03937 inch) diameter oversize bore is required, the block must be bored and a repair sleeve installed.

Bore the block cylinder bore to 104.500-104.515 mm (4.1142-4.1148 inch) - (Fig. 74).

Repair sleeves can be replaced by using a boring bar to bore out the old sleeve. DO NOT cut the cylinder bore beyond the oversize limit.

**Fig. 74 Block Bore for Repair Sleeve Dimensions**

- 1 - BORE DIAMETER
2 - STEP DIMENSION

REPAIR SLEEVE BLOCK REBORE DIMENSIONS CHART

BORE DIAMETER	STEP DIAMETER
104.500 + 0.015 mm (4.1142 + 0.0006 in.)	6.35 mm (0.25 in.)

After machining the block for the new repair sleeve, thoroughly clean the bore of all metal chips, debris and oil residue before installing the sleeve.

Cool the repair sleeve(s) to a temperature of -12°C (10°F) or below for a minimum of one hour. Be ready to install the sleeve immediately after removing it from the freezer.

Apply a coat of Loctite 620, or equivalent to the bore that is to be sleeved.

Wear protective gloves to push the cold sleeve into the bore as far as possible.

Using a sleeve driver, drive the sleeve downward until it contacts the step at the bottom of the bore (Fig. 75).

**Fig. 75 Sleeve Installation**

- 1 - SLEEVE DRIVER
2 - SLEEVE
3 - CONTACT

A sleeve driver can be constructed as follows (Fig. 76).

SLEEVE DRIVER CONSTRUCTION SPECIFICATION CHART

ITEM	MEASUREMENT
A	127 mm (5 in.)
B	38 mm (1.5 in.)
C	6.35 mm (0.25 in.)
D	25.4 mm (1 in.)
E	101 mm (3.976 in.)
F	107.343 mm (4.226 in.)

Set up a boring bar and machine the sleeve to 101.956 mm (4.014 inch) - (Fig. 77).

ENGINE BLOCK (Continued)

**Fig. 76 Sleeve Driver Construction**

2 - HANDLE

After removing the boring bar, use a honing stone to chamfer the corner of the repair sleeve(s) - (Fig. 77).

**Fig. 77 Sleeve Machining Dimensions**

- 1 - DIAMETER
2 - PROTRUSION
3 - CHAMFER

SLEEVE MACHINING DIMENSIONS CHART

ITEM	MEASUREMENT
SLEEVE PROTRUSION	MIN. - FLUSH WITH BLOCK
	MAX. - 0.050 mm (0.0019 in.)
SLEEVE DIAMETER	101.956 mm (4.014 in.)
SLEEVE CHAMFER	APPROX. 1.25 mm (0.049 in.) by 15°

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block. For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

Finished bore inside dimension is 102.020 ± 0.020 mm (4.0165 ± 0.0008 inch).

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry with compressed air.

Wipe the bore with a white, lint-free, lightly oiled cloth. Make sure there is no grit residue present.

Apply a rust-preventing compound if the block will not be used immediately.

A standard diameter piston and a piston ring set must be used with a sleeved cylinder bore.

STANDARD PROCEDURE—CAM BORE REPAIR

The front cam bushing bore can be bored to 59.235 Mm ± 0.013 mm (2.332 inch ± 0.0006 inch) oversize. DO NOT bore the intermediate or rear cam bore to the front cam bore oversize dimensions. Intermediate and rear cam bores may be bored to 57.235 mm ± 0.013 mm (2.253 inch ± 0.0006 inch) oversize.

A surface finish of 2.3 micrometers (92 microinch) must be maintained. Not more than 20% of an area of any one bore may be 3.2 micrometers (126 microinch).

Camshaft bores can be repaired individually. It is not necessary to repair undamaged cam bores in order to repair individually damaged cam bores. The standard front bushing cannot be used to repair intermediate or rear bores.

Install all cam bushings flush or below the front cam bore surface. The oil hole must align to allow a 3.2 mm (0.125 inch) rod to pass through freely (Fig. 78).

**Fig. 78 Oil Hole Alignment**

- 1 - CAMSHAFT BUSHING

INSPECTION

Measure the combustion deck face using a straight edge and a feeler gauge (Fig. 79). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.00 mm (2.0 inch) diameter.

ENGINE BLOCK (Continued)

Overall variation end to end or side to side is 0.075 mm (0.003 inch).

If the surface exceeds the limit, .

Fig. 79 Combustion Deck Face Measurement

- 1 - STRAIGHT EDGE
2 - FEELER GAUGE

Inspect the cylinder bores for damage or excessive wear.

Measure the cylinder bores (Fig. 80). If the cylinder bores exceeds the limit, (Refer to 9 - ENGINE/ENGINE BLOCK - STANDARD PROCEDURE).

Fig. 80 Cylinder Bore Diameter

Inspect the camshaft bores for scoring or excessive wear.

Measure the camshaft bores (Refer to 9 - ENGINE - SPECIFICATIONS). Limit for the No.1 bore applies to the ID of the bushing.

If a bore exceeds the limit, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - STANDARD PROCEDURE).

Inspect the tappet bores for scoring or excessive wear 16.000 mm min - 16.055 mm max (.63 in. min - .6321 in. max) (Fig. 81). If out of limits, replace the cylinder block.

Fig. 81 Tappet Bore Diameter

CAMSHAFT & BEARINGS (IN BLOCK)

REMOVAL

REMOVAL—CAMSHAFT BEARINGS

NOTE: Measure the diameter of each bore. (The limit for the bushing in the No.1 bore is the same as for the other bores without bushings). The limit of the inside diameter is 54.089 min. - 54.164 max. mm (2.1295 min. - 2.1325 max. inch). If the camshaft bore for the first cam bushing is worn beyond the limit, install a new service bushing. Inspect the rest of the camshaft bores for damage or excessive wear. If the bores without a bushing are worn beyond the limit, the engine must be removed for machining and installation of service bushings. If badly worn, replace the cylinder block.

(1) Remove the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(2) Remove the bushing from the No.1 bore, using a universal cam bushing tool.

(3) Mark the cylinder block so you can align the oil hole in the cylinder block with the oil hole in the bushing.

REMOVAL—CAMSHAFT

(1) Disconnect both battery negative cables.

(2) Recover A/C refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(3) Raise vehicle on hoist.

(4) Drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

- (5) Lower vehicle.
- (6) Remove radiator upper hose.
- (7) Remove viscous fan/drive assembly and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (8) Disconnect the coolant recovery bottle hose from the radiator filler neck.
- (9) Disconnect lower radiator hose from radiator outlet.
- (10) **Automatic Transmission models:** Disconnect transmission oil cooler lines from radiator using Special Tool 6931 (unless equipped with finger-release disconnect).
- (11) Remove radiator mounting screws and lift radiator out of engine compartment.
- (12) Remove upper radiator support panel.
- (13) Remove front bumper assembly (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - REMOVAL).
- (14) If A/C equipped, disconnect A/C condenser refrigerant lines.
- (15) Disconnect charge air cooler piping from the cooler inlet and outlet.
- (16) Remove the two charge air cooler mounting bolts.
- (17) Remove charge air cooler (and A/C condenser if equipped) from vehicle.
- (18) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (19) Remove the fan support/hub assembly (Fig. 82).
- (20) Remove crankshaft damper (Fig. 83) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (21) Remove the crankcase breather vapor canister from the gear housing cover (Fig. 84).

**Fig. 82 Fan Support/Hub Removal/Installation**

- 4 - ISOLATOR (5)

(22) Using Special Tool 7471-B Crankshaft Barring Tool, rotate the crankshaft to bring the engine to TDC #1.

(23) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the sealing surfaces.

(24) Remove the cylinder head cover (Fig. 85) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(25) Remove the rocker arms (Fig. 86), cross heads, and push rods (Fig. 87). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder exhaust and the #6 cylinder intake and exhaust pushrods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

(26) Raise the tappets as follows, using the wooden dowel rods (Fig. 88) provided with the Miller Tool Kit 8502 or Cummins tappet replacement tool kit #3822513:

(a) Insert the slotted end of the dowel rod into the tappet. **The dowel rods for the rear two**

clearance. Press firmly to ensure that it is seated in the tappet.

(b) Raise the dowel rod to bring the tappet to the top of its travel, and wrap a rubber band around the dowel rods (Fig. 88) to prevent the tappets from dropping into the crankcase.

(c) Repeat this procedure for the remaining cylinders.

(27) Verify that the camshaft timing marks are aligned with the crankshaft and injection pump marks (Fig. 89).

80b4fa36

Fig. 88 Use Wooden Dowel Rods to Secure Tappets in Place

(28) Remove the bolts from the thrust plate (Fig. 90).

CAUTION: When removing the camshaft and thrust plate, grab the thrust plate to prevent it from falling into the crankcase.

(29) Remove the camshaft (Fig. 91) and thrust plate.

80b4fa34

Fig. 89 Timing Mark Alignment

Fig. 90 Thrust Plate Bolt Location

- 1 - CAMSHAFT GEAR
- 2 - THRUST PLATE

INSPECTION**Camshaft**

(1) Inspect the valve lobes and bearing journals for cracks, pitting, scoring, or generally excessive wear. Replace any camshaft that exceeds the allowable limits.

(2) Measure the bearing journals and lobes (Fig. 92).

CAUTION: If Camshaft lobes are worn, requiring camshaft replacement, it is necessary to replace the tappets also. (Refer to 9 - ENGINE/ENGINE BLOCK/SOLID LIFTERS - REMOVAL).

Camshaft Bushing/Bores

Camshaft bores No. 2-7 **do not** use a bushing.

(1) Inspect the camshaft bushing and bores for signs of excessive wear.

(2) Measure the camshaft bushing and bores (Fig. 93) with a telescoping bore gauge and micrometer. If out of specification, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(3) Inspect the camshaft bushing oil hole for alignment with cylinder block (Fig. 94).

80b4fa38

Fig. 93 Measuring Camshaft Bushing and Bores

J9109-54

Fig. 94 Inspecting Oil Hole Alignment

1 - CAMSHAFT BUSHING

Camshaft Gear

Inspect the camshaft gear for cracks (gear and hub) (Fig. 95), and chipped/broken/fretted teeth (Fig. 96). If replacement is necessary, (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

80b4fa30

Fig. 95 Inspect Camshaft Gear Hub for Cracks

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

80b4fa31

Fig. 96 Inspect Camshaft Gear for Cracks and Fretting

Thrust Plate

Inspect the camshaft thrust plate for excessive wear in the camshaft contact area. Measure thrust plate thickness using the CAMSHAFT THRUST PLATE THICKNESS CHART. Replace any thrust plate that falls outside of these specifications:

CAMSHAFT THRUST PLATE THICKNESS CHART

9.34 mm (0.368 in.) MIN.

9.58 mm (0.377 in.) MAX.

INSTALLATION

INSTALLATION—CAMSHAFT BEARINGS

(1) Apply a coating of Loctite® 640 Adhesive to the backside of the new bushing. Avoid getting adhesive in the oil hole.

(2) Use a universal cam bushing installation tool and install the bushing so that it is even with the front face of the cylinder block. The oil hole must be aligned. A 3.2 mm (0.128 inch) diameter rod must be able to pass through the hole (Fig. 97).

(3) Measure the installed bushing. The limit of the inside diameter is 54.133 mm (2.1312 inch).

INSTALLATION—CAMSHAFT

(1) Lubricate the camshaft bushing and bores with fresh engine oil or suitable equivalent.

(2) Liberally coat the camshaft lobes, journals, and thrust washer with fresh engine oil or suitable equivalent.

CAUTION: When installing the camshaft (Fig. 91), **DO NOT** push it in farther than it will go with the thrust washer in place. Pushing it too far can dislodge the plug in the rear of the camshaft bore and cause an oil leak.

J9109-54

Fig. 97 Oil Hole Alignment

1 - CAMSHAFT BUSHING

(3) Install the camshaft (Fig. 91) and thrust plate. Align the timing marks as shown in (Fig. 89).

(4) Install the thrust plate bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Measure camshaft back lash and end clearance (Fig. 98).

J9109-57

Fig. 98 Camshaft Backlash and End Clearance

BACKLASH — 0.080—0.330 mm
(0.003—0.013 inch)

CLEARANCE — 0.152—0.254 mm
(0.006—0.010 inch)

(6) Remove the wooden dowel rods and rubber bands from the tappets.

(7) Lubricate the push rods with engine oil and install in their original location (Fig. 87). **Verify that they are seated in the tappets.**

(8) Lubricate the valve tips with engine oil and install the crossheads in their original locations.

(9) Lubricate the crossheads and push rod sockets with engine oil and install the rocker arms and pedestals in their original locations (Fig. 86). Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(10) **Verify valve lash adjustment (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE).**

CAMSHAFT & BEARINGS (IN BLOCK) (Continued)

- (11) Install the cylinder head cover and reusable gasket (Fig. 85) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- (12) Install gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - INSTALLATION).
- (13) Install the crankshaft damper (Fig. 83) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
- (14) Install the fan support/hub assembly (Fig. 82) and tighten bolts to 24 N·m (18 ft. lbs.) torque.
- (15) Install the crankcase breather housing (Refer to 9 - ENGINE - INSTALLATION).
- (16) Install the charge air cooler (with a/c condenser and auxiliary transmission oil cooler, if equipped) and tighten the mounting bolts to 2 N·m (17 in. lbs.) torque.
- (17) Connect charge air cooler inlet and outlet pipes. Tighten clamps to 10 N·m (100 in. lbs.) torque.
- (18) Install the radiator upper support panel.
- (19) Close radiator petcock and lower the radiator into the engine compartment. Tighten the mounting bolts to 11 N·m (95 in. lbs.) torque.
- (20) Raise vehicle on hoist.
- (21) Connect radiator lower hose and install clamp.
- (22) Connect transmission auxiliary oil cooler lines (if equipped).
- (23) Lower vehicle.
- (24) Install the fan shroud and tighten the mounting screws to 6 N·m (50 in. lbs.) torque.
- (25) Install the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
- (26) Install the coolant recovery and windshield washer fluid reservoirs to the fan shroud.
- (27) Connect the coolant recovery hose to the radiator filler neck.
- (28) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (29) Install the front bumper assembly (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).
- (30) Add engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (31) Charge A/C system with refrigerant (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (32) Connect the battery negative cables.
- (33) Start engine and check for engine oil and coolant leaks.

CONNECTING ROD BEARINGS

STANDARD PROCEDURE—CONNECTING ROD BEARING AND CRANKSHAFT JOURNAL CLEARANCE

Measure the connecting rod bore with the bearings installed and the bolts tightened to 100 N·m (73 ft. lbs.) torque.

Record the smaller diameter.

Measure the diameter of the rod journal at the location shown (Fig. 99). Calculate the average diameter for each side of the journal.

The clearance is the difference between the connecting rod bore (smallest diameter) and the average diameter for each side of the crankshaft journal.

Fig. 99 Connecting Rod Journal Diameter Limits

CONNECTING ROD JOURNAL DIAMETER LIMITS CHART

DESCRIPTION	MEASUREMENT
CRANKSHAFT ROD JOURNAL DIAMETER	MINIMUM 68.962 mm (2.715 in.)
	MAXIMUM 69.013 mm (2.717 in.)
OUT-OF-ROUND TAPER	MAXIMUM 0.050 mm (0.002 in.)
	MAXIMUM 0.013 mm (0.0005 in.)
BEARING CLEARANCE	MAXIMUM 0.089 mm (0.0035 in.)

CONNECTING ROD BEARINGS (Continued)

CONNECTING ROD JOURNAL DIAMETER
LIMITS CHART

DESCRIPTION	MEASUREMENT
CRANKSHAFT ROD JOURNAL DIAMETER	MINIMUM 68.962 mm (2.715 in.)
	MAXIMUM 69.013 mm (2.717 in.)
OUT-OF-ROUND	MAXIMUM 0.050 mm (0.002 in.)
TAPER	MAXIMUM 0.013 mm (0.0005 in.)
BEARING CLEARANCE	MAXIMUM 0.089 mm (0.0035 in.)

If the crankshaft is within limits, replace the bearing. If the crankshaft is out of limits, grind the crankshaft to the next smaller size and use oversize rod bearings.

CRANKSHAFT

DESCRIPTION

The crankshaft (Fig. 100) is a forged steel, integrally balanced unit. It is supported by seven main bearings, with position number six designated as the thrust journal. The crankshaft is held in place by main caps and 12 mm capscrews. The crankshaft also has internal cross drillings to supply the connecting rods with engine oil.

80c41fb5

Fig. 100 Crankshaft

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE—MAIN BEARING CLEARANCE

Inspect the main bearing bores for damage or abnormal wear.

Install the crankshaft main bearings and measure main bearing bore diameter with the main bolts tightened to 176 N·m (130 ft. lbs.) torque (Fig. 101).

80bb0c4b

Fig. 101 Crankshaft Main Bearing Bore Diameter

1 - MAIN BEARING CAPS

MAIN BEARING BORE DIAMETER CHART

ITEM	MAIN BEARING BORE DIAMETER (MAXIMUM)
A	83.106 mm 3.2719 in.)

Measure the diameter of the main journal at the locations shown (Fig. 102). Calculate the average diameter for each side of the journal.

80bb0c4a

Fig. 102 Crankshaft Main Journal Diameter

CRANKSHAFT MAIN BEARINGS (Continued)

CRANKSHAFT MAIN JOURNAL DIAMETER
CHART

ITEM	SPECIFICATION
MINIMUM DIAMETER	82.962 mm (3.2662 in.)
MAXIMUM DIAMETER	83.013 mm (3.2682 in.)

Calculate the main bearing journal to bearing clearance. the clearance specifications are 0.119 mm (0.00475 inch). If the crankshaft journal is within limits, replace the main bearings. If not within specifications, grind the crankshaft to next size and use oversize bearings.

CRANKSHAFT OIL SEAL -
FRONT

REMOVAL

- (1) Disconnect both battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (4) Lower vehicle.
- (5) Remove radiator upper hose.
- (6) Disconnect coolant recovery bottle from radiator filler neck and lift bottle off of fan shroud.
- (7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.
- (8) Remove the fan shroud-to-radiator mounting bolts.
- (9) Remove viscous fan/drive assembly. **The fan drive nut has left handed threads.** (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (10) Remove cooling fan shroud and fan assembly from the vehicle.
- (11) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (12) Remove the cooling fan support/hub from the front of the engine (Fig. 103).
- (13) Raise the vehicle on hoist.
- (14) Remove the crankshaft damper (Fig. 104).
- (15) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.
- (16) Support the cover on a flat work surface with wooden blocks (Fig. 105), and using a suitable punch and hammer, drive the old seal out of the cover from the outside of the cover (Fig. 105).

INSTALLATION

- (1) Clean cover and housing gasket mating surfaces. Use a suitable scraper and be careful not to

80b46d24

Fig. 103 Fan Support Hub Assembly—Removal/Installation

- 1 - FAN SUPPORT/HUB
2 - FAN PULLEY

80b46d29

2 - BOLT

damage the gear housing surface, since it is aluminum. Remove any old sealer from the oil seal bore. Thoroughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

- (2) Inspect the gear housing and cover for cracks and replace if necessary. Carefully straighten any bends or imperfections in the gear cover with a ball-peen hammer on a flat surface. Inspect the crankshaft front journal for any grooves or nicks that would affect the integrity of the new seal.

- (3) Apply a bead of Mopar® Stud & Bearing Mount to the outside diameter of the seal. Do not lubricate the inside diameter of the new seal.

CRANKSHAFT OIL SEAL - FRONT (Continued)

80b46d25

Fig. 105 Removing Seal from Cover

1 - PUNCH

(4) With the cover supported by wood blocks, install the seal into the rear of the cover using crankshaft seal installer Special Tool 8281 and driver handle C-4171 (Fig. 106). Strike the driver handle until the installation tool bottoms out on the inside of the cover.

(5) Install the plastic seal pilot (provided with seal kit) into the crankshaft seal.

80b46d26

Fig. 106 Installing Seal Into Cover With Tool 8281

1 - SEAL INSTALLER 8281
2 - DRIVER HANDLE C4171
3 - SEAL

80b46d27

Fig. 107 Installing Front Cover with Seal Pilot

1 - SEAL PILOT

(6) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

(7) Install the cover to the gear housing, aligning the seal pilot with the nose of the crankshaft (Fig. 107).

(8) Install the cover bolts and tighten to 24 N·m (18 ft. lbs.) torque. Remove pilot tool.

(9) Install the crankshaft damper (Fig. 104) and torque the bolts to 125 N·m (92 ft. lbs.). Use the engine barring tool to keep the engine from rotating during tightening operation.

(10) Install the fan support/hub assembly (Fig. 103) and torque bolts to 24 N·m (18 ft. lbs.).

(11) Install cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(12) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect battery negative cables.

(15) Start engine and check for oil leaks.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the transmission and transfer case (if equipped).

(3) Remove the clutch cover and disc (if manual transmission equipped) (Refer to 6 - CLUTCH/CLUTCH DISC - REMOVAL).

(4) Remove the flywheel or converter drive plate.

(5) Drill holes 180° apart into the seal. Be careful not to contact the drill against the crankshaft.

CRANKSHAFT OIL SEAL - REAR (Continued)

(6) Install #10 sheet metal screws in the drilled holes and remove the rear seal with a slide hammer (Fig. 108).

Fig. 108 Crankshaft Rear Seal Removal

- 1 - NO. 10 SCREW
- 2 - REAR SEAL
- 3 - CRANKSHAFT
- 4 - SLIDE HAMMER

INSTALLATION

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal surfaces must be completely dry when the seal is installed. Use a soap and water solution on outside diameter of seal to ease assembly.

(1) Clean the crankshaft journal with a suitable solvent and dry with a clean shop towel or compressed air. Wipe the inside bore of the crankshaft seal retainer with a clean shop towel.

(2) Inspect the crankshaft journal for gouges, nicks, or other imperfections. If the seal groove in the crankshaft is excessively deep, install the new seal 1/8" deeper into the retainer bore, or obtain a crankshaft wear sleeve that is available in the aftermarket.

(3) Install the seal pilot, provided in the replacement kit, onto the crankshaft.

(4) Using the provided alignment/installation tool, start the seal over the pilot and into the retainer by hand.

(5) Using a ball peen hammer, strike the tool at the 12, 3, 6, and 9 o'clock positions until the alignment tool bottoms out on the retainer (Fig. 109).

(6) Remove the seal pilot.

(7) Install the flywheel or converter drive plate. Tighten the bolts to 137 N·m (101 ft. lbs.) torque.

Fig. 109 Seal Installation Using Alignment Tool and Hammer

- 1 - SEAL PILOT TOOL
- 2 - INSTALLATION TOOL
- 3 - SEAL
- 4 - RETAINER

(8) Install the clutch cover and disc (if equipped) (Refer to 6 - CLUTCH/CLUTCH DISC - INSTALLATION).

(9) Install the transmission and transfer case (if equipped).

(10) Lower vehicle.

(11) Connect battery negative cables.

(12) Check engine oil level and adjust, if necessary.

(13) Start engine and check for oil leaks.

CRANKSHAFT REAR OIL SEAL RETAINER

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove the oil pan drain plug and drain the engine oil. Re-install plug and torque to 60 N·m (44 ft. lbs.) torque.

(4) Remove transmission and transfer case (if equipped) from vehicle.

(5) Remove flywheel or torque converter drive plate.

(6) Disconnect starter cables from starter motor.

(7) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL) and transmission adapter plate assembly.

(8) Disconnect cables from starter motor.

(9) Remove the eight flywheel housing to block bolts and remove housing and starter motor as an assembly.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

(10) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.

(11) Remove oil pan and suction tube (Fig. 110) (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

Fig. 110 Oil Pan, Suction Tube and Gasket

- 1 - GASKET
- 2 - SUCTION TUBE
- 3 - OIL PAN

(12) Remove the six (6) retainer-to-block bolts (Fig. 111).

(13) Remove the rear seal retainer and gasket (Fig. 111).

(14) Support the seal retainer and drive out the crankshaft seal with a hammer and suitable punch.

INSTALLATION

(1) If using the old seal retainer, it is recommended that the crankshaft seal is replaced. Support the seal retainer and drive out the old seal.

(2) Using the retainer alignment/seal installation tool provided in the seal service kit, install the alignment tool into the retainer and install to the cylinder block (Fig. 112), using a new gasket. Tighten the six (6) mounting bolts by hand.

(3) Starting with the center two bolts, tighten the retainer in a circular pattern to 9 N·m (80 in. lbs.). Remove the alignment tool.

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal surfaces must be completely dry when the seal is

Fig. 111 Crankshaft Rear Seal Retainer and Gasket

- 2 - GASKET
- 3 - BOLT

Fig. 112 Aligning Seal Retainer with Alignment/Installation Tool

- 1 - ALIGNMENT / INSTALLATION TOOL
- 2 - SEAL RETAINER

installed. Use a soap and water solution on outside diameter of seal to ease assembly.

(4) Make sure the provided seal pilot is installed into the new crankshaft seal. Use the alignment/installation tool and press the seal onto the crankshaft (Fig. 113). Alternately drive the seal at the 12, 3, 6 and 9 o'clock positions.

(5) Remove the alignment tool and trim the retainer gasket even with the oil pan mounting surface (Fig. 114).

(6) Remove the seal pilot.

(7) Apply a small amount of Mopar® Silicone Rubber Adhesive Sealant to the oil pan rail T-joints.

CRANKSHAFT REAR OIL SEAL RETAINER (Continued)

Fig. 113 Installing Seal Using Alignment Tool and Hammer

- 1 - SEAL PILOT TOOL
- 2 - INSTALLATION TOOL
- 3 - SEAL
- 4 - RETAINER

Fig. 114 Trimming Excess Gasket Material

- 1 - GASKET

(8) Install the oil pan, suction tube and gaskets (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(9) Install the flywheel housing and bolts. Tighten the bolts to 60 N·m (44 ft. lbs.) torque.

(10) Install the starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(11) Install the flywheel or converter drive plate. Tighten bolts to 137 N·m (101 ft. lbs.)

(12) Install the transmission and transfer case (if equipped).

(13) Lower vehicle.

(14) Fill the crankcase with new engine oil.

(15) Connect the battery negative cables.

(16) Start engine and check for oil leaks.

SOLID LIFTERS/TAPPETS

REMOVAL

NOTE: This procedure requires use of Miller Tool 8502 Tappet Replacement Kit, or Cummins Tool Kit #3822513.

(1) Remove camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(2) Insert the trough (provided with tool kit) the full length of the camshaft bore (Fig. 115). Make sure the cap end goes in first and the open side faces up (towards tappets).

(3) **Remove only one tappet at a time.** Remove rubber band from one cylinder pair and attach tappet dowel not being removed to the next cylinder pair (Fig. 116).

(4) Raise dowel rod (disengage from tappet) and allow tappet to fall into trough (Fig. 117).

(5) Carefully remove trough (**do not rotate**) and tappet. If the tappet is not being replaced, mark it so it can be installed in its original location.

(6) Re-install trough and repeat procedure on remaining tappets.

Fig. 115 Inserting the Trough

- 1 - TROUGH

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

SOLID LIFTERS/TAPPETS (Continued)

80b4faa0

Fig. 116 Secure Dowel/Tappet to Adjacent Cylinder

80b4faa1

Fig. 117 Lift Dowel Rod to Disengage from Tappet**INSPECTION**

(1) Visually inspect the tappet the tappet socket, stem, and face for excessive wear, cracks, or obvious damage (Fig. 118).

(2) Measure the tappet stem diameter. Replace the tappet if it falls below the minimum size (Fig. 118).

INSTALLATION

(1) Insert the trough the full length of the camshaft bore (Fig. 115). Again, make sure the cap end goes in first and the open side faces up (towards tappets).

(2) Lower the tappet installation tool through the push rod hole (Fig. 119) and into the trough.

(3) Retrieve the tappet installation tool using the hooked rod provided with the tool kit (Fig. 120).

(4) Lubricate the tappet with clean engine oil or suitable equivalent and install the tappet to the installation tool (Fig. 121).

(5) Pull the tappet up and into position (Fig. 121). If difficulty is experienced getting the tappet to make the turn into the tappet bore, wiggle the trough while **gently** pulling on the tappet.

J9109-152

Fig. 118 Tappet Inspection**TAPPET STEM DIAMETER**

15.925 mm (0.627 in.) MIN.

15.977 mm (0.629 in.) MAX.

80b4faa2

Fig. 119 Insert Installation Tool through Push Rod Hole

(6) With the tappet in place, rotate the trough one half turn so the open side is down (toward crankshaft) (Fig. 122).

(7) Remove the tappet installation tool from the tappet.

(8) Re-install a dowel rod and secure the rod with a rubber band.

(9) Rotate the trough one half turn and repeat the procedure for the remaining tappets.

(10) Install the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - INSTALLATION).

PISTON & CONNECTING ROD**DESCRIPTION**

The piston (Fig. 123) is constructed of aluminum and is gravity cast, free floating design. The piston

PISTON & CONNECTING ROD (Continued)

80b4faa3

Fig. 120 Retrieve Tappet Installation Tool through Cam Bore

80b4faa4

Fig. 121 Insert Tool and Pull Tappet Into Place

80b4faa5

Fig. 122 Rotate Trough One Half Turn (180°)

incorporates a centrally located high swirl combustion bowl, and utilizes a "keystone" style top compression ring (Fig. 124), and a "Tapered Face"

intermediate ring (Fig. 124), for superior cylinder wall scraping. Piston cooling nozzles cool the piston and pin with engine oil supplied by the crankshaft main journals.

The connecting rods (Fig. 125) are a split angle design constructed of micro alloy. The rods have a pressed in place wrist pin bushing which is lubricated by the piston cooling nozzle oil spray.

TOP RING

TOP

INTERMEDIATE RING

OIL CONTROL RING

J9109-69

Fig. 124 Piston Ring Identification

STANDARD PROCEDURE—PISTON GRADING

- When rebuilding an engine with the original cylinder block, crankshaft and pistons, make sure the pistons are installed in their original cylinder.
- If replacing the piston(s), make sure the replacement piston(s) are the same grade as the one being replaced.
- If a new cylinder block and/or crankshaft is used, the piston grading procedure **MUST** be performed to determine the proper piston grade for each cylinder.

PISTON & CONNECTING ROD (Continued)

80c41f5b

Fig. 125 Connecting Rod

(1) Install any of the original connecting rod and piston assemblies into the No.1 cylinder. DO NOT install the piston rings.

(2) Install the upper bearing shell in the connecting rod with the tang of the bearing in the slot of the connecting rod. The connecting rod bearing shell must be installed in the original connecting rod and cap. Use clean lubricating oil to coat the inside diameter of the connecting rod bearing shell.

(3) Install the bearing shell in the connecting rod cap with the tang of the bearing in the slot to the cap. Use clean lubricating oil to coat the inside diameter of the bearing shell.

(4) The four digit number stamped on the connecting rod and cap at the parting line must match and

be installed on the oil cooler side of the engine. Install the connecting rod cap and cap screws. Tighten the cap screws to 35 N·m (26 ft. lbs.) torque.

(5) Use a fine grit stone to remove any burrs from the cylinder block head deck. Zero the dial indicator to the cylinder block head deck.

(6) Move the dial indicator directly over the piston pin to eliminate any side-to-side movement.

(7) Rotate the crankshaft to top dead center (TDC). Rotate the crankshaft clockwise and counter-clockwise to find the highest dial indicator reading. Record the reading.

(8) Remove the piston and connecting rod assembly from the No.1 cylinder and install the assembly into the No.2 cylinder. Repeat the procedure for every cylinder using the same piston and connecting rod assembly.

(9) Determine the grade of the piston being used by referring to the Piston Protrusion Chart below. Four digits on top of the piston can be cross referenced to a DaimlerChrysler part number for replacement (Fig. 126). If the number on the piston cannot be seen, measure from the top of the piston to the top of the piston pin to see what grade piston is used (Fig. 127).

J9509-2

Fig. 126 Piston Grading Number Location

NOTE: NEVER INTERMIX PISTONS FROM ONE ENGINE APPLICATION TO ANOTHER ENGINE APPLICATION. SEVER DRIVEABILITY CONCERNS MAY RESULT.

6052	6155	0.711-0.813 mm (0.028-0.032 in.)	B
6052	6155	0.609-0.711 mm (0.024-0.028 in.)	C

NOTE: Use the table below when piston grading numbers are missing or not legible.

ALTERNATIVE GRADE IDENTIFICATION METHOD

DIMENSION "A"	REF. NUMBER		GRADE
	235 HP	245 HP	
51.554-51.607 mm (2.029-2.031 in.)	6153	6050	A
51.654-51.707 mm (2.033-2.035 in.)	6154	6051	B
51.754-51.807 mm (2.037-2.039 in.)	6155	6052	C

REMOVAL

- (1) Disconnect the battery cables.
- (2) Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
- (3) Remove the oil pan and suction tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

- (4) Using Miller Tool 7471-B crankshaft barring tool, rotate the crankshaft so all of the pistons are below TDC.

PISTON & CONNECTING ROD (Continued)

**Fig. 127 Piston Grading Measurement**

(5) Before removing the piston(s) from the bore(s):

(a) Remove any carbon ridge formations or deposits at the top of the bore with a dull scraper or soft wire brush.

(b) If cylinder bore wear ridges are found, use a ridge reamer to cut the ridge from the bore. DO NOT remove more metal than necessary to remove the ridge.

NOTE: If cylinders have ridges, the cylinders are oversize and will more than likely need boring.

(6) Using a hammer and steel stamp, identify the front of the piston by stamping the cylinder number in each piston to be removed at the top of the piston toward the front of the engine. DO NOT stamp in the outside 5 mm (.197 in.) of the piston diameter.

(7) Mark the connecting rod and cap with the corresponding cylinder numbers.

(8) Remove the connecting rod bolts and rod caps. Use care so the cylinder bores and connecting rods are not damaged.

(9) Use a hammer handle or similar object to push the piston and connecting rod through the cylinder bore.

(10) Store the piston/rod assemblies in a rack.

(11) If a piston must be replaced, replace with the same part number (grading) that was removed.

CLEANING

CAUTION: DO NOT use bead blast to clean the pistons. DO NOT clean the pistons and rods in an acid tank.

Clean the pistons and pins in a suitable solvent, rinse in hot water and blow dry with compressed air. Soaking the pistons over night will loosen most of the carbon build up. De-carbon the ring grooves with a broken piston ring and again clean the pistons in sol-

vent. Rinse in hot water and blow dry with compressed air.

INSPECTION**INSPECTION**

Inspect the pistons for damage and excessive wear. Check top of the piston, ring grooves, skirt and pin bore. Measure the piston skirt diameter (Fig. 128). If the piston is out of limits, replace the piston.

The upper groove only needs to be inspected for damage. Use a new piston ring to measure the clearance in the intermediate ring groove (Fig. 129). If the clearance of the intermediate ring exceeds 0.095 mm (0.0038 inch), replace the piston.

Use a new oil ring to measure the clearance in the oil groove (Fig. 129). If the clearance exceeds 0.085 mm (0.0034 inch), replace the piston.

Measure the pin bore (Fig. 130). The maximum diameter is 40.012 mm (1.5753 inch). If the bore is over limits, replace the piston.

Inspect the piston pin for nicks, gouges and excessive wear. Measure the pin diameter (Fig. 131). The minimum diameter is 39.990 mm (1.5744 inch). If the diameter is out of limits, replace the pin.

Connecting Rods**CLEANING**

Clean the connecting rods in a suitable solvent, rinse in hot water and blow dry with compressed air.

INSPECTION**Fig. 128 Piston Skirt Diameter**

PISTON SKIRT DIAMETER (MIN.)

101.864 mm (4.0104 in.)

Inspect the connecting rod for damage and wear. The I-Beam section of the connecting rod cannot have dents or other damage. Damage to this part can cause stress risers which will progress to breakage.

2 - PIN BORE

**Fig. 131 Piston Pin Diameter**

- 1 - PISTON PIN

Measure the connecting rod pin bore (Fig. 132). The maximum diameter is 40.042 mm (1.5764 inch). If out of limits, replace the connecting rod.

**Fig. 132 Connecting Rod Pin Bore**

- 1 - CONNECTING ROD

INSTALLATION

- (1) Lubricate the cylinder bores with clean engine oil.
- (2) Generously lubricate the rings and piston skirts with clean engine oil.
- (3) Compress the rings using a piston ring compressor tool (Fig. 133). If using a strap-type ring compressor, make sure the inside end of the strap does not hook on a ring gap and break the ring.

**Fig. 133 Piston Ring Compressor Tool**

- 1 - PISTON RING COMPRESSOR TOOL

- (4) Bar the crankshaft so the rod journal for the piston to be installed is at BDC (Bottom Dead Center) - (Fig. 134).

- (5) Be sure the mark you made on the piston and the numbers on the rod and cap are oriented as illustrated.

- (6) Position the piston and rod assembly into the cylinder bore with the mark you made on the piston towards the front of the cylinder block. In this position the numbers on the connecting rod should be facing the oil cooler side of the engine, and the rod

PISTON & CONNECTING ROD (Continued)

Fig. 134 Piston/Rod Assembly at BDC

bolt holes toward the camshaft. Use care when you install the piston and connecting rod so the cylinder bore is not damaged.

(7) Push the piston into the bore until the top of the piston is approximately 50 mm (2 inch) below the top of the block. Carefully pull the connecting rod onto the crankshaft journal.

(8) Use clean engine oil to lubricate the threads and under the heads of the connecting rod bolts.

(9) The number stamped on the rod cap at the parting line must match and be installed towards the oil cooler side of the engine (Fig. 135).

Fig. 135 Correct Rod Cap Installation

(10) Install the rod cap and bolts to the connecting rod. Tighten the connecting rod and bolt evenly in 3 steps.

- Tighten the bolts to 35 N·m (26 ft. lbs.) torque.
- Tighten the bolts to 70 N·m (51 ft. lbs.) torque.
- Tighten the bolts to 100 N·m (73 ft. lbs.) torque.

(11) The crankshaft must rotate freely. Check for freedom of rotation as the caps are installed. If the crankshaft does not rotate freely, check the installation of the rod bearing and the bearing size.

(12) Measure the side clearance between the connecting rod and the crankshaft (Fig. 136). DO NOT measure the clearance between the cap and crankshaft.

Fig. 136 Side Clearance between Connecting Rod/Crankshaft

1 - FEELER GAUGE

(13) Install the suction tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Install the cylinder head onto the engine (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(15) Install a new filter and fill the crankcase with new engine oil.

(16) Connect the battery negative cables and start engine.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Determine the piston diameter and obtain the appropriate ring set. The piston rings can be identified as shown in (Fig. 137).

TOP RING

TOP

INTERMEDIATE RING

OIL CONTROL RING

J9109-69

Fig. 137 Piston Ring Identification

(2) Position each ring in the cylinder and use a piston to square it with the bore at a depth of 89.0 mm (3.5 inch) - (Fig. 138).

(3) Use a feeler gauge to measure the piston ring gap.

PISTON RINGS (Continued)

**Fig. 138 Position of Ring in Cylinder Bore**

Fig. 145 Front Engine Mount—Typical

- 1 - MOUNT
2 - BOLT (4)

FRONT MOUNT (Continued)

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine mount to the block. Install the bolts and tighten to 149 N·m (110 ft. lbs.) torque.

(2) Install the thru-bolt into the engine mount.

(3) Lower the engine while guiding the mount and thru-bolt into the frame mounted support cushion brackets (Fig. 146).

J9409-122

Fig. 146 Positioning Engine Front Mounts

1 - ENGINE SUPPORT BRACKET/CUSHION

2 - SUPPORT CUSHION BRACKET

(4) Install the thru-bolt nut and tighten the nut to 88 N·m (65 ft. lbs.) torque.

(5) Passenger side: Install the two (2) transmission oil cooler bracket to mount bolts. Tighten the bolts to 47 N·m (35 ft. lbs.) torque.

(6) Remove lifting fixture.

(7) Lower the vehicle.

(8) Install the viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(9) Connect the battery negative cables.

REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 147).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 50).

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

LUBRICATION

DESCRIPTION

NOTE: Refer to (Fig. 148) and (Fig. 149) for circuit illustrations.

A gear driven gerotor type oil pump is mounted behind the front gear cover in the lower right portion on the engine.

OPERATION

A gerotor style oil pump draws oil from the crankcase through the suction tube and delivers it through the block where it enters the oil cooler cover and pressure regulator valve. When oil pressure exceeds 449 kPa (65 PSI), the valve opens exposing the dump port, which routes excess oil back to the oil sump.

At the same time, oil is directed to a cast in passage in the oil cooler cover, leading to the oil cooler element. As the oil travels through the element plates, it is cooled by engine coolant traveling past the outside of the plates. It is then routed to the oil filter head and through a full flow oil filter. If a plugged filter is encountered, the filter by-pass valve opens, allowing unfiltered oil to lubricate the engine. This condition can be avoided by frequent oil and filter changes, per the maintenance schedules found in the owners manual. The by-pass valve is calibrated to open when it sees a pressure drop of more than 344 kPa (50 psi) across the oil filter.

The oil filter head then divides the oil between the engine and the turbocharger. The turbocharger receives filtered, cooled and pressurized oil through a supply line from the filter head. The oil lubricates the turbocharger and returns to the pan by way of a drain tube connecting the bottom of the turbocharger to a pressed in tube in the cylinder block.

Oil is then carried across the block to an angle drilling which intersects the main oil rifle. The main

LUBRICATION (Continued)

J9509-126

Fig. 147 Engine Rear Support Cushion Assembly

oil rifle runs the length of the block and delivers oil to the crankshaft main journals and valve train. Oil travels to the crankshaft through a series of transfer drillings (one for each main bearing) and lubricates a groove in the main bearing upper shell. From there another drilling feeds the camshaft main journals. The piston cooling nozzles are also supplied by the main bearing upper shell. Crankshaft internal cross-drillings supply oil to the connecting rod journals.

Another series of transfer drillings intersecting the main oil rifle supply the valve train components. Oil travels up the drilling, through a hole in the head gasket, and through a drilling in the cylinder head (one per cylinder), where it enters the rocker arm pedestal and is divided between the intake and exhaust rocker arm. Oil travels up and around the rocker arm mounting bolt, and lubricates the rocker shaft by cross drillings that intersect the mounting bolt hole. Grooves at both ends of the rocker shaft supply oil through the rocker arm where the oil travels to the push rod and socket balls (Fig. 148) and (Fig. 149).

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

- (1) Remove the engine oil pressure sensor and install Oil Pressure Line and Gauge Tool C-3292 with a suitable adapter.
- (2) Start engine and warm to operating temperature.
- (3) Record engine oil pressure and compare with engine oil pressure chart.

CAUTION: If engine oil pressure is zero at idle, DO NOT RUN THE ENGINE.

Engine Oil Pressure (MIN)	
At Idle	103.4 kPa (15 psi)
At 2000 rpm	310.2 kPa (45 psi)

- If minimum engine oil pressure is below these ranges, (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- (4) Remove oil pressure gauge and install the oil pressure sensor. Tighten the sensor to 16 N·m (144 in. lbs.) torque.

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL LEVEL

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

- To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable oil level is in the SAFE RANGE on the engine oil dipstick (Fig. 150).
- Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level of a cold engine is not accurate.
- (1) Position vehicle on level surface.

Fig. 150 Oil Level Indicator (Dipstick)

1 - ADD OIL MARK

2 - O-RING

3 - SAFE RANGE

- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Replace dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading.
- (6) Add oil only if level is below the SAFE RANGE area on the dipstick.
- (7) Replace dipstick

STANDARD PROCEDURE - ENGINE OIL SERVICE

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

NOTE: Change engine oil and filter at intervals specified in the owner's manual.

- (1) Operate the engine until the water temperature reaches 60°C (140°F). Shut the engine off.
- (2) Use a container that can hold at least 14 liters (15 quarts) to hold the used oil. Remove the oil drain plug and drain the used engine oil into the container.

OIL (Continued)

(3) Always check the condition of the used oil. This can give you an indication of engine problems that might exist.

- Thin, black oil indicates fuel dilution.
- Milky discoloration indicates coolant dilution.

(4) Clean the area around the oil filter head. Remove the filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(5) Install new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

(6) Clean the drain plug and the sealing surface of the pan. Check the condition of the threads and sealing surface on the oil pan and drain plug.

(7) Install the drain plug. Tighten the plug to 50 N·m (37 ft. lbs.) torque.

(8) Use only High-Quality Multi-Viscosity lubricating oil in the Cummins Turbo Diesel engine. Choose the correct oil for the operating conditions (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

(9) Fill the engine with the correct grade of new oil (Refer to LUBRICATION & MAINTENANCE/FLUID CAPACITIES - SPECIFICATIONS).

(10) Start the engine and operate it at idle for several minutes. Check for leaks at the filter and drain plug.

(11) Stop engine. Wait several minutes to allow the oil to drain back to the pan and check the level again.

USED ENGINE OIL DISPOSAL Care should be exercised when disposing of used engine oil after it has been drained from a vehicle's engine.

OIL COOLER & LINES

CLEANING AND INSPECTION

Clean the sealing surfaces.

Apply 483 kPa (70 psi) air pressure to the element to check for leaks. If the element leaks, replace the element.

OIL FILTER

REMOVAL

(1) Clean the area around the oil filter head. Remove the filter using a 90-95 mm filter wrench.

(2) Clean the gasket surface of the filter head. The filter canister O-Ring seal can stick on the filter head. Make sure it is removed.

INSTALLATION

(1) Fill the oil filter element with clean oil before installation. Use the same type oil that will be used in the engine.

(2) Apply a light film of lubricating oil to the sealing surface before installing the filter.

CAUTION: Mechanical over-tightening may distort the threads or damage the filter element seal.

(3) Install the filter until it contacts the sealing surface of the oil filter adapter. Tighten filter an additional ½ turn.

OIL PAN

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove transmission and transfer case (if equipped).

(4) Remove flywheel.

(5) Disconnect starter cables from starter motor.

(6) Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL) and transmission adapter plate assembly.

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

(7) Drain the engine oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

(8) Install the oil pan drain plug with a new sealing washer and tighten to 60 N·m (44 ft. lbs.) torque.

(9) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.

(10) Remove oil pan and suction tube (Fig. 151).

CLEANING

Remove all gasket material from the oil pan and cylinder block sealing surfaces. Extra effort may be required around T-joint areas. Clean oil pan and flush suction tube with a suitable solvent.

INSPECTION

Inspect the oil pan, suction tube, and tube braces for cracks and damage. Replace any defective component. Inspect the oil drain plug and drain hole threads. Inspect the oil pan sealing surface for straightness. Repair any minor imperfections with a ball-peen hammer. Do not attempt to repair an oil pan by welding.

OIL PAN (Continued)

**Fig. 151 Oil Pan, Suction Tube and Gasket**

- 1 - GASKET
- 2 - SUCTION TUBE
- 3 - OIL PAN

INSTALLATION

(1) Fill the T-joint between the pan rail/gear housing and pan rail/rear seal retainer with sealant. Use Mopar® Silicone Rubber Adhesive Sealant or equivalent.

(2) Apply a film of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the oil pan gasket. Apply sealant only to the side that faces the oil pan.

(3) Place suction tube in oil pan and guide them into place (Fig. 151). Using a new tube to oil pump gasket, install and tighten the suction tube bolts by hand. Starting with the oil pump inlet bolts, tighten the bolts to 24 N·m (18 ft. lbs.) torque. Tighten the remaining tube brace bolts to 24 N·m (18 ft. lbs.) torque.

(4) Starting in the center and working outward, tighten the oil pan bolts to 24 N·m (18 ft. lbs.) torque.

(5) Install the flywheel housing assembly with the starter motor attached and tighten bolts to 60 N·m (44 ft. lbs.) torque.

(6) Connect starter motor cables.

(7) Install transmission and transfer case (if equipped).

(8) Lower vehicle.

(9) Install battery negative cables.

(10) Fill the crankcase with new engine oil.

(11) Start engine and check for leaks. Stop engine, check oil level, and adjust, if necessary.

OIL PRESSURE RELIEF VALVE**REMOVAL**

(1) Disconnect the battery negative cables.

(2) Remove the threaded plug, spring and plunger (Fig. 152). Insert a finger or a seal pick to lift the plunger from the bore.

NOTE: If the plunger is stuck in the bore, it will be necessary to remove the filter head.

**Fig. 152 Oil Pressure Regulator**

- 1 - OIL FILTER
- 2 - PLUG
- 3 - GASKET
- 4 - SPRING
- 5 - VALVE

CLEANING

(1) Clean the regulator spring and plunger with a suitable solvent and blow dry with compressed air. If the plunger bore requires cleaning, it is necessary to remove the oil filter head to avoid getting debris into the engine.

INSPECTION

Inspect the plunger and plunger bore for cracks and excessive wear. Polished surfaces are acceptable. Verify that the plunger moves freely in the bore.

Check the spring for height and load limitations (Fig. 153). Replace the spring if out of limits shown in the figure.

INSTALLATION

(1) Install the plunger, spring, and plug as shown in (Fig. 152). Tighten the plug to 80 N·m (60 ft. lbs.) torque.

(2) Connect the battery negative cables.

(3) Start the engine and verify that it has oil pressure.

OIL PRESSURE RELIEF VALVE (Continued)

OIL PUMP

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Remove fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (4) Remove the fan support/hub assembly.
- (5) Remove crankshaft damper (Fig. 156) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (6) Remove the gear housing cover (Fig. 157) (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - REMOVAL).
- (7) Remove the four mounting bolts and pull the pump from the bore in the cylinder block (Fig. 158).

CLEANING

Clean all parts in solvent and dry with compressed air. Clean the old sealer residue from the back of the gear housing cover and front of the gear housing.

INSPECTION

Disassemble and inspect the oil pump as follows:

- (1) Visually inspect the lube pump gears for chips, cracks or excessive wear.

OIL PUMP (Continued)

Fig. 157 Gear Housing and Cover

- 1 - GEAR HOUSING
2 - GEAR HOUSING COVER

- (2) Remove the back plate (Fig. 159).
- (3) Mark TOP on the gerotor planetary using a felt tip pen (Fig. 159).
- (4) Remove the gerotor planetary (Fig. 159). Inspect for excessive wear or damage. Inspect the pump housing and gerotor drive for damaged and excessive wear.
- (5) Install the gerotor planetary in the original position. The chamfer must be on the O.D. and down.
- (6) Measure the tip clearance (Fig. 160). Maximum clearance is 0.1778 mm (0.007 inch). If the oil pump is out of limits, replace the pump.
- (7) Measure the clearance of the gerotor drive/gerotor planetary to port plate (Fig. 161). Maximum clearance is 0.127 mm (0.005 inch). If the oil pump is out of limits, replace the pump.

(8) Measure the clearance of the gerotor planetary to the body bore (Fig. 162). Maximum clearance is 0.381 mm (0.015 inch). If the oil pump is out of limits, replace the pump.

(9) Measure the gears backlash (Fig. 163). The limits of a used pump is 0.075- 0.85 mm (0.0296-0.0335 inch). If the backlash is out of limits, replace the oil pump.

(10) Install the back plate.

J9109-156

Fig. 159 Gerotor Planetary and Gerotor

- 1 - OIL PUMP BACK PLATE
2 - GEROTOR
3 - GEROTOR PLANETARY

INSTALLATION

(1) Lubricate the pump with clean engine oil. Filling the pump with clean engine oil during installation will help to prime the pump at engine start up.

(2) Verify the idler gear pin is installed in the locating bore in the cylinder block.

2 - GEROTOR

J9109-23

Fig. 162 Measuring Gerotor Planetary to Body Bore Clearance1 - BODY BORE
2 - GEROTOR PLANETARY

(3) Install the pump (Fig. 158). Tighten the oil pump mounting bolts in two steps, in the sequence shown in (Fig. 164).

- Step 1—Tighten to 5 N·m (44 in. lbs.) torque.
- Step 2—Tighten to 24 N·m (18 ft. lbs.) torque.

(4) The back plate on the pump seats against the bottom of the bore in the cylinder block. When the pump is correctly installed, the flange on the pump will not touch the cylinder block.

J9109-24

Fig. 163 Measure Gear Backlash1 - OIL PUMP DRIVE GEAR
2 - IDLER GEAR
3 - BACKLASH
4 - BACKLASH

J9109-20

Fig. 164 Oil Pump Mounting Bolt Torque Sequence

(5) Measure the idler gear to pump drive gear backlash and the idler gear to crankshaft gear backlash (Fig. 165). The backlash should be 0.75- 0.85 mm (0.0296-0.0335 inch). If the backlash is out of limits, replace the oil pump.

(6) If the adjoining gear moves when you measure the backlash, the reading will be incorrect.

J9109-25

Fig. 165 Idler Gear to Pump Drive Gear and Crankshaft Gear Backlash

OIL PUMP (Continued)

(7) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

(8) Install the gear housing cover (Refer to 9 - ENGINE/VALVE TIMING/GEAR HOUSING COVER - INSTALLATION).

(9) Install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(10) Install the fan support/hub assembly and torque bolts to 24 N·m (18 ft. lbs.).

(11) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Install the cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(13) Connect battery negative cables.

(14) Start engine and check for oil leaks.

Fig. 166 Charge Air Cooler Air Tube

- 6 - AIR TUBE (INT. MAN.-TO-INTERCOOLER)
- 7 - RUBBER HOSE
- 8 - AIR INTAKE HOUSING
- 9 - CABLE BRACKET HOUSING

INTAKE MANIFOLD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the charge air cooler outlet tube from the air inlet housing (Fig. 166).

(3) Remove the engine oil dipstick tube mounting bolt (Fig. 166). Position dipstick tube to the side.

(4) Disconnect the air grid heater power cables at the cable mounting studs (Fig. 167).

(5) Remove the four (4) air inlet housing mounting bolts (Fig. 167) and remove the housing from top of the heater elements.

(6) Remove the intake air grid heater from the manifold (Fig. 168).

(7) Remove the high pressure fuel lines. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - REMOVAL).

(8) Remove the remaining intake manifold cover-to-cylinder head bolts.

(9) Remove the intake manifold cover and gasket. Keep the gasket material and any other material out of the air intake.

(10) Clean the intake manifold cover and cylinder head sealing surface.

CLEANING

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

INSTALLATION

(1) Using a new gasket, install the intake manifold cover.

(2) Install the cover-to-cylinder head bolts that do not hold down the high pressure fuel line support brackets. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Install the high pressure fuel lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - INSTALLATION).

(4) Install the high pressure fuel line support bracket-to-intake manifold cover bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Using two (2) new gaskets, install the intake air grid heater and air inlet housing (Fig. 167). Position the ground cable and install and tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(6) Install and tighten the air intake heater power supply nuts to 14 N·m (120 in. lbs.) torque.

(7) Install the engine oil dipstick tube and mounting bolt (Fig. 166).

INTAKE MANIFOLD (Continued)

**Fig. 167 Air Inlet Housing**

**Fig. 168 Intake Air Grid Heater**

- 1 - AIR HEATER ELEMENTS
- 2 - LOWER GASKET
- 3 - BLOCK
- 4 - UPPER GASKET

(8) Position the charge air cooler outlet tube onto the air inlet housing (Fig. 166). Tighten the clamps to 8 N·m (72 in. lbs.) torque.

(9) Perform the fuel system air bleed procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(10) Connect the battery negative cables.

EXHAUST MANIFOLD

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Disconnect the exhaust pipe from the turbo-charger elbow (Fig. 169) .
- (4) Lower vehicle.
- (5) Disconnect the turbocharger air inlet hose (Fig. 170) .
- (6) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 171) .

J9411-18

Fig. 169 Exhaust Pipe

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER EXHAUST PIPE

(7) Disconnect the charge air cooler inlet pipe from the turbocharger (Fig. 171) .

(8) Remove the turbocharger and gasket from the exhaust manifold.

(9) Remove the cab heater return pipe nut from the exhaust manifold stud. Position the tube out of the way.

(10) Remove the exhaust manifold-to-cylinder head bolts and spacers (Fig. 172) .

(11) Remove the exhaust manifold and gaskets (Fig. 172) .

CLEANING

Clean the cylinder head and exhaust manifold sealing surfaces with a suitable scraper. Use a Scotch-Brite™ pad or equivalent.

EXHAUST MANIFOLD (Continued)

80b5cc58

Fig. 172 Exhaust Manifold and Gaskets**INSPECTION**

Inspect the exhaust manifold for cracks. Measure the exhaust manifold for flatness. Place a ruler over all of the exhaust ports and insert a feeler gauge between the port flange and the ruler.

INSTALLATION

(1) Using new gaskets, install the exhaust manifold and gaskets. Install the bolts and spacers and tighten the bolts in the sequence shown in (Fig. 172) to 43 N·m (32 ft. lbs.) torque.

(2) Install the cab heater return hose to the manifold bolt stud. Tighten the nut to 24 N·m (18 ft. lbs.) torque.

(3) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(4) Install the oil drain tube and oil supply line to the turbocharger. Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

(5) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Rotate the turbocharger impeller by hand to distribute the oil thoroughly.

(6) Install and tighten the oil supply line fitting nut to 20 N·m (133 in. lbs.) torque.

J9511-7

Fig. 171 Oil Supply Line and Charge Air Cooler Inlet Duct

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER
- 3 - AIR INLET TUBE
- 4 - INTERCOOLER INLET DUCT
- 5 - WASTE GATE ACTUATOR

EXHAUST MANIFOLD (Continued)

(7) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(8) Position the air inlet hose to the turbocharger (Fig. 170). Tighten the clamp to 8 N·m (72 in. lbs.) torque.

(9) Raise vehicle on hoist.

(10) Connect the exhaust pipe to the turbocharger (Fig. 169) and tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(11) Lower the vehicle.

(12) Connect the battery negative cables.

(13) Start the engine to check for leaks.

VALVE TIMING

STANDARD PROCEDURE - TIMING
VERIFICATION

(1) Remove the cylinder head cover.

(2) Remove fuel injector from cylinder number 1.

(3) Remove the crankcase breather from the gear housing cover.

(4) Using Special Tool 7471B rotate the engine until the timing mark on the fuel pump gear is aligned with the TDC mark on the gear housing cover.

(5) Using a 8 in.x 1/4 in. dowel rod inserted into cylinder number 1, rock the crankshaft back and forth to verify piston number 1 is at TDC.

(6) With piston number 1 at TDC the timing mark on the fuel pump gear should be aligned with the TDC mark on the gear housing cover. If marks do not line up, remove the gear housing cover.

(7) With cylinder number still at TDC, inspect the keyway on the crankshaft gear for proper alignment (12 o'clock position).

(8) If the keyway is not at 12 o'clock position replace the crankshaft gear assembly.

(9) If the keyway is at 12 o'clock position, verify timing mark alignment between the camshaft gear, crankshaft gear and the fuel pump gear, if not aligned inspect keyway on camshaft gear.

(10) Inspect keyway on camshaft gear for proper alignment with the key in the camshaft, if alignment is off replace the camshaft/gear assembly.

(11) If timing marks alignment is off and no damage is found at either the crankshaft or camshaft gear keyways, realign timing marks as necessary.

GEAR HOUSING

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Lower vehicle.

(5) Remove radiator upper hose.

(6) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(8) Remove the fan shroud-to-radiator mounting bolts.

(9) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(10) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(11) Remove the cooling fan support/hub from the front of the engine (Fig. 173).

(12) Raise the vehicle on hoist.

(13) Remove the crankshaft damper (Fig. 174) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(14) Lower the vehicle.

(15) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing (Fig. 175), taking care not to mar the gasket surfaces.

Fig. 173 Fan Support/Hub Assembly - Removal/Installation

- 1 - FAN SUPPORT/HUB
2 - FAN PULLEY

(16) Remove the fuel injection pump (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - REMOVAL).

(17) Disconnect the camshaft position sensor connector.

J9209-157

Fig. 175 Gear Housing and Cover

- 1 - GEAR HOUSING
2 - GEAR HOUSING COVER

(18) Remove the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

(19) Remove the six front oil pan fasteners.

(20) Remove the gear housing fasteners.

NOTE: Use care when removing the gear housing, to avoid damage to the oil pan gasket, as the gasket will be reused if it is not damaged.

(21) Slide a feeler gauge between the gear housing and oil pan gasket, to break the gasket seal.

(22) Remove the gear housing and gasket (Fig. 176).

(23) Clean the gasket material from the cylinder block and gear housing.

INSTALLATION

(1) Inspect the oil pan gasket, if the gasket can be reused, coat both sides with a film of Mopar® Silicone Rubber Adhesive Sealant.

(2) If the gasket is torn, it can be repaired. Cut the old gasket off even with the front of the cylinder block.

(3) Using the old gasket as a pattern, cut the front section of a new gasket to the same size.

(4) Clean the sealing surfaces and coat the new gasket on both sides with a film of Mopar® Silicone Rubber Adhesive Sealant.

(5) Mark and trim 1.59mm (1/16 in.) off of the bottom of the new gear housing gasket. Only trim the part of the gasket that meets the oil pan.

NOTE: When properly trimmed, the gear housing gasket should be even with the oil pan gasket when installed.

(6) Install the new gear housing gasket on the alignment dowels

NOTE: (M8×1.25×50) guide pins can be used to assist in aligning the gasket and gear housing. Be sure to remove the guide pins after alignment.

(7) Carefully install the gear housing, making sure both gaskets stay in place (Fig. 176).

GEAR HOUSING (Continued)

(8) Install and tighten the gear housing bolts to 24 N·m (18 ft. lbs.) torque.

(9) Install and tighten the oil pan bolts to 24 N·m (18 ft. lbs.) torque.

(10) Install the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - INSTALLATION). Align the crankshaft, camshaft, and injection pump gear marks as shown in (Fig. 177).

80b4fa34

Fig. 177 Camshaft/Crankshaft Gear Alignment

(11) If a new housing is installed, the camshaft position sensor must be transferred to the new housing.

(12) Connect the camshaft position sensor connector.

(13) Install the injection pump (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL INJECTION PUMP - INSTALLATION).

(14) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the crankshaft front oil seal.

(15) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(16) Using the seal pilot to align the cover (Fig. 178), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(17) Remove the seal pilot.

(18) Raise the vehicle.

(19) Install the crankshaft damper (Fig. 174) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(20) Lower vehicle.

80b46d27

Fig. 178 Installing Cover with Seal Pilot

1 - SEAL PILOT

(21) Install the fan support/hub assembly (Fig. 173) and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(22) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(23) Install the cooling fan and shroud together (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(24) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(25) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(26) Install the radiator upper hose and clamps.

(27) Add engine oil.

(28) Add coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(29) Connect the battery cables.

(30) Start engine and inspect for leaks.

GEAR HOUSING COVER

REMOVAL

(1) Disconnect both battery negative cables.

(2) Raise vehicle on hoist.

(3) Partially drain engine coolant into container suitable for re-use (Refer to 7 - COOLING - STANDARD PROCEDURE).

(4) Lower vehicle.

(5) Remove radiator upper hose.

(6) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

GEAR HOUSING COVER (Continued)

(8) Remove viscous fan/drive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(9) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Remove the cooling fan support/hub from the front of the engine (Fig. 179).

(11) Raise the vehicle on hoist.

(12) Remove the crankshaft damper (Fig. 180) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(13) Lower the vehicle.

(14) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.

J9209-157

Fig. 181 Gear Housing and Cover

- 1 - GEAR HOUSING
2 - GEAR HOUSING COVER

INSTALLATION

(1) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the seal.

(2) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(3) Using the seal pilot to align the cover (Fig. 182), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

80b46d27

Fig. 182 Installing Cover with Seal Pilot

- 1 - SEAL PILOT

- (4) Remove the seal pilot.
(5) Raise the vehicle.
(6) Install the crankshaft damper (Fig. 180) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(7) Lower vehicle.

GEAR HOUSING COVER (Continued)

(8) Install the fan support/hub assy. (Fig. 179) and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(9) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(10) Install the cooling fan and shroud together (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(11) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(12) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(13) Install the radiator upper hose and clamps.

(14) Add coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(15) Connect the battery cables.

(16) Start engine and inspect for leaks.

EXHAUST SYSTEM

DESCRIPTION

DESCRIPTION - 5.9/8.0L

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The federal gasoline engine exhaust system (Fig. 1) consists of engine exhaust manifolds, exhaust pipes, catalytic converter(s), extension pipe (if needed), exhaust heat shields, muffler and exhaust tailpipe.

The California emission vehicles exhaust system also contains the above components as well as mini catalytic converters added to the exhaust pipe (Fig. 2).

The exhaust system must be properly aligned to prevent stress, leakage and body contact. Minimum clearance between any exhaust component and the body or frame is 25.4 mm (1.0 in.). If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

DESCRIPTION—5.9L DIESEL

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, exhaust pipe, resonator, extension pipe (if needed), muffler and exhaust tailpipe.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. The exhaust components should be kept a minimum of 25.4 mm (1.0 in.) away from the body and frame. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

EXHAUST SYSTEM (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - GAS ENGINE

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints. 2. Rusted or blown out muffler. 3. Broken or rusted out exhaust pipe. 4. Exhaust pipe leaking at manifold flange. 5. Exhaust manifold cracked or broken. 6. Leak between exhaust manifold and cylinder head. 7. Catalytic converter rusted or blown out. 8. Restriction in exhaust system.	1. Tighten clamps/bolts at leaking joints. 2. Replace muffler. Inspect exhaust system. 3. Replace exhaust pipe. 4. Tighten/replace flange attaching nuts/bolts. 5. Replace exhaust manifold. 6. Tighten exhaust manifold to cylinder head bolts. 7. Replace catalytic converter assy. 8. Remove restriction, if possible. Replace restricted part if necessary.
caution: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.		

DIAGNOSIS AND TESTING - DIESEL ENGINE

CATALYTIC CONVERTER -
3.9L/5.2L/5.9L

DESCRIPTION

The stainless steel catalytic converter is located under the vehicle, integral to the exhaust pipe(s).

OPERATION

The catalytic converter captures and burns any unburned fuel mixture exiting the combustion chambers during the exhaust stroke of the engine. This process aids in reducing emissions output.

REMOVAL

- (1) Raise and support vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove clamps and nuts (Fig. 3) (Fig. 4).

Fig. 3 Catalytic Converter and Exhaust Pipe 3.9L, 5.2L and 5.9L Light Duty (Federal)

- 1 - BOLT
- 2 - EXHAUST PIPE W/CONVERTER
- 3 - NUT
- 4 - RETAINER

- (4) Remove the catalytic converter.

CATALYTIC CONVERTER - 3.9L/5.2L/5.9L (Continued)

Fig. 4 Catalytic Converter and Exhaust Pipe 3.9L, 5.2L and 5.9L Light Duty (California)

- 1 - BOLT
- 2 - RETAINER
- 3 - EXHAUST MANIFOLD
- 4 - NUT
- 5 - MINI CATALYTIC CONVERTER
- 6 - CATALYTIC CONVERTER WITH PIPES

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

INSTALLATION

- (1) Assemble converter and clamps loosely in place.
- (2) Install the exhaust pipe onto exhaust manifolds, tighten 31 N·m (23 ft. lbs.).
- (3) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

CATALYTIC CONVERTER - 5.9L HD/8.0L

DESCRIPTION

The stainless steel catalytic converter is located under the vehicle, attached to the exhaust pipe(s).

OPERATION

The catalytic converter captures and burns any unburned fuel mixture exiting the combustion chambers during the exhaust stroke of the engine. This process aids in reducing emissions output.

REMOVAL

- (1) Raise and support vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove clamps and nuts (Fig. 5) (Fig. 6).

- 3 - CLAMP
- 4 - HANGER ASSY. DUAL CLAMP
- 5 - MUFFLER
- 6 - EXTENSION PIPE
- 7 - CATALYTIC CONVERTER
- 8 - DOWN PIPE LEFT

- (4) Remove the catalytic converter.

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

CATALYTIC CONVERTER - 5.9L HD/8.0L (Continued)

**Fig. 6 Catalytic Converter 8.0L**

- 1 - CLAMPS
- 2 - CATALYTIC CONVERTERS
- 3 - MUFFLER
- 4 - HANGER ASSY. DUAL CLAMP
- 5 - EXTENSION PIPES
- 6 - DOWN PIPE

INSTALLATION

- (1) Assemble converter and clamps loosely in place.
- (2) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (3) Lower the vehicle.
- (4) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

EXHAUST PIPE - 3.9L/5.2L/5.9L**REMOVAL**

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove exhaust pipe to manifold bolts, retainers and nuts (Fig. 7).
- (4) Remove the clamp nuts (Fig. 7).
- (5) Remove the exhaust pipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

**Fig. 7 Exhaust Pipe 3.9L, 5.2L, 5.9L Light Duty**

- 1 - EXHAUST PIPE WITH CATALYTIC CONVERTER
- 2 - CLAMP
- 3 - MUFFLER

INSTALLATION

- (1) Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.
- (2) Position the exhaust pipe to manifold. Install the bolts, retainers and nuts. Tighten the nuts to 31 N·m (23 ft. lbs.) torque.
- (3) Tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST PIPE - 5.9L HD/8.0L**REMOVAL**

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove exhaust pipe to manifold bolts, retainers and nuts (Fig. 8).
- (4) Remove the clamp nuts (Fig. 9) (Fig. 10).
- (5) Disconnect the exhaust pipe from the support hangers on the 5.9L (Heavy Duty) and the 8.0L engines (Fig. 8).
- (6) Remove the exhaust pipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

(1) Connect the exhaust pipe support hangers on the (Fig. 8).

(2) Position the exhaust pipe for proper clearance with the frame and underbody parts. A minimum clearance of 25.4 mm (1.0 in.) is required.

(3) Position the exhaust pipe to manifold. Install the bolts, retainers and nuts. Tighten the nuts to 31 N·m (23 ft. lbs.) torque.

(4) Tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST PIPE - 5.9L DIESEL

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise and support the vehicle on a hoist.
- (3) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (4) Remove the exhaust pipe-to-extension pipe clamp. Separate the exhaust pipe and extension pipe.
- (5) Remove the exhaust pipe-to-turbocharger elbow bolts (Fig. 11).
- (6) Remove the exhaust pipe from the transmission support (Fig. 11).

J9411-18

Fig. 11 Exhaust Pipe Removal/Installation

- 1 - EXHAUST PIPE
- 2 - TURBOCHARGER EXHAUST PIPE

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Install the exhaust pipe into the transmission support and onto the turbocharger flange (Fig. 11).
- (2) Install the exhaust pipe-to-turbocharger elbow bolts and tighten to 31 N·m (23 ft. lbs.) torque.
- (3) Install the extension pipe and clamp to the exhaust pipe using a new clamp and tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Connect the battery negative cables.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required. Adjust the alignment, if needed.

HEAT SHIELDS

DESCRIPTION

There are two types of heat shields used. One is stamped steel the other is molded foil sheets. The shields attach to the vehicle around the exhaust system to prevent heat from the exhaust system from entering the passenger area and other areas where the heat can cause damage to other components.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the nuts or bolts holding the exhaust heat shield to the floor pan, crossmember or bracket.
- (3) Slide the shield out around the exhaust system.

INSTALLATION

- (1) Position the exhaust heat shield to the floor pan, crossmember or bracket and install the nuts or bolts.
- (2) Tighten the nuts and bolts 11 N·m (100 in. lbs.).
- (3) Lower the vehicle.

MUFFLER - 3.9L/5.2L/5.9L/8.0L

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Disconnect the muffler hanger (Fig. 12) (Fig. 13).
- (4) Remove clamps and nuts (Fig. 12) (Fig. 13).
- (5) Remove the muffler.

INSTALLATION

- (1) Assemble muffler and clamps loosely to permit proper alignment of all parts.
- (2) Connect the muffler hanger.
- (3) Tighten the clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

MUFFLER - 5.9L DIESEL

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise and support the vehicle.
- (3) Remove the muffler to tail pipe and extension pipe clamps (Fig. 14).
- (4) Disconnect the muffler from the hanger isolators (Fig. 14).
- (5) Disconnect the muffler from the tailpipe.
- (6) Disconnect the muffler from the extension pipe and remove from the vehicle..

INSTALLATION

- (1) Install the muffler hanger rods into the isolators (Fig. 14).
- (2) Install the muffler into the extension pipe.
- (3) Install the muffler into the tail pipe.
- (4) Install the exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 48 N·m (35 ft. lbs.) torque.
- (5) Lower the vehicle.
- (6) Connect the battery negative cables.
- (7) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between exhaust system components and body/frame parts. Adjust the alignment, if needed.

TAILPIPE - 3.9L/5.2L/5.9L

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Disconnect the exhaust tailpipe support hanger.
- (4) Remove clamps and nuts.
- (5) Remove the exhaust tailpipe.

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Loosely assemble exhaust tailpipe to permit proper alignment of all parts.
- (2) Connect the support hangers.
- (3) Position the exhaust tailpipe for proper clearance with the underbody parts.
- (4) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.
- (5) Lower the vehicle.

TAILPIPE - 3.9L/5.2L/5.9L (Continued)

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Adjust the alignment, if needed.

TAILPIPE - 5.9L HD/8.0L

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the clamp nuts with Mopar® Rust Penetrant. Allow 5 minutes for penetration.
- (3) Disconnect the exhaust tailpipe support hangers (Fig. 15).
- (4) Remove clamps and nuts.
- (5) Remove the exhaust tailpipe.

Fig. 15 TAILPIPE 8.0L AND 5.9L HEAVY DUTY

- 4 - MUFFLER
- 5 - INSULATOR

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

INSTALLATION

- (1) Loosely assemble exhaust tailpipe to permit proper alignment of all parts (Fig. 15).
- (2) Connect the support hangers (Fig. 15).
- (3) Position the exhaust tailpipe for proper clearance with the underbody parts.

(4) Tighten all clamp nuts to 48 N·m (35 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. A minimum of 25.4 mm (1.0 in.) is required between the exhaust system components and body/frame parts. Adjust the alignment, if needed.

TAILPIPE - 5.9L DIESEL

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise and support the vehicle.
- (3) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (4) Disconnect the exhaust tailpipe support hanger isolators (Fig. 16).
- (5) Remove the muffler-to-tailpipe clamps (Fig. 16).
- (6) Remove the tailpipe from the vehicle.

Fig. 16 Tailpipe Removal/Installation

- 1 - HANGER BRACKETS

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

TAILPIPE - 5.9L DIESEL (Continued)

INSTALLATION

- (1) Install the tailpipe into the muffler.
- (2) Install the tailpipe hanger rods into the isolators (Fig. 16).
- (3) Install the exhaust clamp, align the exhaust system, and tighten the clamp 48 N·m (35 ft. lbs.) torque.
- (4) Lower the vehicle.
- (5) Connect the battery negative cables.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

RESONATOR

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Remove the exhaust clamps from the resonator to extension pipes (Fig. 17).
- (4) Separate the resonator from the front and rear extension pipes (Fig. 17) and remove the resonator from the vehicle.

80b5cc61

Fig. 17 Resonator Removal/Installation

- 1 - EXTENSION PIPE
- 2 - RESONATOR
- 3 - EXTENSION PIPE
- 4 - CLAMP

INSTALLATION

- (1) Assemble the resonator to the front and rear extension pipes (Fig. 17).
- (2) Install new exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 48 N·m (35 ft. lbs.) torque.
- (3) Lower the vehicle.

- (4) Connect the battery negative cables.
- (5) Start the engine and inspect for exhaust leaks.

TURBOCHARGER SYSTEM

DIAGNOSIS AND TESTING - TURBOCHARGER BOOST PRESSURE

NOTE: This diagnostic procedure is to be used with the DRBIII® while test driving the vehicle under normal load and driving conditions.

Low turbocharger boost pressure can cause poor engine performance and driveability concerns. The following procedure will test the turbocharger boost pressure.

- (1) Loosen clamps holding air inlet duct rubber sleeve to the intake manifold and air inlet duct. Remove rubber sleeve (Fig. 18).

80bc4a2e

Fig. 18 INTAKE MANIFOLD TO AIR INLET DUCT RUBBER SLEEVE

- 1 - INTAKE MANIFOLD AIR INLET
- 2 - CLAMPS
- 3 - AIR INLET DUCT
- 4 - AIR INLET DUCT RUBBER SLEEVE

- (2) Position Special Tool 8462 onto air inlet duct and intake manifold. Using the existing clamps tighten to 8 N·m (72 in. lbs.).

- (3) Install the 3447.5 kpa 500 psi (gray) Pressure Transducer (part of OT-CH8520 Transducer Kit) into Special Tool 8462.

TURBOCHARGER SYSTEM (Continued)

(4) Connect the DRBIII® to the pressure transducer following the instructions supplied with the DRB III®.

(5) Enter DRBIII® into pressure reading mode and test drive vehicle.

(6) The turbocharger boost pressure must be between 110 - 138 kpa (16 - 20 psi.). If pressure readings are lower than 110 kpa (16 psi.) inspect for the following:

- Restricted air inlet system
- Leak in the charge air cooler system (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/CHARGE AIR COOLER AND PLUMBING - DIAGNOSIS AND TESTING)
- Turbocharger wastegate broken or misadjusted
- Turbocharger damaged (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/TURBOCHARGER - INSPECTION)

TURBOCHARGER

DESCRIPTION

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (4) major component systems (Fig. 19) (Fig. 20) :

- Turbine section
- Compressor section
- Bearing housing
- Wastegate

OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:

- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

The turbocharger also uses a wastegate (Fig. 21) , which regulates intake manifold air pressure and prevents over boosting at high engine speeds. When the wastegate valve is closed, all of the exhaust gases flow through the turbine wheel. As the intake manifold pressure increases, the wastegate actuator opens

80b5cc50

Fig. 19 Turbocharger Operation

the valve, diverting some of the exhaust gases away from the turbine wheel. This limits turbine shaft speed and air output from the impeller.

TURBOCHARGER (Continued)

**Fig. 21 Wastegate Operation**

- 7 - WASTEGATE
- 8 - EXHAUST
- 9 - TURBINE
- 10 - SIGNAL LINE

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line that is tapped into the oil filter head. The oil travels into the bearing housing, where it lubricates the shaft and bearings (Fig. 22). A return pipe at the bottom of the bearing housing, routes the engine oil back to the crankcase.

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate "cool-down" periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil

80b5cc57

Fig. 22 Turbocharger Oil Supply and Drain

- 1 - BEARINGS
- 2 - OIL SUPPLY (FROM FILTER HEAD)
- 3 - OIL RETURN (TO SUMP)

to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Raise vehicle on hoist.
- (3) Disconnect the exhaust pipe from the turbocharger elbow (Fig. 23).
- (4) Lower vehicle.
- (5) Disconnect the turbocharger air inlet hose (Fig. 24).
- (6) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 25).
- (7) Disconnect the charge air cooler inlet pipe from the turbocharger (Fig. 25).
- (8) Remove the turbocharger and gasket from the exhaust manifold.
- (9) If the turbocharger is not to be installed immediately, cover the opening to prevent material from entering into the manifold.
- (10) If replacing the turbocharger, transfer the discharge elbow and clamp to the new assembly.
- (11) Clean and inspect the sealing surface.

TURBOCHARGER (Continued)

**Fig. 23 Exhaust Pipe Removal/Installation**

4 - HOSE CLAMP
5 - HINGE TABS
6 - FILTER MINDER
7 - CLIPS (4)
8 - TUBE ALIGNMENT NOTCHES

CAUTION: The turbocharger is only serviced as an assembly. Do not attempt to repair the turbocharger as turbocharger and/or engine damage can result.

CLEANING

Clean the turbocharger and exhaust manifold mounting surfaces with a suitable scraper.

**Fig. 25 Oil Supply Line and Charge Air Cooler Inlet Duct**

- 1 - EXHAUST PIPE
2 - TURBOCHARGER
3 - AIR INLET TUBE
4 - COOLER INLET DUCT

INSPECTION

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

(1) Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:

- Cracks in the turbine and compressor housing that go completely through.
- Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
- Cracks in the mounting flange that intersect bolt through-holes.
- Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.

(2) Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips. Note: Some impellers may have a factory placed paint mark which, after normal operation, appears to be a crack. Remove this mark with a suitable solvent to verify that it is not a crack.

(3) Visually inspect the turbocharger compressor housing for an impeller rubbing condition (Fig. 26). Replace the turbocharger if the condition exists.

(4) Measure the turbocharger axial end play:

- (a) Install a dial indicator as shown in (Fig. 27). Zero the indicator at one end of travel.

TURBOCHARGER (Continued)

(b) Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.038 mm (0.0015 in.) MIN. and 0.089 mm (0.0035 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

(5) Measure the turbocharger bearing radial clearance:

(a) Insert a narrow blade or wire style feeler gauge between the compressor wheel and the housing (Fig. 28).

(b) Gently push the compressor wheel toward the housing and record the clearance.

(c) With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.

(d) Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.

(e) Allowable radial bearing clearance is 0.326 mm (0.0128 in.) MIN. and 0.496 mm (0.0195 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assy.

1 - FEELER GAUGE

INSTALLATION

(1) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(2) Install the oil drain tube and oil supply line to the turbocharger (Fig. 25). Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

(3) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Carefully rotate the turbocharger impeller by hand to distribute the oil thoroughly.

(4) Install and tighten the oil supply line fitting nut to 20 N·m (133 in. lbs.) torque.

(5) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 11 N·m (95 in. lbs.) torque.

(6) Position the air inlet hose to the turbocharger (Fig. 24). Tighten the clamp to 11 N·m (95 in. lbs.) torque.

(7) Raise vehicle on hoist.

(8) Connect the exhaust pipe to the turbocharger (Fig. 23) and tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(9) Lower the vehicle.

(10) Connect the battery negative cables.

(11) Start the engine to check for leaks.

CHARGE AIR COOLER AND PLUMBING

DESCRIPTION

The charge air system (Fig. 29) consists of the charge air cooler piping, charge air cooler and intake air grid heater.

The charge air cooler is a heat exchanger that uses air flow from vehicle motion to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases engine efficiency and power.

Fig. 29 Intake Air Circulation

- 1 - CHARGE AIR COOLER
- 2 - AIRFILTER
- 3 - TURBOCHARGER

OPERATION

Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in front of the radiator. From the charge air cooler the air flows back into the intake manifold.

DIAGNOSIS AND TESTING - CHARGE AIR COOLER SYSTEM - LEAKS

Low turbocharger boost pressure and low engine performance can be caused by leaks in the charge air cooler or its plumbing. The following procedure outlines how to check for leaks in the charge air cooler system.

(1) Loosen clamp and remove turbocharger to air inlet duct rubber sleeve from turbocharger (Fig. 30).

(2) Insert Special Tool 8442 Adapter into the rubber sleeve. Tighten existing clamp to 8 N·m (72 in.lbs.).

CAUTION: Do not apply more than 138 kpa (20 psi) air pressure to the charge air cooler system, severe damage to the charge air cooler system may occur.

(3) Connect regulated air supply to air fitting on Special Tool 8442 Adapter. Set air pressure to a Maximum of 138 kpa (20 psi).

(4) Using soapy water check the air inlet ducts, rubber sleeves, charge air cooler and intake manifold for leaks.

Fig. 30 AIR INLET DUCT RUBBER SLEEVE

- 1 - CLAMP
- 2 - TURBOCHARGER
- 3 - AIR DUCT RUBBER SLEEVE
- 4 - AIR INLET DUCT

REMOVAL

WARNING: IF THE ENGINE WAS JUST TURNED OFF, THE AIR INTAKE SYSTEM TUBES MAY BE HOT.

- (1) Disconnect the battery negative cables.
- (2) Remove the front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front BUMPER - REMOVAL).
- (3) Remove the front support bracket.

CHARGE AIR COOLER AND PLUMBING (Continued)

(4) Discharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) and remove the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL) (Fig. 31) (if A/C equipped).

(5) Remove the transmission auxiliary cooler (Fig. 31) (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).

Fig. 31 Condenser and Transmission Auxiliary Cooler

- 1 - A/C CONDENSOR
- 2 - TRANSMISSION COOLER
- 3 - INTERCOOLER

(6) Remove the boost tubes from the charge air cooler (Fig. 32).

(7) Remove the charge air cooler bolts. Pivot the charge air cooler forward and up to remove.

CLEANING

CAUTION: Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

NOTE: If internal debris cannot be removed from the cooler, the charge air cooler **MUST** be replaced.

(1) If the engine experiences a turbocharger failure or any other situation where oil or debris get into the charge air cooler, the charge air cooler must be cleaned internally.

(2) Position the charge air cooler so the inlet and outlet tubes are vertical.

(3) Flush the cooler internally with solvent in the direction opposite of normal air flow.

Fig. 32 Air Intake System Tubes

- 1 - CLAMP
- 2 - INTERCOOLER INLET DUCT
- 3 - CLAMP
- 4 - VALVE COVER
- 5 - AIR INLET HOUSING
- 6 - CLAMP
- 7 - INTERCOOLER OUTLET DUCT
- 8 - CLAMP
- 9 - INTERCOOLER

(4) Shake the cooler and lightly tap on the end tanks with a rubber mallet to dislodge trapped debris.

(5) Continue flushing until all debris or oil are removed.

(6) Rinse the cooler with hot soapy water to remove any remaining solvent.

(7) Rinse thoroughly with clean water and blow dry with compressed air.

INSPECTION

Visually inspect the charge air cooler for cracks, holes, or damage. Inspect the tubes, fins, and welds for tears, breaks, or other damage. Replace the charge air cooler if damage is found.

Pressure test the charge air cooler, using Charge Air Cooler Tester Kit #3824556. This kit is available through Cummins® Service Products. Instructions are provided with the kit.

CHARGE AIR COOLER AND PLUMBING (Continued)

INSTALLATION

(1) Position the charge air cooler. Install the bolts and tighten to 2 N·m (17 in. lbs.) torque.

(2) Install the air intake system tubes to the charge air cooler. With the clamps in position, tighten the clamps to 11 N·m (95 in. lbs.) torque.

(3) Install the transmission auxiliary cooler (if equipped) (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

(4) Install the A/C condenser (if A/C equipped) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

Recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(5) Install the front support bracket. Install and tighten the bolts.

(6) Install the front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT BUMPER - INSTALLATION).

(7) Connect the battery negative cables.

(8) Start engine and check for boost system leaks.

BUMPERS

DESCRIPTION

Bumpers are used at the front and rear of the vehicle. Bumpers may be chrome or painted.

Bumpers are designed to protect the exterior sheet-metal in low impact situations. The bumpers are attached to the frame and provide mounting points for some optional accessories such as fog lights and tow hooks.

FRONT AIR DAM

REMOVAL

- (1) Remove Pin-type fasteners attaching air dam to bottom of front bumper (Fig. 1).
- (2) Remove screws attaching air dam to bottom of front bumper.
- (3) Separate air dam from bumper.

Fig. 1 Front Bumper Air Dam

- 1 - BUMPER
- 2 - SCREW
- 3 - LOWER AIR DAM
- 4 - PIN TYPE FASTENER
- 5 - LOWER FASCIA

INSTALLATION

- (1) Position air dam on bumper.
- (2) Install screws attaching air dam to bottom of front bumper.
- (3) Install Pin-type fasteners attaching air dam to bottom of front bumper.

FRONT FASCIA

REMOVAL

- (1) Open hood.
- (2) Remove fasteners at fender side openings.
- (3) Separate fascia from bumper.

INSTALLATION

- (1) Position fascia on bumper.
- (2) Install front fascia. See fascia adjustment procedure in this section.
- (3) Install fasteners at fender side openings.

ADJUSTMENTS

ADJUSTMENT

- (1) Remove the plastic rivet that secures the front upper fascia to the front lower fascia (Fig. 2).
- (2) Position the upper front fascia so that there is approximately a 19 mm (3/4 in.) gap between the lower portion of the front fender and the upper portion of the front upper fascia (Fig. 3). The gap should ideally be 19 mm (3/4 in.), but it is more important to avoid a V-Gap between the lower portion of the front fender and the upper portion of the front upper fascia than maintaining the gap. There are ribs in the front upper fascia and lower fascia that will hold the front upper fascia in position (Fig. 4).
- (3) Attach the front upper fascia to the front lower fascia using a new plastic rivet.

FRONT LOWER FASCIA

REMOVAL

- (1) Open hood.
- (2) Remove fasteners at side fender openings.
- (3) Remove lower air dam. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT AIR DAM - REMOVAL)
- (4) Disengage clips attaching end of upper fascia to bumper face bar (Fig. 5).
- (5) Disengage clips attaching lower fascia to bumper face bar.
- (6) Separate lower fascia from bumper.

J9413-2

Fig. 5 Front Bumper Lower Fascia

1 - LOWER FASCIA
 2 - RETAINING CLIP
 3 - BUMPER

INSTALLATION

- (1) Position lower fascia on bumper.
- (2) Engage clips attaching lower fascia to bumper face bar.
- (3) Install lower air dam. (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT AIR DAM - INSTALLATION)
- (4) Install fasteners at side fender openings.

FRONT FASCIA - SPORT

REMOVAL

The fascia can be removed from the vehicle without removing the bumper.

- (1) Disconnect wire connectors from fog lamps.
- (2) Remove screws attaching rearward edges of fascia to outer bumper brackets (Fig. 7).
- (3) Remove screws attaching bottom of air deflector.
- (4) Lift top of fascia upward to disengage from retaining clips on front bumper.
- (5) Pull fascia from front bumper and separate from vehicle.

INSTALLATION

- (1) Position fascia on front bumper.
- (2) Engage fascia with retaining clips on front bumper.

FRONT FASCIA - SPORT (Continued)

(3) Install screws attaching bottom of fascia to air deflector.

(4) Align fascia and wheelhouse liners with outer bumper brackets and install screws.

(5) Connect harness connectors to fog lamps.

FRONT BUMPER

REMOVAL

(1) Support front bumper on a suitable lifting device.

(2) Remove bolts attaching front bumper outer bracket to frame rail (Fig. 6).

(3) Remove nuts and stud plates attaching front bumper to end of frame rail.

(4) Disengage wire connectors from fog lamps, if equipped.

(5) Separate front bumper from vehicle.

INSTALLATION

(1) Support front bumper on a suitable lifting device.

(2) Position front bumper on vehicle.

(3) Engage fog lamp wire connectors, if equipped.

(4) Install nuts and stud plates attaching front bumper to end of frame rail. Tighten nuts to 94 N·m (70 ft. lbs.) torque.

(5) Install bolts attaching front bumper outer bracket to frame rail. Tighten bolts to 94 N·m (70 ft. lbs.) torque.

REAR BUMPER

REMOVAL

- (1) Support rear bumper on a suitable lifting device.
- (2) Remove nuts attaching rear bumper to inner and outer brackets (Fig. 8).
- (3) Disengage license plate lamp wire connector from body wire harness, if equipped.
- (4) Separate rear bumper from vehicle.

INSTALLATION

- (1) Support rear bumper on a suitable lifting device.
- (2) Position rear bumper on vehicle.
- (3) Engage license plate lamp wire connector to body wire harness, if equipped.
- (4) Install nuts attaching rear bumper to inner and outer brackets. Tighten nuts to 94 N·m (70 ft. lbs.) torque.

FRAME

DESCRIPTION

DESCRIPTION

The BR/BE frame is the structural center of the vehicle. In addition to supporting the body and payload, the frame provides a station for the engine and drivetrain. BR/BE trucks have a ladder type frame with Box-section front rails, dropped center section, and open-channel side rails in the rear.

Cross members attach to the side rails with rivets, welds, or bolts. The cab is isolated from the frame with rubber load cushions with through bolts. The cargo box or bed is attached to the frame with bolts.

The frame is designed to absorb and dissipate flexing and twisting due to acceleration, braking, cornering, and road surface variances without bending when subjected to normal driving conditions.

FRAME (Continued)

FRAME SERVICE

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE EYE PROTECTION WHEN GRINDING OR WELDING METAL, SERIOUS EYE INJURY CAN RESULT. BEFORE PROCEEDING WITH FRAME REPAIR INVOLVING GRINDING OR WELDING, VERIFY THAT VEHICLE FUEL SYSTEM IS NOT LEAKING OR IN CONTACT WITH REPAIR AREA, PERSONAL INJURY CAN RESULT. DO NOT ALLOW OPEN FLAME TO CONTACT PLASTIC BODY PANELS. FIRE OR EXPLOSION CAN RESULT. WHEN WELDED FRAME COMPONENTS ARE REPLACED, 100% PENETRATION WELD MUST BE ACHIEVED DURING INSTALLATION. IF NOT, DANGEROUS OPERATING CONDITIONS CAN RESULT. STAND CLEAR OF CABLES OR CHAINS ON PULLING EQUIPMENT DURING FRAME STRAIGHTENING OPERATIONS, PERSONAL INJURY CAN RESULT. DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT SUPPORTED ON SAFETY STANDS, PERSONAL INJURY CAN RESULT.

CAUTION: Do not reuse damaged fasteners, quality of repair would be suspect. Do not drill holes in top or bottom frame rail flanges, frame rail failure can result. Do Not use softer than Grade 5 bolts to replace production fasteners, loosening or failure can result. When using heat to straighten frame components do not exceed 566°C (1050°F), metal fatigue can result. Welding the joints around riveted cross members and frame side rails can weaken frame.

FRAME STRAIGHTENING

When necessary, a conventional frame that is bent or twisted can be straightened by application of heat. The temperature must not exceed 566°C (1050°F). The metal will have a dull red glow at the desired temperature. Excessive heat will decrease the strength of the metal and result in a weakened frame.

Welding the joints around riveted cross members and frame side rails is not recommended.

A straightening repair process should be limited to frame members that are not severely damaged. The replacement bolts, nuts and rivets that are used to join the frame members should conform to the same specifications as the original bolts, nuts and rivets.

FRAME REPAIRS

DRILLING HOLES

Do not drill holes in frame side rail top and bottom flanges, metal fatigue can result causing frame failure. Holes drilled in the side of the frame rail must be at least 38 mm (1.5 in.) from the top and bottom flanges.

Additional drill holes should be located away from existing holes.

WELDING

Use MIG, TIG or arc welding equipment to repair welded frame components.

Frame components that have been damaged should be inspected for cracks before returning the vehicle to use. If cracks are found in accessible frame components perform the following procedures.

- (1) Drill a hole at each end of the crack with a 3 mm (0.125 in.) diameter drill bit.
- (2) Using a suitable die grinder with 3 inch cut off wheel, V-groove the crack to allow 100% weld penetration.
- (3) Weld the crack.
- (4) If necessary when a side rail is repaired, grind the weld smooth and install a reinforcement channel (Fig. 9) over the repaired area.

NOTE: If a reinforcement channel is required, the top and bottom flanges should be 0.250 inches narrower than the side rail flanges. Weld only in the areas indicated (Fig. 9).

Fig. 9 Frame Reinforcement

- 1 - .250 IN FROM EDGE
- 2 - TOP FLANGE
- 3 - BOTTOM FLANGE
- 4 - FRAME RAIL
- 5 - FRAME REPAIR REINFORCEMENT

FRAME (Continued)

FRAME FASTENERS

Bolts, nuts and rivets can be used to repair frames or to install a reinforcement section on the frame. Bolts can be used in place of rivets. When replacing rivets with bolts, install the next larger size diameter bolt to assure proper fit. If necessary, ream the hole out just enough to sufficiently receive the bolt.

Conical-type washers are preferred over the split-ring type lock washers. Normally, grade-5 bolts are adequate for frame repair. **Grade-3 bolts or softer should not be used.** Tightening bolts/nuts with the

correct torque, refer to the Introduction Group at the front of this manual for tightening information.

SPECIFICATIONS

FRAME DIMENSION

Frame dimensions are listed in Millimeters (mm) scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location (Fig. 10) .

DIMENSIONS FOR DIFFERING WHEELBASES*

FUEL DELIVERY - GASOLINE

DESCRIPTION - FUEL DELIVERY SYSTEM

The fuel delivery system consists of:

- the fuel pump module containing the electric fuel pump, fuel filter/fuel pressure regulator, rollover valve (certain modules), fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of pump module
- fuel tubes/lines/hoses
- quick-connect fittings
- fuel injector rail
- fuel injectors
- fuel tank
- fuel tank filler/vent tube assembly
- fuel tank filler tube cap
- accelerator pedal
- throttle cable

OPERATION - FUEL DELIVERY SYSTEM

Fuel is returned through the fuel pump module and back into the fuel tank through the fuel filter/fuel pressure regulator. A separate fuel return line from the engine to the tank is not used with any gasoline powered engine.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module lock-nut/gasket and fuel tank check valve(s) (refer to 25, Emission Control System for Fuel Tank Check Valve information).

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used. The fuel filler tube contains a flap door located below the fuel fill cap.

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in 25, Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

DIAGNOSIS AND TESTING - FUEL PRESSURE LEAK DOWN TEST

Use this test in conjunction with the Fuel Pump Pressure Test and Fuel Pump Capacity Test.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line

full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

Abnormally long periods of cranking to restart a **hot** engine that has been shut down for a short period of time may be caused by:

- Fuel pressure bleeding past a fuel injector(s).
- Fuel pressure bleeding past the check valve in the fuel pump module.

(1) Disconnect the fuel inlet line at fuel rail. Refer to Fuel Tubes/Lines/Hoses and Clamps for procedures. On some engines, air cleaner housing removal may be necessary before fuel line disconnection.

(2) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.

(3) Connect correct Fuel Line Pressure Test Adapter Tool Hose between disconnected fuel line and fuel rail (Fig. 1).

- 4 - FUEL PRESSURE TEST GAUGE
- 5 - FUEL LINE CONNECTION AT RAIL
- 6 - FUEL RAIL

FUEL DELIVERY - GASOLINE (Continued)

(4) Connect the 0-414 kPa (0-60 psi) fuel pressure test gauge (from Gauge Set 5069) to the test port on the appropriate Adaptor Tool. **The DRB® III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

The fittings on both tools must be in good condition and free from any small leaks before performing the proceeding test.

(5) Start engine and bring to normal operating temperature.

(6) Observe test gauge. Normal operating pressure should be 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi).

(7) Shut engine off.

(8) Pressure should not fall below **30 psi for five minutes.**

(9) If pressure falls below 30 psi, it must be determined if a fuel injector, the check valve within the fuel pump module, or a fuel tube/line is leaking.

(10) Again, start engine and bring to normal operating temperature.

(11) Shut engine off.

(12) **Testing for fuel injector or fuel rail leakage:** Clamp off the rubber hose portion of Adaptor Tool between the fuel rail and the test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a fuel injector or the fuel rail is leaking.

(13) **Testing for fuel pump check valve, filter/regulator check valve or fuel tube/line leakage:** Clamp off the rubber hose portion of Adaptor Tool between the vehicle fuel line and test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a leak may be found at a fuel tube/line. If no leaks are found at fuel tubes or lines, one of the check valves in either the electric fuel pump or filter/regulator may be leaking.

Note: A quick loss of pressure usually indicates a defective check valve in the filter/regulator. A slow loss of pressure usually indicates a defective check valve in the electric fuel pump.

The electric fuel pump is not serviced separately. Replace the fuel pump module assembly. The filter/regulator may be replaced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE

Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.

(1) Remove fuel fill cap.

(2) Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(3) Start and run engine until it stalls.

(4) Attempt restarting engine until it will no longer run.

(5) Turn ignition key to OFF position.

CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.

(6) Unplug connector from any fuel injector.

(7) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.

(8) Connect other end of jumper wire to positive side of battery.

(9) Connect one end of a second jumper wire to remaining injector terminal.

CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.

(10) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.

(11) Place a rag or towel below fuel line quick-connect fitting at fuel rail.

(12) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.

(13) Return fuel pump relay to PDC.

(14) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB® scan tool must be used to erase a DTC.

FUEL FILTER/PRESSURE REGULATOR

DESCRIPTION

A combination fuel filter and fuel pressure regulator (Fig. 2) is used on all engines. It is located on the top of the fuel pump module. A separate frame mounted fuel filter is not used with any engine.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

- 3 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 4 - EXCESS FUEL BACK TO TANK
- 5 - FUEL INLET
- 6 - RUBBER GROMMET
- 7 - TOP OF PUMP MODULE

OPERATION

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is not controlled by engine vacuum or the powertrain control module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi) at the fuel injectors. It contains a diaphragm, calibrated springs and a fuel return valve. The internal fuel filter (Fig. 2) is also part of the assembly.

Fuel is supplied to the filter/regulator by the electric fuel pump through an opening tube at the bottom of filter/regulator (Fig. 2).

The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check

valve is located at the outlet end of the electric fuel pump. **Refer to Fuel Pump—Description and Operation for more information. Also refer to the Fuel Pressure Leak Down Test and the Fuel Pump Pressure Tests.**

If fuel pressure at the pressure regulator exceeds approximately 49.2 psi, an internal diaphragm opens and excess fuel pressure is routed back into the tank through the bottom of pressure regulator.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE, EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL FILTER/FUEL PRESSURE REGULATOR, FUEL SYSTEM PRESSURE MUST BE RELEASED.

Refer to Fuel System Pressure Release in Fuel Delivery System section of this group.

The fuel filter/fuel pressure regulator (Fig. 3) is located at top of fuel pump module (Fig. 4) or (Fig. 5).

80a92a65

(2) The fuel filter/regulator is pressed into a rubber grommet. Remove by twisting and pulling straight up (Fig. 6).

CAUTION: Do not pull filter/regulator more than three inches from fuel pump module. Damage to coiled fuel tube (line) may result.

Fig. 6 Filter/Regulator Removal and Installation—TYPICAL

- 1 - RUBBER GROMMET
- 2 - FUEL FILTER/FUEL PRESSURE REGULATOR

(3) Gently cut old fuel tube (line) clamp (Fig. 7) taking care not to damage plastic fuel tube. Remove and discard old fuel tube clamp.

Fig. 7 Fuel Tube and Clamp—TYPICAL

- 1 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 2 - TUBE CLAMP
- 3 - FUEL TUBE

(4) Remove plastic fuel tube from filter/regulator by gently pulling downward. Remove filter/regulator from fuel pump module.

FUEL FILTER/PRESSURE REGULATOR (Continued)

INSTALLATION

- (1) Install a new clamp over plastic fuel tube.
- (2) Install filter/regulator to fuel tube. Rotate filter/regulator in fuel tube (line) (Fig. 8) until it is pointed to drivers side of vehicle (Fig. 4) or (Fig. 5).
- (3) Tighten line clamp to fuel line using special Hose Clamp Pliers number C-4124 or equivalent (Fig. 8) . **Do not use conventional side cutters to tighten this type of clamp.**

Fig. 8 Tightening Fuel Tube Clamp—TYPICAL

- 1 - TOOL C-4124
2 - TUBE CLAMP
3 - FUEL TUBE

- (4) Press filter/regulator (by hand) into rubber grommet. The assembly should be pointed towards drivers side of vehicle (Fig. 4) or (Fig. 5) .
- (5) Install fuel tank. Refer to Fuel Tank Removal/Installation.
- (6) Check for fuel leaks.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

For Fuel Gauge Operation: A constant current source of about 32 mA is supplied to the resistor

track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). The resistor track is used to vary the voltage depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit. Output voltages will vary from about .6 volts at FULL, to about 8.6 volts at EMPTY (Jeep models), or, about 7.0 volts at EMPTY (Dodge Truck models). **NOTE: For diagnostic purposes, this voltage can only be verified with the fuel gauge sending unit circuit closed (i.e. having all of the sending units electrical connectors connected).**

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

For OBD II Emission Monitor Requirements: The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

DIAGNOSIS AND TESTING - FUEL GAUGE SENDING UNIT

The fuel gauge sending unit contains a variable resistor (track). As the float moves up or down, electrical resistance will change. Refer to Instrument Panel and Gauges under Electrical for Fuel Gauge testing. To test the gauge sending unit only, it must be removed from vehicle. The unit is part of the fuel pump module. Refer to Fuel Pump Module Removal/Installation for procedures. Measure the resistance across the sending unit terminals. With float in up position, resistance should be 20 ohms \pm 6 ohms. With float in down position, resistance should be 220 ohms \pm 6 ohms.

REMOVAL

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

module (Fig. 9). The fuel pump module is located inside of fuel tank.

(1) Remove fuel tank. Refer to Fuel Tank—All Engines in the Removal/Installation section.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Unplug 4-way electrical connector (Fig. 9).

(4) Disconnect 2 sending unit wires at 4-way connector. The locking collar of connector must be removed before wires can be released from connector. Note location of wires within 4-way connector.

(5) The sending unit is retained to pump module with a small lock tab and notch (Fig. 10). Carefully push lock tab to the side and away from notch while sliding sending unit downward on tracks for removal. Note wire routing while removing unit from module.

80b0d725

Fig. 9 Fuel Gauge Sending Unit Location—TYPICAL Module

- 3 - ELECTRIC FUEL PUMP
- 4 - FUEL GAUGE FLOAT
- 5 - FUEL PUMP INLET FILTER
- 6 - FUEL GAUGE SENDING UNIT
- 7 - MODULE LOCK TABS (3)

INSTALLATION

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 9). The fuel pump module is located inside of fuel tank.

(1) Position sending unit into tracks. Note wire routing.

(2) Push unit on tracks until lock tab snaps into notch.

(3) Connect 2 sending unit wires into 4-way connector and install locking collar.

(4) Connect 4-way electrical connector to module.

Fig. 10 Fuel Gauge Sending Unit Lock Tab/Tracks

- 1 - FUEL GAUGE SENDING UNIT
- 2 - LOCK TAB
- 3 - NOTCH
- 4 - TRACKS

(5) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(6) Install fuel tank. Refer to Fuel Tank—All Engines in the Removal/Installation section.

FUEL LINES

DESCRIPTION

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

FUEL PUMP

DESCRIPTION

The electric fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump. The electric fuel pump is not a separate, serviceable component.

OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** Refer to the Fuel Pressure Leak Down Test for more information.

The electric fuel pump is not a separate, serviceable component.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FUEL PUMP CAPACITY TEST

Before performing this test, verify fuel pump pressure. Refer to Fuel Pump Pressure Test. Use this test in conjunction with the Fuel Pressure Leak Down Test.

(1) Release fuel system pressure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect fuel supply line at fuel rail. Refer to Quick-Connect Fittings. Some engines may require air cleaner housing removal before line disconnection.

(3) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.

(4) Connect correct Fuel Line Pressure Test Adapter Tool Hose into disconnected fuel supply line. Insert other end of Adaptor Tool Hose into a graduated container.

(5) Remove fuel fill cap.

(6) To activate fuel pump and pressurize system, obtain DRB® scan tool and actuate ASD Fuel System Test.

(7) A good fuel pump will deliver at least 1/4 liter of fuel in 7 seconds. Do not operate fuel pump for longer than 7 seconds with fuel line disconnected as fuel pump module reservoir may run empty.

(a) If capacity is lower than specification, but fuel pump can be heard operating through fuel fill cap opening, check for a kinked/damaged fuel supply line somewhere between fuel rail and fuel pump module.

(b) If line is not kinked/damaged, and fuel pressure is OK, but capacity is low, replace fuel filter/fuel pressure regulator. The filter/regulator may be serviced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

(c) If both fuel pressure and capacity are low, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

DIAGNOSIS AND TESTING - FUEL PUMP PRESSURE TEST

Use this test in conjunction with the Fuel Pump Capacity Test, Fuel Pressure Leak Down Test and Fuel Pump Amperage Test found elsewhere in this group.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

All fuel systems are equipped with a fuel tank module mounted, combination fuel filter/fuel pressure regulator. The fuel pressure regulator is not controlled by engine vacuum.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. BEFORE DISCONNECTING FUEL LINE AT FUEL RAIL, THIS PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

(1) Remove protective cap at fuel rail test port. Connect the 0–414 kPa (0–60 psi) fuel pressure gauge (from gauge set 5069) to test port pressure fitting on fuel rail (Fig. 11). **The DRB® III Scan Tool along with the PEP module, the 500 psi pressure**

FUEL PUMP (Continued)

transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.

Fig. 11 FUEL PRESSURE TEST GAUGE (TYPICAL GAUGE INSTALLATION AT TEST PORT)

- 1 - SERVICE (TEST) PORT
- 2 - FUEL PRESSURE TEST GAUGE
- 3 - FUEL RAIL

(2) Start and warm engine and note pressure gauge reading. Fuel pressure should be $339 \text{ kPa} \pm 34 \text{ kPa}$ ($49.2 \text{ psi} \pm 5 \text{ psi}$) at idle.

(3) If engine runs, but pressure is below 44.2 psi, check for a kinked fuel supply line somewhere between fuel rail and fuel pump module. If line is not kinked, but specifications for either the Fuel Pump Capacity, Fuel Pump Amperage or Fuel Pressure Leak Down Tests were not met, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

(4) If operating pressure is above 54.2 psi, electric fuel pump is OK, but fuel pressure regulator is defective. Replace fuel filter/fuel pressure regulator. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for more information.

(5) Install protective cap to fuel rail test port.

DIAGNOSIS AND TESTING - FUEL PUMP AMPERAGE TEST

This amperage (current draw) test is to be done in conjunction with the Fuel Pump Pressure Test, Fuel Pump Capacity Test and Fuel Pressure Leak Down Test. Before performing the amperage test, be sure the temperature of the fuel tank is above 50° F (10° C).

The DRB® Scan Tool along with the DRB Low Current Shunt (LCS) adapter (Fig. 12) and its test leads will be used to check fuel pump amperage specifications.

Fig. 12 LOW CURRENT SHUNT

- 1 - LOW CURRENT SHUNT ADAPTER
- 2 - PLUG TO DRB
- 3 - TEST LEAD RECEPTACLES

(1) Be sure fuel tank contains fuel before starting test. If tank is empty or near empty, amperage readings will be incorrect.

(2) Obtain LCS adapter.

(3) Plug cable from LCS adapter into DRB scan tool at SET 1 receptacle.

(4) Plug DRB into vehicle 16-way connector (data link connector).

(5) Connect (-) and (+) test cable leads into LCS adapter receptacles. Use **10 amp (10A +)** receptacle and common (-) receptacles.

(6) Gain access to MAIN MENU on DRB screen.

(7) Press DVOM button on DRB.

(8) Using left/right arrow keys, highlight CHANNEL 1 function on DRB screen.

(9) Press ENTER three times.

(10) Using up/down arrow keys, highlight RANGE on DRB screen (screen will default to 2 amp scale).

(11) Press ENTER to change 2 amp scale to 10 amp scale. **This step must be done to prevent damage to DRB scan tool or LCS adapter (blown fuse).**

(12) Remove cover from Power Distribution Center (PDC).

(13) Remove fuel pump relay from PDC. Refer to label on PDC cover for relay location.

FUEL PUMP (Continued)

WARNING: BEFORE PROCEEDING TO NEXT STEP, NOTE THE FUEL PUMP WILL BE ACTIVATED AND SYSTEM PRESSURE WILL BE PRESENT. THIS WILL OCCUR AFTER CONNECTING TEST LEADS FROM LCS ADAPTER INTO FUEL PUMP RELAY CAVITIES. THE FUEL PUMP WILL OPERATE EVEN WITH IGNITION KEY IN OFF POSITION. BEFORE ATTACHING TEST LEADS, BE SURE ALL FUEL LINES AND FUEL SYSTEM COMPONENTS ARE CONNECTED.

CAUTION: To prevent possible damage to the vehicle electrical system and LCS adapter, the test leads must be connected into relay cavities exactly as shown in following steps.

Depending upon vehicle model, year or engine configuration, three different types of relays may be used: Type-1, type-2 and type-3.

(14) If equipped with **type-1 relay** (Fig. 13), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 13).

(15) If equipped with **type-2 relay** (Fig. 14), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 14).

(16) If equipped with **type-3 relay** (Fig. 15), attach test leads from LCS adapter into PDC relay cavities number 3 and 5. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 15).

(17) When LCS adapter test leads are attached into relay cavities, fuel pump **will be activated**. Determine fuel pump amperage on DRB screen. Amperage should be below 10.0 amps. If amperage is below 10.0 amps, and specifications for the Fuel Pump Pressure, Fuel Pump Capacity and Fuel Pressure Leak Down tests were met, the fuel pump module is OK.

(18) If amperage is more than 10.0 amps, replace fuel pump module assembly. The electric fuel pump is not serviced separately.

(19) Disconnect test leads from relay cavities immediately after testing.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module on all gas powered engines is installed in the top of the fuel tank (Fig. 16) or (Fig. 17). The fuel pump module (Fig. 16), (Fig. 17) or (Fig. 18) contains the following:

- A combination fuel filter/fuel pressure regulator
- Electric fuel pump
- Fuel pump reservoir
- A separate in-tank fuel filter (at bottom of module)
- Check valve (certain modules)
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection at filter/regulator
- A threaded locknut retaining pump module to fuel tank
- A gasket between tank flange and module
- Auxiliary non-pressurized fuel supply fitting (not all engines)

The fuel gauge sending unit (fuel level sensor), and pick-up filter (at bottom of module) may be serviced separately. If the electrical fuel pump requires service, the entire fuel pump module must be replaced. The fuel filter/fuel pressure regulator may be serviced separately. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

OPERATION

Refer to Fuel Pump, Fuel Filter/Fuel Pressure Regulator and Fuel Gauge Sending Unit.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING THE FUEL PUMP MODULE, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Drain and remove fuel tank. Refer to Fuel Tank - All Engines in the Removal/Installation section.

(2) The plastic fuel pump module locknut is threaded onto fuel tank (Fig. 19) or (Fig. 20). Install Special Tool 6856 to locknut and remove locknut (Fig. 21). The fuel pump module will spring up when locknut is removed.

(3) Remove module from fuel tank.

INSTALLATION

CAUTION: Whenever the fuel pump module is serviced, the rubber gasket must be replaced.

(1) Using a new gasket, position fuel pump module into opening in fuel tank.

80b0d722

Fig. 20 Fuel Pump Module—35 Gallon Fuel Tank

(3) Rotate module until positioned as shown in (Fig. 19) or (Fig. 20). This step must be performed to prevent float from contacting side of fuel tank. Be sure fuel filter/fuel pressure regulator is pointed to drivers side of vehicle.

(4) Install Special Tool 6856 (Fig. 21) to locknut.

(5) Tighten locknut to 24– 44 N·m (18–32 ft. lbs.) torque.

(6) Install fuel tank. Refer to Fuel Tank - All Engines in the Removal/Installation section.

FUEL RAIL

DESCRIPTION

DESCRIPTION - 5.9L

The fuel injector rail is used to attach the fuel injectors to the engine. It is mounted to the engine (Fig. 22).

DESCRIPTION - 8.0L

The fuel injector rail is used to attach the fuel injectors to the engine. The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the lower half of the two-piece intake manifold (Fig. 23). The metal, one-piece fuel rail is not repairable.

OPERATION

OPERATION - 5.9L

High pressure from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

80a6h165

Fig. 22 Fuel Rail—5.9L Engine—Typical

- 5 - FUEL PRESSURE TEST PORT
- 6 - FUEL INJECTORS (10)

A fuel pressure test port is located on the fuel rail. A quick-connect fitting with a safety latch clip is used to attach the fuel line to the fuel rail.

FUEL RAIL (Continued)

The fuel rail is not repairable.

CAUTION: The left and right sections of the fuel rail are connected with a flexible connecting hose. Do not attempt to separate the rail halves at this connecting hose. Due to the design of this connecting hose, it does not use any clamps. Never attempt to install a clamping device of any kind to the hose. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose.

OPERATION - 8.0L

High pressure from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

A fuel pressure test port is located on the fuel rail. A quick-connect fitting with a safety latch clip is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

REMOVAL

REMOVAL - 5.9L

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE TURNED OFF). BEFORE SERVICING FUEL RAIL ASSEMBLY, FUEL SYSTEM PRESSURE MUST BE RELEASED.

To release fuel pressure, refer to Fuel System Pressure Release Procedure found in this group.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connecting hose (Fig. 24). Due to the design of this connecting hose, it does use any clamps. Never attempt to install a clamping device of any kind to the hose. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose.

- (1) Remove negative battery cable at battery.
 - (2) Remove air cleaner.
 - (3) Perform fuel pressure release procedure.
 - (4) Remove throttle body from intake manifold.
- Refer to Throttle Body removal in this group.

(5) If equipped with air conditioning, remove the A-shaped A/C compressor-to-intake manifold support bracket (three bolts) (Fig. 25).

(6) Disconnect electrical connectors at all fuel injectors. To remove connector refer to (Fig. 26). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring har-

ness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

(7) Disconnect fuel tube (line) at side of fuel rail. Refer to Quick-Connect Fittings for procedures,

(8) Remove the remaining fuel rail mounting bolts.

(9) Gently rock and pull the **left** fuel rail until the fuel injectors just start to clear the intake manifold. Gently rock and pull the **right** fuel rail until the fuel injectors just start to clear the intake manifold. Repeat this procedure (left/right) until all fuel injectors have cleared the intake manifold.

REMOVAL - 8.0L

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

- (1) Remove negative battery cable at battery.
- (2) Remove air cleaner housing and tube.
- (3) Perform fuel pressure release procedure. Refer to Fuel Delivery System section of this group.
- (4) Disconnect throttle body linkage and remove throttle body from intake manifold. Refer to Throttle Body removal in this group.
- (5) Remove ignition coil pack and bracket assembly (Fig. 29) at intake manifold and right engine valve cover (four bolts).
- (6) Remove upper half of intake manifold. Refer to Engines for procedures.
- (7) Disconnect electrical connectors at all fuel injectors. To remove connector refer to (Fig. 30). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification.
- (8) Disconnect fuel line quick-connect fitting at left-rear end of fuel rail. A special 3/8 inch fuel line disconnection tool will be necessary.

FUEL RAIL (Continued)

(10) Gently rock and pull the **left** fuel rail until the fuel injectors just start to clear the intake manifold. Gently rock and pull the **right** fuel rail until the fuel injectors just start to clear the intake manifold. Repeat this procedure (left/right) until all fuel injectors have cleared the intake manifold.

(11) Remove fuel rail (with injectors attached) from engine.

(12) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 27) or (Fig. 28).

INSTALLATION

INSTALLATION - 5.9L

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

(3) Position the fuel rail/fuel injector assembly to the injector openings on the intake manifold.

(4) Guide each injector into the intake manifold. Be careful not to tear the injector o-ring.

FUEL RAIL (Continued)

(5) Push the **right** fuel rail down until fuel injectors have bottomed on injector shoulder. Push the **left** fuel rail down until fuel injectors have bottomed on injector shoulder.

(6) Install fuel rail mounting bolts.

(7) Connect electrical connector to intake manifold air temperature sensor.

(8) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 26). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(9) Install the A/C support bracket (if equipped).

(10) Install throttle body to intake manifold. Refer to Throttle Body installation in this section of the group.

(11) Install fuel tube (line) at side of fuel rail. Refer to Quick-Connect Fittings for procedures.

(12) Install air cleaner.

(13) Connect battery cable to battery.

(14) Start engine and check for leaks.

INSTALLATION - 8.0L

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

NOTE: The fuel injector electrical connectors on all 10 injectors should be facing to the right (passenger) side of the vehicle (Fig. 31).

(3) Position the fuel rail/fuel injector assembly to the injector openings on the intake manifold.

(4) Guide each injector into the intake manifold. Be careful not to tear the injector o-ring.

(5) Push the **right** fuel rail down until fuel injectors have bottomed on injector shoulder. Push the **left** fuel rail down until fuel injectors have bottomed on injector shoulder.

(6) Install the six fuel rail mounting bolts into the lower half of intake manifold. Tighten bolts to 15 N·m (136 in. lbs.) torque.

(7) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 30). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector. The injector wiring harness is numerically tagged.

(8) Install upper half of intake manifold. Refer to Engines for procedures.

(9) Connect main fuel line at fuel rail. Refer to Quick-Connect Fittings for procedures.

(10) Install ignition coil pack and bracket assembly at intake manifold and right engine valve cover (four bolts).

(11) Install throttle body to intake manifold. Refer to Throttle Body removal in this group.

(12) Install throttle body linkage to throttle body.

(13) Install air cleaner tube and housing.

(14) Install negative battery cable at battery.

(15) Start engine and check for leaks.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

A fuel tank check valve(s) is mounted into the top of the fuel tank (or pump module). Refer to Emission Control System for fuel tank check valve information.

An evaporation control system is connected to the rollover valve(s) to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to Emission Control System for additional information.

REMOVAL

WARNING: GASOLINE POWERED ENGINES: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. BEFORE SERVICING THE FUEL TANK, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE BEFORE SERVICING THE FUEL TANK.

Two different procedures may be used to drain fuel tank (lowering tank or using DRB scan tool). When equipped with a diesel engine, the DRB scan tool cannot be used (no electric fuel pump).

The quickest draining procedure involves lowering the fuel tank.

Gasoline Powered Engines: As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRB scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure in this group for procedures.

FUEL TANK (Continued)

Attach end of special test hose tool number 6541, 6539, 6631 or 6923 at fuel rail disconnection (tool number will depend on model and/or engine application). Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty.

If electric fuel pump is not operating, tank must be lowered for fuel draining. Refer to following procedures.

- (1) Remove fuel tank filler tube cap.
- (2) Perform Fuel System Pressure Release procedure as described in this group.
- (3) Gasoline Engines: Disconnect negative battery cable at battery. Diesel Engines: Disconnect both negative battery cables at both batteries.
- (4) Raise vehicle on hoist.
- (5) Certain models are equipped with a separate grounding wire (strap) connecting the fuel fill tube assembly to the body. Disconnect wire by removing screw.
- (6) Open fuel fill door and remove screws mounting fuel filler tube assembly to body. Do not disconnect rubber fuel fill or vent hoses from tank at this time.
- (7) Place a transmission jack under center of fuel tank. Apply a slight amount of pressure to fuel tank with transmission jack.
- (8) Remove fuel tank mounting strap nuts from mounting strap studs (Fig. 32). If equipped, remove fuel tank shield bolts.
- (9) Lower fuel tank only enough to allow access to top of tank. The 2 tank fittings (where rubber fuel fill and vent hose connections are made) must be positioned above tank level. Rotate tank slightly to allow these fittings to be above tank level.

WARNING: WRAP SHOP TOWELS AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(10) While working over left rear tire/wheel, disconnect rubber fuel vent hose at fuel tank (Fig. 32) (vent hose is the smallest of 2 hoses). Position fuel siphoning/drain hose into this fitting at tank. Drain fuel into an approved portable holding tank or a properly labeled gasoline (or diesel fuel) safety container.

(11) Disconnect rubber fuel fill hose at fuel tank (Fig. 32).

(12) Gas Powered Engines:

(a) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel pump module (Fig. 33) or (Fig. 34).

(b) If equipped with 26 or 34 gallon fuel tank, two EVAP lines are connected to the fuel tank check valves. Disconnect EVAP line from check valve at top of module (Fig. 33). Disconnect other

EVAP line from check valve near rear of tank (Fig. 33).

(c) If equipped with 35 gallon fuel tank, two EVAP lines are connected to the fuel tank check valves. Disconnect EVAP lines from check valves at top-front and top-rear of fuel tank (Fig. 35).

(d) Disconnect fuel supply line at fuel filter/fuel pressure regulator supply fitting (Fig. 33) or (Fig. 34). Refer to Quick-Connect Fittings for procedures.

(13) Diesel Powered Engines:

(a) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel tank module (Fig. 36).

(b) Disconnect fuel supply and fuel return lines at the fuel tank module fittings (Fig. 36). Refer to Quick-Connect Fittings for procedures.

(14) Gasoline Engines: If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation in this group. Diesel Engines: If fuel tank module removal is necessary, refer to Fuel Tank Module Removal/Installation in this group.

INSTALLATION

(1) Gasoline Engines: If fuel pump module is being installed, refer to Fuel Pump Module Removal/Installation in this group. Diesel Engines: If fuel tank mod-

FUEL TANK (Continued)

ule is being installed, refer to Fuel Tank Module Removal/Installation in this group.

(2) Place fuel tank on top of transmission jack.

(3) Install rubber fill and vent lines to tank. Tighten hose clamps to 2.3 N·m (20 in. lbs.) torque.

(4) Raise tank into position while guiding fill and vent hoses to body. Raise tank only enough to allow access to top of tank.

(5) **Gas Powered Engines:**

(a) Connect electrical connector to fuel pump module.

(b) Connect EVAP hoses at rollover valves.

(c) Connect fuel supply line at fuel filter/fuel pressure regulator. Refer to Quick-Connect Fittings for procedures.

(6) **Diesel Powered Engines:**

(a) Connect electrical connector to fuel tank module.

(b) Connect fuel supply and fuel return lines to fuel tank module fittings. Refer to Quick-Connect Fittings in this group.

(7) Connect two mounting straps and mounting strap nuts.

(8) Tighten strap nuts to 41 N·m (30 ft. lbs.) torque. Do not over tighten retaining strap nuts.

(9) Remove transmission jack.

(10) Connect fuel filler tube assembly to body.

(11) If equipped, connect grounding wire (strap) and screw.

(12) Refill fuel tank and inspect all hoses and lines for leaks.

(13) Connect negative battery cable(s) to battery(s).

FUEL TANK CHECK VALVE

DESCRIPTION

Diesel Powered Engine: One fuel tank check valve is used. The check valve is located on the top of the fuel tank module (Fig. 37). The valve may be serviced separately.

Gasoline Powered Engines: If equipped with a 26 or 34 gallon fuel tank, two check valves are used. One of the valves is permanently mounted to the top of fuel tank (Fig. 38). If replacement of this particular valve is necessary, the fuel tank must be replaced. The other check valve is located on the top of the fuel pump module (Fig. 38). This valve may be serviced separately. If replacement is necessary, refer to the Removal/Installation section of this group.

If equipped with a 35 gallon fuel tank, two check valves are used. Both valves are permanently mounted to the top of fuel tank (Fig. 39). If replacement is necessary, the fuel tank must be replaced.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING THE CHECK VALVE, FUEL SYSTEM PRESSURE MUST BE RELEASED (GASOLINE POWERED ENGINES ONLY). REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN GROUP 14, FUEL SYSTEM.

(1) **Diesel Powered Engine:** One check valve is used. The valve is located on top of fuel tank module (Fig. 40) and may be serviced separately.

(a) Disconnect both negative battery cables at both batteries.

(b) Remove fuel filler cap and drain fuel tank.

(c) Remove fuel tank. Refer to Fuel Tank Removal/Installation in Fuel System.

(d) The check valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.

(e) Discard old grommet.

(2) **Gasoline Powered Engines:** If equipped with a 26 or 34 gallon fuel tank, two check valves are used. One of the valves is permanently mounted to top of fuel tank (Fig. 41). If replacement of this particular valve is necessary, fuel tank must be replaced. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System. The other check valve is located on top of fuel pump module (Fig. 41). This valve may be serviced separately. Refer to following steps for procedures.

Fig. 41 Check Valve Locations - Gas Powered - 26/34 Gallon Tank

Fig. 42 Check Valve Locations - Gas Powered with 35 Gallon Tank

- 1 - FRONT FUEL TANK CHECK VALVE
- 2 - FUEL PUMP MODULE
- 3 - REAR FUEL TANK CHECK VALVE
- 4 - FUEL TANK

If equipped with a 35 gallon fuel tank, two check valves are also used, but both valves are permanently mounted to top of fuel tank (Fig. 42). If replacement is necessary, fuel tank must be replaced. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System.

- (a) Disconnect negative battery cable at battery.
- (b) Remove fuel filler cap and drain fuel tank.
- (c) Remove fuel tank. Refer to Fuel Tank Removal/Installation in Fuel System.
- (d) Disconnect tube (line) at valve.
- (e) The check valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.
- (f) Discard old grommet.

INSTALLATION

- (1) Install new grommet into fuel pump (or fuel tank) module.
- (2) Using finger pressure only, press valve into place.
- (3) Install fuel tank. Refer to Fuel Tank Installation.
- (4) Fill fuel tank. Install fuel tank filler cap.
- (5) Connect negative battery cable(s).
- (6) Start vehicle and check for leaks.

INLET FILTER

REMOVAL

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 43). The fuel pump module is located inside of fuel tank.

Fig. 43 Fuel Pump Inlet Filter

- 1 - FUEL PUMP INLET FILTER
- 2 - LOCK TABS (2)
- 3 - FUEL PUMP MODULE (BOTTOM)

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove filter by carefully prying 2 lock tabs at bottom of module with 2 screwdrivers. Filter is snapped to module.

(4) Clean bottom of pump module.

INSTALLATION

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 43). The fuel pump module is located inside of fuel tank.

(1) Snap new filter to bottom of module. Be sure o-ring is in correct position.

(2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Install fuel tank. Refer to Fuel Tank Removal/Installation.

QUICK CONNECT FITTING

DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to Quick-Connect Fittings Removal/Installation for more information.

CAUTION: The interior components (o-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

Also refer to Fuel Tubes/Lines/Hoses and Clamps.

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Safety latch clips are used on certain components/lines. Certain fittings may require use of a special tool for disconnection.

DISCONNECTING

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSE, FITTING OR LINE, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

CAUTION: The interior components (o-rings, spacers) of some types of quick-connect fitting are not serviced separately. If service parts are not available, do not attempt to repair a damaged fitting or fuel line. If repair is necessary, replace complete fuel line assembly.

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) **2-Button Type Fitting:** This type of fitting is equipped with a push-button located on each side of quick-connect fitting (Fig. 44). Press on both buttons simultaneously for removal.

80cc704d

Fig. 44 2-BUTTON TYPE FITTING

1 - QUICK-CONNECT FITTING

2 - PUSH-BUTTONS (2)

(5) **Single-Tab Type Fitting:** This type of fitting is equipped with a single pull tab (Fig. 45). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component.

(a) Press release tab on side of fitting to release pull tab (Fig. 46). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

(b) While pressing release tab on side of fitting, use screwdriver to pry up pull tab (Fig. 46).

(c) Raise pull tab until it separates from quick-connect fitting (Fig. 47).

(6) **Two-Tab Type Fitting:** This type of fitting is equipped with tabs located on both sides of fitting (Fig. 48). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

- 3 - QUICK-CONNECT FITTING

(a) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 48) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.

(b) Pull fitting from fuel system component being serviced.

(c) The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

- 2 - QUICK-CONNECT FITTING

(7) **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 49) usually black in color.

(a) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 49). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

- 3 - FUEL RAIL

(b) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(c) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

QUICK CONNECT FITTING (Continued)

(8) **Latch Clips:** Depending on vehicle model and engine, 2 different types of safety latch clips are used (Fig. 50) or (Fig. 51). Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

(a) Type 1: Pry up on latch clip with a screwdriver (Fig. 50).

(b) Type 2: Separate and unlatch 2 small arms on end of clip (Fig. 51) and swing away from fuel line.

(c) Slide latch clip toward fuel rail while lifting with screwdriver.

(d) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 52). Use tool to release locking fingers in end of line.

(e) With special tool still inserted, pull fuel line from fuel rail.

(f) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(9) Disconnect quick-connect fitting from fuel system component being serviced.

CONNECTING

(1) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(2) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(3) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(4) Continue pushing until a click is felt.

(5) Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.

(6) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(7) Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**

(8) Connect negative cable to battery.

(9) Start engine and check for leaks.

FUEL INJECTION - GASOLINE

DIAGNOSIS AND TESTING

VISUAL INSPECTION—5.9L ENGINES

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify that the three 32-way electrical connectors are fully inserted into the connector of the powertrain control module (PCM) (Fig. 1).

Fig. 1 Powertrain Control Module (PCM)

- 1 - PCM MOUNTING BOLTS (3)
- 2 - POWERTRAIN CONTROL MODULE (PCM)
- 3 - (3) 32-WAY CONNECTORS

(2) Inspect the battery cable connections. Be sure that they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect the ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 2). Refer to label on PDC cover for relay location.

(4) Inspect ignition coil connections. Verify that coil secondary cable is firmly connected to coil (Fig. 3).

(5) Verify that distributor cap is correctly attached to distributor. Be sure that spark plug cables are firmly connected to the distributor cap and the spark plugs are in their correct firing order. Be sure that coil cable is firmly connected to distributor cap and coil. Be sure that camshaft position sensor wire con-

- 2 - COIL CONNECTOR
- 3 - IGNITION COIL
- 4 - COIL MOUNTING BOLTS

ductor (at the distributor) is firmly connected to harness connector. Inspect spark plug condition. Refer to 8, Ignition. Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(6) Verify that generator output wire, generator connector and ground wire are firmly connected to the generator.

(7) Inspect the system body grounds for loose or dirty connections. Refer to 8, Wiring for ground locations.

(8) Verify positive crankcase ventilation (PCV) valve operation. Refer to 25, Emission Control System for additional information. Verify PCV valve hose is firmly connected to PCV valve and manifold (Fig. 4).

FUEL INJECTION - GASOLINE (Continued)

**Fig. 4 PCV Valve**

- 1 - PCV VALVE
- 2 - PCV VALVE HOSE CONNECTIONS

(9) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

(10) Verify that hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

(11) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to the throttle arm of throttle body for any binding or restrictions.

(12) If equipped with vacuum brake booster, verify that vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(13) Inspect the air cleaner inlet and air cleaner element for dirt or restrictions.

(14) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(15) Verify that the intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 5).

(16) Verify that MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 6). Also verify that rubber L-shaped fitting from MAP sensor to the throttle body is firmly connected (Fig. 7).

(17) Verify that fuel injector wire harness connectors are firmly connected to injectors in the correct order. Each harness connector is numerically tagged with the injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(18) Verify harness connectors are firmly connected to idle air control (IAC) motor, throttle position sensor (TPS) and manifold absolute pressure (MAP) sensor (Fig. 6).

**Fig. 5 Air Temperature**

- 2 - ELECTRICAL CONNECTOR

**Fig. 6 Sensor and IAC Motor Location—Typical (V-8 Shown)**

- 1 - MAP SENSOR
- 2 - IDLE AIR CONTROL MOTOR
- 3 - THROTTLE POSITION SENSOR

(19) Verify that wire harness connector is firmly connected to the engine coolant temperature sensor (Fig. 8).

(20) Raise and support the vehicle.

(21) Verify oxygen sensor wire connectors are firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 9), (Fig. 10) or (Fig. 11).

Fig. 8 Engine Coolant Temperature

- 1 - GENERATOR
- 2 - A/C COMPRESSOR
- 3 - ENGINE COOLANT TEMPERATURE SENSOR
- 4 - ELEC. CONN.

(22) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

(23) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic convertor.

(24) If equipped with automatic transmission, verify that electrical harness is firmly connected to park/neutral switch. Refer to 21, Automatic Transmission.

Fig. 10 Pre-Catalyst/Post-Catalyst Sensors

- 1 - POST CATALYST OXYGEN SENSOR (1/3)
- 2 - PRE-CATALYST OXYGEN SENSOR (1/2)

(25) Verify electrical harness is firmly connected to rear wheel speed sensor. Verify rear wheel speed sensor is firmly attached to rear axle with proper air gap. Refer to 5, Brakes for information.

(26) If equipped with 4-wheel antilock brake system, verify electrical harness is firmly connected to each front wheel speed sensor. Verify both front wheel speed sensors are firmly attached. Refer to 5, Brakes for information.

(27) Verify that fuel pump/gauge sender unit wire connector is firmly connected to harness connector.

(28) Inspect fuel hoses at fuel pump/gauge sender unit for cracks or leaks.

FUEL INJECTION - GASOLINE (Continued)

80bfe0e8

Fig. 11 Oxygen Sensors

(29) Inspect transmission torque converter housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(30) Verify that battery cable and solenoid feed wire connections to the starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

VISUAL INSPECTION—8.0L ENGINE

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify that the three 32-way electrical connectors are fully inserted into the connector of the powertrain control module (PCM) (Fig. 12).

(2) Inspect the battery cable connections. Be sure that they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect the ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 13). Refer to label on PDC cover for relay location.

(4) Inspect ignition coil pack primary connections. Verify that secondary cables are firmly connected to coils (Fig. 14).

(5) Be sure that spark plug cables are firmly connected and the spark plugs are in their correct firing order. Be sure that camshaft position sensor wire connector is firmly connected to harness connector. Inspect spark plug condition. Refer to 8, Ignition.

Fig. 13 Power Distribution Center (PDC)

- 1 - POWER DISTRIBUTION CENTER (PDC)

Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(6) Verify that generator output wire, generator connector and ground wire are firmly connected to the generator.

(7) Inspect the system body grounds for loose or dirty connections. Refer to 8, Wiring for ground locations.

(8) Verify crankcase ventilation (CCV) operation. Refer to 25, Emission Control System for additional information.

(9) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

(10) Verify that hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

FUEL INJECTION - GASOLINE (Continued)

Fig. 14 Ignition Coil Pack—8.0L Engine

(11) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to the throttle arm of throttle body for any binding or restrictions.

(12) If equipped with vacuum brake booster, verify that vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(13) Inspect the air cleaner inlet and air cleaner element for dirt or restrictions.

(14) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(15) Verify that the intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 15).

Fig. 15 Air Temperature Sensor—8.0L Engine

- 1 - INTAKE MANIFOLD AIR TEMP. SENSOR
- 2 - INTAKE MANIFOLD

(16) Verify that MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 16).

Fig. 16 Map Sensor —8.0L Engine

- 1 - MAP SENSOR
- 2 - MOUNTING BOLTS
- 3 - THROTTLE BODY

(17) Verify that fuel injector wire harness connectors are firmly connected to injectors in the correct order. Each harness connector is numerically tagged with the injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(18) Verify harness connectors are firmly connected to idle air control (IAC) motor and throttle position sensor (TPS).

(19) Verify that wire harness connector is firmly connected to the engine coolant temperature sensor (Fig. 17).

(22) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

(23) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic convertor.

(24) If equipped with automatic transmission, verify that electrical harness is firmly connected to park/neutral switch. Refer to 21, Automatic Transmission.

(25) Verify electrical harness is firmly connected to rear wheel speed sensor. Verify rear wheel speed sensor is firmly attached to rear axle with proper air gap. Refer to 5, Brakes for information.

(26) If equipped with 4-wheel antilock brake system, verify electrical harness is firmly connected to each front wheel speed sensor. Verify both front wheel speed sensors are firmly attached. Refer to 5, Brakes for information.

(27) Verify that fuel pump/gauge sender unit wire connector is firmly connected to harness connector.

(28) Inspect fuel hoses at fuel pump/gauge sender unit for cracks or leaks.

(29) Inspect transmission torque convertor housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(30) Verify that battery cable and solenoid feed wire connections to the starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

INSTALLATION

(1) Position pedal/bracket assembly over pivot pin (Fig. 22) .

(2) Install two new pivots/bushings. Using large pliers, press both bushings together until they bottom on sides of pedal/bracket assembly. Bushing retaining ears will snap into position when properly installed.

(3) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 21) . Align index slot on plastic cable retainer to this index tab.

CRANKSHAFT POSITION SENSOR**DESCRIPTION****DESCRIPTION - 5.9L**

The Crankshaft Position (CKP) sensor is located near the outer edge of the flywheel (starter ringear).

DESCRIPTION - 8.0L

The Crankshaft Position (CKP) sensor is located on the right-lower side of the cylinder block, forward of the right engine mount, just above the oil pan rail (Fig. 23).

80b01ce8

Fig. 23 CKP Sensor Location—8.0L V-10 Engine

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - HOLE
- 3 - OIL FILTER
- 4 - PLASTIC TIE STRAP
- 5 - PIGTAIL HARNESS

OPERATION**OPERATION - 5.9L**

Engine speed and crankshaft position are provided through the CKP sensor. The sensor generates pulses that are the input sent to the Powertrain Control Module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On 5.9L V-8 engines, the flywheel/drive plate has 8 single notches, spaced every 45 degrees, at its outer edge (Fig. 24).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM. For each engine revolution, there are 8 pulses generated on V-8 engines.

The engine will not operate if the PCM does not receive a CKP sensor input.

CRANKSHAFT POSITION SENSOR (Continued)

**Fig. 24 CKP Sensor Operation—5.9L Engine**

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - NOTCHES
- 3 - FLYWHEEL

OPERATION - 8.0L

The Crankshaft Position (CKP) sensor detects notches machined into the middle of the crankshaft (Fig. 25).

**Fig. 25 CKP Sensor Operation—8.0L V-10 Engine**

- 1 - CRANKSHAFT NOTCHES
- 2 - CRANKSHAFT
- 3 - CRANKSHAFT POSITION SENSOR

There are five sets of notches. Each set contains two notches. Basic ignition timing is determined by the position of the last notch in each set of notches. Once the Powertrain Control Module (PCM) senses the last notch, it will determine crankshaft position (which piston will next be at Top Dead Center). An input from the camshaft position sensor is also needed. It may take the module up to one complete engine revolution to determine crankshaft position during engine cranking.

The PCM uses the signal from the camshaft position sensor to determine fuel injector sequence. Once crankshaft position has been determined, the PCM begins energizing a ground circuit to each fuel injector to provide injector operation.

REMOVAL**REMOVAL - 5.9L**

The sensor is bolted to the top of the cylinder block near the rear of right cylinder head (Fig. 26).

- 2 - ELECTRICAL CONNECTOR
- 3 - PIGTAIL HARNESS

INSTALLATION - 8.0L

The crankshaft position sensor is located on the right-lower side of the cylinder block, forward of the right engine mount, just above the oil pan rail (Fig. 27).

- (1) Apply a small amount of engine oil to sensor o-ring (Fig. 29).

- (2) Install sensor into cylinder block with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CRANKSHAFT POSITION SENSOR (Continued)

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block (Fig. 28). If sensor is not flush, damage to sensor mounting tang may result.

(3) Install mounting bolt and tighten to 8 N·m (70 in. lbs.) torque.

(4) Connect sensor pigtail harness to main engine wiring harness

(5) Install new plastic tie strap (Fig. 27) to secure sensor pigtail harness to side of engine block. Thread tie strap through casting hole on cylinder block.

FUEL PUMP RELAY

DESCRIPTION

The 5-pin, 12-volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

OPERATION

The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shut-down the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

REMOVAL

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 30). Refer to label on PDC cover for relay location.

(1) Remove PDC cover.

(2) Remove relay from PDC.

(3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.

(4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 30). Refer to label on PDC cover for relay location.

(1) Install relay to PDC.

(2) Install cover to PDC.

Fig. 30 Power Distribution Center (PDC)

1 - POWER DISTRIBUTION CENTER (PDC)

IDLE AIR CONTROL MOTOR

DESCRIPTION

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

OPERATION

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

IDLE AIR CONTROL MOTOR (Continued)

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

IAC Stepper Motor Program: The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a "No-Load" engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

REMOVAL

REMOVAL - 5.9L

The IAC motor is located on the back of the throttle body (Fig. 31).

- (1) Remove air cleaner assembly.
- (2) Disconnect electrical connector from IAC motor.
- (3) Remove two mounting bolts (screws) (Fig. 31).

J9214-23

Fig. 31 Mounting Bolts (Screws)—IAC Motor—5.9L Engines

- 1 - MOUNTING SCREWS

INSTALLATION

INSTALLATION - 5.9L

The IAC motor is located on the back of the throttle body (Fig. 31).

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner assembly.

INSTALLATION - 8.0L

The IAC motor is located on the back of the throttle body (Fig. 32).

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner housing to throttle body.
- (5) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.
- (6) Install air cleaner housing cover.

INTAKE AIR TEMPERATURE SENSOR

DESCRIPTION - 5.9L/8.0L

The 2-wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the

sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION - 5.9L/8.0L

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5-volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

REMOVAL

REMOVAL - 5.9L

The intake manifold air temperature sensor is located in the front/side of the intake manifold (Fig. 33).

- (1) Remove air cleaner assembly.
- (2) Disconnect electrical connector at sensor (Fig. 33).
- (3) Remove sensor from intake manifold.

**Fig. 33 Air Temperature Sensor—5.9L**

- 1 - INTAKE MANIFOLD AIR TEMPERATURE SENSOR
- 2 - ELECTRICAL CONNECTOR

INTAKE AIR TEMPERATURE SENSOR (Continued)

REMOVAL - 8.0L

The intake manifold air temperature sensor is located in the side of the intake manifold near the front of throttle body (Fig. 34).

- (1) Disconnect electrical connector at sensor.
- (2) Remove sensor from intake manifold.

Fig. 34 Air Temperature Sensor—8.0L Engine

- 1 - INTAKE MANIFOLD AIR TEMP. SENSOR
2 - INTAKE MANIFOLD

INSTALLATION**INSTALLATION - 5.9L**

The intake manifold air temperature sensor is located in the front/side of the intake manifold (Fig. 33).

- (1) Install sensor to intake manifold. Tighten to 12–15 N·m (110–130 in. lbs.) torque.
- (2) Install electrical connector.
- (3) Install air cleaner.

INSTALLATION - 8.0L

The intake manifold air temperature sensor is located in the side of the intake manifold near the front of throttle body (Fig. 34).

- (1) Install sensor to intake manifold. Tighten to 12–15 N·m (110–130 in. lbs.) torque.
- (2) Install electrical connector.

MANIFOLD ABSOLUTE PRESSURE SENSOR**DESCRIPTION - 5.9L/8.0L**

On 5.9L engines, the MAP sensor is mounted on the side of the engine throttle body. The sensor is connected to the throttle body with a rubber L-shaped fitting.

On the 8.0L 10-cylinder engine, the MAP sensor is mounted into the right side of the intake manifold.

OPERATION - 5.9L/8.0L

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width

MANIFOLD ABSOLUTE PRESSURE SENSOR (Continued)

- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops .10 in. Hg. If a storm goes through it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

REMOVAL

REMOVAL - 5.9L

The MAP sensor is located on the front of the throttle body (Fig. 35). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 36).

The MAP sensor is located on the front of the throttle body (Fig. 35). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 36).

- (1) Remove air cleaner assembly.
- (2) Remove two MAP sensor mounting bolts (screws) (Fig. 35).
- (3) While removing MAP sensor, slide the vacuum rubber L-shaped fitting (Fig. 36) from the throttle body.
- (4) Remove rubber L-shaped fitting from MAP sensor.

Fig. 35 MAP Sensor Location—5.9L Engines

- 1 - MAP SENSOR
- 2 - MOUNTING SCREWS (2)

Fig. 36 MAP Sensor L-Shaped Rubber Fitting—5.9L Engines

- 2 - MOUNTING BOLTS
- 3 - THROTTLE BODY

INSTALLATION

INSTALLATION - 5.9L

The MAP sensor is located on the front of the throttle body (Fig. 35). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 36).

- (1) Install rubber L-shaped fitting to MAP sensor.
- (2) Position sensor to throttle body while guiding rubber fitting over throttle body vacuum nipple.
- (3) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.
- (4) Install air cleaner.

INSTALLATION - 8.0L

The MAP sensor is mounted into the right upper side of the intake manifold (Fig. 37). A rubber gasket is used to seal the sensor to the intake manifold. The rubber gasket is part of the sensor and is not serviced separately.

- (1) Check the condition of the sensor seal. Clean the sensor and lubricate the rubber gasket with clean engine oil.
- (2) Clean the sensor opening in the intake manifold.
- (3) Install the sensor into the intake manifold.
- (4) Install sensor mounting bolts. Tighten bolts to 2 N·m (20 in. lbs.) torque.
- (5) Install the electrical connector to sensor.

O2 SENSOR

DESCRIPTION

The Oxygen Sensors (O2S) are attached to, and protrude into the vehicle exhaust system. Depending on the emission package, the vehicle may use a total of either 2 or 4 sensors.

Medium and Heavy Duty 8.0L V-10 Engine: Four sensors are used (2 upstream, 1 pre-catalyst and 1 post-catalyst). With this emission package, the 1/1 upstream sensor (left side) is located in the left exhaust downpipe before both the pre-catalyst sensor (1/2), and the main catalytic converter. The 2/1 upstream sensor (right side) is located in the right exhaust downpipe before both the pre-catalyst sensor (1/2), and the main catalytic converter. The pre-catalyst sensor (1/2) is located after the 1/1 and 2/1 sensors, and just before the main catalytic converter. The post-catalyst sensor (1/3) is located just after the main catalytic converter.

Heavy Duty 5.9L Engine: Two sensors are used. They are **both** referred to as upstream sensors (left side is referred to as 1/1 and right side is referred to as 2/1). With this emission package, a sensor is located in each of the exhaust downpipes before the main catalytic converter.

OPERATION

An O2 sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7-to-1 air/fuel ratio necessary for proper engine operation and to control emissions.

The O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the O2 sensor case housing.

Four wires (circuits) are used on each O2 sensor: a 12-volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

Oxygen Sensor Heaters/Heater Relays: Depending on the emissions package, the heating elements within the sensors will be supplied voltage from either the ASD relay, or 2 separate oxygen sensor relays. Refer to 8, Wiring Diagrams to determine which relays are used.

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures

O2 SENSOR (Continued)

around 70°F, the resistance of the heating element is approximately 4.5 ohms. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

Upstream Sensors: Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Downstream Sensors: Two downstream sensors are used (1/2 and 2/2). The downstream sensors are used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage, and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Medium and Heavy Duty 8.0L V-10 Engine: Four oxygen sensors are used (2 upstream, 1 pre-catalyst and 1 post-catalyst). The upstream sensors (1/1 and 2/1) will fine-tune the air-fuel ratio through the Powertrain Control Module (PCM). The pre-catalyst (1/2) and post-catalyst (1/3) sensors will determine catalytic convertor efficiency (efficiency of the main

catalytic convertor). This is also done through the PCM.

Heavy Duty 5.9L Engine: Downstream sensors are not used with this emissions package, meaning catalytic convertor efficiency is not calculated with this package. Two upstream sensors are used. The left upstream sensor (1/1) will monitor cylinders 1, 3, 5 and 7. The right upstream sensor (2/1) will monitor cylinders 2, 4, 6 and 8. The PCM monitors the oxygen content of the sensors, and will fine-tune the air-fuel ratio.

Engines equipped with either a downstream sensor(s), or a post-catalytic sensor, will monitor catalytic convertor efficiency. If efficiency is below emission standards, the Malfunction Indicator Lamp (MIL) will be illuminated and a Diagnostic Trouble Code (DTC) will be set. Refer to Monitored Systems in Emission Control Systems for additional information.

REMOVAL

Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

The O2S (oxygen sensors) are numbered 1/1, 1/2, 1/3, 2/1 and 2/2.

On HDC engines, the pre-catalyst/post catalyst O2S sensors are located at the inlet and outlet ends of the catalytic converter (Fig. 38).

The 1/1 and 2/1 sensors are located before the mini-cats (Fig. 39). The 1/2 and 2/2 sensors are located after the mini-cats (Fig. 39).

Fig. 38 Pre-catalyst/Post catalyst Oxygen Sensors—HDC Engines

- 1 - POST CATALYST OXYGEN SENSOR (1/3)
- 2 - PRE-CATALYST OXYGEN SENSOR (1/2)

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

O2 SENSOR (Continued)

Fig. 39 Oxygen Sensors—5.9L California Engines

- (1) Raise and support the vehicle.
- (2) Disconnect the wire connector from the O2S sensor.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

- (3) Remove the O2S sensor with an oxygen sensor removal and installation tool.

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to the threads of a new oxygen sensor.**

- (1) Install the O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.
- (2) Connect the O2S sensor wire connector.
- (3) Lower the vehicle.

PTO SWITCH

DESCRIPTION

This Powertrain Control Module (PCM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

OPERATION

The input is used only to tell the PCM that the PTO has been engaged. The PCM will disable (temporarily shut down) certain OBD II diagnostic trouble codes when the PTO is engaged.

When the aftermarket PTO switch has been engaged, a 12V + signal is sent through circuit G113 to PCM pin A13. The PCM will then sense and determine that the PTO has been activated.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

REMOVAL

REMOVAL - 5.9L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

- (1) Remove the air cleaner.
- (2) Disconnect throttle body electrical connectors at MAP sensor, IAC motor and TPS (Fig. 40).
- (3) Remove vacuum line at throttle body.
- (4) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section of this group for additional information.
- (5) Remove four throttle body mounting bolts (Fig. 41).
- (6) Remove throttle body from intake manifold.
- (7) Discard old throttle body-to-intake manifold gasket.

REMOVAL - 8.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

- (1) Remove the air cleaner cover.

(6) Remove throttle body from intake manifold.

(7) Discard old throttle body-to-intake manifold gasket.

INSTALLATION

INSTALLATION - 5.9L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

(1) Clean the mating surfaces of the throttle body and the intake manifold.

(2) Install new throttle body-to-intake manifold gasket.

(3) Install throttle body to intake manifold.

(4) Install four mounting bolts. Tighten bolts to 23 N·m (200 in. lbs.) torque.

(5) Install control cables.

(6) Install vacuum line to throttle body.

(7) Install electrical connectors.

(8) Install air cleaner.

THROTTLE BODY (Continued)

INSTALLATION - 8.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

(1) Clean the mating surfaces of the throttle body and the intake manifold.

(2) Install new throttle body-to-intake manifold gasket.

(3) Install throttle body to intake manifold.

(4) Install four mounting nuts. Tighten nuts to 22 N·m (192 in. lbs.) torque.

(5) Install control cables.

(6) Install electrical connectors.

(7) Install air cleaner housing to throttle body.

(8) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.

(9) Install air cleaner housing cover.

THROTTLE CONTROL CABLE

REMOVAL

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

(1) From inside the vehicle, hold up the accelerator pedal. Remove the plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 21). The plastic cable retainer snaps into pedal the arm.

(2) Remove the cable core wire at the pedal arm.

(3) Remove the air cleaner housing.

(4) From inside the vehicle, pinch both sides of the plastic cable housing retainer tabs at the dash panel (Fig. 21).

(5) Remove cable housing from dash panel and pull the cable into the engine compartment.

(6) **5.9L Engines:** Disconnect the cable from the routing/holddown clip at the radiator fan shroud.

(7) **8.0L V-10 Engine:** Remove the throttle cable socket at throttle lever ball. (Fig. 44) (snaps off).

(8) **5.9L Engines:** Slip the cable end rearward from pin on throttle body (Fig. 43).

(9) Remove cable housing at throttle body mounting bracket by pressing on release tab with a small screwdriver (Fig. 45) or (Fig. 44). **To prevent cable housing breakage, press on the tab only enough to release the cable from the bracket.** Lift the cable housing straight up from bracket while pressing on release tab. Remove throttle cable from vehicle.

THROTTLE CONTROL CABLE (Continued)

**Fig. 45 Cable Release**

1 - TAB

INSTALLATION**(1) 5.9L Engines:**

(a) Rotate and hold the throttle cam in the full wide open position. Snap the cable end onto lever pin (Fig. 43).

(b) Connect cable to throttle body mounting bracket (push down and lock).

(c) Connect cable to fan shroud routing clip.

(2) 8.0L V-10 Engine:

(a) Connect cable end socket to throttle body lever ball (snaps on) (Fig. 44).

(b) Connect cable to throttle body mounting bracket (push down and lock).

(3) Install the remaining cable housing end into and through the dash panel opening (snaps into position). The two plastic pinch tabs (Fig. 21) should lock the cable to dash panel.

(4) From inside the vehicle, hold up the accelerator pedal. Install the throttle cable core wire and plastic cable retainer into and through the upper end of the pedal arm (the plastic retainer is snapped into the pedal arm). When installing the plastic retainer to the accelerator pedal arm, note the index tab on the pedal arm (Fig. 21). Align the index slot on the plastic cable retainer to this index tab.

THROTTLE POSITION SENSOR**DESCRIPTION**

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade.

OPERATION

The TPS is a 3-wire variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance (output voltage) of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
- Deceleration fuel lean out
- Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
- A/C WOT cutoff (certain automatic transmissions only)

REMOVAL**REMOVAL - 5.9L**

The TPS is located on the side of the throttle body.

- (1) Remove air intake tube at throttle body.
- (2) Disconnect TPS electrical connector.
- (3) Remove two TPS mounting bolts (Fig. 46).
- (4) Remove TPS from throttle body.

REMOVAL - 8.0L

The TPS is located on the side of the throttle body (Fig. 47).

- (1) Remove air intake tube at air cleaner housing.
- (2) Remove the air cleaner cover.
- (3) Remove the 4 air cleaner housing mounting nuts and remove housing from throttle body.
- (4) Disconnect TPS electrical connector.
- (5) Remove two TPS mounting bolts (Fig. 47).
- (6) Remove TPS from throttle body.

INSTALLATION

INSTALLATION - 5.9L

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 48). The TPS must be installed so that it can be rotated a few degrees. If the sensor will not rotate, install the sensor with the throttle shaft on the other side of the socket tangs. The TPS will be under slight tension when rotated.

- (1) Install the TPS and two retaining bolts.

- (2) Tighten bolts to 7 N-m (60 in. lbs.) torque.
- (3) Manually operate the throttle control lever by hand to check for any binding of the TPS.
- (4) Connect TPS electrical connector to TPS.
- (5) Install air intake tube.

INSTALLATION - 8.0L

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 49). The TPS must be installed so that it can be rotated a few degrees. If the sensor will not rotate, install the sensor with the throttle shaft on the other side of the socket tangs. The TPS will be under slight tension when rotated.

- (2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
- (3) Manually operate the throttle control lever by hand to check for any binding of the TPS.
- (4) Connect TPS electrical connector to TPS.
- (5) Install air cleaner housing to throttle body.
- (6) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.
- (7) Install air cleaner housing cover.
- (8) Install air intake tube to cover.

FUEL INJECTOR

DESCRIPTION

A separate fuel injector (Fig. 50) is used for each individual cylinder.

Fig. 50 Fuel Injector

- 1 - FUEL INJECTOR
- 2 - NOZZLE
- 3 - TOP (FUEL ENTRY)

OPERATION

OPERATION

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

An individual fuel injector is used for each individual cylinder. The top (fuel entry) end of the injector is attached into an opening on the fuel rail.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

OPERATION - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

FUEL INJECTOR (Continued)

DIAGNOSIS AND TESTING - FUEL INJECTOR

To perform a complete test of the fuel injectors and their circuitry, use the DRB scan tool and refer to the appropriate Powertrain Diagnostics Procedures manual. To test the injector only, refer to the following:

Disconnect the fuel injector wire harness connector from the injector. The injector is equipped with 2 electrical terminals (pins). Place an ohmmeter across the terminals. Resistance reading should be approximately 12 ohms \pm 1.2 ohms at 20°C (68°F).

REMOVAL

- (1) Remove air cleaner assembly.
- (2) Remove fuel injector rail assembly. Refer to Fuel Injector Rail removal in this section.
- (3) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 51) or (Fig. 52).
- (4) Remove injector(s) from fuel rail.

Fig. 51 Fuel Injector Mounting—Typical

- 3 - FUEL RAIL

Fig. 52 Injector Retaining Clips—Typical Injector

- 1 - PLIERS
- 2 - INJECTOR CLIP
- 3 - FUEL INJECTOR
- 4 - FUEL RAIL

INSTALLATION

- (1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.
- (2) Install injector(s) and injector clip(s) to fuel rail.
- (3) Install fuel rail assembly. Refer to Fuel Injector Rail installation.
- (4) Install air cleaner.
- (5) Start engine and check for leaks.

FUEL DELIVERY - DIESEL

DESCRIPTION

DESCRIPTION - DIESEL FUEL DELIVERY SYSTEM

The fuel system on the Cummins 24 valve—Turbo Diesel Engine uses an **electronically controlled** fuel injection pump with three control modules.

Also refer to the Powertrain Control Module (PCM) or Engine Control Module sections.

Some fuel system components are shown in (Fig. 1).

The fuel delivery system consists of the:

- Accelerator pedal
- Air cleaner housing/element
- Fuel drain manifold (passage)
- Fuel filter/water separator
- Fuel heater
- Fuel heater relay
- Fuel transfer (lift) pump
- Fuel injection pump
- Fuel injectors
- Fuel heater temperature sensor
- Fuel tank
- Fuel tank filler/vent tube assembly

- Fuel tank filler tube cap
- Fuel tank module containing the rollover valve, fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of tank module
- Fuel tubes/lines/hoses
- High-pressure fuel injector lines
- In-tank fuel filter (at bottom of fuel tank module)
- Low-pressure fuel supply lines
- Low-pressure fuel return line
- Overflow valve
- Quick-connect fittings
- Throttle cable
- Water draining

OPERATION

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 120,000 KPA (17,405 PSI). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FUEL SYSTEM AIR LEAK VACUUM TEST

The proceeding test will determine if a fuel system air leak exists at the engine. Air leaks will cause hard starting and/or poor performance.

A hand-operated vacuum pump/gauge equipped with a remote or built-on fluid container will be used. A typical hand-operated pump is shown in (Fig. 2). The use of a hand-operated pump **with** a fluid container will prevent fuel oil from entering and possibly damaging pump. Two rubber caps (one 5/16" and one 3/8") will also be used to temporarily plug / seal fuel system.

80cd386c

Fig. 2 HAND-OPERATED VACUUM PUMP (TYPICAL)

- 1 - PUMP
- 2 - CONTAINER

Vacuum Test Set-Up, Specifications and Conditions

- Examine all engine fuel system components, fittings, lines and hoses for visual evidence of fuel leakage. Repair as necessary before proceeding.
- Be sure gauge on your hand-operated pump is accurate and pump does not leak. Perform a simple test on pump. Add a 3 foot section (minimum) of clear plastic hose to the pump.
- Apply maximum 15-20 inches of vacuum for tests.
- System should hold 15-20 inches of vacuum for 5 continuous minutes. After 5 minutes, vacuum should not drop more than 0.1 inch Hg for 1 minute.

- Disconnect fuel supply and return lines (quick-connects) at rear of engine (Fig. 3).

- Drain as much fuel as possible from engine fuel lines. Also, completely drain fuel filter/water separator housing. Refer to Fuel Filter/Water Separator Removal and Installation for fuel draining procedures. This step must be done to prevent liquid fuel from entering and possibly damaging your hand-operated pump.

80cd2af0

Fig. 3 QUICK-CONNECT FITTINGS LOCATION

- 1 - FUEL SUPPLY LINE
- 2 - SUPPORT BRACKET BOLT
- 3 - FUEL RETURN LINE
- 4 - QUICK-CONNECT FITTINGS (2)

Testing All Engine Fuel System Components Together

This test will indicate an air leak is present somewhere on the engine.

- (1) Be sure water drain valve is securely closed.
- (2) Examine all engine fuel system components, fittings, lines and hoses for visual evidence of fuel leakage. Repair as necessary.
- (3) Install 5/16" rubber cap to fuel return line on engine (Fig. 4).
- (4) Install hand-operated vacuum pump to fuel supply line on engine (Fig. 4).
- (5) Perform vacuum test. Be careful not to allow liquid fuel to get into your hand-operated vacuum pump.
- (6) Vacuum holds ? End of test; no leaks found on engine.
- (7) Vacuum leak ? Proceed. The following tests will isolate the component that is leaking.

FUEL DELIVERY - DIESEL (Continued)

**Fig. 4 VACUUM PUMP INSTALLED TO FUEL LINE**

- 1 - FUEL SUPPLY LINE
- 2 - FUEL TRANSFER PUMP
- 3 - FUEL RETURN LINE
- 4 - RUBBER CAP
- 5 - FLUID CONTAINER
- 6 - HAND-OPERATED PUMP

Testing Fuel Transfer Pump

(1) Leave vacuum pump attached to fuel supply line (Fig. 5).

(2) Disconnect rubber fuel hose from fitting at outlet side of fuel transfer pump (Fig. 5). To plug / seal system, install 3/8" rubber cap to this fitting (Fig. 5).

(3) Perform vacuum test. Be careful not to allow liquid fuel to get into your hand-operated vacuum pump.

(4) Vacuum leak ? Check/repair all transfer pump fittings and sealing washers for leaks. Check/repair rubber hose and clamps at sides of transfer pump for leaks. Perform another vacuum test. If leak still present, replace fuel transfer pump.

(5) Vacuum holds ? Proceed.

Testing Fuel Filter / Water Separator

(1) Leave vacuum pump attached to fuel supply line (Fig. 4).

(2) Disconnect rubber fuel hose located between VP-44 pump and fuel filter/water separator (Fig. 6). To allow easier hose removal, remove test port fitting and fuel inlet line at VP-44 pump (Fig. 6). To plug / seal system, install 3/8" rubber cap to this outline line (Fig. 7).

(3) Reconnect rubber fuel hose to fitting at outlet side of fuel transfer pump (Fig. 5).

(4) Perform vacuum test. Be careful not to allow liquid fuel to get into hand-operated vacuum pump.

**Fig. 5 FUEL HOSE AT TRANSFER PUMP**

- 1 - HAND-OPERATED PUMP
- 2 - RUBBER CAP TO FUEL TRANSFER PUMP OUTLET FITTING
- 3 - DISCONNECTED FUEL OUTLET HOSE
- 4 - FUEL TRANSFER PUMP
- 5 - TRANSFER PUMP INLET FITTING

(5) Vacuum leak ? Check/repair all fittings and sealing washers for leaks. Check/repair rubber hose and clamps for leaks. Check fuel heater and water-in-fuel sensor o-rings for leaks. Check filter canister seal at top of canister for leaks. Repair as necessary.

(6) Vacuum holds ? Proceed.

Testing VP-44 Pump and Fuel Return / Drain System Within Cylinder Head

(1) Leave vacuum pump attached to fuel supply line (Fig. 4).

(2) Position rubber hose and 2 clamps to VP-44 drain line. Install test port fitting and fuel drain line to VP-44 pump. Tighten test port fitting to 24 N·m (18 ft. lbs. or 212 in. lbs.) torque. Position 2 hose clamps to rubber hose.

(3) Loosen, but do not remove, fuel line support bracket bolt (Fig. 8).

(4) Disconnect and separate fuel drain line at top of "T" fitting (Fig. 8). To plug / seal system, install 3/8" rubber cap to this disconnected line (Fig. 8).

(5) Perform vacuum test. Be careful not to allow liquid fuel to get into your hand-operated vacuum pump.

(6) Vacuum leak ?

(a) Check return line banjo bolt and sealing washers at rear of cylinder head for leaks. Repair as necessary.

FUEL DELIVERY - DIESEL (Continued)

- 2 - OUTLET LINE
- 3 - RUBBER CAP

(b) Remove all high-pressure fuel lines at injector high-pressure connectors. Examine all injector connector o-rings. If any damage to o-ring exists, replace connector.

(c) If no damage is found at connectors, remove all 6 fuel injectors to inspect o-rings and sealing washers. Also inspect cylinder head bores where these sealing washers make contact. The bore contact area should be smooth and uniform.

(7) Vacuum holds ? Proceed.

**Fig. 8 "T" FITTING - TOP DISCONNECTED**

- 1 - RUBBER SEAL/GASKET
- 2 - FUEL DRAIN LINE AT TOP OF "T" FITTING (FROM REAR OF CYLINDER HEAD)
- 3 - RUBBER CAP
- 4 - "T" FITTING
- 5 - LEFT REAR CORNER OF ENGINE
- 6 - SUPPORT BRACKET BOLT

Testing VP-44 Pump and its Return Line

(1) Remove rubber 3/8" sealing cap and reconnect / tighten fuel drain line to top of "T" fitting (Fig. 8).

(2) Disconnect and separate VP-44 drain line at front of "T" fitting (Fig. 9). To plug / seal system, install 3/8" rubber cap to this disconnected line (Fig. 9).

(3) Disconnect rubber fuel hose at VP-44 inlet (Fig. 10). Connect your hand-operated vacuum pump at this inlet point.

(4) Perform vacuum test. Be careful not to allow liquid fuel to get into your hand-operated vacuum pump.

FUEL DELIVERY - DIESEL (Continued)

(5) Vacuum leak ? Check condition of banjo fittings, banjo bolts, and sealing washers. If leaks are not present, a leak exists within VP-44 pump. Replacement of VP-44 requires authorization.

DIAGNOSIS AND TESTING - AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock. After service is performed, air must be bled from the system before starting the engine.

Inspect the fuel system from the fuel transfer pump to the injectors for loose connections. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the transfer pump. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

For air bleeding, refer to the Air Bleed Procedure.

DIAGNOSIS AND TESTING - FUEL SUPPLY RESTRICTIONS

LOW-PRESSURE LINES

Fuel supply line restrictions or a defective fuel transfer pump can cause starting problems and prevent engine from accelerating. The starting problems include; low power and/or white fog like exhaust.

Test all fuel supply lines for restrictions or blockage. Flush or replace as necessary. Bleed fuel system of air once a fuel supply line has been replaced. Refer to Air Bleed Procedure for procedures.

To test for fuel line restrictions, a vacuum restriction test may be performed. Refer to Fuel Transfer Pump Pressure Test.

HIGH-PRESSURE LINES

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance, engine mis-fire and white smoke from exhaust.

Examine all high-pressure lines for any damage. Each radius on each high-pressure line must be smooth and free of any bends or kinks.

Replace damaged, restricted or leaking high-pressure fuel lines with correct replacement line.

CAUTION: All high-pressure fuel lines must be clamped securely in place in holders. Lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If line is kinked or bent, it must be replaced. Use only recommended lines when replacement of high-pressure fuel line is necessary.

FUEL DELIVERY - DIESEL (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURES - WATER DRAINING AT FUEL FILTER

Refer to Fuel Filter/Water Separator removal/installation for procedures.

STANDARD PROCEDURES - CLEANING FUEL SYSTEM PARTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

STANDARD PROCEDURE - AIR BLEED

A certain amount of air becomes trapped in the fuel system when fuel system components on the supply and/or high-pressure side are serviced or replaced. Primary air bleeding is accomplished using the electric fuel transfer (lift) pump. If the vehicle has been allowed to run completely out of fuel, the fuel injectors must also be bled as the fuel injection pump **is not** self-bleeding (priming).

Servicing or replacing components on the fuel return side will not require air bleeding.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE.

(1) Loosen, but do not remove, banjo bolt (test port fitting) holding low-pressure fuel supply line to side of fuel injection pump (Fig. 11). Place a shop towel around banjo fitting to catch excess fuel.

The fuel transfer (lift) pump is self-priming: When the key is first turned on (without cranking engine), the pump operates for approximately 2 seconds and then shuts off. The pump will also operate for up to 25 seconds after the starter is quickly engaged, and then disengaged without allowing the engine to start. The pump shuts off immediately if the key is on and the engine stops running.

(2) Turn key to CRANK position and quickly release key to ON position before engine starts. This

Fig. 11 Fuel Supply Line Banjo Bolt

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

will operate fuel transfer pump for approximately 25 seconds.

(3) If fuel is not present at fuel supply line after 25 seconds, turn key OFF. Repeat previous step until fuel is exiting at fuel supply line.

(4) Tighten banjo bolt at fuel supply line to 24 N·m (18 ft. lbs.) torque. Primary air bleeding is now completed.

(5) Attempt to start engine. If engine will not start, proceed to following steps. **If engine does start, it may run erratically and be very noisy for a few minutes. This is a normal condition.**

(6) **Continue to next step if:**

- The vehicle fuel tank has been allowed to run empty
- The fuel injection pump has been replaced
- High-pressure fuel lines have been replaced
- Vehicle has not been operated after an extended period

CAUTION: Do not engage the starter motor for more than 30 seconds at a time. Allow two minutes between cranking intervals.

(7) Perform previous air bleeding procedure steps using fuel transfer pump. Be sure fuel is present at fuel supply line (Fig. 11) before proceeding.

FUEL DELIVERY - DIESEL (Continued)

(8) Crank the engine for 30 seconds at a time to allow air trapped in the injection pump to vent out the drain manifold.

WARNING: THE FUEL INJECTION PUMP SUPPLIES EXTREMELY HIGH FUEL PRESSURE TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING AND AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: ENGINE MAY START WHILE CRANKING STARTER MOTOR.

Engine may start, may run erratically and be very noisy for a few minutes. This is a normal condition.

(9) Thoroughly clean area around injector fittings where they join injector connector tubes.

(10) Bleed air by loosening high-pressure fuel line fittings (Fig. 12) at cylinders number 3, 4 and 5.

(11) Continue bleeding injectors until engine runs smoothly. It may take a few minutes for engine to run smooth.

80b46b80

Fig. 12 Bleeding High-Pressure Fuel Lines at Injectors

1 - HIGH-PRESSURE FUEL LINE

(12) Tighten fuel line(s) at injector(s) to 38 N·m (28 ft. lbs.) torque.

SPECIFICATIONS

FUEL SYSTEM PRESSURES—DIESEL ENGINES

DESCRIPTION	PRESSURE
Fuel Transfer (Lift) Pump Pressure With Engine Running	Minimum 69 kPa (10 psi)
Fuel Transfer (Lift) Pump Pressure With Engine Cranking	Minimum 48 kPa (7 psi)
Fuel Injector "Pop Off" Pressure	31,026 kPa (310 bars) or (4500 psi \pm 250 psi)
Fuel Injector Leak-Down Pressure	Approximately 20 bars (291 psi) lower than pop pressure
Fuel Pressure Drop Across Fuel Filter Test Ports	34 kPa max. (5 psi. max.) at 2500 rpm (rated rpm)
Overflow Valve Release Pressure	97 kPa max. (14 psi.) at 2500 rpm (rated rpm)

FUEL FILTER / WATER SEPARATOR

DESCRIPTION

The fuel filter/water separator assembly is located on left side of engine above starter motor (Fig. 13). The assembly also includes the fuel heater and Water-In-Fuel (WIF) sensor.

Fig. 13 FUEL HEATER LOCATION

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

OPERATION

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

Refer to the maintenance schedules for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator Removal/Installation section.

A Water-In-Fuel (WIF) sensor is attached to side of canister. Refer to Water-In-Fuel Sensor Description/Operation.

The fuel heater is installed into the top of the filter/separator housing. Refer to Fuel Heater Description/Operation.

FUEL FILTER / WATER SEPARATOR (Continued)

REMOVAL

Refer to maintenance schedules in this manual for recommended fuel filter replacement intervals.

Draining water from fuel filter/water separator housing:

The housing drain valve (Fig. 14) serves two purposes. One is to **partially** drain filter housing of excess water. The other is to **completely** drain housing for fuel filter, drain valve, heater element or water-in-fuel sensor replacement.

The filter housing should be partially drained whenever water-in-fuel warning lamp remains illuminated. (Note that lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

(1) A drain hose is located at bottom of drain valve (Fig. 14). Place drain pan under drain hose.

(2) **With engine not running**, pull drain valve handle upward to OPEN (DRAIN) position (Fig. 14). Hold drain valve open until all water and contaminants have been removed and clean fuel exits drain hose.

(3) If drain valve, fuel heater element or Water-In-Fuel (WIF) sensor is being replaced, drain housing completely. Dispose of mixture in drain pan according to applicable regulations.

(4) After draining operation, push valve handle downward to CLOSE position (Fig. 14).

Fig. 14 Water Drain Valve and Drain Hose

- 6 - O-RINGS
- 7 - DRAIN VALVE
- 8 - FUEL HEATER THERMOSTAT
- 9 - WATER-IN-FUEL SENSOR

(5) **Fuel Filter Replacement:** The fuel filter is located inside of the fuel filter housing (Fig. 15).

(a) Unscrew and remove fuel filter cap at top of fuel filter housing (Fig. 14). To unscrew, attach tool to 6-sided hex center of cap. Do not attempt to loosen cap at outer edge. The fuel filter cap is designed to remove filter while pulling up on cap.

(b) Remove o-ring (Fig. 15) from filter cap and discard.

(c) The filter is retained to the cap with a series of locking fingers. Carefully pry back a few of the fingers to unlock filter from cap.

(6) **Water-In-Fuel (WIF) Sensor Replacement:** The WIF sensor is located on the side of the fuel filter housing (Fig. 15).

(a) Disconnect electrical connector at sensor (Fig. 16).

(b) Unscrew sensor from filter housing.

FUEL FILTER / WATER SEPARATOR (Continued)

**Fig. 16 Water-In-Fuel Sensor**

- 1 - WATER-IN-FUEL (WIF) SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - WIF SENSOR CONNECTOR

**Fig. 17 Fuel Heater/Filter/Water Separator Location**

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

(c) Check condition of o-ring.

(d) Inspect the 2 WIF sensor probes. Carefully clean contaminants from sensor probes with a cloth if necessary. Replace sensor if probes are covered with contaminants and will not clean up.

(7) **Fuel Heater Element Replacement:** The heater element is located in the fuel filter housing (Fig. 15).

(a) Remove fuel filter. See previous steps.

(b) Disconnect electrical connector from fuel temperature sensor housing at side of fuel filter housing (Fig. 17).

(c) Remove 2 temperature sensor housing mounting screws and carefully remove sensor housing from fuel filter housing.

(d) Pry round wiring connector from fuel filter housing and heater element. This connector passes through the fuel filter housing and is plugged directly into the heater element.

(e) Unlock heater element fingers and pry heater element from filter housing.

(8) **Drain Valve Replacement:** The drain valve is located on the side of the fuel filter housing (Fig. 15).

(a) Disconnect drain hose (Fig. 14) at bottom of drain valve.

(b) Remove 4 drain valve mounting screws.

(c) Remove drain valve from filter housing.

(d) Remove 2 drain valve o-rings from filter housing.

INSTALLATION

Refer to maintenance schedules in this manual for recommended fuel filter replacement intervals.

(1) Thoroughly clean inside of filter housing, filter cap and all related components.

(2) **Fuel Filter:**

(a) Fill fuel filter housing with clean diesel fuel.

If filter housing (canister) is not filled with clean diesel fuel before installation, manual air bleeding of fuel system may be necessary (temporary rough engine running may occur). If necessary, refer to Air Bleed Procedures.

(b) Snap new filter into locking fingers on cap. Hole in filter should face downward.

(c) Install new o-ring to cap.

(d) Apply a light film of clean diesel oil to cap o-ring seal.

(e) Load filter and cap into housing.

(f) Tighten cap to 25 ft. lbs. torque. Do not over-tighten cap.

(3) **Water-In-Fuel (WIF) Sensor:**

(a) Install new o-ring seal to WIF sensor.

(b) Apply a light film of clean diesel oil to o-ring seal.

(c) Install sensor into housing.

FUEL FILTER / WATER SEPARATOR (Continued)

(d) Tighten sensor to 2–3 N·m (15–20 in. lbs.) torque.

(e) Connect electrical connector to WIF sensor.

(f) Install fuel filter. Refer to previous steps.

(4) **Fuel Heater Element:**

(a) Do not install fuel filter until heater element is installed.

(b) Position heater element into filter housing (fingers downward). Lock fingers into housing.

(c) Install new o-ring to electrical connector (where connector passes through filter housing). Apply a light film of clean diesel oil to o-ring seal. Press this connector into filter housing until it snaps into heater element.

(d) Install temperature sensor housing and 2 mounting screws to fuel filter housing.

(e) Connect electrical connector.

(f) Install fuel filter. Refer to previous steps.

(5) **Drain Valve:**

(a) Install 2 new o-rings to valve and filter housing.

(b) Apply a light film of clean diesel oil to both seals.

(c) Position valve to filter housing.

(d) Install 4 mounting screws and tighten to 3–5 N·m (30–40 in. lbs.) torque.

(e) Connect drain hose to drain valve.

(f) Install fuel filter. Refer to previous steps.

(6) Start engine and check for leaks.

Fig. 18 Fuel Heater Location

1 - FUEL HEATER AND TEMP. SENSOR

2 - FUEL FILTER/WATER SEPARATOR

3 - FUEL HEATER ELECTRICAL CONNECTOR

DIAGNOSIS AND TESTING - FUEL HEATER

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

NOTE: The fuel heater element, fuel heater relay and fuel heater temperature sensor are not controlled by the Powertrain Control Module (PCM).

A malfunctioning fuel heater can cause a wax build-up in the fuel filter/water separator. Wax build-up in the filter/separator can cause engine starting problems and prevent the engine from revving up. It can also cause blue or white fog-like exhaust. If the heater is not operating in cold temperatures, the engine may not operate due to fuel waxing.

The fuel heater assembly is located on the side of the fuel filter housing (Fig. 19).

The heater assembly is equipped with a built-in fuel temperature sensor (thermostat) that senses fuel temperature. When fuel temperature drops below 45 degrees \pm 8 degrees F, the sensor allows current to flow to the built-in heater element to warm the fuel. When fuel temperature rises above 75 degrees \pm 8 degrees F, the sensor stops current flow to the heater element (circuit is open).

FUEL HEATER

DESCRIPTION

The fuel heater assembly is located on the side of the fuel filter housing (Fig. 18).

The heater/element assembly is equipped with a temperature sensor (thermostat) that senses fuel temperature. This sensor is attached to the fuel heater/element assembly.

OPERATION

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

When the temperature is below 45 \pm 8 degrees F, the temperature sensor allows current to flow to the heater element warming the fuel. When the temperature is above 75 \pm 8 degrees F, the sensor stops current flow to the heater element.

Battery voltage to operate the fuel heater element is supplied from the ignition switch and through the fuel heater relay. Also refer to Fuel Heater Relay. **The fuel heater element and fuel heater relay are not computer controlled.**

The heater element operates on 12 volts, 300 watts at 0 degrees F.

FUEL HEATER (Continued)

**Fig. 19 Fuel Heater Location**

- 1 - FUEL HEATER AND TEMP. SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - FUEL HEATER ELECTRICAL CONNECTOR

Voltage to operate the fuel heater element is supplied from the ignition switch, through the fuel heater relay (also refer to Fuel Heater Relay), to the fuel temperature sensor and on to the fuel heater element.

The heater element operates on 12 volts, 300 watts at 0 degrees F. As temperature increases, power requirements decrease.

A minimum of 7 volts is required to operate the fuel heater. The resistance value of the heater element is less than 1 ohm (cold) and up to 1000 ohms warm.

TESTING

(1) Disconnect electrical connector at sensor (Fig. 19).

Turn key to ON position. 12 volts should be present at red wire. If not, check fuel heater relay and related wiring. Refer to Relay Test—Fuel Heater. If OK, proceed.

Turn key OFF. Check black wire in connector for ground continuity with an ohmmeter. If continuity is not present, correct open ground circuit. This test can also be performed with a voltmeter by backprobing black wire with it connected to sensor. Reconnect electrical connector and turn key ON. Voltage drop should not exceed 2 volts (2 volts lower than checked at 12V+ connector). If voltage is lower, check for dirty or corroded ground connection and repair. If OK, proceed.

(2) With electrical connector disconnected at sensor and key OFF, check electrical/mechanical operation of fuel temperature sensor. Proceed to next step:

(3) Using an ohmmeter, check for continuity across two terminals in electrical connector at side of sensor. Sensor circuit should be open if fuel temperature has risen above 75 degrees \pm 8 degrees F. Sensor circuit should be closed if fuel temperature has dropped below 45 degrees \pm 8 degrees F. If not, replace fuel heater assembly. This same test can also be performed using a voltmeter, with key ON, and by back-probing connector.

REMOVAL/INSTALLATION

The fuel heater/element/sensor assembly is located inside of the fuel filter housing. Refer to Fuel Filter/Water Separator Removal/Installation for procedures.

FUEL HEATER RELAY**DESCRIPTION**

The fuel heater relay is located in Power Distribution Center (PDC) (Fig. 20). Refer to label on inside of PDC cover for relay location.

**Fig. 20 Power Distribution Center Location**

- 1 - CLIP
- 2 - BATTERY
- 3 - TRAY
- 4 - NEGATIVE CABLE
- 5 - POSITIVE CABLE
- 6 - CLIP
- 7 - FENDER INNER SHIELD
- 8 - POWER DISTRIBUTION CENTER

OPERATION

Battery voltage to operate the fuel heater element is supplied from the ignition switch through the fuel heater relay. **The fuel heater element and fuel heater relay are not computer controlled.**

FUEL HEATER RELAY (Continued)

DIAGNOSIS AND TESTING - FUEL HEATER RELAY

The fuel heater relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

To test the fuel heater, refer to Fuel Heater Test.

To test the heater relay only, refer to following:

The relay terminal numbers from (Fig. 21) can be found on the bottom of the relay.

- Terminal number 30 is connected to battery voltage and can be switched or B+ (hot) at all times.
- The center terminal number 87A is connected (a circuit is formed) to terminal 30 in the de-energized (normally OFF) position.
- Terminal number 87 is connected (a circuit is formed) to terminal 30 in the energized (ON) position. Terminal number 87 then supplies battery voltage to the component being operated.
- Terminal number 86 is connected to a switched (+) power source.
- Terminal number 85 is grounded by the powertrain control module (PCM).

TESTING

(1) Remove relay before testing.

(2) Using an ohmmeter, perform a resistance test between terminals 85 and 86. Resistance value (ohms) should be 75 ± 5 ohms for resistor equipped relays.

(3) Connect the ohmmeter between terminals number 87A and 30. Continuity should be present at this time.

(4) Connect the ohmmeter between terminals number 87 and 30. Continuity should not be present at this time.

(5) Use a set of jumper wires (16 gauge or smaller). Connect one jumper wire between terminal number 85 (on the relay) to the ground side (-) of a 12 Volt power source.

(6) Attach the other jumper wire to the positive side (+) of a 12V power source. Do not connect this jumper wire to relay at this time.

CAUTION: Do not allow the ohmmeter to contact terminals 85 or 86 during these tests. Damage to ohmmeter may result.

Fig. 21 Relay Terminals

FUEL HEATER RELAY (Continued)

(7) Attach the other jumper wire (12V +) to terminal number 86. This will activate the relay. Continuity should now be present between terminals number 87 and 30. Continuity should not be present between terminals number 87A and 30.

(8) Disconnect jumper wires from relay and 12 Volt power source.

(9) If continuity or resistance tests did not pass, replace relay. If tests passed, refer to 8, Wiring Diagrams for (fuel system) relay wiring schematics and for additional circuit information.

REMOVAL

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 22). Refer to label under PDC cover for relay location.

Fig. 22 Power Distribution Center (PDC) Location

- 1 - CLIP
- 2 - BATTERY
- 3 - TRAY
- 4 - NEGATIVE CABLE
- 5 - POSITIVE CABLE
- 6 - CLIP
- 7 - FENDER INNER SHIELD
- 8 - POWER DISTRIBUTION CENTER

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 22). Refer to label under PDC cover for relay location.

- (1) Install relay to PDC.
- (2) Install cover to PDC.

FUEL INJECTION PUMP

DESCRIPTION

DESCRIPTION—FUEL PUMP 245 H.P.

Although the fuel injection pump on the 245 horsepower engine appears similar to other VP 44 injection pumps, there are internal differences that make it unique. If pump replacement is necessary, be sure to verify pump number. The pump number can be found on the Fuel Injection Pump Data Plate (Fig. 23).

- A. ORDER NUMBER
- B. BOSCH PART NUMBER
- C. FACTORY CODE
- D. CUMMINS PART NUMBER
- E. MANUFACTURE DATE
- F. PUMP SERIAL NUMBER
- G. LAST THREE DIGITS OF KEY PART NUMBER

80b4b8c9

Fig. 23 Fuel Injection Pump Data Plate Location

- 1 - PUMP DATA PLATE

DESCRIPTION—FUEL PUMP 235 H.P.

The fuel injection pump is mounted to the rear of the timing gear housing on the left side of engine (Fig. 24).

FUEL INJECTION PUMP (Continued)

**Fig. 24 Fuel Injection Pump Location**

- 1 - FPCM ELECTRICAL CONNECTOR
- 2 - HIGH-PRESSURE FUEL LINES
- 3 - FITTINGS
- 4 - FUEL INJECTION PUMP
- 5 - FPCM

OPERATION

The Bosch VP44 fuel injection pump (Fig. 25) is a solenoid-valve controlled-radial-piston-distributor type pump.

**Fig. 25 Bosch VP44 Fuel Injection Pump**

- 1 - BOSCH VP44 PUMP

The injection pump is driven by the engine camshaft. A gear on the end of the pump shaft meshes with the camshaft gear. The pump is timed to the engine. The VP44 is controlled by an integral (and non-serviceable) Fuel Pump Control Module (FPCM) (Fig. 24). The FPCM can operate the engine as an engine controller if a Crankshaft Position Sensor (CKP) signal is not present.

Fuel from the transfer (lift) pump enters the VP44 where it is pressurized and then distributed through high-pressure lines to the fuel injectors. The VP44 is cooled by the fuel that flows through it. A greater quantity of fuel is required for cooling the VP44 than what is necessary for engine operation. Because of this, approximately 70 percent of fuel entering the pump is returned to the fuel tank through the overflow valve and fuel return line. Refer to Overflow Valve Description/Operation for additional information.

The VP44 is not self-priming. At least two fuel injectors must be bled to remove air from the system. When servicing the fuel system, disconnecting components up to the pump will usually not require air bleeding from the fuel system. However, removal of the high-pressure lines, removal of the VP44 pump, or allowing the vehicle to completely run out of fuel, will require bleeding air from the high-pressure lines at the fuel injectors.

VP44 timing is matched to engine timing by an offset keyway that fits into the pump shaft. This keyway has a stamped number on it that is matched to a number on the VP44 pump (each keyway is calibrated to each pump).

When removing/installing the VP44, the same numbered keyway must always be installed. Also, the arrow on the top of the keyway should be installed pointed rearward towards the pump.

Because of electrical control, the injection pump high and low idle speeds are not adjustable. Also, adjustment of fuel pump timing is not required and is not necessary.

DIAGNOSIS AND TESTING—FUEL INJECTION PUMP TIMING

With the Bosch VP44 injection pump, there are no mechanical adjustments needed for fuel injection timing. All timing and fuel adjustments are made by the Engine Control Module (ECM). However, if a Diagnostic Trouble Code (DTC) has been stored indicating an "engine sync error" or a "static timing error", perform the following.

FUEL INJECTION PUMP (Continued)

Note: If this DTC appears after installation of a new or rebuilt injection pump, the pump keyway has probably been installed backwards. Refer to Fuel Injection Pump Removal/Installation for keyway information.

- 3 - PUMP GEAR
- 4 - CAM GEAR
- 5 - CRANKSHAFT GEAR

(1) Remove hose clamp and crankcase vent hose at crankcase breather (Fig. 26). Remove crankcase breather from gear cover. Breather threads into cover.

(2) Remove injection pump nut and washer (Fig. 27). Locate keyway behind washer.

(3) Be sure keyway aligning fuel injection pump shaft to injection pump gear is in proper position and pump gear has not slipped on pump shaft.

The following steps will require removing timing gear cover to gain access to timing gears. Refer to Group 9, Engines for procedures.

(4) Use a T-type puller to separate injection pump gear from pump shaft.

(5) Be sure keyway has been installed with arrow pointed to **rear** of pump (Fig. 28).

(6) **Pump timing has been calibrated to pump keyway. Be sure 3-digit number on pump keyway (Fig. 28) matches 3-digit number on fuel injection pump data plate. Plate is located on side of injection pump (Fig. 29). Twenty-one different calibrated keyways/pumps are available.**

(7) Verify timing marks on crank, cam and pump are aligned (Fig. 30).

(8) Perform necessary gear alignment/repairs as needed.

(9) Install crankcase breather to gear cover. Install hose clamp and crankcase vent hose to breather (Fig. 26).

(10) After repairs are completed, erase DTC using DRB Scan Tool.

REMOVAL

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables at both batteries. Cover and isolate ends of cables.

(2) Thoroughly clean fuel lines at cylinder head and injection pump ends. Thoroughly clean fuel injection pump and supply/return lines at side of pump.

(3) Disconnect 9-way electrical connector at Fuel Pump Control Module (FPCM) (Fig. 31).

Fig. 31 FPCM 9-Way Connector

- 1 - FPCM ELECTRICAL CONNECTOR
- 2 - HIGH-PRESSURE FUEL LINES
- 3 - FITTINGS
- 4 - FUEL INJECTION PUMP
- 5 - FPCM

(4) Remove fuel return line at side of injection pump by removing overflow valve (Fig. 32). Place rag beneath overflow valve to catch excess fuel.

(5) Remove fuel supply line at side of injection pump by removing banjo bolt (Fig. 32). Also remove same line at top of fuel filter housing (banjo bolt).

(6) Remove all high-pressure fuel lines, intake air tube, accelerator pedal position sensor, air intake housing, engine oil dipstick tube, wiring clips, electrical cables at intake heaters and engine lifting bracket. Refer to High-Pressure Fuel Line Removal/Installation. All of these items are covered in this procedure.

(7) Remove hose clamp at crankcase vent hose (Fig. 33) and remove hose from canister.

(8) Remove (unscrew) canister (Fig. 33) from gear cover.

**Fig. 35 Rotating Engine with Barring Tool**

- 1 - REAR FLANGE
- 2 - BARRING TOOL

CAUTION: To prevent pump/gear keyway from falling into gear housing, engine must be rotated until keyway is at 12 o'clock position (Fig. 36). If gear retainer nut, washer or key drops into gear housing, cover may have to be removed to retrieve them before engine is started.

(9) Remove nut and washer retaining injection pump gear to injection pump shaft (Fig. 34).

FUEL INJECTION PUMP (Continued)

**Fig. 41 Keyway, Keyway Arrow and Keyway Number**

- 1 - INJECTION PUMP
- 2 - DIRECTIONAL ARROW
- 3 - 3-DIGIT KEYWAY NUMBER
- 4 - O-RING

(13) Use T-bar type puller (Fig. 37) to separate injection pump gear from injection pump shaft. Attach two M8 X 1.24 MM (metric) screws through puller and into two threaded holes supplied in pump gear. Pull injection pump gear forward until it loosens from injection pump shaft. **Pull on gear only enough to loosen it from injection pump shaft. Pulling gear too far may cause damage or breakage to gear cover.**

(14) Remove 2 rear/lower pump bracket bolts (Fig. 38).

(15) Remove 4 injection pump-to-gear housing mounting nuts (Fig. 39).

(16) Remove injection pump from gear housing. **Take care not to nick injection pump shaft on aluminum gear housing when removing pump. Also be very careful not to drop pump keyway (Fig. 41) into gear housing.**

CAUTION: Whenever the fuel injection pump is removed from the engine, the pump drive gear is laying loose on the camshaft drive gear. Never attempt to crank or rotate the engine with the pump removed from the engine. Serious damage will occur.

INSTALLATION

(1) Inspect pump mounting surfaces at pump and mounting flange for nicks, cuts or damage. Inspect o-ring surfaces for nicks, cuts or damage.

(2) Clean injection pump mounting flange (Fig. 40) at gear housing. Also clean front of injection pump.

(3) Install new rubber o-ring (Fig. 41) at pump mounting area.

**Fig. 42 Injection Pump Installation**

- 1 - DOWEL
- 2 - PUMP
- 3 - PUMP SHAFT TAPER
- 4 - INJECTION PUMP GEAR TAPER

(4) Apply clean engine oil to injection pump o-ring only.

FUEL INJECTION PUMP (Continued)

The machined tapers on both injection pump shaft and injection pump gear (Fig. 42) must be absolutely dry, clean and free of any dirt or oil film. This will ensure proper gear-to-shaft tightening.

(5) Clean pump gear and pump shaft at machined tapers (Fig. 42) with an evaporative type cleaner such as brake cleaner.

Keyway Installation:

(6) The pump/gear keyway has an arrow and a 3-digit number stamped at top edge (Fig. 41). Position keyway into pump shaft with **arrow pointed to rear of pump**. Also be sure 3-digit number stamped to top of keyway is same as 3-digit number stamped to injection pump data plate (Fig. 43). If wrong keyway is installed, a diagnostic trouble code may be set.

80b4b8c9

Fig. 43 Injection Pump Data Plate Location

1 - PUMP DATA PLATE

(7) Position pump assembly to mounting flange on gear cover while aligning injection pump shaft through back of injection pump gear. When installing pump, dowel (Fig. 42) on mounting flange must align to hole in front of pump.

(8) After pump is positioned flat to mounting flange, install four pump mounting nuts and tighten finger tight only. Do not attempt a final tightening at this time. **Do not attempt to tighten (pull) pump to gear cover using mounting nuts. Damage to pump or gear cover may occur. The pump must be positioned flat to its mounting flange before attempting to tighten mounting nuts.**

(9) To prevent damage or cracking of components, tighten nuts/bolts in the following sequence:

(a) Install injection pump shaft washer and nut to pump shaft. Tighten nut **finger tight only**.

(b) Install 2 rear/lower pump mounting bolts **finger tight only**.

(c) Do preliminary tightening of injection pump shaft nut to 30 N·m (15–22 ft. lbs.) torque. **This is not the final torque.**

(d) Tighten 4 pump mounting nuts to 43 N·m (32 ft. lbs.) torque.

(e) Tighten 2 rear/lower pump bracket-to-pump bolts 24 N·m (18 ft. lbs.) torque.

(f) Do final tightening of injection pump shaft nut to 170 N·m (125 ft. lbs.) torque. Use barring tool to prevent engine from rotating when tightening gear.

(10) Install canister (Fig. 33) to gear cover.

(11) Install crankcase vent hose (Fig. 33) to canister and install hose clamp.

(12) Using new gaskets, install fuel return line and overflow valve to side of injection pump (Fig. 32). Tighten overflow valve to 24 N·m (18 ft. lbs.) torque.

(13) Using new gaskets, install fuel supply line to side of injection pump and top of fuel filter housing (Fig. 32). Tighten banjo bolts to 24 N·m (18 ft. lbs.) torque.

(14) Install all high-pressure fuel lines, intake air tube, accelerator pedal position sensor, air intake housing, engine oil dipstick tube, wiring clips, electrical cables at intake heaters and engine lifting bracket. Refer to High-Pressure Fuel Line Removal/Installation. All of these items are covered in this procedure.

(15) Connect 9-way electrical connector to Fuel Pump Control Module (FPCM) (Fig. 31).

(16) Connect both negative battery cables to both batteries.

(17) Bleed air from fuel system. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(18) Check system for fuel or engine oil leaks.

FUEL INJECTION PUMP DATA PLATE

SPECIFICATIONS

FUEL INJECTION PUMP DATA PLATE

Pertinent information about the fuel injection pump is machined into a boss on the drivers side of the fuel injection pump (Fig. 44).

Fig. 44 Fuel Injection Pump Data Plate Location

1 - PUMP DATA PLATE

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel tank module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel tank module on diesel powered models has 3 different circuits (wires). Two of these circuits are used at the fuel gauge sending unit for fuel gauge operation. The other wire is used for a ground. The diesel engine does not have a fuel tank module mounted electric fuel pump. The electric fuel pump (fuel transfer pump) is mounted to the engine.

For Fuel Gauge Operation: A constant input voltage source of about 12 volts (battery voltage) is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel tank module electrical connector unplugged).** With the connectors plugged, output voltages will vary from about .6 volts at FULL, to about 7.0 volts at EMPTY. The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

FUEL LINES

DESCRIPTION

DESCRIPTION

All fuel lines up to the fuel injection pump are considered low-pressure. This includes the fuel lines from: the fuel tank to the fuel transfer pump, and the fuel transfer pump to the fuel injection pump. The fuel return lines, the fuel drain manifold and the fuel drain manifold lines are also considered low-pressure lines. High-pressure lines are used between the fuel injection pump and the fuel injectors. Also refer to High-Pressure Fuel Lines Description/Operation.

FUEL LINES (Continued)

DESCRIPTION—HIGH PRESSURE FUEL LINES

The high-pressure fuel lines are the 6 lines located between the fuel injection pump and the fuel injector connector tubes (Fig. 45). All other fuel lines are considered low-pressure lines.

Fig. 45 High-Pressure Fuel Lines

OPERATION—HIGH PRESSURE FUEL LINES

CAUTION: The high-pressure fuel lines must be held securely in place in their holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel under pressure of up to approximately 120,000 kPa (17,405 PSI) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING - HIGH-PRESSURE FUEL LINE LEAKS

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES OF UP TO 120,000 kPa (17,400 PSI), USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Start the engine. Move the cardboard over the high-pressure fuel lines and check for fuel spray onto the cardboard (Fig. 46). If a high-pressure line connection is leaking, bleed the system and tighten the connection. Refer to the Air Bleed Procedure in this group for procedures. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

Fig. 46 Typical Test for Leaks with Cardboard

- 1 - HIGH-PRESSURE LINE
- 2 - CARDBOARD
- 3 - FITTING

FUEL LINES (Continued)

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

High-pressure lines are used between the fuel injection pump and the fuel injectors only. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

(2) Thoroughly clean fuel lines at cylinder head and injection pump ends.

(3) Remove cable cover (Fig. 47). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 47). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal. **Do not remove any cables at lever.**

(5) Using 2 small screwdrivers, pry front wiring clip (Fig. 49) from cable bracket housing. Position wiring harness towards front of engine.

(6) Remove electrical connector from APPS by pushing connector tab rearward while pulling down on connector (Fig. 50).

(7) Disconnect 2 electrical cables from cable mounting studs (Fig. 51) at intake air heater on top of intake manifold.

(8) Remove engine oil dipstick from engine.

(9) Remove engine oil dipstick tube support mounting bolt (Fig. 51) and position tube to side.

(10) Disconnect clamps and remove air tube (intake manifold-to-intercooler) (Fig. 49).

(11) Remove 4 air intake housing mounting bolts and remove housing (Fig. 52) and (Fig. 51). Position ground cable at top of air intake housing to front of engine.

(12) Remove intake manifold air heater element block from engine (Fig. 53). Discard old upper and lower gaskets

(13) Remove 3 cable bracket housing mounting bolts (Fig. 52). Carefully position cable bracket and cable assembly to side of engine. **Leave cables connected to lever.**

(18) Loosen high-pressure lines at cylinder head for cylinders 1, 2 and 4 (Fig. 54).

(19) Carefully remove front line bundle from engine. **Do not bend lines while removing.** While removing front line bundle, note line position.

(20) Loosen high-pressure lines at injection pump beginning with cylinders 3, 5 and 6.

(21) Loosen high-pressure lines at cylinder head for cylinders 3, 5 and 6 (Fig. 54).

(22) Carefully remove rear line bundle from engine. **Do not bend lines while removing.** While removing rear line bundle, note line position.

INSTALLATION

High-pressure lines are used between the fuel injection pump and the fuel injectors only. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

FUEL LINES (Continued)

CAUTION: Be sure that the high-pressure fuel lines are installed in the same order that they were removed.

(1) Lubricate threads of injector line fittings with clean engine oil.

(2) Loosen, but do not remove, all fuel line support bracket bolts.

(3) Install **rear** injection line bundle beginning with cylinder head (fuel injector) connections, followed by injection pump connections. Tighten all fittings finger tight.

(4) Tighten fittings at fuel injector ends for cylinders number 6 and 5 to 38 N·m (28 ft. lbs.) torque. **Do not tighten number 3 line at this time. It will be tightened during bleeding procedure.**

(5) Tighten 3 fittings at fuel injection pump ends to 24 N·m (18 ft. lbs.) torque.

(6) Install **front** injection line bundle beginning with cylinder head (fuel injector) connections, followed by injection pump connections. Tighten all fittings finger tight.

(7) Tighten fitting at fuel injector end for cylinder number 2 to 38 N·m (28 ft. lbs.) torque. **Do not tighten lines number 1 or 4 at this time. They will be tightened during bleeding procedure.**

(8) Tighten remaining 3 fittings at fuel injection pump ends to 24 N·m (18 ft. lbs.) torque.

(9) Install fuel line support bracket bolts to intake manifold and tighten to 24 N·m (18 ft. lbs.) torque.

CAUTION: Be sure fuel lines are not contacting each other or any other component. Noise will result.

(10) Install engine lifting bracket at rear of intake manifold. Tighten 2 bolts to 77 N·m (57 ft. lbs.) torque.

(11) Install cable bracket housing/cable assembly and tighten 3 mounting bolts to 24 N·m (18 ft. lbs.) torque.

(12) Clean any old gasket material below and above intake manifold air heater element block. Also clean mating areas at intake manifold and air intake housing.

(13) Using new gaskets, position intake manifold air heater element block to engine.

(14) Install air intake housing and position ground cable. Install 4 mounting bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(15) Install air tube (intake manifold-to-charge air cooler) (Fig. 49). Tighten clamps to 8 N·m (72 in. lbs.) torque.

(16) Install engine oil dipstick tube support mounting bolt and tighten to 24 N·m (18 ft. lbs.) torque.

(17) Install engine oil dipstick to engine.

(18) Connect 2 electrical cables to cable mounting studs.

(19) Connect electrical connector to bottom of APPS by pushing connector upward until it snaps into position.

(20) Connect wiring harness (clip) at bottom of Accelerator Pedal Position Sensor (APPS) mounting bracket (Fig. 48).

(21) Connect front wiring clip (Fig. 49) to cable bracket housing.

(22) Install cable cover (Fig. 47).

(23) Connect both negative battery cables to both batteries.

(24) Bleed air from fuel system. Do this at fuel injector ends of lines. Use cylinders numbers 1, 3 and 4 for bleeding. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). After bleeding, tighten fittings to 38 N·m (28 ft. lbs.) torque.

(25) Check lines/fittings for leaks.

FUEL TANK

DESCRIPTION - DIESEL FUEL TANK

The fuel tank is similar to the tank used with gasoline powered models. The tank is equipped with a separate fuel return line and a different fuel tank module for diesel powered models. A fuel tank mounted, electric fuel pump is not used with diesel powered models. Refer to Fuel Tank Module for additional information.

For removal and installation procedures, refer to Fuel Tank - Gasoline Engines.

FUEL TANK MODULE

DESCRIPTION

An electric fuel pump is **not used** in the fuel tank module for diesel powered engines. Fuel is supplied by the engine mounted fuel transfer pump and the fuel injection pump.

The fuel tank module is installed in the top of the fuel tank (Fig. 56). The fuel tank module (Fig. 56) contains the following components:

- Fuel reservoir
- A separate in-tank fuel filter
- Rollover valve
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection
- Fuel return line connection
- Auxiliary non-pressurized fuel supply fitting

OPERATION

Refer to Fuel Gauge Sending Unit.

FUEL TANK MODULE (Continued)

Fig. 56 Top View of Fuel Tank Module—Diesel

- 1 - AUXILIARY CAPPED FITTING
- 2 - FUEL PUMP MODULE
- 3 - FUEL SUPPLY/RETURN FITTINGS
- 4 - ELECTRICAL CONNECTOR
- 5 - LOCKNUT
- 6 - ROLLOVER VALVE

REMOVAL

- (1) Drain and remove fuel tank. Refer to Fuel Tank Removal/Installation.
- (2) Thoroughly clean area around tank module at top of tank.
- (3) The plastic fuel tank module locknut is threaded onto fuel tank. Install Special Tool 6856 to locknut and remove locknut (Fig. 57). The fuel tank module will spring up when locknut is removed.
- (4) Remove module from fuel tank.

INSTALLATION

CAUTION: Whenever the fuel tank module is serviced, the rubber gasket must be replaced.

- (1) Thoroughly clean locknut and locknut threads at top of tank.
- (2) Using new gasket, carefully position fuel tank module into opening in fuel tank.
- (3) Position locknut over top of fuel tank module. Install locknut finger tight.
- (4) When looking down at tank from drivers side of tank, the arrow at top of module should be aligned between two marks stamped into tank (approximately 2 o'clock position). The fuel line connectors, roll over valve and fuel gauge electrical connector should all be pointed to drivers side of vehicle. Rotate and align module/tank marks if necessary before tightening locknut. **This step must be performed to pre-**

Fig. 57 Locknut Removal/Installation—TYPICAL MODULE

- 1 - SPECIAL TOOL 6856
- 2 - LOCKNUT

vent the module's float from contacting side of fuel tank.

- (5) Tighten locknut to 24–44 N·m (18–32 ft. lbs.) torque.
- (6) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL TRANSFER PUMP

DESCRIPTION

The fuel transfer pump (fuel lift pump) is located on the left-rear side of the engine cylinder block above the starter motor (Fig. 58). The 12-volt electric vane-type pump is operated and controlled by the Engine Control Module (ECM) (Fig. 59).

OPERATION

The purpose of the fuel transfer pump is to supply (transfer) a low-pressure fuel source: **from** the fuel tank, **through** the fuel filter/water separator and **to** the fuel injection pump. Here, the low-pressure is raised to a high-pressure by the fuel injection pump for operation of the high-pressure fuel injectors. Check valves within the pump, control direction of fuel flow and prevent fuel bleed-back during engine shut down.

Normal current flow to the pump is 12 amperes.

With the engine running, the pump has **2** modes of operation: Mode 1: 100 percent duty-cycle with a minimum pressure of 10 psi **except when the engine is cranking**. Mode 2: 15 percent duty-cycle with maximum pressure of 7 psi **with the engine cranking**.

The 15 percent duty-cycle is used to limit injection pump inlet pressure until the engine is running.

FUEL TRANSFER PUMP (Continued)

**Fig. 58 Fuel Transfer Pump Location**

- 1 - OIL PRESSURE SENSOR
- 2 - PUMP BRACKET NUTS (3)
- 3 - SUPPORT BRACKET BOLT
- 4 - BANJO BOLT (REAR)
- 5 - FUEL SUPPLY LINE
- 6 - ELECTRICAL CONNECTOR
- 7 - BANJO BOLT (FRONT)
- 8 - FUEL TRANSFER PUMP

The transfer pump is self-priming: When the key is first turned on (without cranking engine), the pump will operate for approximately 1/4 second and then shut off. The pump will also operate for up to 25 seconds after the starter is engaged, and then disengaged and the engine is not running. The pump shuts off immediately if the key is on and the engine stops running.

The fuel volume of the transfer pump will always provide more fuel than the fuel injection pump requires. Excess fuel is returned from the injection pump through an overflow valve. The valve is located on the side of the injection pump (Fig. 60). It is also used to connect the fuel return line to the side of the injection pump. This valve opens at approximately 97 kPa (14 psi) and returns fuel to the fuel tank through the fuel return line.

DIAGNOSIS AND TESTING - FUEL TRANSFER PUMP PRESSURE

The following tests will include: pressures tests of fuel transfer pump (engine running and engine cranking), a test for supply side restrictions, and a test for air in fuel supply side.

**Fig. 59 Engine Control Module (ECM) Location**

- 1 - ENGINE CONTROL MODULE (ECM)
- 2 - HEX HEADED BOLT
- 3 - 50-WAY CONNECTOR
- 4 - FUEL TRANSFER PUMP
- 5 - MOUNTING BOLTS (3)

**Fig. 60 Injection Pump Overflow Valve Location**

- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

FUEL TRANSFER PUMP (Continued)

Refer to Fuel Transfer Pump Description/Operation for an operational description of transfer pump.

The fuel transfer (lift) pump is located on left side of engine and above starter motor (Fig. 61).

Fig. 61 Fuel Transfer Pump Location

- 1 - OIL PRESSURE SENSOR
- 2 - PUMP BRACKET NUTS (3)
- 3 - SUPPORT BRACKET BOLT
- 4 - BANJO BOLT (REAR)
- 5 - FUEL SUPPLY LINE
- 6 - ELECTRICAL CONNECTOR
- 7 - BANJO BOLT (FRONT)
- 8 - FUEL TRANSFER PUMP

An improperly operating fuel transfer pump, a plugged or dirty fuel filter, or a defective overflow valve can cause low engine power, excessive white smoke and/or hard engine starting.

Before performing following tests, inspect fuel supply and return lines for restrictions, kinks or leaks.

Fuel leaking from pump casing indicates a leaking pump which must be replaced.

Pressure Test: Because the transfer pump is operating at two different pressure cycles (engine running and engine cranking), two different pressure tests will be performed.

(1) Remove protective cap at test port (Fig. 62). Clean area around cap/fitting before cap removal.

(2) Install Special Fuel Pressure Test Gauge 6828 (or equivalent) to fitting at test port (Fig. 62).

(3) To prevent engine from starting, remove fuel system relay (fuel injection pump relay). Relay is located in Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

Fig. 62 Fuel Pressure Test Port Fitting

- 1 - FUEL PRESSURE TEST PORT

Fig. 63 Fuel Return and Supply Line Quick-Connect Locations

- 1 - FUEL RETURN LINE
- 2 - QUICK-CONNECT FITTINGS
- 3 - FUEL SUPPLY LINE

(4) Using key, crank engine over while observing gauge. Pressure should be 5–7 psi.

(5) Re-install fuel system relay to PDC.

(6) Start engine and record fuel pressure. Pressure should be a **minimum** of 69 kPa (10 psi) at idle speed.

FUEL TRANSFER PUMP (Continued)

(7) Because fuel pump relay was removed, a Diagnostic Trouble Code (DTC) may have been set. After testing is completed, and relay has been installed, use DRB scan tool to remove DTC.

Fuel Supply Restriction Test:

Due to very small vacuum specifications, the DRB scan tool along with the Periphral Expansion Port (PEP) Module and 0-15 psi transducer must be used.

(8) Verify transfer pump pressure is OK before performing restriction test.

(9) Locate and disconnect fuel supply line quick-connect fitting at left-rear of engine (Fig. 63). After disconnecting line, plastic clip will remain attached to metal fuel line at engine. Carefully remove clip from metal line. Snap same clip into fuel supply hose.

(10) Install Special Rubber Adapter Hose Tool 6631 (3/8") into ends of disconnected fuel supply line.

(11) Install transducer from PEP module to brass "T" fitting on tool 6631.

(12) Hook up DRB scan tool to transducer.

WARNING: DO NOT STAND IN LINE WITH THE COOLING FAN FOR THE FOLLOWING STEPS.

(13) Start engine and record vacuum reading with engine speed at high-idle (high-idle means engine speed is at 100 percent throttle and no load). The fuel restriction test **MUST** be done with engine speed at high-idle.

(14) If vacuum reading is **less** than 6 in/hg. (0-152 mm hg.), test is OK. If vacuum reading is **higher** than 6 in/hg. (152 mm hg.), restriction exists in fuel supply line or in fuel tank module. Check fuel supply line for damage, dents or kinking. If OK, remove module and check module and lines for blockage. Also check fuel pump inlet filter at bottom of module for obstructions.

Testing For Air Leaks in Fuel Supply Side:

(15) A 3-foot section of 3/8" I.D. clear tubing is required for this test.

(16) Using a tire core valve removal tool, carefully remove core valve from inlet fitting test port.

(17) Attach and clamp the 3/8" clear hose to fitting nipple.

(18) Place other end of hose into a large clear container. Allow hose to loop as high as possible **above** test port.

(19) The fuel transfer pump can be put into a 25 second run (test) mode if key is quickly turned to crank position and released back to run position without starting engine.

To prevent engine from starting in this test, first remove fuel system relay (fuel injection pump relay). Relay is located in Power Distribution Center (PDC). Refer to label under PDC cover for relay location. Because fuel pump relay was removed, a Diagnostic

Trouble Code (DTC) may have been set. After testing is completed, and relay has been installed, use DRB scan tool to remove DTC.

(20) Allow air to purge from empty hose before examining for air bubbles. Air bubbles should not be present.

(21) If bubbles are present, check for leaks in supply line to fuel tank.

(22) If supply line is not leaking, remove fuel tank module and remove filter at bottom of module (filter snaps to module). Check for leaks between supply nipple at top of module, and filter opening at bottom of module. Replace module if necessary.

(23) After performing test, install core back into test fitting. Before installing protective cap, be sure fitting is not leaking.

REMOVAL

The fuel transfer pump (fuel lift pump) is located on left side of engine, below and rearward of fuel filter (Fig. 64).

Fig. 64 Fuel Transfer Pump Location

- 1 - OIL PRESSURE SENSOR
- 2 - PUMP BRACKET NUTS (3)
- 3 - SUPPORT BRACKET BOLT
- 4 - BANJO BOLT (REAR)
- 5 - FUEL SUPPLY LINE
- 6 - ELECTRICAL CONNECTOR
- 7 - BANJO BOLT (FRONT)
- 8 - FUEL TRANSFER PUMP

(1) Disconnect both negative battery cables at both batteries.

FUEL TRANSFER PUMP (Continued)

(2) Thoroughly clean area around transfer pump and fuel lines of any contamination.

(3) Remove starter motor. Refer to Starter Removal/Installation in 8, Starting System for procedures.

(4) Place a drain pan below the pump.

(5) Disconnect fuel line quick-connect fitting at fuel supply line (Fig. 64) at rear of pump.

(6) Remove support bracket bolt at top of pump (Fig. 64).

(7) Remove front and rear banjo bolts at pump (Fig. 64).

(8) Disconnect electrical connector at side of pump (Fig. 64).

(9) Remove three pump bracket nuts (Fig. 64) and remove pump from vehicle.

INSTALLATION

The fuel transfer pump (fuel lift pump) is located on left side of engine, below and rearward of fuel filter (Fig. 64).

(1) Install new gaskets to fuel supply line/support bracket and banjo bolt at rear of pump. Install line and banjo bolt to pump. **Do not** tighten banjo bolt at this time.

(2) Install new gaskets to fuel line and banjo bolt at front of pump.

(3) Position 3 pump studs into pump mounting bracket and install 3 nuts. **Do not** tighten nuts at this time.

(4) Install support bracket bolt (Fig. 64). **Do not** tighten bolt at this time.

(5) Tighten 3 pump nuts to 12 N·m (9 ft. lbs.) torque.

(6) Tighten both banjo bolts to 24 N·m (18 ft. lbs.) torque.

(7) Tighten support bracket bolt 12 N·m (9 ft. lbs.) torque.

(8) Connect electrical connector to pump (Fig. 64).

(9) Connect fuel line quick-connect fitting to fuel supply line at rear of pump.

(10) Install starter motor. Refer to Starter Removal/Installation in 8, Starting for procedures.

(11) Connect both negative battery cables at both batteries.

(12) Bleed air at fuel supply line at side of fuel injection pump. Refer to the Air Bleed Procedure.

(13) Start engine and check for leaks.

OVERFLOW VALVE

DESCRIPTION

The overflow valve is located on the side of the injection pump (Fig. 65). It is also used to connect the fuel return line (banjo fitting) to the fuel injection pump.

Fig. 65 Overflow Valve Location

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

OPERATION

Fuel volume from the fuel transfer (lift) pump will always provide more fuel than the fuel injection pump requires. The overflow valve (a check valve) is used to route excess fuel through the fuel return line and back to the fuel tank. Approximately 70% of supplied fuel is returned to the fuel tank. The valve opens at approximately 97 kPa (14 psi). If the check valve within the assembly is sticking open, fuel drainage of the injection pump could cause hard starting.

If a Diagnostic Trouble Code (DTC) has been stored for "decreased engine performance due to high injection pump fuel temperature", the overflow valve may be stuck in closed position.

DIAGNOSIS AND TESTING - OVERFLOW VALVE

Fuel volume from the fuel transfer (lift) pump will always provide more fuel than the fuel injection pump requires. The overflow valve (a check valve) is used to route excess fuel through the fuel return line and back to the fuel tank. Approximately 70% of supplied fuel is returned to the fuel tank. The valve is located on the side of the injection pump (Fig. 66). It is also used to connect the fuel return line (banjo fitting) to the fuel injection pump. The valve opens at approximately 97 kPa (14 psi). If the check valve

OVERFLOW VALVE (Continued)

within the assembly is sticking, low engine power or hard starting may result.

If a Diagnostic Trouble Code (DTC) has been stored for "decreased engine performance due to high injection pump fuel temperature", the overflow valve may be stuck in closed position.

Fig. 66 Overflow Valve Location

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

A rubber tipped blow gun with regulated air line pressure is needed for this test.

- (1) Clean area around overflow valve and fuel return line at injection pump before removal.
- (2) Remove valve from pump and banjo fitting.
- (3) Discard old sealing gaskets.
- (4) Set regulated air pressure to approximately 97 kPa (14–16 psi).
- (5) Using blow gun, apply pressure to overflow valve inlet end (end that goes into injection pump).
- (6) Internal check valve should release, and air should pass through valve at 97 kPa (14–16 psi). If not, replace valve.
- (7) Reduce regulated air pressure to 10 psi and observe valve. Valve should stay shut. If not, replace valve.
- (8) Install new sealing gaskets to valve.
- (9) Install valve through banjo fitting and into pump.
- (10) Tighten to 30 N·m (24 ft. lbs.) torque.

REMOVAL

The overflow valve (pressure relief valve) is located at the outside of fuel injection pump (Fig. 67). It connects the fuel return line (banjo fitting) to the pump. The valve has no internal serviceable parts and must be replaced as an assembly. Two sealing gaskets are used. One gasket is located between pump and banjo fitting. The other is located between the banjo fitting and end of valve.

Fig. 67 Overflow Valve Location

- 1 - FUEL SUPPLY LINE
- 2 - FUEL RETURN LINE
- 3 - BANJO BOLT (TEST PORT FITTING)
- 4 - OVERFLOW VALVE
- 5 - BANJO FITTING

- (1) Clean area around overflow valve and fuel return line at injection pump before removal.
- (2) Remove valve from pump and banjo fitting.
- (3) Discard old sealing gaskets.

INSTALLATION

The overflow valve (pressure relief valve) is located at the outside of fuel injection pump (Fig. 67). It connects the fuel return line (banjo fitting) to the pump. The valve has no internal serviceable parts and must be replaced as an assembly. Two sealing gaskets are used. One gasket is located between pump and banjo fitting. The other is located between the banjo fitting and end of valve.

- (1) Install new sealing gaskets to valve.
- (2) Install valve through banjo fitting and into pump.
- (3) Tighten to 30 N·m (24 ft. lbs.) torque.

WATER IN FUEL SENSOR

DESCRIPTION

The WIF sensor is located on the side of the fuel filter/water separator canister (Fig. 68).

Fig. 68 Water-in-Fuel Sensor Location

- 1 - WATER-IN-FUEL (WIF) SENSOR
- 2 - FUEL FILTER/WATER SEPARATOR
- 3 - WIF SENSOR CONNECTOR

OPERATION

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CCD bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input at the end of the intake manifold air heater post-heat cycle.

REMOVAL

The Water-In-Fuel (WIF) sensor is located at the side of fuel filter/water separator canister. Refer to Fuel Filter/Water Separator Removal/Installation for WIF sensor removal/installation procedures.

FUEL DRAIN MANIFOLD

DESCRIPTION

The fuel drain manifold is actually a rifled passage within the cylinder head (Fig. 69).

Fig. 69 Fuel Drain Manifold Passage

- 1 - REAR OF CYLINDER HEAD
- 2 - BANJO FITTING/BOLT
- 3 - FUEL RETURN TO TANK
- 4 - FUEL RETURN LINES
- 5 - FUEL RETURN LINE FROM PUMP OVERFLOW VALVE
- 6 - FUEL DRAIN MANIFOLD PASSAGE
- 7 - "T"

OPERATION

When the engine is running, and during injection, a small amount of fuel flows past the injector nozzle and is not injected into the combustion chamber. This fuel is used to lubricate the fuel injectors. Excess fuel drains into the fuel drain manifold (or passage). Fuel is drained from this passage into a line at the rear of the cylinder head (Fig. 69). After exiting the cylinder head, fuel is routed (returned) back to the fuel tank. A "T" is installed into the fuel return line (Fig. 69). This "T" is used to allow excess fuel from the injection pump to be returned into the fuel tank. A one-way check valve within the overflow valve prevents fuel (from the fuel drain manifold) from entering the fuel injection pump.

A **small** amount of fuel is returned from the fuel injectors, while a **large** amount (about 70% of supplied fuel) is returned from the fuel injection pump.

FUEL DRAIN MANIFOLD (Continued)

REMOVAL

The fuel drain manifold (line) connects a fuel return passage within the cylinder head to a "T" fitting on the fuel return line. It is located at the rear of the cylinder head.

(1) Disconnect both negative battery cables at both batteries.

(2) Remove starter motor. Refer to Group 8B for procedures.

(3) Disconnect fitting at "T" (Fig. 70).

Fig. 70 Fuel Return Line at Rear of Cylinder Head

1 - REAR OF CYLINDER HEAD

2 - BANJO FITTING/BOLT

3 - FUEL RETURN TO TANK

4 - FUEL RETURN LINES

5 - FUEL RETURN LINE FROM PUMP OVERFLOW VALVE

6 - FUEL DRAIN MANIFOLD PASSAGE

7 - "T"

(4) Remove banjo bolt at rear of cylinder head. Discard old sealing washers.

(5) Remove fuel line from vehicle.

(6) Clean connection at rear of cylinder head before line installation.

INSTALLATION

The fuel drain manifold (line) connects a fuel return passage within the cylinder head to a "T" fitting on the fuel return line. It is located at the rear of the cylinder head.

Servicing fuel return components will not require air bleeding.

(1) Using new sealing washers, assemble banjo bolt to fuel line.

(2) Position line to engine and loosely tighten fasteners.

(3) Tighten banjo bolt to 24 N·m (18 ft. lbs.) torque.

(4) Tighten fitting at "T" to 12 N·m (106 in. lbs.) torque.

(5) Install starter motor. Refer to 8, Starter for procedures.

(6) Connect both negative battery cables at both batteries.

FUEL INJECTION - DIESEL

DESCRIPTION - DIESEL FUEL INJECTION SYSTEM

The Engine Control Module (ECM) and Fuel Injection Pump Control Module (FPCM) are used primarily for fuel system control. The ECM is a separate replaceable component, while the FPCM is internal to the fuel injection pump and is a non-serviceable part. The ECM and FPCM are interconnected (wired together) for fuel injection control.

The Powertrain Control Module (PCM) is used to regulate or control the A/C, charging and speed control systems. It is also used to partially control certain electronic automatic transmission components. The PCM also has control over certain instrument panel components.

Refer to either Powertrain Control Module (PCM) or Engine Control Module (ECM) for additional information. Refer to (Fig. 1) for a partial list of fuel system components.

FUEL INJECTION - DIESEL (Continued)

DIAGNOSIS AND TESTING - BOOST PRESSURE

Two pressure gauges attached at two different points are required for this test.

Fig. 2 Boost Pressure Test at Intake Manifold

- 1 - REAR OF INTAKE MANIFOLD
- 2 - 3/4" PIPE PLUG

Fig. 3 Boost Pressure Test at Turbocharger

- 1 - TURBOCHARGER
- 2 - 1/8" FITTING
- 3 - SIGNAL LINE
- 4 - WASTEGATE ACTUATOR
- 5 - CONTROL ROD
- 6 - OIL SUPPLY LINE

(1) Obtain two 6828 fuel pressure test gauges (equivalent gauges are OK). **Gauge Consistency Test:** Connect the gauges together to a common pressure source and verify pressure consistency of both gauges. Do this consistency test at approximately 206 kPa (30 psi). If pressures are different, they can still be used for test. Note and record differences in pressures before testing. Make adjustments as necessary.

(2) Remove 3/4" pipe plug fitting at rear of intake manifold (Fig. 2). Temporarily replace this fitting with fitting reducer to adapt to pressure gauge.

Note: This pipe plug is located to front of MAP sensor. Do not remove plug to rear of MAP sensor. This is a COOLANT passage plug.

(3) Loosen hose clamp and disconnect rubber signal line (Fig. 3) from 1/8" brass fitting at front of turbocharger.

(4) Remove 1/8" brass fitting (Fig. 3) from turbocharger. Temporarily replace this fitting with a 1/8" "T" fitting to adapt to pressure gauge.

(5) Reattach signal line to temporary "T".

(6) Attach first pressure gauge to intake manifold fitting.

(7) Attach second pressure gauge to "T" fitting at turbocharger.

Engine must be at rated RPM and full load for the test.

If gauge pressure differential is greater than 3 psi (6 in. Hg), check intercooler and associated piping for restrictions, plugging or damage.

Maximum pressure at intake manifold (rated rpm and load) is 36-37 in/hg \pm 3 in/hg (17.7-18.2 psi \pm 1.5 psi).

Wastegate should open at no higher than 38.7 in/hg (19 psi) at wide open throttle, full load. If wastegate is out of adjustment, a DTC may have been set. Refer to Wastegate Adjustment in Engines for adjustment procedures.

ACCELERATOR PEDAL POSITION SENSOR

DESCRIPTION

The APPS assembly is located at the top-left-front of the engine (Fig. 4). A plastic cover is used to cover the assembly. The actual sensor is located behind its mounting bracket (Fig. 5).

Fig. 4 APPS Assembly Location

- 1 - LEVER
- 2 - MOUNTING BOLTS (6)
- 3 - WIRE HARNESS CLIP
- 4 - CALIBRATION SCREWS (NO ADJUSTMENT)
- 5 - APPS ASSEMBLY

OPERATION

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the Engine Control Module (ECM) with a DC voltage signal proportional to the angle, or position of the accelerator pedal. In previous model years, this part was known as the Throttle Position Sensor (TPS).

Diesel engines used in previous model years used a mechanical cable between the accelerator pedal and the TPS lever. Linkage and bellcranks between the TPS cable lever and the fuel injection pump were also used. Although the cable has been retained with the APPS, the linkage and bellcranks between the cable lever and the fuel injection pump are no longer used.

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated and permanently positioned to its mounting bracket.

Fig. 5 APPS Sensor Location (Rear View)

- 1 - APPS
- 2 - TAB
- 3 - PUSH FOR REMOVAL
- 4 - APPS CONNECTOR

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 4) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

REMOVAL

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket. The APPS assembly is located at left-front of engine below plastic cable/lever/linkage cover (Fig. 6).

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 8) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

ACCELERATOR PEDAL POSITION SENSOR (Continued)

(1) Disconnect both negative battery cables at both batteries.

(2) Remove cable cover (Fig. 6). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 6). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(3) Using finger pressure only, disconnect end of speed control servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 7). **DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(4) Using two small screwdrivers, pry throttle cable connector socket from throttle lever ball (Fig. 7). **Be very careful not to bend throttle lever arm.**

(5) Disconnect transmission control cable at lever arm (if equipped). Refer to 21, Transmission.

(6) Squeeze pinch tabs on speed control cable (Fig. 7) and pull cable rearward to remove from cable mounting bracket.

(7) Squeeze pinch tabs on throttle cable (Fig. 7) and pull cable rearward to remove from cable mounting bracket.

(8) If equipped with an automatic transmission, refer to 21, Transmission for transmission control cable removal procedures.

(9) Disconnect wiring harness clip (Fig. 8) at bottom of bracket.

(10) Remove 6 mounting bolts (Fig. 8) and partially remove APPS assembly from engine. After assembly is partially removed, disconnect electrical connector from bottom of sensor by pushing on connector tab (Fig. 9).

(11) Remove APPS assembly from engine.

INSTALLATION

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket. The APPS assembly is located at left-front of engine below plastic cable/lever/linkage cover (Fig. 6).

(1) Snap electrical connector into bottom of sensor.

(2) Position APPS assembly to engine and install 6 bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.

(3) Connect wiring harness clip (Fig. 8) at bottom of bracket.

(4) If equipped with an automatic transmission, refer to Group 21, Transmission for transmission control cable installation procedures.

(5) Install speed control cable into mounting bracket. Be sure pinch tabs (Fig. 7) have secured cable.

(6) Install throttle cable into mounting bracket. Be sure pinch tabs (Fig. 7) have secured cable.

(7) Connect throttle cable at lever (snaps on).

(8) Connect speed control cable to lever by pushing cable connector rearward onto lever pin while holding lever forward.

(9) Install cable cover.

(10) Connect both negative battery cables to both batteries.

(11) **ECM Calibration:** Turn key to ON position. Without starting engine, slowly press throttle pedal to floor and then slowly release. This step must be done (one time) to ensure accelerator pedal position sensor calibration has been learned by ECM. If not done, possible DTC's may be set.

(12) Use DRB scan tool to erase any DTC's from ECM/PCM.

FUEL INJECTOR

DESCRIPTION

Six individual, high-pressure fuel injectors are used. The injectors are vertically mounted (Fig. 10) into a bored hole in the top of the cylinder head. This bored hole is located between the intake/exhaust valves.

80b46ce3

Fig. 10 Fuel Injector Location

- 4 - SHIM
- 5 - BOLTS

FUEL INJECTOR (Continued)

OPERATION

High-pressure fuel is supplied from the injection pump, through a high-pressure fuel line, through a steel connector and into the fuel injector. When fuel pressure rises to approximately 31,026 kPa (4,500 psi), the needle valve spring tension is overcome. The needle valve rises and fuel flows through the spray holes in the nozzle tip into the combustion chamber. The pressure required to lift the needle valve is the nozzle opening pressure. This is sometimes referred to as the "pop" pressure setting.

Each fuel injector is connected to each high-pressure fuel line with a steel connector (Fig. 11). This steel connector is positioned into the cylinder head and sealed with an o-ring. The connectors are sealed to the high-pressure fuel lines with fittings (Fig. 11). The ferrule (Fig. 11) on the end of the high-pressure fuel line pushes against the steel connector when the fuel line fitting is torqued into the cylinder head. This torquing force provides a sealing pressure between both the fuel line-to-connector and the fuel connector-to-fuel injector. **The fitting torque is very critical.** If the fitting is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If the fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside the cylinder head and will not be visible. The result will be a possible fuel injector miss-fire and low power.

- 3 - FERRULE
- 4 - FITTING
- 5 - FUEL LINE
- 6 - INJECTOR

The fuel injectors use hole type nozzles (Fig. 12). High-pressure flows into the side of the injector and causes the injector needle to lift and fuel to be injected. The clearances in the nozzle bore (Fig. 12) are extremely small and any sort of dirt or contaminants will cause the injector to stick. Because of this, it is very important to do a thorough cleaning of any

FUEL INJECTOR (Continued)

lines before opening up any fuel system component. Always cover or cap any open fuel connections before a fuel system repair is performed.

Each fuel injector connector tube contains an edge filter (Fig. 13) that breaks up small contaminants that enter the injector. The edge filter uses the injectors pulsating high-pressure to break up most particles so they are small enough to pass through the injector. **The edge filters are not a substitute for proper cleaning and covering of all fuel system components during repair.**

The bottom of each fuel injector is sealed to the cylinder head with a **1.5mm** thick copper shim (gasket) (Fig. 12). The correct thickness shim must always be re-installed after removing an injector.

Fuel pressure in the injector circuit decreases after injection. The injector needle valve is immediately closed by the needle valve spring and fuel flow into the combustion chamber is stopped. Exhaust gases are prevented from entering the injector nozzle by the needle valve.

DIAGNOSIS AND TESTING—FUEL INJECTOR TEST

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 14).

80b46ce4

Fig. 14 Fuel Injector Connections

- 1 - CONNECTOR
- 2 - O-RING
- 3 - FERRULE
- 4 - FITTING
- 5 - FUEL LINE
- 6 - INJECTOR

A leaking fuel injector can cause fuel knock, poor performance, black smoke, poor fuel economy and rough engine idle. If fuel injector needle valve does not operate properly, engine may misfire and produce low power.

A leak in injection pump-to-injector high-pressure fuel line can cause many of same symptoms as malfunctioning injector. Inspect for leaks in high-pressure lines before checking for malfunctioning fuel injector.

WARNING: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF UP TO APPROXIMATELY 120,000 kPa (17,400 psi) TO EACH INDIVIDUAL INJECTOR THROUGH HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO EXHAUST MANIFOLD WHEN BLEEDING AIR FROM FUEL SYSTEM.

80b46b80

Fig. 15 Inspecting Injector Operation

- 1 - HIGH-PRESSURE FUEL LINE

(1) To determine which fuel injector is malfunctioning, run engine and isolate each cylinder using DRB scan tool. **The DRB scan tool lists the injector firing order in both cylinder numerical order (1-2-3-4-5-6), and actual firing order (1-5-3-6-2-4).**

FUEL INJECTOR (Continued)

- 1 - ADAPTOR TOOL 8301
- 2 - TIP
- 3 - FUEL INJECTOR
- 4 - INLET AT SIDE OF INJECTOR

80b4b8c7

(2) Note RPM drop for each cylinder. As an alternative, loosen high-pressure fuel line fitting at fuel injector connector tube (Fig. 15). Listen for a change in engine speed. After testing, tighten line fitting to 40 N·m (30 ft. lbs.) torque. If engine speed drops, injector was operating normally. If engine speed remains same, injector may be malfunctioning. Test all injectors in same manner one at a time.

(3) Once injector has been found to be malfunctioning, remove it from engine and test it. Refer to Fuel Injector Removal/Installation.

WARNING: FUEL INJECTOR TESTERS CAN DEVELOP EXTREMELY HIGH PRESSURES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN OPERATING INJECTOR TESTOR.

(4) After injector has been removed, obtain bench-mount fuel injector tester OTC® (SPX®) part number 4210 (Fig. 16) (or equivalent). Install Special Tool number 8301 (Fuel Injector Adapter) to 4210 tester. Install fuel injector into 8301 adapter. Be sure tip of adapter tool 8301 is aligned to inlet hole at side of injector (Fig. 17) before tightening tool. Tighten tool 8301 to injector. Position container below injector before testing.

(5) Refer to operating instructions supplied with pressure tester for procedures.

(a) Check opening pressure or "pop" pressure. Pressure should be approximately 31,026 kPa (310 bars) or (4500 psi ± 250 psi). If fuel injector needle valve is opening (popping) too early or too late, replace injector.

(b) Perform a leak-down test on injector. Apply pressure with injector tester. The injector should not leak (drip) fuel with pressure at approximately 20 bars (291 psi) lower than pop pressure.

(c) Operate tester lever quickly several times to check injector spray pattern. Verify fuel is spraying from each injector nozzle hole. Injector should also spray evenly from each nozzle hole.

(d) Pay attention to size and shape of spray plumes. They should all be equal. If possible, compare spray pattern to that of a new fuel injector with same part number. Checking each plume for consistency is an excellent indicator of injector performance. Even if only one nozzle hole is plugged, significant performance problems could result.

(e) Look for burrs on injector inlet.

(f) Check nozzle holes for hole erosion or plugging.

(g) Inspect end of nozzle for burrs or rough machine marks.

(h) Look for cracks at nozzle end.

(i) Check nozzle color for signs of overheating. Overheating will cause nozzle to turn a dark yellow/tan or blue (depending on overheating temperature).

(j) Look at end of injector tube where it meets injector. A small, shiny band should be seen at this point. The band should have a consistent thickness. If not, injector could be leaking into fuel return.

(k) If any of these conditions occur, replace injector.

FUEL INJECTOR (Continued)

REMOVAL

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 18).

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

Each fuel injector is connected to each high-pressure fuel line with a steel connector tube (Fig. 19). This steel connector is positioned into cylinder head and sealed with an o-ring. The connectors are connected to high-pressure fuel lines with fittings (Fig. 19).

(2) If injector at #1 or #2 cylinder is being removed, intake manifold air heater assembly must be removed. Refer to Intake Manifold Air Heater Removal/Installation.

(3) If injector at #5 cylinder is being removed, remove engine lifting bracket (2 bolts).

(4) Thoroughly clean area around injector and injector high-pressure lines before removal.

(5) Remove necessary high-pressure fuel lines. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - REMOVAL). **Do not bend any high-pressure fuel line to gain access to fuel injector.** Cover or cap any open fuel connections.

(6) Remove valve cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(7) Thread Special Tool 8324 (Fuel Injector Connector Tube Remover) onto end of injector connector tube (Fig. 20).

(8) Pull injector connector tube from cylinder head. **The injector connector tube must be removed before attempting to remove fuel injector or serious damage to fuel injector and tube will result.**

(9) Remove and discard old o-ring (Fig. 19) from injector connector tube.

(10) Remove fuel injector hold down clamp bolt at front end of clamp (Fig. 18). **Do not loosen or remove special (2 shouldered) bolt at rear end of clamp.** Remove injector clamp by sliding it from shoulders on rear clamp bolt.

(11) Thread rod from Special Tool number 8318 (Fuel Injector Remover) into top of fuel injector (Fig. 21).

(12) Tighten nut on 8318 tool to pull (remove) fuel injector from cylinder head.

(13) Remove and discard old o-ring from fuel injector.

(14) Remove and discard copper sealing washer (shim) (Fig. 22) from bottom of injector. **If copper**

sealing washer has remained in cylinder head, it must be removed.

INSTALLATION

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 18).

(1) Inspect fuel injector.

(a) If necessary, perform pressure test of injector. Refer to Fuel Injector Testing.

(b) Look for burrs on injector inlet.

(c) Check nozzle holes for hole erosion or plugging.

(d) Inspect end of nozzle for burrs or rough machine marks.

(e) Look for cracks at nozzle end.

(f) Check nozzle color for signs of overheating. Overheating will cause nozzle to turn a dark yellow/tan or blue (depending on overheating temperature).

FUEL INJECTOR (Continued)

(g) If any of these conditions occur, replace injector.

(2) Thoroughly clean fuel injector cylinder head bore with special Cummins wire brush tool or equivalent (Fig. 24). Blow out bore hole with compressed air.

**Fig. 24 Cleaning Cylinder Head Injector Bore—
TYPICAL BORE**

1 - INJECTOR BORE
2 - WIRE BRUSH

(3) The bottom of fuel injector is sealed to cylinder head bore with a copper sealing washer (shim) of a certain thickness. A new shim with correct thickness must always be re-installed after removing injector. Measure thickness of injector shim (Fig. 23). **Shim Thickness: 1.5 mm (.060")**

(4) Install new shim (washer) to bottom of injector (Fig. 22). Apply light coating of clean engine oil to washer. This will keep washer in place during installation.

(5) Install new o-ring to fuel injector. Apply small amount of clean engine oil to o-ring.

(6) Note fuel inlet hole on side of fuel injector. This hole must be positioned towards injector connector tube. Position injector into cylinder head bore being extremely careful not to allow injector tip to touch sides of bore. Press fuel injector into cylinder head with finger pressure only. **Do not use any tools to press fuel injector into position. Damage to machined surfaces may result.**

(7) Position fuel injector hold down clamp into shouldered bolt while aligning slot in top of injector into groove in bottom of clamp. Tighten opposite clamp bolt (Fig. 18) to 10 N·m (89 in. lbs.) torque.

(8) Install new o-ring to fuel injector connector tube. Apply small amount of clean engine oil to o-ring.

(9) Press injector connector tube into cylinder head with finger pressure only. **Do not use any tools to press tube into position. Damage to machined surfaces may result.**

(10) Connect high-pressure fuel lines. Refer to High-Pressure Fuel Lines Removal/Installation. **The fuel line fitting torque is very critical.** If fitting is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside cylinder head and will not be visible resulting in a possible fuel injector miss and low power.

(11) Install valve cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(12) (If necessary) install intake manifold air heater assembly. Refer to Intake Manifold Air Heater Removal/Installation.

(13) (If necessary) install engine lifting bracket. Tighten 2 bolts to 77 N·m (57 ft. lbs.) torque.

(14) Connect negative battery cables to both batteries.

(15) Bleed air from high-pressure lines (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

FUEL INJECTION PUMP RELAY

DESCRIPTION

The fuel injection pump relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

OPERATION

The Engine Control Module (ECM) energizes the electric fuel injection pump through the fuel injection pump relay. Battery voltage is applied to the fuel injection pump relay at all times. When the key is turned ON, the relay is energized when a 12-volt signal is provided by the ECM. When energized, 12-volts is supplied to the Fuel Pump Control Module. The Fuel Pump Control Module is located on the top of the fuel injection pump and is non-servicable.

FUEL TEMPERATURE SENSOR

DESCRIPTION

Two different fuel temperature sensors are used. One of the sensors is located inside of the Bosch VP44 fuel injection pump and is a non-serviceable part. The other fuel temperature sensor is located in the top of the fuel filter housing and is serviceable (serviceable if replacing the fuel heater).

OPERATION

The sensor located in the Bosch VP44 fuel injection pump is used to check fuel temperature within the injection pump and to set a Diagnostic Trouble Code (DTC) if a specific high fuel temperature has been reached. If high temperature has been reached, engine power will be de-rated by the Engine Control Module (ECM).

The sensor located in the top of the fuel filter housing is used to control the fuel heater element. Refer to Fuel Heater Description and Operation for additional information.

INTAKE AIR HEATER

DESCRIPTION

The intake manifold air heater element assembly is located in the top of the intake manifold (Fig. 25).

80b46b90

Fig. 25 Air Heater Elements Location

- 1 - AIR HEATER ELEMENTS
- 2 - LOWER GASKET
- 3 - BLOCK
- 4 - UPPER GASKET

OPERATION

The air heater elements are used to heat incoming air to the intake manifold. This is done to help engine starting and improve driveability with cool or cold outside temperatures.

Electrical supply for the 2 air heater elements is controlled by the Engine Control Module (ECM) through the 2 air heater relays. Refer to Intake Manifold Air Heater Relays for more information.

Two heavy-duty cables connect the 2 air heater elements to the 2 air heater relays. Each of these cables will supply approximately 95 amps at 12 volts to an individual heating element within the heater block assembly.

Refer to the Powertrain Diagnostic Procedures manual for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

REMOVAL

The 2 intake manifold air heater elements are attached to a metal block located at the top of the intake manifold (Fig. 26). If servicing either of the heater elements, the entire block/element assembly must be replaced.

80b46b90

Fig. 26 Intake Manifold Air Heater Element Location

(4) Remove engine oil dipstick tube mounting bolt (Fig. 28). Position dipstick tube to the side.

(5) Disconnect heater electrical cables at cable mounting studs (Fig. 28).

(6) Disconnect ground cable bolt and ground cable from housing (Fig. 27).

(7) Remove 4 housing bolts (Fig. 28).

(8) Remove air intake housing from top of heater elements.

(9) Remove heater element assembly from intake manifold.

(10) Clean old gasket material from air intake housing and intake manifold.

(11) Clean old gasket material from both ends of heater block (Fig. 26).

INSTALLATION

The 2 intake manifold air heater elements are attached to a metal block located at the top of the intake manifold (Fig. 26). If servicing either of the heater elements, the entire block/element assembly must be replaced.

(1) Using 2 new gaskets, position element assembly and air housing to intake manifold.

(2) Position ground cable (Fig. 27) to air housing.

(3) Install 4 housing bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(4) Connect heater cables at cable mounting studs (Fig. 28). **Do not allow the cable eyelets to contact any other metal source other than the cable nuts/studs.**

(5) Install engine oil dipstick tube and mounting bolt.

(6) Connect rubber hose to air intake housing.

(7) Connect clamp to rubber hose at air intake housing.

(8) Connect both negative battery cables at both batteries.

INTAKE AIR HEATER RELAY

DESCRIPTION

The 2 intake manifold air heater relays are located in the engine compartment, attached to the left inner fender below the left battery (Fig. 29).

OPERATION

The Engine Control Module (ECM) operates the 2 heating elements through the 2 intake manifold air heater relays.

Refer to Powertrain Diagnostic Procedures for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

INTAKE AIR HEATER RELAY (Continued)

- 3 - RELAY TRIGGER WIRES (4)
- 4 - INTAKE AIR HEATER RELAYS (2)
- 5 - RUBBER SHIELDS (4)
- 6 - CABLES TO BATTERY (+)

REMOVAL

The relays are located in engine compartment, bolted to left inner fender below left battery (Fig. 30).

The mounting bracket and both relays are replaced as an assembly.

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect four relay trigger wires at both relays (Fig. 30). Note position of wiring before removing.

(3) Lift four rubber shields from all 4 cables (Fig. 30).

(4) Remove four nuts at cable connectors (Fig. 30). Note position of wiring before removing.

(5) Remove three relay mounting bracket bolts (Fig. 30) and remove relay assembly.

INSTALLATION

The relays are located in engine compartment, bolted to left inner fender below left battery (Fig. 30).

(1) Install relay assembly to inner fender. Tighten mounting bolts to 4.5 N·m (40 in. lbs.) torque.

(2) Connect eight electrical connectors to relays.

(3) Connect battery cables to both batteries.

INTAKE AIR TEMPERATURE SENSOR**DESCRIPTION - DIESEL**

The intake manifold air temperature sensor is installed into the rear of the intake manifold (Fig. 31) with the sensor element extending into the air stream.

OPERATION - DIESEL

The IAT provides an input voltage to the Engine Control Module (ECM) indicating intake manifold air temperature. The input is used along with inputs from other sensors for intake air heater element operation, for engine protection, fuel timing and fuel control. As the temperature of the air-fuel stream in the manifold varies, the sensor resistance changes. This results in a different input voltage to the ECM.

INTAKE AIR TEMPERATURE SENSOR (Continued)

REMOVAL - DIESEL

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 32).

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 32).

- (1) Disconnect electrical connector from IAT sensor (Fig. 32).
- (2) Remove IAT sensor from intake manifold (Fig. 33).
- (3) Discard sensor o-ring (Fig. 33).

INSTALLATION - DIESEL

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 32).

- (1) Clean sensor mounting hole (Fig. 33) of rust or contaminants.
- (2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.
- (3) Install IAT sensor into intake manifold. Tighten to 14 N·m (10 ft. lbs.) torque.
- (4) Connect sensor electrical connector.

- 3 - IAT SENSOR
- 4 - ELECTRICAL CONNECTOR
- 5 - ELECTRICAL CONNECTOR

MAP SENSOR

DESCRIPTION - DIESEL

The MAP sensor is installed into the rear of the intake manifold (Fig. 31).

OPERATION - DIESEL

The MAP sensor reacts to air pressure changes in the intake manifold. It provides an input voltage to the Engine Control Module (ECM). As pressure changes, MAP sensor voltage will change. The change in MAP sensor voltage results in a different input voltage to the ECM. The ECM uses this input, along with inputs from other sensors to provide fuel timing, fuel control and engine protection. Engine protection is used to derate (drop power off) the engine if turbocharger pressure becomes too high.

REMOVAL - DIESEL

The MAP sensor is located in the left/rear side of the intake manifold (Fig. 34).

Fig. 34 MAP Sensor Location

INSTALLATION

The MAP sensor is located in the left/rear side of the intake manifold (Fig. 34).

- (1) Clean sensor mounting hole (Fig. 35) of rust or contaminants.
- (2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.
- (3) Install MAP sensor into intake manifold. Tighten to 14 N·m (10 ft. lbs.) torque.
- (4) Connect sensor electrical connector.

PTO SWITCH

DESCRIPTION

OPERATION

This Engine Control Module (ECM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

The input is used to tell the ECM that the PTO has been engaged. When engaged, the ECM will disable certain OBD II functions until the PTO has been turned off.

THROTTLE CONTROL CABLE

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 39). The plastic cable retainer snaps into pedal arm.

(3) Remove cable core wire at pedal arm.

(4) From inside vehicle, pinch both sides of plastic cable housing retainer tabs at dash panel.

(5) Remove cable housing from dash panel and pull cable into engine compartment.

(6) Remove cable cover (Fig. 36). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 36). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(7) Using 2 screwdrivers, pry cable connector socket from throttle lever ball (Fig. 37). **Be very careful not to bend throttle lever arm.**

Fig. 36 Cable/Lever/Throttle Linkage Cover

- 2 - DASH PANEL
- 3 - CABLE CORE WIRE
- 4 - THROTTLE PEDAL ARM
- 5 - INDEX TAB
- 6 - CABLE RETAINER
- 7 - CABLE STOP

INSTALLATION

(1) Install cable through mounting hole on cable mounting bracket (Fig. 37). Cable snaps into bracket. Be sure 2 pinch tabs are secure.

(2) Using large pliers, connect cable end socket to throttle lever ball (snaps on).

(3) Install remaining cable housing end into and through dash panel opening (snaps into position). The two plastic pinch tabs should lock cable to dash panel.

(4) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 39). Align index slot on plastic cable retainer to this index tab.

(5) Connect negative battery cables to both batteries.

(6) Before starting engine, operate accelerator pedal to check for any binding.

(7) Install cable/lever cover.

STEERING

TABLE OF CONTENTS

	page		page

DIAGNOSIS AND TESTING - POWER		LINKAGE - 4WD	42
STEERING SYSTEM	2		
DIAGNOSIS AND TESTING - POWER			
STEERING FLOW AND PRESSURE	4		

STEERING

DESCRIPTION

The power steering system consist of a steering column, steering gear and hydraulic pump. The gear is mounted to the frame rail and attaches to the steering linkage. The pump is a constant flow rate and displacement vane-type pump. The pump supplies hydraulic fluid pressure to the power steering gear (Fig. 1).

Vehicles equipped with trailer tow option have a power steering pump oil cooler.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft, turns the pitman shaft, which turns the steering linkage.

STEERING (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING SYSTEM

STEERING NOISE

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

CONDITION	POSSIBLE CAUSES	CORRECTION

DIAGNOSIS AND TESTING - POWER STEERING
FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 (Fig. 2) and Adapter Kit 6893.

Fig. 2 Pressure Test Gauge

- 1 - GAUGE HOSE
- 2 - TUBE
- 3 - ADAPTER FITTINGS
- 4 - ANALYZER

POWER STEERING ANALYZER INSTALLATION

WITHOUT HYDRAULIC BOOSTER

- (1) Remove the high pressure hose from the power steering pump.
- (2) Connect Tube 6844 into the pump hose fitting.
- (3) Connect pressure gauge hose from the Power Steering Analyzer to Tube 6844.
- (4) Connect Adapter 6826 to Power Steering Analyzer test valve end.
- (5) Connect the power steering hose from the steering gear to Adapter 6826.

WITH HYDRAULIC BOOSTER

- (1) Remove high pressure hose which goes to the steering gear from the tube coming out of the booster.
- (2) Connect Adapter 6826 to the Power Steering Analyzer pressure gauge hose.
- (3) Connect pressure gauge hose to the tube coming out of the booster.
- (4) Connect Tube 6844 to the steering gear hose and Power Steering Analyzer test valve end.

FLOW AND PRESSURE TEST

- (1) Check belt condition and tension.
- (2) Open the test valve completely.
- (3) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.
- (4) Check fluid level, add fluid as necessary. Start engine again and let idle.
- (5) Gauge should read below 1034 kPa (150 psi), if above, inspect the hoses for restrictions and repair as

STEERING (Continued)

necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).

(6) Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification (Refer to pump specification chart for GPM) the pump should be replaced.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

(7) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.

- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

(8) Open the test valve and turn the steering wheel to the extreme left and right positions three times against the stops. Record the highest pressure reading at each position. Compare the readings to the pump specifications chart. If pressures readings are not within 50 psi of each other, the gear is leaking internally and must be repaired.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

PUMP SPECIFICATION

ENGINE	RELIEF PRESSURE (P.S.I.)	FLOW (G.P.M.) at 1500 RPM
3.9L	1450 to 1550	2.7 to 3.1
5.2L	1450 to 1550	2.7 to 3.1
5.9L	1450 to 1550	2.7 to 3.1
8.0L	1450 to 1550	2.7 to 3.1
5.9L Diesel	1450 to 1550	3.1 to 3.5
All With Hydraulic Booster	1450 to 1550	3.1 to 3.5

NOTE: After performing test and removing Power Steering Analyzer, check power steering fluid level.

COLUMN

DESCRIPTION

The tilt and standard column (Fig. 1) has been designed to be serviced as an assembly; less wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

OPERATION

SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or the airbag, refer to the WARNINGS and CAUTIONS below.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COAT-

INGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

CAUTION: Do not hammer on steering column shaft or shift tube. This may cause the shaft/shift tube to collapse or damage the bearing.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Do not remove shaft lock plate, plate retainer, park lock link or slider. This will damage the column (Fig. 2) and (Fig. 3).

REMOVAL

- (1) Position the front wheels straight ahead.
- (2) Disconnect the negative (ground) cable from the battery.
- (3) Remove the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
- (4) Remove the steering wheel with an appropriate puller, (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).

1 - CAUTION: NEVER REMOVE SHAFT LOCK PLATE RETAINER

CAUTION: Ensure the puller bolts are fully engaged into the steering wheel and not into the clock-spring, before attempting to remove the wheel. Failure to do so may damage the steering wheel.

(5) Remove the shift link rod in the engine compartment (if equipped). Pry the rod out from the grommet in the shift lever.

(6) Scribe or paint reference mark on the column shaft-to-coupler. This will aid in column shaft installation alignment. Remove the steering column shaft-to-coupler bolt (Fig. 4).

(7) Remove the steering column opening cover/knee blocker, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

COLUMN (Continued)

(8) Remove the PRNDL cable on column shift vehicles. Put the shift lever in **Park** position. Pull the cable and twist to remove from the position arm. Push the tab up on bottom of the cable retainer, then squeeze sides to remove retainer from the column (Fig. 5).

Fig. 5 PRNDL Drive

- 1 - PRNDL LEVER
- 2 - THUMB SCREW
- 3 - CABLE RETAINER
- 4 - PRNDL CABLE

(9) Remove the tilt lever (if equipped) from the column.

(10) Remove the upper and lower lock housing shroud and remove the lower fixed shroud.

(11) Remove the turn signal multi-function switch connector with a 7mm socket (Fig. 6).

J918J-1

Fig. 6 Multi-function Switch

- 1 - STEERING COLUMN ASSY.
- 2 - MULTI-FUNCTION SWITCH CONNECTOR
- 3 - TURN SIGNAL SWITCH AND LEVER

(12) Loosen the upper Support Bracket nuts to allow some slack. This will aid in removal of the upper fixed shroud.

(13) Remove the electrical connections from Key-in light, Ignition Switch, Horn, Overdrive Switch and Clock Spring (Speed Control) (Fig. 7).

J918J-2

Fig. 7 Steering Column Wiring

- 1 - KEY-IN SWITCH & HALO LIGHT
- 2 - MULTI-FUNCTION SWITCH
- 3 - TURN SIGNAL SWITCH & LEVER
- 4 - IGNITION SWITCH
- 5 - SPEED CONTROL

(14) Remove the wiring harness from the column by prying out the plastic retainer buttons.

(15) Remove the toe plate fasteners.

(16) Remove the column from vehicle.

(17) Remove the Ignition and Multi-Function Switch, then remove the Clock Spring and tape the Clock Spring to prevent it from turning, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

INSTALLATION

(1) Install the clock spring and switches, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

NOTE: Turn the Ignition Switch to the on position and verify the gear shifter moves. If the shifter does not move ensure the Ignition Switch is installed properly.

(2) Column shift vehicles, install a new grommet. Use multi-purpose lubricant, or equivalent, to aid installation of the grommet.

NOTE: A new grommet should be used when ever the rod is disconnected from the lever.

COLUMN (Continued)

- (3) Remove the shipping lock pin if necessary.
- (4) Install the column through the floor pan.
- (5) Position the column bracket breakaway capsules on the mounting studs. Install, but **loose assemble** the two upper bracket nuts.
- (6) With the front wheels in the straight-ahead position. Align steering column shaft to the coupler. Install a **new** pinch bolt and tighten to 49 N·m (36 ft. lbs.).
- (7) Clip the wiring harness on the steering column. Connect the multi- function switch wiring and tighten with 7mm socket.
- (8) Install the upper fixed shroud.
- (9) Be sure both breakaway capsules are fully seated in the slots in the column support bracket. Pull the column rearward then tighten upper bracket nuts to 12 N·m (105 in. lbs.).
- (10) Tighten the toe plate to floor pan attaching nuts to 22.5 N·m (200 in. lbs.).
- (11) Install the wiring connections to the column. Install the lower fixed shroud.
- (12) Column shift vehicles, install the PRNDL driver cable. Place shifter in Park position. If indica-

tor needs adjusting, turn thumb screw on cable retainer to adjust cable.

(13) Install the lock housing shrouds. Install the tilt lever (if equipped).

(14) Install the knee blocker and steering column opening cover, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(15) Install steering wheel and tighten nut to 61 N·m (45 ft. lbs.), (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).

(16) Install the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

(17) Column shift vehicles, connect the shift link rod to the transmission shift lever. Use multi-purpose lubricant, or an equivalent product, to aid the installation.

(18) Install the battery ground (negative) cable.

(19) Verify operation of the automatic transmission shift linkage and adjust as necessary, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 44RE/GEAR SHIFT CABLE - ADJUSTMENTS).

KEY-IN IGNITION SWITCH

DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column. It closes a path to ground for the Central Timer Module (CTM) when the ignition key is inserted in the ignition lock cylinder and the driver door ajar switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition lock cylinder. The ground path is also opened when the driver door ajar switch is open (driver door is closed).

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced, (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

DIAGNOSIS AND TESTING - IGNITION SWITCH AND KEY LOCK CYLINDER

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to Ignition Switch in the appropriate section of Electrical Wiring Diagrams.

KEY-IN IGNITION SWITCH (Continued)

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Vehicles equipped with an automatic transmission and a floor mounted shifter: a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is rotated to the LOCKED or ACCESSORY position. The interlock device within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

If the ignition key is difficult to rotate to or from the LOCK or ACCESSORY position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. Refer to Brake Transmission Shift Interlock Cable Adjustment in Transmissions for adjustment procedures.

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is in the LOCKED or ACCESSORY position. If it is difficult to rotate the key to or from the LOCK or ACCESSORY position, the interlock device within the steering column may be defective. This device is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a lever is located on the steering column behind the ignition key lock cylinder. The lever must be manually operated to allow rotation of the ignition key lock cylinder to the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

On other models, the ignition key cylinder must be depressed to allow it to be rotated into the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lock mechanism within the steering column may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

LOCK CYLINDER

REMOVAL

The ignition key must be in the key cylinder for cylinder removal.

- (1) Disconnect negative cable from battery.
- (2) If equipped with tilt column, remove tilt lever by turning it counterclockwise.
- (3) Remove upper and lower covers (shrouds) from steering column (Fig. 8).

Fig. 8 Shroud Removal/Installation—Typical

- 1 - NUT
- 2 - STEERING WHEEL
- 3 - TILT LEVER
- 4 - UPPER SHROUD
- 5 - PANEL BRACKET
- 6 - SPACER
- 7 - NUT
- 8 - LOWER SHROUD
- 9 - CLOCK SPRING

- (4) If equipped with automatic transmission, place shifter in PARK position.

- (5) A retaining pin (Fig. 9) is located at side of key cylinder assembly.

- (a) Rotate key to RUN position.

- (b) Press in on retaining pin while pulling key cylinder from ignition switch.

INSTALLATION

The ignition key must be in the key cylinder and turned clockwise to the RUN position for cylinder installation.

LOCK CYLINDER (Continued)

80a592b6

Fig. 9 Retaining Pin

- 1 - IGNITION SWITCH
- 2 - KEY/KEY CYLINDER (RUN POSITION)
- 3 - RETAINING PIN

(1) Install the lock cylinder into the housing using care to align the end of the lock cylinder with the ignition switch.

(2) Push the lock cylinder in until it clicks.

IGNITION SWITCH

DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key lock cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is in the LOCKED or ACCESSORY position. If it is difficult to rotate the key to or from the LOCK or ACCESSORY position, the interlock device within the steering column may be defective. This device is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a lever is located on the steering column behind the ignition key lock cylinder. The lever must be manually operated to allow rotation of the ignition

key lock cylinder to the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

On other models, the ignition key cylinder must be depressed to allow it to be rotated into the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lock mechanism within the steering column may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

DIAGNOSIS AND TESTING - IGNITION SWITCH

TEST AND REPAIR

If the key removal effort is excessive on a vehicle with a automatic transmission first adjust the shift linkage, (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 42RE/GEAR SHIFT CABLE - ADJUSTMENTS).

If the ignition switch effort is excessive remove the ignition key cylinder from the steering column. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - INSTALLATION). Check the turning effort of the key cylinder. If the ignition key cylinder effort is excessive replace the key cylinder. If the ignition key cylinder operates properly look for the following conditions.

(1) Look for rough areas or flash in the casting and if found remove with a file (Fig. 10).

(2) Grease the lock plate actuator, lock plate, slider and locking link.

80b1e145

Fig. 10 Steering Column Flash Removal

- 1 - FILE THIS AREA TO REMOVE FLASHING AND PROVIDE CLEARANCE TO ELIMINATE BINDING
- 2 - PARK LOCK SLIDER
- 3 - CAUTION: NEVER REMOVE SHAFT LOCK PLATE

IGNITION SWITCH (Continued)

REMOVAL

- (1) Remove the key lock cylinder.
- (2) Remove the three ignition mounting screws (Fig. 11).
- (3) Gently pull the switch away from the column. Disconnect the electrical connector (Fig. 12).
- (4) Disconnect the halo lamp wiring connector (Fig. 12).

**Fig. 11 SWITCH MOUNTING SCREWS**

- 1 - KEY-IN SWITCH & HALO LIGHT
- 2 - MULTI-FUNCTION SWITCH
- 3 - TURN SIGNAL SWITCH & LEVER
- 4 - IGNITION SWITCH
- 5 - SPEED CONTROL

INSTALLATION

- (1) Rotate the flag on the rear of the ignition switch to the RUN position (Fig. 13). This step must be done to allow the tang (Fig. 14) on the key cylinder to fit into the slots (Fig. 11) within the ignition switch.

**Fig. 13 FLAG IN RUN POSITION**

- 1 - REAR OF IGNITION SWITCH
- 2 - PARK LOCK DOWEL PIN (RUN POSITION)
- 3 - FLAG (RUN POSITION)

- (2) With the key into the key lock cylinder, rotate the key clockwise until the retaining pin can be depressed (Fig. 14) or (Fig. 15).

- (3) Install the key cylinder into the ignition switch by aligning the retaining pin slot. Push the key cylinder into the switch until the retaining pin engages. After the pin engages, rotate the key to the OFF or LOCK position.

- (4) Check for proper retention of the key cylinder by attempting to pull the cylinder from the switch.

- (5) Automatic Transmission Only: Before attaching the ignition switch to the steering column, the transmission shifter must be in the PARK position. The park lock dowel pin on the rear of the ignition switch (Fig. 16) must also be properly indexed into the park lock linkage (Fig. 17) before installing the switch.

- (6) The flag at the rear of the ignition switch must be properly indexed into the steering column before installing the switch. This flag is used to operate the steering wheel lock lever in the steering column (Fig. 18). This lever allows the steering wheel position to be locked when the key is in the LOCK position.

- (7) Place the ignition switch in the LOCK position. The switch is in the LOCK position when the column lock flag is parallel to the ignition switch terminals (Fig. 16).

- 3 - IGNITION SWITCH MOUNTING PAD
- 4 - STEERING COLUMN
- 5 - SLOT

(8) Automatic Transmissions Only: Apply a light coating of grease to the park lock dowel pin and park lock slider linkage. Before installing the switch, push the park lock slider linkage (Fig. 17) forward until it bottoms. Do a final positioning by pulling it rearwards about one-quarter inch.

(9) Apply a light coating of grease to both the column lock flag and shaft at the end of the flag.

(10) Place the ignition switch into the openings on the steering column

(a) Automatic Transmissions Only: Be sure the park lock dowel pin on the rear of the ignition switch enters the slot in the park lock slider linkage (Fig. 17).

(b) Be sure the flag on the rear of the switch is positioned above the steering wheel lock lever (Fig. 18).

(c) Align the dowel pins on the rear of the switch into the holes on the side of the steering column.

(d) Install the three ignition mounting screws. Tighten the screws to 2 N·m (17 in. lbs.).

IGNITION SWITCH (Continued)

(e) After installing the ignition switch rotate the ignition key from the LOCK to the ON position. Verify that the park lock slider moves in the slider slot, allowing the gear shift lever to be moved out of PARK (automatic transmissions only). If the slider does not move, and the gear shift lever is locked in PARK, the ignition switch park lock dowel pin, on the rear of the ignition switch, is not properly installed in the slot of the park lock slider linkage. Remove the ignition switch and reinstall.

Fig. 18 STEERING WHEEL LOCK LEVER

- 1 - STEERING COLUMN
- 2 - STEERING WHEEL LOCK LEVER
- 3 - LOCATER (SHAFT AT END OF FLAG)

(11) Connect the electrical connectors for the ignition switch and halo lamp.

(12) Install the steering column shrouds. Tighten the screws to 2 N·m (17 in. lbs.).

(13) Install the tilt column lever. (if equipped).

(14) Connect the battery.

(15) Automatic Transmissions Only: The shifter should lock in the PARK position when the key is in the LOCK position (if equipped with a shift lock device). The shifter should unlock when the key is rotated to the ON position.

(16) Check for proper operation of the ignition switch in ACCESSARY, LOCK, OFF, ON, RUN and start positions.

(17) The steering wheel should lock when the key is in the LOCK position. Rotate the steering wheel at least 180° to verify. The steering wheel should unlock when the key is rotated to the ON position.

GEAR SHIFT LEVER

REMOVAL

- (1) Remove the tilt lever.
- (2) Remove the upper and lower shrouds.
- (3) Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
- (4) Remove the steering column mounting nuts.
- (5) Lower the steering column to remove the secondary shrouds.
- (6) Raise the steering column back on the mounting bolts and finger tighten the nuts.
- (7) Disconnect over drive switch wiring.
- (8) Using a drift of the appropriate size drive the knurled pin out of the steering column and gear shift lever. Remove the gear shift lever from the steering column assembly.

CAUTION: The pin can only be removed from the direction shown (Fig. 19).

GEAR SHIFT LEVER (Continued)

INSTALLATION

(1) Install the gear shift lever into the steering column assembly. Align the pin holes in the gear shift lever and the steering column assembly.

CAUTION: The pin must be installed in the original direction.

(2) Carefully Install the pin into the steering column assembly and through the shift lever. If the pin binds check the alignment on the holes. Be sure pin is fully installed into the steering column assembly.

(3) Connect over drive switch wiring.

(4) Lower the steering column to install the secondary shrouds.

(5) Install the steering column mounting nuts. Tighten the nuts to 12 N·m (105 in. lbs.).

(6) Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEER-

ING COLUMN OPENING COVER - INSTALLATION).

(7) Install the upper and lower shrouds.

(8) Install the tilt lever.

STEERING WHEEL**REMOVAL**

For steering wheel removal procedure, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

INSTALLATION

For steering wheel installation procedure, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

GEAR

DESCRIPTION

The power steering gear is a recirculating ball type gear (Fig. 1). The gear ratio's used are 17.5:1 and 14:1.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a

bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft, turns the pitman shaft, which turns the steering linkage.

DIAGNOSIS AND TESTING - POWER STEERING GEAR LEAKAGE

(1) Possible power steering gear leakage areas. (Fig. 2).

GEAR (Continued)

1. SIDE COVER LEAK - TORQUE SIDE COVER BOLTS TO SPECIFICATION. REPLACE THE SIDE COVER SEAL IF THE LEAKAGE PERSISTS.
2. ADJUSTER PLUG SEAL - REPLACE THE ADJUSTER PLUG SEALS.
3. PRESSURE LINE FITTING - TORQUE THE HOSE FITTING NUT TO SPECIFICATIONS. IF LEAKAGE PERSISTS, REPLACE THE SEAL.
4. PITMAN SHAFT SEALS - REPLACE THE SEALS.
5. TOP COVER SEAL - REPLACE THE SEAL.

80a1c3c2

Fig. 2 STEERING GEAR**REMOVAL**

- (1) Place the front wheels in a straight-ahead position.
- (2) Disconnect and cap the fluid hoses from steering gear.
- (3) Remove coupler pinch bolt at the steering gear and slide shaft off gear (Fig. 3).

J9419-20

Fig. 3 Column Shaft

- 1 - STEERING GEAR
- 2 - STEERING COUPLER

- (4) Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from the shaft with Puller C-4150A (Fig. 4).

J9519-2

Fig. 4 Pitman Arm

- 1 - PITMAN ARM
- 2 - SPECIAL TOOL C-4150-A
- 3 - WRENCH

- (5) Remove steering gear retaining bolts and nuts. Remove the steering gear from the vehicle.

INSTALLATION

- (1) Position the steering gear on the frame rail and install the bolts. Tighten mounting bolts to specifications.
- (2) Align steering coupler on gear shaft. Install pinch bolt and tighten to 49 N·m (36 ft. lbs.) torque.
- (3) Align and install the pitman arm.
- (4) Install the washer and retaining nut on the pitman shaft. Tighten the nut to 251 N·m (185 ft. lbs.).
- (5) Connect fluid hoses to steering gear, tighten to 31 N·m (23 ft. lbs.). Add fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

ADJUSTMENTS

CAUTION: Steering gear must be adjusted in the proper order. If adjustments are not performed in order, gear damage and improper steering response may result.

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

GEAR (Continued)

WORM THRUST BEARING PRELOAD

- (1) Mount the gear carefully into a vise.

CAUTION: Do not overtighten the vise on the gear case. This may affect the adjustment

- (2) Remove adjuster plug locknut (Fig. 5).
 (3) Rotate the stub shaft back and forth with a 12 point socket to drain the remaining fluid.

Fig. 5 Adjuster Lock Nut

- 1 - ADJUSTER NUT
 2 - STEERING GEAR
 3 - LOCK NUT
 4 - PUNCH

(4) Turn the adjuster in with Spanner Wrench C-4381. Tighten the plug and thrust bearing in the housing until firmly bottomed in the housing about 28-31 N·m (20-23 ft. lbs.).

(5) Place an index mark on the housing even with one of the holes in adjuster plug (Fig. 6).

(6) Measure back (counterclockwise) 18 mm (0.70 in) and mark the housing (Fig. 7).

(7) Rotate adjustment cap back (counterclockwise) with spanner wrench until hole is aligned with the second mark (Fig. 8).

(8) Install and tighten lock nut to 108 N·m (80 ft. lbs.). Be sure adjustment cap does not turn while tightening the lock nut.

PITMAN SHAFT OVER-CENTER PRELOAD

NOTE: Before performing this procedure, the worm bearing preload adjustment must be performed.

(1) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

(2) Starting at either stop, turn the stub shaft back 1/2 the total number of turns. This is the center of the gear travel (Fig. 9).

J8919-58

Fig. 6 Alignment Marking On Housing

1 - INDEX

J8919-59

Fig. 7 Second Marking On Housing

1 - REFERENCE MARK

(3) Place the torque wrench in the vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range (Fig. 10). This is the Over-Center Rotating Torque.

NOTE: The stub shaft must rotate smoothly without sticking or binding.

GEAR (Continued)

J9219-30

Fig. 8 Aligning To The Second Mark

- 1 - FIRST MARK
- 2 - SECOND MARK
- 3 - SPANNER WRENCH

J8919-62

Fig. 9 Steering Gear Centered

- 1 - ADJUSTMENT SCREW
- 2 - MASTER SPLINE

(4) Rotate the stud shaft between 180° and 270° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.

(5) The Over-Center Rotating Torque should be 0.23-0.68 N·m (2-6 in. lbs.) **higher** than the Preload Rotating Torque.

(6) If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back (COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.

80b34e43

Fig. 10 Checking Over-center Rotation Torque

- 1 - CENTER

(7) Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat measurement until correct Over-Center Rotating Torque is reached.

NOTE: To increase the Over-Center Rotating Torque turn the screw **CLOCKWISE**.

(8) Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 49 N·m (36 ft. lbs.).

PITMAN BEARING

REMOVAL

(1) Clean exposed end of pitman shaft and housing with a wire brush.

(2) Remove preload adjuster nut (Fig. 11).

(3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

(4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

(5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 11).

NOTE: The pitman shaft will not clear the housing if it is not centered.

(6) Remove pitman shaft from the side cover.

(7) Remove dust seal from the housing with a seal pick (Fig. 12).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

(8) Remove retaining ring with snap ring pliers.

(9) Remove washer from the housing.

(11) Remove pitman shaft bearing from housing with a bearing driver and handle (Fig. 13).

Fig. 13 Needle Bearing Removal

- 1 - REMOVER
2 - SIDE COVER AREA

INSTALLATION

(1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 14). Drive bearing into housing until the driver bottoms out.

NOTE: Install upper pitman shaft bearing with the part number/letters facing the driver.

(2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 15). Drive bearing into housing until the bearing shoulder is seated against the housing.

(3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.

(4) Install the oil seal with Driver 8294 and Handle C-4171.

(5) Install plastic backup washer.

NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

(6) Install metal backup washer.

(7) Install the retainer ring with snap ring pliers.

(8) Coat the dust seal with **special grease** supplied with the new seal.

(9) Install dust seal with Driver 8294 and Handle C-4171.

(10) Install new pitman shaft cover o-ring.

(11) Install pitman shaft assembly into the housing.

(12) Install cover bolts and tighten to 62 N-m (46 ft. lbs.).

(13) Perform over-center rotation torque adjustment, (Refer to 19 - STEERING/GEAR - DIAGNOSIS AND TESTING).

PITMAN SHAFT

REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Remove preload adjuster nut (Fig. 16).
- (3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.
- (4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.
- (5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 16).

NOTE: The pitman shaft will not clear the housing if it is not centered.

PITMAN SHAFT (Continued)

INSTALLATION

- (1) Install pitman shaft bearing into housing with a bearing driver and handle.
- (2) Coat the oil seal and washer with **special grease** supplied with the new seal.
- (3) Install the oil seal with a driver and handle.
- (4) Install backup washer.
- (5) Install the retainer ring with snap ring pliers.
- (6) Coat the dust seal with **special grease** supplied with the new seal.
- (7) Install dust seal with a driver and handle.
- (8) Install pitman shaft to side cover by screwing shaft in until it fully seats to side cover.
- (9) Install preload adjuster nut. **Do not tighten nut until after Over-Center Rotation Torque adjustment has been made.**
- (10) Install gasket to side cover and bend tabs around edges of side cover (Fig. 11).
- (11) Install pitman shaft assembly and side cover to housing.
- (12) Install side cover bolts and tighten to 60 N·m (44 ft. lbs.).
- (13) Perform over-center rotation torque adjustment, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

(3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.

(4) Install the oil seal with Driver 8294 and Handle C-4171.

(5) Install plastic backup washer.

NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

(6) Install metal backup washer.

(7) Install the retainer ring with snap ring pliers.

(8) Coat the dust seal with **special grease** supplied with the new seal.

(9) Install dust seal with Driver 8294 and Handle C-4171.

(10) Install new pitman shaft cover o-ring.

(11) Install pitman shaft assembly into the housing.

(12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).

(13) Perform over-center rotation torque adjustment, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

SPOOL VALVE**REMOVAL**

(1) Remove lock nut (Fig. 24).

(2) Remove adjuster nut with Spanner Wrench C-4381.

SPOOL VALVE (Continued)

(3) Remove thrust support assembly out of the housing (Fig. 25).

(4) Pull stub shaft and valve assembly from the housing (Fig. 26).

SPOOL VALVE (Continued)

**Fig. 28 Spool Valve**

- 1 - SPOOL VALVE
2 - ROTATE VALVE TO REMOVE
3 - VALVE BODY

(7) Remove spool valve O-ring and valve body teflon rings and O-rings underneath the teflon rings (Fig. 29).

**Fig. 29 Valve Seals**

- 1 - O-RING SEALS

(8) Remove the O-ring between the worm shaft and the stub shaft.

INSTALLATION

NOTE: Clean and dry all components, then lubricate with power steering fluid.

- (1) Install spool valve spool O-ring.
- (2) Install spool valve in valve body by pushing and rotating. Hole in spool valve for stub shaft pin must be accessible from opposite end of valve body.
- (3) Install stub shaft in valve spool and engage locating pin on stub shaft into spool valve hole (Fig. 30).

NOTE: Notch in stub shaft cap must fully engage valve body pin and seat against valve body shoulder.

**Fig. 30 Stub Shaft Installation**

- 1 - NOTCH IN CAP
2 - VALVE BODY PIN

(4) Install O-rings and teflon rings over the O-rings on valve body.

(5) Install O-ring into the back of the stub shaft cap (Fig. 31).

(6) Install stub shaft and valve assembly in the housing. Line up worm shaft to slots in the valve assembly.

(7) Install thrust support assembly.

NOTE: The thrust support is serviced as an assembly. If any component of the thrust support is damaged the assembly must be replaced.

SPOOL VALVE (Continued)

**Fig. 31 Stub Shaft Cap O-Ring**

3 - O-RING

**Fig. 32 End Plug Retaining Ring**

- 1 - RETAINING RING

- (8) Install adjuster nut and lock nut.
(9) Adjust Thrust Bearing Preload and Over-Center Rotating Torque, (Refer to 19 - STEERING/GEAR - ADJUSTMENTS).

STEERING GEAR HOUSING PLUG

REMOVAL

(1) Unseat and remove retaining ring from groove with a punch through the hole in the end of the housing (Fig. 32).

(2) Slowly rotate stub shaft with 12 point socket COUNTER-CLOCKWISE to force the end plug out from housing.

CAUTION: Do not turn stub shaft any further than necessary. The rack piston balls will drop out of the rack piston circuit if the stub shaft is turned too far.

- (3) Remove O-ring from the housing (Fig. 33).

**Fig. 33 End Plug Components**

- 1 - HOUSING ASSEMBLY
2 - HOUSING END PLUG O-RING SEAL
3 - HOUSING END PLUG
4 - RETAINING RING

STEERING GEAR HOUSING PLUG (Continued)

INSTALLATION

- (1) Lubricate O-ring with power steering fluid and install into the housing.
- (2) Install end plug by tapping the plug lightly with a plastic mallet into the housing.
- (3) Install retaining ring so one end of the ring covers the housing access hole (Fig. 34).

**Fig. 34 Installing The**

- 1 - RING CAP
- 2 - PUNCH ACCESS HOLE
- 3 - RETAINER RING

WORM SHAFT

REMOVAL

- (1) Remove housing end plug, (Refer to 19 - STEERING/GEAR/STEERING GEAR HOUSING PLUG - REMOVAL).
- (2) Remove rack piston plug (Fig. 35).
- (3) Remove side cover and pitman shaft.
- (4) Turn stub shaft COUNTERCLOCKWISE until the rack piston begins to come out of the housing.
- (5) Insert Arbor C-4175 into bore of rack piston (Fig. 36) and hold tool tightly against worm shaft.
- (6) Turn the stub shaft with a 12 point socket COUNTERCLOCKWISE, this will force the rack piston onto the tool and hold the rack piston balls in place.
- (7) Remove the rack piston and tool together from housing.
- (8) Remove tool from rack piston.
- (9) Remove rack piston balls.
- (10) Remove clamp bolts, clamp and ball guide (Fig. 37).

- 3 - WORM SHAFT
- 4 - BEARING

INSTALLATION

NOTE: Clean and dry all components and lubricate with power steering fluid.

(1) Check for scores, nicks or burrs on the rack piston finished surface. Slight wear is normal on the worm gear surfaces.

(2) Install O-ring and teflon ring on the rack piston.

(3) Install worm shaft in the rack piston and align worm shaft spiral groove with rack piston ball guide hole (Fig. 40).

J9319-39

Fig. 40 Installing Balls in Rack Piston

- 1 - INSTALL BALLS IN THIS HOLE WHILE SLOWLY ROTATING WORM COUNTER CLOCKWISE
- 2 - WORM FLANGE

WORM SHAFT (Continued)

CAUTION: The rack piston balls must be installed alternately into the rack piston and ball guide. This maintains worm shaft preload. There are 12 black balls and 12 silver (Chrome) balls. The black balls are smaller than the silver balls.

(4) Lubricate and install rack piston balls through return guide hole while turning worm shaft COUNTERCLOCKWISE (Fig. 40).

(5) Install remaining balls in guide using grease to hold the balls in place (Fig. 41).

(6) Install the guide onto rack piston and install clamp and clamp bolts. Tighten bolts to 4.8 N·m (43 in. lbs.).

(7) Insert Arbor C-4175 into bore of rack piston and hold tool tightly against worm shaft.

(8) Turn the worm shaft COUNTERCLOCKWISE while pushing on the arbor. This will force the rack piston onto the arbor and hold the rack piston balls in place.

(9) Install the races and thrust bearing on the worm shaft and install shaft in the housing (Fig. 39).

(10) Install the stub shaft with spool valve, thrust support assembly and adjuster nut in the housing.

(11) Install the rack piston and arbor tool into the housing.

(12) Hold arbor tightly against worm shaft and turn stub shaft CLOCKWISE until rack piston is seated on worm shaft.

(13) Install pitman shaft and side cover in the housing.

(14) Install rack piston plug and tighten to 150 N·m (111 ft. lbs.).

(15) Install housing end plug. (Refer to 19 - STEERING/GEAR/STEERING GEAR HOUSING PLUG - INSTALLATION).

PUMP

DESCRIPTION

The P-Series pump is used on these vehicles (Fig. 1). The pump shaft has a pressed-on pulley that is belt driven by the crankshaft pulley on gasoline engines. The pump is driven off the back of the vacuum pump on the diesel engine.

Trailer tow option vehicles are equipped with a power steering pump oil cooler. The oil cooler is mounted to the front crossmember.

NOTE: Power steering pumps are not interchangeable with pumps installed on other vehicles.

OPERATION

Hydraulic pressure is provided by the pump for the power steering gear. The power steering pump is a constant flow rate and displacement, vane-type pump. The pump is connected to the steering gear via the pressure hose and the return hose. On vehicles equipped with a hydraulic booster, the pump supplies the hydraulic pressure for the booster.

DIAGNOSIS AND TESTING - PUMP LEAKAGE

(1) Possible pump leakage areas. (Fig. 2).

Fig. 2 POWER STEERING PUMP

1 - CHECK OIL LEVEL; IF LEAKAGE PERSISTS WITH THE CORRECT LEVEL AND CAP TIGHT, REPLACE THE CAP
 2 - SHAFT SEAL

3 - RESERVOIR O-RING
 4 - O-RING SEAL

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal temperature.

- (1) Turn steering wheel all the way to the left
- (2) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.
- (3) Raise the front wheels off the ground.
- (4) Slowly turn the steering wheel lock-to-lock 20 times with the engine off while checking the fluid level.

NOTE: Vehicles with long return lines or oil coolers turn wheel 40 times.

- (5) Start the engine. With the engine idling maintain the fluid level.
- (6) Lower the front wheels and let the engine idle for two minutes.
- (7) Turn the steering wheel in both direction and verify power assist and quit operation of the pump.

If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

STANDARD PROCEDURE - FLUSHING POWER STEERING SYSTEM

Flushing is required when the power steering/hydraulic booster system fluid has become contaminated. Contaminated fluid in the steering/booster system can cause seal deterioration and affect steering gear/booster spool valve operation.

- (1) Raise the front end of the vehicle off the ground until the wheels are free to turn.
- (2) Remove the return line from the pump.

NOTE: If vehicle is equipped with a hydraulic booster remove both return lines from the pump.

PUMP (Continued)

- (3) Plug the return line port/ports at the pump.
- (4) Position the return line/lines into a large container to catch the fluid.
- (5) While an assistant is filling the pump reservoir start the engine.
- (6) With the engine running at idle turn the wheel back and forth.

NOTE: Do not contact or hold the wheel against the steering stops.

- (7) Run a quart of fluid through the system then stop the engine and install the return line/lines.
- (8) Fill the system with fluid and perform Steering Pump Initial Operation, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
- (9) Start the engine and run it for fifteen minutes then stop the engine.
- (10) Remove the return line/lines from the pump and plug the pump port/ports.
- (11) Pour fresh fluid into the reservoir and check the draining fluid for contamination. If the fluid is still contaminated, disassemble and clean the steering gear and flush the system again.
- (12) Install the return line/lines and perform Steering Pump Initial Operation, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

REMOVAL

REMOVAL - GASOLINE ENGINE

- (1) Remove the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) OR (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (2) Remove the hoses from the power steering pump and cap the fittings.
- (3) Remove battery ground cable and unthread stud from cylinder head, do not remove from bracket.
- (4) Loosen upper bracket bolt and remove the lower bracket to engine block bolts.
- (5) Pivot the pump assembly past the coolant tube.
- (6) Remove the upper stud and remove upper bolt from cylinder head.
- (7) Remove steering pump and mounting bracket from engine as an assembly.
- (8) Remove the pump pulley with Puller C-4333, to access pump attaching bolts, (Refer to 19 - STEERING/PUMP/PULLEY - REMOVAL).
- (9) Remove the front pump bracket (Fig. 3). On 8.0L engine remove rear pump bracket (Fig. 4).

REMOVAL - DIESEL ENGINE

- (1) Remove and cap steering pump hoses and vacuum pump vacuum line.
- (2) Remove the sender unit from engine block and plug hole in block (Fig. 5).

**Fig. 5 Oil Pressure Sending Unit**

- 1 - OIL PRESSURE SENDER UNIT
- 2 - ELECTRICAL CONNECTOR
- 3 - ENGINE BLOCK
- 4 - STEERING PUMP

(3) Remove the serpentine belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove and cap the oil feed line from the bottom of the vacuum pump (Fig. 6).

(5) Remove the lower bolt that attaches the vacuum/steering pump assembly to the engine block. Remove the nut from the steering pump attaching bracket (Fig. 6).

(6) Remove upper bolt from the pump assembly (Fig. 7) and remove the assembly.

(7) Remove the mounting gasket.

(8) Remove the steering pump to vacuum pump bracket attaching nuts (Fig. 8).

(9) Slide the steering pump from the bracket. Use care not to damage the internal oil seal in the vacuum pump (Fig. 9).

(10) Remove the two pump body spacers.

INSTALLATION

INSTALLATION - GASOLINE ENGINE

(1) Install the front pump bracket and tighten bolts to 47 N·m (35 ft. lbs.). On 8.0L engine install rear pump bracket and tighten nut to 47 N·m (35 ft. lbs.), tighten bolts to 24 N·m (18 ft. lbs.).

(2) Install the pump pulley with Installer C-4063-B, (Refer to 19 - STEERING/PUMP/PULLEY - INSTALLATION).

(3) Install steering pump assembly on the engine block. Install the upper stud and bolt in bracket.

(4) Pivot the pump down past the coolant tube and install the lower bolts in bracket.

(5) Tighten the bolts and nut to 41 N·m (30 ft. lbs.).

(6) Connect the hoses to the pump.

(7) Install the serpentine drive belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION), (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(8) Fill the reservoir with power steering fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - DIESEL ENGINE

(1) Install the two pump body spacers.

(2) Rotate the drive gear until the steering pump and vacuum pump drive dogs align. Install the steering pump onto the vacuum pump bracket. Use care to avoid damaging the oil seal in the vacuum pump during installation. **The steering pump housing and spacers must mate completely with the vacuum pump bracket.**

(3) Install the vacuum pump bracket to steering pump nuts and tighten to 24 N·m (18 ft. lbs.).

(4) Position new gasket on vacuum pump assembly. Use sealer if necessary to retain the gasket.

(5) Align and install the pump assembly on the engine. Ensure the steering pump stud is inserted into the block bracket. Tighten the pump-to-engine block attaching bolts to 77 N·m (57 ft. lbs.).

(6) Install the steering pump to attaching bracket nut and tighten to 24 N·m (18 ft. lbs.).

(7) Remove plug and install the oil pressure sending unit and electrical connector.

(8) Install the oil feed line to the vacuum pump. Tighten the oil line connection to 7 N·m (60 in. lbs./ 5 ft. lbs.).

PUMP (Continued)

(9) Install the fluid hoses to the power steering pump. Tighten the pressure fitting at the pump to 31 N·m (23 ft. lbs.).

(10) Install and clamp the hose on the vacuum pump.

(11) Install the serpentine belt, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(12) Fill the reservoir with power steering fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

(13) Start the engine and check the operation of the brakes.

- (3) Install pump assembly.
- (4) With Serpentine Belts; Run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

HOSES - PRESSURE

DESCRIPTION

The hose consists of two metal ends and rubber center section that contains a tuning cable.

OPERATION

Power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the power steering gear.

HOSES - RETURN

DESCRIPTION

Power steering return line is a hose which is clamped at the pump and the gear.

OPERATION

Power steering return line, is used to transfer low pressure power steering fluid, from the power steering gear to the power steering pump.

LINKAGE - 2WD

DESCRIPTION

Light duty (LD) and heavy duty (HD) steering linkage is used with IFS suspensions. The linkage is comprised of a idler arm, pitman arm, center link and tie rod ends. Heavy duty linkage is used on 8800 and 10500 lb. GVW vehicles.

CAUTION: If any steering components are replaced or serviced an alignment must be performed.

NOTE: When servicing the steering linkage, use care to avoid damaging ball stud seals. Use Puller C-3894-A or an appropriate puller to remove tie rod ends (Fig. 1).

Fig. 1 Tie Rod End

- 1 - CLAMP
- 2 - ADJUSTMENT SLEEVE
- 3 - PULLER TOOL C-3894-A
- 4 - SEAL
- 5 - TIE-ROD END

STANDARD PROCEDURE - LUBRICATION

Periodic lubrication of the idler arm is required. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

REMOVAL

- (1) Remove the nut from the tie-rod.
- (2) Remove the tie-rod end ball studs from the steering knuckles with an appropriate puller.
- (3) Remove inner tie-rod ends from center link.
- (4) Remove idler arm stud from center link with an appropriate puller. Remove the idler arm bolt from frame bracket.
- (5) Remove pitman arm ball stud from center link.
- (6) Mark the pitman arm and shaft positions for installation reference. Remove pitman arm with Puller C-4150A (Fig. 2).

Fig. 2 Pitman Arm

- 1 - PITMAN ARM
- 2 - SPECIAL TOOL C-4150-A
- 3 - WRENCH

LINKAGE - 2WD (Continued)

INSTALLATION

(1) Position idler arm on the frame bracket and tighten the bolt to specification.

(2) Center steering gear to alignment marks and install pitman arm.

(3) Install the lock washer and retaining nut on the pitman shaft. Tighten the nut to 251 N·m (185 ft. lbs.).

(4) Install center link to ball studs and tighten retaining nuts to specification.

(5) Install tie-rod ends into center link and tighten the nuts to 88 N·m (65 ft. lbs.). Install new nuts.

(6) Install tie-rod ends into steering knuckles and tighten nuts to 108 N·m (80 ft. lbs.).

(7) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

(8) After adjustment, tighten the tie-rod adjustment sleeve clamp bolt to 61 N·m (45 ft. lbs.).

STANDARD PROCEDURE - LUBRICATION

Periodic lubrication of the steering system components is required. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

The following components must be lubricated:

- Tie rod
- Tie rod end
- Drag link

REMOVAL

- (1) Remove steering damper mounting nuts and bolts and remove damper.
- (2) Remove tie rod nuts.
- (3) Remove tie rod from drag link and left knuckle with Puller C-4150A.
- (4) Remove drag and nuts.
- (5) Remove drag link from right knuckle and pitman arm with Puller C-4150A.

LINKAGE - 4WD (Continued)

(6) Mark the pitman arm and shaft positions for installation reference. Remove the nut and washer from the pitman arm. Remove the pitman arm with Puller C-4150A.

INSTALLATION

- (1) Align reference marks and install pitman arm.
- (2) Install the lock washer and retaining nut on the pitman shaft and tighten nut to 251 N·m (185 ft. lbs.).
- (3) Install drag link to the pitman arm. Install the nut and tighten to 108 N·m (80 ft. lbs.).
- (4) Install drag link to the right steering knuckle. Install the nut and tighten to 88 N·m (65 ft. lbs.).
- (5) Install tie rod to the left steering knuckle and drag link. Install the nuts and tighten to 108 N·m (80 ft. lbs.).

(6) Install steering damper on the axle. Tighten nut to 95 N·m (75 ft. lbs.).

(7) Install steering damper on the tie rod. Tighten nut to 81 N·m (60 ft. lbs.).

(8) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, refer to Group 2 Suspension.

(9) After adjustment tighten tie rod adjustment sleeve clamp bolts to 61 N·m (45 ft. lbs.).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

MANUAL - NV4500

DESCRIPTION

The NV4500 is a five speed constant mesh manual transmission (Fig. 1). All gear ranges including reverse are synchronized. Fifth gear is an overdrive range. The transmission has a cast iron gear case and aluminum shift cover.

Two versions are used, a standard duty for 5.9L applications and a heavy duty for V10 and Cummins diesel applications. Main differences are the larger diameter input shaft, output shaft and mainshaft fifth gear in the heavy duty model.

Tapered roller bearings support the drive gear, mainshaft and countershaft in the gear case. Roller bearings in the drive gear support the forward end of

the mainshaft. The mainshaft gears are all supported on caged type roller bearings. Drive gear thrust reaction is controlled by a needle type thrust bearing. The bearing is located at the forward end of the mainshaft.

The transmission is a top loader style. The shift lever is located in a shifter tower which is bolted to the shift cover and operates the shift forks and rails directly. The shift forks and rails are all located within the aluminum cover which is bolted to the top of the gear case.

SHIFT PATTERN

The shift pattern is in a modified H pattern (Fig. 2). Overdrive fifth and reverse gears are in line and outboard of the first through fourth gear positions.

FIRST	5.61:1
SECOND	3.04:1
THIRD	1.67:1
FOURTH	1.00:1
FIFTH	0.75:1
REVERSE	5.04:1

IDENTIFICATION

The transmission identification tag is attached to the driver side PTO cover (Fig. 3).

The tag provides the transmission model number, build date and part number. Be sure to reinstall the I.D. tag if removed during service. The information on the tag is essential to correct parts ordering.

J9221-14

Fig. 3 Identification Tag Location

- 1 - PTO COVER
2 - I.D. TAG

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point all the transmission gears are spinning.

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

DIAGNOSIS AND TESTING

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check. A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition. Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer. A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

MANUAL - NV4500 (Continued)**HARD SHIFTING**

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds. Severe highly audible transmission noise is generally the initial indicator of a lubricant problem.

Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Shift transmission into Neutral.
- (3) Remove shift boot screws from floorpan and slide boot upward on the shift lever.
- (4) Remove shift lever extension from shift tower and lever assembly.
- (5) Remove shift tower bolts holding tower to isolator plate and transmission shift cover.
- (6) Remove shift tower and isolator plate from transmission shift cover.
- (7) Raise and support vehicle.
- (8) Remove skid plate, if equipped.
- (9) Mark propeller shaft and axle yokes for installation reference and remove shaft/shafts.
- (10) Remove exhaust system Y-pipe.
- (11) Disconnect speed sensor and backup light switch connectors.
- (12) Support engine with safety stand and a wood block.
- (13) If transmission is to be disassembled for, remove drain bolt at bottom of PTO cover and drain lubricant (Fig. 4).

**Fig. 4 Drain Bolt**

- 1 - PTO COVER
- 2 - DRAIN BOLT
- 3 - FILL PLUG

TWO WHEEL DRIVE

- (1) Remove nuts/bolts attaching transmission to rear mount.
- (2) Support and secure transmission with safety chains to a transmission jack.
- (3) Remove rear crossmember.
- (4) Remove clutch slave cylinder bolts and move cylinder aside for clearance.
- (5) Remove transmission harness wires from clips on transmission shift cover.
- (6) Remove transmission to clutch housing bolts.
- (7) Slide transmission and jack rearward until input shaft clears clutch housing.
- (8) Lower transmission jack and remove transmission from under vehicle.

FOUR WHEEL DRIVE

- (1) Disconnect transfer case shift linkage at transfer case range lever. Then remove transfer case shift mechanism from transmission (Fig. 5).
- (2) Support and secure transfer case to transmission jack with safety chains.
- (3) Remove transfer case mounting nuts.
- (4) Move transfer case rearward until input gear clears transmission mainshaft.
- (5) Lower transfer case assembly and move it from under vehicle.
- (6) Support and secure transmission with safety chains to a transmission jack.
- (7) Remove transmission harness from retaining clips on transmission shift cover.
- (8) Remove bolts/nuts attaching transmission mount to rear crossmember.
- (9) Remove rear crossmember.
- (10) Remove clutch slave cylinder splash shield, if equipped.

MANUAL - NV4500 (Continued)

J9421-258

Fig. 5 Transfer Case Shift Mechanism-Typical

- 1 - TRANSMISSION
2 - TRANSFER CASE SHIFT MECHANISM

(11) Loosen clutch slave cylinder attaching nuts until cylinder piston rod is clear of release lever. This reduces pressure on lever and release bearing making transmission removal/installation easier. Cylinder does not have to be removed completely.

(12) Remove transmission bolts from clutch housing.

(13) Move transmission rearward until input shaft clears clutch disc and release bearing.

(14) Lower transmission and remove it from under vehicle.

DISASSEMBLY**EXTENSION/ADAPTER HOUSING**

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft.
- (3) Support transmission with a transmission jack.
- (4) Remove engine rear support.
- (5) Remove transfer case, if equipped.
- (6) Remove bolts attaching extension/adapter housing to gear case (Fig. 6).

(7) Remove extension/adapter housing (Fig. 7). There is one alignment dowel in the gear case and one in the extension/adapter housing.

(8) Remove rubber spline seal from end of mainshaft (Fig. 8). The seal is used to prevent lubricant loss during shipping and does not have to be replaced if damaged.

FIFTH GEAR NUT

- (1) Remove extension/adapter housing.
- (2) Loosen fifth gear clamp nut clamping screw approximately 1 1/2 turns.

80a953d3

Fig. 6 Extension/Adapter Housing Bolts

- 1 - EXTENSION HOUSING
2 - BOLTS (8)

80b171f5

Fig. 7 Extension/Adapter Housing

- 1 - GEAR CASE
2 - EXTENSION HOUSING

(3) Install nut Wrench 6743 on fifth gear nut (Fig. 9).

NOTE: Wrench only fits one way on nut. Make sure wrench is fully engaged in nut slots and is not cocked.

MANUAL - NV4500 (Continued)

**Fig. 8 Mainshaft Spline Seal**

- 1 - MAINSHAFT
2 - RUBBER SPLINE SEAL

(4) Install splined Socket 6993 4X2 Socket 6984 4X4 to retain mainshaft while removing the fifth gear nut.

(5) Install breaker bar in socket wrench (Fig. 9)

NOTE: Wedge breaker bar handle against workbench. Purpose of socket wrench and breaker bar is to prevent mainshaft from turning while nut is loosened.

(6) Remove fifth gear nut, then remove belleville washer from mainshaft.

**Fig. 9 Fifth Gear Nut**

2 - FIFTH GEAR NUT
3 - SPLINE SOCKET 6993 OR 6984

FIFTH GEAR

(1) Remove roll pins that secure countershaft fifth gear shift fork to shift rail with pin punch (Fig. 10). Drive roll pins out from the bottom of fork.

**Fig. 10 Fifth Gear Shift Fork Roll Pins**

- 1 - FORK ROLL PINS
2 - FIFTH GEAR SHIFT FORK

(2) Remove fifth gear clutch hub and gear snap ring on countershaft (Fig. 11).

(3) Remove countershaft fifth gear clutch gear and stop ring.

(4) Remove fifth gear shift fork and gear assembly. Remove assembly by tapping fork off rail with plastic mallet.

(5) Remove fifth gear shift fork from sleeve.

(6) Remove sleeve, struts and strut springs from countershaft fifth gear hub, if necessary.

**Fig. 11 Countershaft Fifth Gear Clutch Gear Snap Ring**

- 1 - CLUTCH GEAR RING
2 - FIFTH SYNCHRO CLUTCH GEAR

MANUAL - NV4500 (Continued)

(7) Remove countershaft fifth gear needle bearing assembly (Fig. 12).

(8) Remove cone shaped rear bearing thrust washer from end of countershaft (Fig. 13). Note position of washer and washer bore notch for locating pin for assembly reference.

(9) Remove and retain thrust washer locating pin from countershaft.

2 - THRUST WASHER PIN

(10) Remove mainshaft overdrive fifth gear with Puller Tool Set 6444.

(11) Position first Puller Jaw 6459 or 6820 on gear (Fig. 14).

(12) Assemble Puller Flange 6444-1 and Puller Rods 6444-3 4X2 or 6444-4 4X4 vehicles (Fig. 15).

80b1b2a8

Fig. 14 First Puller Jaw On Mainshaft Fifth (Overdrive) Gear

- 1 - MAINSHAFT FIFTH GEAR
2 - JAWS 6459 OR 6820
3 - MAINSHAFT

(13) Slide assembled puller flange and rods onto output shaft. Then seat flange in notch of puller jaw (Fig. 15).

80b1b2a9

Fig. 15 Seating Puller Flange In First Puller

- 1 - JAWS 6459 or 6820
2 - PULLER FLANGE 6444-1

(14) Position second puller jaw on gear and in notch of puller flange (Fig. 16).

(15) Slide Retaining Collar 6444-8 over puller jaws to hold them in place (Fig. 16).

(16) Install Puller and Bolt 6444 on puller rods. Then secure puller to rods with retaining nuts (Fig. 17).

(17) Tighten puller bolt to remove gear from shaft splines (Fig. 17).

MANUAL - NV4500 (Continued)

**Fig. 16 Retaining Collar Over Puller Jaws**

- 1 - JAWS 6459 or 6820
- 2 - COLLAR 6444-8

- 4 - WRENCH
- 5 - MAINSHAFT
- 6 - PULLER FLANGE 6444-1

(18) Remove mainshaft rear bearing plate bolts and remove fifth gear plate end play shims and bearing cup (Fig. 18).

FRONT RETAINER

(1) Remove and discard front bearing retainer bolts (Fig. 19). Do not reused retainer bolts.

**Fig. 18 Mainshaft Fifth Gear Bearing Plate, Bearing Shims And Rear Bearing Cup**

- 1 - MAINSHAFT REAR BEARING CUP
- 2 - BEARING SHIMS
- 3 - BEARING PLATE
- 4 - FIFTH GEAR

**Fig. 19 Front Bearing Retainer**

- 1 - DRIVE GEAR
- 2 - FRONT BEARING RETAINER

(2) Lightly tapping retainer back and forth with plastic mallet. Then rock retainer back and forth by hand to work it out of gear case.

NOTE: Retainer flange extends into transmission case and is a snug fit.

(3) Remove front retainer seal by (Fig. 20) collapsing one side of seal then prying it out.

(4) To remove front retainer bearing cup, assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 21).

(5) Insert Puller Jaws 6453-1 in puller flange (Fig. 21). Narrow lip of puller jaws will go under bearing cup.

(6) Install Disc C-4487-1 into bearing retainer on heavy duty transmissions for Insert 6453-2 to rest upon.

MANUAL - NV4500 (Continued)

**Fig. 20 Bearing Retainer Seal**

- 1 - SEAL
2 - FRONT BEARING RETAINER

- 1 - WRENCH
2 - INSERT 6453-2
3 - FRONT RETAINER
4 - PULLER 6444
5 - WRENCH

(7) Install assembled tools in front retainer (Fig. 22) with puller jaws seated under bearing cup.

(8) Place Insert Tool 6453-2 in center of puller jaws, to hold puller jaws in place (Fig. 22).

(9) Install Puller 6444 on puller rods (Fig. 23) and install retaining nuts on puller rods.

(10) Tighten puller bolt to draw bearing cup out of retainer (Fig. 23).

MANUAL - NV4500 (Continued)

DRIVE GEAR

- (1) Remove drive gear (Fig. 24).
- (2) Remove pilot bearing from drive gear (Fig. 25).

**Fig. 24 Drive Gear**

- 1 - MAINSHAFT
- 2 - DRIVE GEAR

**Fig. 25 Pilot Bearing**

- 1 - DRIVE GEAR
- 2 - MAINSHAFT PILOT BEARING

- (3) Remove tapered bearing from drive gear with Puller Flange 6444-1 and Puller Rods 6444-6 (Fig. 26). Then position first Puller Jaw 6447 on bearing

(4) Slide assembled puller flange and rod tools onto input shaft. Then seat flange in notch of puller jaw.

(5) Position second Puller Jaw 6447 on gear and in notch of puller flange.

(6) Slide Retaining Collar 6444-8 over puller jaws to hold them in place.

(7) Install Puller 6444 on puller rods then install retaining nuts.

(8) Tighten puller bolt to remove bearing cone from drive gear.

**Fig. 26 Front Bearing Puller**

MANUAL - NV4500 (Continued)

MAINSHAFT AND GEARTRAIN

- (1) Move 1-2 and 3-4 synchro sleeves into neutral.
- (2) Remove drive gear thrust bearing from forward end of mainshaft (Fig. 27).

**Fig. 27 Drive Gear Thrust Bearing**

- 1 - MAINSHAFT
2 - DRIVE GEAR THRUST BEARING

- (3) Remove fourth gear clutch gear and synchro stop ring from mainshaft (Fig. 28).

**Fig. 28 Fourth Gear Clutch Gear Stop Ring**

- 1 - FOURTH GEAR SYNCHRO STOP RING
2 - FOURTH SPEED CLUTCH GEAR

- (4) Roll gear case onto left side (Fig. 29).
- (5) To remove mainshaft assembly (Fig. 29) lift front end of mainshaft slightly.

NOTE: Handling mainshaft carefully because gears are loose on the mainshaft.

- (6) Grasp mainshaft rear splines, then turn spline end of mainshaft counterclockwise to rotate shaft and geartrain out of case. Tilt mainshaft outward and removed from case.

**Fig. 29 Mainshaft And Geartrain**

- 1 - MAINSHAFT AND CASE

REVERSE IDLER AND COUNTERSHAFT

- (1) Remove countershaft rear bearing plate (Fig. 30).

**Fig. 30 Countershaft Rear Bearing Plate**

- 1 - REAR BEARING PLATE
2 - COUNTERSHAFT

MANUAL - NV4500 (Continued)

(2) Remove countershaft end play shim and rear bearing cup (Fig. 31).

Fig. 31 Countershaft End Play Shim And Rear Bearing Cup

- 1 - COUNTERSHAFT REAR BEARING CUP
2 - END PLAY SHIM

(3) Remove reverse idler shaft (Fig. 32).

Fig. 32 Reverse Idler Shaft

- 1 - REVERSE IDLER SHAFT

(4) Rotate countershaft outward and push reverse idler gear away from countershaft and toward front of case (Fig. 33).

(5) Remove idler gear (Fig. 34).

(6) Keep reverse idler gear bearings and spacer together (Fig. 35). Insert idler shaft through gear and bearings to keep them in place.

Fig. 33 Idler Gear Moved Away From Countershaft

- 1 - REVERSE IDLER GEAR
2 - COUNTERSHAFT

Fig. 34 Reverse Idler Gear

- 1 - REVERSE IDLER GEAR
2 - DRIVE GEAR BORE

Fig. 35 Idler Gear Components

- 1 - BEARINGS
2 - REVERSE IDLER GEAR

MANUAL - NV4500 (Continued)

(7) Remove idler gear thrust washers from gear case. Install washers on idler shaft to keep them together for cleaning and inspection.

(8) To remove countershaft rear bearing ,assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 36).

NOTE: Shaft cannot be removed from case until rear bearing has been removed.

(9) Position first Puller Jaw 6449 on bearing cone

(10) Seat puller flange in notch of puller jaw just installed on bearing cone

(11) Install second Puller Jaw 6449 on bearing and in notch of puller flange

(12) Slide Retaining Collar 6444-8 over puller jaws to hold them in place

NOTE: Retaining collar has small lip on one end and only fits one way over jaws.

(13) Install Puller 6444 on puller rods, then secure puller to rods with retaining nuts

(14) Tighten puller bolt to remove bearing from shaft. If bearing is exceptionally tight, tap end of puller bolt with copper mallet to help loosen bearing.

Fig. 36 Countershaft Rear Bearing

- 1 - COLLAR 6444-8
- 2 - JAWS 6449
- 3 - PULLER 6444
- 4 - WRENCH

(15) Remove bearing puller tools then rotate countershaft out of gear case (Fig. 37).

(16) To Remove countershaft front bearing, assemble Puller Flange 6444-1 and Puller Bolts 6444-4 (Fig. 38).

(17) Position first Puller Jaw 6451 on bearing.

(18) Seat puller flange in notch of puller jaw.

(19) Install second Puller Jaw 6451 on bearing and in notch of puller flange.

Fig. 37 Countershaft And Case

- 1 - COUNTERSHAFT

(20) Slide Retaining Collar 6444-8 over puller jaws to hold them in place

NOTE: Retaining collar has small lip on one end and only fits one way over jaws.

(21) Install puller bridge and bolt assembly 6444 on puller bolts and install retaining nuts

(22) Tighten puller bolt to remove bearing from shaft. If bearing is exceptionally tight, tap end of puller bolt with mallet to help loosen bearing.

Fig. 38 Countershaft Front Bearing

- 1 - JAWS 6451
- 2 - COLLAR 6444-8
- 3 - PULLER 6444
- 4 - FLANGE 6444-1

(23) Remove bearing puller tools.

MANUAL - NV4500 (Continued)

GEAR CASE

(1) Remove countershaft front bearing cap with hammer (Fig. 39).

Fig. 39 Countershaft Front Bearing Cap

- 1 - HAMMER
2 - BEARING CAP

(2) Remove countershaft front bearing cup with Remover 6454 and Handle C-4171 (Fig. 40).

Fig. 40 Countershaft Front Bearing Cup

- 1 - REMOVER 6454
2 - HANDLE C-4171

(3) Remove roll pin that secures shift lug on shift rail in case (Fig. 41). A small pin punch can be modified by putting a slight bend in it to drive pin completely out of shift rail (Fig. 41).

(4) Remove shift lug rail.

Fig. 41 Shift Lug Roll Pin

- 1 - PUNCH
2 - 30° BEND
3 - PIN PUNCH MODIFICATION
4 - SHIFT LUG
5 - SHIFT RAIL

MAINSHAFT

NOTE: Gear and synchro components can be installed backwards. Paint or scribe gear and synchro components for installation reference. Then stack geartrain parts in order of removal.

(1) Remove drive gear thrust bearing from end of mainshaft, if not previously removed.

(2) Remove 3-4 synchro hub, third gear stop ring and third gear as an assembly (Fig. 42).

(3) Remove third gear bearing from mainshaft (Fig. 43).

(4) Remove third gear bearing spacer (Fig. 44).

(5) Remove second gear thrust washer snap ring from mainshaft (Fig. 44).

MANUAL - NV4500 (Continued)

J9221-120

**Fig. 47 Second Gear**

1 - SECOND GEAR

**Fig. 48 Second Gear Bearing**

1 - SECOND GEAR NEEDLE BEARING

(10) Remove second gear clutch cone snap ring from mainshaft synchro hub groove (Fig. 49).

**Fig. 49 Second Gear Clutch Cone Snap Ring**

1 - 1-2 SLEEVE
 2 - SNAP RING
 3 - SECOND GEAR CLUTCH CONE

(11) Remove second gear clutch cone, synchro clutch ring and synchro stop ring (Fig. 50).

**Fig. 50 Second Gear Clutch Cone And Ring**

1 - 1-2 SLEEVE AND HUB
 2 - SYNCHRO STOP RING
 3 - CLUTCH RING
 4 - SECOND GEAR CLUTCH CONE

(12) Remove 1-2 synchro hub snap ring (Fig. 51).

(13) Remove 1-2 synchro sleeve, hub, struts and springs as an assembly (Fig. 52). Note tapered side of sleeve also goes toward front. Do not disassemble synchro components unless worn or damaged.

(14) Remove first gear synchro stop ring and clutch ring (Fig. 53).

MANUAL - NV4500 (Continued)

J9221-129

Fig. 51 1-2 Sleeve And Hub Snap Ring

J9221-131

Fig. 53 First Gear Stop And Clutch Ring

- 1 - FIRST GEAR CLUTCH RING
2 - FIRST GEAR STOP RING

(15) Remove first gear clutch cone front snap ring from mainshaft hub (Fig. 54).

J9221-132

Fig. 54 First Gear Clutch Gear Front Snap Ring

- 1 - FIRST SPEED CLUTCH GEAR
2 - CLUTCH GEAR SNAP RING (FRONT)

(16) Remove first gear clutch cone (Fig. 55).

(17) Remove first gear clutch gear rear snap ring from mainshaft hub (Fig. 55). Do not remove this snap ring unless mainshaft is to be replaced.

J9221-133

Fig. 55 First Gear Clutch Gear

- 1 - CLUTCH GEAR SNAP RING (REAR)
2 - FIRST SPEED CLUTCH GEAR

(18) To remove mainshaft rear bearing, assemble Puller Flange 6444-1 and Puller Rods 6444-3 for 4X2 or 6444-4 for 4X4 (Fig. 56).

(19) Position the first Puller Jaw 6445 on the bearing cone.

(20) Seat Puller Flange 6444-1 in notch of first puller jaw.

(21) Install the second Puller Jaw 6445 on the bearing cone and puller flange.

MANUAL - NV4500 (Continued)

J9221-138

Fig. 56 Mainshaft Rear Bearing Puller

- 1 - REAR BEARING

- 5 - MAINSHAFT
- 6 - PULLER 6444
- 7 - RODS 6443-3 OR 6444-4
- 8 - JAW 6445

(22) Install Puller 6444 on the puller rods and secure with nuts.

(23) Hold hex portion of Puller 6444 a wrench (Fig. 57) and tighten screw.

(24) Remove bearing puller tools and rear mainshaft bearing from output shaft.

(25) Remove reverse gear thrust washer (Fig. 58).

(26) Remove reverse gear and synchro components as assembly (Fig. 59). Do not disassemble synchro components unless they are damaged. If synchro sleeve or struts require service, mark position of sleeve on hub before removal. Correct sleeve position is important as sleeve can be installed backwards causing shift problems.

(27) Remove reverse gear bearing assembly from mainshaft (Fig. 59).

(28) Remove reverse gear bearing spacer from mainshaft (Fig. 60).

(29) Remove reverse clutch gear snap ring (Fig. 60). Tension of this snap ring is considerable. Heavy duty snap ring pliers will be required to spread the ring far enough to remove it.

CLEANING

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean the shaft bearings with a mild solvent such as Mopar degreasing solvent, Gunk or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.

Inspect the reverse idler gear, bearings, shaft and thrust washers. Replace the bearings if the rollers are worn, chipped, cracked, flat-spotted or brinnelled. Replace the gear if the teeth are chipped, cracked or worn thin.

Inspect the front bearing retainer and bearing cup. Replace the bearing cup if scored, cracked, brinnelled or rough. Check the release bearing slide surface of the retainer carefully. Replace the retainer if worn or damaged in any way.

Inspect mainshaft bearing surfaces, splines, snap ring grooves and threads. Replace the shaft if any surfaces exhibit considerable wear or damage.

Inspect the countershaft and bearings. Replace the shaft if any surfaces exhibit considerable wear or damage.

Inspect shift forks for wear and distortion. Check fit of the sleeve in the fork to be sure the two parts fit and work smoothly. Replace the fork if the roll pin holes are worn oversize or damaged. Do not attempt to salvage a worn fork. Replace shift fork roll pins if necessary or if doubt exists about their condition.

The all bearings for wear, roughness, flat spots, pitting or other damage. Replace the bearings if necessary.

Inspect the blocker rings and fiction cones. replace either part if worn or damaged in any way. Replace if the friction material is burned, flaking off or worn.

Inspect synchro components wear or damage. Replace parts if worn, cracked or distorted.

Inspect all of the thrust washers and locating pins. Replace the pins if bent or worn. Replace the washers if worn or the locating pin notches are distorted.

Inspect the case and housing/adaptor sealing and mating surfaces are free of burrs and nicks. Inspect the alignment dowels in the case top surface and in the housing/adaptor are tight and in good condition. Replace the gear case or housing/adaptor if cracked or broken.

MANUAL - NV4500 (Continued)

ASSEMBLY

NOTE: Gaskets are not used in the transmission. Use Mopar Silicone Sealer or equivalent on all gear case and extension housing sealing surfaces.

COUNTERSHAFT AND REVERSE IDLER GEAR

(1) Install countershaft front bearing cup in case with Handle C-4171 and Installer 6061-1.

(2) Install front bearing on countershaft with Installer C-4340 (Fig. 64).

Fig. 64 Countershaft Front Bearing

- 1 - FRONT BEARING
- 2 - INSTALLER C-4340
- 3 - COUNTERSHAFT

(3) Lubricate countershaft front bearing cup and cone with petroleum jelly.

(4) Position gear case on end with rear of case facing up (Fig. 65).

(5) Install countershaft in gear case (Fig. 65).

NOTE: Do not install rear countershaft bearing on countershaft at this time.

(6) Lubricate reverse idler gear bearings with petroleum jelly and install first bearing and second bearing (Fig. 66).

(7) Install idler gear front thrust washer on boss in gear case (Fig. 66). Coat thrust washer with liberal quantity of petroleum jelly to hold it in place.

(8) Install reverse idler gear in case (Fig. 67).

(9) Install idler gear rear thrust washer between idler gear and case boss (Fig. 67).

(10) Align idler gear bearings and thrust washers with a drift.

(11) Install reverse idler shaft with notched end of shaft facing countershaft (Fig. 68).

Fig. 65 Countershaft In Gear Case

80b1b2ba

Fig. 70 Countershaft Rear Bearing

- 1 - INSTALLER C-4040
- 2 - REAR BEARING
- 3 - COUNTERSHAFT

(12) Lift countershaft upward and position wood block between front of shaft and case (Fig. 69).

(13) Install rear bearing cone on countershaft with Installer C-4040 (Fig. 70).

(14) Remove wood block from under countershaft and lower countershaft front bearing into front bearing cup.

(15) Lubricate countershaft rear bearing cup and cone with petroleum jelly.

(16) Install countershaft rear bearing cup in gear case and over rear bearing (Fig. 71). Tap cup into place with plastic mallet if necessary.

(17) Install countershaft rear bearing plate (Fig. 72).

NOTE: Verify plate is seated in notch in reverse idler shaft before tightening bearing plate bolts.

(18) Apply Mopar silicone adhesive/sealer or equivalent to flange and lip of new cap. Install **new** front bearing cap in gear case (Fig. 73) with Handle C-4171 and Installer C-3972-A.

MANUAL - NV4500 (Continued)

**Fig. 71 Countershaft Rear Bearing Cup**

1 - COUNTERSHAFT REAR BEARING CUP

1 - COUNTERSHAFT
2 - REAR BEARING PLATE
3 - IDLER SHAFT

**Fig. 73 Countershaft Front Bearing Cap**

1 - FRONT BEARING CAP (SEAT WITH WOOD BLOCK)

COUNTERSHAFT END PLAY

- (1) Rotate countershaft 4-5 times to seat bearings.
- (2) Mount dial indicator on case. Then position indicator plunger on end of countershaft and zero dial indicator (Fig. 74).
- (3) Raise countershaft with screwdriver and note end play reading on dial indicator. End play should be 0.051 - 0.15 mm (0.002 - 0.006 in.).

**Fig. 74 Measuring Countershaft End Play**

1 - DIAL INDICATOR
2 - COUNTER SHAFT
3 - INDICATOR MOUNTING ARM AND BASE

- (4) Remove countershaft rear bearing plate.
- (5) Install a end play shim that will provide minimum countershaft end play. Position shim on rear bearing cup (Fig. 75).

**Fig. 75 Countershaft End Play Shim**

1 - REAR BEARING CUP
2 - END PLAY SHIM (SELECTIVE)

MANUAL - NV4500 (Continued)

- (6) Install countershaft rear bearing plate (Fig. 72).

NOTE: Verify plate is seated in reverse idler shaft notch and end play shims are still in position before installing bolts.

- (7) Apply 1-2 drops Mopar Loc N' Seal or equivalent to threads of rear bearing plate bolts. Then install and tighten bearing plate bolts to 23 N·m (200 in. lbs.).

SHIFT LUG AND RAIL

- (1) Lubricate shift lug and rail with Castrol® Syntorq or equivalent.
- (2) Insert shift lug rail part way into case.
- (3) Install shift lug on rail.
- (4) Position shift rail so roll pin notches are toward outside of case (Fig. 76).
- (5) Install roll pin that secures lug to rail (Fig. 76).

Fig. 76 Shift Lug And Rail

- 1 - NOTCHES (FOR 5TH GEAR SHIFT FORK ROLL PINS)
- 2 - LUG RAIL
- 3 - ROLL PIN HOLE
- 4 - SHIFT LUG

MAINSHAFT AND GEARTRAIN

CAUTION: The reverse, 1-2 and 3-4 synchro components can be assembled and installed incorrectly. Follow assembly procedures for component identification and location.

Lubricate mainshaft bearing surfaces and all bearing assemblies with Castrol® Syntorq or with petroleum jelly.

- (1) Install first snap ring in rear most groove of mainshaft hub (Fig. 77). This snap ring locates first gear clutch gear on shaft.

NOTE: Four of these snap rings are used to secure various components on the mainshaft 1-2 synchro hub. The snap rings are all the same size and are interchangeable.

Fig. 77 First Gear Bearing and Snap Ring

- 1 - SNAP RING
- 2 - FIRST GEAR BEARING
- 3 - MAINSHAFT SYNCHRO HUB

- (2) Install first gear clutch cone on mainshaft 1-2 synchro hub with recessed side of cone facing front (Fig. 78). Verify cone is seated against snap ring on hub.

Fig. 78 First Gear Clutch Cone

- 1 - MAINSHAFT 1-2 SYNCHRO HUB
- 2 - FIRST GEAR CLUTCH CONE

- (3) Install snap ring on mainshaft 1-2 synchro hub to secure clutch cone (Fig. 79). Verify snap ring is seated in hub groove and against clutch cone.

- (4) Support mainshaft in upright position to install remaining gears, snap rings and synchro components. Shaft can be supported in gear case or hole can be cut in workbench to support shaft.

MANUAL - NV4500 (Continued)

80aa0f8c

Fig. 79 First Gear Clutch Cone Snap Ring

- 1 - FIRST GEAR CLUTCH CONE
- 2 - MAINSHAFT 1-2 SYNCHRO HUB
- 3 - CLUTCH CONE SNAP RING

(5) If 1-2 synchro hub and sleeve were disassembled for service, reassemble hub, sleeve, struts and springs as follows:

(a) Align and install sleeve on hub. Rotate sleeve until it slides onto hub. Sleeve only fits one way and will easily slide onto hub when long slot in sleeve, aligns with long shoulder on hub (Fig. 80).

(b) Place wood blocks under hub that will raise hub about 3.5 cm (1.375 in.) above surface of work-bench. Then allow sleeve to drop down on hub (Fig. 81).

(c) Install springs and struts in hub (Fig. 81). Use lots of petroleum jelly to hold them in place. Then compress struts with your fingers and move sleeve upward until struts are started in sleeve. Verify that struts are engaged in sleeve before proceeding.

(d) Turn synchro assembly upright. Then move sleeve into neutral position on hub and work struts into sleeve at same time. Be sure struts are seated and springs are not displaced during assembly.

(6) Install first gear stop ring in 1-2 synchro hub and sleeve (Fig. 82). Verify stop ring is seated and engaged in hub and sleeve.

Fig. 82 First Gear Stop Ring In Synchro Hub

MANUAL - NV4500 (Continued)

(7) Install 1-2 synchro assembly and stop ring on mainshaft with the taper on the sleeve facing forward. (Fig. 83).

80aa0f9a

Fig. 83 1-2 Synchro

- 1 - MAINSHAFT HUB
- 2 - 1-2 SYNCHRO ASSEMBLY
- 3 - TAPERED SIDE OF SLEEVE

(8) Install snap ring that secures 1-2 synchro on mainshaft hub (Fig. 84). Verify snap ring is seated in groove in mainshaft hub.

80aa0f9b

Fig. 84 1-2 Synchro Snap Ring

- 1 - SYNCHRO SNAP RING
- 2 - 1-2 SYNCHRO ASSEMBLY
- 3 - MAINSHAFT HUB

(9) Assemble second gear clutch cone, clutch ring and stop ring (Fig. 85).

(10) Install assembled second gear clutch cone and rings on mainshaft and in 1-2 synchro hub (Fig. 86).

80aa0f9c

Fig. 85 Second Gear Clutch Cone, Clutch Ring And Stop Ring

- 1 - STOP RING
- 2 - CLUTCH RING

Fig. 86 Second Gear Clutch Cone, Clutch Ring And Stop Ring

- 1 - CLUTCH CONE
- 2 - STOP RING
- 3 - CLUTCH RING

MANUAL - NV4500 (Continued)

(11) Install snap ring that secures second gear clutch cone on mainshaft (Fig. 87). Use narrow blade screwdriver to work snap ring into hub groove as shown. Verify snap ring is seated in mainshaft groove.

NOTE: If snap ring will not fit in groove, clutch cone is slightly misaligned.

80aa0fbf

Fig. 87 Second Gear Clutch Cone Snap Ring

- 2 - MAINSHAFT HUB
- 3 - SNAP RING
- 4 - SECOND GEAR CLUTCH CONE

(12) Install second gear bearing on mainshaft (Fig. 88).

80aa0fc0

Fig. 88 Second Gear Bearing

- 1 - SECOND GEAR BEARING

(13) Install second gear on mainshaft and bearing. Rotate gear until tabs of second gear clutch ring are seated in tab slots in gear (Fig. 89).

(14) Install thrust washer pin in shaft (Fig. 90).

J9221-218

Fig. 89 Second Gear

- 1 - SECOND GEAR
- 2 - CLUTCH RING TABS
- 3 - TAB SLOTS (IN GEAR)

80aa0fc1

Fig. 90 Thrust Washer Pin

- 1 - THRUST WASHER PIN
- 2 - SECOND GEAR

MANUAL - NV4500 (Continued)

(15) Install second gear thrust washer. Verify washer is seated on gear and pin (Fig. 91).

Fig. 91 Second Gear Thrust Washer

80aa0fc2

- 1 - SECOND GEAR
- 2 - SECOND GEAR THRUST WASHER
- 3 - LOCATING PIN IN WASHER NOTCH

(16) Install second gear thrust washer snap ring (Fig. 92). Verify snap ring is seated in mainshaft groove.

(17) Install third gear bearing spacer on shaft and seat it against thrust washer snap ring (Fig. 92).

J9221-122

Fig. 92 Snap Ring And Third

- 1 - SECOND GEAR THRUST WASHER
- 2 - THRUST WASHER SNAP RING
- 3 - THIRD GEAR BEARING SPACER

(18) Install third gear bearing on mainshaft (Fig. 93). Bearing should be flush with mainshaft hub.

NOTE: If bearing is not flush with hub, the bearing spacer or snap ring was not installed.

(19) Install third gear over bearing and onto mainshaft (Fig. 94).

80aa0fc3

Fig. 93 Third Gear Bearing

- 1 - THIRD GEAR BEARING

J9221-226

Fig. 94 Third Gear

- 1 - THIRD GEAR

(20) Install synchro stop ring on third gear (Fig. 95). Verify stop ring is seated on cone taper.

J9221-227

Fig. 95 Third Gear Stop Ring

- 1 - SYNCHRO STOP RING
- 2 - THIRD GEAR

(21) If 3-4 synchro was disassembled for service, reassemble synchro components as follows:

MANUAL - NV4500 (Continued)

(a) Align and install synchro sleeve on hub (Fig. 96). **Front side of hub has a narrow groove machined in it.**

(b) Insert all three synchro struts in slots machined in sleeve and hub (Fig. 96).

(c) Install and seat synchro springs (Fig. 96). Use screwdriver to compress springs and seat them in struts and hub as shown.

Fig. 96 Synchro Assembly (3-4)

- 1 - STRUT (3)
- 2 - SPRING (3)
- 3 - 3-4 SLEEVE
- 4 - 3-4 HUB

(22) Start 3-4 synchro assembly on mainshaft with the hub groove and sleeve groove both facing forward. Tap assembly onto shaft splines until hub is about 3 mm (0.125 in.) away from third gear stop ring. Then align stop ring with synchro sleeve and hub and seat synchro assembly with Installer C-4040 (Fig. 97).

Fig. 97 Seating 3-4 Synchro Assembly On Mainshaft

- 1 - 3-4 SYNCHRO HUB
- 2 - HUB GROOVE
- 3 - INSTALLER C-4040

(23) Verify 3-4 synchro hub is seated on shaft with approximately 3 mm (0.125 in.) of shaft spline visible.

NOTE: If hub is not seated, stop ring lugs are misaligned. Rotate ring until lugs are engaged in 3-4 hub slots.

(24) Verify that second and third gear rotate freely at this point. If not, determine the cause and correct.

(25) Invert mainshaft in case or bench.

(26) Install first gear bearing on mainshaft.

(27) Install first gear on shaft with clutch hub side of gear facing the front of shaft (Fig. 98). Verify tabs on clutch ring are aligned and seated in first gear hub.

NOTE: 1-2 synchro hub will not seat properly if clutch ring tabs are misaligned.

(28) Install reverse clutch gear on first gear (Fig. 98). Verify clutch gear is seated on shaft splines.

(29) Install reverse clutch gear snap ring with heavy duty snap ring pliers (Fig. 98). Verify snap ring is seated in groove.

NOTE: Reverse gear will not fit properly if snap ring is not seated.

80aa0fc4

Fig. 98 First Gear And Clutch Gear

- 1 - FIRST GEAR
- 2 - REVERSE CLUTCH GEAR SNAP RING
- 3 - REVERSE CLUTCH GEAR

(30) Install stop ring on clutch cone (Fig. 99). Verify stop ring is seated on cone taper.

(31) Install reverse gear bearing spacer on mainshaft and seat against reverse clutch gear snap ring (Fig. 100).

(32) Install reverse gear bearing on mainshaft (Fig. 100).

MANUAL - NV4500 (Continued)

80ae0fc5

Fig. 99 Clutch Gear Stop Ring

- 3 - FIRST GEAR

J9221-192

Fig. 100 Reverse Gear Bearing And Spacer

- 1 - REVERSE GEAR BEARING
- 2 - BEARING SPACER
- 3 - FIRST GEAR

(33) If reverse gear sleeve and struts were disassembled for service, reassemble sleeve, struts and springs as follows:

CAUTION: The reverse sleeve will fit either way on the hub. Verify tapered side of the sleeve faces rearward.

(a) Position sleeve on hub so tapered side of sleeve faces rearward. (Fig. 101).

(b) Rotate sleeve to align teeth on sleeve and hub. Sleeve will slide easily into place on hub when properly aligned.

(c) Install springs in gear hub (Fig. 101). Use petroleum jelly to hold springs in place if desired.

(d) Compress first spring with flat blade screwdriver and slide strut into position in hub slot. Then work spring into seat in strut with small hooked tool or screwdriver.

(e) Install second and third struts in same manner as described in step (d).

(f) Work sleeve upward on hub until struts are centered and seated in sleeve. Sleeve should be in neutral position after seating struts.

J9221-189

Fig. 101 Reverse Gear Synchro Assembly

- 1 - REVERSE GEAR
- 2 - SLEEVE
- 3 - SPRING (3)
- 4 - STRUT (3)
- 5 - HUB

(34) Install reverse gear and synchro assembly on mainshaft (Fig. 102). Rotate assembly until stop ring lugs engage in hub slots and gear drops into seated position.

J9221-193

Fig. 102 Reverse Gear

- 1 - REVERSE GEAR AND SYNCHRO ASSEMBLY

(35) Install reverse gear thrust washer (Fig. 103).

(36) Install rear bearing on mainshaft with Installer 6446. Seat bearing on output shaft and against thrust washer (Fig. 104).

MANUAL - NV4500 (Continued)

**Fig. 103 Reverse Gear Thrust Washer**

- 1 - THRUST WASHER
2 - REVERSE GEAR

**Fig. 104 Mainshaft Rear Bearing**

- 1 - INSTALLER 6446
2 - MAINSHAFT REAR BEARING

(37) Install fourth gear stop ring in 3-4 synchro sleeve (Fig. 105).

**Fig. 105 Fourth gear Stop Ring**

- 1 - 3-4 SYNCHRO SLEEVE
2 - FOURTH SPEED STOP RING

(38) Install fourth gear clutch gear in stop ring (Fig. 106).

**Fig. 106 Fourth gear Clutch Gear**

- 1 - FOURTH SPEED CLUTCH GEAR

(39) Roll gear case onto its left side.

(40) Grip mainshaft at pilot bearing hub and just behind reverse gear. Then lift assembly and guide rear of shaft through bearing bore at rear of case.

(41) Continue holding front of shaft but switch grip at rear to shaft output splines. Lift mainshaft assembly slightly, align gears and seat assembly in case.

(42) Set transmission case upright (Fig. 107).

**Fig. 107 Mainshaft And Geartrain In Case**

- 1 - MAINSHAFT AND GEARTRAIN
2 - FOURTH SPEED CLUTCH GEAR

(43) Install drive gear thrust bearing on mainshaft (Fig. 108). Use plenty of petroleum jelly to hold bearing in place.

(44) Check alignment and mesh of mainshaft gears. If gears are not aligned, roll case on side and realign shaft and gears in case.

MANUAL - NV4500 (Continued)

**Fig. 108 Drive Gear Thrust Bearing**

- 1 - MAINSHAFT
2 - DRIVE GEAR THRUST BEARING

DRIVE GEAR AND RETAINER

(1) Install bearing on drive gear with Installer 6448 (Fig. 109).

**Fig. 109 Front Bearing On Drive Gear**

- 1 - INSTALLER 6448
2 - BEARING
3 - DRIVE GEAR

(2) Lubricate pilot bearing with petroleum jelly and install it in drive gear bore.

(3) Install drive gear on mainshaft. Work gear rearward until mainshaft hub is seated in pilot bearing.

(4) Install bearing cup in front retainer with Handle C-4171 and Installer C-4308 (Fig. 110).

(5) Install new oil seal in front bearing retainer with Installer 6052 (Fig. 111). Use one or two wood blocks to support retainer as shown. Lubricate seal lip with petroleum jelly after installation.

(6) Clean contact surfaces of gear case and front bearing retainer with a wax and grease remover.

(7) Apply Mopar Silicone Sealer or equivalent to flange surface of front bearing retainer (Fig. 112).

**Fig. 110 Front Bearing Cup In Retainer**

- 1 - INSTALLER C-4308
2 - HANDLE C-4171
3 - WOOD BLOCKS
4 - RETAINER

**Fig. 111 Bearing Retainer Oil Seal**

- 1 - INSTALLER 6052
2 - RETAINER
3 - WOOD BLOCK

(8) Install front bearing retainer over drive gear and start it into case.

(9) Start front bearing retainer in gear case. Verify retainer lube channel is at the top-center (**12 O'clock**) position (Fig. 112).

(10) Align front bearing retainer bolt holes and tap retainer into place with plastic mallet. Install **new** retainer bolts and tighten to 30 N·m (22 ft. lbs.) (Fig. 113).

NOTE: Never reuse the old bolts.

MANUAL - NV4500 (Continued)

J9221-231

- 3 - APPLY GASKET MAKER HERE

J9221-103

Fig. 113 Front Bearing Retainer

- 1 - DRIVE GEAR
- 2 - FRONT BEARING RETAINER

MAINSHAFT END PLAY

(1) Install mainshaft rear bearing cup in case and over bearing. Tap bearing cup into place with plastic mallet.

(2) Install rear bearing plate to hold mainshaft and rear bearing in position (Fig. 114).

NOTE: Do not install any end play shims at this time.

(3) Tighten rear bearing plate bolts securely.

(4) Place gear case in upright position on bench. Either cut hole in bench to accept drive gear and front retainer or use C-clamps to secure transmission on bench.

NOTE: Do not leave transmission unsupported.

(5) Install Extension Rod 8161 into a suitable threaded hole in rear of case.

(6) Mount dial indicator on extension rod and position indicator plunger against end of mainshaft.

(7) Move mainshaft forward to remove all play then zero dial indicator.

(8) Move mainshaft upward and record dial indicator reading. Move mainshaft with pry tool positioned between drive gear and case.

(9) End play should be 0.051-0.15 mm (0.002-0.006 in.). Select fit shims are available to adjust end play. If end play adjustment is required, remove bearing plate and install necessary shim.

(10) Reinstall rear bearing plate with oil hole in bearing plate at the top (Fig. 114).

(11) Apply Mopar Lock N' Seal or equivalent to bearing plate bolt threads. Install and tighten bolts to 23 N·m (200 in. lbs.).

80b1b2de

Fig. 114 Rear Bearing Plate

- 1 - BEARING PLATE OIL HOLE (AT TOP)
- 2 - MAINSHAFT REAR BEARING PLATE

(12) Install mainshaft fifth gear with Installer 6446 (Fig. 115). Gear is seated when it contacts rear bearing.

COUNTERSHAFT FIFTH GEAR SYNCHRO

(1) Install thrust washer pin in countershaft (Fig. 116).

(2) Install thrust washer on countershaft. Turn washer until pin engages in washer notch (Fig. 117).

NOTE: The flat side of washer faces the rear and cone side faces the front.

(3) Lubricate and install fifth gear bearing on countershaft (Fig. 118).

(4) Install synchro sleeve on hub of countershaft fifth gear with tapered side of sleeve facing front and the flat side facing rear (Fig. 119).

(5) Install shift fork in synchro sleeve (Fig. 120).

MANUAL - NV4500 (Continued)**Fig. 115 Mainshaft Fifth Gear**

2 - THRUST WASHER

**Fig. 120 Fifth Gear Shift Fork In Synchro Sleeve**

- 1 - SYNCHRO SLEEVE
2 - SHIFT FORK

MANUAL - NV4500 (Continued)

(6) Install assembled fifth gear, synchro sleeve and shift fork (Fig. 121). Align fork with shift lug rail and align gear with bearings and countershaft. Start components onto shaft and rail, then tap gear and fork into place with plastic or rawhide mallet.

80b1b2e4

Fig. 121 Countershaft Fifth Gear, Shift Fork And Synchro Sleeve

- 1 - SHIFT FORK AND SLEEVE
- 2 - FIFTH GEAR HUB
- 3 - SHIFT FORK ROLL PINS

(7) Install fifth gear synchro struts and springs (Fig. 122).

J9221-240

Fig. 122 Fifth Gear Synchro Struts And Springs

- 1 - FIFTH GEAR HUB
- 2 - SYNCHRO SPRING (3)
- 3 - SYNCHRO STRUT (3)

(8) Assemble and install fifth synchro clutch gear and stop ring in fifth gear hub (Fig. 123). Verify parts are seated in fifth gear hub.

(9) Install clutch gear snap ring (Fig. 124).

80b1b2e5

Fig. 123 Fifth Synchro Clutch Gear And Stop Ring

- 2 - CLUTCH GEAR

J9221-89

Fig. 124 Fifth Synchro Clutch Snap Ring

- 1 - CLUTCH GEAR RING
- 2 - FIFTH SYNCHRO CLUTCH GEAR

(10) Align roll pin holes in shift fork with notches in shift lug rail. Then install roll pins from top side of fork (Fig. 121).

NOTE: Roll pins only fit one way due to small shoulder at one end of each pin.

FIFTH GEAR NUT

- (1) Install belleville washer onto the mainshaft.
- (2) Install fifth gear nut over the mainshaft.
- (3) Tighten the clamp bolt until the gap in the clamp nut assembly is closed.
- (4) Back the clamp bolt off one full turn.
- (5) Place 10-15 drops of Loctite 272 onto the mainshaft threads where the fifth gear nut will be engaged.
- (6) Install fifth gear nut on mainshaft (Fig. 125).

MANUAL - NV4500 (Continued)

80b171f9

Fig. 125 Fifth Gear Nut

- 1 - FIFTH GEAR
2 - FIFTH GEAR NUT

(7) Hold mainshaft Socket 6993 4X2 or Socket 6984 4X4 while installing the fifth gear nut.

(8) Tighten fifth gear nut as much as possible with Nut Wrench 6743, long handle ratchet, breaker bar and applicable socket wrench (Fig. 126).

80b171f8

Fig. 126 Fifth Gear Nut

- 1 - WRENCH 6443 OR 6743
2 - FIFTH GEAR NUT
3 - SOCKET 6993 OR 6984

(9) Lock mainshaft gears by shifting all synchro sleeves into engaged position.

(10) Tighten fifth gear nut with Nut Wrench 6743 and high capacity torque wrench. Tighten nut to 366-

380 N·m (270-280 ft. lbs.). Have helper hold transmission steady if necessary.

(11) Torque the fifth gear clamp nut clamping bolt to 13.5 N·m (10 ft. lbs.).

(12) Unlock the mainshaft gears by shifting all synchro sleeves out of the engaged position.

EXTENSION/ADAPTER HOUSING

(1) Clean mating surfaces of extension/adapter housing and gear case with a wax and grease remover.

(2) Check alignment dowels in gear case and housing or adapter. Be sure dowels are in position and seated.

(3) Apply Mopar Silicone Sealer or equivalent to gear case and housing mating surfaces.

(4) Align and install extension/adapter housing on gear case (Fig. 127).

80b171f5

Fig. 127 Installing Extension/Adapter Housing

- 1 - GEAR CASE
2 - EXTENSION HOUSING

(5) Apply Mopar Lock N' Seal or equivalent to threads of extension/adapter housing bolts.

(6) Install and tighten housing bolts to 54 N·m (40 ft. lbs.).

(7) Install transfer case, if equipped.

(8) Install engine rear support.

(9) Install propeller shaft(s).

(10) Remove transmission support stand and lower vehicle.

MANUAL - NV4500 (Continued)

INSTALLATION

NOTE: If a new transmission is being installed, use all components supplied with the new transmission. For example, if a new shift tower is supplied with the new transmission, do not re-use the original shift tower.

(1) Apply light coat of Mopar high temperature bearing grease or equivalent to contact surfaces of the following components:

- input shaft splines.
- release bearing slide surface of front retainer.
- release bearing bore.
- release fork.
- release fork ball stud.
- propeller shaft slip yoke.

(2) Apply sealer to threads of bottom PTO cover bolt and install bolt in case.

(3) Mount transmission on jack and position transmission under vehicle.

(4) Raise transmission until input shaft is centered in release bearing and clutch disc hub.

(5) Move transmission forward and start input shaft in release bearing, clutch disc and pilot bushing.

(6) Work transmission forward until seated against clutch housing. Do not allow transmission to remain unsupported after input shaft has entered clutch disc.

(7) Install and tighten transmission-to-clutch housing bolts to 108 N·m (80 ft. lbs.).

(8) Install transmission mount on transmission or rear crossmember.

(9) Install rear crossmember.

(10) Remove transmission jack and engine support fixture.

(11) Position transmission harness wires in clips on shift cover.

(12) Install clutch slave cylinder and install slave cylinder shield, if equipped.

(13) Connect speed sensor and backup light switch wires.

TWO WHEEL DRIVE

(1) Fill transmission with recommended lubricant. Correct fill level is bottom edge of fill plug hole.

(2) Align and install propeller shaft.

(3) Lower vehicle.

(4) Clean the mating surfaces of shift tower, isolator plate and shift cover with suitable wax and grease remover.

(5) Apply Mopar Gasket Maker or equivalent to the sealing surface of the shift cover. Do not over apply sealant.

(6) Install the isolator plate onto the shift cover, metal side down.

(7) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(8) Verify that the shift tower, isolator plate and the shift tower bushings are properly aligned.

(9) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(10) Install the shift lever extension onto the shift tower and lever assembly.

(11) Install shift boot and bezel.

(12) Connect battery negative cable.

FOUR WHEEL DRIVE

(1) Install transfer case shift mechanism on transmission.

(2) Install transfer case on transmission jack. Secure transfer case to jack with safety chains.

(3) Raise jack and align transfer case input gear with transmission mainshaft.

(4) Move transfer case forward and seat it on adapter.

(5) Install and tighten transfer case attaching nuts. Tighten nuts to 41–47 N·m (30–35 ft. lbs.) if case has 3/8 studs or 30–41 N·m (22–30 ft. lbs.) if case has 5/16 studs.

(6) Install transfer case shift mechanism to side of transfer case.

(7) Connect transfer case shift lever to range lever on transfer case.

(8) Align and connect propeller shafts.

(9) Fill transmission with required lubricant. Check lubricant level in transfer case and add lubricant if necessary.

(10) Install transfer case skid plate, if equipped and crossmember. Tighten attaching bolts/nuts to 41 N·m (30 ft. lbs.).

(11) Install exhaust system components.

(12) Lower vehicle.

(13) Clean the mating surfaces of shift tower, isolator plate and shift cover with suitable wax and grease remover.

(14) Apply Mopar Gasket Maker or equivalent to the sealing surface of the shift cover. Do not over apply sealant.

(15) Install the isolator plate onto the shift cover, metal side down.

(16) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(17) Verify that the shift tower, isolator plate and the shift tower bushings are properly aligned.

MANUAL - NV4500 (Continued)

(18) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(19) Install the shift lever extension onto the shift tower and lever assembly.

(20) Install shift lever boot and bezel.

(21) Connect battery negative cable.

ADAPTER HOUSING SEAL - NV4500

REMOVAL

- (1) Raise and support vehicle.
- (2) Mark the propeller shafts and yokes for installation reference and remove the shafts.
- (3) Support transmission with a transmission jack.
- (4) Remove engine rear support.
- (5) Remove transfer case.
- (6) Remove adapter housing seal with a pry tool or slide hammer mounted screw (Fig. 128).

Fig. 128 Adapter Housing - 4WD

- 1 - ADAPTER HOUSING
2 - SEAL

INSTALLATION

- (1) Install adapter housing seal with Installer C-3860-A and Handle C-4171.
- (2) Install transfer case.
- (3) Install propeller shafts with reference marks aligned.
- (4) Fill transfer case and transmission to proper level.
- (5) Remove support and lower vehicle.

EXTENSION HOUSING SEAL - NV4500

REMOVAL

- (1) Raise and support the vehicle.
- (2) Mark the propeller shaft and yoke for installation reference.
- (3) Remove the propeller shaft.
- (4) Remove extension housing seal (Fig. 129) using Remover C-3985-B.

- (5) On heavy duty 4X2 vehicles, remove extension housing seal with a pry tool or a slide hammer mounted screw.

Fig. 129 Extension Housing - 2WD

FIFTH-REVERSE SHIFT FORK PADS

Three shift pads on the forks are held in place by tension and a small locating tang (Fig. 135).

To remove the pads, grasp a pad with hand and tilt it out and off the fork. If pad is difficult to remove by hand, insert a screwdriver blade between the pad and fork and pry the pad off.

EXPANSION PLUG

The expansion plugs at the rear of the shift rail bores (Fig. 136) can be replaced if loose/leaking.

(1) Drill 6 mm (1/4 in.) diameter hole in center of the plug to be removed.

(2) Pry plug out of cover with tapered punch.

SHIFT MECHANISM - NV4500 (Continued)**Fig. 135 Shift Fork Pad Locations**

- 1 - SHIFT FORK PADS
2 - FIFTH-REVERSE FORK

**Fig. 136 Expansion Plug Location**

- 1 - EXPANSION PLUGS

(3) Clean all chips from shift cover and plug bores. Then clean plug bores with solvent and dry with clean shop towel.

INSTALLATION**EXPANSION PLUG**

(1) Apply small bead of Mopar silicone sealer or equivalent to outer edge of each new plug.

(2) Position each plug in bore and tap into place with hammer and punch or socket.

FIFTH-REVERSE SHIFT FORK PADS

(1) Align pad locating tab.

(2) Snap pads into place and verify locating tabs are locked-in.

SHIFT COVER

(1) Clean mating surfaces of shift cover and gear case with wax and grease remover.

(2) Apply a small amount of Mopar silicone sealer or equivalent to sealing surface of shift cover.

CAUTION: Do not over-apply an excessive amount sealer. Excess can squeezed into gear case and could block lubricant feed holes in time.

(3) Lubricate synchro sleeves with Castrol® Syn-torq gear lubricant or equivalent. Then apply light coat of petroleum jelly to shift fork contact surfaces.

(4) Verify shift fork pads (Fig. 137) are secure.

**Fig. 137 Fifth-Reverse Shift Fork Pads**

- 1 - SHIFT FORK PADS
2 - FIFTH-REVERSE FORK

(5) Verify 1-2 and 3-4 synchro sleeves and forks in shift cover are in neutral position.

(6) Align and seat shift cover on transmission.

NOTE: If cover will not seat, it may not be aligned on gear case dowels or shift forks are not aligned with sleeves and shift lug.

(7) Apply Mopar Lock N' Seal or equivalent to threads of shift cover bolts.

(8) Install shift cover bolts and tighten to 27-31 N·m (216-276 in. lbs.).

(9) Apply sealer to backup lamp switch. Install switch into cover and tighten to 22-34 N·m (193-265 in. lbs.).

(10) Install vent assembly if removed. Apply an adhesive/sealer to vent tube to help secure it in cover.

(11) Install transmission.

SHIFT COVER - NV4500

REMOVAL

- (1) Shift transmission into Neutral.
- (2) Unscrew and remove the shift lever extension from the shift
- (3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.
- (4) Remove the bolts holding the shift tower to the isolator plate and transmission shift cover.
- (5) Remove the shift tower and isolator plate from the transmission shift cover.

INSTALLATION

- (1) Clean the mating surfaces of shift tower, isolator plate and shift cover with suitable wax and grease remover.

(2) Apply Mopar Gasket Maker or equivalent to the sealing surface of the shift cover. Do not over apply sealant.

(3) Install the isolator plate onto the shift cover, metal side down.

(4) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(5) Verify shift tower, isolator plate and shift tower bushings are properly aligned.

(6) Install bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2-11.25 N·m (7.5-8.3 ft. lbs.).

(7) Install shift lever extension, shift boot and bezel.

MANUAL - NV5600

DESCRIPTION

The NV5600 is a six speed constant mesh manual transmission (Fig. 1). All gear ranges including reverse are synchronized. First and second gears utilize dual cone synchronizers in order to aid shifting. Sixth gear is an overdrive range. The transmission uses cast iron for the gear case and extension/adaptor housing and aluminum for the clutch housing.

To drain the trans remove the bottom PTO cover bolt. Fill the trans through the plug to the rear of the PTO cover (Fig. 1). Dry fill is approximately 4.5 liters (9.5 pints) or to the bottom edge of the fill plug hole.

The transmission is a end loader transmission. The shift lever is located in a shifter tower which is bolted to the gear case and operates the shift shaft.

The shift pattern is in a modified H pattern (Fig. 2). Overdrive fifth and sixth gears are in line and outboard of the first through fourth gear positions. Reverse gear is to the right of fifth and sixth and forward of the neutral gate.

The gear ratios are:

GEAR RATIOS

GEAR	RATIO
FIRST	5.63:1
SECOND	3.38:1
THIRD	2.04:1
FOURTH	1.39:1
FIFTH	1.00:1
SIXTH	0.73:1
REVERSE	5.63:1

IDENTIFICATION

The transmission has two identification tags attached to the driver side upper clutch housing (Fig. 3). One tag provides the transmission part number. The second tag provides sequencing and build date information. The information on the tags are essential to correct parts ordering.

MANUAL - NV5600 (Continued)

Fig. 3 Identification Tag Location

1 - IDENTIFICATION TAGS

OPERATION

The driver selects a particular gear by moving the shift lever to the desired gear position. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and friction cone and eventually will

slide over the teeth, locking the gear to the mainshaft or countershaft through the synchronizer.

DIAGNOSIS AND TESTING**LOW LUBRICANT LEVEL**

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill or an incorrect lubricant level check. A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

Leaks can occur at the mating surfaces of the gear case, adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition. Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening or use of a non-recommended sealer. A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab and or chatter.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases this condition will decline as the rings wear-in.

MANUAL - NV5600 (Continued)

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds. Severe highly audible transmission noise is generally the initial indicator of a lubricant problem.

Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL

NOTE: Use a heavy duty scissors style transmission jack for remove of the transmission.

- (1) Disconnect battery negative cable.
- (2) Shift transmission into Neutral.
- (3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.
- (4) Remove the bolts holding the shift tower to the isolator plate and transmission gear case.
- (5) Remove the shift tower and isolator plate from the transmission gear case.
- (6) Raise and support vehicle.
- (7) Remove skid plate, if equipped.
- (8) Mark propeller shaft/shafts and axle yokes for installation reference.
- (9) Remove propeller shaft.
- (10) Disconnect and remove exhaust system as necessary.
- (11) Disconnect wires at backup light switch.
- (12) Support engine with adjustable safety stand and wood block.
- (13) If transmission is to be disassembled for repair, remove drain bolt at bottom of PTO cover and drain lubricant from transmission (Fig. 4).

Fig. 4 NV5600 Drain Bolt

- 1 - PTO COVER
2 - DRAIN BOLT

- (14) Remove clutch slave cylinder splash shield, if equipped.

- (15) Remove clutch slave cylinder bolts and move cylinder aside for clearance.

- (16) Remove wire harness from clips on transmission.

TWO WHEEL DRIVE

- (1) Remove bolts/nuts mounting transmission to the rear mount.

- (2) Support and secure transmission with safety chains to a transmission jack.

- (3) Remove rear crossmember.

- (4) Remove transmission clutch housing bolts at the engine block.

- (5) Slide transmission and jack rearward until input shaft clears clutch disc and pressure plate.

- (6) Lower transmission jack and remove transmission from under vehicle.

FOUR WHEEL DRIVE

- (1) Disconnect transfer case shift linkage at transfer case range lever.

- (2) Support and secure transfer case with safety chains to a transmission jack.

- (3) Remove transfer case mounting nuts.

- (4) Move transfer case rearward until input gear clears transmission mainshaft.

- (5) Lower transfer case assembly and move it from under vehicle.

- (6) Support and secure transmission with safety chains to a transmission jack.

- (7) Remove bolts/nuts attaching transmission mount to rear crossmember.

- (8) Remove rear crossmember.

- (9) Remove transmission clutch housing bolts at the engine block.

- (10) Move transmission rearward until input shaft clears clutch disc.

- (11) Lower transmission and remove it from under vehicle.

DISASSEMBLY

NOTE: Use Fixture 8241 for moving and handling the transmission. The fixture supports the transmission at the center of gravity in order to ease mounting the transmission into the build fixture.

- (1) Mount the transmission into Fixture 8230 (Fig. 5).

- (2) Rotate the transmission to the horizontal position, if necessary.

MANUAL - NV5600 (Continued)

**Fig. 5 TRANSMISSION BUILD FIXTURE**

MANUAL - NV5600 (Continued)

**Fig. 9 PRIMARY SHIFT RAIL DETENT**

1 - PRIMARY SHFT RAIL DETENT SPRING

**Fig. 10 PRIMARY SHIFT RAIL DETENT**

1 - PRIMARY SHFT RAIL DETENT PLUNGER

(7) Remove clutch housing bolts (10) (Fig. 11) from inside the housing.

(8) Remove shift rail blocker bolt (Fig. 12) from the side of the transmission gear case.

EXTENSION/ADAPTER HOUSING

(1) Remove bolts holding the extension/adapter housing onto the transmission gear case.

(2) Remove extension/adapter housing from the transmission gear case with Puller 8244 (Fig. 13).

NOTE: It may be necessary to straighten the housing during removal due to the tendency for the reverse idler shaft to bind into one side of the housing.

**Fig. 11 CLUTCH HOUSING BOLTS**

(3) Remove crossover detent plug, spring and plunger from the extension/adaptor housing (Fig. 14).

80b6b1b8

Fig. 14 Crossover Cam Detent Plug

- 1 - DETENT PLUG
2 - EXTENSION HOUSING

(4) Remove bolt and washer holding the crossover cam to the extension/adaptor housing (Fig. 15).

(5) Remove crossover cam from the extension/adaptor housing.

(6) Remove back-up lamp switch from the extension/adaptor housing.

80c07138

Fig. 15 Crossover Cam Bolt

- 1 - CROSSOVER CAM
2 - BOLT
3 - EXTENSION HOUSING

(7) Remove countershaft rear bearing race from the extension/adaptor housing with Remover L-4518 (Fig. 16).

NOTE: Tag all countershaft pre-load shims from between the bearing race and the housing (Fig. 17).

(8) Remove crossover cam bushing from the extension/adaptor housing with Remover 8240.

80b6b1bb

Fig. 16 Countershaft Rear Bearing Race

- 1 - REMOVER

(9) On 4X2 vehicles, remove extension housing seal with a pry tool or a slide hammer and screw.

(10) On 4X4 vehicles, remove adapter housing seal with a pry tool or a slide hammer and screw.

MANUAL - NV5600 (Continued)

**Fig. 17 Countershaft Rear Bearing Race and Shim**

- 1 - PRE-LOAD SHIM

REVERSE GEAR

- (1) Remove crossover cam rollers and pin (Fig. 18).

**Fig. 18 CROSSOVER CAM ROLLERS**

- 1 - CROSSOVER CAM PIN
2 - CROSSOVER CAM ROLLERS

- (2) Remove reverse idler thrust washer from the reverse idler.

- (3) Remove reverse idler and reverse countershaft gears together (Fig. 19).

- (4) Remove reverse idler gear rear bearing, bearing spacer, front bearing and front thrust washer from the idler gear shaft.

- (5) Remove reverse countershaft rear bearing from the countershaft reverse gear assembly with Puller C-293-PA and Adapters C-293-52 (Fig. 20).

- (6) With a bearing splitter and shop press separate the countershaft reverse gear and sleeve (Fig. 21).

**Fig. 19 REVERSE IDLER AND COUNTERSHAFT**

- 1 - REVERSE IDLER GEAR
2 - COUNTERSHAFT REVERSE GEAR

**Fig. 20 COUNTERSHAFT REAR BEARING**

- 1 - PULLER
2 - ADAPTERS

- (7) Remove output shaft nut with Wrench 8226 on the shaft nut and Socket 6993 or 6984 to hold the shaft (Fig. 22). Discard output shaft nut from the output shaft.

NOTE: If necessary strike the flat side area of Wrench 8226 with a hammer to break the nut loose.

- (8) Remove output shaft ball bearing assembly and reverse thrust washer from the output shaft (Fig. 23).

- (9) Remove reverse gear, reverse gear synchronizer cone, reverse gear outer blocker ring and reverse gear bearing (Fig. 24).

- (10) Remove reverse gear bearing sleeve from the output shaft (Fig. 25).

MANUAL - NV5600 (Continued)

**Fig. 21 Reverse Countershaft**

**Fig. 22 Output Shaft Nut**

- 1 - WRENCH
2 - SOCKET

NOTE: If necessary heat the sleeve slightly with a heat gun. Do not use a torch to heat the sleeve or damage to the output shaft may occur.

(11) Remove roll-pin securing the reverse shift fork to the reverse shift rail with a 6mm (7/32 inch) punch and hammer.

(12) Remove reverse shift fork and synchronizer as an assembly from the reverse shift rail and the output shaft (Fig. 26).

TRANSMISSION GEAR CASE

(1) Remove remaining bolts holding the transmission gear case to the clutch housing.

(2) Remove the shift socket roll pin with a 6mm (7/32 inch) punch and hammer.

**Fig. 24 REVERSE GEAR COMPONENTS**

- 1 - REVERSE GEAR
2 - REVERSE BEARING
3 - BLOCKER RING
4 - FRICTION CONE

(3) Turn shift socket so it won't catch the case when lifting it up.

MANUAL - NV5600 (Continued)

**Fig. 25 REVERSE BEARING SLEEVE**

**Fig. 27 TRANSMISSION LIFT**1 - FIXTURE
2 - TRANSMISSION CASE

(6) Remove rear output shaft and countershaft bearing races from the transmission gear case with a brass drift and hammer.

GEARTRAIN

(1) Remove bolts holding the 5-6 crossover bracket to the clutch housing (Fig. 28).

**Fig. 28 5-6 CROSSOVER**

1 - 5-6 CROSSOVER BRACKET

**Fig. 26 REVERSE SHIFT FORK**1 - REVERSE SYNCHRO
2 - REVERSE SHIFT FORK

(4) Install Fixture 8232 to the transmission gear case.

(5) Attach an engine crane or equivalent to Fixture 8232 and remove the transmission gear case from the clutch housing (Fig. 27).

(2) Attach Fixture 8232 to the output shaft and countershaft (Fig. 29).

MANUAL - NV5600 (Continued)

(3) Attach an engine crane or equivalent to Fixture 8232 and raise the geartrain approximately 1/4 in. from the clutch housing.

Fig. 29 ATTACH FIXTURE

1 - FIXTURE

(4) Remove 5-6 crossover bracket from the clutch housing.

(5) Lower the geartrain back into the clutch housing.

(6) Install Holding Tool 8242 (Fig. 30) onto the 5-6 synchro and tighten the screw to hold the 5-6 synchro together during the removal operation.

NOTE: Note the order of the shift fork arms at the primary shift rail, while in the Neutral position.

(7) Raise geartrain and shift rails until all the shift rails clear the clutch housing.

(8) Remove shift rails from the rest of the geartrain (Fig. 31).

(9) Raise the geartrain until the input shaft is clear of the clutch housing.

(10) Remove geartrain from the clutch housing and install the geartrain into Support Stand 8246 (Fig. 32).

(11) Remove Fixture 8232 from the output shaft and the countershaft.

80b6b1c9

80b6b331

Fig. 33 FRONT COUNTERSHAFT BEARING

1 - PULLER

2 - ADAPTERS

(13) Separate the output shaft from the input shaft. Hold the 5-6 synchro together while removing the output shaft to prevent the synchro sleeve from being dislodged from the synchro hub.

COUNTERSHAFT BEARINGS

(1) Remove snap-ring holding the front countershaft bearing onto the countershaft.

(2) Remove front countershaft bearing with Sleeve 6444-8, Adapters 6451, Puller Rods 6444-4 and Puller 6444 (Fig. 33).

(3) Remove rear countershaft bearing with Sleeve 6444-8, Adapters 6447, Puller Rods 6444-4, Puller 6444 and suitable press button (Fig. 34).

OUTPUT SHAFT BEARINGS

(1) Remove snap-ring holding the pocket bearing onto the output shaft.

(2) Remove pocket bearing from the output shaft with Sleeve 6444-8, Adapters 8234, Puller Rods 6444-4 and the remainder of Puller 6444 (Fig. 35).

(3) Remove snap-ring holding the rear output shaft bearing onto the output shaft.

(4) Use Sleeve 6444-8, Adapters 8271 and Puller Rods 6444-3 for 4X2 vehicles or Puller Rods 6444-4 for 4X4 vehicles with the remainder of Puller 6444 to remove the rear output shaft bearing from the output shaft.

(5) Remove rear output shaft thrust washer from the output shaft.

80b6b334

INPUT SHAFT

(1) Remove fifth gear blocker ring from the input shaft (Fig. 36).

**Fig. 36 FIFTH GEAR BLOCKER RING**

- 1 - FIFTH GEAR BLOCKER RING
2 - INPUT SHAFT

(2) Remove fifth gear friction cone from the input shaft (Fig. 37).

**Fig. 37 FIFTH GEAR FRICTION CONE**

- 1 - FIFTH GEAR FRICTION CONE
2 - INPUT SHAFT

(3) Remove output shaft pocket bearing race from the input shaft with Puller L-4518 (Fig. 38).

(4) Remove input shaft bearing and oil guide from the input shaft with Sleeve 6444-8, Adapters 8243, Puller Rods 6444-6 and the remainder of Puller 6444 (Fig. 39).

OUTPUT SHAFT

NOTE: Some gear and synchro components can be installed backwards. Mark the gears, clutch gears, synchro hubs, and sleeves for installation reference during teardown. Use paint or a scribe for marking purposes. Then stack the geartrain parts in order of removal.

COUNTERSHAFT

(1) Install the countershaft into Fixture 8227 with press blocks located under the fifth countershaft gear.

(2) Place the assembly into a shop press.

(3) Use Guide 8235 on end of countershaft and press the countershaft fifth gear from the countershaft (Fig. 44).

(4) Place countershaft in Fixture 8227 with press blocks placed under the sixth countershaft gear.

(5) Use Guide 8235 on end of countershaft and press the countershaft sixth gear from the countershaft (Fig. 45).

(6) Remove countershaft from the press and Fixture 8227.

(7) Remove fourth countershaft gear, friction cone, blocker ring and bearing from the countershaft (Fig. 46).

**Fig. 46 FOURTH COUNTERSHAFT GEAR**

- 1 - FOURTH GEAR BLOCKER RING
- 2 - FOURTH GEAR BEARING
- 3 - COUNTERSHAFT
- 4 - FOURTH GEAR FRICTION CONE
- 5 - FOURTH COUNTERSHAFT GEAR

(8) Install countershaft into Fixture 8227 with press blocks located under the third countershaft gear.

(9) Place assembly into a shop press and press third countershaft gear, 3-4 synchro and fourth countershaft gear bearing sleeve from the countershaft (Fig. 47).

(10) Remove countershaft from the press and Fixture 8227.

(11) Remove third countershaft gear bearing from the countershaft (Fig. 48).

(12) The 2-3 thrust washer should not normally need to be removed from the countershaft. If necessary slide 2-3 thrust washer off countershaft.

CLUTCH HOUSING

(1) Remove input shaft retainer bolts from the clutch housing and remove retainer (Fig. 49).

(2) Remove countershaft oil guide from the countershaft front bearing bore in the clutch housing (Fig. 50).

(3) Remove countershaft front bearing race, end-play shims and spacer from the clutch housing with Remover 6061-1 and Handle C-4171 (Fig. 51).

(4) Remove input shaft bearing race with Remover/Installer 8237 and Handle C-4171.

(5) Remove input shaft oil guide and retainer seal (Fig. 52).

**Fig. 52 OIL GUIDE AND SEAL**

- 1 - INPUT SHAFT OIL GUIDE
2 - INPUT SHAFT OIL SEAL

CLEANING

Clean the gears, bearings shafts, extension/adaptor housing and gear case with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.

Inspect the reverse idler gear, bearings, shaft and thrust washers. Replace the bearings if the rollers are worn, chipped, cracked, flat-spotted or brinnelled. Replace the gear if the teeth are chipped, cracked or worn thin.

Inspect the front bearing retainer and bearing cup. Replace the bearing cup if scored, cracked, brinnelled or rough. Check the release bearing slide surface of the retainer carefully. Replace the retainer if worn or damaged in any way.

Inspect mainshaft bearing surfaces, splines, snap ring grooves and threads. Replace the shaft if any surfaces exhibit considerable wear or damage.

Inspect the countershaft and bearings. Replace the shaft if any surfaces exhibit considerable wear or damage.

Inspect shift forks for wear and distortion. Check fit of the sleeve in the fork to be sure the two parts fit and work smoothly. Replace the fork if the roll pin holes are worn oversize or damaged. Do not attempt to salvage a worn fork. Replace shift fork roll pins if necessary or if doubt exists about their condition.

The all bearings for wear, roughness, flat spots, pitting or other damage. Replace the bearings if necessary.

Inspect the blocker rings and fiction cones. replace either part if worn or damaged in any way. Replace if the friction material is burned, flaking off or worn.

Inspect synchro components wear or damage. Replace parts if worn, cracked or distorted.

Inspect all of the thrust washers and locating pins. Replace the pins if bent or worn. Replace the washers if worn or the locating pin notches are distorted.

Inspect the case and housing/adaptor sealing and mating surfaces are free of burrs and nicks. Inspect the alignment dowels in the case top surface and in the housing/adaptor are tight and in good condition. Replace the gear case or housing/adaptor if cracked or broken.

MANUAL - NV5600 (Continued)**ASSEMBLY**

NOTE: Gaskets are not used in the transmission. Use Mopar Gasket Maker or equivalent on all gear case and extension housing sealing surfaces.

OUTPUT SHAFT

(1) Place second gear on bench with the synchro clutch ring up.

(2) Install second gear synchro inner blocker ring onto second gear (Fig. 53).

**Fig. 53 INNER BLOCKER RING**

- 1 - INNER BLOCKER RING

(5) Install 1-2 synchro assembly onto the second gear assembly (Fig. 56).

**Fig. 56 3-4 SYNCHRO ASSEMBLY**

- 1 - SYNCHRO
- 2 - GEAR

MANUAL - NV5600 (Continued)

(6) Reverse assembly on the bench.

(7) Lubricate and install second gear bearing into second gear (Fig. 57).

Fig. 57 SECOND GEAR BEARING

- 1 - BEARING
- 2 - GEAR

(8) Place 1-2 synchro, second gear and second gear bearing assembly on shop press with second gear facing upward.

(9) Install output shaft into the second gear 1-2 synchro assembly with the front of the output shaft facing upward (Fig. 58).

(10) Press the output shaft into position.

(11) Place first gear on bench with the synchro clutch ring up.

(12) Install first gear synchro inner blocker ring onto first gear (Fig. 53).

(13) Install first gear synchro friction cone over the blocker ring and onto first gear (Fig. 54).

(14) Install first gear synchro outer blocker ring over the first gear synchro friction cone. Align one of the lugs on the outer ring with a lug on the inner ring (Fig. 55).

(15) Reverse the output shaft in the press.

(16) Install first gear bearing sleeve onto the output shaft.

(17) Install first gear bearing sleeve the remainder of the way onto the output shaft using Installer 8228 and a shop press (Fig. 59).

(18) Install first gear and blocker assembly onto the output shaft (Fig. 60).

(19) Install first gear bearing over the output shaft and into first gear.

(20) Install output shaft thrust washer onto the output shaft (Fig. 61).

(21) Install rear output shaft bearing onto the output shaft with Installer 8228 and a shop press (Fig. 62).

2 - OUTPUT SHAFT THRUST WASHER

(23) Reverse output shaft in the Fixture 8227 and support the shaft with press blocks under first gear.

(24) Install sixth gear bearing onto the output shaft.

(25) Install sixth gear onto the output shaft and over the sixth gear bearing (Fig. 63).

(26) Install the sixth gear friction cone onto sixth gear.

(27) Install sixth gear blocker ring over the sixth gear friction cone (Fig. 64).

(28) Install Guide 8235 onto the end of the output shaft (Fig. 65).

(29) Install 5-6 synchro over Guide 8235 and onto the output shaft.

(30) Press 5-6 synchro (Fig. 66) onto the output shaft with Installer 8156 and a shop press.

MANUAL - NV5600 (Continued)

COUNTERSHAFT

- (1) Place third countershaft gear on the bench with the synchro clutch ring up.
(2) Install third countershaft gear friction cone onto third gear (Fig. 68).

**Fig. 68 FRICTION CONE ONTO GEAR**

- 1 - FRICTION CONE
2 - GEAR
3 - CLUTCH RING

- (3) Install third countershaft gear blocker ring onto the friction cone (Fig. 69).

**Fig. 69 BLOCKER RING ONTO FRICTION CONE**

- 1 - BLOCKER RING
2 - GEAR
3 - FRICTION CONE

- (4) Install 3-4 synchro assembly onto the blocker ring/gear assembly (Fig. 70).
(5) Reverse the assembly on the bench.
(6) Install third countershaft gear bearing into the third countershaft gear.

**Fig. 70 3-4 SYNCHRO ASSEMBLY**

- 1 - SYNCHRO
2 - GEAR

- (7) Install 2-3 thrust washer onto the countershaft.
(8) Place third gear/3-4 synchro assembly in a shop press.
(9) Install countershaft through the third gear/3-4 synchro assembly.
(10) Press countershaft into the 3-4 synchro assembly (Fig. 71).
(11) Install fourth countershaft gear bearing sleeve onto the output shaft.

MANUAL - NV5600 (Continued)

**Fig. 71 COUNTERSHAFT INTO 3-4 SYNCHRO**

- 1 - COUNTERSHAFT
- 2 - 2-3 THRUST WASHER
- 3 - THIRD COUNTERSHAFT GEAR

(12) Press fourth countershaft bearing sleeve onto the countershaft with Installer 8228 and a shop press.

(13) Place fourth countershaft gear on the bench with the synchro clutch ring up.

(14) Install fourth countershaft gear friction cone onto fourth countershaft gear (Fig. 68).

(15) Install fourth countershaft gear blocker ring onto the friction cone (Fig. 69).

(16) Install fourth countershaft gear bearing into the fourth countershaft gear.

(17) Place sixth countershaft gear in the shop press.

(18) Position fourth countershaft gear assembly onto the sixth countershaft gear (Fig. 72).

(19) Install countershaft into the fourth/sixth countershaft gear assembly in the shop press.

(20) Press countershaft into sixth gear (Fig. 73).

CAUTION: Gear and shaft must be aligned while pressing or the gear will bind on the shaft.

(21) Place fifth countershaft gear into the shop press.

**Fig. 72 FOURTH COUNTERSHAFT ONTO SIXTH COUNTERSHAFT GEAR**

- 1 - COUNTERSHAFT
- 2 - SIXTH COUNTERSHAFT GEAR
- 3 - 3-4 SYNCHRO

MANUAL - NV5600 (Continued)

(22) Install countershaft into the fifth countershaft gear and press countershaft into fifth gear (Fig. 74).

CAUTION: Gear and shaft must be aligned while pressing or the gear will bind on the shaft.

80b6b35e

Fig. 74 COUNTERSHAFT TO FIFTH COUNTERSHAFT GEAR

- 1 - COUNTERSHAFT
2 - FIFTH COUNTERSHAFT GEAR

(23) Place front countershaft bearing onto the countershaft.

(24) Install front countershaft bearing onto the countershaft with Installer 8236 and Handle C-4171.

(25) Install a **new** snap-ring to hold the front countershaft bearing onto the countershaft.

(26) Place rear countershaft bearing onto the countershaft.

INPUT SHAFT

(1) Place the input shaft bearing onto the input shaft.

(2) Install input shaft bearing with Installer MD998805 (Fig. 75).

80b6b360

Fig. 75 INPUT SHAFT BEARING

- 1 - INSTALLER
2 - INPUT SHAFT BEARING

(3) Position the input shaft bearing oil guide on the input shaft (Fig. 76).

(4) Install input shaft bearing oil guide with Installer MD998805.

(5) Place the output shaft pocket bearing race in the input shaft.

(6) Install output shaft pocket bearing race into the input shaft with Installer C-4628 and Handle C-4171 (Fig. 77).

MANUAL - NV5600 (Continued)

80b6b361

Fig. 76 INPUT SHAFT OIL GUIDE

- 1 - INPUT SHAFT
2 - INPUT SHAFT OIL GUIDE

CLUTCH HOUSING

(1) Install input shaft bearing race so that the bearing race protrudes 0.3 in. above the front surface of the clutch housing. Install bearing race with Remover/Installer 8237 and Handle C-4171.

(2) Install countershaft front bearing race into the clutch housing so that the bearing race protrudes 0.4 in. above the front surface of the clutch housing. Install bearing race with Remover 6061-1 and Handle C-4171.

(3) Install countershaft oil guide and spacer into the countershaft front bearing bore in the clutch housing (Fig. 78).

(4) Clean all old sealer from the input shaft retainer and the clutch housing but **DO NOT** apply new sealer at this time. New sealer will be applied after all the preload measurements are made and end-play shims are installed.

NOTE: Do not replace the input shaft seal at this time. A new seal will be installed after all the preload measurements are made and endplay shims are installed.

80b6b35f

2 - INPUT SHAFT
3 - INSTALLER

80b6b362

Fig. 78 OIL GUIDE AND SPACER

- 1 - 0.3 IN. BEYOND FLUSH
2 - 0.4 IN. BEYOND FLUSH

(5) Install input shaft retainer onto the clutch housing and install bolts to hold the input shaft retainer.

MANUAL - NV5600 (Continued)**GEARTRAIN**

- (1) Install input shaft into Support Stand 8246.
- (2) Install fifth gear friction cone onto the input shaft.
- (3) Install fifth gear blocker ring onto the fifth gear friction cone.
- (4) Install output shaft into the input shaft (Fig. 79).

80b6b363

Fig. 79 OUTPUT SHAFT AND INPUT SHAFT

- 1 - OUTPUT SHAFT
- 2 - INPUT SHAFT
- 3 - SUPPORT STAND

(5) Install countershaft into the Support Stand 8246 and verify that all gears are meshed with their mates on the mainshaft (Fig. 80).

(6) Install Fixture 8232 to the output shaft and countershaft.

(7) Install Holding Tool 8242 onto the 5-6 synchro and tighten the screw to hold the 5-6 synchro together during the remainder of the installation procedure.

(8) Attach a engine crane or equivalent to Fixture 8232 and move the geartrain from the Support Stand 8246 to the clutch housing (Fig. 81).

(9) Install shift forks and rails onto the geartrain (Fig. 82).

80b6b364

Fig. 80 COUNTERSHAFT TO MAINSHAFT

- 1 - COUNTERSHAFT
- 2 - OUTPUT SHAFT
- 3 - SUPPORT STAND

NOTE: The closest shift arm to the geartrain is for Reverse. The next is 5-6, then 3-4 and then 1-2 when moving out from the geartrain.

(10) Install geartrain and shift rails into the clutch housing. Lower the geartrain and rails into the housing slowly while guiding input shaft through input shaft seal. Avoid any binds on the shift rails, forks and synchros as the rails enter their bushings.

CAUTION: Do not damage input shaft seal with the input shaft splines.

(11) With the geartrain approximately 1/4 in. from the clutch housing, remove Holding Tool 8242 from the 5-6 synchro (Fig. 83).

(12) Install 5-6 crossover bracket and arm to the shift rails and the clutch housing.

(13) Lower geartrain the remainder of the way into the clutch housing.

(14) Install the 5-6 crossover bracket bolts and tighten to 28 N·m (20 ft. lbs.) (Fig. 84).

(15) Remove engine crane and Fixture 8232 from the output shaft and the countershaft.

MANUAL - NV5600 (Continued)

- 1 - SHIFT RAILS

TRANSMISSION GEAR CASE

(1) Install rear output shaft bearing race into the transmission gear case with Installer C-4308 and Handle C-4171.

80b6b1c8

Fig. 84 5-6 CROSSOVER BRACKET BOLTS

- 1 - 5-6 CROSSOVER BRACKET

(2) Install rear countershaft bearing race into the transmission gear case with Installer 8153 and Handle C-4171.

(3) Install Fixture 8232 to the transmission gear case.

NOTE: Shift socket must be loose on the shift shaft and is rotated a minimum of 90° from its normal position. This will ensure enough clearance to install the transmission gear case.

MANUAL - NV5600 (Continued)

- (4) Apply sealant to the clutch housing.
- (5) Attach an engine crane or equivalent to Fixture 8232 and install the transmission gear case onto the clutch housing (Fig. 85).

**Fig. 85 TRANSMISSION GEAR CASE**

- 1 - FIXTURE
- 2 - TRANSMISSION CASE

- (6) Install clutch housing bolts and tighten to 48 N·m (35 ft.lbs.).
- (7) Install shift socket roll pin with a suitable 6mm (7/32 inch) punch and hammer.

MAINSHAFT AND COUNTERSHAFT ENDPLAY

- (1) With transmission in vertical position, use Socket 6993 to rotate the shafts and seat the bearings.
- (2) Measure mainshaft endplay with Dial Indicator Set C-3339 and Extension Rod 8161 installed onto the rear of the transmission gear case (Fig. 86).
- (3) Measure countershaft end-play with Dial Indicator Set C-3339 and Extension Rod 8161 installed onto the rear of the transmission gear case (Fig. 87).
- (4) Rotate transmission into a horizontal position and remove the input shaft retainer.
- (5) Install shims necessary to achieve an end-play of 0.051-0.15 mm (0.002-0.006 in.) for the mainshaft and countershaft.

NOTE: Countershaft shims go between the bearing race and spacer. Mainshaft shims go into the input shaft retainer.

**Fig. 86 MAINSHAFT END-PLAY**

- 2 - EXTENSION ROD
- 3 - MAIN SHAFT

**Fig. 87 COUNTERSHAFT END-PLAY**

- 1 - EXTENSION ROD
- 2 - DIAL INDICATOR
- 3 - COUNTERSHAFT

- (6) Install a **new** input shaft seal into the input shaft retainer with Installer C-4965.

MANUAL - NV5600 (Continued)

(7) Install input shaft oil guide with C-3972-A and Handle C-4171.

(8) Apply sealer to the input shaft retainer and install retainer onto the clutch housing. Install bolts and tighten to 28 N·m (20 ft.lbs.).

REVERSE GEAR

(1) Install reverse shift fork and synchronizer as an assembly onto the reverse shift rail and output shaft (Fig. 88).

NOTE: Raised square shoulder and snap-ring on the synchro face the case.

Fig. 88 REVERSE SHIFT FORK AND SYNCHRO

- 1 - REVERSE SYNCHRO
2 - REVERSE SHIFT FORK

(2) Install roll-pin securing the reverse shift fork to the reverse shift rail with 6mm (7/32 in) punch and a hammer.

(3) Install reverse gear bearing sleeve onto the output shaft with Installer 6446 if necessary (Fig. 89).

(4) Install reverse gear, reverse gear synchronizer cone, reverse gear outer blocker ring and reverse gear bearing (Fig. 90).

(5) Install output shaft ball bearing assembly and reverse thrust washer onto the output shaft (Fig. 91).

NOTE: Raised shoulder on thrust washer faces away from the reverse gear.

(6) Install a **new** output shaft nut onto the output shaft.

Fig. 89 REVERSE BEARING SLEEVE

- 1 - REVERSE GEAR BEARING SLEEVE

(7) With Wrench 8226 on the output shaft nut and Socket 6993 or 6984 holding the output shaft, tighten the nut to 339 N·m (250 ft.lbs.).

(8) Stake nut into the slot in the output shaft with a 9mm (5/16 in.) punch.

(9) Press countershaft reverse gear into the sleeve with a shop press.

(10) Install reverse countershaft rear bearing onto the countershaft reverse gear assembly with Installer C-4652 and Handle C-4171.

(11) Install reverse idler gear rear bearing, bearing spacer, front bearing, and front thrust washer onto the idler gear shaft.

(12) Install idler and reverse countershaft gears together (Fig. 92).

(13) Install reverse idler thrust washer from the reverse idler.

(14) Install crossover cam rollers and pin (Fig. 93).

EXTENSION/ADAPTER HOUSING

(1) Install extension housing bushing with Installer 8156 and Handle C-4171, if necessary. The oil feed hole must be at the 12 o'clock position when installed.

(2) On 4X2 vehicles, install extension housing seal with Installer 8154 and Handle C-4171, with the weep hole at the bottom.

NOTE: Drain hole located in the dust boot portion of the seal must face downward (toward the ground) when installed.

809f4ceb

80c07139

Fig. 93 CROSSOVER CAM ROLLERS AND PIN

- 1 - CROSSOVER CAM PIN
- 2 - CROSSOVER CAM ROLLERS

(3) On 4X4 vehicles, install adapter housing seal with Installer C-3860-A and Handle C-4171.

(4) Install the crossover cam bushing into the extension/adapter housing with Installer 8239 and Handle C-4171.

(5) Clean the rear of the transmission case of all sealer.

(6) Install reverse countershaft gear bearing race onto the reverse countershaft gear bearing.

(7) Measure the distance from the back of the bearing race to Gauge Bar 6311 (Fig. 94).

(8) Measure thickness of the gauge bar and record the total of the two measurements.

(9) Clean all the sealer from the extension/adapter housing.

MANUAL - NV5600 (Continued)

80c0713b

Fig. 94 MEASURE HEIGHT OF REVERSE COUNTERSHAFT

1 - MEASURE DISTANCE FROM RACE TO GAUGE BAR

(10) Place Gauge Bar 6311 across the housing face. Measure the distance from the top of the bar to the bottom of the reverse countershaft bearing race bore (Fig. 95).

80ba7712

Fig. 95 REVERSE COUNTERSHAFT GEAR BEARING RACE BORE

1 - GAUGE BAR TO BEARING RACE BORE MEASUREMENT

(11) Subtract thickness of the gauge bar from the measurement and record the result.

(12) The difference between the two measurements is the end-play for the reverse countershaft gear assembly.

(13) Install shims to achieve 0.15-0.25 mm (0.006-0.010 in.) end-play for the reverse countershaft gear assembly into the reverse countershaft bearing race bore.

(14) Use Installer to install the reverse countershaft bearing race into the extension/adapter housing.

(15) Install back-up lamp switch into the extension/adapter housing and tighten to 28 N·m (20 ft.lbs.).

(16) Install crossover cam into the extension/adapter housing.

(17) Install bolt to hold the crossover cam to the extension/adapter housing (Fig. 96).

80c07138

Fig. 96 CROSSOVER CAM

1 - CROSSOVER CAM

2 - BOLT

3 - EXTENSION HOUSING

(18) Install crossover detent plunger, spring and plug into the extension/adapter housing. Tighten the plug to 47.5 N·m (35 ft.lbs.) (Fig. 97).

(19) Apply sealer to the surface of the transmission case.

(20) Install extension/adapter housing onto the transmission case.

(21) Install bolts to hold the extension/adapter housing onto the transmission gear case. Tighten bolts to 48 N·m (35 ft.lbs.).

(22) Install shift rail blocker bolt and tighten bolt to 55 N·m (41 ft.lbs.).

(23) Install primary shift rail detent plunger, spring and plug into the transmission case. Tighten detent plug to 47.5 N·m (35 ft.lbs.).

MANUAL - NV5600 (Continued)

**Fig. 97 CROSSOVER CAM DETENT PLUG**

- 1 - DETENT PLUG
2 - EXTENSION HOUSING

(24) Install shift tower onto the transmission case and tighten bolts to 9 N·m (7 ft.lbs.).

INSTALLATION

NOTE: If installing a new transmission, use all components supplied with the transmission. If a new shift tower is supplied with the new transmission, do not re-use the original shift tower.

(1) Apply a light coat of Mopar high temperature bearing grease or equivalent to contact surfaces of following components:

- input shaft splines.
- release bearing slide surface of front retainer.
- release bearing bore.
- release fork.
- release fork ball stud.
- propeller shaft slip yoke.

(2) Apply sealer to threads of bottom PTO cover bolt and install bolt in case.

(3) Mount transmission on jack and position transmission under vehicle.

(4) Raise transmission until input shaft is centered in clutch disc hub.

(5) Move transmission forward and start input shaft in clutch disc and pilot bushing/bearing.

(6) Work transmission forward until seated against engine block. Do not allow transmission to remain unsupported after input shaft has entered clutch disc.

(7) Install and tighten transmission-to-engine block bolts.

(8) Install clutch slave cylinder.

(9) Connect backup light switch wires.

(10) Position transmission harness wires in clips on transmission.

(11) Install transmission mount on transmission or rear crossmember.

(12) Install rear crossmember.

(13) Remove transmission jack and engine support fixture.

(14) Fill transmission with required lubricant (Fig. 98). Check lubricant level in transfer case if equipped.

**Fig. 98 FILL PLUG**

- 1 - FILL PLUG

TWO WHEEL DRIVE

(1) Install propeller shaft with reference marks aligned.

(2) Install exhaust system components.

(3) Remove support and lower vehicle.

(4) Shift transmission into third gear.

(5) Clean the mating surfaces of shift tower and isolator plate with suitable wax and grease remover.

(6) Apply Mopar Gasket Maker or equivalent to sealing surface of the transmission case. Do not over apply sealant.

(7) Install isolator plate onto the transmission case metal side down.

(8) Install shift tower onto the isolator plate. No sealant is necessary between the shift tower and top of isolator plate.

(9) Verify shift tower, isolator plate and the shift socket are properly aligned.

(10) Install bolts to hold the shift tower to the isolator plate and the transmission case. Tighten bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(11) Install shift boot and bezel.

(12) Connect battery negative cable.

FOUR WHEEL DRIVE

(1) Install and secure transfer case on the transmission jack.

(2) Raise and align transfer case input gear with transmission mainshaft.

MANUAL - NV5600 (Continued)

(3) Move transfer case forward and seat it on adapter.

(4) Install and tighten transfer case mounting nuts to 41-47 N·m (30-35 ft. lbs.) if case has 3/8 studs. If case has 5/16 studs tighten to 30-41 N·m (22-30 ft. lbs.).

(5) Connect transfer case shift lever to range lever on transfer case.

(6) Install propeller shafts with reference marks aligned.

(7) Install transfer case skid plate, if equipped, and crossmember. Tighten attaching bolts/nuts to 41 N·m (30 ft. lbs.).

(8) Install exhaust system components.

(9) Remove support and lower vehicle.

(10) Shift transmission into third gear.

(11) Clean the mating surfaces of shift tower, isolator plate and transmission case with suitable wax and grease remover.

(12) Apply Mopar Gasket Maker or equivalent to the sealing surface of the transmission case. Do not over apply sealant.

(13) Install isolator plate onto the transmission case, metal side down.

(14) Install shift tower onto the isolator plate. No sealant is necessary between the shift tower and top of isolator plate.

(15) Verify that the shift tower, isolator plate and the shift tower bushings are properly aligned.

(16) Install the bolts to hold the shift tower to the isolator plate and the transmission case. Tighten the shift tower bolts to 10.2-11.25 N·m (7.5-8.3 ft. lbs.).

(17) Install shift lever boot and bezel.

(18) Connect battery negative cable.

ADAPTER HOUSING SEAL - NV5600

REMOVAL

- (1) Raise and support vehicle.
- (2) Mark propeller shaft and yokes for installation reference and remove shaft.
- (3) Remove the transfer case.
- (4) Remove the adapter housing seal with a pry tool or slide hammer with a screw.

INSTALLATION

- (1) Install adapter housing seal with Installer and Handle C-4171.
- (2) Install transfer case.
- (3) Install propeller shaft with reference marks aligned.
- (4) Check fluid level.
- (5) Remove support and lower vehicle.

EXTENSION HOUSING SEAL - NV5600

REMOVAL

- (1) Raise and support vehicle.
- (2) Mark propeller shaft and pinion yoke for installation reference and remove the propeller shaft.
- (3) Remove extension housing seal with a pry tool or a slide hammer and screw.
- (4) Remove extension housing bushing with Remover 8155 (Fig. 99).

- 2 - HANDLE

- (3) Install propeller shaft with reference marks aligned.
- (4) Check and fill transmission.
- (5) Remove support and lower vehicle.

SHIFT COVER - NV5600

REMOVAL

- (1) Shift transmission into Neutral.
- (2) Unscrew and remove the shift lever extension from the shift
- (3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.
- (4) Remove the bolts holding the shift tower to the isolator plate and transmission gear case.
- (5) Remove the shift tower (Fig. 102) and isolator plate (Fig. 103) from the transmission.

Fig. 102 SHIFT TOWER

- 1 - SHIFT TOWER
2 - TRANSMISSION

INSTALLATION

- (1) Shift transmission into third gear.

Fig. 103 SHIFT TOWER ISOLATOR PLATE

- 1 - ISOLATOR PLATE
2 - TRANSMISSION

(2) Clean the mating surfaces of shift tower, isolator plate and transmission gear case with suitable wax and grease remover.

(3) Apply Mopar Gasket Maker or equivalent to the sealing surface of the transmission. Do not over apply sealant.

(4) Install isolator plate onto the transmission, metal side down.

(5) Install shift tower onto the isolator plate. No sealant is necessary between the shift tower and isolator plate.

(6) Verify shift tower, isolator plate and shift tower bushings are properly aligned.

(7) Install shift tower bolts and tighten the shift tower bolts to 8-10 N·m (7-9 ft. lbs.).

(8) Install shift lever extension, shift boot and bezel.

AUTOMATIC TRANSMISSION - 46RE

DESCRIPTION

The 46RE (Fig. 1) is a four speed fully automatic transmissions with an electronic governor. The 46RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

GEAR RATIOS

The 46RE gear ratios are:

1st	2.45:1
2nd	1.45:1
3rd	1.00:1
4th	0.69:1
Rev.	2.21

OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 46RE (Continued)

PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

**Fig. 3 Park Powerflow**

- 1 - LEVER ENGAGED FOR PARK
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT

NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

Fig. 4 Neutral Powerflow

- 1 - PAWL DISENGAGED FOR NEUTRAL
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT
- 4 - CAM
- 5 - PAWL

REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to

the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

- 8 - INPUT SHAFT

SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed.

Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

- 6 - INPUT SHAFT
- 7 - REAR CLUTCH APPLIED
- 8 - KICKDOWN BAND APPLIED
- 9 - INPUT SHAFT

DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front

annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing

valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION**

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

AUTOMATIC TRANSMISSION - 46RE (Continued)

DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform hydraulic pressure test if shift problems were noted during road test.
- (6) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift or throttle linkage.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
- (4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
 - (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

CLUTCH AND BAND APPLICATION CHART

SHIFT LEVER POSITION	TRANSMISSION CLUTCHES AND BANDS					OVERDRIVE CLUTCHES		
	FRONT CLUTCH	FRONT BAND	REAR CLUTCH	REAR BAND	OVER- RUNNING CLUTCH	OVER- DRIVE CLUTCH	DIRECT CLUTCH	OVER- RUNNING CLUTCH

Drive - First			X		X		X	X
Drive - Second		X	X				X	X
Drive - Third	X		X				X	X
Drive - Fourth	X		X			X		
Manual Second		X	X		X		X	X
Manual First			X	X	X		X	X

AUTOMATIC TRANSMISSION - 46RE (Continued)

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi

range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

J9321-137

Fig. 9 Pressure Test Port Locations

- 1 - REAR SERVO TEST PORT
- 2 - GOVERNOR TEST PORT
- 3 - ACCUMULATOR TEST PORT
- 4 - FRONT SERVO TEST PORT
- 5 - OVERDRIVE CLUTCH TEST PORT

Test One - Transmission In Manual Low

This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

AUTOMATIC TRANSMISSION - 46RE (Continued)

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.

- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two - Transmission In 2 Range

This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three - Transmission In D Range Third Gear

This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.

- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

Test Four - Transmission In Reverse

This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

(1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.

(2) Move 300 psi Gauge C-3293-SP back to rear servo port.

(3) Have helper start and run engine at 1600 rpm for test.

(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.

(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.

(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

Test Five - Governor Pressure

This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

AUTOMATIC TRANSMISSION - 46RE (Continued)

Test Six - Transmission In Overdrive Fourth Gear

This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor

TEST CONDITION	INDICATION
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

DIAGNOSIS AND TESTING - AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

80b1717e

- 8 - REAR CLUTCH APPLY
- 9 - TO TORQUE CONVERTOR
- 10 - TO COOLER
- 11 - FROM TORQUE CONVERTOR

AUTOMATIC TRANSMISSION - 46RE (Continued)

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 12).
- (2) Leaks at the converter hub weld (Fig. 12).

CONVERTER HOUSING AREA LEAK CORRECTION

- (1) Remove converter.
- (2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.
- (3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.
- (4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is

AUTOMATIC TRANSMISSION - 46RE (Continued)

scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Add Fluid
	2. Throttle Linkage Mis-adjusted.	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose.	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken.	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect.	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect.	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Mis-adjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter and flush cooler and line before installing new converter.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Mis-adjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump).	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Mis-adjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB® scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Transfer case failure can plug cooler.
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Mis-adjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB® scan tool and repair as required.
	8. Front Band Mis-adjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Mis-adjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Mis-adjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn.	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Circuit Electrical Fault.	1. Test with DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Mis-adjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB® scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	6. TPS Malfunction.	6. Replace sensor, check with DRB® scan tool.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Mis-adjusted/Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor Component Electrical Fault.	3. Check operating pressures and test with DRB® scan tool, repair faulty component.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Mis-adjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Mis-assembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Mis-assembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking.	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage.
	3. Rear Band Mis-adjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Overdrive Direct Clutch Worn.	5. Disassemble overdrive. Repair as needed.
	6. Hydraulic Pressure Too Low.	6. Perform hydraulic pressure tests to determine cause.
	7. Rear Servo Leaking.	7. Air pressure check clutch-servo operation and repair as required.
	8. Band Linkage Binding.	8. Inspect and repair as required.
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage.
	4. Gearshift Linkage Mis-adjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines.	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN LOW GEAR "D" ONLY, BUT NOT IN MANUAL 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Mis-adjusted.	8. Adjust bands.
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Mis-adjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required.
NO 4-3 DOWNSHIFT	1. Circuit Wiring and/or Connectors Shorted.	1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required.
	2. PCM Malfunction.	2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty.
	3. TPS Malfunction	3. Check TPS with DRB® scan tool at PCM.
	4. Lockup Solenoid Not Venting.	4. Remove valve body and replace solenoid assembly if plugged or shorted.
	5. Overdrive Solenoid Not Venting.	5. Remove valve body and replace solenoid if plugged or shorted.
	6. Valve Body Valve Sticking.	6. Repair stuck 3-4 shift valve or lockup timing valve.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF	1. Control Switch Open/Shorted.	1. Test and replace switch if faulty.
	2. Overdrive Solenoid Connector Shorted.	2. Test solenoids and replace if seized or shorted.
	3. PCM Malfunction.	3. Test with DRB® scan tool. Replace PCM if faulty.
	4. Valve Body Stuck Valves.	4. Repair stuck 3-4, lockup or lockup timing valve.
CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT	1. Transmission Fluid Low.	1. Add Fluid.
	2. Throttle Cable Mis-adjusted.	2. Adjust cable.
	3. Overdrive Clutch Select Spacer Wrong Spacer.	3. Replace overdrive piston thrust plate spacer.
3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT	1. Overdrive Solenoid Connector or Wiring Shorted.	1. Test connector and wiring for loose connections, shorts or ground and repair as needed.
	2. TPS Malfunction.	2. Test TPS and replace as necessary. Check with DRB® scan tool.
	3. PCM Malfunction.	3. Test PCM with DRB® scan tool and replace controller if faulty.
	4. Overdrive Solenoid Malfunction.	4. Replace solenoid.
	5. Valve Body Malfunction.	5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 3-4 UPSHIFT	1. O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB® scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB® scan tool and replace if necessary.
	6. Neutral Sense to PCM Wire Shorted/Cut.	6. Test switch/sensor as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Mis-adjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB® scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance.	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Mis-adjusted.	1. Adjust linkage/cable.
	2. Neutral Sense Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Park/Neutral Switch, or Transmission Range Sensor Faulty.	3. Refer to service section for test and replacement procedure.
	4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Mis-adjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.

AUTOMATIC TRANSMISSION - 46RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS.	1. Fluid Lines and Fittings Loose/Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose/Leaky/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

AUTOMATIC TRANSMISSION - 46RE (Continued)

**STANDARD PROCEDURE - ALUMINUM
THREAD REPAIR**

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

- (1) Disconnect battery negative cable.
- (2) Disconnect and lower or remove necessary exhaust components.
- (3) Remove engine-to-transmission struts, if equipped (Fig. 13).

J9421-255

Fig. 13 Transmission-To-Engine Strut Attachment

- 1 - ENGINE BLOCK
- 2 - STRUT (PASSENGER SIDE)
- 3 - ENGINE MOUNT
- 4 - STRUT (DRIVER SIDE)

- (4) Disconnect fluid cooler lines at transmission.
- (5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- (6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.
- (7) Remove torque converter access cover.
- (8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.
- (9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

80b170f3

Fig. 14 Fill Tube Attachment

- 1 - TRANSFER CASE VENT TUBE
- 2 - FILL TUBE (V8)
- 3 - TUBE SEAL
- 4 - FILL TUBE (V6)

- (10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

- (11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

- (12) Disconnect wires from park/neutral position switch and transmission solenoid.

AUTOMATIC TRANSMISSION - 46RE (Continued)

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

Fig. 15 Rear Support Cushion

- 1 - EXHAUST PIPE ARM AND BRACKET
- 2 - CROSSMEMBER
- 3 - REAR SUPPORT AND CUSHION

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

DISASSEMBLY

(1) Clean exterior of transmission with suitable solvent or pressure washer.

(2) Place transmission in vertical position.

(3) Measure the input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-5 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. Record the maximum travel for assembly reference.

Fig. 16 Checking Input Shaft End Play

- 1 - TOOL 8266-8
- 2 - TOOL 8266-5
- 3 - TOOL C-3339

AUTOMATIC TRANSMISSION - 46RE (Continued)

(4) Remove throttle and shift levers from valve manual shaft and throttle lever shaft.

(5) Remove transmission oil pan and gasket.

(6) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

Fig. 17 Oil Filter Removal

- 1 - OIL FILTER
- 2 - VALVE BODY
- 3 - FILTER SCREWS (2)

(7) Remove park/neutral position switch and seal.

(8) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

(9) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

(10) Remove accumulator outer spring, piston and inner spring (Fig. 20). Note position of piston and springs for assembly reference. Remove and discard piston seals if worn or cut.

(11) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

Fig. 18 Valve Body Bolt Locations

2 - OUTER SPRING
3 - INNER SPRING

Fig. 21 Front Band Lever Pin Access Plug

- 1 - FRONT BAND REACTION PIN ACCESS PLUG
2 - 1/4 DRIVE EXTENSION AND RATCHET

(13) Remove oil pump and reaction shaft support assembly as follows:

(a) Tighten front band adjusting screw until band is tight around front clutch retainer (Fig. 22). This will prevent retainer from coming out with pump and possibly damaging clutch or pump components.

(b) Remove oil pump bolts.

(c) Thread Slide Hammer Tools C-3752 into threaded holes in flange of oil pump housing (Fig. 23).

(d) Remove oil pump and reaction shaft support by bumping slide hammers outward alternately to pull pump from case (Fig. 24).

(14) Remove oil pump gasket (Fig. 25). Note gasket position in case for assembly reference.

(15) Loosen front band adjusting screw until band is completely loose.

(16) Remove front band strut and anchor (Fig. 26).

(17) Squeeze front band together slightly and slide band over front clutch retainer and out of case (Fig. 27).

Fig. 27 Front Band Removal

1 - FRONT BAND
 2 - FRONT CLUTCH RETAINER

(18) Remove front and rear clutch assemblies as a unit (Fig. 28).

(19) Remove front band reaction pin and lever. Start pin through lever and out of case bore with drift or punch. Then use pencil magnet to withdraw pin completely (Fig. 29).

(20) Remove intermediate shaft thrust washer. Triangular shaped washer will either be on shaft pilot hub or in rear clutch retainer (Fig. 30).

(21) Remove thrust plate from intermediate shaft hub (Fig. 31).

(22) Remove intermediate shaft-planetary geartrain assembly (Fig. 32).

(23) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

AUTOMATIC TRANSMISSION - 46RE (Continued)

(24) Loosen rear band locknut and loosen adjusting screw 3-4 turns.

(25) Remove snap-ring that retains low-reverse drum on overdrive piston retainer hub (Fig. 33).

Fig. 28 Removing Front/Rear Clutch Assemblies

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

**Fig. 33 Low-Reverse Drum Snap-Ring**

1 - LOW-REVERSE DRUM
2 - TABBED WASHER
3 - SNAP-RING

(26) Slide low-reverse drum and thrust washer off piston retainer hub and out of rear band (Fig. 34).

(27) Note that overrunning clutch race will remain on splines of low-reverse drum after removal (Fig. 35). **The race is a permanent press fit on the hub splines. Do not attempt to remove the race.**

(28) Remove overrunning clutch assembly (Fig. 36). Assembly can be removed without displacing rollers and springs if care is exercised. Note position of rollers and springs for assembly reference.

(29) Remove rear band adjusting lever, reaction lever and pin (Fig. 37).

(30) Remove strut from rear band. Keep strut with levers and pin for cleaning, inspection and assembly reference.

(31) Remove rear band and link (Fig. 38).

**Fig. 34 Low-Reverse Drum And Thrust Washer**

1 - LOW-REVERSE DRUM
2 - SPOTFACE FOR WASHER
3 - THRUST WASHER

**Fig. 35 Overrunning Clutch Race Position On Low-Reverse Drum**

1 - OVERRUNNING CLUTCH RACE
2 - LOW-REVERSE DRUM

(32) Compress front servo rod guide with large C-clamp and Tool C-4470, or Compressor Tool C-3422-B (Fig. 39). Compress guide only enough to permit snap-ring removal (about 1/8 in.).

AUTOMATIC TRANSMISSION - 46RE (Continued)

**Fig. 37 Rear Band Levers And Pins**

- 1 - REAR BAND ADJUSTING LEVER
- 2 - REACTION LEVER
- 3 - BAND LINK
- 4 - REAR BAND REACTION PIN

(33) Remove servo piston snap-ring (Fig. 39). Unseat one end of ring. Then carefully work removal tool around back of ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(34) Remove tools and remove servo piston and spring.

(35) Compress rear servo piston with C-clamp and Tool C-4470, or Valve Spring Compressor C-3422-B (Fig. 40). Compress servo spring retainer only enough to permit snap-ring removal.

(36) Remove servo piston snap-ring (Fig. 40). Start one end of ring out of bore. Then carefully work removal tool around back of snap-ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(37) Remove tools and remove rear servo retainer, spring and piston assembly.

CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for reassembly operations are equally clean.

Shop towels used for wiping off tools and your hands must be made from **lint free** materials. Lint will stick to transmission parts and could interfere with valve operation or even restrict fluid passages.

Lubricate transmission clutch and gear components with Mopar® ATF +4, type 9602, during reassembly. Soak clutch discs in transmission fluid before installation.

Use Mopar® Door Ease, or Ru-Glyde™ on piston seals and O-rings to ease installation. Petroleum jelly can also be used to lubricate and hold thrust washers and plates in position during assembly.

Do not use chassis grease, bearing grease, white grease, or similar lubricants on any part. These types of lubricants can eventually block or restrict fluid passages and valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and sub-assemblies are easily installed by hand when properly aligned. If a part seems difficult to install, it is either misaligned or incorrectly assembled. Verify that thrust washers, thrust plates and seal rings are correctly positioned.

AUTOMATIC TRANSMISSION - 46RE (Continued)

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright. Either tilt the case upward with wood blocks, or cut a hole in the bench large enough for the intermediate shaft and rear support. Then lower the shaft and support into the hole and support the rear of the case directly on the bench.

FRONT/REAR SERVO

(1) Lubricate rear servo piston seal with Mopar® Door Ease or ATF +4. Lubricate servo bore in case with ATF +4.

(2) Install rear servo piston in case. Position piston at slight angle to bore and insert piston with twisting motion (Fig. 41).

(3) Install rear servo spring and retainer in case bore (Fig. 42). Be sure spring is seated on piston.

(4) Compress rear servo piston with C-clamp or Valve Spring Compressor C-3422-B and install servo piston snap-ring (Fig. 43).

(5) Lubricate front servo piston components and servo bore in case with transmission fluid.

(6) Install front servo piston in bore. Carefully "run" small, suitable tool around piston ring to press it back into groove and ease installation (Fig. 44). Rotate piston into bore at same time. Rock piston slightly to ease piston ring past snap-ring groove and into bore.

**Fig. 41 Rear Servo Piston**

1 - REAR SERVO PISTON

(7) Bottom front servo piston in bore and install servo spring.

(8) Install front servo piston rod guide as follows:

(a) Place Tool SP-5560 (or similar size tool) on guide and position C-clamp on tool and case (Fig. 45).

**Fig. 42 Rear Servo Piston Spring And Retainer**

1 - PISTON SPRING
2 - REAR SERVO PISTON

**Fig. 43 Rear Servo Snap-Ring**

1 - TOOL C-4470
2 - C-CLAMP
3 - REAR SERVO SPRING RETAINER
4 - RETAINER SNAP-RING

(b) Slowly compress rod guide while simultaneously easing seal ring into bore with suitable tool.

(9) Install rod guide snap-ring (Fig. 45).

AUTOMATIC TRANSMISSION - 46RE (Continued)

**Fig. 44 Front Servo Piston**

- 1 - USE SUITABLE TOOL TO HELP SEAT PISTON RING
 2 - FRONT SERVO PISTON

(3) Install low-reverse drum (Fig. 47). Slide drum through rear band, onto piston retainer hub and into engagement with overrunning clutch and race.

**Fig. 46 Rear Band And Link**

- 1 - REAR BAND
 2 - BAND LINK

**Fig. 45 Front Servo Rod Guide And Snap-Ring**

OVERRUNNING CLUTCH, REAR BAND, AND LOW-REVERSE DRUM

(1) Install overrunning clutch components if not yet installed.

(2) Position rear band and link in case (Fig. 46).

**Fig. 47 Low-Reverse Drum**

- 1 - LOW-REVERSE DRUM
 2 - REAR BAND LINK
 3 - HUB OF OVERDRIVE PISTON RETAINER

AUTOMATIC TRANSMISSION - 46RE (Continued)

(4) Install thrust washer in low-reverse drum spot-face (Fig. 48). Use petroleum jelly to hold washer in place.

(5) Install snap-ring that secures low-reverse drum to piston retainer hub (Fig. 48).

(6) Insert band reaction pin part way into case and band link (Fig. 49).

(7) Install rear band adjusting lever, reaction lever, and strut (Fig. 50). Be sure levers and strut are aligned and engaged before seating band reaction pin in case.

Fig. 48 Low-Reverse Drum Snap-Ring

- 4 - STRUT

PLANETARY GEARTRAIN, FRONT/REAR CLUTCH, AND FRONT BAND

(1) Remove Alignment Shaft 6227-2, if installed previously.

(2) Install assembled intermediate shaft and planetary geartrain (Fig. 51). **Support shaft carefully during installation. Do not allow shaft bearing/bushing surfaces to become nicked or scratched.**

(3) Lubricate intermediate shaft thrust plate with petroleum jelly and install plate on shaft pilot hub (Fig. 52).

(4) Check input shaft front seal rings, fiber thrust washer and rear seal ring (Fig. 53). Be ends of rear seal ring are hooked together and diagonal cut ends of front seal rings are firmly seated against each other as shown. Lubricate seal rings with petroleum jelly after checking them.

(5) Assemble front and rear clutches (Fig. 54). Align lugs on front clutch discs. Mount front clutch on rear clutch. Turn front clutch retainer back and forth until front clutch discs are fully seated on rear clutch splined hub.

(6) Install intermediate shaft thrust washer in hub of rear clutch retainer (Fig. 55). Use petroleum jelly to hold washer in place. Position washer so grooves are facing outward. **Washer only fits one way in clutch retainer hub.**

AUTOMATIC TRANSMISSION - 46RE (Continued)

**Fig. 51 Intermediate Shaft And Planetary Geartrain**

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

**Fig. 53 Input Shaft Seal Rings And Thrust Washer**

1 - TORLON® FRONT SEAL RINGS
 2 - INPUT SHAFT
 3 - REAR SEAL RING
 4 - THRUST WASHER

**Fig. 52 Intermediate Shaft Thrust Plate**

1 - SHAFT THRUST PLATE
 2 - INTERMEDIATE SHAFT PILOT HUB

(7) Place transmission case in upright position, or place blocks under front end of transmission repair stand to tilt case rearward. This makes it easier to install front/rear clutch assembly.

(8) Align discs in rear clutch. Then install and engage assembly in front planetary and driving shell (Fig. 56). Turn clutch retainers back and forth until both clutches are seated.

(9) Position front band lever in case and over servo rod guide. Then install front band lever pin in case and slide it through lever.

**Fig. 54 Assembling Front And Rear Clutches**

1 - FRONT CLUTCH ASSEMBLY
 2 - REAR CLUTCH ASSEMBLY
 3 - REAR CLUTCH SPLINED HUB

AUTOMATIC TRANSMISSION - 46RE (Continued)

(10) Coat threads of front band pin access plug with sealer and install it in case. Tighten plug to 17 N·m (13 ft. lbs.) torque.

(11) Slide front band over front clutch retainer and install front band strut and anchor (Fig. 57).

(12) Tighten front band adjusting screw until band is tight on clutch retainer. This will hold clutches in place while oil pump is being installed. **Verify that front/rear clutch assembly is still properly seated before tightening band.**

Fig. 55 Intermediate Shaft Thrust Washer

- 1 - BE SURE WASHER GROOVES FACE OUT AS SHOWN
- 2 - REAR CLUTCH RETAINER HUB
- 3 - SHAFT THRUST WASHER

OIL PUMP

(1) Install oil pump Pilot Studs C-3288-B in case (Fig. 58).

(2) Install new oil pump gasket on pilot studs and seat it in case. Be sure gasket is properly aligned with fluid passages in case (Fig. 58).

(3) Coat the reaction shaft thrust washer with petroleum jelly to hold it in place. Then install washer over reaction shaft hub and seat it on pump (Fig. 59).

CAUTION: The thrust washer bore (I.D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.

(4) Check seal rings on reaction shaft support. Be sure rings are hooked together correctly. Also be sure fiber thrust washer is in position (Fig. 60). Use extra petroleum jelly to hold washer in place if necessary.

Fig. 56 Front/Rear Clutch Assemblies

- 1 - FRONT AND REAR CLUTCH ASSEMBLIES

Fig. 57 Front Band And Linkage

- 1 - LEVER
- 2 - STRUT
- 3 - ANCHOR
- 4 - FRONT BAND

(5) Lubricate oil pump seals with petroleum Mopar® ATF +4, type 9602.

AUTOMATIC TRANSMISSION - 46RE (Continued)

(6) Mount oil pump on pilot studs and slide pump into case opening (Fig. 61). **Work pump into case by hand. Do not use a mallet or similar tools to seat pump.**

(7) Remove pilot studs and install oil pump bolts. Tighten pump bolts alternately and evenly to fully seat pump in case. Then final-tighten pump bolts to 20 N·m (15 ft. lbs.) torque.

(8) Verify correct installation. Rotate input and intermediate shafts and check for bind. If bind exists, components are either mis-assembled, or not seated. Disassemble and correct as necessary before proceeding.

AUTOMATIC TRANSMISSION - 46RE (Continued)

INPUT SHAFT END PLAY CHECK

NOTE: Overdrive unit must be installed in order to correctly measure the input shaft end-play.

- (1) Measure input shaft end play (Fig. 62).

NOTE: If end play is incorrect, transmission is incorrectly assembled, or reaction shaft thrust washer is incorrect. The reaction shaft thrust washer is selective.

- (a) Attach Adapter 8266-5 to Handle 8266-8.
- (b) Attach dial indicator C-3339 to Handle 8266-8.
- (c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.
- (d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
- (e) Move input shaft in and out and record reading. End play should be 0.86-2.13 mm (0.034-0.084 in.). Adjust as necessary.

80c070b4

Fig. 62 Checking Input Shaft End Play

- 1 - TOOL 8266-8
2 - TOOL 8266-5
3 - TOOL C-3339

ACCUMULATOR, VALVE BODY, OIL PAN, AND TORQUE CONVERTER

- (1) Install accumulator inner spring, piston and outer spring (Fig. 63).

- (2) Verify that park/neutral position switch has **not** been installed in case. Valve body can not be installed if switch is in position.

- (3) Install new valve body manual shaft seal in case (Fig. 64). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

- (4) Install valve body as follows:

- (a) Start park rod into park pawl. If rod will not slide past park pawl, pawl is engaged in park gear. Rotate overdrive output shaft with suitable size 12 point socket; this will free pawl and allow rod to engage.

- (b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case.

- (c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.**

- (5) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

- (6) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

J9121-208

Fig. 63 Accumulator Piston And Springs

- 1 - ACCUMULATOR PISTON
2 - OUTER SPRING
3 - INNER SPRING

CAUTION: If the condition of the transmission before the overhaul procedure caused excessive metallic or fiber contamination in the fluid, replace the torque converter and reverse flush the cooler(s) and cooler lines. Fluid contamination and transmission failure can result if not done.

- (7) Install torque converter. Use C-clamp or metal strap to hold converter in place for installation.

BAND ADJUSTMENT AND FINAL

- (1) Adjust front and rear bands as follows:

AUTOMATIC TRANSMISSION - 46RE (Continued)

**Fig. 64 Manual Lever Shaft Seal**

- 1 - 15/16" SOCKET
2 - SEAL

- (a) Loosen locknut on each band adjusting screw 4-5 turns.
- (b) Tighten both adjusting screws to 8 N·m (72 in. lbs.).
- (c) Back off front band adjusting screw 2-7/8 turns.
- (d) Back off rear band adjusting screw 2 turns.
- (e) Hold each adjusting screw in position and tighten locknut to 34 N·m (25 ft. lbs.) torque.
- (2) Install magnet in oil pan. Magnet seats on small protrusion at corner of pan.
- (3) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 13.6 N·m (125 in. lbs.).
- (4) Install throttle valve and shift selector levers on valve body manual lever shaft.
- (5) Apply small quantity of dielectric grease to terminal pins of solenoid case connector and neutral switch.
- (6) Fill transmission with recommended fluid. Refer to Service Procedures section of this group.

INSTALLATION

- (1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.
- (2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 65). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

**Fig. 65 Checking Converter Seating - Typical**

- 1 - SCALE
2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

AUTOMATIC TRANSMISSION - 46RE (Continued)

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(20) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to

31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

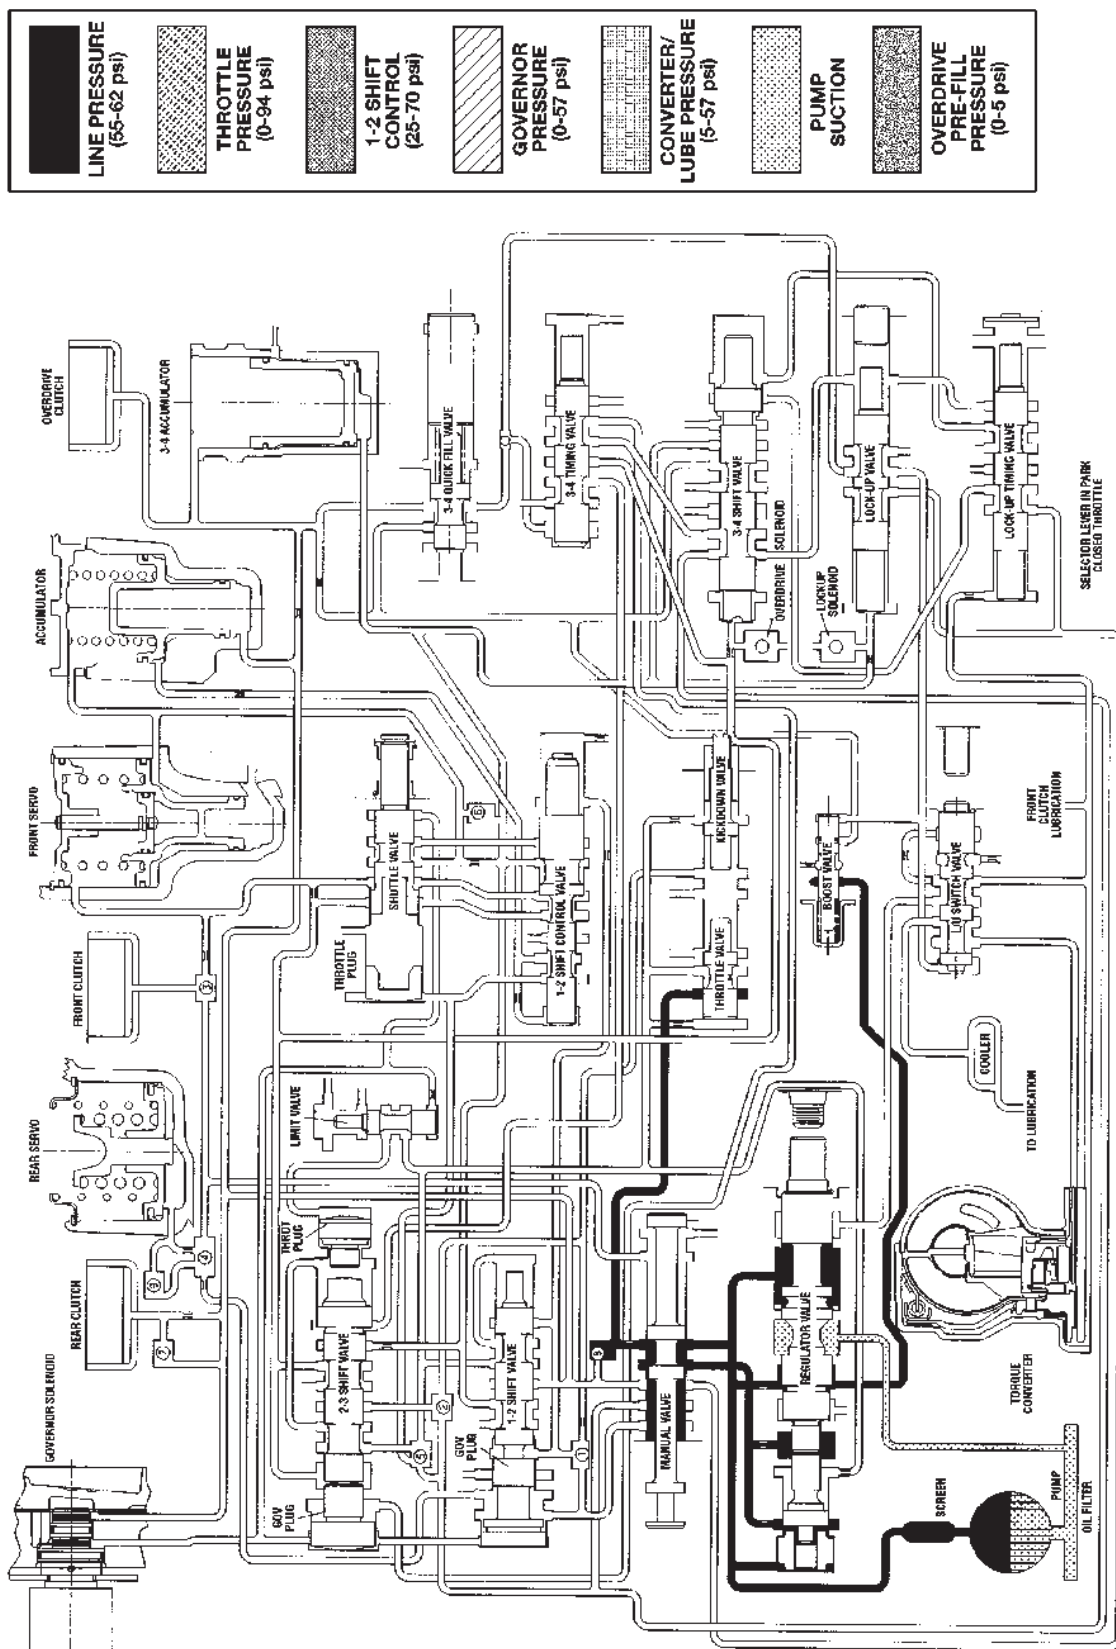

(27) Adjust gearshift linkage and throttle valve cable if necessary.

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

PRESSURE TEST

Overdrive clutch	Fourth gear only	Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle.
Line pressure (at accumulator)	Closed throttle	372-414 kPa (54-60 psi).
Front servo	Third gear only	No more than 21 kPa (3 psi) lower than line pressure.
Rear servo	1 range R range	No more than 21 kPa (3 psi) lower than line pressure. 1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm.
Governor	D range closed throttle	Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 66) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 67).

Fig. 66 Accumulator

- 3 - TEFLON SEALS
- 4 - PISTON SPRING
- 5 - COVER PLATE AND SCREWS

ACCUMULATOR (Continued)

OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 68), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 69), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

NOTE: The accumulator is shown in the inverted position for illustrative purposes.

BOTTOMED AGAINST ACCUMULATOR PLATE

BANDS

DESCRIPTION

KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 71) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission

BANDS (Continued)

case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

Fig. 71 Front Band

- 1 - FRONT BAND
- 2 - TRANSMISSION HOUSING

LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 72) is similar in appearance and operation to the front band. The rear band is also a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

Fig. 72 Rear Band And Link

- 1 - BAND LINK
- 2 - REAR BAND

OPERATION

KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

ADJUSTMENTS

ADJUSTMENT - BANDS

FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 73). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and an appropriate Torx™ socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 2-7/8 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.
- (6) Lower vehicle.

REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque (Fig. 74).
- (5) Back off adjusting screw 2 turns.
- (6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

BANDS (Continued)

**Fig. 73 Front Band Adjustment Screw Location**

- 1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 13.6 N·m (125 in. lbs.) torque.

(8) Lower vehicle and refill transmission with Mopar® ATF +4, Type 9602 fluid.

**Fig. 74 Rear Band Adjustment Screw Location**

ELECTRONIC GOVERNOR

DESCRIPTION

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor

- Powertrain control module (PCM)

GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 75).

**Fig. 75 Governor Pressure Solenoid Valve**

- 1 - SOLENOID FILTER
2 - GOVERNOR PRESSURE SOLENOID

GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 76).

**Fig. 76 Governor Pressure Sensor**

- 1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 76).

ELECTRONIC GOVERNOR (Continued)

GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, -1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output values are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the "cold" period of operation.

GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

GOVERNOR PRESSURE CURVES**LOW TRANSMISSION FLUID TEMPERATURE**

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade "hunting" prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The ini-

ELECTRONIC GOVERNOR (Continued)

tial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine "flare." The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove transmission fluid pan and filter.
- (3) Disengage wire connectors from pressure sensor and solenoid (Fig. 77).

Fig. 77 Governor Solenoid And Pressure Sensor

- 1 - PRESSURE SENSOR
- 2 - PRESSURE SOLENOID
- 3 - GOVERNOR

- (4) Remove screws holding pressure solenoid retainer to governor body.

- (5) Separate solenoid retainer from governor (Fig. 78).

- (6) Pull solenoid from governor body (Fig. 79).

- (7) Pull pressure sensor from governor body.

Fig. 78 Pressure Solenoid Retainer

- 1 - PRESSURE SOLENOID RETAINER
- 2 - GOVERNOR

- (8) Remove bolts holding governor body to valve body.

EXTENSION HOUSING BUSHING

REMOVAL

- (1) Remove extension housing yoke seal.
- (2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 85).

**Fig. 85 Bushing Removal - Typical**

- 1 - REMOVER
- 2 - EXTENSION HOUSING BUSHING

INSTALLATION

- (1) Align bushing oil hole with oil slot in extension housing.
- (2) Tap bushing into place with Installer 6951 and Handle C-4171.

- (3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 86).

**Fig. 86 Extension Housing Seal Installation**

- 1 - SPECIAL TOOL C-3995-A OR C-3972-A
- 2 - SPECIAL TOOL C-4471

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Seal Remover C-3985-B (Fig. 87) from overdrive housing.

**Fig. 87 Removing Overdrive Housing Yoke Seal**

- 1 - SPECIAL TOOL C-3985-B
- 2 - SEAL

INSTALLATION

- (1) Place seal in position on overdrive housing.
- (2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 88).
- (3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

FLUID AND FILTER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

FLUID AND FILTER (Continued)

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 89) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not overfill.

PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

(5) Hook up DRB® scan tool and select engine.

804d8eae

Fig. 89 Dipstick Fluid Level Marks - Typical

1 - DIPSTICK

2 - MAXIMUM CORRECT FLUID LEVEL

3 - ACCEPTABLE FLUID LEVEL

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the figure. (Fig. 90)

(9) Adjust transmission fluid level shown on the dipstick according to the figure.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

(10) Check transmission for leaks.

STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 91).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan and gasket away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan and gasket away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 92).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

FLUID AND FILTER (Continued)

Fig. 91 Transmission Pan

- 1 - TRANSMISSION
- 2 - GASKET
- 3 - PAN

Fig. 92 Transmission Filter

- 1 - TRANSMISSION
- 2 - FILTER

FLUID AND FILTER (Continued)

INSTALLATION

(1) Position a new transmission oil filter onto the valve body.

(2) Install the screws to hold the filter to the valve body. Tighten the screws to 4 N·m (35 in.lbs.).

(3) Clean the gasket surfaces of the transmission oil pan and transmission pan rail.

NOTE: The transmission pan oil gasket is reusable. Inspect the sealing surfaces of the gasket. If the sealing ribs on both surfaces appear to be in good condition, clean the gasket of any foreign material and reinstall.

(4) Position the oil pan gasket onto the oil pan.

(5) Position the oil pan and gasket onto the transmission and install several bolts to hold the pan and gasket to the transmission.

(6) Install the remainder of the oil pan bolts. Tighten the bolts to 13.6 N·m (125 in.lbs.).

(7) Lower vehicle and fill transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/FLUID - STANDARD PROCEDURE)

STANDARD PROCEDURE - TRANSMISSION
FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick**. Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

FRONT CLUTCH

DESCRIPTION

The front clutch assembly (Fig. 93) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

FRONT CLUTCH (Continued)

**Fig. 93 Front Clutch Components**

- 7 - CLUTCH DISCS
- 8 - RETAINER SNAP-RING
- 9 - CLUTCH PISTON SPRINGS (9)
- 10 - OUTER PISTON SEAL
- 11 - FRONT CLUTCH RETAINER

DISASSEMBLY

(1) Remove the waved snap-ring, reaction plate, clutch plates, and clutch discs.

(2) Compress clutch piston retainer and piston springs with Compressor Tool C-3863-A (Fig. 94).

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove clutch piston springs (Fig. 95). Note position of piston springs for assembly reference.

(5) Remove clutch piston from retainer with a twisting motion.

(6) Remove and discard clutch piston inner and outer seals.

(7) Assemble Tool Handle C-4171 and Bushing Remover SP-3629 (Fig. 96).

(8) Insert remover tool in bushing and drive bushing straight out of clutch retainer.

- 7 - CLUTCH DISCS
- 8 - RETAINER SNAP-RING
- 9 - CLUTCH PISTON SPRINGS (9)
- 10 - OUTER PISTON SEAL
- 11 - FRONT CLUTCH RETAINER

INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, the lugs are damaged, or if the facing is flaking off. Replace the steel plates and reaction plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plate are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston springs and spring retainer if either are distorted, warped or broken.

Check the lug grooves in the clutch piston retainer. The steel plates should slide freely in the slots. Replace the piston retainer if the grooves are worn or damaged. Also check action of the check ball in the piston retainer. The ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or there is any doubt about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check the clutch piston check ball. The ball should be securely in place. Replace the piston if the ball is missing, or seized in place.

ASSEMBLY

NOTE: The 46RE transmission uses three plates and discs for the front clutch.

(1) Mount Bushing Installer SP-5511 on tool handle (Fig. 97).

(2) Slide new bushing onto installer tool and start bushing into retainer.

(3) Tap new bushing into place until installer tool bottoms against clutch retainer.

(4) Remove installer tools and clean retainer thoroughly.

(5) Soak clutch discs in transmission fluid.

(6) Install new inner piston seal onto the outer diameter of the clutch retainer inner hub.

(7) Install new outer seal onto the clutch piston. Be sure seal lips of both seals face the interior of the retainer.

(8) Lubricate new inner and outer piston seals with Ru-Glyde™, or Mopar® Door Ease.

(9) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.015 - 0.020 in. thick), can be used to guide seals into place if necessary.

- 2 - SPECIAL TOOL SP-3629
- 3 - SPECIAL TOOL SP-5511
- 4 - SPECIAL TOOL C-4171
- 5 - FRONT CLUTCH RETAINER

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

(10) Install and position nine clutch piston springs (Fig. 98).

(11) Install spring retainer on top of piston springs.

(12) Compress spring retainer and piston springs with Tool C-3863-A.

(13) Install spring retainer snap-ring and remove compressor tool.

(14) Install clutch plates and discs (Fig. 95). Three clutch discs, three steel plates and one reaction plate are required.

(15) Install reaction plate followed by waved snap-ring.

(16) Check clutch pack clearance with feeler gauge (Fig. 99). Clearance between waved spring and pressure plate should 1.78 - 3.28 mm (0.070 - 0.129 in.). If clearance is incorrect, clutch plates, clutch discs, snap-ring, or pressure plate may have to be changed.

FRONT SERVO

DESCRIPTION

The kickdown servo (Fig. 100) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend through its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity

- 3 - PISTON
- 4 - SPRING
- 5 - RELEASE PRESSURE
- 6 - APPLY PRESSURE
- 7 - PISTON ROD

until the front clutch is applied, giving a small amount of overlap between them.

DISASSEMBLY

- (1) Remove seal ring from rod guide (Fig. 101).
- (2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.
- (3) Remove and discard servo component O-ring and seal rings.

CLEANING

Clean the servo piston components (Fig. 102) with solvent and dry them with compressed air.

INSPECTION

Inspect the servo components (Fig. 103). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap-ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

ASSEMBLY

Clean and inspect front servo components.

- (1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.
- (2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 104).

OIL PUMP

DESCRIPTION

The oil pump (Fig. 105) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a reaction shaft support.

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

- 10 - OUTER GEAR
- 11 - "O" RING

RH284

OIL PUMP (Continued)

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

DISASSEMBLY

(1) Mark position of support in oil pump body for assembly alignment reference. Use scribe or paint to make alignment marks.

(2) Place pump body on two wood blocks.

(3) Remove reaction shaft support bolts and separate support from pump body (Fig. 106).

(4) Remove pump inner and outer gears (Fig. 107).

(5) Remove o-ring seal from pump body (Fig. 108).

Discard seal after removal.

(6) Remove oil pump seal with Remover Tool C-3981. Discard seal after removal.

OIL PUMP BUSHING REMOVAL

(1) Position pump housing on clean, smooth surface with gear cavity facing down.

(2) Remove bushing with Tool Handle C-4171 and Bushing Remover SP-3550 (Fig. 109).

REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Cup Tool SP-3633, Nut SP-1191 and Bushing Remover SP-5301 (Fig. 110).

(2) Hold cup tool firmly against reaction shaft. Thread remover tool into bushing as far as possible by hand.

(3) Using wrench, thread remover tool an additional 3-4 turns into bushing to firmly engage tool.

(4) Tighten tool hex nut against cup tool to pull bushing from shaft. Clean all chips from shaft and support after bushing removal.

OIL PUMP (Continued)

- 7 - BOLTS (6)
- 8 - #1 THRUST WASHER (SELECTIVE)
- 9 - INNER GEAR
- 10 - OUTER GEAR
- 11 - "O" RING

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge (Fig. 111).

OIL PUMP (Continued)

- 8 - BUSHING

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

ASSEMBLY**OIL PUMP BUSHING**

(1) Assemble Tool Handle C-4171 and Bushing Installer SP-5118 (Fig. 112).

(2) Place bushing on installer tool and start bushing into shaft.

(3) Tap bushing into place until Installer Tool SP-5118 bottoms in pump cavity. Keep tool and bushing square with bore. Do not allow bushing to become cocked during installation.

(4) Stake pump bushing in two places with blunt punch. Remove burrs from stake points with knife blade (Fig. 113).

REACTION SHAFT SUPPORT BUSHING

(1) Place reaction shaft support upright on a clean, smooth surface.

(2) Assemble Bushing Installer Tools C-4171 and SP-5302. Then slide new bushing onto installer tool (Fig. 114).

**Fig. 111 Checking Pump Gear Tip Clearance**

- 1 - FEELER GAUGE
- 2 - INNER GEAR

OIL PUMP BODY

(1) Lubricate pump gears with transmission fluid and install them in pump body.

(2) Install thrust washer on reaction shaft support hub. Lubricate washer with petroleum jelly or transmission fluid before installation.

(3) If reaction shaft seal rings are being replaced, install new seal rings on support hub. Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

(4) Align and install reaction shaft support on pump body.

(5) Install bolts attaching reaction shaft support to pump. Tighten bolts to 20 N·m (175 in. lbs.) torque.

(6) Install new pump seal with Installer Tool C-3860-A (Fig. 115). Use hammer or mallet to tap seal into place.

OIL PUMP (Continued)

(7) Install new o-ring on pump body. Lubricate oil seal and o-ring with petroleum jelly.

(8) Cover pump assembly to prevent dust entry and set aside for assembly installation.

OUTPUT SHAFT FRONT BEARING

REMOVAL

- (1) Remove overdrive unit from the vehicle.
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 116).
- (4) Pull bearing from output shaft.

INSTALLATION

- (1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.
- (2) Push bearing onto shaft until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing onto output shaft.
- (4) Install overdrive geartrain into housing.
- (5) Install overdrive unit in vehicle.

OUTPUT SHAFT REAR BEARING (Continued)

INSTALLATION

- (1) Place replacement bearing in position in housing.
- (2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing into housing (Fig. 117).
- (4) Install overdrive geartrain into housing.
- (5) Install overdrive unit in vehicle.

OVERDRIVE CLUTCH

DESCRIPTION

The overdrive clutch (Fig. 118) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

J9321-369

Fig. 118 Overdrive Clutch

1 - REACTION PLATE

2 - PRESSURE PLATE

OVERDRIVE UNIT

REMOVAL

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Remove transfer case, if equipped.
- (4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if necessary.
- (5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.
- (7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.
- (8) Support transmission with transmission jack.
- (9) Remove bolts attaching overdrive unit to transmission (Fig. 119).

CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.

Fig. 119 Overdrive Unit Bolts

- 1 - OVERDRIVE UNIT
2 - ATTACHING BOLTS (7)

- (10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

- (11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

- (12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

- (13) Position drain pan on workbench.

- (14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

- (15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

- (16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

DISASSEMBLY

- (1) Remove transmission speed sensor and o-ring seal from overdrive case (Fig. 120).

- (2) Remove overdrive piston thrust bearing (Fig. 121).

Fig. 120 Transmission Speed Sensor

- 1 - SOCKET AND WRENCH
2 - SPEED SENSOR
3 - O-RING

OVERDRIVE UNIT (Continued)

Fig. 121 Overdrive Piston Thrust Bearing Removal/Installation

- 1 - THRUST BEARING
- 2 - OVERDRIVE PISTON
- 3 - THRUST PLATE

OVERDRIVE PISTON

(1) Remove overdrive piston thrust plate (Fig. 122). Retain thrust plate. It is a select fit part and may possibly be reused.

Fig. 122 Overdrive Piston Thrust Plate Removal/Installation

- 1 - OVERDRIVE PISTON
- 2 - OVERDRIVE PISTON SPACER (SELECT FIT)

(2) Remove intermediate shaft spacer (Fig. 123). Retain spacer. It is a select fit part and may possibly be reused.

Fig. 123 Intermediate Shaft Spacer Location

- 1 - INTERMEDIATE SHAFT
- 2 - INTERMEDIATE SHAFT SPACER (SELECT FIT)

(3) Remove overdrive piston from retainer (Fig. 124).

Fig. 124 Overdrive Piston Removal

- 1 - PISTON RETAINER
- 2 - OVERDRIVE PISTON

OVERDRIVE UNIT (Continued)

OVERDRIVE CLUTCH PACK

- (1) Remove overdrive clutch pack wire retaining ring (Fig. 125).
- (2) Remove overdrive clutch pack (Fig. 126).
- (3) Note position of clutch pack components for assembly reference (Fig. 127).

Fig. 125 Removing Overdrive Clutch Pack Retaining Ring

1 - OVERDRIVE CLUTCH PACK RETAINING RING

Fig. 126 Overdrive Clutch Pack Removal

1 - OVERDRIVE CLUTCH PACK

OVERDRIVE GEARTRAIN

- (1) Remove overdrive clutch wave spring (Fig. 128).
- (2) Remove overdrive clutch reaction snap-ring (Fig. 129). Note that snap-ring is located in same groove as wave spring.
- (3) Remove Torx™ head screws that attach access cover and gasket to overdrive case (Fig. 130).
- (4) Remove access cover and gasket (Fig. 131).
- (5) Expand output shaft bearing snap-ring with expanding-type snap-ring pliers. Then push output shaft forward to release shaft bearing from locating ring (Fig. 132).

Fig. 127 Overdrive Clutch Component Position - Typical

1 - REACTION PLATE 3 - PRESSURE PLATE
2 - CLUTCH PLATES (3) 4 - CLUTCH DISCS (4)

Fig. 128 Overdrive Clutch Wave Spring Removal

(8) Remove rear bearing from output shaft (Fig. 134).

DIRECT CLUTCH, HUB AND SPRING

WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

OVERDRIVE UNIT (Continued)

(1) Mount geartrain assembly in shop press (Fig. 135).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 135). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 135).

(4) Remove direct clutch pack snap-ring (Fig. 136).

(5) Remove direct clutch hub retaining ring (Fig. 137).

(6) Release press load slowly and completely (Fig. 138).

(7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 138).

Fig. 135 Geartrain Mounted In Shop Press

- 3 - DIRECT CLUTCH PACK

(2) Remove sun gear and spring plate. Then remove planetary thrust bearing and planetary gear (Fig. 140).

**Fig. 139 Direct Clutch Hub And Spring Removal**

- 1 - DIRECT CLUTCH SPRING
- 2 - DIRECT CLUTCH HUB

(3) Remove overrunning clutch assembly with expanding type snap-ring pliers (Fig. 141). Insert pliers into clutch hub. Expand pliers to grip hub splines and remove clutch with counterclockwise, twisting motion.

(4) Remove thrust bearing from overrunning clutch hub.

**Fig. 140 Removing Sun Gear, Thrust Bearing And Planetary Gear**

- 1 - PLANETARY GEAR
- 2 - PLANETARY THRUST BEARING
- 3 - CLUTCH SPRING PLATE
- 4 - SPRING PLATE SNAP-RING
- 5 - SUN GEAR

(5) Remove overrunning clutch from hub.
(6) Mark position of annulus gear and direct clutch drum for assembly alignment reference (Fig. 142). Use small center punch or scribe to make alignment marks.

**Fig. 141 Overrunning Clutch Assembly Removal/Installation**

- 1 - OVERRUNNING CLUTCH
- 2 - NEEDLE BEARING

(7) Remove direct clutch drum rear retaining ring (Fig. 143).

(8) Remove direct clutch drum outer retaining ring (Fig. 144).

OVERDRIVE UNIT (Continued)

8921-249

Fig. 142 Marking Direct Clutch Drum And Annulus Gear For Assembly Alignment

- 1 - DIRECT CLUTCH DRUM
- 2 - HAMMER
- 3 - PUNCH

(9) Mark annulus gear and output shaft for assembly alignment reference (Fig. 145). Use punch or scriber to mark gear and shaft.

J9121-292

Fig. 143 Clutch Drum Inner Retaining Ring Removal

- 1 - INNER RETAINING RING
- 2 - DIRECT CLUTCH DRUM
- 3 - ANNULUS GEAR

(10) Remove snap-ring that secures annulus gear on output shaft (Fig. 146). Use two screwdrivers to unseat and work snap-ring out of groove as shown.

(11) Remove annulus gear from output shaft (Fig. 147). Use rawhide or plastic mallet to tap gear off shaft.

J9121-293

Fig. 144 Clutch Drum Outer Retaining Ring Removal

- 3 - PUNCH

GEAR CASE AND PARK LOCK

- (1) Remove locating ring from gear case.
- (2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.
- (3) Remove reaction plug snap-ring and remove reaction plug.
- (4) Remove output shaft seal.

CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

OVERDRIVE UNIT (Continued)

**Fig. 146 Annulus Gear Snap-Ring Removal**

- 1 - OUTPUT SHAFT
- 2 - ANNULUS GEAR
- 3 - SNAP-RING

**Fig. 147 Annulus Gear Removal**

- 1 - OUTPUT SHAFT
- 2 - ANNULUS GEAR

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should be clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

ASSEMBLY**GEARTRAIN AND DIRECT CLUTCH**

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

OVERDRIVE UNIT (Continued)

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 148). Lubricate bushings with petroleum jelly, or transmission fluid.

Fig. 148 Output Shaft Pilot Bushing

- 1 - OUTPUT SHAFT HUB
- 2 - OVERRUNNING CLUTCH HUB BUSHING
- 3 - INTERMEDIATE SHAFT PILOT BUSHING

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 149).

(4) Align and install clutch drum on annulus gear (Fig. 150). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 150).

Fig. 149 Annulus Gear Installation

- 1 - SNAP-RING
- 2 - OUTPUT SHAFT FRONT BEARING
- 3 - ANNULUS GEAR

(6) Slide clutch drum forward and install inner retaining ring (Fig. 151).

Fig. 150 Clutch Drum And Outer Retaining Ring Installation

- 1 - ANNULUS GEAR
- 2 - OUTER SNAP-RING
- 3 - CLUTCH DRUM

(7) Install rear bearing and snap ring on output shaft (Fig. 152). Be sure locating ring groove in bearing is toward rear.

Fig. 151 Clutch Drum Inner Retaining Ring Installation

- 1 - ANNULUS GEAR
- 2 - INNER SNAP-RING
- 3 - CLUTCH DRUM

(8) Install overrunning clutch on hub (Fig. 153). Note that clutch only fits one way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

OVERDRIVE UNIT (Continued)

**Fig. 152 Rear Bearing And Snap-Ring Installation**

5 - ANNULUS GEAR
6 - OVERRUNNING CLUTCH ASSEMBLY SEATED IN OUTPUT SHAFT

**Fig. 153 Assembling Overrunning Clutch And Hub**

- 1 - CLUTCH HUB
2 - OVERRUNNING CLUTCH

(10) Install overrunning clutch in output shaft (Fig. 154). Insert snap ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 155). Be sure planetary pinions are fully seated in annulus gear before proceeding.

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

(13) Install planetary thrust bearing on sun gear (Fig. 156). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 157). Be sure sun gear and thrust bearing are fully seated before proceeding.

**Fig. 155 Planetary Gear Installation**

- 1 - PLANETARY GEAR
2 - ANNULUS GEAR

- 4 - SUN GEAR

**Fig. 157 Sun Gear Installation**

- 1 - SUN GEAR AND SPRING PLATE ASSEMBLY

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 158). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 159). Be sure spring is properly seated on spring plate.

NOTE: The direct clutch in a 46RE transmission uses 8 clutch discs.

**Fig. 159 Direct Clutch Spring Installation**

- 1 - SPECIAL TOOL 6227-2

OVERDRIVE UNIT (Continued)

J9521-50

Fig. 160 46RE Direct Clutch Pack Components

1 - CLUTCH DISCS (8)
2 - PRESSURE PLATE

3 - CLUTCH PLATES (7)
4 - REACTION PLATE

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 160).

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 161).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 162).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 163). Be sure hub is started on sun gear splines before proceeding.

WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

**Fig. 163 Direct Clutch Pack And Clutch Hub Installation**

- 1 - CLUTCH HUB
- 2 - DIRECT CLUTCH PACK
- 3 - CLUTCH DRUM

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap ring (Fig. 164). Be very sure snap ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 165). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

**Fig. 164 Direct Clutch Pack Snap-Ring Installation**

OVERDRIVE UNIT (Continued)

GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 166). Be sure pin is seated in hole in case before installing snap ring.

(4) Install reaction plug snap-ring (Fig. 167). Compress snap ring only enough for installation; do not distort it.

J9121-338

Fig. 166 Reaction Plug Locating Pin And Snap-Ring

1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)

2 - LOCATING PIN

3 - PARK LOCK REACTION PLUG

8921-240

Fig. 167 Reaction Plug And Snap-Ring Installation

1 - REACTION PLUG SNAP-RING

2 - SNAP-RING PLIERS

(5) Install new seal in gear case. Use Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 168).

(7) Support geartrain on Tool 6227-1 (Fig. 169). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 169).

J9321-403

1 - CASE ACCESS HOLE

2 - TAB ENDS OF LOCATING RING

J9321-360

Fig. 169 Overdrive Gear Case Installation

1 - GEARTRAIN ASSEMBLY

2 - GEAR CASE

OVERDRIVE UNIT (Continued)

(9) Expand front bearing locating ring with snap ring pliers (Fig. 170). Then slide case downward until locating ring locks in bearing groove and release snap ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 171).

Fig. 170 Seating Locating Ring In Rear Bearing

- 1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

Fig. 171 Locating Ring Access Cover And Gasket Installation

- 1 - TORX SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

OVERDRIVE CLUTCH

NOTE: The overdrive clutch in a 46RE transmission uses 4 clutch discs.

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 172).

(2) Install wave spring on top of reaction ring (Fig. 173). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

(3) Assemble overdrive clutch pack (Fig. 174).

Fig. 172 Overdrive Clutch Reaction Ring Installation

- 1 - REACTION RING
2 - CLUTCH HUB

Fig. 173 Overdrive Clutch Wave Spring Installation

- 1 - WAVE SPRING

(4) Install overdrive clutch reaction plate first.

NOTE: The reaction plate is the same thickness as the pressure plate in a 46RE transmission.

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 175).

INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

J9321-227

Fig. 174 46RE Overdrive Clutch Components

J9221-47

Fig. 176 Shaft End Play Measurement

- 1 - SPECIAL TOOL 6312
2 - SPECIAL TOOL 6311
3 - SPECIAL TOOL C-4962

- (b) Position Gauge Tool 6311 across face of overdrive case (Fig. 176). Then position Dial Caliper C-4962 over gauge tool.
- (c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 176).
- (d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 177).
- (e) Remove Gauge Alignment Tool 6312.

End Play Measurement (Inches)	Spacer Thickness (Inches)
.7336 - .7505	.158 - .159
.7506 - .7675	.175 - .176
.7676 - .7855	.193 - .194
.7856 - .8011	.211 - .212

J9121-341

Fig. 177 Intermediate Shaft End Play Spacer Selection

OVERDRIVE UNIT (Continued)

OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 178).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 179).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

Fig. 178 Overdrive Piston Thrust Plate Measurement

1 - SPECIAL TOOL 6311

2 - DIRECT CLUTCH HUB THRUST BEARING SEAT

3 - SPECIAL TOOL C-4962

OVERDRIVE PISTON

(1) Install new seals on overdrive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

End Play Measurement (Inches)	Spacer Thickness (Inches)
1.7500 - 1.7649	.108 - .110
1.7650 - 1.7799	.123 - .125
1.7800 - 1.7949	.138 - .140
1.7950 - 1.8099	.153 - .155
1.8100 - 1.8249	.168 - .170
1.8250 - 1.8399	.183 - .185
1.8400 - 1.8549	.198 - .200
1.8550 - 1.8699	.213 - .215
1.8700 - 1.8849	.228 - .230
1.8850 - 1.8999	.243 - .245

J9121-342

Fig. 179 Overdrive Piston Thrust Plate Selection

(5) Install overdrive piston in overdrive piston retainer by:

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case.

INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 180).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

OVERDRIVE UNIT (Continued)

**Fig. 180 Trimming Overdrive Case Gasket**

- 1 - GASKET
2 - SHARP KNIFE

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 181).

**Fig. 181 Intermediate Shaft Selective Spacer Location**

- 1 - SELECTIVE SPACER
2 - SPACER GROOVE
3 - INTERMEDIATE SHAFT

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

OVERDRIVE SWITCH

DESCRIPTION

The overdrive OFF (control) switch is located in the shift lever arm (Fig. 182). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

80a8et1

Fig. 182 Overdrive Off Switch

OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the con-

OVERDRIVE SWITCH (Continued)

ontrol switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

REMOVAL

(1) Using a plastic trim tool, remove the overdrive off switch retainer from the shift lever (Fig. 183).

Fig. 183 Overdrive Off Switch Retainer

- 1 - GEAR SHIFT LEVER
- 2 - OVERDRIVE OFF SWITCH RETAINER
- 3 - PLASTIC TRIM TOOL

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 184)

INSTALLATION

NOTE: There is enough slack in the wire to pull out the connector from the lever.

(1) Pull the connector out of the lever just enough to grasp it.

80a8ed2b

Fig. 184 Remove the Overdrive Off Switch

- 1 - GEAR SHIFT LEVER
- 2 - OVERDRIVE OFF SWITCH

CAUTION: Be careful not to bend the pins on the overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.

(2) Install the overdrive off switch into the connector (Fig. 185)

80a8eb39

Fig. 185 Install the Overdrive Off Switch

- 1 - GEAR SHIFT LEVER

- 3 - OVERDRIVE OFF SWITCH

(3) Push the overdrive off switch and wiring into the shift lever.

(4) Install the overdrive off switch retainer onto the shift lever.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

DESCRIPTION

The overrunning clutch (Fig. 186) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

80be45f8

Fig. 186 Overrunning Clutch

- 1 - OUTER RACE (CAM)
- 2 - ROLLER
- 3 - SPRING
- 4 - SPRING RETAINER
- 5 - INNER RACE (HUB)

OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a free-wheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

DISASSEMBLY

- (1) Remove the overdrive piston (Fig. 187).
- (2) Remove the overdrive piston retainer bolts.
- (3) Remove overdrive piston retainer.

- (4) Remove case gasket.
- (5) Tap old cam out of case with pin punch. Insert punch through bolt holes at rear of case (Fig. 188). Alternate position of punch to avoid cocking cam during removal.
- (6) Clean clutch cam bore and case. Be sure to remove all chips/shavings generated during cam removal.

Fig. 187 Overdrive Piston Removal

- 3 - SELECTIVE SPACER
- 4 - PISTON RETAINER

Fig. 188 Overrunning Clutch Cam

- 1 - PIN PUNCH
- 2 - REAR SUPPORT BOLT HOLES

CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

ASSEMBLY

(1) Temporarily install overdrive piston retainer in case. Use 3-4 bolts to secure retainer.

(2) Align and start new clutch cam in the transmission case. Be sure serrations on cam and in case are aligned (Fig. 189). Then tap cam into case just enough to hold it in place.

(3) Verify that cam is correctly positioned before proceeding any further. Narrow ends of cam ramps should be to left when cam is viewed from front end of case (Fig. 189).

(4) Insert Adapter Tool SP-5124 into piston retainer (Fig. 190).

(5) Assemble Puller Bolt SP-3701 and Press Plate SP-3583-A (Fig. 191).

Fig. 189 Positioning Replacement Clutch Cam In Case

- 1 - ALIGN SERRATIONS ON CAM AND IN CASE
2 - CLUTCH CAM

2 - SPECIAL TOOL SP-5124

Fig. 191 Assembling Clutch Cam Puller Bolt And Press Plate

- 1 - PULLER BOLT SP-3701
2 - PRESS PLATE SP-3583-A

(6) Install assembled puller plate and bolt (Fig. 192). Insert bolt through cam, case and adapter tool. Be sure plate is seated squarely on cam.

(7) Hold puller plate and bolt in place and install puller nut SP-3701 on puller bolt (Fig. 193).

(8) Tighten puller nut to press clutch cam into case (Fig. 193). Be sure cam is pressed into case evenly and does not become cocked.

(9) Remove clutch cam installer tools.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

(10) Stake case in 14 places around clutch cam to help secure cam in case. Use blunt punch or chisel to stake case.

(11) Remove piston retainer from case. Cover retainer with plastic sheeting, or paper to keep it dust free.

(12) Clean case and cam thoroughly. Be sure any chips/shavings generated during cam installation are removed from case.

Fig. 192 Positioning Puller Plate On Clutch Cam

1 - SPECIAL TOOL SP-3701

2 - BE SURE PLATE SP-3583-A IS SEATED SQUARELY ON CAM

(13) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 194). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

(14) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 195). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

(15) Install new seals on overdrive piston.

(16) Stand transmission case upright on bellhousing.

(17) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(18) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(19) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

PARK/NEUTRAL POSITION SWITCH

DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

REMOVAL

- (1) Raise vehicle and position drain pan under switch.
- (2) Disconnect switch wires.
- (3) Remove switch from case.

INSTALLATION

- (1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 196).

**Fig. 196 Park/Neutral Position Switch**

- 1 - NEUTRAL CONTACT
2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
3 - PARK CONTACT
4 - SWITCH

- (2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

- (3) Test continuity of new switch with 12V test lamp.

- (4) Connect switch wires and lower vehicle.

- (5) Top off transmission fluid level.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

PISTONS (Continued)

OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 197) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

Fig. 197 Force and Pressure Relationship

PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 198) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken.

The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

80bfe273

Fig. 198 Pressure on a Confined Fluid

FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 199), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 199), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

PISTONS (Continued)

80bfe274

Fig. 199 Force Multiplication

PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 200) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

80bfe275

Fig. 200 Piston TravelPLANETARY GEARTRAIN/
OUTPUT SHAFT

DESCRIPTION

The planetary gearsets (Fig. 201) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

80be45f9

Fig. 201 Planetary Gearset

- 1 - ANNULUS GEAR
- 2 - SUN GEAR
- 3 - PLANET CARRIER
- 4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.

OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

DISASSEMBLY

(1) Remove planetary snap-ring from intermediate shaft (Fig. 202). Discard snap-ring as it is not reusable.

(2) Remove front planetary gear and front annulus gear as assembly (Fig. 203).

(3) Remove front planetary gear and thrust washer from front annulus gear (Fig. 204). Note thrust washer position for assembly reference.

(4) Remove tabbed thrust washer from driving shell (Fig. 205). Note washer position for assembly reference.

(5) Remove sun gear and driving shell as assembly (Fig. 206).

INSPECTION

Inspect the planetary gear sets and annulus gears. The planetary pinions, shafts, washers, and retaining pins are serviceable. However, if a pinion carrier is damaged, the entire planetary gear set must be replaced as an assembly.

Replace the annulus gears if the teeth are chipped, broken, or worn, or the gear is cracked. Replace the planetary thrust plates and the tabbed thrust washers if cracked, scored or worn.

Inspect the machined surfaces of the intermediate shaft. Be sure the oil passages are open and clear. Replace the shaft if scored, pitted, or damaged.

Inspect the sun gear and driving shell. If either component is worn or damaged, remove the sun gear rear retaining ring and separate the sun gear and

thrust plate from the driving shell. Then replace the necessary component.

Replace the sun gear as an assembly if the gear teeth are chipped or worn. Also replace the gear as an assembly if the bushings are scored or worn. The sun gear bushings are not serviceable. Replace the thrust plate if worn, or severely scored. Replace the driving shell if distorted, cracked, or damaged in any way.

Replace all snap-rings during geartrain assembly. Reusing snap-rings is not recommended.

ASSEMBLY

(1) Lubricate sun gear and planetary gears with transmission fluid during assembly. Use petroleum jelly to lubricate intermediate shaft bushing surfaces, thrust washers and thrust plates and to hold these parts in place during assembly.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(2) Install front snap-ring on sun gear and install gear in driving shell. Then install thrust plate over sun gear and against rear side of driving shell (Fig. 210). Install rear snap-ring to secure sun gear and thrust plate in driving shell.

(3) Install rear annulus gear on intermediate shaft (Fig. 211).

(4) Install thrust plate in annulus gear (Fig. 212). Be sure plate is seated on shaft splines and against gear.

J9321-175

J9121-69

Fig. 212 Installing Rear Annulus Thrust Plate

- 1 - REAR ANNULUS GEAR
- 2 - THRUST PLATE

(5) Install rear planetary gear in rear annulus gear (Fig. 213). Be sure planetary carrier is seated against annulus gear.

(6) Install tabbed thrust washer on front face of rear planetary gear (Fig. 214). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

(7) Lubricate sun gear bushings with petroleum jelly or transmission fluid.

(8) Install sun gear and driving shell on intermediate shaft (Fig. 215). Seat shell against rear planetary gear. Verify that thrust washer on planetary gear was not displaced during installation.

(9) Install tabbed thrust washer in driving shell (Fig. 216), be sure washer tabs are seated in tab slots of driving shell. Use extra petroleum jelly to hold washer in place if desired.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(10) Install tabbed thrust washer on front planetary gear (Fig. 217). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

Fig. 217 Installing Thrust Washer On Front Planetary Gear

- 1 - TABBED THRUST WASHER
2 - FRONT PLANETARY GEAR

Fig. 218 Assembling Front Planetary And Annulus Gears

- 1 - FRONT ANNULUS GEAR
2 - FRONT PLANETARY GEAR

(11) Install front annulus gear over and onto front planetary gear (Fig. 218). Be sure gears are fully meshed and seated.

(12) Install front planetary and annulus gear assembly (Fig. 219). Hold gears together and slide them onto shaft. Be sure planetary pinions are seated on sun gear and that planetary carrier is seated on intermediate shaft.

(13) Place geartrain in upright position. Rotate gears to be sure all components are seated and properly assembled. Snap-ring groove at forward end of intermediate shaft will be completely exposed when components are assembled correctly.

(14) Install new planetary snap-ring in groove at end of intermediate shaft (Fig. 220).

(15) Turn planetary geartrain over. Position wood block under front end of intermediate shaft and support geartrain on shaft. Be sure all geartrain parts have moved forward against planetary snap-ring. This is important for accurate end play check.

(16) Check planetary geartrain end play with feeler gauge (Fig. 221). Insert gauge between rear annulus gear and shoulder on intermediate shaft as shown. End play should be 0.15 to 1.22 mm (0.006 to 0.048 in.).

(17) If end play is incorrect, install thinner/thicker planetary snap-ring as needed.

REAR CLUTCH

DESCRIPTION

The rear clutch assembly (Fig. 222) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

REAR CLUTCH (Continued)

| 8 - PRESSURE PLATE | 18 - FIBER THRUST WASHER |
| 9 - CLUTCH DISCS | 19 - RETAINING RING |
| 10 - SNAP-RING (SELECTIVE) | |

DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front and rear seal rings.

(3) Remove selective clutch pack snap-ring (Fig. 223).

(4) Remove the reaction plate, clutch discs, steel plates, pressure plate, wave spring, spacer ring, and piston spring (Fig. 223).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft retaining ring. It may be necessary to press the input shaft in slightly to relieve tension on the retaining ring.

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop

towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

REAR CLUTCH (Continued)

**Fig. 223 Rear Clutch Components**

80aacf93

- 1 - REAR CLUTCH RETAINER

- 15 - PISTON
- 16 - OUTER PISTON SEAL
- 17 - REAR SEAL RING
- 18 - FIBER THRUST WASHER
- 19 - RETAINING RING

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary.

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then partially press input shaft into retainer (Fig. 224). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft retaining ring.

(5) Press the input shaft the remainder of the way into the clutch retainer.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

REAR CLUTCH (Continued)

(9) Install piston spring in retainer and on top of piston. Concave side of spring faces downward (toward piston).

(10) Install the spacer ring and wave spring into the retainer. Be sure spring is completely seated in retainer groove.

Fig. 224 Pressing Input Shaft Into Rear Clutch Retainer

- 1 - INPUT SHAFT
- 2 - REAR CLUTCH RETAINER
- 3 - PRESS RAM

(11) Install pressure plate (Fig. 223). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 223).

(13) Install the reaction plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 225).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 225).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.635 - 0.914 mm (0.025 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap ring thicknesses are:

- 0.107 - 0.109 in.
- 0.098 - 0.100 in.
- 0.095 - 0.097 in.
- 0.083 - 0.085 in.
- 0.076 - 0.078 in.
- 0.071 - 0.073 in.
- 0.060 - 0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 226). Use enough petroleum jelly to hold washer in place.

(17) Set rear clutch aside for installation during final assembly.

REAR SERVO

DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

DISASSEMBLY

- (1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 227).
- (2) Remove and discard servo piston seal ring.

Fig. 227 Rear Servo Components

- 2 - PISTON SEAL
- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP-RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

CLEANING

Remove and discard the servo piston seal ring (Fig. 228). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap-rings and use new ones at assembly.

- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP-RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

ASSEMBLY

- (1) Lubricate piston and guide seals (Fig. 229) with petroleum jelly. Lubricate other servo parts with Mopar® ATF +4, type 9602, transmission fluid.
- (2) Install new seal ring on servo piston.
- (3) Assemble piston, plug, spring and new snap-ring.
- (4) Lubricate piston seal lip with petroleum jelly.

SHIFT MECHANISM

DESCRIPTION

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

ADJUSTMENTS

ADJUSTMENT

Check linkage adjustment by starting engine in PARK and NEUTRAL. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions.

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 230). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

- (1) Shift transmission into PARK.
- (2) Raise and support vehicle.

(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 230).

(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.

(5) Move transmission shift lever fully rearward to the Park detent.

(6) Center adjusting swivel on shift rod.

(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).

(8) Lower vehicle and verify proper adjustment.

SOLENOID

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** sole-

SOLENOID (Continued)

noid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

SPEED SENSOR

DESCRIPTION

The speed sensor (Fig. 231) is located in the over-drive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

J9321-411

Fig. 231 Transmission Output Speed Sensor

- 1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
2 - SEAL

OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

THROTTLE VALVE CABLE

DESCRIPTION

Transmission throttle valve cable (Fig. 232) adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 233). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

THROTTLE VALVE CABLE (Continued)

Fig. 232 Throttle Valve Cable Attachment - At Engine

- 1 - THROTTLE VALVE CABLE
- 2 - CABLE BRACKET
- 3 - THROTTLE BODY LEVER
- 4 - ACCELERATOR CABLE
- 5 - SPEED CONTROL CABLE

ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

ADJUSTMENT VERIFICATION

- (1) Turn ignition key to OFF position.
- (2) Remove air cleaner.
- (3) Verify that lever on throttle body is at curb idle position (Fig. 234). Then verify that the transmission throttle lever (Fig. 235) is also at idle (fully forward) position.
- (4) Slide cable off attachment stud on throttle body lever.
- (5) Compare position of cable end to attachment stud on throttle body lever:
 - Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 236).

Fig. 233 Throttle Valve Cable at Throttle Linkage

- 1 - THROTTLE LINKAGE
- 2 - THROTTLE VALVE CABLE LOCKING CLIP
- 3 - THROTTLE VALVE CABLE

- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

THROTTLE VALVE CABLE (Continued)

- 4 - TRANSFER CASE SHIFTER CABLE BRACKET RETAINING BOLT (1 OR 2)
- 5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
- 6 - ELECTRICAL CONNECTORS
- 7 - TRANSMISSION FLUID LINES

ADJUSTMENT PROCEDURE

- (1) Turn ignition switch to OFF position.
- (2) Remove air cleaner if necessary.
- (3) Disconnect cable end from attachment stud.
Carefully slide cable off stud. Do not pry or pull cable off.
- (4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.
- (5) Pry the T.V. cable lock (A) into the UP position (Fig. 236). This will unlock the cable and allow for readjustment.
- (6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable. **Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 236).
- (7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 236). This will lock the present T.V. cable adjustment.

NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.

- (8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).
- (9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 237) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.

- 2 - IMPELLER
- 3 - HUB
- 4 - STATOR
- 5 - FRONT COVER
- 6 - CONVERTER CLUTCH DISC
- 7 - DRIVE PLATE

IMPELLER

The impeller (Fig. 238) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

| 3 - IMPELLER VANES AND COVER ARE INTEGRAL | |

TURBINE

The turbine (Fig. 239) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

The stator assembly (Fig. 240) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 241). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

- 3 - IMPELLER
- 4 - STATOR
- 5 - TURBINE
- 6 - PISTON
- 7 - FRICTION DISC

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 242) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

OPERATION

The converter impeller (Fig. 243) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it con-

tinues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 244). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

2 - FRONT OF ENGINE

3 - INCREASED ANGLE AS OIL STRIKES VANES

4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased.

REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

TORQUE CONVERTER (Continued)

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 245). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

Fig. 245 Checking Torque Converter Seating - Typical

1 - SCALE

2 - STRAIGHTEDGE

TORQUE CONVERTER DRAINBACK VALVE**DESCRIPTION**

The drainback valve is located in the transmission cooler outlet (pressure) line.

OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

TORQUE CONVERTER DRAINBACK VALVE (Continued)

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

TRANSMISSION TEMPERATURE SENSOR

DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 246). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 2000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

VALVE BODY

DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 247), (Fig. 248), (Fig. 249), and (Fig. 250):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

CHECK BALLS

CHECK BALL NUMBER	DESCRIPTION
1	Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug.
2	Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug.
3	Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch.
4	Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo.
5	Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure.
6	Provides a by-pass around the front servo orifice so that the servo can release quickly.
7	Provides a by-pass around the rear clutch orifice so that the clutch can release quickly.
8	Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient.
9	Provides a by-pass around the rear servo orifice so that the servo can release quickly.
ECE (10)	Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown.

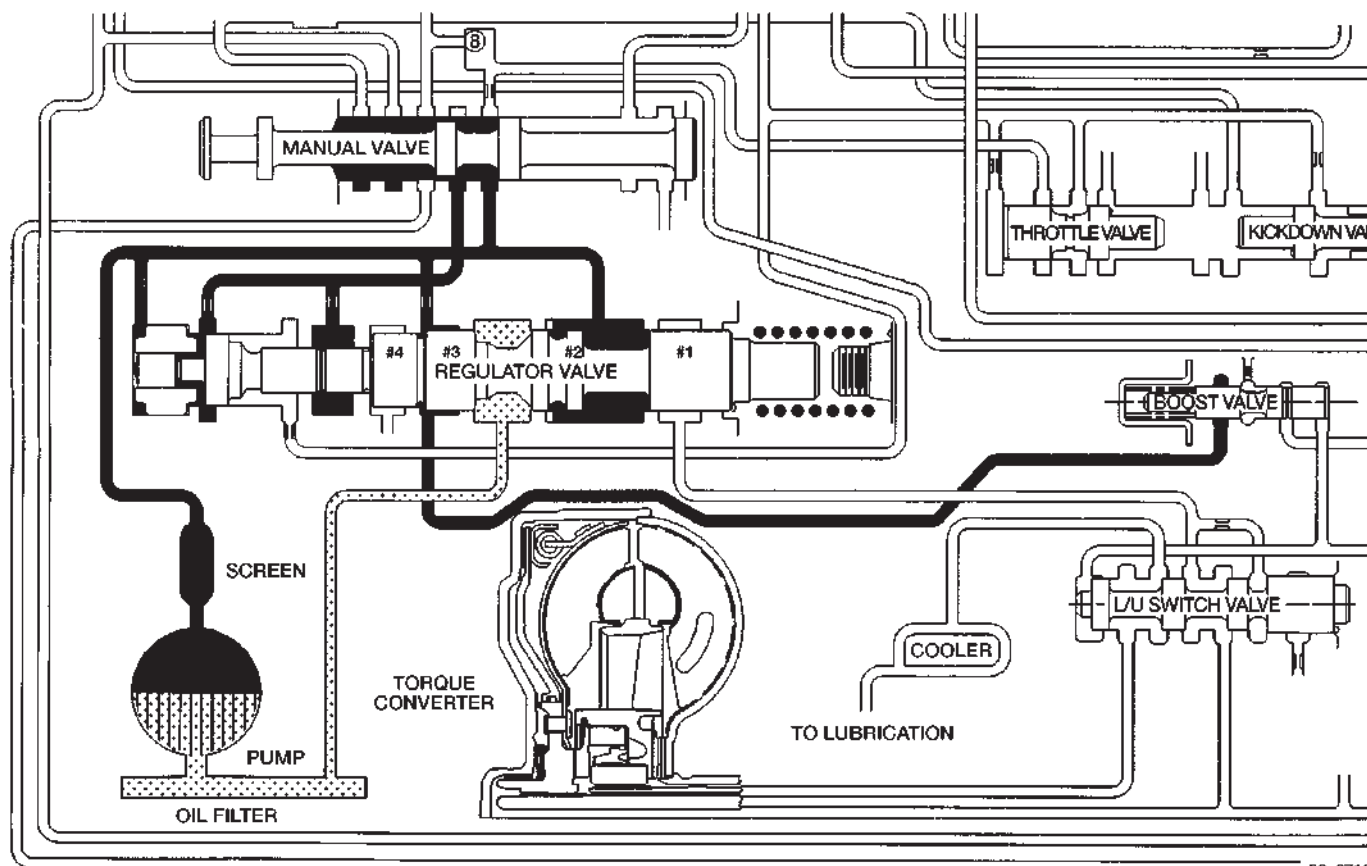

VALVE BODY (Continued)

REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 251) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

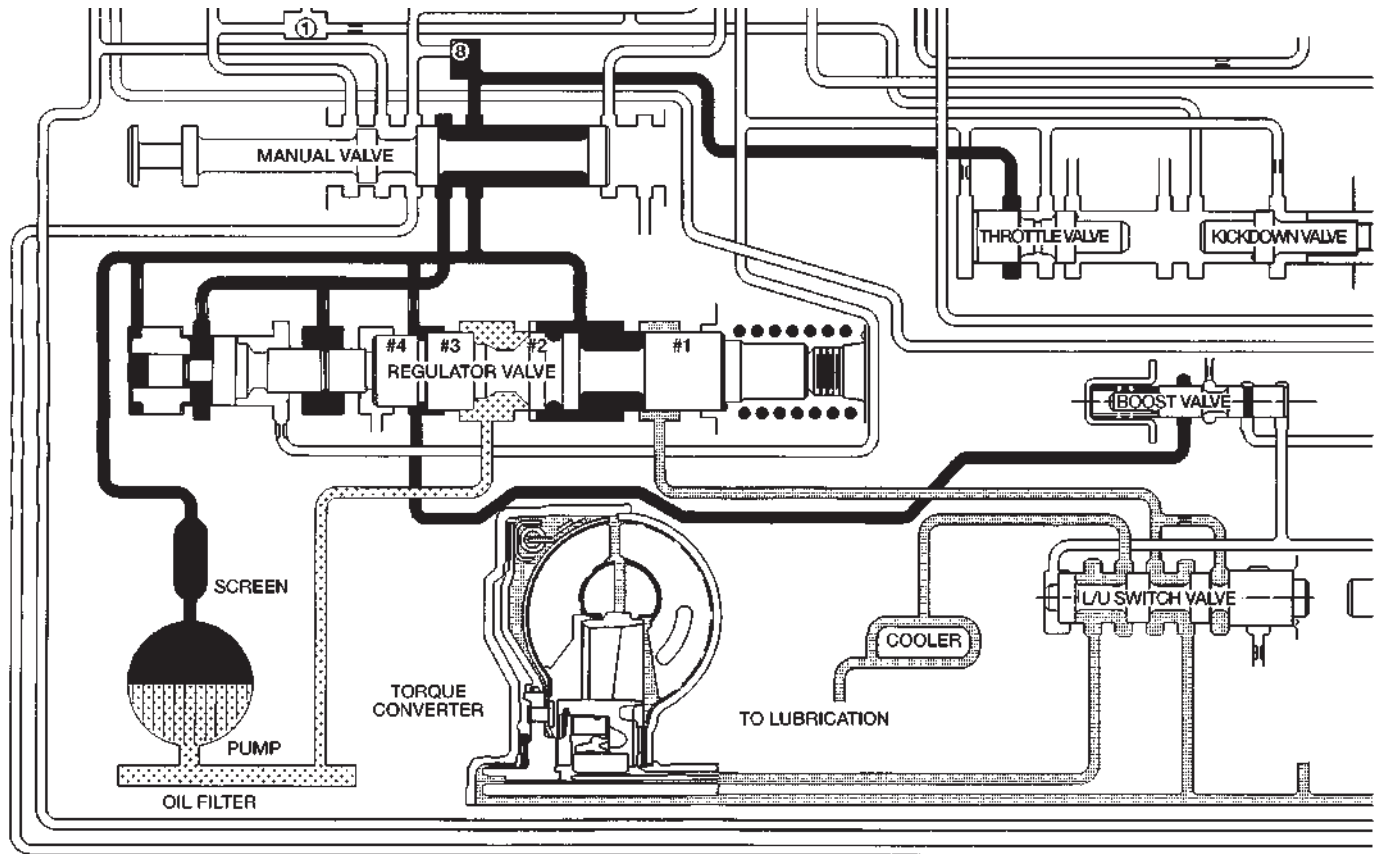

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 252), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

80c0713c

Fig. 251 Regulator Valve in PARK Position

VALVE BODY (Continued)

80880187

Fig. 252 Regulator Valve in NEUTRAL Position

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 253). The regulated line pressure in REVERSE (Fig. 254) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 255) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

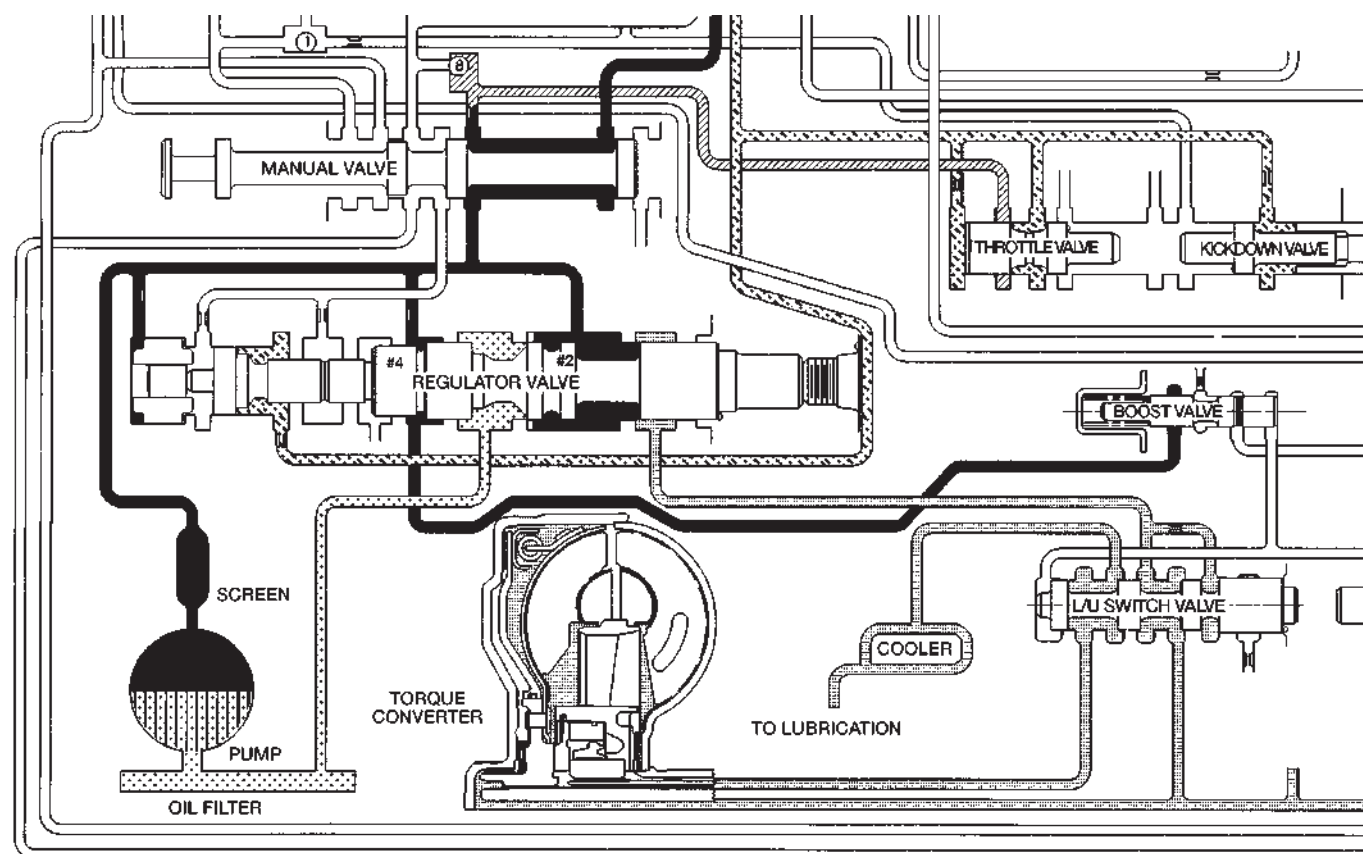

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

Fig. 254 Regulator Valve in REVERSE Position

VALVE BODY (Continued)

8088018a

*Fig. 255 Kickdown Valve-Wide Open Throttle***KICKDOWN LIMIT VALVE**

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 256) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 257), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 258), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle

VALVE BODY (Continued)

Fig. 256 Kickdown Limit Valve-Low Speeds

80c07143

Fig. 257 Kickdown Limit Valve-High Speeds

80c07144

Fig. 258 1-2 Shift Valve-Before Shift

pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 259).

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.

VALVE BODY (Continued)

80c07145

Fig. 259 1-2 Shift Valve-After Shift

- When in a manual selection position, it will be hydraulically “blocked” into position so no upshift can occur.

The physical blocking of the upshift while in the manual “1” position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a “relay” and “balanced” valve.

The valve has two specific operations (Fig. 260):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kick-down ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or “modulated throttle pressure” is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is “cushioned” and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control’s spring cavity, adding to the spring load on the valve. The result of this increased “modulated” throttle pressure is a firmer WOT upshift.

2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 261) consists of the 2-3 shift valve, governor plug and spring, and

a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead-end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

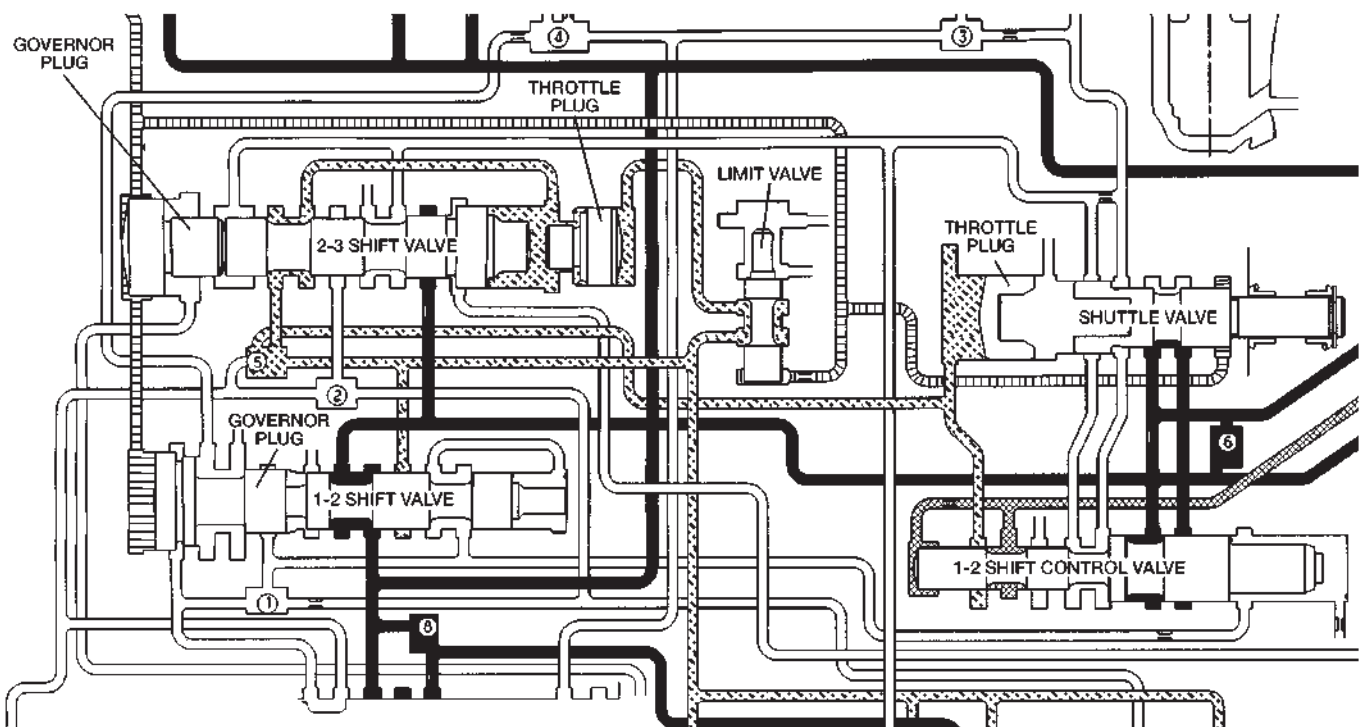

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 262), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual “1” or manual “2” gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

VALVE BODY (Continued)

80c07146

Fig. 260 1-2 Shift Control Valve

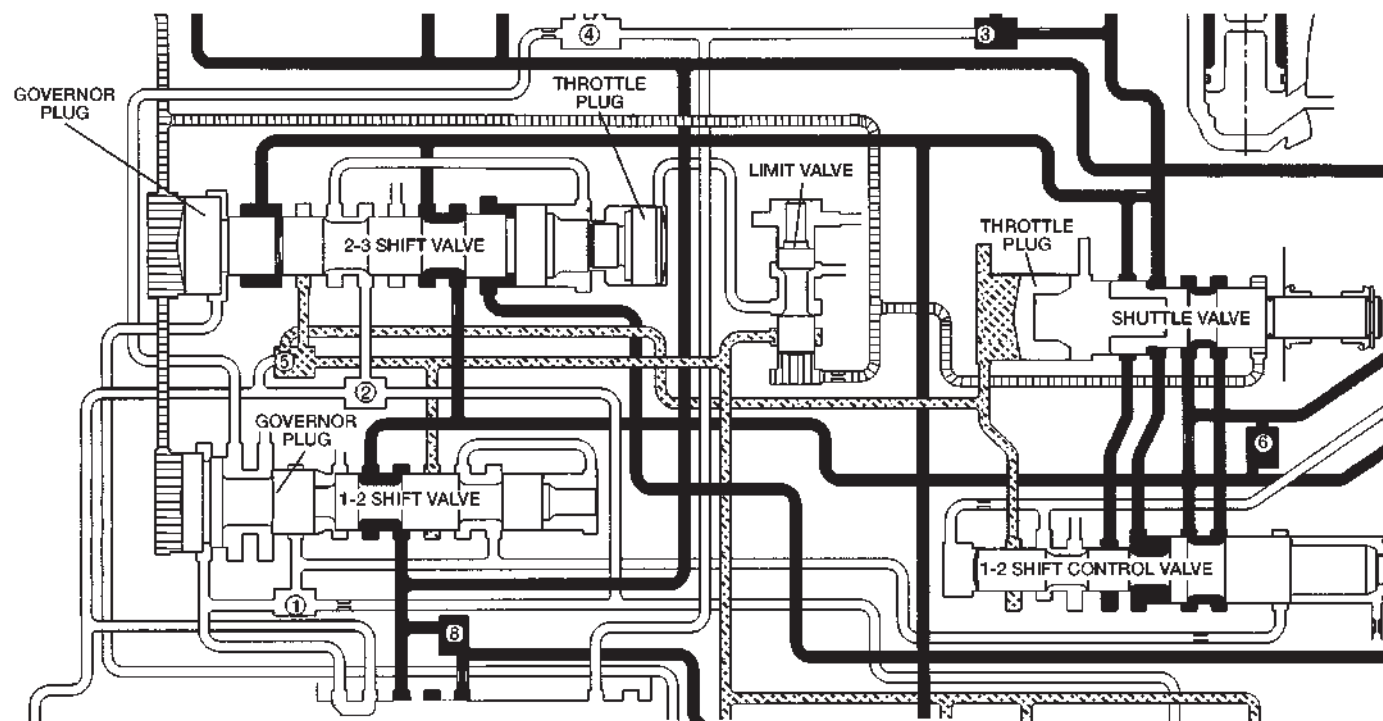

80c07147

*Fig. 261 2-3 Shift Valve-Before Shift***3-4 SHIFT VALVE**

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 263). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift

valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 264). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

VALVE BODY (Continued)

80880192

Fig. 263 3-4 Shift Valve Before Shift

80880193

Fig. 264 3-4 Shift Valve After Shift

VALVE BODY (Continued)

3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 264). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 263).

3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 263). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 264). Clutch fill is then completed through the regular feed orifice.

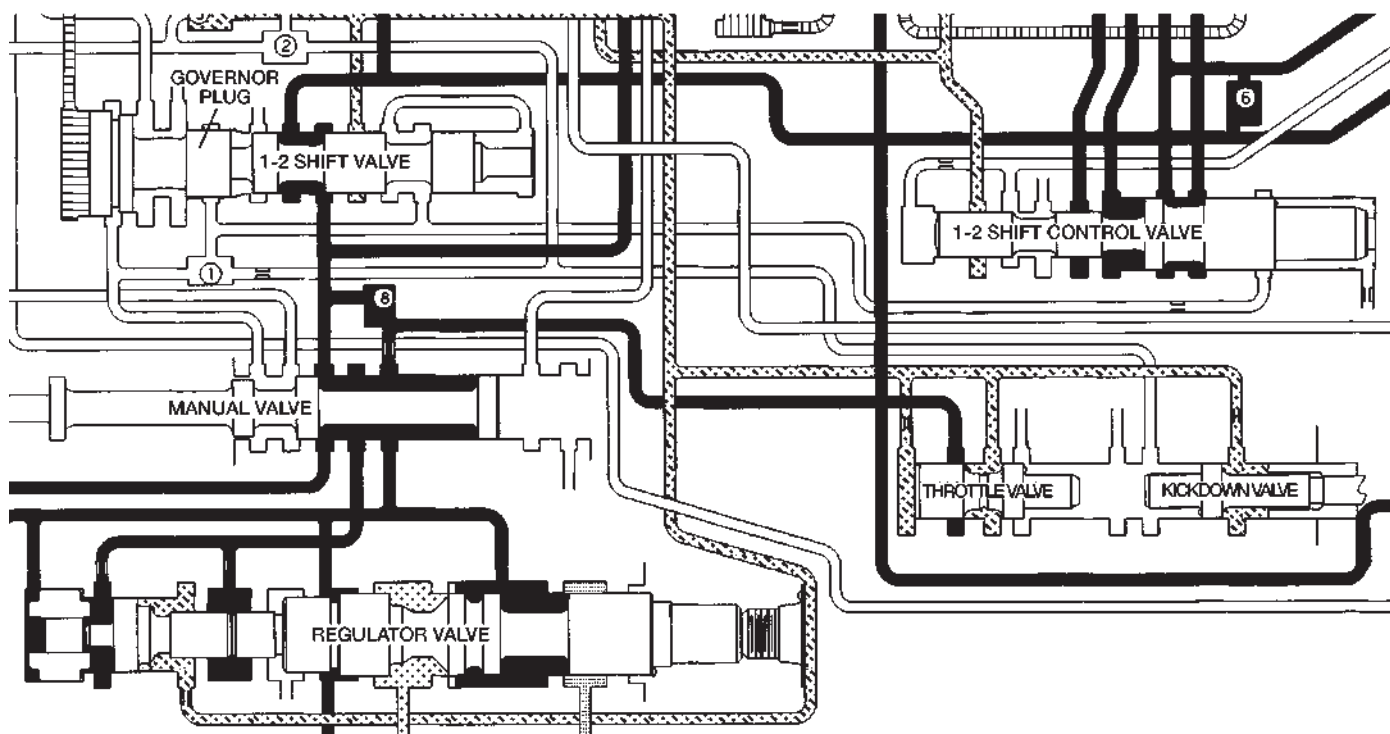

THROTTLE VALVE

In all gear positions the throttle valve (Fig. 265) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the

throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the

80c07149

Fig. 265 Throttle Valve

VALVE BODY (Continued)

throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 266), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

30660199

Fig. 266 Switch Valve-Torque Converter Unlocked

VALVE BODY (Continued)

Once the TCC control valve has moved to the right (Fig. 267), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

MANUAL VALVE

The manual valve (Fig. 268) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

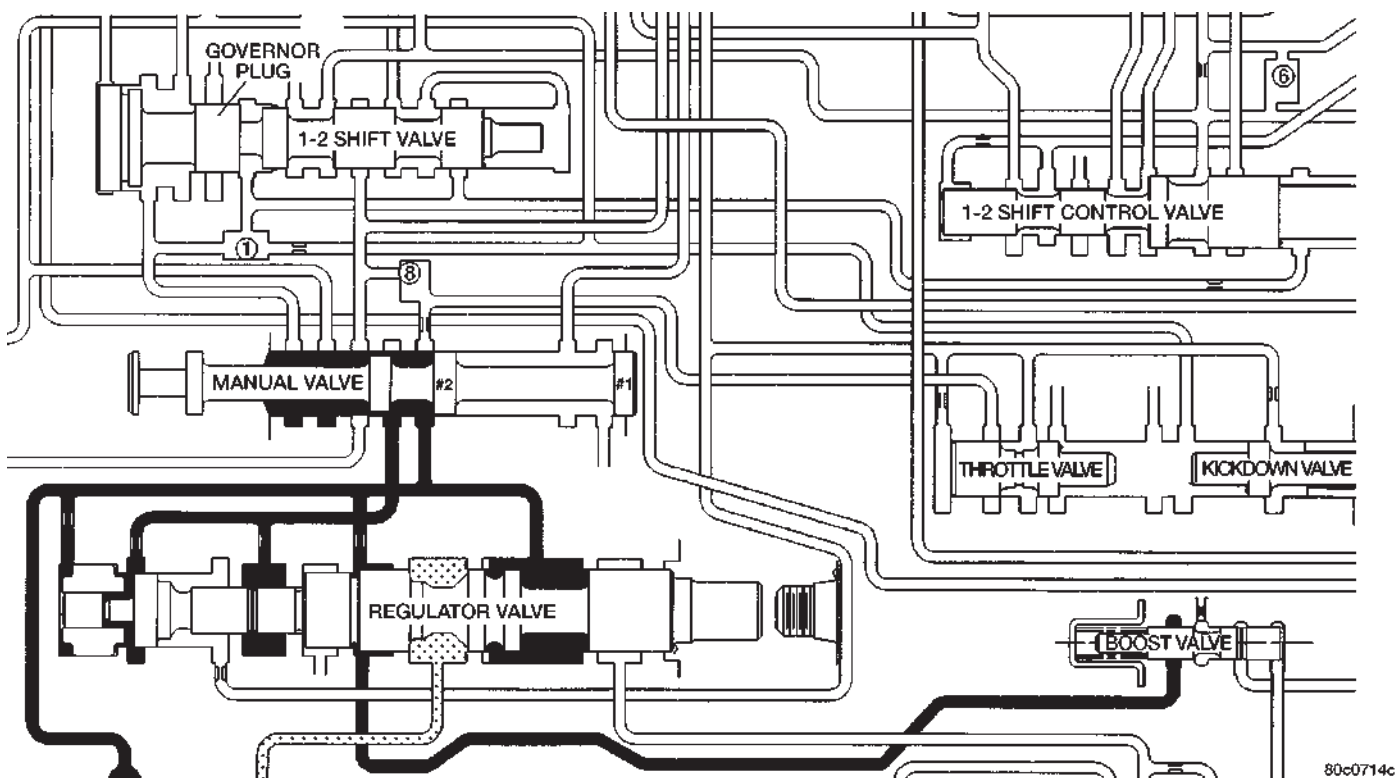

Fig. 267 Switch Valve-Torque Converter Locked

VALVE BODY (Continued)

80c0714c

Fig. 268 Manual Valve**CONVERTER CLUTCH LOCK-UP VALVE**

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 260) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by-pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 "lift foot" upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

VALVE BODY (Continued)

BOOST VALVE

The boost valve (Fig. 269) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 270), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

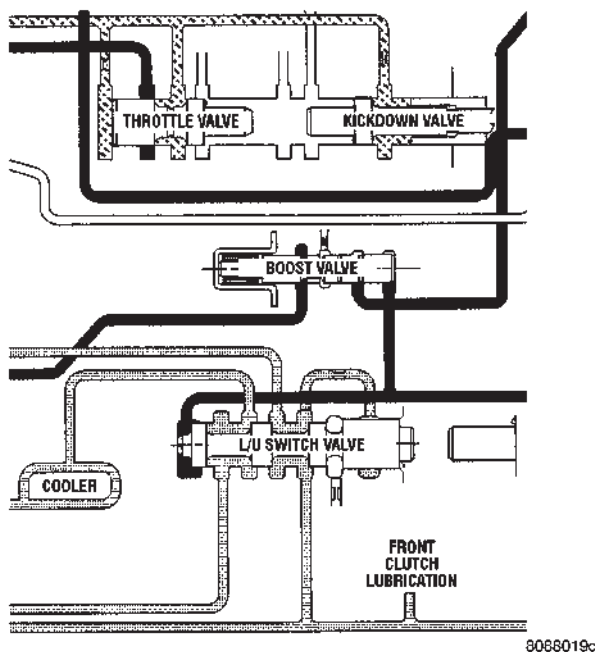

Fig. 269 Boost Valve Before Lock-up

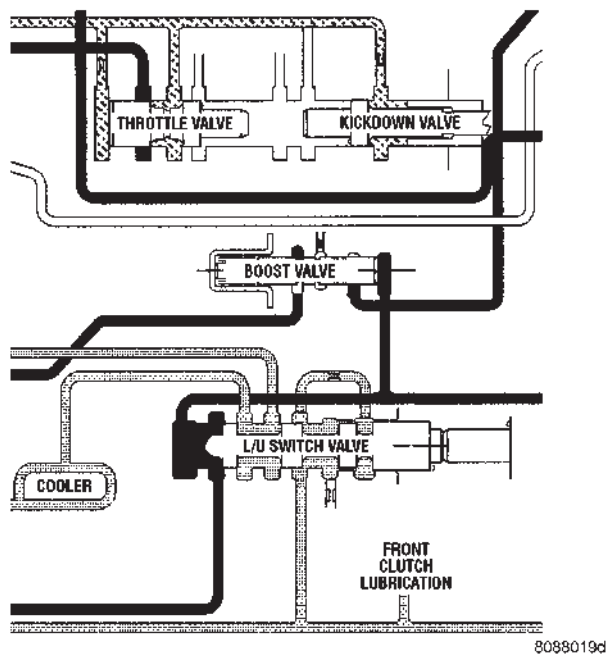

Fig. 270 Boost Valve After Lock-up

REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).
- Converter clutch/overdrive solenoid assembly and harness.

- Governor housing gasket.
 - Solenoid case connector O-rings.
- (1) Shift transmission into NEUTRAL.
 - (2) Raise vehicle.
 - (3) Remove gearshift and throttle levers from shaft of valve body manual lever.
 - (4) Disconnect wires at solenoid case connector (Fig. 271).
 - (5) Position drain pan under transmission oil pan.
 - (6) Remove transmission oil pan and gasket.
 - (7) Remove fluid filter from valve body.
 - (8) Remove bolts attaching valve body to transmission case.
 - (9) Lower valve body enough to remove accumulator piston and springs.
 - (10) Work manual lever shaft and electrical connector out of transmission case.
 - (11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 272).

DISASSEMBLY

CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

- (1) Disconnect wires from governor pressure sensor and solenoid.
- (2) Remove screws attaching governor body and retainer plate to transfer plate.
- (3) Remove retainer plate, governor body and gasket from transfer plate.
- (4) Remove governor pressure sensor from governor body.
- (5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.
- (6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 273). Retain shoulder bolt. Either tape it to

harness or thread it back into accumulator housing after connector removal.

(7) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 274).

(8) Turn valve body over and remove screws that attach overdrive/converter solenoid assembly to valve body (Fig. 275).

(9) Remove solenoid and harness assembly from valve body (Fig. 276).

(10) Remove boost valve cover (Fig. 277).

(11) Remove boost valve retainer, valve spring and boost valve (Fig. 278).

**Fig. 293 Number 10 Check Ball**

1 - NUMBER 10 CHECK BALL (3/16")

**Fig. 294 Transfer Plate**1 - UPPER HOUSING
2 - TRANSFER PLATE**VALVE BODY UPPER HOUSING**

(1) Note location of check balls in valve body upper housing (Fig. 297). Then remove the one large diameter and the six smaller diameter check balls.

(2) Remove governor plug and shuttle valve covers (Fig. 299).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 298).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 299).

**Fig. 295 Upper Housing Separator Plate**1 - TRANSFER PLATE
2 - UPPER HOUSING SEPARATOR PLATE
3 - FILTER SCREEN
4 - BRACE**Fig. 296 Rear Clutch and Rear Servo Check Ball Locations**1 - REAR CLUTCH CHECK BALL
2 - REAR SERVO CHECK BALL
3 - TRANSFER PLATE

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 286).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 300).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 300).

(9) Remove 1-2 shift control valve and spring (Fig. 300).

(10) Remove 1-2 shift valve and spring (Fig. 300).

VALVE BODY (Continued)

(11) Remove 2-3 shift valve and spring from valve body (Fig. 300).

(12) Remove pressure plug cover (Fig. 300).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 300).

J9321-154

Fig. 297 Check Ball Locations In Upper Housing

2 - LARGE DIAMETER CHECK BALL (1)

J9121-179

Fig. 298 Shuttle Valve E-Clip And Secondary Spring

- 1 - E-CLIP
2 - SECONDARY SPRING AND GUIDES
3 - SHUTTLE VALVE

VALVE BODY LOWER HOUSING

(1) Remove timing valve cover.

(2) Remove 3-4 timing valve and spring.

(3) Remove 3-4 quick fill valve, spring and plug.

(4) Remove 3-4 shift valve and spring.

(5) Remove converter clutch valve, spring and plug (Fig. 301).

(6) Remove converter clutch timing valve, retainer and valve spring.

3-4 ACCUMULATOR HOUSING

(1) Remove end plate from housing.

(2) Remove piston spring.

(3) Remove piston. Remove and discard piston seals (Fig. 302).

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either part has sustained physical damage (dented, deformed, broken, etc.).

CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.

INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

VALVE BODY (Continued)

J9421-217

Fig. 299 Shuttle and Boost Valve Location

- | | |
|------------------------------------|-----------------------------------|
| 1 - SPRING | 8 - SHUTTLE VALVE COVER |
| 2 - RETAINER | 9 - SHUTTLE VALVE |
| 3 - BOOST VALVE | 10 - SHUTTLE VALVE PRIMARY SPRING |
| 4 - BOOST VALVE PLUG | 11 - GOVERNOR PLUG COVER |
| 5 - SPRING GUIDES | 12 - THROTTLE PLUG |
| 6 - E-CLIP | 13 - UPPER HOUSING |
| 7 - SHUTTLE VALVE SECONDARY SPRING | 14 - BOOST VALVE COVER |

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

VALVE BODY (Continued)

J9321-157

Fig. 300 Upper Housing Shift Valve and Pressure Plug Locations

- | | |
|--------------------------------|--|
| 1 - UPPER HOUSING | 8 - RETAINER |

| 5 - LIMIT VALVE HOUSING | 12 - PLUG SLEEVE |
| 6 - LIMIT VALVE COVER | 13 - THROTTLE PRESSURE SPRING AND PLUG |
| 7 - LIMIT VALVE AND SPRING | |

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

ASSEMBLY

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 301).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 302).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 303).

(2) Install filter screen in upper housing separator plate (Fig. 304).

(3) Align and position upper housing separator plate on transfer plate (Fig. 305).

(4) Install brace plate (Fig. 305). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 306). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 307). Be sure filter screen is seated in proper housing recess.

(3) Install the Number 10 check ball into the transfer plate (Fig. 308). The check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 309).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 310).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 310).

UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 311), (Fig. 312) and (Fig. 313) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

J9321-442

Fig. 310 Installing Lower Housing On Transfer Plate And Upper Housing

1 - VALVE BODY SCREWS (13)

2 - LOWER HOUSING

3 - UPPER HOUSING

4 - TRANSFER PLATE

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

| 7 - LIMIT VALVE AND SPRING | |

BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 314).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 314).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 315).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 315).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 316).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 317).

(2) Loosely attach accumulator housing with right-side screw (Fig. 317). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 318). Tighten screws to 4 N·m (35 in. lbs.).

VALVE BODY (Continued)

VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 319).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 320).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 321). Seat tang in dimple before tightening connector screw.

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(21) Verify that solenoid wire harness is properly routed (Fig. 322). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 323). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 324).

(3) Check condition of seals on accumulator piston (Fig. 325). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

VALVE BODY (Continued)

- (15) Connect solenoid case connector wires.
- (16) Install oil pan and new gasket. Tighten pan bolts to 13.6 N·m (125 in. lbs.) torque.
- (17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.
- (18) Check and adjust gearshift and throttle valve cables, if necessary.

ADJUSTMENTS - VALVE BODY

CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 326).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

VALVE BODY (Continued)

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

Fig. 326 Line Pressure Adjustment

- 1 - WRENCH
- 2 - 1-5/16 INCH

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 327).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

AUTOMATIC TRANSMISSION - 47RE

DESCRIPTION

The 47RE (Fig. 1) is a four speed fully automatic transmissions with an electronic governor. The 47RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. It also contains the kickdown (front) and the low/reverse (rear) bands which, along with the overrunning clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

GEAR RATIOS

The 47RE gear ratios are:

1st	2.45:1
2nd	1.45:1
3rd	1.00:1
4th	0.69:1
Rev.	2.21

OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position, throttle pressure, and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

AUTOMATIC TRANSMISSION - 47RE (Continued)

PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front clutch hub and rear clutch retainer stops at the rear clutch retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

**Fig. 3 Park Powerflow**

- 1 - LEVER ENGAGED FOR PARK
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT

NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

Fig. 4 Neutral Powerflow

- 1 - PAWL DISENGAGED FOR NEUTRAL
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT
- 4 - CAM
- 5 - PAWL

REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to

the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed.

Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

AUTOMATIC TRANSMISSION - 47RE (Continued)

80c070aa

Fig. 7 Second Gear Powerflow**DIRECT DRIVE POWERFLOW**

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front

annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

AUTOMATIC TRANSMISSION - 47RE (Continued)

**Fig. 8 Direct Drive Powerflow****FOURTH GEAR POWERFLOW**

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing

valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION**

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

AUTOMATIC TRANSMISSION - 47RE (Continued)

DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform hydraulic pressure test if shift problems were noted during road test.
- (6) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift or throttle linkage.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
- (4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
 - (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

CLUTCH AND BAND APPLICATION CHART

SHIFT LEVER POSITION	TRANSMISSION CLUTCHES AND BANDS					OVERDRIVE CLUTCHES		
	FRONT CLUTCH	FRONT BAND	REAR CLUTCH	REAR BAND	OVER- RUNNING CLUTCH	OVER- DRIVE CLUTCH	DIRECT CLUTCH	OVER- RUNNING CLUTCH
Reverse	X			X			X	
Drive - First			X		X		X	X
Drive - Second		X	X				X	X
Drive - Third	X		X				X	X
Drive - Fourth	X		X			X		
Manual Second		X	X		X		X	X
Manual First			X	X	X		X	X

AUTOMATIC TRANSMISSION - 47RE (Continued)

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi

range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

J9321-137

Fig. 9 Pressure Test Port Locations

- 1 - REAR SERVO TEST PORT
- 2 - GOVERNOR TEST PORT
- 3 - ACCUMULATOR TEST PORT
- 4 - FRONT SERVO TEST PORT
- 5 - OVERDRIVE CLUTCH TEST PORT

Test One - Transmission In Manual Low

This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

AUTOMATIC TRANSMISSION - 47RE (Continued)

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.

- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two - Transmission In 2 Range

This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.

(2) Have helper start and run engine at 1000 rpm.

(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.

(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three - Transmission In D Range Third Gear

This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

(1) Turn OD switch off.

(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.

(3) Move Gauge C-3293-SP over to front servo port for this test.

(4) Have helper start and run engine at 1600 rpm for this test.

(5) Move transmission shift lever two detents rearward from full forward position. This is D range.

(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.

- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

Test Four - Transmission In Reverse

This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

(1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.

(2) Move 300 psi Gauge C-3293-SP back to rear servo port.

(3) Have helper start and run engine at 1600 rpm for test.

(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.

(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.

(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

Test Five - Governor Pressure

This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

AUTOMATIC TRANSMISSION - 47RE (Continued)

Test Six - Transmission In Overdrive Fourth Gear

This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor

TEST CONDITION	INDICATION
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

DIAGNOSIS AND TESTING - AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

80b1717e

- 10 - TO COOLER
- 11 - FROM TORQUE CONVERTOR

AUTOMATIC TRANSMISSION - 47RE (Continued)

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump o-ring or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 12).
- (2) Leaks at the converter hub weld (Fig. 12).

Fig. 11 Converter Housing Leak Paths

- 1 - PUMP SEAL
- 2 - PUMP VENT
- 3 - PUMP BOLT
- 4 - PUMP GASKET

- 7 - REAR MAIN SEAL LEAK

Fig. 12 Converter Leak Points - Typical

- 1 - OUTSIDE DIAMETER WELD
- 2 - TORQUE CONVERTER HUB WELD
- 3 - STARTER RING GEAR
- 4 - LUG

CONVERTER HOUSING AREA LEAK CORRECTION

- (1) Remove converter.
- (2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.
- (3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.
- (4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is

AUTOMATIC TRANSMISSION - 47RE (Continued)

scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite™ 592, or Permatex® No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD, FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Add Fluid
	2. Throttle Linkage Mis-adjusted.	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose.	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken.	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect.	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect.	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Mis-adjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter and flush cooler and line before installing new converter.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Mis-adjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump).	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Mis-adjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB® scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Transfer case failure can plug cooler.
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Mis-adjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB® scan tool and repair as required.
	8. Front Band Mis-adjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Mis-adjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Mis-adjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn.	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Circuit Electrical Fault.	1. Test with DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Mis-adjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB® scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	6. TPS Malfunction.	6. Replace sensor, check with DRB® scan tool.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Mis-adjusted/ Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor Component Electrical Fault.	3. Check operating pressures and test with DRB® scan tool, repair faulty component.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Mis-adjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Mis-assembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Mis-assembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking.	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage.
	3. Rear Band Mis-adjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Overdrive Direct Clutch Worn.	5. Disassemble overdrive. Repair as needed.
	6. Hydraulic Pressure Too Low.	6. Perform hydraulic pressure tests to determine cause.
	7. Rear Servo Leaking.	7. Air pressure check clutch-servo operation and repair as required.
	8. Band Linkage Binding.	8. Inspect and repair as required.
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage.
	4. Gearshift Linkage Mis-adjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines.	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR "D" ONLY, BUT NOT IN MANUAL 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Mis-adjusted.	8. Adjust bands.
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Mis-adjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required.
NO 4-3 DOWNSHIFT	1. Circuit Wiring and/or Connectors Shorted.	1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required.
	2. PCM Malfunction.	2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty.
	3. TPS Malfunction	3. Check TPS with DRB® scan tool at PCM.
	4. Lockup Solenoid Not Venting.	4. Remove valve body and replace solenoid assembly if plugged or shorted.
	5. Overdrive Solenoid Not Venting.	5. Remove valve body and replace solenoid if plugged or shorted.
	6. Valve Body Valve Sticking.	6. Repair stuck 3-4 shift valve or lockup timing valve.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF	1. Control Switch Open/Shorted.	1. Test and replace switch if faulty.
	2. Overdrive Solenoid Connector Shorted.	2. Test solenoids and replace if seized or shorted.
	3. PCM Malfunction.	3. Test with DRB® scan tool. Replace PCM if faulty.
	4. Valve Body Stuck Valves.	4. Repair stuck 3-4, lockup or lockup timing valve.
CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT	1. Transmission Fluid Low.	1. Add Fluid.
	2. Throttle Cable Mis-adjusted.	2. Adjust cable.
	3. Overdrive Clutch Select Spacer Wrong Spacer.	3. Replace overdrive piston thrust plate spacer.
3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT	1. Overdrive Solenoid Connector or Wiring Shorted.	1. Test connector and wiring for loose connections, shorts or ground and repair as needed.
	2. TPS Malfunction.	2. Test TPS and replace as necessary. Check with DRB® scan tool.
	3. PCM Malfunction.	3. Test PCM with DRB® scan tool and replace controller if faulty.
	4. Overdrive Solenoid Malfunction.	4. Replace solenoid.
	5. Valve Body Malfunction.	5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 3-4 UPSHIFT	1. O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB® scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB® scan tool and replace if necessary.
	6. Neutral Sense to PCM Wire Shorted/Cut.	6. Test switch/sensor as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Mis-adjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB® scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance.	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Mis-adjusted.	1. Adjust linkage/cable.
	2. Neutral Sense Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Park/Neutral Switch, or Transmission Range Sensor Faulty.	3. Refer to service section for test and replacement procedure.
	4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Mis-adjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.

AUTOMATIC TRANSMISSION - 47RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS.	1. Fluid Lines and Fittings Loose/Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose/Leaky/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

AUTOMATIC TRANSMISSION - 47RE (Continued)

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

- (1) Disconnect battery negative cable.
- (2) Disconnect and lower or remove necessary exhaust components.
- (3) Remove engine-to-transmission struts, if equipped (Fig. 13).

J9421-255

Fig. 13 Transmission-To-Engine Strut Attachment

- 1 - ENGINE BLOCK
- 2 - STRUT (PASSENGER SIDE)
- 3 - ENGINE MOUNT
- 4 - STRUT (DRIVER SIDE)

- (4) Disconnect fluid cooler lines at transmission.
- (5) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- (6) Disconnect and remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain the sensor attaching bolts.
- (7) Remove torque converter access cover.
- (8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.
- (9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

80b170f3

Fig. 14 Fill Tube Attachment

- 1 - TRANSFER CASE VENT TUBE
- 2 - FILL TUBE (V8)
- 3 - TUBE SEAL
- 4 - FILL TUBE (V6)

(10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(11) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(12) Disconnect wires from park/neutral position switch and transmission solenoid.

AUTOMATIC TRANSMISSION - 47RE (Continued)

(13) Disconnect gearshift rod and torque shaft assembly from transmission.

(14) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(15) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(16) Support rear of engine with safety stand or jack.

(17) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(18) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

Fig. 15 Rear Support Cushion

- 1 - EXHAUST PIPE ARM AND BRACKET
- 2 - CROSSMEMBER
- 3 - REAR SUPPORT AND CUSHION

(19) Remove bolts attaching crossmember to frame and remove crossmember.

(20) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(21) Remove all converter housing bolts.

(22) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(23) Lower transmission and remove assembly from under the vehicle.

(24) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

DISASSEMBLY

(1) Clean exterior of transmission with suitable solvent or pressure washer.

(2) Place transmission in vertical position.

(3) Measure the input shaft end play as follows (Fig. 16).

(a) Attach Adapter 8266-5 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. Record the maximum travel for assembly reference.

Fig. 16 Checking Input Shaft End Play

- 1 - TOOL 8266-8
- 2 - TOOL 8266-5
- 3 - TOOL C-3339

AUTOMATIC TRANSMISSION - 47RE (Continued)

(4) Remove throttle and shift levers from valve manual shaft and throttle lever shaft.

(5) Remove transmission oil pan and gasket.

(6) Remove filter from valve body (Fig. 17). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

Fig. 17 Oil Filter Removal

- 1 - OIL FILTER
- 2 - VALVE BODY
- 3 - FILTER SCREWS (2)

(7) Remove park/neutral position switch and seal.

(8) Remove hex head bolts attaching valve body to transmission case (Fig. 18). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

(9) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 19).

(10) Remove accumulator outer spring, piston and inner spring (Fig. 20). Note position of piston and springs for assembly reference. Remove and discard piston seals if worn or cut.

(11) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

Fig. 18 Valve Body Bolt Locations

- 1 - VALVE BODY BOLTS
- 2 - VALVE BODY BOLTS

- 2 - OUTER SPRING
- 3 - INNER SPRING

Fig. 21 Front Band Lever Pin Access Plug

- 1 - FRONT BAND REACTION PIN ACCESS PLUG
- 2 - 1/4 DRIVE EXTENSION AND RATCHET

(13) Remove oil pump and reaction shaft support assembly as follows:

(a) Tighten front band adjusting screw until band is tight around front clutch retainer (Fig. 22). This will prevent retainer from coming out with pump and possibly damaging clutch or pump components.

(b) Remove oil pump bolts.

(c) Thread Slide Hammer Tools C-3752 into threaded holes in flange of oil pump housing (Fig. 23).

(d) Remove oil pump and reaction shaft support by bumping slide hammers outward alternately to pull pump from case (Fig. 24).

(14) Remove oil pump gasket (Fig. 25). Note gasket position in case for assembly reference.

(15) Loosen front band adjusting screw until band is completely loose.

(16) Remove front band strut and anchor (Fig. 26).

(17) Squeeze front band together slightly and slide band over front clutch retainer and out of case (Fig. 27).

Fig. 22 Tightening Front Band To Hold Front Clutch In Place

**Fig. 25 Oil Pump Gasket**

1 - OIL PUMP GASKET

**Fig. 27 Front Band Removal**

1 - FRONT BAND
 2 - FRONT CLUTCH RETAINER

(18) Remove front and rear clutch assemblies as a unit (Fig. 28).

(19) Remove front band reaction pin and lever. Start pin through lever and out of case bore with drift or punch. Then use pencil magnet to withdraw pin completely (Fig. 29).

(20) Remove intermediate shaft thrust washer. Triangular shaped washer will either be on shaft pilot hub or in rear clutch retainer (Fig. 30).

(21) Remove thrust plate from intermediate shaft hub (Fig. 31).

(22) Remove intermediate shaft-planetary geartrain assembly (Fig. 32).

(23) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

AUTOMATIC TRANSMISSION - 47RE (Continued)

(24) Loosen rear band locknut and loosen adjusting screw 3-4 turns.

(25) Remove snap-ring that retains low-reverse drum on overdrive piston retainer hub (Fig. 33).

Fig. 28 Removing Front/Rear Clutch Assemblies

1 - FRONT AND REAR CLUTCH ASSEMBLIES

2 - INTERMEDIATE SHAFT PILOT HUB

Fig. 31 Intermediate Shaft Thrust Plate

1 - SHAFT THRUST PLATE

2 - INTERMEDIATE SHAFT PILOT HUB

(26) Slide low-reverse drum and thrust washer off piston retainer hub and out of rear band (Fig. 34).

(27) Note that overrunning clutch race will remain on splines of low-reverse drum after removal (Fig. 35). **The race is a permanent press fit on the hub splines. Do not attempt to remove the race.**

AUTOMATIC TRANSMISSION - 47RE (Continued)

**Fig. 32 Intermediate Shaft And Planetary Geartrain**

1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

**Fig. 33 Low-Reverse Drum Snap-Ring**

1 - LOW-REVERSE DRUM
2 - TABBED WASHER
3 - SNAP-RING

(28) Remove overrunning clutch assembly (Fig. 36). Assembly can be removed without displacing rollers and springs if care is exercised. Note position of rollers and springs for assembly reference.

(29) Remove rear band adjusting lever and reaction pin.

(30) Remove rear band.

(31) Compress front servo rod guide with large C-clamp and Tool C-4470, or Compressor Tool C-3422-B (Fig. 37). Compress guide only enough to permit snap-ring removal (about 1/8 in.).

**Fig. 34 Low-Reverse Drum And Thrust Washer**

2 - SPOTFACE FOR WASHER
3 - THRUST WASHER

**Fig. 35 Overrunning Clutch Race Position On Low-Reverse Drum**

1 - OVERRUNNING CLUTCH RACE
2 - LOW-REVERSE DRUM

(32) Remove servo piston snap-ring (Fig. 37). Unseat one end of ring. Then carefully work removal tool around back of ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(33) Remove tools and remove servo piston and spring.

AUTOMATIC TRANSMISSION - 47RE (Continued)

**Fig. 36 Overrunning Clutch**

- 1 - CLUTCH CAM
- 2 - OVERRUNNING CLUTCH ASSEMBLY

(34) Compress rear servo piston with C-clamp and Tool C-4470, or Valve Spring Compressor C-3422-B (Fig. 38). Compress servo spring retainer only enough to permit snap-ring removal.

(35) Remove servo piston snap-ring (Fig. 38). Start one end of ring out of bore. Then carefully work removal tool around back of snap-ring until free of ring groove. **Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.**

(36) Remove tools and remove rear servo retainer, spring and piston assembly.

- 4 - RETAINER SNAP-RING

CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bush-

AUTOMATIC TRANSMISSION - 47RE (Continued)

ings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for reassembly operations are equally clean.

Shop towels used for wiping off tools and your hands must be made from **lint free** materials. Lint will stick to transmission parts and could interfere with valve operation or even restrict fluid passages.

Lubricate transmission clutch and gear components with Mopar® ATF +4, type 9602, during reassembly. Soak clutch discs in transmission fluid before installation.

Use Mopar® Door Ease, or Ru-Glyde™ on piston seals and o-rings to ease installation. Petroleum jelly can also be used to lubricate and hold thrust washers and plates in position during assembly.

Do not use chassis grease, bearing grease, white grease, or similar lubricants on any part. These types of lubricants can eventually block or restrict fluid passages and valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and sub-assemblies are easily installed by hand when properly aligned. If a part seems difficult to install, it is either misaligned or incorrectly assembled. Verify that thrust washers, thrust plates and seal rings are correctly positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install

when the transmission case is upright. Either tilt the case upward with wood blocks, or cut a hole in the bench large enough for the intermediate shaft and rear support. Then lower the shaft and support into the hole and support the rear of the case directly on the bench.

FRONT/REAR SERVO

(1) Lubricate rear servo piston seal with Mopar® Door Ease or ATF +4. Lubricate servo bore in case with ATF +4.

(2) Install rear servo piston in case. Position piston at slight angle to bore and insert piston with twisting motion (Fig. 39).

(3) Install rear servo spring and retainer in case bore (Fig. 40). Be sure spring is seated on piston.

(4) Compress rear servo piston with C-clamp or Valve Spring Compressor C-3422-B and install servo piston snap-ring (Fig. 41).

(5) Lubricate front servo piston components and servo bore in case with transmission fluid.

(6) Install front servo piston in bore. Carefully "run" small, suitable tool around piston ring to press it back into groove and ease installation (Fig. 42). Rotate piston into bore at same time. Rock piston slightly to ease piston ring past snap-ring groove and into bore.

Fig. 39 Rear Servo Piston

1 - REAR SERVO PISTON

(7) Bottom front servo piston in bore and install servo spring.

(8) Install front servo piston rod guide as follows:

(a) Place Tool SP-5560 (or similar size tool) on guide and position C-clamp on tool and case (Fig. 43).

(b) Slowly compress rod guide while simultaneously easing seal ring into bore with suitable tool.

(9) Install rod guide snap-ring (Fig. 43).

- 4 - RETAINER SNAP-RING

OVERRUNNING CLUTCH, REAR BAND, AND LOW-REVERSE DRUM

(1) Install overrunning clutch components if not yet installed.

(2) Position rear band reaction pin and band in case. Be sure that the twin lugs on the band are seated against the reaction pin.

(3) Install low-reverse drum. Slide drum through rear band, onto piston retainer hub and into engagement with overrunning clutch and race.

**Fig. 43 Front Servo Rod Guide And Snap-Ring**

- 1 - C-CLAMP
- 2 - ROD GUIDE
- 3 - SMALL SCREWDRIVER
- 4 - ROD GUIDE SNAP-RING
- 5 - TOOL SP-5560

(4) Install thrust washer in low-reverse drum spot-face (Fig. 44). Use petroleum jelly to hold washer in place.

(5) Install snap-ring that secures low-reverse drum to piston retainer hub (Fig. 44).

(6) Insert the rear band pivot pin part way into the case.

AUTOMATIC TRANSMISSION - 47RE (Continued)

(7) Install rear band adjusting lever and pivot pin. Be sure lever and the single lug on the band are aligned and engaged before seating band pivot pin in case.

Fig. 44 Low-Reverse Drum Snap-Ring

- 1 - LOW-REVERSE DRUM
- 2 - TABBED WASHER
- 3 - SNAP-RING

PLANETARY GEARTRAIN, FRONT/REAR CLUTCH, AND FRONT BAND

(1) Remove Alignment Shaft 6227-2, if installed previously.

(2) Install assembled intermediate shaft and planetary geartrain (Fig. 45). **Support shaft carefully during installation. Do not allow shaft bearing/bushing surfaces to become nicked or scratched.**

(3) Lubricate intermediate shaft thrust plate with petroleum jelly and install plate on shaft pilot hub (Fig. 46).

(4) Check input shaft front seal rings, fiber thrust washer and rear seal ring (Fig. 47). Be ends of rear seal ring are hooked together and diagonal cut ends of front seal rings are firmly seated against each other as shown. Lubricate seal rings with petroleum jelly after checking them.

(5) Assemble front and rear clutches (Fig. 48). Align lugs on front clutch discs. Mount front clutch on rear clutch. Turn front clutch retainer back and forth until front clutch discs are fully seated on rear clutch splined hub.

(6) Install intermediate shaft thrust washer in hub of rear clutch retainer (Fig. 49). Use petroleum jelly to hold washer in place. Position washer so grooves are facing outward. **Washer only fits one way in clutch retainer hub.**

(7) Place transmission case in upright position, or place blocks under front end of transmission repair

Fig. 45 Intermediate Shaft And Planetary Geartrain

- 1 - INTERMEDIATE SHAFT AND PLANETARY GEAR TRAIN ASSEMBLY

Fig. 46 Intermediate Shaft Thrust Plate

- 1 - SHAFT THRUST PLATE
- 2 - INTERMEDIATE SHAFT PILOT HUB

stand to tilt case rearward. This makes it easier to install front/rear clutch assembly.

(8) Align discs in rear clutch. Then install and engage assembly in front planetary and driving shell (Fig. 50). Turn clutch retainers back and forth until both clutches are seated.

(9) Position front band lever in case and over servo rod guide. Then install front band lever pin in case and slide it through lever.

(10) Coat threads of front band pin access plug with sealer and install it in case. Tighten plug to 17 N·m (13 ft. lbs.) torque.

AUTOMATIC TRANSMISSION - 47RE (Continued)

**Fig. 47 Input Shaft Seal Rings And Thrust Washer**

- 4 - THRUST WASHER

**Fig. 48 Assembling Front And Rear Clutches**

- 1 - FRONT CLUTCH ASSEMBLY
- 2 - REAR CLUTCH ASSEMBLY
- 3 - REAR CLUTCH SPLINED HUB

(11) Slide front band over front clutch retainer and install front band strut and anchor (Fig. 51).

(12) Tighten front band adjusting screw until band is tight on clutch retainer. This will hold clutches in place while oil pump is being installed. **Verify that front/rear clutch assembly is still properly seated before tightening band.**

**Fig. 49 Intermediate Shaft Thrust Washer**

- 1 - BE SURE WASHER GROOVES FACE OUT AS SHOWN
- 2 - REAR CLUTCH RETAINER HUB
- 3 - SHAFT THRUST WASHER

OIL PUMP

(1) Install oil pump Pilot Studs C-3288-B in case (Fig. 52).

(2) Install new oil pump gasket on pilot studs and seat it in case. Be sure gasket is properly aligned with fluid passages in case (Fig. 52).

(3) Coat the reaction shaft thrust washer with petroleum jelly to hold it in place. Then install washer over reaction shaft hub and seat it on pump (Fig. 53).

CAUTION: The thrust washer bore (I.D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.

(4) Check seal rings on reaction shaft support. Be sure rings are hooked together correctly. Also be sure fiber thrust washer is in position (Fig. 54). Use extra petroleum jelly to hold washer in place if necessary.

(5) Lubricate oil pump seals with petroleum Mopar® ATF +4, type 9602.

AUTOMATIC TRANSMISSION - 47RE (Continued)

**Fig. 50 Front/Rear Clutch Assemblies**

1 - FRONT AND REAR CLUTCH ASSEMBLIES

**Fig. 51 Front Band And Linkage**

1 - LEVER
 2 - STRUT
 3 - ANCHOR
 4 - FRONT BAND

(6) Mount oil pump on pilot studs and slide pump into case opening (Fig. 55). **Work pump into case**

by hand. Do not use a mallet or similar tools to seat pump.

(7) Remove pilot studs and install oil pump bolts. Tighten pump bolts alternately and evenly to fully seat pump in case. Then final-tighten pump bolts to 20 N·m (15 ft. lbs.) torque.

(8) Verify correct installation. Rotate input and intermediate shafts and check for bind. If bind exists, components are either mis-assembled, or not seated. Disassemble and correct as necessary before proceeding.

**Fig. 52 Oil Pump Gasket And Pilot Studs**

1 - OIL PUMP GASKET
 2 - PILOT STUDS C-3288-B

**Fig. 53 Reaction Shaft Thrust Washer**

1 - THRUST WASHER
 2 - CHAMFERED SIDE OF WASHER BORE GOES TOWARD PUMP

INPUT SHAFT END PLAY CHECK

NOTE: Overdrive unit must be installed in order to correctly measure the input shaft end-play.

AUTOMATIC TRANSMISSION - 47RE (Continued)

**Fig. 54 Reaction Shaft Seal Ring And Thrust Washer**

- 1 - SEAL RINGS
- 2 - REACTION SHAFT SUPPORT
- 3 - THRUST WASHER (FIBER)

**Fig. 55 Oil Pump**

- 1 - SEAT OIL PUMP IN CASE BY HAND
- 2 - REMOVE PILOT STUDS WHEN PUMP IS SEATED

(1) Measure input shaft end play (Fig. 56).

NOTE: If end play is incorrect, transmission is incorrectly assembled, or reaction shaft thrust washer is incorrect. The reaction shaft thrust washer is selective.

- (a) Attach Adapter 8266-5 to Handle 8266-8.
- (b) Attach dial indicator C-3339 to Handle 8266-8.
- (c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-5 to secure it to the input shaft.
- (d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
- (e) Move input shaft in and out and record reading. End play should be 0.86 - 2.13 mm (0.034 - 0.084 in.). Adjust as necessary.

**Fig. 56 Checking Input Shaft End Play**

- 1 - TOOL 8266-8
- 2 - TOOL 8266-5
- 3 - TOOL C-3339

ACCUMULATOR, VALVE BODY, OIL PAN, AND TORQUE CONVERTER

- (1) Install accumulator inner spring, piston and outer spring (Fig. 57).
- (2) Verify that park/neutral position switch has **not** been installed in case. Valve body can not be installed if switch is in position.
- (3) Install new valve body manual shaft seal in case (Fig. 58). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.
- (4) Install valve body as follows:

AUTOMATIC TRANSMISSION - 47RE (Continued)

(a) Start park rod into park pawl. If rod will not slide past park pawl, pawl is engaged in park gear. Rotate overdrive output shaft with suitable size 12 point socket; this will free pawl and allow rod to engage.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation..**

(5) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(6) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

Fig. 57 Accumulator Piston And Springs

- 1 - ACCUMULATOR PISTON
- 2 - OUTER SPRING
- 3 - INNER SPRING

Fig. 58 Manual Lever Shaft Seal

- 1 - 15/16" SOCKET
- 2 - SEAL

CAUTION: If the condition of the transmission before the overhaul procedure caused excessive metallic or fiber contamination in the fluid, replace the torque converter and reverse flush the cooler(s) and cooler lines. Fluid contamination and transmission failure can result if not done.

(7) Install torque converter. Use C-clamp or metal strap to hold converter in place for installation.

BAND ADJUSTMENT AND FINAL

(1) Adjust front and rear bands as follows:

(a) Loosen locknut on each band adjusting screw 4-5 turns.

(b) Tighten both adjusting screws to 8 N·m (72 in. lbs.).

(c) Back off front band adjusting screw 1-7/8 turns.

(d) Back off rear band adjusting screw 3 turns.

(e) Hold each adjusting screw in position and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(2) Install magnet in oil pan. Magnet seats on small protrusion at corner of pan.

(3) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 13.6 N·m (125 in. lbs.).

(4) Install throttle valve and shift selector levers on valve body manual lever shaft.

(5) Apply small quantity of dielectric grease to terminal pins of solenoid case connector and neutral switch.

(6) Fill transmission with recommended fluid.

INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate pocket in the rear oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub of the crankshaft with a light coating of Mopar® High Temp Grease.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

AUTOMATIC TRANSMISSION - 47RE (Continued)

(6) Check converter seating with steel scale and straightedge (Fig. 59). Surface of converter lugs should be 19mm (0.75 in.) to the rear of straightedge when the converter is fully seated.

(7) Temporarily secure converter with C-clamp.

Fig. 59 Checking Converter Seating - Typical

- 1 - SCALE
2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install bolts attaching converter housing to engine.

(14) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(15) Remove engine support fixture.

(16) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(17) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(18) Connect gearshift and throttle cable to transmission.

(19) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(20) Install torque converter-to-driveplate bolts. Tighten bolts to 47 N·m (35 ft. lbs.).

(21) Install converter housing access cover.

(22) Install starter motor and cooler line bracket. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

(23) Connect cooler lines to transmission.

(24) Install transmission fill tube. Install new seal on tube before installation.

(25) Install exhaust components.

(26) Align and connect propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(27) Adjust gearshift linkage and throttle valve cable if necessary.

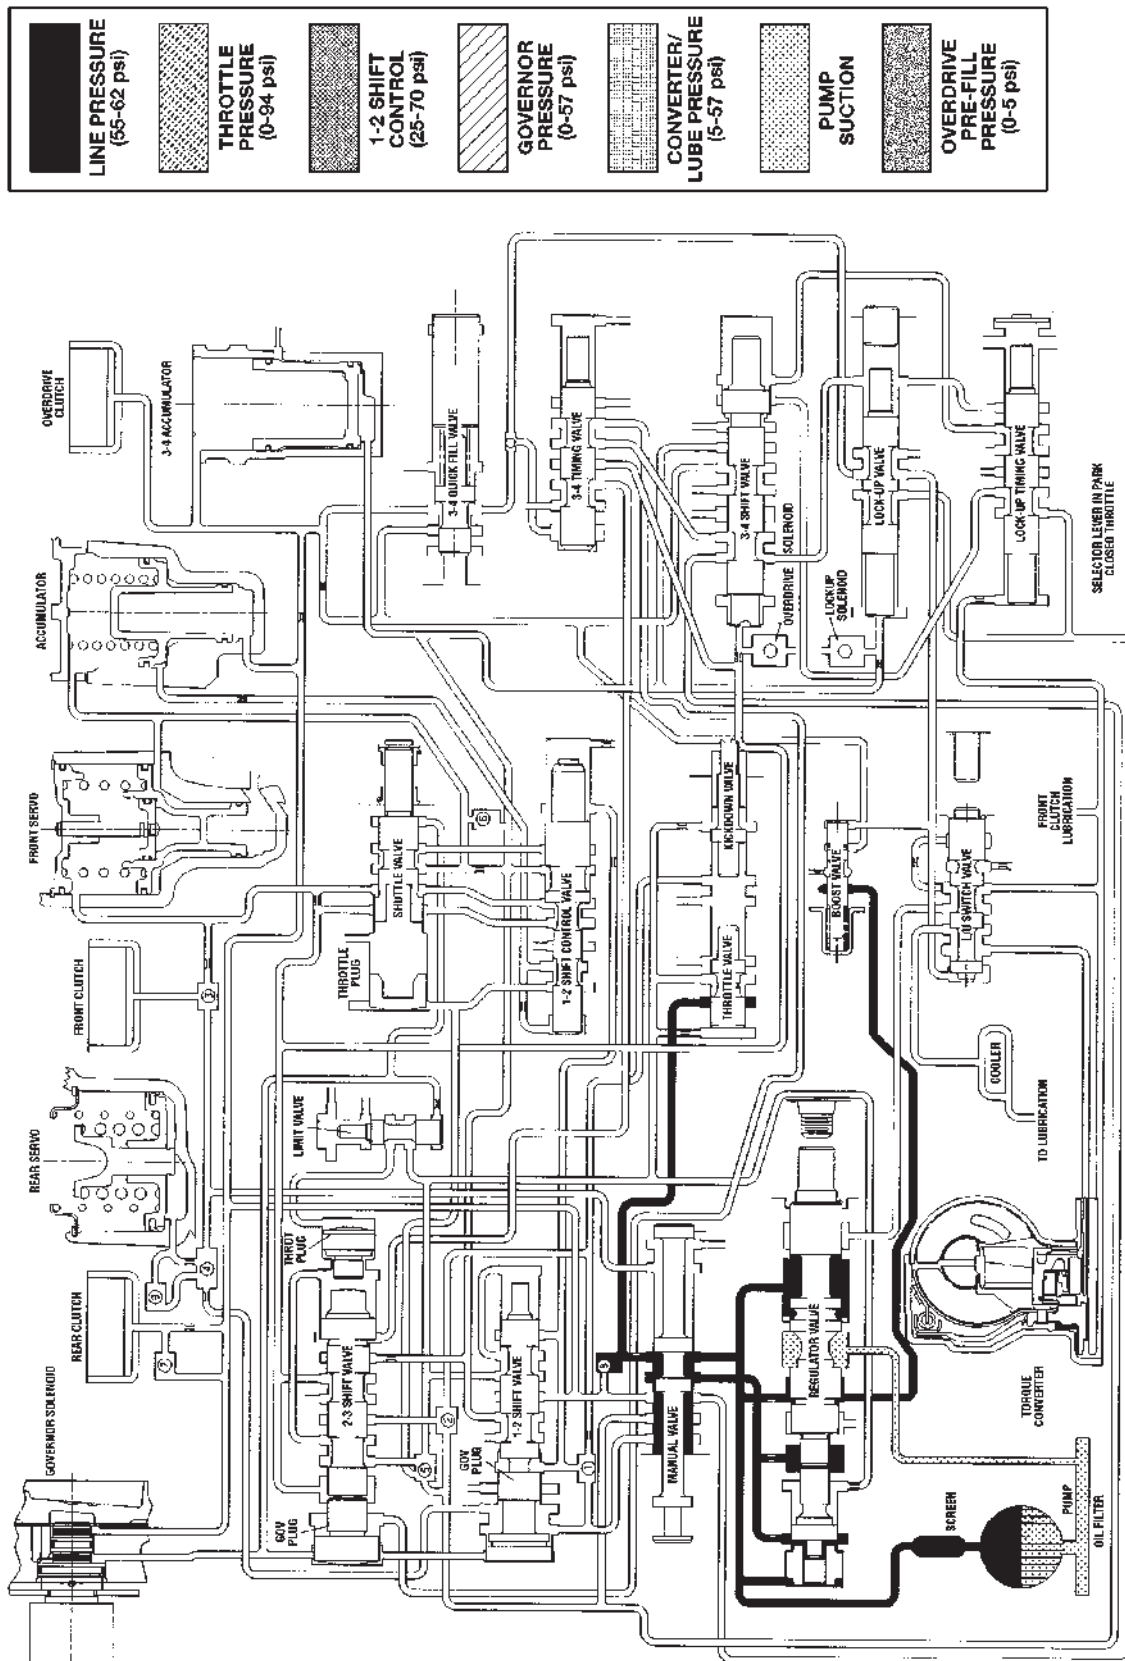

(28) Lower vehicle.

(29) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

AUTOMATIC TRANSMISSION - 47RE (Continued)

PRESSURE TEST

Overdrive clutch	Fourth gear only	Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle.
Line pressure (at accumulator)	Closed throttle	372-414 kPa (54-60 psi).
Front servo	Third or Fourth gear only	No more than 21 kPa (3 psi) lower than line pressure.
Rear servo	1 range R range	No more than 21 kPa (3 psi) lower than line pressure. 1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm.
Governor	D range closed throttle	Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 60) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 61).

Fig. 60 Accumulator

- 1 - ACCUMULATOR PISTON

- 2 - 3-4 ACCUMULATOR HOUSING
- 3 - TEFLON SEALS
- 4 - PISTON SPRING
- 5 - COVER PLATE AND SCREWS

ACCUMULATOR (Continued)

OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 62), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 63), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

NOTE: The accumulator is shown in the inverted position for illustrative purposes.

BOTTOMED AGAINST ACCUMULATOR PLATE

INSPECTION

Inspect the accumulator piston and seal rings (Fig. 64). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 64). Replace the springs if the coils are cracked, distorted or collapsed.

BANDS

DESCRIPTION

KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 65) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission

BANDS (Continued)

case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

Fig. 65 Front Band

- 2 - TRANSMISSION HOUSING

Fig. 66 Rear Band

- 1 - ADJUSTING SCREW
- 2 - LOCKNUT
- 3 - LEVER
- 4 - REAR BAND
- 5 - REACTION PIN
- 6 - O-RINGS
- 7 - PIVOT PIN

LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 66) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

OPERATION

KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

ADJUSTMENTS

ADJUSTMENT - BANDS

FRONT BAND

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 67). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and an appropriate Torx™ socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 1-7/8 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.
- (6) Lower vehicle.

BANDS (Continued)

**Fig. 67 Front Band Adjustment Screw Location**

- 1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque (Fig. 68).
- (5) Back off adjusting screw 3 turns.
- (6) Hold adjusting screw in place and tighten lock-nut to 34 N·m (25 ft. lbs.) torque.
- (7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 13.6 N·m (125 in. lbs.) torque.
- (8) Lower vehicle and refill transmission with Mopar® ATF +4, Type 9602 fluid.

**Fig. 68 Rear Band Adjustment Screw Location**

- 1 - LOW-REVERSE BAND ADJUSTMENT

ELECTRONIC GOVERNOR**DESCRIPTION**

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 69).

**Fig. 69 Governor Pressure Solenoid Valve**

- 1 - SOLENOID FILTER
2 - GOVERNOR PRESSURE SOLENOID

GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 70).

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 70).

GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, -1°C (30°F). A second curve is used when fluid

ELECTRONIC GOVERNOR (Continued)

**Fig. 70 Governor Pressure Sensor**

- 1 - GOVERNOR BODY
 2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output values are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the "cold" period of operation.

GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

GOVERNOR PRESSURE CURVES**LOW TRANSMISSION FLUID TEMPERATURE**

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade "hunting" prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a

ELECTRONIC GOVERNOR (Continued)

heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The initial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine "flare." The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove transmission fluid pan and filter.
- (3) Disengage wire connectors from pressure sensor and solenoid (Fig. 71).
- (4) Remove screws holding pressure solenoid retainer to governor body.
- (5) Separate solenoid retainer from governor (Fig. 72).
- (6) Pull solenoid from governor body (Fig. 73).
- (7) Pull pressure sensor from governor body.
- (8) Remove bolts holding governor body to valve body.
- (9) Separate governor body from valve body (Fig. 74).
- (10) Remove governor body gasket.

- 3 - GOVERNOR

Fig. 72 Pressure Solenoid Retainer

- 1 - PRESSURE SOLENOID RETAINER
- 2 - GOVERNOR

INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace o-ring seals, clean the gasket surfaces and replace gasket.

- (1) Place gasket in position on back of governor body (Fig. 75).
- (2) Place governor body in position on valve body.
- (3) Install bolts to hold governor body to valve body.
- (4) Lubricate o-ring on pressure sensor with transmission fluid.
- (5) Align pressure sensor to bore in governor body.
- (6) Push pressure sensor into governor body.
- (7) Lubricate o-ring, on pressure solenoid, with transmission fluid.

FLUID AND FILTER**DIAGNOSIS AND TESTING****DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL**

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid

expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates

FLUID AND FILTER (Continued)

sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

- (2) Position vehicle on level surface.
- (3) Start and run engine at curb idle speed.
- (4) Apply parking brakes.
- (5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.
- (6) Clean top of filler tube and dipstick to keep dirt from entering tube.
- (7) Remove dipstick (Fig. 83) and check fluid level as follows:
 - (a) Correct acceptable level is in crosshatch area.
 - (b) Correct maximum level is to MAX arrow mark.
 - (c) Incorrect level is at or below MIN line.
 - (d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not over-fill.

804d8ee

Fig. 83 Dipstick Fluid Level Marks—Typical

- 1 - DIPSTICK
- 2 - MAXIMUM CORRECT FLUID LEVEL
- 3 - ACCEPTABLE FLUID LEVEL

PROCEDURE TWO

- (1) Start engine and apply parking brake.
- (2) Shift the transmission into DRIVE for approximately 2 seconds.
- (3) Shift the transmission into REVERSE for approximately 2 seconds.
- (4) Shift the transmission into PARK.
- (5) Hook up DRB® scan tool and select engine.
- (6) Select sensors.
- (7) Read the transmission temperature value.
- (8) Compare the fluid temperature value with the chart.
- (9) Adjust transmission fluid level shown on the dipstick according to the chart (Fig. 84).

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

- (10) Check transmission for leaks.

FLUID AND FILTER (Continued)

80a3d16f

Fig. 84 47RE Fluid Fill Graph**STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT**

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Place a large diameter shallow drain pan beneath the transmission pan.
- (3) Remove bolts holding front and sides of pan to transmission (Fig. 85).
- (4) Loosen bolts holding rear of pan to transmission.
- (5) Slowly separate front of pan and gasket away from transmission allowing the fluid to drain into drain pan.
- (6) Hold up pan and remove remaining bolt holding pan to transmission.
- (7) While holding pan level, lower pan and gasket away from transmission.
- (8) Pour remaining fluid in pan into drain pan.
- (9) Remove screws holding filter to valve body (Fig. 86).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

80b17180

Fig. 85 Transmission Pan

- 1 - TRANSMISSION
- 2 - GASKET
- 3 - PAN

FLUID AND FILTER (Continued)

INSTALLATION

Fig. 86 Transmission Filter

- 1 - TRANSMISSION
2 - FILTER

- (1) Position a new transmission oil filter onto the valve body.
- (2) Install the screws to hold the filter to the valve body. Tighten the screws to 4 N·m (35 in.lbs.).
- (3) Clean the gasket surfaces of the transmission oil pan and transmission pan rail.

NOTE: The transmission pan oil gasket is reusable. Inspect the sealing surfaces of the gasket. If the sealing ribs on both surfaces appear to be in good condition, clean the gasket of any foreign material and reinstall.

- (4) Position the oil pan gasket onto the oil pan.
- (5) Position the oil pan and gasket onto the transmission and install several bolts to hold the pan and gasket to the transmission.
- (6) Install the remainder of the oil pan bolts. Tighten the bolts to 13.6 N·m (125 in.lbs.).
- (7) Lower vehicle and fill transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/FLUID - STANDARD PROCEDURE)

STANDARD PROCEDURE - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

- (1) Remove dipstick and insert clean funnel in transmission fill tube.
- (2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:
 - (a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.
 - (b) If transmission was completely overhauled, torque converter was replaced or drained, and

cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

- (3) Apply parking brakes.
- (4) Start and run engine at normal curb idle speed.
- (5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.
- (6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.
- (7) Drive vehicle until transmission fluid is at normal operating temperature.
- (8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

- (9) Add fluid to bring level up to MAX arrow mark.
- When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

FRONT CLUTCH

DESCRIPTION

The front clutch assembly (Fig. 87) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack.

FRONT CLUTCH (Continued)

**Fig. 87 Front Clutch Components**

- 1 - INNER PISTON SEAL
- 2 - CLUTCH PISTON
- 3 - CLUTCH PISTON SPRING RETAINER
- 4 - CLUTCH PLATES
- 5 - CLUTCH PACK SNAP-RING (WAVED)

- 7 - CLUTCH DISCS
- 8 - RETAINER SNAP-RING
- 9 - CLUTCH PISTON SPRINGS (9)
- 10 - OUTER PISTON SEAL
- 11 - FRONT CLUTCH RETAINER

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

DISASSEMBLY

- (1) Remove the waved snap-ring, reaction plate, clutch plates, and clutch discs.
- (2) Compress clutch piston retainer and piston springs with Compressor Tool C-3863-A (Fig. 88).
- (3) Remove retainer snap-ring and remove compressor tool.
- (4) Remove clutch piston springs (Fig. 89). Note position of piston springs for assembly reference.
- (5) Remove clutch piston from retainer with a twisting motion.
- (6) Remove and discard clutch piston inner and outer seals.

**Fig. 88 Removing Front Clutch Spring Retainer Snap-Ring**

- 5 - CLUTCH PACK SNAP-RING (WAVED)
- 6 - REACTION PLATE

- 7 - CLUTCH DISCS
- 8 - RETAINER SNAP-RING
- 9 - CLUTCH PISTON SPRINGS (9)
- 10 - OUTER PISTON SEAL
- 11 - FRONT CLUTCH RETAINER

(7) Assemble Tool Handle C-4171 and Bushing Remover SP-3629 (Fig. 90).

(8) Insert remover tool in bushing and drive bushing straight out of clutch retainer.

INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, the lugs are damaged, or if the facing is flaking off. Replace the steel plates and reaction plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plate are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston springs and spring retainer if either are distorted, warped or broken.

Check the lug grooves in the clutch piston retainer. The steel plates should slide freely in the slots. Replace the piston retainer if the grooves are worn or damaged. Also check action of the check ball in the piston retainer. The ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or there is any doubt about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check the clutch piston check ball. The ball should be securely in place. Replace the piston if the ball is missing, or seized in place.

- 3 - SPECIAL TOOL SP-5511
- 4 - SPECIAL TOOL C-4171
- 5 - FRONT CLUTCH RETAINER

ASSEMBLY

NOTE: The 47RE transmission uses four plates and discs for the front clutch.

- (1) Mount Bushing Installer SP-5511 on tool handle (Fig. 91).
- (2) Slide new bushing onto installer tool and start bushing into retainer.
- (3) Tap new bushing into place until installer tool bottoms against clutch retainer.
- (4) Remove installer tools and clean retainer thoroughly.
- (5) Soak clutch discs in transmission fluid.
- (6) Install new inner piston seal onto the outer diameter of the clutch retainer inner hub.
- (7) Install new outer seal onto the clutch piston. Be sure seal lips of both seals face the interior of the retainer.
- (8) Lubricate new inner and outer piston seals with Ru-Glyde™, or Mopar® Door Ease.
- (9) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.015 - 0.020 in. thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

- (10) Install and position nine clutch piston springs (Fig. 92).

J9521-75

Fig. 92 Front Clutch Spring Position

- 1 - 9 SPRING CLUTCH

FRONT CLUTCH (Continued)

(11) Install spring retainer on top of piston springs.

(12) Compress spring retainer and piston springs with Tool C-3863-A.

(13) Install spring retainer snap-ring and remove compressor tool.

(14) Install clutch plates and discs (Fig. 95). Four clutch discs, four steel plates and one reaction plate are required.

(15) Install reaction plate followed by waved snap-ring.

(16) Check clutch pack clearance with feeler gauge (Fig. 93). Clearance between waved spring and pressure plate should 1.78-3.28 mm (0.070-0.129 in.). If clearance is incorrect, clutch plates, clutch discs, snap-ring, or pressure plate may have to be changed.

FRONT SERVO

DESCRIPTION

The kickdown servo (Fig. 94) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

80be45fa

Fig. 94 Front Servo

- 1 - VENT
- 2 - INNER PISTON
- 3 - PISTON
- 4 - SPRING
- 5 - RELEASE PRESSURE
- 6 - APPLY PRESSURE
- 7 - PISTON ROD

OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend through its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

DISASSEMBLY

- (1) Remove seal ring from rod guide (Fig. 95).
- (2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.
- (3) Remove and discard servo component O-ring and seal rings.

CLEANING

Clean the servo piston components (Fig. 96) with solvent and dry them with compressed air.

FRONT SERVO (Continued)

- 8 - SERVO SPRING
- 9 - WASHER
- 10 - SPRING
- 11 - PISTON ROD

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new o-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap-ring (Fig. 98).

OIL PUMP

DESCRIPTION

The oil pump (Fig. 99) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a reaction shaft support.

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURE - OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

OIL PUMP (Continued)

**Fig. 99 Oil Pump Assembly**

- 7 - BOLTS (6)
- 8 - #1 THRUST WASHER (SELECTIVE)
- 9 - INNER GEAR
- 10 - OUTER GEAR
- 11 - "O" RING

DISASSEMBLY

(1) Mark position of support in oil pump body for assembly alignment reference. Use scribe or paint to make alignment marks.

(2) Place pump body on two wood blocks.

(3) Remove reaction shaft support bolts and separate support from pump body (Fig. 100).

(4) Remove pump inner and outer gears (Fig. 101).

(5) Remove o-ring seal from pump body (Fig. 102). Discard seal after removal.

(6) Remove oil pump seal with Remover Tool C-3981. Discard seal after removal.

OIL PUMP BUSHING REMOVAL

(1) Position pump housing on clean, smooth surface with gear cavity facing down.

(2) Remove bushing with Tool Handle C-4171 and Bushing Remover SP-3550 (Fig. 103).

REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Cup Tool SP-3633, Nut SP-1191 and Bushing Remover SP-5301 (Fig. 104).

(2) Hold cup tool firmly against reaction shaft. Thread remover tool into bushing as far as possible by hand.

(3) Using wrench, thread remover tool an additional 3-4 turns into bushing to firmly engage tool.

(4) Tighten tool hex nut against cup tool to pull bushing from shaft. Clean all chips from shaft and support after bushing removal.

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

OIL PUMP (Continued)

**Fig. 102 Oil Pump Assembly**

- 2 - VENT BAFFLE
- 3 - OIL PUMP BODY
- 4 - GASKET
- 5 - REACTION SHAFT SUPPORT
- 6 - SEAL RINGS

- 7 - BOLTS (6)
- 8 - #1 THRUST WASHER (SELECTIVE)
- 9 - INNER GEAR
- 10 - OUTER GEAR
- 11 - "O" RING

INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be mea-

sured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

(1) Position an appropriate piece of Plastigage™ across both gears.

(2) Align the plastigage to a flat area on the reaction shaft housing.

(3) Install the reaction shaft to the pump housing.

(4) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge (Fig. 105).

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

OIL PUMP BODY

(1) Lubricate pump gears with transmission fluid and install them in pump body.

(2) Install thrust washer on reaction shaft support hub. Lubricate washer with petroleum jelly or transmission fluid before installation.

(3) If reaction shaft seal rings are being replaced, install new seal rings on support hub. Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

OIL PUMP (Continued)

CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

(4) Align and install reaction shaft support on pump body.

(5) Install bolts attaching reaction shaft support to pump. Tighten bolts to 20 N·m (175 in. lbs.) torque.

(6) Install new pump seal with Installer Tool C-3860-A (Fig. 109). Use hammer or mallet to tap seal into place.

(7) Install new o-ring on pump body. Lubricate oil seal and o-ring with petroleum jelly.

(8) Cover pump assembly to prevent dust entry and set aside for assembly installation.

OUTPUT SHAFT FRONT BEARING

REMOVAL

- (1) Remove overdrive unit from the vehicle.
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 110).
- (4) Pull bearing from output shaft.

Fig. 110 Output Shaft Front Bearing

- 1 - OUTPUT SHAFT FRONT BEARING
- 2 - SNAP-RING
- 3 - OUTPUT SHAFT
- 4 - GROOVE TO REAR
- 5 - OVERDRIVE GEARTRAIN

INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.

(2) Push bearing onto shaft until the snap-ring groove is visible.

(3) Install snap-ring to hold bearing onto output shaft.

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

OUTPUT SHAFT REAR BEARING

REMOVAL

- (1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/OVERDRIVE - REMOVAL)
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 111).
- (4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

Fig. 111 Output Shaft Rear Bearing

- 1 - OUTPUT SHAFT REAR BEARING
2 - OVERDRIVE HOUSING
3 - SNAP-RING

INSTALLATION

- (1) Place replacement bearing in position in housing.
- (2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing into housing (Fig. 117).
- (4) Install overdrive geartrain into housing.
- (5) Install overdrive unit in vehicle.

OVERDRIVE CLUTCH

DESCRIPTION

The overdrive clutch (Fig. 112) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

OVERDRIVE CLUTCH (Continued)

J9321-369

Fig. 112 Overdrive Clutch

1 - REACTION PLATE

2 - PRESSURE PLATE

OVERDRIVE SWITCH

DESCRIPTION

The overdrive OFF (control) switch is located in the shift lever arm (Fig. 113). The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

80a8et1c1

Fig. 113 Overdrive Off Switch

OPERATION

At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time

causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

REMOVAL

(1) Using a plastic trim tool, remove the overdrive off switch retainer from the shift lever (Fig. 114).

(2) Pull the switch outwards to release it from the connector in the lever (Fig. 115)

OVERDRIVE SWITCH (Continued)

**Fig. 114 Overdrive Off Switch Retainer**

- 2 - OVERDRIVE OFF SWITCH WIRING CONNECTOR
- 3 - OVERDRIVE OFF SWITCH

**Fig. 115 Remove the Overdrive Off Switch**

- 1 - GEAR SHIFT LEVER
- 2 - OVERDRIVE OFF SWITCH

INSTALLATION

NOTE: There is enough slack in the wire to pull out the connector from the lever.

(1) Pull the connector out of the lever just enough to grasp it.

CAUTION: Be careful not to bend the pins on the overdrive off switch. Use care when installing the switch, as it is not indexed, and can be accidentally installed incorrectly.

(2) Install the overdrive off switch into the connector (Fig. 116)

(3) Push the overdrive off switch and wiring into the shift lever.

(4) Install the overdrive off switch retainer onto the shift lever.

OVERDRIVE UNIT**REMOVAL**

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Remove transfer case, if equipped.
- (4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if necessary.
- (5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.
- (7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.
- (8) Support transmission with transmission jack.
- (9) Remove bolts attaching overdrive unit to transmission (Fig. 117).

CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.

OVERDRIVE UNIT (Continued)

**Fig. 117 Overdrive Unit Bolts**

- 1 - OVERDRIVE UNIT
2 - ATTACHING BOLTS (7)

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

DISASSEMBLY

(1) Remove transmission speed sensor and o-ring from overdrive case (Fig. 118).

(2) Remove overdrive piston thrust bearing (Fig. 119).

3 - SNAP-RING

DIRECT CLUTCH, HUB AND SPRING

WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(1) Mount geartrain assembly in shop press (Fig. 133).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 133). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 133).

OVERDRIVE UNIT (Continued)

- (4) Remove direct clutch pack snap-ring (Fig. 134).
- (5) Remove direct clutch hub retaining ring (Fig. 135).
- (6) Release press load slowly and completely (Fig. 136).
- (7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 136).

GEARTRAIN

- (1) Remove direct clutch hub and spring (Fig. 137).
- (2) Remove sun gear and spring plate. Then remove planetary thrust bearing and planetary gear (Fig. 138).

**Fig. 137 Direct Clutch Hub And Spring Removal**

- 1 - DIRECT CLUTCH SPRING
- 2 - DIRECT CLUTCH HUB

**Fig. 138 Removing Sun Gear, Thrust Bearing And Planetary Gear**

- 1 - PLANETARY GEAR
- 2 - PLANETARY THRUST BEARING
- 3 - CLUTCH SPRING PLATE
- 4 - SPRING PLATE SNAP-RING
- 5 - SUN GEAR

(3) Remove overrunning clutch assembly with expanding type snap-ring pliers (Fig. 139). Insert pliers into clutch hub. Expand pliers to grip hub splines and remove clutch with counterclockwise, twisting motion.

(4) Remove thrust bearing from overrunning clutch hub.

(5) Remove overrunning clutch from hub.

(6) Mark position of annulus gear and direct clutch drum for assembly alignment reference (Fig. 140). Use small center punch or scriber to make alignment marks.

**Fig. 139 Overrunning Clutch Assembly Removal/Installation**

- 1 - OVERRUNNING CLUTCH
- 2 - NEEDLE BEARING

OVERDRIVE UNIT (Continued)

8921-249

Fig. 140 Marking Direct Clutch Drum And Annulus Gear For Assembly Alignment

- 1 - DIRECT CLUTCH DRUM
- 2 - HAMMER
- 3 - PUNCH

(7) Remove direct clutch drum rear retaining ring (Fig. 141).

(8) Remove direct clutch drum outer retaining ring (Fig. 142).

(9) Mark annulus gear and output shaft for assembly alignment reference (Fig. 143). Use punch or scriber to mark gear and shaft.

- 1 - OUTPUT SHAFT
- 2 - HAMMER
- 3 - PUNCH

OVERDRIVE UNIT (Continued)

(10) Remove snap-ring that secures annulus gear on output shaft (Fig. 144). Use two screwdrivers to unseat and work snap-ring out of groove as shown.

(11) Remove annulus gear from output shaft (Fig. 145). Use rawhide or plastic mallet to tap gear off shaft.

Fig. 144 Annulus Gear Snap-Ring Removal

- 1 - OUTPUT SHAFT
- 2 - ANNULUS GEAR
- 3 - SNAP-RING

Fig. 145 Annulus Gear Removal

- 1 - OUTPUT SHAFT
- 2 - ANNULUS GEAR

GEAR CASE AND PARK LOCK

- (1) Remove locating ring from gear case.
- (2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.
- (3) Remove reaction plug snap-ring and remove reaction plug.
- (4) Remove output shaft seal.

CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

OVERDRIVE UNIT (Continued)

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should be clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

ASSEMBLY

GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 146). Lubricate bushings with petroleum jelly, or transmission fluid.

Fig. 146 Output Shaft Pilot Bushing

- 1 - OUTPUT SHAFT HUB
- 2 - OVERRUNNING CLUTCH HUB BUSHING
- 3 - INTERMEDIATE SHAFT PILOT BUSHING

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 147).

(4) Align and install clutch drum on annulus gear (Fig. 148). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 148).

Fig. 147 Annulus Gear Installation

- 1 - SNAP-RING
- 2 - OUTPUT SHAFT FRONT BEARING
- 3 - ANNULUS GEAR

Fig. 148 Clutch Drum And Outer Retaining Ring Installation

- 1 - ANNULUS GEAR
- 2 - OUTER SNAP-RING
- 3 - CLUTCH DRUM

OVERDRIVE UNIT (Continued)

(6) Slide clutch drum forward and install inner retaining ring (Fig. 149).

(7) Install rear bearing and snap-ring on output shaft (Fig. 150). Be sure locating ring groove in bearing is toward rear.

Fig. 149 Clutch Drum Inner Retaining Ring Installation

- 1 - ANNULUS GEAR
- 2 - INNER SNAP-RING
- 3 - CLUTCH DRUM

Fig. 150 Rear Bearing And Snap-Ring Installation

- 1 - REAR BEARING
- 2 - SNAP-RING

(8) Install overrunning clutch on hub (Fig. 151). Note that clutch only fits one way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

Fig. 151 Assembling Overrunning Clutch And Hub

- 1 - CLUTCH HUB
- 2 - OVERRUNNING CLUTCH

(10) Install overrunning clutch in output shaft (Fig. 152). Insert snap-ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 153). Be sure planetary pinions are fully seated in annulus gear before proceeding.

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

(13) Install planetary thrust bearing on sun gear (Fig. 154). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 155). Be sure sun gear and thrust bearing are fully seated before proceeding.

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 156). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 157). Be sure spring is properly seated on spring plate.

NOTE: The direct clutch in a 47RE transmission uses 10 clutch discs.

OVERDRIVE UNIT (Continued)

- 4 - PRESS PLATES

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components.

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 158).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 159).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 160). Be sure hub is started on sun gear splines before proceeding.

**Fig. 158 Correct Position Of Direct Clutch Reaction Plate**

SOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap-ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap-ring (Fig. 161). Be very sure snap-ring is fully seated in clutch drum ring groove.

(25) Install clutch hub retaining ring (Fig. 162). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

J9321-400

2 - SNAP-RING PLIERS

GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 163). Be sure pin is seated in hole in case before installing snap-ring.

(4) Install reaction plug snap-ring (Fig. 164). Compress snap-ring only enough for installation; do not distort it.

**Fig. 163 Reaction Plug Locating Pin And Snap-Ring**

- 1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)
2 - LOCATING PIN
3 - PARK LOCK REACTION PLUG

(5) Install new seal in gear case. Use Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 165).

(7) Support geartrain on Tool 6227-1 (Fig. 166). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 166).

**Fig. 165 Correct Rear Bearing Locating Ring Position**

- 1 - CASE ACCESS HOLE
2 - TAB ENDS OF LOCATING RING

OVERDRIVE UNIT (Continued)

**Fig. 166 Overdrive Gear Case Installation**

- 1 - GEARTRAIN ASSEMBLY
2 - GEAR CASE

(9) Expand front bearing locating ring with snap-ring pliers (Fig. 167). Then slide case downward until locating ring locks in bearing groove and release snap-ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 168).

**Fig. 167 Seating Locating Ring In Rear Bearing**

- 1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

OVERDRIVE CLUTCH

NOTE: The overdrive clutch in a 47RE transmission uses 5 clutch discs.

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 169).

**Fig. 168 Locating Ring Access Cover And Gasket Installation**

- 1 - TORX SCREWDRIVER (T25)
2 - ACCESS COVER SCREWS

(2) Install wave spring on top of reaction ring (Fig. 170). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

(3) Assemble overdrive clutch pack.

**Fig. 169 Overdrive Clutch Reaction Ring Installation**

- 1 - REACTION RING
2 - CLUTCH HUB

**Fig. 170 Overdrive Clutch Wave Spring Installation**

- 1 - WAVE SPRING

(4) Install overdrive clutch reaction plate first.

OVERDRIVE UNIT (Continued)

NOTE: The reaction plate is thicker than the pressure plate in a 47RE transmission.

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 171).

Fig. 171 Overdrive Clutch Pack Retaining Ring Installation

1 - OVERDRIVE CLUTCH PACK RETAINING RING

INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 172). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 172).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 173).

(e) Remove Gauge Alignment Tool 6312.

J9221-47

Fig. 172 Shaft End Play Measurement

1 - SPECIAL TOOL 6312
2 - SPECIAL TOOL 6311
3 - SPECIAL TOOL C-4962

End Play Measurement (Inches)	Spacer Thickness (Inches)
.7336 - .7505	.158 - .159
.7506 - .7675	.175 - .176
.7676 - .7855	.193 - .194
.7856 - .8011	.211 - .212

J9121-341

Fig. 173 Intermediate Shaft End Play Spacer Selection

OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 174).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 175).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

OVERDRIVE UNIT (Continued)

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

Fig. 174 Overdrive Piston Thrust Plate Measurement

- 1 - SPECIAL TOOL 6311
2 - DIRECT CLUTCH HUB THRUST BEARING SEAT
3 - SPECIAL TOOL C-4962

End Play Measurement (Inches)	Spacer Thickness (Inches)
1.7500 - 1.7649	.108 - .110
1.7650 - 1.7799	.123 - .125
1.7800 - 1.7949	.138 - .140
1.7950 - 1.8099	.153 - .155
1.8100 - 1.8249	.168 - .170

1.8850 - 1.8999	.243 - .245

J9121-342

Fig. 175 Overdrive Piston Thrust Plate Selection

OVERDRIVE PISTON

- (1) Install new seals on overdrive piston.
- (2) Stand transmission case upright on bellhousing.
- (3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.
- (4) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.
- (5) Install overdrive piston in overdrive piston retainer by:
 - (a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and o-ring seal in overdrive case.

INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 176).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

Fig. 176 Trimming Overdrive Case Gasket

- 1 - GASKET
2 - SHARP KNIFE

OVERDRIVE UNIT (Continued)

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 177).

Fig. 177 Intermediate Shaft Selective Spacer Location

- 1 - SELECTIVE SPACER
- 2 - SPACER GROOVE
- 3 - INTERMEDIATE SHAFT

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

DESCRIPTION

The overrunning clutch (Fig. 178) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

80be45f8

Fig. 178 Overrunning Clutch

- 1 - OUTER RACE (CAM)
- 2 - ROLLER
- 3 - SPRING
- 4 - SPRING RETAINER
- 5 - INNER RACE (HUB)

OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a free-wheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

DISASSEMBLY

- (1) Remove the overdrive piston (Fig. 179).
- (2) Remove the overdrive piston retainer bolts.
- (3) Remove overdrive piston retainer.
- (4) Remove case gasket.
- (5) Tap old cam out of case with pin punch. Insert punch through bolt holes at rear of case (Fig. 180). Alternate position of punch to avoid cocking cam during removal.
- (6) Clean clutch cam bore and case. Be sure to remove all chips/shavings generated during cam removal.

Fig. 179 Overdrive Piston Removal

- 3 - SELECTIVE SPACER
- 4 - PISTON RETAINER

Fig. 180 Overrunning Clutch Cam

- 1 - PIN PUNCH
- 2 - REAR SUPPORT BOLT HOLES

CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

ASSEMBLY

(1) Temporarily install overdrive piston retainer in case. Use 3-4 bolts to secure retainer.

(2) Align and start new clutch cam in the transmission case. Be sure serrations on cam and in case are aligned (Fig. 181). Then tap cam into case just enough to hold it in place.

(3) Verify that cam is correctly positioned before proceeding any further. Narrow ends of cam ramps should be to left when cam is viewed from front end of case (Fig. 181).

(4) Insert Adapter Tool SP-5124 into piston retainer (Fig. 182).

(5) Assemble Puller Bolt SP-3701 and Press Plate SP-3583-A (Fig. 183).

(6) Install assembled puller plate and bolt (Fig. 184). Insert bolt through cam, case and adapter tool. Be sure plate is seated squarely on cam.

(7) Hold puller plate and bolt in place and install puller nut SP-3701 on puller bolt (Fig. 185).

(8) Tighten puller nut to press clutch cam into case (Fig. 185). Be sure cam is pressed into case evenly and does not become cocked.

(9) Remove clutch cam installer tools.

(10) Stake case in 14 places around clutch cam to help secure cam in case. Use blunt punch or chisel to stake case.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

Fig. 181 Positioning Replacement Clutch Cam In Case

(11) Remove piston retainer from case. Cover retainer with plastic sheeting, or paper to keep it dust free.

(12) Clean case and cam thoroughly. Be sure any chips/shavings generated during cam installation are removed from case.

(13) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 186). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

Fig. 184 Positioning Puller Plate On Clutch Cam

(16) Stand transmission case upright on bellhousing.

(17) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(18) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(19) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-3 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

PARK/NEUTRAL POSITION SWITCH

DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

REMOVAL

- (1) Raise vehicle and position drain pan under switch.
- (2) Disconnect switch wires.
- (3) Remove switch from case.

INSTALLATION

- (1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 188).
- (2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.
- (3) Test continuity of new switch with 12V test lamp.
- (4) Connect switch wires and lower vehicle.
- (5) Top off transmission fluid level.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained

Fig. 188 Park/Neutral Position Switch

- 1 - NEUTRAL CONTACT
- 2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
- 3 - PARK CONTACT
- 4 - SWITCH

within the system through the use of piston rings or seals.

OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 189) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 190) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force

PISTONS (Continued)

80bfe272

Fig. 189 Force and Pressure Relationship

exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

80bfe273

Fig. 190 Pressure on a Confined Fluid**FORCE MULTIPLICATION**

Using the 10 PSI example used in the illustration (Fig. 191), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 191), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

80bfe274

Fig. 191 Force Multiplication**PISTON TRAVEL**

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 192) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

Fig. 192 Piston TravelPLANETARY GEARTRAIN/
OUTPUT SHAFT

DESCRIPTION

The planetary gearsets (Fig. 193) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

80be45f9

Fig. 193 Planetary Gearset

- 1 - ANNULUS GEAR
- 2 - SUN GEAR
- 3 - PLANET CARRIER
- 4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.

OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.

DISASSEMBLY

- (1) Remove planetary snap-ring from intermediate shaft (Fig. 194). Discard snap-ring as it is not reusable.

J9321-168

INSPECTION

Inspect the planetary gear sets and annulus gears. The planetary pinions, shafts, washers, and retaining pins are serviceable. However, if a pinion carrier is damaged, the entire planetary gear set must be replaced as an assembly.

Replace the annulus gears if the teeth are chipped, broken, or worn, or the gear is cracked. Replace the planetary thrust plates and the tabbed thrust washers if cracked, scored or worn.

Inspect the machined surfaces of the intermediate shaft. Be sure the oil passages are open and clear. Replace the shaft if scored, pitted, or damaged.

Inspect the sun gear and driving shell. If either component is worn or damaged, remove the sun gear rear retaining ring and separate the sun gear and thrust plate from the driving shell. Then replace the necessary component.

Replace the sun gear as an assembly if the gear teeth are chipped or worn. Also replace the gear as an assembly if the bushings are scored or worn. The sun gear bushings are not serviceable. Replace the thrust plate if worn, or severely scored. Replace the driving shell if distorted, cracked, or damaged in any way.

Replace all snap-rings during geartrain assembly. Reusing snap-rings is not recommended.

ASSEMBLY

(1) Lubricate sun gear and planetary gears with transmission fluid during assembly. Use petroleum jelly to lubricate intermediate shaft bushing surfaces, thrust washers and thrust plates and to hold these parts in place during assembly.

(2) Install front snap-ring on sun gear and install gear in driving shell. Then install thrust plate over sun gear and against rear side of driving shell (Fig. 202). Install rear snap-ring to secure sun gear and thrust plate in driving shell.

(3) Install rear annulus gear on intermediate shaft (Fig. 203).

(4) Install thrust plate in annulus gear (Fig. 204). Be sure plate is seated on shaft splines and against gear.

Fig. 203 Installing Rear Annulus Gear On Intermediate Shaft

- 1 - REAR ANNULUS GEAR
- 2 - OUTPUT SHAFT

(5) Install rear planetary gear in rear annulus gear (Fig. 205). Be sure planetary carrier is seated against annulus gear.

(6) Install tabbed thrust washer on front face of rear planetary gear (Fig. 206). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

(7) Lubricate sun gear bushings with petroleum jelly or transmission fluid.

J9121-70

Fig. 205 Installing Rear Planetary Gear

Fig. 207 Installing Sun Gear And Driving Shell

- 1 - OUTPUT SHAFT
2 - DRIVING SHELL
3 - REAR PLANETARY GEAR
4 - OUTPUT SHAFT
5 - SUN GEAR

(11) Install front annulus gear over and onto front planetary gear (Fig. 210). Be sure gears are fully meshed and seated.

(12) Install front planetary and annulus gear assembly (Fig. 211). Hold gears together and slide them onto shaft. Be sure planetary pinions are seated on sun gear and that planetary carrier is seated on intermediate shaft.

J9121-74

Fig. 209 Installing Thrust Washer On Front Planetary Gear

- 1 - TABBED THRUST WASHER
2 - FRONT PLANETARY GEAR

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(13) Place geartrain in upright position. Rotate gears to be sure all components are seated and properly assembled. Snap-ring groove at forward end of intermediate shaft will be completely exposed when components are assembled correctly.

(14) Install new planetary snap-ring in groove at end of intermediate shaft (Fig. 212).

(15) Turn planetary geartrain over. Position wood block under front end of intermediate shaft and support geartrain on shaft. Be sure all geartrain parts have moved forward against planetary snap-ring. This is important for accurate end play check.

(16) Check planetary geartrain end play with feeler gauge (Fig. 213). Insert gauge between rear annulus gear and shoulder on intermediate shaft as shown. End play should be 0.15 to 1.22 mm (0.006 to 0.048 in.).

(17) If end play is incorrect, install thinner/thicker planetary snap-ring as needed.

REAR CLUTCH**DESCRIPTION**

The rear clutch assembly (Fig. 214) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the

80aacf93

REAR CLUTCH (Continued)

control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved spring is used to cushion the application of the clutch pack. The snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the piston. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force

acting on the residual fluid trapped in the clutch piston retainer.

DISASSEMBLY

- (1) Remove fiber thrust washer from forward side of clutch retainer.
- (2) Remove input shaft front and rear seal rings.
- (3) Remove selective clutch pack snap-ring (Fig. 215).
- (4) Remove the reaction plate, clutch discs, steel plates, pressure plate, wave spring, spacer ring, and piston spring (Fig. 215).
- (5) Remove clutch piston with rotating motion.
- (6) Remove and discard piston seals.
- (7) Remove input shaft retaining ring. It may be necessary to press the input shaft in slightly to relieve tension on the retaining ring.
- (8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

REAR CLUTCH (Continued)

CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary.

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then partially press input shaft into retainer (Fig. 216). Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft retaining ring.

(5) Press the input shaft the remainder of the way into the clutch retainer.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

(9) Install piston spring in retainer and on top of piston. Concave side of spring faces downward (toward piston).

(10) Install the spacer ring and wave spring into the retainer. Be sure spring is completely seated in retainer groove.

Fig. 216 Pressing Input Shaft Into Rear Clutch Retainer

- 1 - INPUT SHAFT
- 2 - REAR CLUTCH RETAINER
- 3 - PRESS RAM

REAR CLUTCH (Continued)

(11) Install pressure plate (Fig. 223). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 223).

(13) Install the reaction plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 217).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 217).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.635 - 0.914 mm (0.025 - 0.036 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap ring thicknesses are:

- 0.107 - 0.109 in.
- 0.098 - 0.100 in.
- 0.095 - 0.097 in.
- 0.083 - 0.085 in.
- 0.076 - 0.078 in.
- 0.071 - 0.073 in.
- 0.060 - 0.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 218). Use enough petroleum jelly to hold washer in place.

(17) Set rear clutch aside for installation during final assembly.

REAR SERVO

DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston

moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

DISASSEMBLY

- (1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 219).
- (2) Remove and discard servo piston seal ring.

REAR SERVO (Continued)

**Fig. 219 Rear Servo Components**

- 1 - SNAP-RING

- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP-RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

ASSEMBLY

(1) Lubricate piston and guide seals (Fig. 221) with petroleum jelly. Lubricate other servo parts with Mopar® ATF +4, type 9602, transmission fluid.

(2) Install new seal ring on servo piston.

(3) Assemble piston, plug, spring and new snap-ring.

SHIFT MECHANISM**DESCRIPTION**

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)
- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

OPERATION

Manual LOW (1) range provides first gear only. Overrun braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

SHIFT MECHANISM (Continued)

ADJUSTMENTS

ADJUSTMENT

Check linkage adjustment by starting engine in PARK and NEUTRAL. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions.

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 222). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

- (1) Shift transmission into PARK.
- (2) Raise and support vehicle.
- (3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 222).
- (4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.
- (5) Move transmission shift lever fully rearward to the Park detent.
- (6) Center adjusting swivel on shift rod.
- (7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).
- (8) Lower vehicle and verify proper adjustment.

SOLENOID

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must there-

80c072ba

Fig. 222 Linkage Adjustment Components

- 2 - TORQUE SHAFT ASSEMBLY
- 3 - TORQUE SHAFT ARM
- 4 - ADJUSTING SWIVEL
- 5 - LOCK BOLT

fore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to

SOLENOID (Continued)

control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

SPEED SENSOR

DESCRIPTION

The speed sensor (Fig. 223) is located in the over-drive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

J9321-411

Fig. 223 Transmission Output Speed Sensor

- 1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
- 2 - SEAL

OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. Signals from this sensor are shared with the powertrain control module.

THROTTLE VALVE CABLE

DESCRIPTION

Transmission throttle valve cable (Fig. 224) adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle down-shift sensitivity.

If cable setting is too loose, early shifts and slip-page between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle down-shifts may be very sensitive.

Fig. 224 Throttle Valve Cable Attachment - At Engine

- 1 - THROTTLE VALVE CABLE
- 2 - CABLE BRACKET
- 3 - THROTTLE BODY LEVER
- 4 - ACCELERATOR CABLE
- 5 - SPEED CONTROL CABLE

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 225). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

THROTTLE VALVE CABLE (Continued)

- 3 - THROTTLE VALVE CABLE

ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

ADJUSTMENT VERIFICATION

- (1) Turn ignition key to OFF position.
- (2) Remove air cleaner.
- (3) Verify that lever on throttle body is at curb idle position (Fig. 226). Then verify that the transmission throttle lever (Fig. 227) is also at idle (fully forward) position.
- (4) Slide cable off attachment stud on throttle body lever.
- (5) Compare position of cable end to attachment stud on throttle body lever:

**Fig. 226 Throttle Valve Cable Attachment - At Engine**

- 1 - THROTTLE VALVE CABLE
- 2 - CABLE BRACKET
- 3 - THROTTLE BODY LEVER
- 4 - ACCELERATOR CABLE
- 5 - SPEED CONTROL CABLE

- Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 228).

- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

ADJUSTMENT PROCEDURE

- (1) Turn ignition switch to OFF position.
 - (2) Remove air cleaner if necessary.
 - (3) Disconnect cable end from attachment stud.
- Carefully slide cable off stud. Do not pry or pull cable off.**

THROTTLE VALVE CABLE (Continued)

Fig. 227 Throttle Valve Cable at Transmission

- 2 - THROTTLE VALVE CABLE
- 3 - TRANSFER CASE SHIFTER CABLE
- 4 - TRANSFER CASE SHIFTER CABLE BRACKET RETAINING BOLT (1 OR 2)
- 5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
- 6 - ELECTRICAL CONNECTORS
- 7 - TRANSMISSION FLUID LINES

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Pry the T.V. cable lock (A) into the UP position (Fig. 228). This will unlock the cable and allow for readjustment.

(6) Apply just enough tension on the T.V. cable (B) to remove any slack in the cable. **Pulling too tight will cause the T.V. lever on the transmission to move out of its idle position, which will result in an incorrect T.V. cable adjustment.** Slide the sheath of the T.V. cable (D) back and forth until the centerlines of the T.V. cable end (B) and the throttle bell crank lever (C) are aligned within one millimeter (1mm) (Fig. 228).

(7) While holding the T.V. cable in the set position push the T.V. cable lock (A) into the down position (Fig. 228). This will lock the present T.V. cable adjustment.

Fig. 228 Throttle Valve Cable at Throttle Linkage

- 1 - THROTTLE LINKAGE
- 2 - THROTTLE VALVE CABLE LOCKING CLIP
- 3 - THROTTLE VALVE CABLE

NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.

(8) Reconnect the T.V. cable (B) to the throttle bellcrank lever (C).

(9) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 229) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 230) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 231) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 232) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 233). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

Fig. 232 Stator Components

- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 234) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

Fig. 235 Torque Converter Fluid Operation

1 - APPLY PRESSURE

2 - THE PISTON MOVES SLIGHTLY FORWARD

3 - RELEASE PRESSURE

4 - THE PISTON MOVES SLIGHTLY REARWARD

OPERATION

The converter impeller (Fig. 235) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of

the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

TORQUE CONVERTER (Continued)

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 236). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

Fig. 236 Stator Operation

- 2 - FRONT OF ENGINE
- 3 - INCREASED ANGLE AS OIL STRIKES VANES
- 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear under various conditions, such as when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the

vehicle begins to go uphill or the throttle pressure is increased.

REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

- (3) Pull the torque converter forward until the center hub clears the oil pump seal.
- (4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

- (1) Lubricate oil pump seal lip with transmission fluid.
- (2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
- (6) Check converter seating with a scale and straightedge (Fig. 237). Surface of converter lugs should be 19mm (0.75 in.) to the rear of the straightedge when converter is fully seated.
- (7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.
- (8) Install the transmission in the vehicle.
- (9) Fill the transmission with the recommended fluid.

TORQUE CONVERTER (Continued)

Fig. 237 Typical Method Of Checking Converter Seating

2 - STRAIGHTEDGE

TORQUE CONVERTER DRAINBACK VALVE

DESCRIPTION

The drainback valve is located in the transmission cooler outlet (pressure) line.

OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

STANDARD PROCEDURE - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch par-

ticles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

TRANSMISSION TEMPERATURE SENSOR

DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 238). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 2000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

80c072af

Fig. 238 Governor Pressure Sensor

1 - GOVERNOR BODY

2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

TRANSMISSION TEMPERATURE SENSOR (Continued)

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

VALVE BODY

DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 239), (Fig. 240), (Fig. 241), and (Fig. 242):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve

- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

VALVE BODY (Continued)

CHECK BALLS

CHECK BALL NUMBER	DESCRIPTION
1	Allows either the manual valve to put line pressure on the 1-2 governor plug or the KD Valve to put WOT line pressure on the 1-2 governor plug.
2	Allows either the manual valve to put line pressure on the 2-3 governor plug or the KD Valve to put WOT line pressure on the 2-3 governor plug.
3	Allows either the Reverse circuit or the 3rd gear circuit to pressurize the front clutch.
4	Allows either the Manual Low circuit from the Manual Valve or the Reverse from the Manual Valve circuit to pressurize the rear servo.
5	Directs line pressure to the spring end of the 2-3 shift valve in either Manual Low or Manual 2nd, forcing the downshift to 2nd gear regardless of governor pressure.
6	Provides a by-pass around the front servo orifice so that the servo can release quickly.
7	Provides a by-pass around the rear clutch orifice so that the clutch can release quickly.
8	Directs reverse line pressure through an orifice to the throttle valve eliminating the extra leakage and insuring that Reverse line pressure pressure will be sufficient.
9	Provides a by-pass around the rear servo orifice so that the servo can release quickly.
ECE (10)	Allows the lockup clutch to used at WOT in 3rd gear by putting line pressure from the 3-4 Timing Valve on the interlock area of the 2-3 shift valve, thereby preventing a 3rd gear Lock-up to 2nd gear kickdown.

REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

VALVE BODY (Continued)

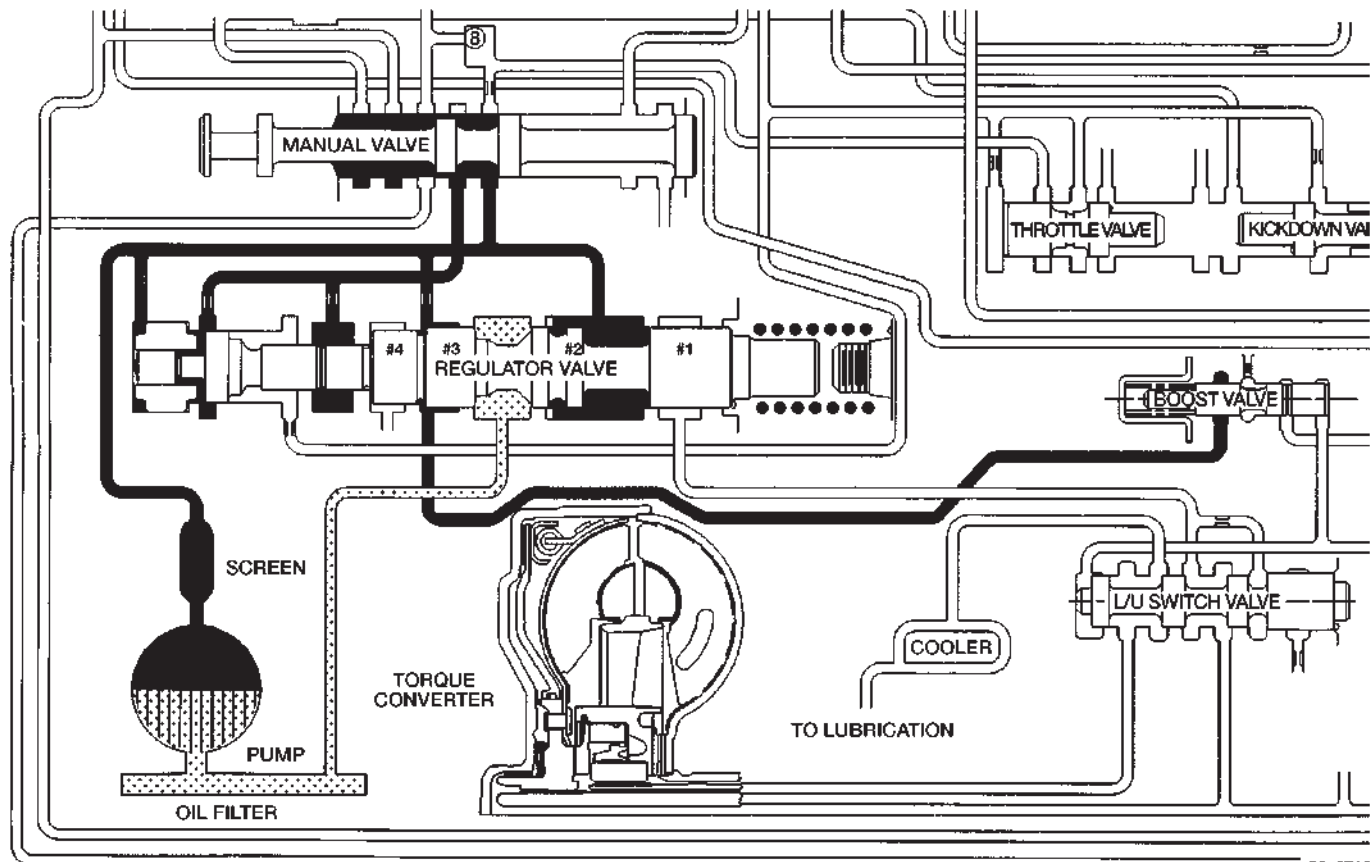

Fig. 243 Regulator Valve in PARK Position

80c0713c

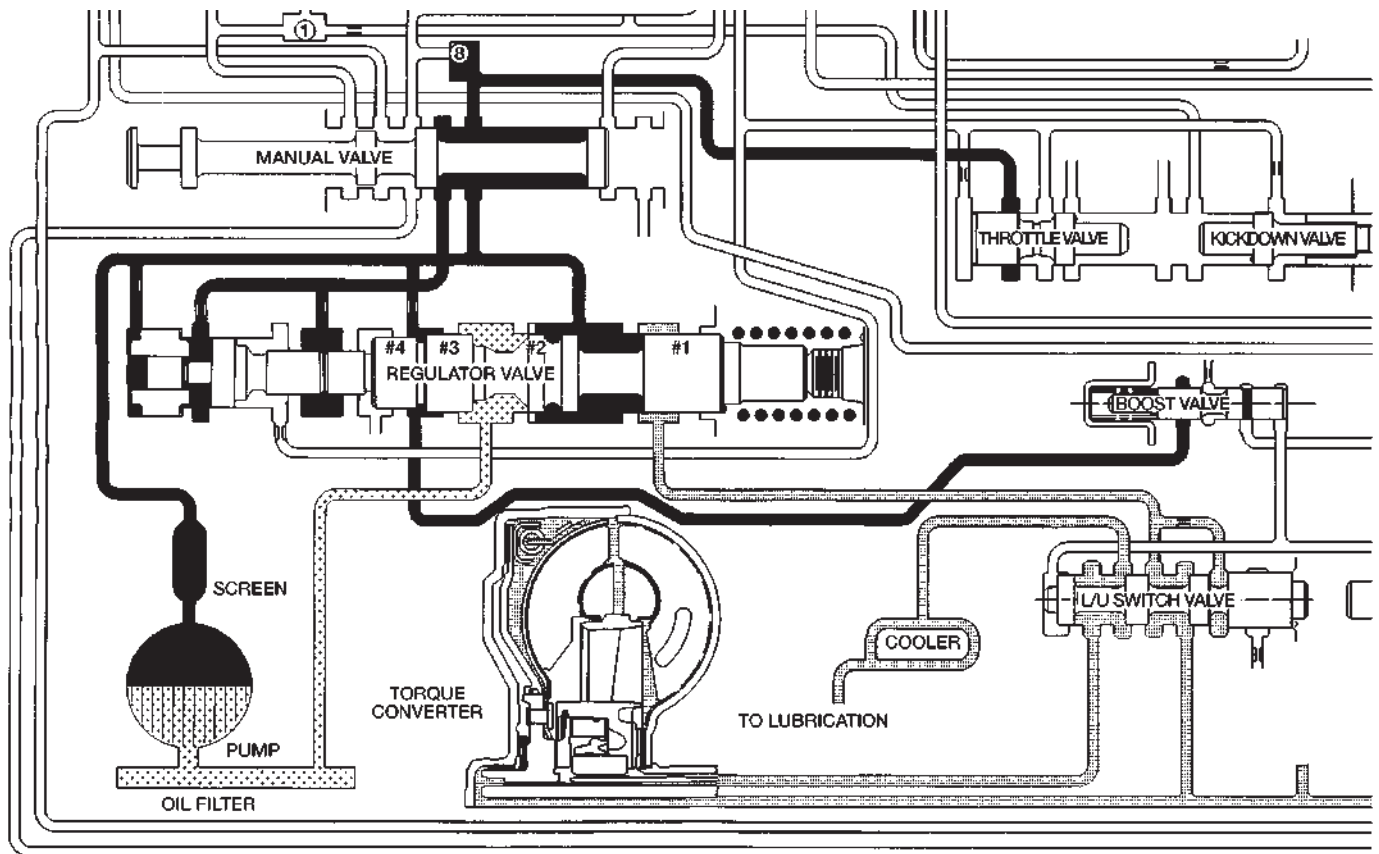

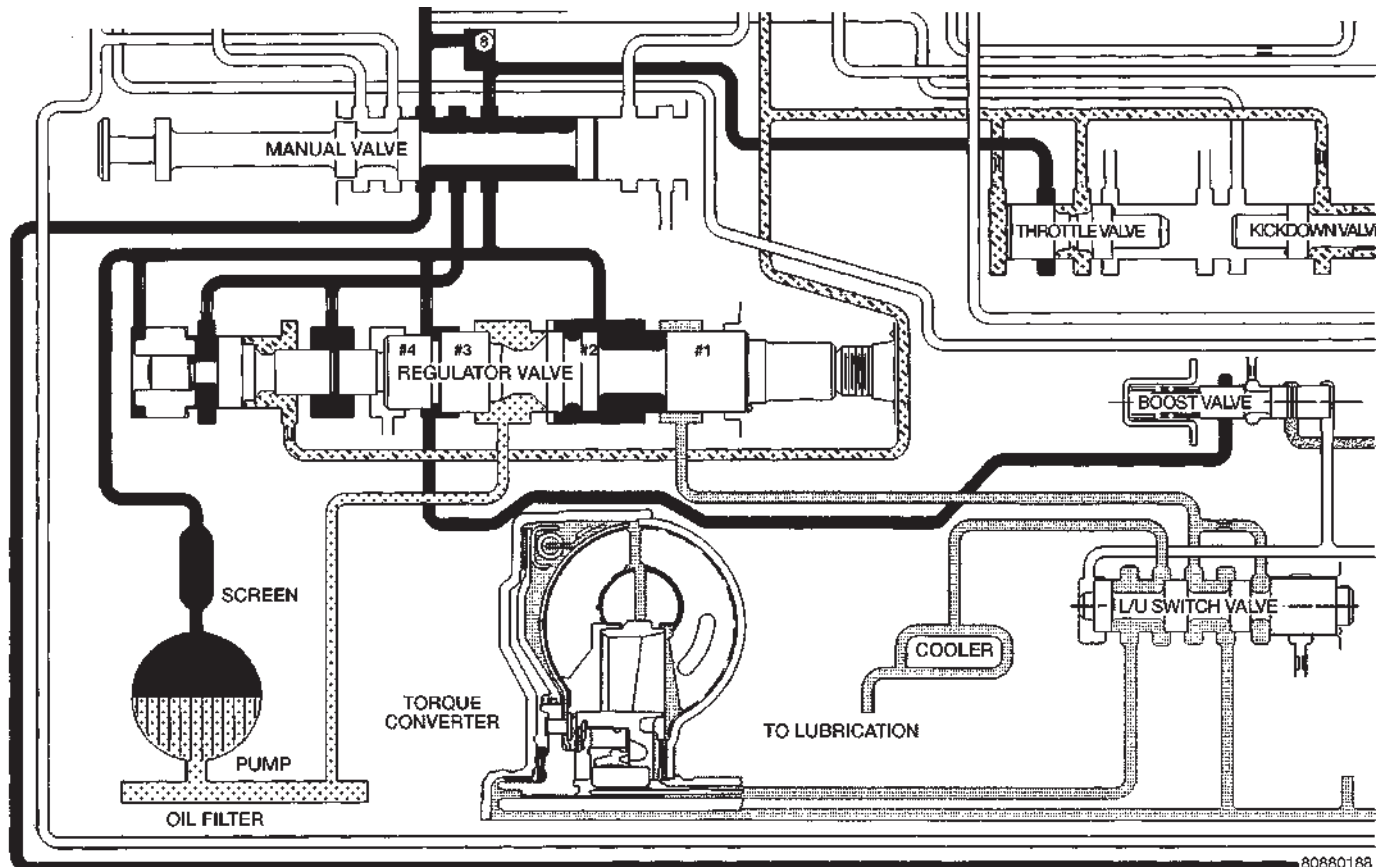

The regulator valve (Fig. 243) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 244), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other

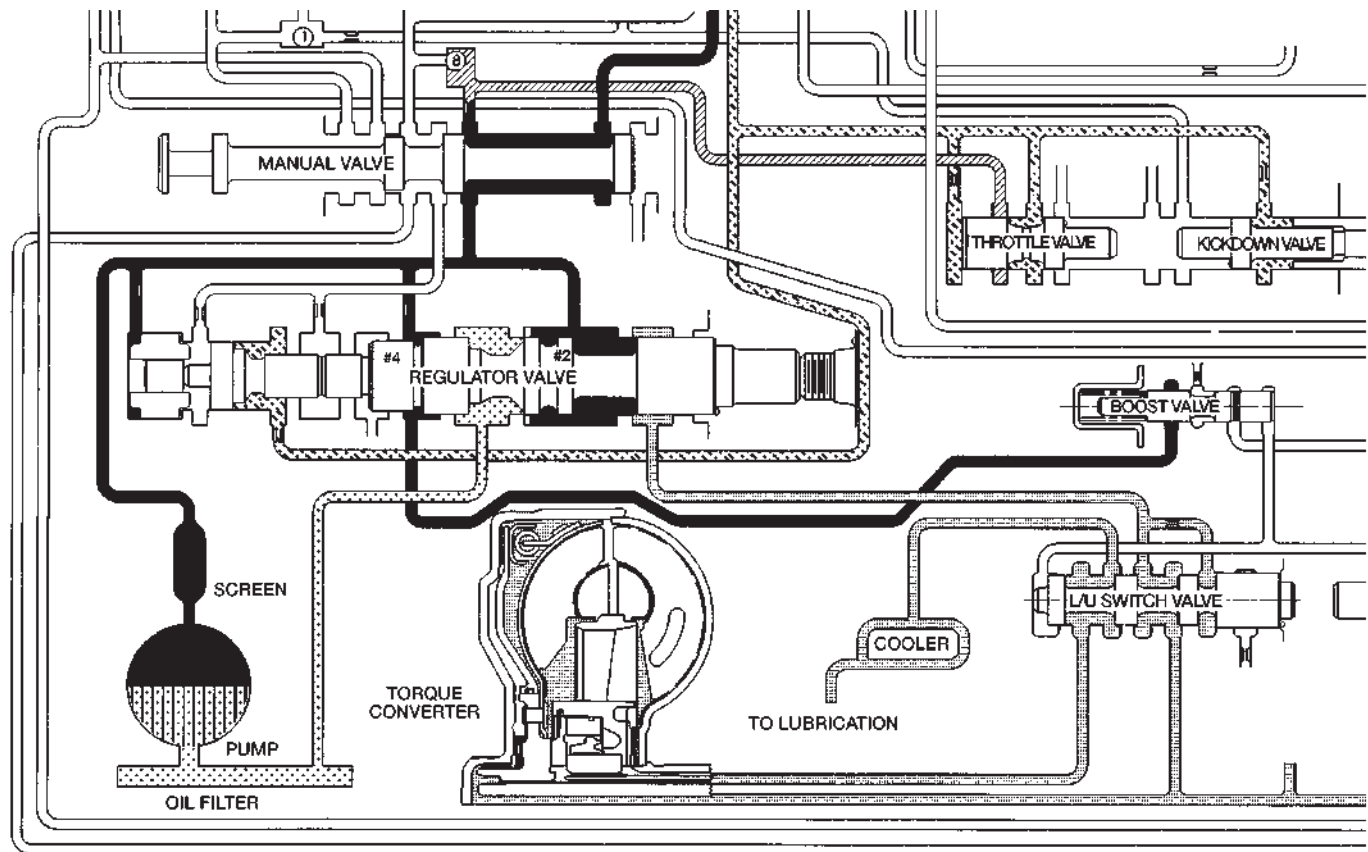

transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing the valve to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 245). The regulated line pressure in REVERSE (Fig. 246) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

VALVE BODY (Continued)

*Fig. 244 Regulator Valve in NEUTRAL Position**Fig. 245 Regulator Valve in DRIVE Position*

VALVE BODY (Continued)

80c07140

Fig. 246 Regulator Valve in REVERSE Position**KICKDOWN VALVE**

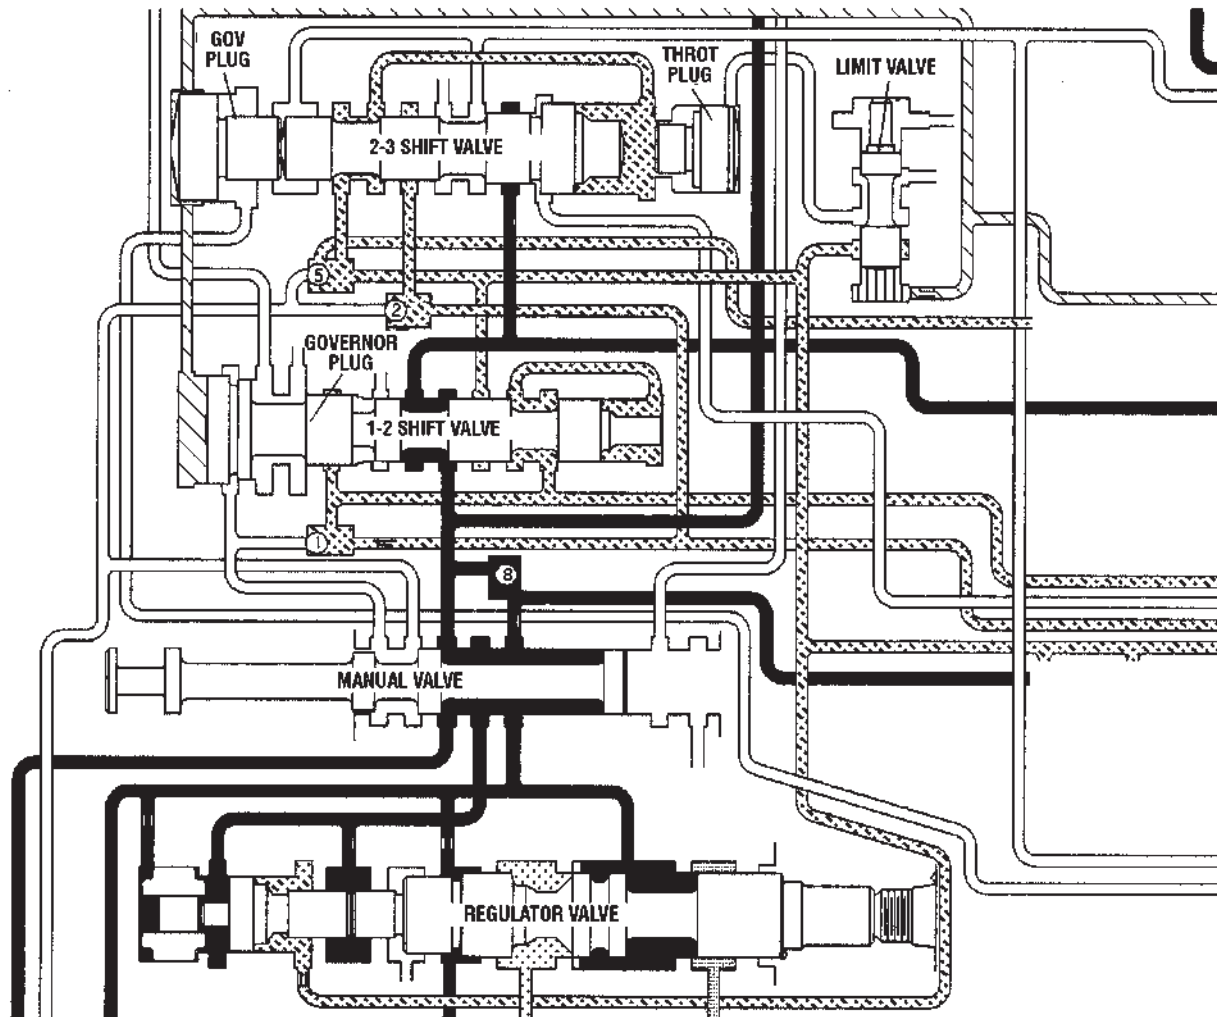

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 247) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 248) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 249), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

Fig. 249 Kickdown Limit Valve-High Speeds

1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 250), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle

pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 251).

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically "blocked" into position so no upshift can occur.

The physical blocking of the upshift while in the manual "1" position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

80c07144

Fig. 250 1-2 Shift Valve-Before Shift

VALVE BODY (Continued)

80c07145

Fig. 251 1-2 Shift Valve-After Shift

The valve has two specific operations (Fig. 252):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kickdown ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

2-3 SHIFT VALVE

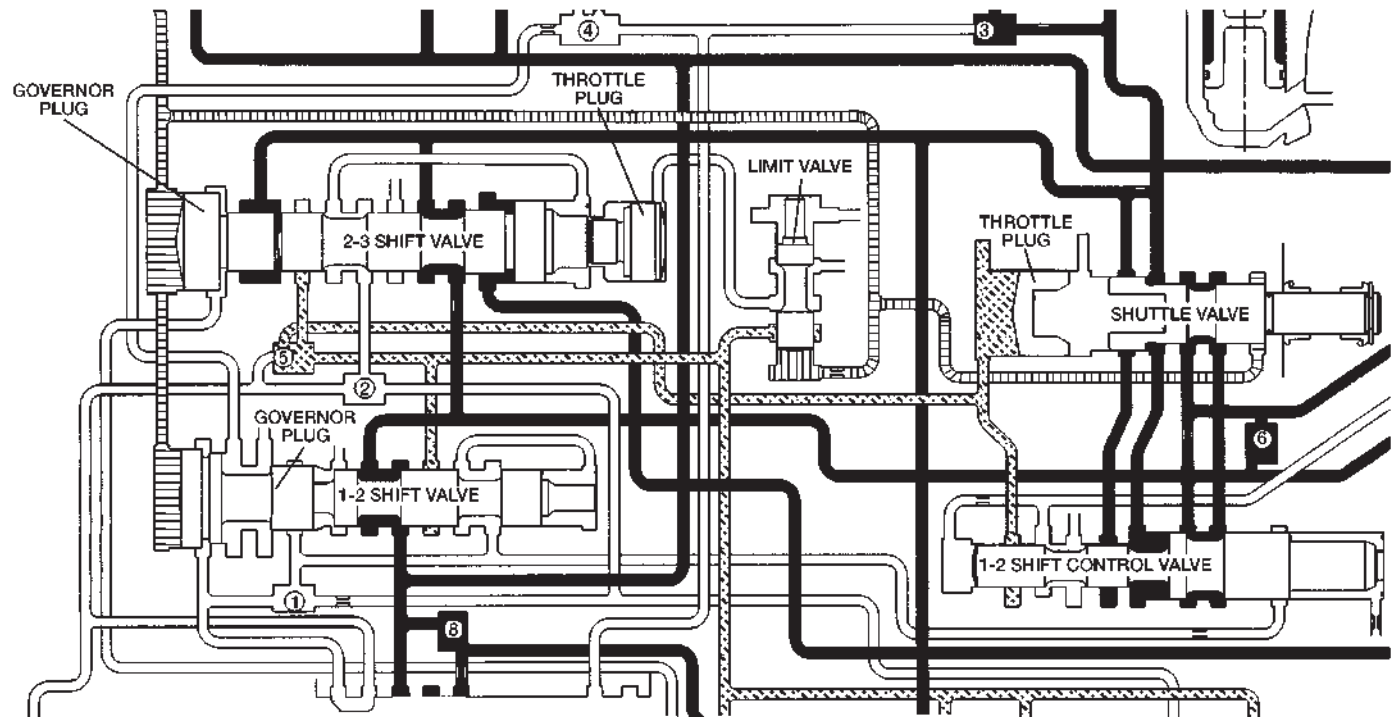

The 2-3 shift valve mechanism (Fig. 253) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead-end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

VALVE BODY (Continued)

*Fig. 252 1-2 Shift Control Valve**Fig. 253 2-3 Shift Valve-Before Shift*

VALVE BODY (Continued)

80c07148

Fig. 254 2-3 Shift Valve-After Shift

After the shift (Fig. 254), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 255). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 256). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

3-4 TIMING VALVE

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 256). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3

80880192

Fig. 255 3-4 Shift Valve Before Shift

valve from downshifting before the 3-4 valve (Fig. 255).

VALVE BODY (Continued)

Fig. 256 3-4 Shift Valve After Shift

3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 255). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a pre-determined pressure develops within the clutch, the valve closes the bypass (Fig. 256). Clutch fill is then completed through the regular feed orifice.

THROTTLE VALVE

In all gear positions the throttle valve (Fig. 257) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

Fig. 257 Throttle Valve

VALVE BODY (Continued)

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 258), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

Once the TCC control valve has moved to the right (Fig. 259), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

MANUAL VALVE

The manual valve (Fig. 260) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

CONVERTER CLUTCH LOCK-UP VALVE

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

VALVE BODY (Continued)

80680199

Fig. 258 Switch Valve-Torque Converter Unlocked**SHUTTLE VALVE**

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 252) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by-pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of

fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 "lift foot" upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

VALVE BODY (Continued)

8088019a

Fig. 259 Switch Valve-Torque Converter Locked**BOOST VALVE**

The boost valve (Fig. 261) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 262), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor (includes transmission temperature thermistor).

VALVE BODY (Continued)

DISASSEMBLY

CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

(1) Disconnect wires from governor pressure sensor and solenoid.

(2) Remove screws attaching governor body and retainer plate to transfer plate.

(3) Remove retainer plate, governor body and gasket from transfer plate.

(4) Remove governor pressure sensor from governor body.

(5) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(6) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 265). Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.

- 2 - TUBE BRACE (DOUBLE TAB)

(25) Remove boost valve connecting tube (Fig. 283). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

Fig. 283 Boost Valve Tube

- 1 - BOOST VALVE TUBE
- 2 - LOWER HOUSING
- 3 - DISENGAGE THIS END OF TUBE FIRST
- 4 - UPPER HOUSING

CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.

(26) Turn valve body over so lower housing is facing upward (Fig. 284). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(27) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 284). Note position of boost valve tube brace for assembly reference.

(28) Remove lower housing and overdrive separator plate from transfer plate (Fig. 284).

VALVE BODY (Continued)

(29) Remove the Number 10 check ball from the transfer plate (Fig. 285). The check ball is approximately 4.8 mm (3/16 in.) in diameter.

(30) Remove transfer plate from upper housing (Fig. 286).

(31) Turn transfer plate over so upper housing separator plate is facing upward.

(32) Remove upper housing separator plate from transfer plate (Fig. 287). Note position of filter in separator plate for assembly reference.

(33) Remove rear clutch and rear servo check balls from transfer plate. Note check ball location for assembly reference (Fig. 288).

3-4 ACCUMULATOR HOUSING

- (1) Remove end plate from housing.
- (2) Remove piston spring.
- (3) Remove piston. Remove and discard piston seals (Fig. 294).

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning

solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either

part has sustained physical damage (dented, deformed, broken, etc.).

CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.

INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or

correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

VALVE BODY (Continued)

- 1 - ACCUMULATOR PISTON
- 2 - 3-4 ACCUMULATOR HOUSING
- 3 - TEFLON SEALS
- 4 - PISTON SPRING
- 5 - COVER PLATE AND SCREWS

CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and

transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

ASSEMBLY

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 301).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

3-4 ACCUMULATOR

- (1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 302).
- (2) Install new seal rings on accumulator piston.
- (3) Install piston and spring in housing.
- (4) Install end plate on housing.

TRANSFER PLATE

- (1) Install rear clutch and rear servo check balls in transfer plate (Fig. 295).
- (2) Install filter screen in upper housing separator plate (Fig. 296).
- (3) Align and position upper housing separator plate on transfer plate (Fig. 297).
- (4) Install brace plate (Fig. 297). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.
- (5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

Fig. 295 Rear Clutch And Rear Servo Check Ball Locations

- 1 - REAR CLUTCH CHECK BALL
- 2 - REAR SERVO CHECK BALL
- 3 - TRANSFER PLATE

UPPER AND LOWER HOUSING

- (1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 298). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

- 1 - UPPER HOUSING SEPARATOR PLATE
- 2 - FILTER SCREEN

Fig. 297 Brace Plate

- 1 - BRACE
- 2 - TRANSFER PLATE
- 3 - SEPARATOR PLATE

- (2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 299). Be sure filter screen is seated in proper housing recess.

- (3) Install the Number 10 check ball into the transfer plate (Fig. 300). The check ball is approximately 4.8 mm (3/16 in.) in diameter.

- (4) Position lower housing separator plate on transfer plate (Fig. 301).

- (5) Install lower housing on assembled transfer plate and upper housing (Fig. 302).

- (6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 302).

UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 303), (Fig. 304) and (Fig. 305) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

Fig. 303 Shuttle and Boost Valve Locations

| 7 - THROTTLE VALVE AND SPRING | |

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 306).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 306).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 307).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 307).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 308).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

VALVE BODY (Continued)

J9521-108

Fig. 308 Securing Boost Valve Tube With Brace Tabs

1 - BEND TABS UP AGAINST TUBE AS SHOWN

3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 309).

(2) Loosely attach accumulator housing with right-side screw (Fig. 309). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 310). Tighten screws to 4 N·m (35 in. lbs.).

VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 311).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

J9321-160

J9521-180

Fig. 310 Seating 3-4 Accumulator On Lower Housing

1 - ACCUMULATOR BOX

2 - CONVERTER CLUTCH VALVE PLUG

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 312).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

VALVE BODY (Continued)

- (11) Install manual valve.
- (12) Install throttle valve and spring.
- (13) Install kickdown valve and detent.
- (14) Install pressure regulator valve.
- (15) Install switch valve.
- (16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.
- (17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)
- (18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.
- (19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 313). Seat tang in dimple before tightening connector screw.
- (20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.
- (21) Verify that solenoid wire harness is properly routed (Fig. 314). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

J9521-178

Fig. 311 Detent Ball Spring

1 - SPECIAL TOOL 6583 POSITIONED ON DETENT HOUSING

GOVERNOR BODY, SENSOR AND SOLENOID

- (1) Turn valve body assembly over so accumulator side of transfer plate is facing down.
- (2) Install new O-rings on governor pressure solenoid and sensor.
- (3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

J9121-54

Fig. 312 Manual And Throttle Lever Alignment

- 4 - KICKDOWN VALVE

J9321-427

Fig. 313 Solenoid Harness Case Connector Shoulder Bolt

- 1 - SOLENOID HARNESS CASE CONNECTOR
- 2 - 3-4 ACCUMULATOR HOUSING

- (4) Install governor pressure sensor in governor body.
- (5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.
- (6) Position governor body gasket on transfer plate.
- (7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.
- (8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

**Fig. 314 Solenoid Harness Routing**

- 1 - OVERDRIVE/CONVERTER SOLENOID WIRE HARNESS
2 - 3-4 ACCUMULATOR COVER PLATE

- (9) Connect harness wires to governor pressure solenoid and governor pressure sensor.
(10) Install fluid filter and pan.
(11) Lower vehicle.
(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

INSTALLATION

- (1) Check condition of O-ring seals on valve body harness connector (Fig. 315). Replace seals on connector body if cut or worn.
(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 316).
(3) Check condition of seals on accumulator piston (Fig. 317). Install new piston seals, if necessary.
(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.
(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.
(6) Lubricate seal rings on valve body harness connector with petroleum jelly.
(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 13.6 N·m (125 in. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

**Fig. 315 Valve Body Harness Connector O-Ring Seal**

- 1 - CONNECTOR O-RINGS
2 - VALVE BODY HARNESS CONNECTOR
3 - HARNESS

ADJUSTMENTS - VALVE BODY**CONTROL PRESSURE ADJUSTMENTS**

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

VALVE BODY (Continued)

**Fig. 316 Manual Lever Shaft Seal**

- 1 - 15/16" SOCKET
2 - SEAL

**Fig. 317 Accumulator Piston Components**

- 1 - INNER SPRING
2 - ACCUMULATOR PISTON
3 - OUTER SPRING
4 - SEAL RINGS

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 318).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

**Fig. 318 Line Pressure Adjustment**

- 1 - WRENCH
2 - 1-5/16 INCH

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 319).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

**Fig. 319 Throttle Pressure Adjustment**

TRANSFER CASE - NV241LD

DESCRIPTION

The NV241LD transfer case is a part-time transfer case with a low-range gear system. It provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability.

The synchronizer mechanism consists of a brass stop ring, synchro hub, and the sliding clutch. The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

IDENTIFICATION

An identification tag (Fig. 1) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

Fig. 1 Transfer Case Identification Tag - Typical

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

OPERATION

OPERATING RANGES

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only

TRANSFER CASE - NV241LD (Continued)

exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer case. The switch is operated by the transfer case range rod.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

SHIFTING

The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into the 4L operating range.

DIAGNOSIS AND TESTING - TRANSFER CASE

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting. 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. 3) Transfer case external shift linkage binding. 4) Insufficient or incorrect lubricant. 5) Internal components binding, worn, or damaged.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. 4) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. 5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

TRANSFER CASE - NV241LD (Continued)

Condition	Possible Cause	Correction
Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position. 2) Shift linkage out of adjustment. 3) Shift linkage loose or binding. 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. 5) Low range gear worn or damaged.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. 2) Adjust linkage. 3) Tighten, lubricate, or repair linkage as necessary. 4) Disassemble unit and repair as necessary. 5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled. 2) Vent closed or restricted. 3) Output shaft seals damaged or installed incorrectly.	1) Drain lubricant to the correct level. 2) Clear or replace vent as necessary. 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)
- (3) Position drain oil container under transfer case.
- (4) Remove transfer case drain plug and drain lubricant into container.
- (5) Disconnect vent hose and vacuum harness at transfer case switch.
- (6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
- (7) Support transmission with jack stand.
- (8) Remove rear crossmember.
- (9) Mark front and rear propeller shafts for assembly reference.

(10) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.

(12) Remove nuts attaching transfer case to transmission.

(13) Move transfer case assembly rearward until free of transmission output shaft.

(14) Lower jack and move transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

TRANSFER CASE - NV241LD (Continued)

REAR EXTENSION, RETAINER, AND REAR CASE

(1) Remove rear extension bolts (Fig. 2).

**Fig. 2 Rear Extension Bolt Removal**

1 - SOCKET

2 - REAR EXTENSION

(2) Remove rear extension housing (Fig. 3). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it.

**Fig. 3 Rear Extension Housing Removal**

1 - SEAL

2 - REAR EXTENSION HOUSING

3 - REAR RETAINER

(3) Remove output bearing retaining ring with heavy duty snap-ring pliers (Fig. 4).

**Fig. 4 Removing Output Bearing Retaining Ring**

1 - OUTPUT BEARING

2 - RETAINING RING

3 - REAR RETAINER

(4) Remove rear retainer bolts (Fig. 5).

**Fig. 5 Removing Rear Extension Bolts**

1 - SOCKET

2 - REAR RETAINER

TRANSFER CASE - NV241LD (Continued)

(5) Loosen rear retainer with pry bar placed under flange (Fig. 6).

Fig. 6 Loosening Rear Retainer

- 2 - FLANGE
- 3 - PRY TOOL

(6) Remove rear retainer and output bearing as assembly (Fig. 7).

Fig. 7 Rear Retainer Removal

- 1 - OUTPUT BEARING
- 2 - REAR RETAINER

COMPANION FLANGE AND SHIFT LEVER

- (1) Shift transfer case into NEUTRAL.
- (2) Remove companion flange nut (Fig. 8). Discard nut after removal. It is not reusable.

Fig. 8 Removing Companion Flange Nut

- 1 - COMPANION FLANGE
- 2 - 1-1/8" SOCKET

(3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.

(4) Remove companion flange rubber seal from front output shaft (Fig. 9).

Fig. 9 Companion Flange Seal Removal

- 1 - FLANGE SEAL

(5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 10).

Fig. 10 Shift Lever Removal

- 1 - SHIFT LEVER
- 2 - NUT/WASHER

TRANSFER CASE - NV241LD (Continued)

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Remove output bearing retaining ring with heavy duty snap-ring pliers.
- (2) Remove output shaft bearing.
- (3) Note position of bolts that attach rear case to front case (Fig. 11). Some bolts/studs at ends of case require flat washers. Mark position of these bolts with paint or scribe.
- (4) Remove rear case-to-front case bolts.

J9421-278

Fig. 11 Removing Case Attaching Bolts

J9421-283

Fig. 13 Removing Rear Case From Alignment Dowels

- 1 - CASE DOWELS (2)
- 2 - REAR CASE

TRANSFER CASE - NV241LD (Continued)

(7) Remove rear case and oil pump assembly from front case.

(8) Remove shift rail cup and spring (Fig. 14).

Fig. 14 Shift Rail Cup And Spring Removal

- 1 - SHIFT RAIL
- 2 - SPRING
- 3 - CUP

(9) Remove front sprocket retaining ring (Fig. 15).

Fig. 15 Removing Front Sprocket Retaining Ring

- 1 - FRONT SPROCKET
- 2 - RETAINING RING
- 3 - FRONT OUTPUT SHAFT

(10) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1-inch) simultaneously (Fig. 16).

(11) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

Fig. 16 Removing Drive Chain And Front Sprocket

- 1 - CHAIN
- 2 - DRIVE SPROCKET
- 3 - FRONT SPROCKET

SHIFT FORKS AND MAINSHAFT

(1) Remove vacuum/indicator switch (Fig. 17).

Fig. 17 Vacuum/Indicator Switch Removal

- 1 - 1-1/16" SOCKET
- 2 - INDICATOR SWITCH

(2) Loosen poppet plunger screw (Fig. 18).

Fig. 18 Loosening Poppet Plunger Screw

- 1 - POPPET PLUNGER SCREW

TRANSFER CASE - NV241LD (Continued)

(3) Remove poppet plunger screw and spring (Fig. 19). Note that screw has O-ring seal. Remove and discard seal this seal.

Fig. 19 Poppet Plunger Screw And Spring Removal

- 1 - POPPET PLUNGER SCREW
- 2 - O-RING
- 3 - PLUNGER SPRING

(4) Remove poppet plunger with magnet (Fig. 20).

Fig. 20 Poppet Plunger Removal

- 1 - MAGNET
- 2 - POPPET PLUNGER

(5) Remove front output shaft from bearing in case (Fig. 21).

(6) Pull mainshaft assembly out of input gear, sliding clutch and case (Fig. 22).

Fig. 21 Front Output Shaft Removal

- 1 - BALL BEARING
- 2 - FRONT OUTPUT SHAFT

Fig. 22 Mainshaft Assembly Removal

- 1 - SLIDING CLUTCH
- 2 - MODE FORK
- 3 - MAINSHAFT ASSEMBLY

TRANSFER CASE - NV241LD (Continued)

(7) Remove mode fork, sliding clutch and shift rail as assembly (Fig. 23). Note which way clutch fits in fork (long side of clutch goes to front).

Fig. 23 Mode Fork, Shift Rail And Sliding Clutch Removal

- 1 - MODE FORK
- 2 - SHIFT RAIL
- 3 - SLIDING CLUTCH

- (8) Remove range fork retaining ring.
- (9) Remove range fork and hub as an assembly (Fig. 24). Note fork position for installation reference.
- (10) Remove shift sector (Fig. 25).

Fig. 24 Range Fork And Hub Removal

- 1 - RANGE HUB
- 2 - RANGE FORK

Fig. 25 Shift Sector Removal

- 1 - SHIFT SECTOR

(11) Remove shift sector shaft nylon retainer and O-ring from shaft bore in front case (Fig. 26).

Fig. 26 Removing Sector Shaft O-Ring And Retainer

- 1 - SHAFT BORE
- 2 - NYLON RETAINING RING
- 3 - SECTOR SHAFT O-RING

TRANSFER CASE - NV241LD (Continued)

MAINSHAFT

(1) Remove retaining ring that secures synchronizer hub onto mainshaft (Fig. 27). Use standard (instead of parallel jaw) snap-ring pliers to remove this retaining ring.

Fig. 27 Synchronizer Hub Retaining Ring Removal

- 1 - SYNCHRO HUB
2 - RETAINING RING

(2) Remove synchronizer hub (Fig. 28).

Fig. 28 Synchronizer Hub Removal

- 1 - SYNCHRO HUB
2 - MAINSHAFT

(3) Inspect synchronizer hub struts and springs. If struts appear worn, remove struts and springs from hub. Note position of springs for installation reference (Fig. 29).

Fig. 29 Synchronizer Strut And Spring Removal

- 1 - SYNCHRO STRUTS
2 - SYNCHRO HUB
3 - SYNCHRO SPRINGS

(4) Remove brass stop ring (Fig. 30). Discard stop ring if worn, cracked, or any teeth are missing.

Fig. 30 Synchronizer Stop Ring Removal

- 1 - DRIVE SPROCKET
2 - STOP RING

TRANSFER CASE - NV241LD (Continued)

(5) Remove drive sprocket (Fig. 31).

J9421-315

Fig. 31 Drive Sprocket Removal

- 1 - DRIVE SPROCKET
2 - MAINSHAFT

INPUT AND PLANETARY GEAR

(1) Remove front bearing retainer attaching bolts (Fig. 32).

(2) Remove front bearing retainer. Pry retainer loose with pry tool positioned in slots at each end of retainer (Fig. 33).

J9021-11

Fig. 32 Front Bearing Retainer Bolts

- 1 - FRONT CASE
2 - FRONT BEARING RETAINER
3 - RETAINER BOLTS

J8921-266

Fig. 33 Front Bearing Retainer Removal

- 1 - FRONT BEARING RETAINER
2 - RETAINER SLOT

(3) Remove front bearing retainer seal. Tap seal out with drift and hammer.

(4) Remove input gear retaining ring with heavy duty snap-ring pliers (Fig. 34).

80010944

Fig. 34 Removing Input Gear Retaining Ring

- 1 - INPUT GEAR BEARING RETAINING RING
2 - INPUT GEAR BEARING
3 - SNAP-RING PLIERS

TRANSFER CASE - NV241LD (Continued)

(5) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 35). Tap gear out of bearing with plastic mallet, if necessary.

Fig. 35 Input Gear And Planetary Carrier Removal

1 - INPUT AND LOW RANGE GEAR ASSEMBLY

INPUT AND PLANETARY GEAR

- (1) Remove snap-ring that retains input gear in low range gear (Fig. 36).
- (2) Remove retainer (Fig. 37).
- (3) Remove front tabbed thrust washer (Fig. 38).
- (4) Remove input gear (Fig. 39).
- (5) Remove rear tabbed thrust washer from low range gear (Fig. 40).

Fig. 36 Input Gear Snap-Ring Removal

2 - REAR TABBED THRUST WASHER

INSPECTION**MAINSHAFT/SPROCKET/HUB**

Inspect the splines on the hub and shaft and the teeth on the sprocket (Fig. 41). Minor nicks and scratches can be smoothed with an oilstone, however, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

Inspect the spline teeth on the synchronizer hub. If evidence of chipping or excessive wear is apparent, replace the hub. The hooked end of each synchronizer spring should be inserted in one of the struts. In addition, the springs should not interfere with the polished gear cone or inside diameters of the hub.

Inspect the stop ring for cracks and wear. Replace the ring if necessary or if doubt exists over condition. Check a replacement synchronizer ring for proper fit on the cone with a minimum of wobble. Also check the synchronizer struts for wear or damage.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 42). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

TRANSFER CASE - NV241LD (Continued)

TRANSFER CASE - NV241LD (Continued)

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 43). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

80010948

Fig. 43 Shift Forks

- 1 - RANGE FORK
- 2 - MODE FORK AND RAIL
- 3 - MODE SPRING

Inspect the shift fork wear pads (Fig. 44). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

8001097c

Fig. 44 Shift Fork And Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (NON-SERVICEABLE)

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

Inspect rear extension bushing. Replace if worn or scored.

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 45)

J9021-16

Fig. 45 Low Range Annulus Gear

- 1 - FRONT CASE
- 2 - LOW RANGE ANNULUS GEAR

FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Replace the input retainer seal, do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary.

TRANSFER CASE - NV241LD (Continued)

Or the threads can be repaired with Helicoil™ stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ASSEMBLY

BEARINGS AND SEALS

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 46).

(2) Install locating ring on new bearing.

(3) Position case so that the forward end is facing upward.

(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 47).

J9521-43

Fig. 46 Input Shaft Bearing Removal

1 - SPECIAL TOOL C-4171

2 - SPECIAL TOOL C-4210

(5) Using Installer 6953, remove front output shaft bearing.

(6) Start front output shaft bearing in case (Fig. 48). Then seat bearing with Handle C-4171 and Installer 6953.

(7) Install front output shaft bearing retaining ring.

(8) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

J8921-219

Fig. 47 Seating Input Shaft Bearing

1 - SNAP-RING

2 - INPUT SHAFT BEARING

80a1108e

Fig. 48 Front Output Shaft Bearing Installation

1 - HANDLE C-4171

2 - REMOVER/INSTALLER 6953

(b) Start seal in bore with light taps from hammer (Fig. 49). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

TRANSFER CASE - NV241LD (Continued)

(c) Remove installer and verify that seal is recessed the proper amount (Fig. 50). Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case. This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

Fig. 49 Front Output Seal Installation

- 1 - CORRECT SEAL DEPTH IS 2.03-2.5 mm (0.080-0.100 in.) BELOW TOP EDGE OF BORE
- 2 - FRONT CASE SHAFT BORE
- 3 - FRONT OUTPUT SEAL

(9) Remove seal from front bearing retainer with suitable pry tool.

(10) Install new oil seal in front bearing retainer with Installer 7884 (Fig. 51).

Fig. 51 Install Front Bearing Retainer Seal

- 1 - FRONT BEARING RETAINER
- 2 - SPECIAL TOOL 7884

(11) Remove seal from oil pump with suitable pry tool.

(12) Install new seal in oil pump with Installer 7888 (Fig. 52).

Fig. 52 Oil Pump Seal Installation

- 1 - HOUSING SEAL
- 2 - SPECIAL TOOL 7888
- 3 - OIL PUMP FEED HOUSING

TRANSFER CASE - NV241LD (Continued)

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 53).

(14) Install new pilot bearing with Plug C-293-3.

80a11090

Fig. 53 Remove Input Gear Pilot Bearing

- 1 - DRIFT
- 2 - INPUT GEAR

(15) Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 54).

(16) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 55). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 56).

INPUT AND PLANETARY GEAR

(1) Lubricate gears and thrust washers (Fig. 57) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 57). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snapping.

80a98366

**Fig. 57 Input/Low Range Gear Components**

- 1 - SNAP-RING
2 - RETAINER PLATE
3 - INPUT GEAR
4 - LOW RANGE GEAR
5 - THRUST WASHERS

(6) Align and install low range/input gear assembly in front case (Fig. 58). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(7) Install snap-ring to hold input/low range gear into front bearing (Fig. 59).

**Fig. 59 Install Input Gear Snap-Ring**

- 1 - INPUT GEAR
2 - SNAP-RING

(8) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(9) Apply a 3 mm (1/8 in.) bead of Mopar® Gasket Maker, or equivalent silicone adhesive, to sealing surface of retainer.

(10) Align cavity in seal retainer with fluid return hole in front of case.

CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® Gasket Maker, or equivalent silicone adhesive sealer. Seal failure and fluid leak can result.

(11) Install bolts to hold retainer to transfer case (Fig. 60). Tighten to 21 N·m (16 ft. lbs.) of torque.

TRANSFER CASE - NV241LD (Continued)

**Fig. 60 Install Front Bearing Retainer**

1 - FRONT BEARING RETAINER

SHIFT FORKS AND MAINSHAFT

- (1) Lubricate mainshaft splines with recommended transmission fluid.
- (2) Install drive sprocket on mainshaft (Fig. 61).

**Fig. 61 Drive Sprocket Installation**

1 - MAINSHAFT
2 - DRIVE SPROCKET

- (3) Install brass stop ring on drive sprocket (Fig. 62).

- (4) Install 3 synchronizer struts and 2 springs in hub as follows:

(a) Insert first strut in hub (Fig. 63). Strut shoulders rest (and slide) on sides hub slot as shown.

(b) Insert hooked end of first spring in center of strut to secure it. Then work spring into hub (Fig. 64).

**Fig. 62 Synchronizer Stop Ring Installation**

1 - BRASS STOP RING
2 - DRIVE SPROCKET

- (c) Press spring inward and insert last two struts in hub slots. Be sure spring is positioned under struts to properly secure them (Fig. 65).

- (d) Turn hub over and install remaining spring in hub. Position hooked end of second spring opposite the first spring's hooked end.

**Fig. 63 Installing First Synchronizer Strut And Spring**

1 - FIRST STRUT
2 - SYNCHRO HUB
3 - SPRING

TRANSFER CASE - NV241LD (Continued)

J9421-342

Fig. 65 Correct Position Of Struts And Springs

- 1 - STRUTS
- 2 - SPRING

(5) Install assembled synchronizer hub on main-shaft (Fig. 66). Hub has shoulder on one side which goes toward sprocket (rear of shaft). Flat side of hub faces front of shaft.

(6) Install synchronizer hub retaining ring (Fig. 67). Be sure ring is fully seated before proceeding.

(7) Install sliding clutch (sleeve) on synchronizer hub (Fig. 68).

CAUTION: The sliding clutch must be correctly positioned to ensure proper shifting. Position the clutch on the hub so a clutch spline is centered over each strut as shown (Fig. 69). If the clutch is installed so a gap between splines is aligned with one or more struts, gear clash will result.

**Fig. 68 Sliding Clutch Installation**

- 1 - SLIDING CLUTCH
2 - SYNCHRO HUB

(8) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

(9) Lubricate mainshaft components with transmission fluid.

(10) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 70). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

(11) Assemble and install range fork and hub (Fig. 71). Be sure hub is properly seated in low range gear and engaged to the input gear.

(12) Align and insert range fork pin in shift sector slot.

(13) Install mode fork and shift rail in sliding clutch (Fig. 72).

(14) Install mainshaft/mode fork assembly (Fig. 73). Guide mainshaft through hub and into input gear and shift rail through range fork and into case bore.

**Fig. 69 Correct Alignment Of Struts And Sliding Clutch**

2 - RANGE FORK

(15) Install new o-ring on vacuum/indicator switch, if necessary. Install vacuum/indicator switch (Fig. 74). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

(16) Install new sector shaft o-ring and o-ring retainer in sector shaft bore (Fig. 75). Lubricate o-ring with transmission fluid or petroleum jelly after installation.

(17) Install shift lever on sector shaft (Fig. 76).

(18) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

**Fig. 73 Installing Mainshaft And Mode Fork Assembly**

1 - MAINSHAFT AND MODE FORK ASSEMBLY

2 - SHIFT RAIL

3 - RANGE FORK

(19) Install poppet plunger and spring (Fig. 77).

(20) Install new o-ring on poppet screw and install screw in front case (Fig. 78). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

TRANSFER CASE - NV241LD (Continued)

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Install front output shaft in bearing (Fig. 79).

**Fig. 79 Front Output Shaft Installation**

- 1 - FRONT OUTPUT SHAFT
2 - BEARING

- (2) Insert front sprocket in drive chain (Fig. 80).
(3) Install drive chain around mainshaft sprocket (Fig. 80). Then position front sprocket over front shaft.

- (4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

**Fig. 80 Drive Chain And Front Sprocket Installation**

- 1 - DRIVE SPROCKET
2 - DRIVE CHAIN
3 - FRONT SPROCKET
4 - FRONT SHAFT

- (5) If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.

- (6) Install front sprocket retaining ring (Fig. 81).

**Fig. 81 Front Sprocket Retaining Ring Installation**

- 1 - FRONT SPROCKET
2 - RETAINING RING

- (7) Install spring and cup on shift rail (Fig. 82).

**Fig. 82 Shift Rail Spring And Cup Installation**

- 1 - CUP
2 - SPRING

- (8) Insert magnet in front case pocket (Fig. 83).

OIL PUMP AND REAR CASE

Lubricate the oil pump components with before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

- (1) Install new o-ring in pickup tube inlet of oil pump (Fig. 84).

- (2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches (Fig. 85). Be sure hose that connects tube to filter is securely positioned.

TRANSFER CASE - NV241LD (Continued)

**Fig. 83 Case Magnet Installation**

- 1 - MAGNET
- 2 - CASE POCKET

**Fig. 84 Pickup Tube O-Ring Installation**

- 1 - FILTER
- 2 - TUBE AND HOSE
- 3 - TUBE IN NOTCH

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 86).

**Fig. 86 Positioning Oil Pump In Rear Case**

- 1 - OIL PUMP
- 2 - REAR CASE
- 3 - FILTER
- 4 - PICKUP TUBE

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 87). Be sure oil pump and pickup tube remain in position during case installation.

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail (Fig. 88), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

(8) Check stud at end of case halves (Fig. 89). If stud was loosened or came out during disassembly, apply Loctite™ 242 to stud threads and reseal stud in case.

(9) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

TRANSFER CASE - NV241LD (Continued)

- 1 - OUTPUT BEARING
2 - RETAINING RING

(7) Tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.) torque.

(8) Install new seal in rear extension housing seal with suitable size installer tool.

(9) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

(10) Align and install rear extension on retainer (Fig. 95).

Fig. 95 Rear Extension Installation

- 1 - REAR EXTENSION
2 - RETAINER
3 - EXTENSION SEAL

TRANSFER CASE - NV241LD (Continued)

(11) Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

(2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft.lbs.).

(3) Install rear crossmember.

(4) Remove jack stand from under transmission.

(5) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Connect vacuum harness and vent hose.

(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

(8) Adjust shift linkage, if necessary.

(9) Fill transfer case with recommended transmission fluid and install fill plug.

(10) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

(11) Lower vehicle

BUSHING AND SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.
- (4) Using Remover 8158, remove bushing from extension housing.

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Position replacement bushing in extension housing with fluid port in bushing aligned with slot in housing.
- (3) Using Installer 8157, drive bushing into housing until installer seats against case.
- (4) Using Installer D-163, install seal in extension housing (Fig. 96).

80a4d332

Fig. 96 Install Rear Seal in Extension Housing

- (5) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (6) Verify proper transfer case fluid level.
- (7) Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND
REFILL

The fill and drain plugs are both in the rear case (Fig. 97).

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
- (7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).
- (8) Lower vehicle.

FLUID (Continued)

FRONT OUTPUT SHAFT SEAL

REMOVAL

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (4) Remove companion flange nut (Fig. 98). Discard nut after removal. It is not reusable.

Fig. 98 Removing Companion Flange Nut

- 1 - COMPANION FLANGE
- 2 - 1-1/8" SOCKET

(5) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

(6) Remove companion flange rubber seal from front output shaft (Fig. 99).

Fig. 99 Companion Flange Seal Removal

- 1 - FLANGE SEAL

(7) Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 (Fig. 100) as follows:

- (a) Place new seal on tool. Garter spring on seal goes toward interior of case.
- (b) Start seal in bore. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.
- (c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 101). This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

SHIFT LEVER

REMOVAL

- (1) Shift transfer case into 2H.
- (2) Remove transfer case shifter knob cap.
- (3) Remove nut holding shifter knob to shift lever.
- (4) Remove shifter knob.
- (5) Remove the shift boot from the shifter bezel.
- (6) Remove the bolts securing the shifter mechanism to the floor pan along the driver's side of the transmission tunnel (Fig. 104).
- (7) Raise and support the vehicle.
- (8) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
- (9) Remove the nuts holding the shifter mechanism to the underside of the floor pan.
- (10) Separate shift lever mechanism from the vehicle.

INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 105).

- (2) Position shift lever on vehicle.
- (3) Install nuts to hold shift lever to the underside of the body.
- (4) Install trunnion to shift lever, if necessary.
- (5) Install shift rod to trunnion, if necessary.
- (6) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).

SHIFT LEVER (Continued)

**Fig. 104 Transfer Case Shifter**

- 1 - TRANSFER CASE SHIFTER ASSEMBLY
- 2 - SHIFT ROD
- 3 - TRUNNION
- 4 - LOCK BOLT

**Fig. 105 Shifter Adjustment**

- 1 - LOCATING PIN
- 2 - ADJUSTMENT CHANNEL
- 3 - LOWER SHIFTER LEVER
- 4 - LOCATING HOLE

(7) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.

(8) Lower vehicle.

(9) Install the bolts to hold the shifter mechanism to the floor pan.

(10) Install the transfer case shifter bezel.

(11) Install the shifter boot and the shifter knob onto the shifter lever.

(12) Install nut to hold shifter knob to shift lever.

(13) Install shifter knob cap.

(14) Verify transfer case operation.

ADJUSTMENTS

ADJUSTMENT - SHIFT LEVER

(1) Move shift lever into 2H position.

(2) Raise vehicle.

(3) Loosen shift rod lock bolt at trunnion (Fig. 106).

**Fig. 106 Shift Rod Lock Bolt Location**

- 1 - TRANSFER CASE SHIFTER ASSEMBLY
- 2 - SHIFT ROD
- 3 - TRUNNION
- 4 - LOCK BOLT

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.

SHIFT LEVER (Continued)

(5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.

(6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 107).

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

TRANSFER CASE - NV241HD

DESCRIPTION

The NV241HD is a part-time transfer case with a low-range gear system. The transfer case provides three operating ranges plus a NEUTRAL position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability. Operating ranges are: 2H, 4H, and 4LO.

The synchronizer mechanism consists of a brass stop ring, synchronizer hub, and the sliding clutch (Fig. 1). The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

PTO CAPABILITY

The NV241HD transfer case has power take-off capability. A PTO gear permanently attached to the planetary carrier, and a removable PTO cover are provided for this purpose.

IDENTIFICATION

An identification tag (Fig. 2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

Fig. 2 Transfer Case Identification Tag - Typical

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

OPERATION

OPERATING RANGES

Transfer case operating ranges are:

- 2H (2-wheel drive)
- 4H (4-wheel drive)
- 4LO (4-wheel drive low range)

The 2H range is for use on any road surface at any time.

The 4H and 4LO ranges are for off road use only. They are not for use on hard surface roads. The only

exception being when the road surface is covered by ice and snow or other loose, slippery material.

The low range reduction gear system is operative in 4LO range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer case. The switch is operated by the transfer case range rod.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a NEUTRAL detent. Lever range positions are imprinted in the shift knob.

SHIFTING

The synchronizer components allow the transfer case to be shifted between the 2H and 4H operating ranges while the vehicle is in motion. The vehicle must have the transmission placed in NEUTRAL, or the clutch depressed in the case of a manual transmission, and be moving less than 2-3 MPH when shifting into the 4L operating range.

DIAGNOSIS AND TESTING - TRANSFER CASE

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Diagnosis Chart for further information.

TRANSFER CASE - NV241HD (Continued)**DIAGNOSIS CHART**

Condition	Possible Cause	Correction
Transfer Case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting. 2) If vehicle was operated for an extended period in 4H on a dry paved surface, the driveline torque load may be causing a bind. 3) Transfer case external shift linkage binding. 4) Insufficient or incorrect lubricant. 5) Internal components binding, worn, or damaged.	1) Stop vehicle and shift into desired range. Or, reduce speed to below 3-4 km/h (2-3 mph) before attempting the shift. 2) Stop vehicle and shift the transmission into neutral. Shift the transfer case to 2H and operate vehicle in 2H on dry paved surfaces. 3) Lubricate, repair, or replace linkage bushings, or tighten loose components as necessary. 4) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid. 5) Disassemble the transfer case and replace worn or damaged components as necessary.
Transfer Case noisy in all operating ranges.	1) Insufficient or incorrect lubricant.	1) Drain and refill to edge of fill hole with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
Noisy in, or jumps out of, four wheel drive low range.	1) Transfer case not completely engaged in 4L position. 2) Shift linkage out of adjustment. 3) Shift linkage loose or binding. 4) Range fork damaged, inserts worn, or fork is binding on the shift rail. 5) Low range gear worn or damaged.	1) With the transmission in NEUTRAL, or the clutch depressed in the case of a manual transmission and the vehicle moving under 3-4 km/h (2-3 mph), shift the transfer case to NEUTRAL and then shift into the 4L position. 2) Adjust linkage. 3) Tighten, lubricate, or repair linkage as necessary. 4) Disassemble unit and repair as necessary. 5) Disassemble unit and repair as necessary.
Lubricant leaking from output shaft seal or vent.	1) Transfer case overfilled. 2) Vent closed or restricted. 3) Output shaft seals damaged or installed incorrectly.	1) Drain lubricant to the correct level. 2) Clear or replace vent as necessary. 3) Replace seal as necessary. Check to ensure that another component, the propeller shaft slip yoke for example, is not causing damage to seal.
Abnormal tire wear.	1) Extended operation on hard, dry surfaces in the 4H position.	1) Operate vehicle in the 2H position on hard, dry surfaces.

TRANSFER CASE - NV241HD (Continued)

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL)
- (3) Position drain oil container under transfer case.
- (4) Remove transfer case drain plug and drain lubricant into container.
- (5) Disconnect vent hose and vacuum harness at transfer case switch.
- (6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
- (7) Support transmission with jack stand.
- (8) Remove rear crossmember.
- (9) Mark front and rear propeller shafts for assembly reference.
- (10) Remove front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.
- (12) Remove nuts attaching transfer case to transmission.
- (13) Move transfer case assembly rearward until free of transmission output shaft.
- (14) Lower jack and move transfer case from under vehicle.

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

EXTENSION HOUSING

- (1) Remove extension housing snap-ring access cover.
- (2) Remove bolts holding extension housing to rear case half.
- (3) Tap extension housing with plastic or rawhide hammer to loosen sealant.
- (4) Disengage extension housing snap-ring from rear output shaft bearing.
- (5) Separate extension housing from transfer case.

COMPANION FLANGE AND SHIFT LEVER

- (1) Shift transfer case into NEUTRAL.
- (2) Remove companion flange nut (Fig. 3). Discard nut after removal. It is not reusable.
- (3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.
- (4) Remove companion flange rubber seal from front output shaft (Fig. 4).

**Fig. 3 Removing Companion Flange Nut**

- 1 - COMPANION FLANGE
2 - 1-1/8" SOCKET

**Fig. 4 Companion Flange Seal Removal**

- 1 - FLANGE SEAL

- (5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 5).

**Fig. 5 Shift Lever Removal**

- 1 - SHIFT LEVER
2 - NUT/WASHER

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Remove output bearing retaining ring with heavy duty snap-ring pliers.
- (2) Remove output shaft bearing.
- (3) Note position of bolts that attach rear case to front case (Fig. 6). Some bolts/studs at ends of case

TRANSFER CASE - NV241HD (Continued)

require flat washers. Mark position of these bolts with paint or scribe.

(4) Remove rear case-to-front case bolts.

- 3 - PTO GEAR
- 4 - RETAINING RING

(3) Remove lock ring and front thrust washer from carrier (Fig. 34). Note that lock ring and thrust washer are both tabbed.

(4) Remove input gear from planetary carrier (Fig. 35). Lift gear straight up and out of carrier.

(5) Remove support sleeve from carrier (Fig. 36).

(6) Remove rear thrust washer (Fig. 37).

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

If any pump component is worn, or damaged, the pump must be replaced as an assembly.

TRANSFER CASE - NV241HD (Continued)

- 2 - PLANETARY CARRIER

Inspect the spline teeth on the synchronizer hub (Fig. 38). If evidence of chipping or excessive wear is apparent, replace the hub. The hooked end of each synchronizer spring should be inserted in one of the struts. In addition, the springs should not interfere with the polished gear cone or inside diameters of the hub.

Inspect the stop ring for cracks and wear. Replace the ring if necessary or if doubt exists over condition. Check a replacement synchronizer ring for proper fit on the cone with a minimum of wobble. Also check the synchronizer struts for wear or damage.

Inspect all gear teeth and splines for wear or damage. Also check splines for burrs, or nicks. Remove

minor nicks and scratches with an oil stone. Replace any part with damaged splines.

It is recommended that all retaining rings be replaced during overhaul. Most of the retaining rings can be distorted during removal and should not be reused.

Inspect the two case halves, for cracks, porosity, damaged mating surfaces, stripped bolt threads, or distortion. Replace either case half if necessary. However, stripped threads can be repaired with Heli-Coil™ stainless steel thread inserts. The case vent tube can be resecured with Loctite™ 680 if necessary.

Inspect the annulus gear. Be sure the gear teeth are in good condition. Replace the front case and annulus as an assembly if the gear is damaged.

TRANSFER CASE - NV241HD (Continued)

- 7 - MAINSHAFT

Check condition of the shift fork pads (Fig. 39). The pads should be replaced if cracked, worn, or loose (won't stay on fork).

The shift forks, clutch and sleeve should all be checked for wear, cracks, or any type of damage (Fig. 40). The shift sector shaft and detents should be inspected for wear. The mode fork and shift rail are a one-piece unit. If either part is damaged, replace the fork and rail as an assembly. Replace the shift rail cup and spring if they exhibit wear.

Inspect the planetary thrust washers (Fig. 41) carefully for wear or damage. Replace both washers if necessary.

The planetary carrier cannot be disassembled. It must be serviced as an assembly if damaged. Check condition of the pinion teeth and PTO gear teeth. If pinion tooth wear is evident, it will also be necessary to check condition of the annulus gear teeth.

ASSEMBLY

BEARINGS AND SEALS

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 42).

(2) Install locating ring on new bearing.

(3) Position case so that the forward end is facing upward.

(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 43).

J9521-43

Fig. 42 Input Shaft Bearing Removal

- 1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL C-4210

(5) Using Installer 6953, remove front output shaft bearing.

(6) Start front shaft output bearing in case (Fig. 44). Then seat bearing with Handle C-4171 and Installer 6953.

(7) Install front output bearing retaining ring.

(8) Install new front output seal in front case with Installer Tool 6888 (Fig. 45) and Tool Handle C-4171 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 46). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case. This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The

J8921-219

TRANSFER CASE - NV241HD (Continued)

(13) Inspect carrier needle bearing. If bearing is worn, rough, or damaged in any way, remove it with a brass punch and hammer (Fig. 49).

J9421-306

Fig. 49 Carrier Needle Bearing Removal

- 1 - BRASS PUNCH
- 2 - CARRIER NEEDLE BEARING

(14) Install new needle bearing in planetary carrier (Fig. 50). Use Handle C-4171 and Installer 5062 to install bearing.

J9421-329

Fig. 50 Planetary Carrier Needle Bearing Installation

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL 5062
- 3 - CARRIER BEARING

(15) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 51).

(16) Install new pilot bearing with Plug C-293-3.

(17) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 52).

80a11090

Fig. 51 Remove Input Gear Pilot Bearing

- 1 - DRIFT
- 2 - INPUT GEAR

(18) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 53). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 54).

- (8) Install retaining ring (Fig. 59).

**Fig. 59 Retaining Ring Installation**

- 1 - RETAINING RING

INPUT AND PLANETARY GEAR

- (1) Lubricate planetary pinions and annulus gear with transmission fluid.
 (2) Install planetary/input gear assembly in case (Fig. 60).
 (3) Start planetary pinions in low range annulus gear. Then tap PTO gear, with hammer handle to seat planetary pinions in annulus gear.

**Fig. 60 Planetary/Input Gear Assembly Installation**

- 1 - WOOD/RUBBER HAMMER HANDLE
 2 - PLANETARY ASSEMBLY

TRANSFER CASE - NV241HD (Continued)

(4) Install retaining ring on input gear (Fig. 61).

Fig. 61 Installing Input Gear Retaining Ring

- 1 - INPUT BEARING RETAINING RING
- 2 - SNAP-RING PLIERS
- 3 - INPUT GEAR

(5) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of input retainer. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into oil channel and feed hole in case.

(6) Align oil channel in retainer with oil feed hole in front case (Fig. 62).

(7) Install retainer on input gear shaft and front case (Fig. 63).

Fig. 62 Aligning Retainer Oil Channel and Case Feed Holes

- 1 - FEED HOLE
- 2 - FRONT CASE
- 3 - FEED CHANNEL
- 4 - BEARING RETAINER

Fig. 63 Input Bearing Retainer Installation

- 1 - FRONT CASE
- 2 - INPUT BEARING RETAINER

(8) Apply Mopar® Silicone Sealer to threads of input retainer bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

MAINSHAFT

(1) Install drive sprocket on mainshaft (Fig. 64).

Fig. 64 Drive Sprocket Installation

- 1 - MAINSHAFT
- 2 - DRIVE SPROCKET

TRANSFER CASE - NV241HD (Continued)

(2) Install brass stop ring on drive sprocket (Fig. 65).

Fig. 65 Synchronizer Stop Ring Installation

- 1 - BRASS STOP RING
- 2 - DRIVE SPROCKET

(3) Install 3 synchronizer struts and 2 springs in hub as follows:

(a) Insert first strut in hub (Fig. 66). Strut shoulders rest (and slide) on sides hub slot as shown.

(b) Insert hooked end of first spring in center of strut to secure it. Then work spring into hub (Fig. 67).

(c) Press spring inward and insert last two struts in hub slots. Be sure spring is positioned under struts to properly secure them (Fig. 68).

(d) Turn hub over and install remaining spring in hub. Position hooked end of second spring opposite the first spring's hooked end.

(4) Install assembled synchronizer hub on main-shaft (Fig. 69). Hub has shoulder on one side which goes toward sprocket (rear of shaft). Flat side of hub faces front of shaft.

(5) Install synchronizer hub retaining ring (Fig. 70). Be sure ring is fully seated before proceeding.

(6) Install sliding clutch (sleeve) on synchronizer hub (Fig. 71).

Fig. 66 Installing First Synchronizer Strut And Spring

- 2 - STRUT
- 3 - SLEEVE TOOTH NOT ALIGNED WITH STRUT
- 4 - STRUT

SHIFT FORKS AND MAINSHAFT

(1) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

(2) Lubricate mainshaft components with transmission fluid.

(3) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 73). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

Fig. 73 Shift Sector Installation

- 1 - SHIFT SECTOR
- 2 - SECTOR SHAFT

(4) Assemble range fork and sliding hub (Fig. 74). Then install fork and hub in case. Seat hub on support sleeve and seat range fork pin in shift sector slot (Fig. 75).

Fig. 74 Assembling Range Fork And Sliding Hub

TRANSFER CASE - NV241HD (Continued)

(8) Install new o-ring on vacuum/indicator switch, if necessary. Install vacuum/indicator switch (Fig. 79). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

J9421-268

Fig. 79 Vacuum/Indicator Switch Installation

- 1 - 1-1/16" SOCKET
2 - INDICATOR SWITCH

(9) Install new sector shaft o-ring and o-ring retainer in sector shaft bore (Fig. 80). Lubricate o-ring with transmission fluid or petroleum jelly after installation.

J9421-326

Fig. 80 Sector Shaft O-Ring And Retainer Installation

- 1 - SECTOR SHAFT BORE
2 - O-RING
3 - O-RING RETAINER

(10) Install shift lever on sector shaft (Fig. 81).

(11) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

J9421-271

Fig. 81 Shift Lever Installation

- 1 - SHIFT LEVER
2 - NUT/WASHER

(12) Install poppet plunger and spring (Fig. 82).

(13) Install new o-ring on poppet screw and install screw in front case (Fig. 83). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

J9421-371

Fig. 82 Poppet Plunger And Spring Installation

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Install front output shaft in bearing (Fig. 84).

J9421-351

Fig. 84 Front Output Shaft Installation

- 1 - FRONT OUTPUT SHAFT
2 - BEARING

- (2) Insert front sprocket in drive chain (Fig. 85).
(3) Install drive chain around mainshaft sprocket (Fig. 85). Then position front sprocket over front shaft.
(4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.
(5) If mainshaft and sliding clutch were unseated during chain installation, align and reseat mainshaft in input gear and hub. Then reseat synchronizer hub in sliding clutch. Press synchronizer struts inward to ease clutch back onto hub.
(6) Install front sprocket retaining ring (Fig. 86).

J9421-352

2 - RETAINING RING

TRANSFER CASE - NV241HD (Continued)

(7) Realign sliding clutch on synchronizer hub if necessary. Press synchronizer struts inward to ease realignment. Be sure mainshaft is fully seated before proceeding.

(8) Install spring and cup on shift rail (Fig. 87).

Fig. 87 Shift Rail Spring And Cup Installation

- 1 - CUP
- 2 - SPRING

(9) Insert magnet in front case pocket (Fig. 88).

Fig. 88 Case Magnet Installation

- 1 - MAGNET
- 2 - CASE POCKET

OIL PUMP AND REAR CASE

Lubricate the oil pump components before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

(1) Install new o-ring in pickup tube inlet of oil pump (Fig. 89).

(2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches (Fig. 90). Be sure hose that connects tube to filter is securely positioned.

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 91).

Fig. 89 Pickup Tube O-Ring Installation

- 1 - O-RING (PUMP PICKUP)
- 2 - PICKUP TUBE

Fig. 90 Oil Pickup Tube And Filter Position In Rear Case

- 1 - FILTER
- 2 - TUBE AND HOSE
- 3 - TUBE IN NOTCH

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 92). Be sure oil pump and pickup tube remain in position during case installation.

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail (Fig. 93), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

TRANSFER CASE - NV241HD (Continued)

- 3 - REAR CASE

**Fig. 93 Shift Rail Seated In Rear Case Bore**

- 1 - REAR CASE
- 2 - SHIFT RAIL

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

(8) Check stud at end of case halves (Fig. 94). If stud was loosened or came out during disassembly, apply Loctite™ 242 to stud threads and reseal stud in case.

(9) Apply Loctite™ 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

- flange head bolts to 47-61 N·m (35-45 ft. lbs.)
- all other bolts/nuts to 27-34 N·m (20-25 ft. lbs.)

**Fig. 94 Washer Installation On Case Stud And Dowel Bolts**

- 1 - CASE STUD/BOLT
- 2 - WASHER

(10) Install rear output bearing and snap-ring to output shaft.

TRANSFER CASE - NV241HD (Continued)

COMPANION FLANGE

(1) Install companion flange seal on front shaft (Fig. 95).

Fig. 95 Installing Flange Seal On Front Shaft

- 1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(2) Install companion flange on front shaft (Fig. 96). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

Fig. 96 Installing Companion Flange On Front Shaft

- 1 - COMPANION FLANGE

EXTENSION HOUSING AND PTO COVER

(1) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into oil pump.

(2) Position extension housing over output shaft.

(3) Spread extension housing retaining ring and seat extension housing on rear case. Verify that the retaining ring is seated in output shaft rear bearing.

(4) Install retaining ring access cover.

(5) Apply Mopar® Silicone Sealer, or equivalent, to threads of extension housing bolts. Then install bolts finger tight.

(6) Tighten extension housing bolts to 27-34 N·m (20-25 ft. lbs.) torque.

(7) Apply Mopar® Silicone Sealer to mating surface of PTO cover and to cover bolt shanks and underside of bolt heads. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.

(2) Install and tighten transfer case attaching nuts. Tighten nuts to 30-41 N·m (20-30 ft. lbs.).

(3) Install rear crossmember.

(4) Remove jack stand from under transmission.

(5) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Connect vacuum harness and vent hose.

(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.

(8) Adjust shift linkage, if necessary.

(9) Fill transfer case with recommended transmission fluid and install fill plug.

(10) Install skid plate, if equipped. (Refer to 13 - FRAMES & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION)

(11) Lower vehicle

EXTENSION HOUSING BUSHING AND SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.
- (4) Using Remover 8155, remove bushing from extension housing (Fig. 97).

80aa0fdc

Fig. 97 Extension Housing Bushing Removal

- 1 - REMOVER 8155
- 2 - EXTENSION HOUSING BUSHING

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Position replacement bushing in extension housing with fluid port in bushing aligned with slot in housing.
- (3) Using Installer 8156, drive bushing into housing until installer seats against case (Fig. 98).
- (4) Using Installer 8154, install seal in extension housing (Fig. 99).
- (5) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (6) Verify proper transfer case fluid level.
- (7) Lower vehicle.

FLUID

STANDARD PROCEDURE - FLUID DRAIN/REFILL

- (1) Raise vehicle.
- (2) Position drain pan under transfer case.
- (3) Remove drain and fill plugs and drain lubricant completely.
- (4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).
- (5) Remove drain pan.
- (6) Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, type 9602, Automatic Transmission fluid.
- (7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).
- (8) Lower vehicle.

FRONT OUTPUT SHAFT SEAL

REMOVAL

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (4) Remove companion flange nut (Fig. 100). Discard nut after removal. It is not reusable.

Fig. 100 Removing Companion Flange Nut

- 1 - COMPANION FLANGE
2 - 1-1/8" SOCKET

- (5) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

- (6) Remove companion flange rubber seal from front output shaft (Fig. 101).

Fig. 101 Companion Flange Seal Removal

- 1 - FLANGE SEAL

- (7) Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

INSTALLATION

- (1) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 (Fig. 102) as follows:

- (a) Place new seal on tool. Garter spring on seal goes toward interior of case.

- (b) Start seal in bore. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

- (c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 103). This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

Fig. 102 Front Output Seal Installation

2 - FRONT CASE SHAFT BORE
3 - FRONT OUTPUT SEAL

FRONT OUTPUT SHAFT SEAL (Continued)

(2) Install companion flange seal on front shaft (Fig. 104).

Fig. 104 Installing Flange Seal On Front Shaft

- 1 - FRONT OUTPUT SHAFT
2 - FLANGE SEAL

(3) Install companion flange on front shaft (Fig. 105). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

Fig. 105 Installing Companion Flange On Front Shaft

- 1 - COMPANION FLANGE

(4) Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

SHIFT LEVER

REMOVAL

- (1) Shift transfer case into 2H.
- (2) Remove transfer case shifter knob cap.
- (3) Remove nut holding shifter knob to shift lever.
- (4) Remove shifter knob.
- (5) Remove the shift boot from the shifter bezel.
- (6) Remove the bolts securing the shifter mechanism to the floor pan along the driver's side of the transmission tunnel (Fig. 106).

80be45f5

Fig. 106 Transfer Case Shifter

- 1 - TRANSFER CASE SHIFTER ASSEMBLY
2 - SHIFT ROD
3 - TRUNNION
4 - LOCK BOLT

- (7) Raise and support the vehicle.
- (8) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
- (9) Remove the nuts holding the shifter mechanism to the underside of the floor pan.
- (10) Separate shift lever mechanism from the vehicle.

SHIFT LEVER (Continued)

INSTALLATION

(1) If the shifter mechanism does not have a adjustment locating pin installed, align the adjustment channel on the shifter assembly to the locating hole in the lower shift lever and install an appropriately sized pin to retain the position (Fig. 107).

80be45f6

Fig. 107 Shifter Adjustment

- 1 - LOCATING PIN
- 2 - ADJUSTMENT CHANNEL
- 3 - LOWER SHIFTER LEVER
- 4 - LOCATING HOLE

- (2) Position shift lever on vehicle.
- (3) Install nuts to hold shift lever to the underside of the body.
- (4) Install trunnion to shift lever, if necessary.
- (5) Install shift rod to trunnion, if necessary.
- (6) Tighten the shift rod lock bolt to 10 N·m (90 in.lbs.).
- (7) Remove the shifter adjustment locating pin from the adjustment channel and the locating hole.
- (8) Lower vehicle.
- (9) Install the bolts to hold the shifter mechanism to the floor pan.
- (10) Install the transfer case shifter bezel.
- (11) Install the shifter boot and the shifter knob onto the shifter lever.

- (12) Install nut to hold shifter knob to shift lever.
- (13) Install shifter knob cap.
- (14) Verify transfer case operation.

ADJUSTMENTS**ADJUSTMENT - SHIFT LEVER**

- (1) Move shift lever into 2H position.
- (2) Raise vehicle.
- (3) Loosen shift rod lock bolt at trunnion (Fig. 108).

80be45f5

Fig. 108 Shift Rod Lock Bolt Location

- 1 - TRANSFER CASE SHIFTER ASSEMBLY
- 2 - SHIFT ROD
- 3 - TRUNNION
- 4 - LOCK BOLT

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion. Lubricate the shift rod and trunnion if necessary.

(5) Verify that transfer case shift lever is in 2H detent position. The 2H detent position on the transfer case shift arm is the second position from full forward.

SHIFT LEVER (Continued)

(6) Align the adjustment locating hole on the lower shifter lever with the adjustment channel on the shifter bracket assembly (Fig. 109).

80be45f6

Fig. 109 Shifter Adjustment Location

- 1 - LOCATING PIN
 - 2 - ADJUSTMENT CHANNEL
 - 3 - LOWER SHIFTER LEVER
 - 4 - LOCATING HOLE
-

(7) Insert an appropriately sized pin through into the adjustment channel and through the locating hole to hold the shifter in the correct position.

(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.

(9) Remove the locating pin from the adjustment channel and locating hole.

(10) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 1).

Lateral runout is the **wobble** of the tire or wheel.

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

Fig. 1 Checking Tire/Wheel/Hub Runout J9022-4

- 1 - RADIAL RUNOUT
- 2 - LATERAL RUNOUT

TIRES/WHEELS (Continued)

METHOD 1 (RELOCATE WHEEL ON HUB)

(1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.

(2) Check wheel bearings and adjust if adjustable or replace if necessary.

(3) Check the wheel mounting surface.

(4) Relocate wheel on the mounting, two studs over from the original position.

(5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.

(6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

(1) Remove tire from wheel and mount wheel on service dynamic balance machine.

(2) Check wheel radial runout (Fig. 2) and lateral runout (Fig. 3).

- **STEEL WHEELS:** Radial runout 0.040 in., Lateral runout 0.045 in. (maximum)

- **ALUMINUM WHEELS:** Radial runout 0.030 in., Lateral runout 0.035 in. (maximum)

(3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout, Refer to match mounting procedure.

STANDARD PROCEDURE**STANDARD PROCEDURE - TIRE ROTATION**

Tires on the front and rear axles operate at different loads and perform different steering, driving, and braking functions. For these reasons, the tires wear at unequal rates. They may also develop irregular wear patterns. These effects can be reduced by rotating the tires according to the maintenance schedule in the Owners Manual. This will improve tread life, traction and maintain a smooth quiet ride.

The recommended method of tire rotation is (Fig. 4). Other methods can be used, but may not provide the same tire longevity benefits.

Dual wheel vehicles require a different tire rotation pattern. Refer to (Fig. 5) for the proper tire rotation with dual wheels.

Fig. 4 Tire Rotation Pattern

8031e864

TIRES/WHEELS (Continued)

803f5899

Fig. 5 Dual Wheel Tire Rotation Pattern

1 - FRONT

STANDARD PROCEDURE - MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the out-board surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the out-board flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.

(2) Measure the total runout on the center of the tire tread rib with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot. Place a mark on the tire at the valve stem location (Fig. 6).

(3) Break down the tire and remount it 180 degrees on the rim (Fig. 7).

(4) Measure the total indicator runout again. Mark the tire to indicate the high spot.

(5) If runout is still excessive, the following procedures must be done.

- If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
- If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
- If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread

from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 8). This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

J9322-5

Fig. 8 Remount Tire 90 Degrees In Direction of Arrow

2 - 1ST HIGH SPOT ON TIRE

STANDARD PROCEDURE - TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 9).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 10).

TIRES

DESCRIPTION

DESCRIPTION - SPARE TIRE - TEMPORARY

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

DESCRIPTION - TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation, (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the sidewall of the tire. Refer to the chart to decipher the tire identification code (Fig. 11).

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **R** up to 106 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the sidewall.

Fig. 11 Tire Identification

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

TIRES (Continued)

DESCRIPTION - TIRE PRESSURE FOR HIGH SPEEDS

Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. For speeds up to and including 120 km/h (75 mph), tires must be inflated to the pressures shown on the tire placard. For continuous speeds in excess of 120 km/h (75 mph), tires must be inflated to the maximum pressure specified on the tire sidewall.

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

For emergency vehicles that are driven at speeds over 90 mph (144 km/h), special high speed tires must be used. Consult tire manufacturer for correct inflation pressure recommendations.

DESCRIPTION - REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DESCRIPTION - TIRE INFLATION PRESSURES

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure (Fig. 12).

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks (Fig. 13).

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

J9222-1

Fig. 12 Under Inflation Wear

1 - THIN TIRE THREAD AREAS

J9222-2

Fig. 13 Over Inflation Wear

1 - THIN TIRE THREAD AREA

For proper tire pressure specification refer to the Tire Inflation Pressure Chart provided with the vehicles Owners Manual. A Certification Label on the drivers side door pillar provides the minimum tire and rim size for the vehicle. The label also list the cold inflation pressure for these tires at full load operation

Tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. Tire pressure should be checked cold once a month. Tire pressure decreases as the ambient temperature drops. Check tire pressure frequently when ambient temperature varies widely.

Tire inflation pressures are cold inflation pressure. The vehicle must sit for at least 3 hours to obtain the correct cold inflation pressure reading. Or be driven less than one mile after sitting for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds

TIRES (Continued)

per square inch (psi) during operation. Do not reduce this normal pressure build-up.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 14).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 15).

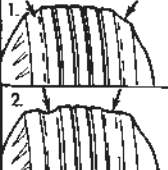

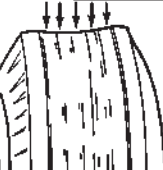

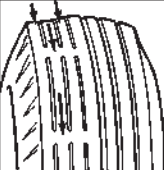

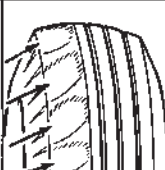

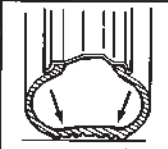

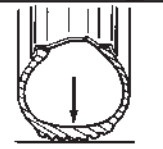

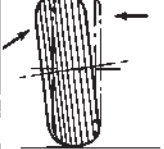

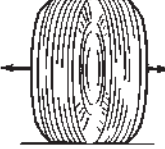

J8922-5

Fig. 14 Tread Wear Indicators

- 1 - TREAD ACCEPTABLE
- 2 - TREAD UNACCEPTABLE
- 3 - WEAR INDICATOR

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 15).

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT

*HAVE TIRE INSPECTED FOR FURTHER USE.

RN797

Fig. 15 Tire Wear Patterns

TIRES (Continued)

DIAGNOSIS AND TESTING - TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

STANDARD PROCEDURE - REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 16). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification, (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

SPARE TIRE

DESCRIPTION

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

WHEELS

DESCRIPTION

Original equipment wheels are designed for the specified Maximum Vehicle Capacity.

All models use steel or cast aluminum drop center wheels.

Cast aluminum wheels require special balance weights and alignment equipment.

Ram Truck Models equipped with dual rear wheels have eight-stud hole rear wheels. The wheels have a flat mounting surface (Fig. 17). The slots in the wheel must be aligned to provide access to the valve stem (Fig. 18).

Fig. 17 Flat Face Wheel

Fig. 18 Dual Rear Wheels

1 - INBOARD WHEEL VALVE STEM
2 - OUTBOARD WHEEL VALVE STEM

J9022-3

Fig. 19 Safety Rim

1 - FLANGE
2 - RIDGE
3 - WELL

OPERATION

The wheel (Fig. 19) has raised sections between the rim flanges and the rim well. Initial inflation of the tire forces the bead over these raised sections. In case of tire failure, the raised sections hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

WHEELS (Continued)

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

STANDARD PROCEDURE - DUAL REAR WHEEL INSTALLATION

Dual rear wheels use a special heavy duty lug nut wrench. It is recommended to remove and install dual rear wheels only when the proper wrench is available. The wrench is also use to remove wheel center caps for more information refer to Owner's Manual.

The tires on both wheels must be completely raised off the ground when tightening the lug nuts. This will ensure correct wheel centering and maximum wheel clamping.

A two piece flat face lug nut with right-hand threads is used for retaining the wheels on the hubs (Fig. 20).

SPECIFICATIONS

TORQUE CHART

TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Lug Nut BR2500 (8 Stud Wheel)	180	135	—
Lug Nut BR3500 (8 Stud Dual Wheel)	195	145	—

The dual rear wheel lug nuts should be tightened according to the following procedure:

- Place two drops of oil to the interface of the nut/washer (Fig. 20) before installing on the wheel stud.

NOTE: Do not use more than two drops of oil on the nut/washer, since the center caps attach in this area.

80a410f9

Fig. 20 Oil Location

1 - PLACE TWO DROPS OF OIL HERE

- Tighten the wheel lug nuts in the numbered sequential pattern until they are snug tight. Then tighten lug nut to specified torque following same number sequence, (Refer to 22 - TIRES/WHEELS/WHEELS - SPECIFICATIONS).

- Tighten lug nuts in same numbered sequence a second time to the specified torque. This will ensure that the wheels are thoroughly mated.

- Check lug nut specified torque after 100 miles (160 kilometers). Also after 500 miles (800 kilometers) of vehicle operation.

NOTE: Wheel lug nuts should be tightened to specified torque at every maintenance interval thereafter.

STUDS

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (4) Remove the stud from the hub with Remover C-4150A (Fig. 21).

Fig. 21 Wheel Stud Removal

- 1 - REMOVER
2 - WHEEL STUD

INSTALLATION

- (1) Install the new stud into the hub flange.
- (2) Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
- (3) Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
- (4) Remove the lug nut and washers.
- (5) Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
- (6) Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE), use new the lug nut on stud or studs that were replaced.
- (7) Remove the support and lower vehicle.

WHEEL COVER

REMOVAL

- (1) Insert a hub/cap remover/installer combination tool around the circumference of the wheel between the wheel and wheel trim cover.
- (2) Twist the tool to remove wheel trim cover.

INSTALLATION

INSTALLATION - REAR

- (1) Install one 1 1/2 in. valve stem extension on each rear inner wheel.

NOTE: A 3/8 in. drive 10mm deep wheel socket with a 10 in. or greater extension can be used to remove the existing valve stem cap and install the extension.

- (2) Install one 1 in. valve stem extension on each outer wheel.
- (3) Align the cooling windows of the wheel skin with the cooling windows of the wheel. Seat one side of the wheel skin's retainer onto the wheel. Using a rubber mallet, strike the wheel skin on the outer circumference. Strike at several locations around the circumference until the skin is fully seated.

NOTE: The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/cap and the wheel.

- (4) Tug on the hub/cap wheel skin to ensure that they are properly installed.

INSTALLATION - FRONT

- (1) Align the valve stem with the notch in the wheel skin.
- (2) Seat on side of the wheel skin's wire retainer on to the wheel.
- (3) Using a rubber mallet, strike the opposite side of the wheel skin until the skin is properly seated.

NOTE: The wheel skin and the hub cap are fully seated when there is a consistent gap between the skin/ cap and the wheel.

- (4) Tug on the hub cap/wheel skin to ensure that they are properly installed.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

- WARNING: USE AN OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**
- **AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**
 - **DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

- CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.**
- **Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
 - **Always have a fire extinguisher ready for use when welding.**
 - **Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.**
 - **Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
 - **Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
 - **Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

BODY (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.

- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.

- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations refer to Group 0, Lubrication and Maintenance, General Information section.

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BODY (Continued)

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

DIAGNOSIS AND TESTING - WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high

cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

Wind noise can also be caused by improperly fitted exterior moldings or body ornamentation. Loose moldings can flutter, creating a buzzing or chattering noise. An open cavity or protruding edge can create a whistling or howling noise. Inspect the exterior of the vehicle to verify that these conditions do not exist.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

APPLIQUE

REMOVAL

(1) Apply a length of masking tape on the body, parallel to the top edge of the applique to use as a guide, if necessary.

(2) Warm the tailgate applique and tailgate metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(3) Pull applique from tailgate (Fig. 1).

INSTALLATION

(1) Remove adhesive tape residue from painted surface of tailgate.

(2) If applique is to be reused, remove tape residue from applique. Clean back of applique with MOPAR®, Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of applique.

(3) Clean tailgate surface with MOPAR®, Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth. An adhesion promoter must be applied to ensure proper applique adhesion.

(4) Remove protective cover from tape on back of applique. Apply applique to body below the masking tape guide (Fig. 1).

Fig. 1 Tailgate Applique

- 1 - TAILGATE
- 2 - TAILGATE
- 3 - ADHESIVE TAPE
- 4 - APPLIQUE

(5) Remove masking tape guide and heat tailgate and applique, see step one. Firmly press applique to tailgate to assure adhesion.

DECALS

REMOVAL

- (1) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
- (2) Peel tape stripe from body panel using an even pressure pull.
- (3) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

INSTALLATION

- (1) Clean painted body surface with Mopar® Super Clean solvent or equivalent and a lint free cloth.
- (2) Remove protective cover from back side of decal.
- (3) Position decal properly on body.
- (4) Press decal firmly to body with palm of hand.
- (5) If temperature is below 21°C (70°F) warm decal with a heat lamp or gun to assure adhesion. Do not exceed 65°C (150°F) when heating emblem.

- 6 - HANDLE

HANDLE ESCUTCHEON

REMOVAL

- (1) Lift and hold tailgate latch release handle.
- (2) Using a trim stick (C-4755), pry bottom of escutcheon outward to disengage clips.
- (3) Rotate escutcheon upward to disengage clip above release handle.
- (4) Push escutcheon downward from behind to clear handle.
- (5) Separate escutcheon from tailgate (Fig. 2).

INSTALLATION

- (1) Insert upper ends of escutcheon into handle opening.
- (2) Lift escutcheon upward from behind release handle.
- (3) Press bottom of escutcheon inward to engage clips.

LATCH

REMOVAL

- (1) Remove tailgate latch handle escutcheon (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - REMOVAL).
- (2) Open tailgate.
- (3) Disengage linkage rod from latch handle.
- (4) Remove screws attaching latch to tailgate (Fig. 3).
- (5) Separate latch from tailgate.
- (6) Pull latch and linkage rod from tailgate (Fig. 4).

INSTALLATION

- (1) Position latch and linkage rod in tailgate.
- (2) Install upper screw attaching latch to tailgate.
- (3) Install lower screw attaching check cable and latch to tailgate.
- (4) Engage linkage rod to latch handle.
- (5) Install tailgate latch handle escutcheon (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - INSTALLATION).

Fig. 4 Tailgate Latch and Linkage Rod

LATCH HANDLE

REMOVAL

- (1) Remove tailgate latch handle escutcheon (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - REMOVAL).
- (2) Disengage clips holding linkage rods to latch handle.
- (3) Separate linkage rods from handle.
- (4) Remove screws attaching latch handle to tailgate (Fig. 5).
- (5) Separate latch handle from tailgate.

J9423-32

Fig. 5 Tailgate Latch Handle

- 1 - SCREW
2 - TAILGATE
3 - HANDLE ASSEMBLY

INSTALLATION

- (1) Position latch handle in tailgate.
- (2) Install screws attaching latch handle to tailgate.
- (3) Install linkage rods to latch handle.
- (4) Engage clips to linkage rods.
- (5) Install tailgate latch handle escutcheon. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/HANDLE ESCUTCHEON - INSTALLATION)

LATCH STRIKER

REMOVAL

- (1) Open tailgate.
- (2) Mark outline of striker on cargo box jamb to aid installation.
- (3) Using a Torx drive wrench, remove striker and washer from cargo box (Fig. 6) .

J9423-102

Fig. 6 Tailgate Striker

- 1 - TAILGATE STRIKER
2 - CARGO BOX

INSTALLATION

- (1) Position striker and washer on jamb using alignment outline as reference and install with Torx drive wrench.

SLAM BUMPER

REMOVAL

- (1) Open tailgate.
- (2) Remove screw holding slam bumper to cargo box (Fig. 7).
- (3) Separate slam bumper from vehicle.

Fig. 7 Tailgate Slam Bumper

- 1 - CARGO BOX
- 2 - SLAM BUMPER
- 3 - TAILGATE

INSTALLATION

- (1) Position slam bumper on vehicle.
- (2) Install screw holding slam bumper to cargo box.
- (3) Close tailgate and verify operation.

CHECK CABLE

REMOVAL

- (1) Open tailgate.
- (2) Pry lock tab outward to clear stud head on cargo box (Fig. 8).
- (3) Push cable end forward until stud head is in clearance hole portion of cable end.
- (4) Separate cable end from stud.
- (5) Remove screw attaching cable to tailgate.
- (6) Separate check cable from tailgate.

INSTALLATION

- (1) Position check cable on tailgate.
- (2) Install screw attaching small end of cable to tailgate.
- (3) Position large end of cable onto stud head and slide downward to secure lock tab.

Fig. 8 Tailgate Check

- 1 - TAILGATE STRIKER
- 2 - SCREW DRIVER
- 3 - TAILGATE CHECK CABLE
- 4 - LOCK TAB

TAILGATE

REMOVAL

- (1) Open tailgate.
- (2) Disconnect tailgate marker light harness, if equipped.
- (3) Remove tailgate check cables (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/CHECK CABLE - REMOVAL).
- (4) Close tailgate until the notch in the right hand collar aligns with the pivot pin.
- (5) Slip tailgate hinge collar from pivot pins.
- (6) Slide tailgate to the right and separate left hand collar from the pivot pin.
- (7) Separate tailgate from vehicle.

INSTALLATION

- (1) Position tailgate collar on left hand pivot pin and slide tailgate to the left.
- (2) Raise tailgate until the notch in the right hand collar aligns with the pivot pin.
- (3) Install tailgate check cables (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/CHECK CABLE - INSTALLATION).
- (4) Connect tailgate marker light harness, if equipped.

APPLIQUE

REMOVAL

- (1) Using a heat lamp, warm B-pillar to 38° C (100° F).
- (2) Remove glass run weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR GLASS RUN WEATHERSTRIP - REMOVAL).
- (3) Remove outer belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - REMOVAL).
- (4) Using an even pressure pull, peel B-pillar applique away from the B-pillar.

INSTALLATION

Installation equipment needed:

- Lint free applicator cloth
- six inch applicator squeegee
- Piercing pin

- (1) Clean B-pillar using Mopar Super Kleen or equivalent.
- (2) Wipe surface with a lint free cloth.

- (3) Using a heat gun, warm surface to 22° C (70° F).

- (4) Fold down, up/down locator tab (1a or 1b) (Fig. 1) along crease.

- (5) Remove carrier from adhesion strip (2).

- (6) Using up/down locator tab (1a or 1b) and fore/aft locator tab (3a or 3b), position the applique on the upper portion of the B-pillar.

- (7) Using the lower edge locator (4), position the applique on the lower portion of the B-pillar.

- (8) Verify the applique is positioned correctly and press the adhesion strip (2) to the door to temporarily secure it in place.

- (9) Remove the carrier for the applique.

- (10) Holding the applique from the surface, apply firm downward pressure with a six inch applicator squeegee. Ensure the lower rear edge (4) is aligned correctly.

- (11) Wrap edges around door to at least a 90° angle.

- (12) Remove premask by pulling in a firm continuous manner from top down at 180°.

- (13) Complete wrapping applique around the door edges.

APPLIQUE (Continued)

(14) Inspect for air bubbles. Small bubbles can be pierced with a sharp pin and smoothed out.

(15) Install outer belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - INSTALLATION).

(16) Install glass run weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR GLASS RUN WEATHERSTRIP - INSTALLATION).

- 4 = Rear Edge Locator

DOOR

REMOVAL

- (1) Remove cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
- (2) Disengage door wire harness connector of instrument panel harness and push door harness through access hole in pillar.
- (3) Remove hidden bolts attaching door hinge to hinge pillar from behind cowl panel (Fig. 2).
- (4) Using a grease pencil or equivalent, mark the outline of the door hinges on the hinge pillar to aid installation.
- (5) Support door on a suitable lifting device.
- (6) Remove bolts attaching lower door hinge to hinge pillar (Fig. 3).
- (7) While holding door steady on lift, remove bolts attaching upper door hinge to hinge pillar.
- (8) Separate door from vehicle.

Fig. 2 Door Hinge Hidden Bolt

- 1 - HINGE
- 2 - DOOR HINGE SCREW
- 3 - A—PILLER
- 4 - DOOR

INSTALLATION

- (1) While holding door steady on lift, position door at A-pillar.
- (2) Align hinges using reference marks.
- (3) Install bolts attaching upper door hinge to hinge pillar.
- (4) Install bolts attaching lower door hinge to hinge pillar (Fig. 3).
- (5) Install hidden bolts attaching door hinge to hinge pillar from behind cowl panel (Fig. 2).
- (6) Align door to achieve equal spacing on all sides and flush across the gaps.
- (7) Tighten hinge bolts to 28 N-m (21 ft. lbs.) torque.
- (8) Route harness through door and engage door wire harness connector.
- (9) Install cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT - FRONT DOOR FORE/AFT

Fore/aft (lateral) door adjustment is done by loosening the hinge to cowl screws one hinge at a time. Then move the door to the correct position.

- (1) Support the door with a padded floor jack.

DOOR (Continued)

Fig. 3 Door

- 1 - DOOR
- 2 - A—PILLER
- 3 - LOWER DOOR HINGE
- 4 - SCREW
- 5 - UPPER DOOR HINGE

(2) Loosen the hinge to cowl screws, if necessary, refer to the front door hinge removal/installation procedure for hinge fastener location. Move the door to the correct fore/aft position.

(3) Tighten the hinge to cowl screws.

(4) Remove the floor jack from the door.

ADJUSTMENT - FRONT DOOR UP/DOWN

Up/down door adjustment is done by loosening the hinge to cowl fasteners at both hinges. Then move the door to the correct position.

(1) Support the door with a padded floor jack.

(2) Loosen hinge to cowl fasteners at both hinges. Move the door to the correct up/down position.

(3) Tighten the hinge to cowl fasteners.

(4) Remove the floor jack from the door.

ADJUSTMENT - FRONT DOOR IN/OUT

In/out door adjustment is done by loosening the hinge to door fasteners. Then move the door to the correct position.

(1) Support the door with a padded floor jack.

(2) Loosen the applicable hinge to door fasteners. Move the door to the correct in/out position.

(3) If necessary, loosen the other hinge to door fasteners and move the door to the correct in/out position.

(4) Tighten the hinge to door fasteners.

(5) Remove the floor jack from the door.

DOOR GLASS

REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Remove inner door belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL).

(3) Align door glass lift plate to access holes in inner door panel.

(4) Loosen bolts attaching front lower run channel to inner door panel.

(5) Remove nuts attaching door glass to lift plate (Fig. 4).

(6) Separate glass from lift plate.

(7) Lift glass upward and out of opening at top of door.

Fig. 4 Door Glass

- 1 - GLASS LIFT PLATE
- 2 - GLASS
- 3 - NUT
- 4 - REGULATOR ARM LOWER CHANNEL

INSTALLATION

(1) Position in door.

(2) Insert glass in lift plate.

CAUTION: Do not exceed 11 N·m (8 ft. lbs.) torque when tightening the nuts that attach the glass to the lift plate.

(3) Install nuts attaching glass to lift plate (Fig. 4). Tighten nuts to 9 N·m (80 in. lbs.) torque.

(4) Tighten bolts attaching front lower run channel to inner door panel.

DOOR GLASS (Continued)

(5) Install inner door belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - INSTALLATION).

(6) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

EXTERIOR HANDLE

REMOVAL

(1) Remove the waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Raise the window to the closed position.

(3) Remove fastener access plug from door end panel.

(4) Disengage clips holding latch and lock rods to door latch.

(5) Separate latch and lock rods from door latch.

(6) Remove nuts attaching outside door handle to door (Fig. 5).

(7) Separate outside door handle from door.

Fig. 5 Outside Door Handle

1 - LOCK KNOB

2 - OUTSIDE HANDLE

INSTALLATION

(1) Position outside door handle in door.

(2) Install nuts attaching outside door handle to door.

(3) Engage latch and lock rods to door latch.

(4) install access plug to door end panel.

(5) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

GLASS RUN CHANNEL

REMOVAL

(1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Raise the window to the closed position.

(3) Remove bolts holding run channel to inner door panel (Fig. 6) and (Fig. 7).

(4) Slide channel downward to disengage it from the upper glass frame.

(5) Separate door glass run channel from door.

Fig. 6 Front Glass Run Lower Channel

1 - FRONT GLASS RUN CHANNEL

Fig. 7 Rear Glass Run Lower Channel

1 - REAR GLASS RUN CHANNEL

INSTALLATION

(1) Position door glass run channels on inner door panel.

(2) Slide channel upward to engage it in the upper glass frame.

(3) Install bolts attaching run channels to inner door panel (Fig. 6) and (Fig. 7).

(4) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

HINGE

REMOVAL

- (1) Remove cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
- (2) Remove hidden bolt attaching door hinge to hinge pillar (Fig. 2).
- (3) Support door on a suitable lifting device.
- (4) Using a grease pencil or equivalent, mark the outline of the door hinge on the hinge pillar to aid installation.
- (5) Remove bolts attaching door hinge to hinge pillar (Fig. 3).
- (6) Remove nut and bolt attaching door hinge to door end frame (Fig. 8).
- (7) Separate door hinge from vehicle.

Fig. 8 Door Hinge

- 1 - UPPER HINGE
- 2 - LOWER HINGE
- 3 - STUD
- 4 - HINGE PILLAR
- 5 - DOOR
- 6 - STUD

INSTALLATION

- (1) If necessary, paint replacement door hinge before installation.
- (2) Position hinge on door end frame.
- (3) Align hinge using reference marks.
- (4) Install nuts and bolts attaching door hinge to door end frame. Tighten nuts and bolts to 28 N·m (21 ft. lbs.) torque.
- (5) Install bolts attaching door hinge to hinge pillar. Tighten bolts to 28 N·m (21 ft. lbs.) torque.

(6) Install hidden bolt attaching door hinge to hinge pillar. Tighten bolt to 28 N·m (21 ft. lbs.) torque.

(7) Remove support.

(8) Install cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

INSIDE HANDLE ACTUATOR

REMOVAL

- (1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
- (2) Raise the window to the closed position.
- (3) Remove the screws attaching the actuator to the door (Fig. 9).

Fig. 9 Front Door Inside Handle Actuator

- 1 - INSIDE HANDLE
- 2 - ACTUATOR

INSTALLATION

- (1) Install the screws attaching the actuator to the door.
- (2) Test handle for proper operation.
- (3) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

LATCH

REMOVAL

- (1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
- (2) Disengage clips attaching lock and latch rods to door latch.
- (3) Disconnect power door lock/latch connector, if equipped (Fig. 10).
- (4) Remove screws attaching door latch to door end panel (Fig. 11).
- (5) Separate door latch/lock from door.

LATCH (Continued)

**Fig. 10 Power Lock/Latch Connector**

- 1 - INSIDE HANDLE - TO - LATCH ROD
- 2 - LOCK KNOB - TO - LATCH ROD
- 3 - POWER LATCH CONNECTOR
- 4 - LOCK CYLINDER - TO - LATCH ROD

- 2 - LATCH
- 3 - INSIDE HANDLE - TO - LATCH ROD
- 4 - LOCK CYLINDER - TO - LATCH ROD
- 5 - LOCK KNOB - TO - LATCH ROD

INSTALLATION

- (1) Position door latch/lock in door.
- (2) Install screws attaching door latch to door end panel. Tighten screws to 10 N·m (89 in. lbs.) torque.
- (3) Connect power door lock/latch connector, if equipped.

(4) Engage clips attaching lock and latch rods to door latch.

(5) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

ADJUSTMENTS**ADJUSTMENT - FRONT DOOR LATCH**

(1) Insert a 4-mm (5/32-in) hex-wrench through the elongated hole in the door end frame near the latch striker opening (Fig. 12).

(2) Loosen torx head screw on the side of the latch linkage.

(3) Lift upward on outside door handle and release it.

(4) Tighten torx head screw on latch.

(5) Verify latch operation.

**Fig. 12 DOOR LATCH ADJUSTMENT**

- 1 - HEX WRENCH

LATCH STRIKER**REMOVAL**

(1) Mark outline of striker base on B-pillar with a grease pencil or equivalent to aid installation.

(2) Remove screws attaching striker to B-pillar (Fig. 13).

(3) Separate striker from vehicle.

INSTALLATION

(1) Position striker on vehicle and align with reference marks.

(2) Install screws attaching striker to B-pillar. Tighten screws to 28 N·m (21 ft. lbs.) torque. (Fig. 13).

LATCH STRIKER (Continued)

J9423-49

J9523-134

Fig. 14 Door Lock Cylinder

- 1 - DOOR HANDLE
- 2 - LOCK CYLINDER
- 3 - LOCK CYLINDER RETAINER
- 4 - LOCK RETAINING CLIP

LOCK CYLINDER

REMOVAL

- (1) Remove outside door handle (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL).
- (2) Remove clip securing lock cylinder to outside door handle (Fig. 14).
- (3) Pull lock cylinder from door handle.

INSTALLATION

- (1) Position lock cylinder in door handle.
- (2) Install clip securing lock cylinder to outside door handle.
- (3) Install outside door handle (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION).

SIDE VIEW MIRROR FLAG

REMOVAL

- (1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
- (2) Remove flag door seal.
- (3) Remove nuts attaching mirror flag cover to door frame (Fig. 15).
- (4) Separate flag cover from door.

J9423-60

Fig. 15 Mirror Flag Cover

- 1 - NUT
- 2 - DOOR
- 3 - FLAG COVER ASSEMBLY

SIDE VIEW MIRROR FLAG (Continued)

INSTALLATION

- (1) Position flag cover on door.
- (2) Install nuts attaching mirror flag cover to door frame.
- (3) Install flag door seal.
- (4) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

TRIM PANEL**REMOVAL**

- (1) Roll window down.
- (2) Remove window crank (Fig. 16), if equipped.
- (3) Remove screw attaching trim panel to outside mirror frame.
- (4) Remove screws attaching pull cup to door (Fig. 17).
- (5) Using a trim panel removal tool, disengage clips around perimeter of trim panel, attaching trim panel to door.
- (6) While holding bottom of trim panel away from door, simultaneously lift upward and inboard.
- (7) Disengage power mirror switch connector, if equipped.
- (8) Disengage power window/lock switch connectors from switch panel, if equipped (Fig. 18).
- (9) Separate trim panel from door.

80ad2f28

Fig. 16 Window Crank—Typical

- 1 - WINDOW CRANK REMOVAL TOOL
- 2 - WINDOW CRANK

INSTALLATION

NOTE: When replacing door trim panel, installer must replace the X-mas tree style pin 6506878aa.

- (1) Engage power mirror switch connector, if equipped.
- (2) Engage power window/lock switch connectors to switch panel, if equipped.

J9423-34

TRIM PANEL (Continued)

- (3) Position trim panel on door.
- (4) Engage clips around perimeter of trim panel, attaching trim panel to door.
- (5) Install screws attaching pull cup to door.
- (6) Install screw attaching trim panel to outside mirror frame.
- (7) Install window crank, if equipped.

WATERDAM

REMOVAL

- (1) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Peel waterdam away from adhesive around perimeter of inner door panel (Fig. 19).

J9423-37

Fig. 19 Door Water Dam

- 1 - WATER DAM
2 - DOOR

INSTALLATION

- (1) Position and align water dam with adhesive around perimeter of inner door panel.
- (2) Press water dam onto inner door panel to secure.
- (3) Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

WINDOW REGULATOR

REMOVAL

- (1) Remove the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
- (2) Remove nuts attaching door glass to window regulator.

- (3) Remove glass from door or move glass to full up position and secure glass to door with tape.
- (4) Disengage power window motor wire connector from door harness, if equipped.
- (5) Remove bolts attaching window regulator to inner door panel.
- (6) Separate window regulator from door panel (Fig. 20).
- (7) Extract window regulator through access hole in inner door panel.

J9423-38

Fig. 20 Door Glass Window Regulator

- 1 - DOOR ASSEMBLY
2 - WINDOW REGULATOR ASSEMBLY
3 - DOOR GLASS ASSEMBLY
4 - WINDOW REGULATOR

INSTALLATION

- (1) Position window regulator in door through access hole.
- (2) Install bolts attaching window regulator to inner door panel.
- (3) Engage power window motor wire connector to door harness, if equipped.
- (4) Install glass in lift plate.
- (5) Install the door waterdam (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

AIR EXHAUSTER

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Peel back waterdam.
- (3) Remove push-in fastener attaching air exhauster to cargo door inner panel (Fig. 1).
- (4) Separate air exhauster from cargo door.

INSTALLATION

- (1) Position air exhauster in cargo door.
- (2) Engage air exhauster upper tabs with cargo door inner panel.
- (3) Install push-in fastener attaching air exhauster to cargo door inner panel (Fig. 1).
- (4) Reposition waterdam.
- (5) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

CHECK

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Remove the bolts attaching the door check to the cab C-pillar.
- (3) Remove the nuts attaching the door check to the cargo door (Fig. 2).
- (4) Remove the door check through the access hole in the cargo door.

80ace4bb

Fig. 2 Door Check

- 1 - CARGO DOOR
2 - DOOR CHECK
3 - CARGO DOOR INNER PANEL

INSTALLATION

- (1) Position the door check in the cargo door through the access hole.
- (2) Install the nuts attaching the door check to the cargo door (Fig. 2).
- (3) Install the bolts attaching the door check to the cab C-pillar.
- (4) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

DOOR

REMOVAL

- (1) Using a grease pencil or equivalent, mark the position of the hinge on the door.
- (2) Remove the cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (3) Remove the cargo door check strap from the cab C-pillar (Refer to 23 - BODY/DOOR - CARGO/CHECK - REMOVAL).

(4) Using the access hole in the cargo door inner panel, disengage the speaker wire from the speaker and route the wire through the door.

- (5) Support the cargo door on a suitable device.
- (6) Remove the bolts attaching the hinges to the cargo door (Fig. 3).

80ace4ba

Fig. 3 Cargo Door

- 1 - CARGO DOOR
2 - CARGO DOOR HINGE

INSTALLATION

- (1) Support the cargo door on a suitable device.
- (2) Using the alignment marks, position the door at the hinge.
- (3) Install the bolts attaching the hinges to the cargo door (Fig. 3). Tighten the bolts to 28 N·m (21 ft. lbs.) torque.
- (4) Route the speaker wire through the door and using the access hole in the cargo door inner panel, engage the speaker wire at the speaker.
- (5) Install the cargo door check strap at the cab C-pillar (Refer to 23 - BODY/DOOR - CARGO/CHECK - INSTALLATION).
- (6) Install the cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT - CARGO DOOR

CARGO DOOR FORE/AFT AND UP/DOWN

- (1) As applicable, remove the C-pillar trim to access the bolts attaching the cargo door to the C-pillar.
- (2) Support the door with a padded floor jack.
- (3) Loosen the applicable C-pillar to hinge bolts and move the door to the correct position. If neces-

DOOR (Continued)

sary, loosen the other C-pillar to hinge bolts and move the door to the correct position.

(4) Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(5) If necessary, loosen the bolts attaching the lower striker and move striker to the correct position.

(6)

If necessary, loosen the bolts attaching the upper latch to the cargo door and move to the correct position. (Fig. 4)

Fig. 4 CARGO DOOR UPPER LATCH

- 1 - UPPER LATCH
- 2 - ADJUSTMENT SLOTS
- 3 - CARGO DOOR

CARGO DOOR IN/OUT

(1) Loosen the applicable hinge to door fasteners and move the door to the correct position.

(2) Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

EXHAUST VENT

REMOVAL

(1) Using a trim stick, carefully pry bottom of vent to disengage from door (Fig. 5).

(2) Separate vent from door.

INSTALLATION

(1) Position upper side of vent in door opening.

(2) Slide upward until tabs on top edge are in place.

(3) Push the lower side of the vent towards the door until the tabs snap into place.

(4) Ensure vent is fully seated.

Fig. 5 Cargo Door Exhaust Vent

- 1 - CARGO DOOR
- 2 - EXHAUST VENT

HINGE

REMOVAL

(1) Remove cargo door (Refer to 23 - BODY/DOOR - CARGO/DOOR - REMOVAL).

(2) Remove quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Remove bolts attaching hinge to C-pillar (Fig. 6).

(4) Separate hinge from vehicle.

Fig. 6 Cargo Door Hinge

- 1 - CARGO DOOR
- 2 - CAB
- 3 - UPPER HINGE
- 4 - LOWER HINGE
- 5 - DOOR CHECK

HINGE (Continued)

INSTALLATION

- (1) Position hinge on vehicle.
- (2) Install bolts attaching hinge to C-pillar (Fig. 6). Tighten bolts to 28 N·m (21 ft. lbs.) torque.
- (3) Install quarter trim panel (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).
- (4) Install cargo door (Refer to 23 - BODY/DOOR - CARGO/DOOR - INSTALLATION).

INSIDE HANDLE ACTUATOR

REMOVAL

NOTE: The cargo door inside handle actuator is heat staked to the trim panel (Fig. 7).

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Disengage release cable from inside handle.
- (3) Using a small file, drummel tool or die grinder, remove the melted material securing the handle to the trim panel.
- (4) Separate the handle from the trim panel.

Fig. 7 Heat Staked Locations

- 1 - RELEASE CABLE
- 2 - HEAT STAKED LOCATIONS
- 3 - CARGO DOOR TRIM PANEL
- 4 - HEAT STAKED LOCATIONS

INSTALLATION

- (1) Position the handle in the trim panel.
- (2) Using a soldering gun, and using the additional studs, heat stake the handle to the trim panel.
- (3) Engage release cable to inside handle.
- (4) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

LATCH - LOWER

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Peel back waterdam to access air exhauster.
- (3) Remove cargo door air exhauster (Refer to 23 - BODY/DOOR - CARGO/AIR EXHAUSTER - REMOVAL).
- (4) Disengage lower latch to shutface handle rod at shutface handle (Fig. 8).
- (5) Remove nuts attaching lower latch to cargo door.
- (6) Separate lower latch and latch rod from cargo door.

Fig. 8 Cargo Door Lower Latch

- 1 - LOWER LATCH TO HANDLE ROD
- 2 - LOWER CARGO DOOR LATCH
- 3 - CARGO DOOR

INSTALLATION

- (1) If installing a new replacement latch:
 - (a) Engage latch rod to latch rod retaining clip in lower latch. Ensure "white" latch installation pin is in the position closest to the latch release lever (Fig. 9).
- (2) If the latch was not replaced and the existing latch is to be installed:
 - (a) Slide "white" latch installation pin to the position closest to the latch release lever.
- (3) Position lower latch and latch rod in cargo door.
- (4) Install nuts attaching lower latch to cargo door. Tighten nuts to 12 N·m (9 ft. lbs.) torque (Fig. 8).
- (5) Engage latch rod to latch rod retaining clip in lower latch.

LATCH - LOWER (Continued)

CAUTION: When engaging lower latch release rod to shutface handle, ensure lower latch rod is pushed all the way down before engaging to the handle.

- (6) Engage lower latch rod to shutface handle
- (7) Cycle the shutface handle and verify latch operation.
- (8) Install cargo door air exhauster (Refer to 23 - BODY/DOOR - CARGO/AIR EXHAUSTER - INSTALLATION).
- (9) Reposition waterdam.
- (10) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

Fig. 9 Cargo Door Lower Latch Installation Pin

- 1 - LATCH ROD RETAINING CLIP
- 2 - SLOT
- 3 - CARGO DOOR LOWER LATCH
- 4 - INSTALLATION PIN
- 5 - LATCH RELEASE LEVER

LATCH - UPPER

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Using a grease pencil or equivalent, mark the position of the bolts.
- (3) Disengage upper latch release rod from shutface handle.
- (4) Remove the bolts attaching upper latch to cargo door (Fig. 10).
- (5) Separate upper latch and latch rod from cargo door.

INSTALLATION

- (1) The new replacement latch is supplied with an alignment set screw located in the lower mounting

Fig. 10 Cargo Door Upper Latch

- 1 - CARGO DOOR
- 2 - UPPER CARGO DOOR LATCH
- 3 - UPPER LATCH TO HANDLE ROD
- 4 - ALIGNMENT SET SCREW

hole of the upper cargo door latch. If a new latch is being installed, use the following procedure:

- (a) Verify alignment set screw is fully seated in latch.
- (b) Engage latch rod to latch.
- (c) Position latch in cargo door with alignment set screw located in the lower hole.
- (d) Align bolt with reference mark.
- (e) Install upper bolt. Tighten bolt to 23 N·m (17 ft. lbs.) torque.
- (f) Engage latch rod to shutface handle.
- (g) Remove alignment set screw from lower hole.
- (h) Align lower bolt with reference mark.
- (i) Install bolt in lower hole. Tighten bolt to 23 N·m (17 ft. lbs.) torque.

CAUTION: When engaging upper latch release rod to shutface handle, ensure the latch rod is pushed all the way up before engaging into the shutface handle.

- (2) If the latch was not replaced and the existing latch is to be installed:
 - (a) Engage latch rod to latch.
 - (b) Position upper latch and latch rod in cargo door.
 - (c) Align bolts with reference marks.
 - (d) Install the bolts attaching upper latch to cargo door (Fig. 10). Tighten the bolts to 23 N·m (17 ft. lbs.) torque.
 - (e) Engage upper latch release rod to shutface handle.
- (3) Cycle the shutface handle and verify latch operation.

LATCH - UPPER (Continued)

(4) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

LATCH STRIKER - LOWER

REMOVAL

- (1) Using a grease pencil or equivalent, mark the position of the lower striker on the sill.
- (2) Remove the torx screws attaching the striker to the sill (Fig. 11) .
- (3) Separate striker from sill.

INSTALLATION

- (1) Using the alignment marks, position striker on sill.
- (2) Install the torx screws attaching the striker to the sill (Fig. 11) . Tighten screws to 28 N·m (21 ft. lbs.) torque.

LATCH STRIKER - UPPER

REMOVAL

- (1) Remove screws attaching striker trim cover to roof.
- (2) Remove bolts attaching striker to roof (Fig. 11).
- (3) Separate upper striker from roof.

Fig. 11 Cargo Door Strikers

- 1 - UPPER STRIKER
- 2 - LOWER STRIKER

INSTALLATION

- (1) Position upper striker on roof.
- (2) Install bolts attaching striker to roof (Fig. 11) . Tighten bolts to 23 N·m (17 ft. lbs.) torque.
- (3) Install the screws attaching striker trim cover to roof.

RELEASE CABLE

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Disengage release cable from inside release handle (Fig. 12).
- (3) Peel back waterdam
- (4) Disengage release cable from shutface door handle (Fig. 13).
- (5) Separate release cable from cargo door.

Fig. 12 Cargo Door Release Handle

- 1 - CARGO DOOR RELEASE CABLE
- 2 - CARGO DOOR RELEASE HANDLE

INSTALLATION

- (1) Position release cable in cargo door.
- (2) Engage release cable to shutface door handle.
- (3) Reposition waterdam
- (4) Engage release cable to inside release handle.
- (5) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

RELEASE CABLE (Continued)

**Fig. 13 Shutface Door Handle**

- 1 - RELEASE CABLE
- 2 - SHUTFACE DOOR HANDLE

**Fig. 15 Shutface Handle**

- 1 - CARGO DOOR RELEASE CABLE
- 2 - CARGO DOOR
- 3 - SHUTFACE DOOR HANDLE

SHUTFACE HANDLE

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Peel back waterdam.
- (3) Disengage upper and lower latch release rods from shutface handle (Fig. 14).
- (4) Disengage cargo door release cable.
- (5) Remove screws attaching shutface handle to cargo door (Fig. 15).
- (6) Separate handle from cargo door.

**Fig. 14 Cargo Door Latch Rods**

- 1 - UPPER LATCH ROD
- 2 - SHUTFACE HANDLE
- 3 - LOWER LATCH ROD

INSTALLATION

- (1) Position handle in cargo door.
- (2) Install screws attaching shutface handle to cargo door (Fig. 15).
- (3) Engage cargo door release cable.

CAUTION: When engaging upper and lower latch release rods to shutface handle, ensure the upper latch rod is pushed all the way up and the lower latch rod is pushed all the way down before engaging into the shutface handle.

- (4) Engage upper and lower latch release rods to shutface handle.
- (5) Cycle the shutface handle and verify operation.
- (6) Reposition waterdam.
- (7) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

TRIM PANEL

REMOVAL

- (1) Remove the screws attaching the cargo door pull cup to the cargo door (Fig. 16).
- (2) Remove the screw attaching the inside release handle to the cargo door.

NOTE: The cargo door trim panel is secured to the cargo door with spring clips and push-in fasteners (Fig. 17).

- (3) Using a trim panel removal tool, remove the push-in fasteners attaching the trim panel to the cargo door.

TRIM PANEL (Continued)

2(4) Pull the trim panel outward to disengage the spring clips.

(5) Separate the trim panel from the cargo door.

(6) Disengage the cargo door release cable from the inside release handle (Fig. 18).

Fig. 16 Cargo Door Trim Panel

- 1 - CARGO DOOR
- 2 - PUSH-IN FASTENER
- 3 - SPRING CLIP
- 4 - CARGO DOOR TRIM

- 6 - INSIDE HANDLE

Fig. 17 Cargo Door Trim Panel Fasteners

- 1 - CARGO DOOR TRIM PANEL
- 2 - SPRING CLIPS
- 3 - PUSH-IN FASTENERS
- 4 - INSIDE RELEASE HANDLE

INSTALLATION

NOTE: When replacing door trim panel, installer must replace the X-mas tree style pins.

(1) Engage the cargo door release cable to the inside release handle (Fig. 18).

(2) Position the trim panel on the cargo door.

(3) Align all fasteners and starting at the top of the panel, push into place to secure.

(4) Install the screw attaching the inside release handle to the cargo door.

(5) Install the screws attaching the cargo door pull cup to the cargo door (Fig. 16).

Fig. 18 Cargo Door Release Cable

- 1 - CARGO DOOR RELEASE CABLE
- 2 - CARGO DOOR RELEASE HANDLE

VENT WINDOW

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Remove the screws attaching the latch to the cargo door (Fig. 19).
- (3) Remove the bolts attaching the vent glass to the cargo door (Fig. 20).
- (4) Remove the glass from the door.
- (5) If necessary, remove the latch from the glass.

Fig. 19 Cargo Door Quarter Glass Vent Window Latch

- 1 - CARGO DOOR QUARTER GLASS
2 - LATCH

Fig. 20 Cargo Door Quarter Glass Vent Window

- 1 - CARGO DOOR
2 - CARGO DOOR QUARTER GLASS

INSTALLATION

- (1) If removed, install the latch to the glass. Tighten the screw with 5 N·m (45 in. lbs.) torque.
- (2) Center the glass in the cargo door opening.
- (3) Install the bolts attaching the vent glass to the cargo door.
- (4) Install the screws attaching the latch to the cargo door.
- (5) Install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

WATERDAM

REMOVAL

- (1) Remove cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - REMOVAL).
- (2) Carefully peel waterdam from door (Fig. 21).

Fig. 21 Cargo Door Waterdam

- 1 - WATER DAM
2 - CARGO DOOR

INSTALLATION

If a replacement waterdam is being applied, clean cargo door inner panel with Mopar Super Clean or equivalent.

- (1) Position waterdam on cargo door and press into place.
- (2) install cargo door trim panel (Refer to 23 - BODY/DOOR - CARGO/TRIM PANEL - INSTALLATION).

EXTERIOR

DESCRIPTION

Exterior sheet metal components make up the exterior of the vehicle. Some exterior metal systems are welded assemblies, such as doors and hoods. Some exterior trim items are made of composite.

OPERATION

The exterior is finished in various metal stampings and composite moldings. These assemblies give the vehicle a finished appearance and protect the occupants from the elements. Some components are part of the energy absorbing system used to protect the occupants in collisions. The exterior sheet metal is repairable and adjustable for fit and finish. Welded and bonded component systems are adjustable as a

system. Trim components made of composite are stamped with the type of material used. DaimlerChrysler uses various fasteners to retain trim items. At times, it is not possible to remove trim items without damaging the fastener. If it is not possible to remove an item without damaging a component, cut or break the fasteners and use new ones when installing the component.

BODY SIDE MOLDINGS

REMOVAL

(1) Warm the effected stick-on molding and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull stick-on molding from painted surface (Fig. 1) and (Fig. 2).

BODY SIDE MOLDINGS (Continued)

80ae8333

Fig. 1 Body Side Moldings

80af619e

Fig. 2 Body Side Moldings—Dual Wheel**INSTALLATION**

(1) Clean body surface with MOPAR® Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

(2) Apply a length of masking tape on the body, parallel to the top edge of the molding to use as a guide, if necessary.

(3) Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide (Fig. 1) and (Fig. 2).

(4) Remove masking tape guide and heat body and molding, see step one. Firmly press molding to body surface to assure adhesion.

BODY STRIPES AND DECALS**REMOVAL**

(1) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Peel decal from body panel using an even pressure pull.

(3) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

INSTALLATION

The painted surface of the body panel to be covered by a decal must be smooth and completely cured before decal can be applied. Ripples and feather edging will read through if surface is not properly prepared. Clean all residue from surface.

(1) Peel paper backing away from decal exposing adhesive back of decal.

(2) Apply soap solution liberally to adhesive back of decal.

(3) Apply soap solution liberally to body panel surface.

(4) Place decal into position on body panel (Fig. 3). Smooth out wrinkles by pulling lightly on edges of decal until it lays flat on painted surface.

(5) Push air pockets from under decal to the perimeter of the panel from the center of the decal out.

BODY STRIPES AND DECALS (Continued)

80b5cb9e

Fig. 3 Decals

1 - TAPE STRIPE

(6) Squeegee soap solution and air bubbles from behind decal from the center of the panel out using a body putty applicator squeegee.

(7) Apply heat to decal to evaporate residual moisture from edges of decal.

(8) Small air or water bubbles under decal can be pierced with a pin and smoothed out.

TAPE STRIPE

REMOVAL

(1) If the panel that is being serviced is not going to be refinished, apply a length of masking tape parallel to the edge of the original tape stripe to aid installation.

(2) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(3) Peel tape stripe (Fig. 4) from body panel using an even pressure pull.

(4) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

J9423-105

Fig. 4 Tape Stripe Overlay

1 - CAB/DOOR TAPE STRIPE
2 - HOOD TAPE STRIPE

TAPE STRIPE (Continued)

INSTALLATION

The painted surface of the body panel to be covered by a tape stripe overlay must be smooth and completely cured before overlay can be applied. If painted surface is not smooth, wet sand with 600 grit wet/dry sand paper until surface is smooth. Ripples and feather edging will read through overlay if surface is not properly prepared. Clean all residue from surface.

Installation equipment:

- Pail filled with mild dish soap solution.
- Lint free applicator cloth or sponge.
- Body putty applicator squeegee.
- Heat gun or sun lamp.
- Razor knife.

(1) Spread replacement tape stripe overlay across a smooth flat work surface, finish side down.

(2) Peel paper backing away from overlay exposing adhesive back of overlay.

(3) Apply soap solution liberally to adhesive back of overlay.

(4) Apply soap solution liberally to body panel surface.

(5) Place overlay into position on body panel. Smooth out wrinkles by pulling lightly on edges of overlay until it lays flat on painted surface.

(6) Push air pockets from under overlay to the perimeter of the panel from the center of the overlay out.

(7) Squeegee soap solution and air bubbles from behind overlay from the center of the panel out using a body putty applicator squeegee (Fig. 5).

CAUTION: Do not cut into painted surface of body panel when trimming overlay to size.

(8) Trim overlay to size using a razor knife. Leave at least 13 mm (0.5 in.) for edges of doors and openings.

CAUTION: Do not overheat overlay when performing step 9.

(9) Apply heat to overlay to evaporate residual moisture from edges of overlay and to allow overlay to be stretched into concave surfaces.

(10) Edge turn overlay around doors or fenders.

(11) Install exterior trim if necessary.

(12) Small air or water bubbles under overlay can be pierced with a pin and smoothed out.

Fig. 5 Tape Stripe Application

- 1 - SQUEEGEE
- 2 - CARRIER
- 3 - BODY PANEL
- 4 - TAPE STRIPE

EXTERIOR NAME PLATES

REMOVAL

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

(1) Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

(2) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.

(3) Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.

(4) Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

INSTALLATION

(1) Remove protective cover from adhesive tape on back of emblem.

(2) Position emblem properly on body (Fig. 6).

(3) Press emblem firmly to body with palm of hand.

(4) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

EXTERIOR NAME PLATES (Continued)

80b3b1d9

Fig. 6 Exterior Nameplates

COWL GRILLE

REMOVAL

- (1) Open hood.
- (2) Remove wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL AND INSTALLATION).
- (3) Disconnect windshield washer tubing from coupling near left hood hinge.
- (4) Remove plastic nuts attaching cowl cover to cowl (Fig. 7).
- (5) Pull cowl seal from flange on front of cowl.
- (6) Separate cowl cover from vehicle.

INSTALLATION

- (1) Position cowl cover on vehicle. Ensure end seals are positioned correctly and in good condition.
- (2) Install cowl seal.
- (3) Install plastic nuts attaching cowl cover to cowl.
- (4) Connect windshield washer tubing to coupling near left hood hinge.
- (5) Install wiper arms.

80b5cb95

Fig. 7 Cowl Cover

- 1 - COWL COVER
- 2 - PLASTIC NUT
- 3 - END SEAL
- 4 - PUSH-IN STUD
- 5 - END SEAL

ROOF JOINT MOLDING

REMOVAL

(1) Warm the roof joint molding and roof panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull molding from roof joint (Fig. 8).

Fig. 8 Roof Joint Molding

- 1 - ROOF
- 2 - JOINT MOLDING
- 3 - B-PILLAR
- 4 - ADHESIVE TAPE

INSTALLATION

(1) Remove adhesive tape residue from roof joint.

(2) If molding is to be reused, remove tape residue from back of molding. Clean molding with MOPAR® Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of molding.

(3) Clean roof joint with MOPAR® Super Kleen solvent or equivalent. Wipe dry with lint free cloth.

(4) Remove protective cover from tape on back of molding and apply molding to roof joint.

(5) Heat roof and molding, see step one. Firmly press molding into roof joint to assure adhesion.

GRILLE

REMOVAL

(1) Open hood.

(2) Remove bolts attaching bottom of grille to frame (Fig. 9).

(3) Remove bolts attaching sides of grille to frame.

(4) Remove nuts attaching grille to hood (Fig. 10).

(5) Separate grille from vehicle.

Fig. 9 Grille - Sport

- 1 - HOOD
- 2 - GRILLE
- 3 - GRILLE FRAME

Fig. 10 Grille - SLT

- 1 - HOOD
- 2 - GRILLE FRAME
- 3 - GRILLE

INSTALLATION

(1) Position grille on vehicle.

(2) Install nuts attaching grille to hood.

(3) Install bolts attaching sides of grille to frame.

(4) Install bolts attaching bottom of grille to frame.

GRILLE FRAME

REMOVAL

(1) Remove bolts attaching guide loop for hood safety catch release rod to grille frame.

(2) Remove grille.

GRILLE FRAME (Continued)

- (3) Remove screws attaching grille frame to hood (Fig. 11) and (Fig. 12).
- (4) Separate grille frame from hood.

80b5cb9c

Fig. 11 Grille Frame - SLT

- 1 - HOOD
2 - GRILLE FRAME

80b76163

Fig. 12 Grille Frame - Sport

- 1 - HOOD
2 - GRILLE FRAME

INSTALLATION

- (1) Position grille frame on hood.
- (2) Install screws attaching grille frame to hood.
- (3) Install grille.
- (4) Install bolts attaching guide loop for hood safety catch release rod to grille frame.

FRONT END SPLASH SHIELDS**REMOVAL**

- (1) Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
- (2) Remove front wheel.
- (3) Remove plastic rivets attaching wheelhouse liner to fender at the edge of wheel opening.
- (4) Remove plastic rivets attaching liner to the wheelhouse (Fig. 13).
- (5) Separate front wheelhouse liner from wheelhouse.

80a7e231

Fig. 13 Front Wheelhouse Liner

- 1 - FENDER
2 - BUMPER ASSEMBLY
3 - PLASTIC RIVET
4 - WHEELHOUSE LINER

INSTALLATION

- (1) Position front wheelhouse liner in wheelhouse.
- (2) Install plastic rivets attaching liner to the wheelhouse.
- (3) Install plastic rivets attaching wheelhouse liner to fender at the edge of wheel opening.
- (4) Install front wheel.
- (5) Remove safety stands and lower vehicle.

LEFT FRONT FENDER

REMOVAL

(1) Remove front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front BUMPER - REMOVAL).

(2) Remove air cleaner from wheelhouse (DIESEL ONLY).

(3) Remove coolant overflow bottle (V-10 ONLY).

(4) Remove battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(5) Remove screws attaching power distribution center to left wheelhouse (Fig. 14).

(6) Disengage wire harness tie-downs from wheelhouse.

(7) Disconnect wiring harness to headlamp connector.

(8) Disconnect wiring harness to airbag sensor and remove airbag sensor from wheelhouse.

(9) Remove bolts attaching anti-lock brake controller to wheelhouse (Fig. 14), if equipped.

(10) Disengage windshield washer tubing tie-downs from wheelhouse (Fig. 14).

(11) Remove bolts attaching front fender to cowl reinforcement (Fig. 15).

(12) Remove bolts attaching front fender to radiator closure panel (Fig. 16).

(13) Remove bolts attaching bottom of front fender to rocker panel lower flange.

(14) Open left door.

(15) Remove bolt attaching front fender to hinge pillar mounting bracket.

(16) Remove bolts attaching top of fender to radiator closure panel.

(17) Separate left front fender from vehicle.

INSTALLATION

(1) Position left front fender on vehicle.

(2) Install bolts attaching top of fender to radiator closure panel.

(3) Install bolt attaching front fender to hinge pillar mounting bracket.

(4) Install bolts attaching bottom of front fender to rocker panel lower flange.

(5) Install bolts attaching front fender to radiator closure panel.

(6) Install bolts attaching front fender to cowl reinforcement.

(7) Secure windshield washer tubing tie-downs to wheelhouse.

(8) Install anti-lock brake controller to wheelhouse, if equipped.

(9) Install airbag sensor to wheelhouse and connect wiring harness to airbag sensor.

(10) Connect wiring harness to headlamp connector.

LEFT FRONT FENDER (Continued)

Fig. 16 Left Fender to Radiator Closure Panel Fasteners

- 1 - LEFT FENDER
2 - RADIATOR CLOSURE PANEL

- (11) Secure wire harness tie-downs to wheelhouse.
- (12) Install power distribution center to wheelhouse.
- (13) Install battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - INSTALLATION).
- (14) Install coolant overflow bottle (V-10 ONLY).
- (15) Install air cleaner (DIESEL ONLY).
- (16) Install front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front Bumper - INSTALLATION).

RIGHT FRONT FENDER

REMOVAL

- (1) Remove front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front Bumper - REMOVAL).
- (2) Disconnect and isolate battery negative cable.
- (3) Remove auxiliary battery and tray on right side, if equipped.
- (4) Disengage wire harness tie-downs from wheelhouse.
- (5) Disconnect wiring harness to headlamp connector.
- (6) Disconnect wiring harness to airbag sensor and remove airbag sensor from wheelhouse.
- (7) Remove front wheelhouse liner (Fig. 13) (Refer to 23 - BODY/EXTERIOR/Front End Splash Shields - REMOVAL).
- (8) Disengage air conditioning tubing from inner fender clips.
- (9) Remove bolts attaching front fender to cowl reinforcement (Fig. 15).
- (10) Remove bolts attaching front fender to radiator closure panel.

- (11) Remove bolts attaching bottom of front fender to rocker panel lower flange (Fig. 17).
- (12) Open right door.
- (13) Remove bolt attaching front fender to hinge pillar mounting bracket (Fig. 17).
- (14) Remove bolts attaching top of fender to radiator closure panel (Fig. 17).
- (15) Separate right front fender from vehicle.

Fig. 17 Right Front Fender

- 1 - RADIATOR CLOSURE PANEL
2 - RIGHT FENDER

INSTALLATION

- (1) Position fender on vehicle.
- (2) Install bolts attaching top of fender to radiator closure panel.
- (3) Install bolt attaching front fender to hinge pillar mounting bracket.
- (4) Install bolts attaching bottom of front fender to rocker panel lower flange.
- (5) Install bolts attaching front fender to radiator closure panel.
- (6) Install bolts attaching front fender to cowl reinforcement.
- (7) Secure air conditioning tubing to inner fender clips.
- (8) Install front wheelhouse liner (Refer to 23 - BODY/EXTERIOR/Front End Splash Shields - INSTALLATION).
- (9) Install airbag sensor and connect wiring harness to airbag sensor.
- (10) Connect wiring harness to headlamp connector.
- (11) Secure wire harness tie-downs to wheelhouse.
- (12) Install auxiliary battery tray and battery on right side, if equipped.
- (13) Connect battery negative cable.
- (14) Install front bumper (Refer to 13 - FRAMES & BUMPERS/BUMPERS/Front Bumper - INSTALLATION).

FUEL FILL DOOR

REMOVAL

- (1) Open fuel fill door.
- (2) Remove bolts attaching fuel fill door to cargo box quarter panel (Fig. 18).
- (3) Separate fuel fill door from vehicle.

Fig. 18 Fuel Fill Door

- 1 - CARGO BOX
2 - FUEL FILL DOOR

INSTALLATION

- (1) Separate fuel fill door on cargo box.
- (2) Install bolts attaching fuel fill door to cargo box quarter panel.

REAR FENDER

REMOVAL

- (1) Open fuel fill door, left side only.
- (2) Remove screws attaching fuel fill neck to rear fender opening.
- (3) Remove tail lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - REMOVAL)
- (4) Remove nuts attaching rear fender to cargo box side panel through tail lamp opening.
- (5) Remove the identification lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/OUTBOARD IDENTIFICATION LAMP - REMOVAL)
- (6) Remove bolts attaching bottom of fender to cargo box forward of rear wheel.
- (7) Remove bolts attaching bottom of fender to cargo box rearward of rear wheel.
- (8) Remove rear wheelhouse splash shields (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL).

(9) Remove rear wheelhouse liner, if equipped (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - REMOVAL).

(10) Remove nuts attaching front of rear fender to cargo box from behind side panel forward of wheelhouse.

(11) Remove screws attaching access panel to top of wheelhouse.

(12) Remove nuts attaching rear fender to cargo box through access hole in top of wheelhouse.

(13) Separate rear fender from cargo box side panel (Fig. 19).

Fig. 19 Rear Fender - Dual Wheels

- 1 - RETAINER
2 - FENDER (DUAL WHEEL)

INSTALLATION

Ensure the retainers are in good condition.

- (1) Position rear fender on cargo box side panel.
- (2) Using access hole in top of wheelhouse, install nuts attaching rear fender to cargo box.
- (3) Install screws attaching access panel to top of wheelhouse.
- (4) From behind side panel forward of wheelhouse, install nuts attaching front of rear fender to cargo box.
- (5) Install rear wheelhouse liners if equipped, (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION).
- (6) Install rear wheelhouse splash shields (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION).
- (7) Install bolts attaching bottom of fender to cargo box rearward of rear wheel.
- (8) Install bolts attaching bottom of fender to cargo box forward of rear wheel.
- (9) Install identification lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/OUTBOARD IDENTIFICATION LAMP - INSTALLATION)

REAR FENDER (Continued)

(10) Using tail lamp opening, install nuts attaching rear fender to cargo box side panel.

(11) Install tail lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP UNIT - INSTALLATION)

(12) Install screws attaching fuel fill neck to rear fender opening.

REAR SPLASH SHIELD

REMOVAL

(1) Remove screws holding rear splash shield to rear wheel opening lip (Fig. 20).

(2) Remove push in fasteners holding rear splash shield to rear wheelhouse.

(3) Separate splash shield from vehicle.

80a1c4d7

Fig. 20 REAR SPLASH SHIELDS

- 1 - FUEL FILLER DOOR
- 2 - REAR FENDER
- 3 - REAR SECTION REAR WHEEL HOUSE LINER
- 4 - PUSH IN FASTENERS

INSTALLATION

(1) Position splash shield in wheelhouse opening.

(2) Install plastic rivets holding rear splash shield to rear wheelhouse.

(3) Install plastic rivets holding rear splash shield to rear wheel opening lip.

REAR WHEELHOUSE LINER

REMOVAL

(1) Remove plastic rivets attaching rear wheelhouse liner to rear wheel opening lip (Fig. 21).

(2) Remove plastic rivets attaching rear wheelhouse liner to rear wheelhouse.

(3) Separate rear wheelhouse liner from vehicle.

J9423-19

Fig. 21 Rear Wheelhouse Liner

- 1 - FENDER
- 2 - WHEEL HOUSELINER
- 3 - PLASTIC RIVET

INSTALLATION

(1) Position rear wheelhouse liner in wheelhouse opening.

(2) Install plastic rivets attaching rear wheelhouse liner to rear wheelhouse.

(3) Working front to rear, install plastic rivets attaching rear wheelhouse liner to rear wheel opening lip.

CARGO BOX

REMOVAL

CAUTION: The bolts attaching the cargo box to the frame are specially coated to provide a locking action. These bolts are not reusable and must be replaced each time the cargo box is removed or replaced.

- (1) Open fuel fill door.
- (2) Remove screws attaching fuel fill neck adaptor to cargo box side wall.
- (3) Separate fuel fill neck from cargo box.
- (4) Disengage tail lamp wire connector from main body harness at left rear frame rail.
- (5) Remove bolts attaching cargo box to frame rails (Fig. 22).
- (6) Using a suitable lifting device, separate cargo box from vehicle.

Fig. 22 Cargo Box

J9423-101

- 1 - CARGO BOX
- 2 - FRAME
- 3 - BOLT
- 4 - AXLE
- 5 - BOLT

INSTALLATION

- (1) Using a suitable lifting device, position cargo box on vehicle.
- (2) Install **new** bolts attaching cargo box to frame rails. Tighten bolts to 54 N·m (40 ft. lbs.) torque.
- (3) Engage tail lamp wire connector to main body harness at left rear frame rail.
- (4) Install fuel fill neck.

SIDE VIEW MIRROR

REMOVAL

- (1) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Remove mirror flag door seal (Fig. 23).
- (3) Disengage power mirror wire connector from door harness, if equipped (Fig. 24).
- (4) Remove nuts attaching sideview mirror to door frame (Fig. 25).
- (5) Separate harness grommet from door frame, if equipped.
- (6) Separate sideview mirror from vehicle.

80b118f9

SIDE VIEW MIRROR (Continued)

**Fig. 25 Sideview Mirror**

- 1 - MIRROR
- 2 - NUT
- 3 - DOOR

INSTALLATION

- (1) Position sideview mirror on door.
- (2) Install harness grommet in door frame, if equipped.
- (3) Install nuts attaching sideview mirror to door (Fig. 25).
- (4) Engage power mirror wire connector to harness, if equipped (Fig. 24).
- (5) Install mirror flag door seal (Fig. 23).
- (6) Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

SIDE VIEW MIRROR - LOW MOUNTED**REMOVAL**

- (1) Remove bolts attaching lower support legs to outer door panel.
- (2) Remove bolts attaching upper support arms to outer door panel (Fig. 26).
- (3) Separate mirror from door.

INSTALLATION

- (1) Position mirror on door.
- (2) Place insulation washers between support frame and door panel.
- (3) Install bolts attaching upper support arms to outer door panel.
- (4) Install bolts attaching lower support legs to outer door panel.

**Fig. 26 Low Mounted Side View Mirror**

- 1 - FLAG COVER
- 2 - MIRROR
- 3 - WASHER
- 4 - NUTSERT
- 5 - WASHER
- 6 - NUTSERT

SIDE VIEW MIRROR GLASS**REMOVAL**

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

- (1) Carefully pull/pry the broken glass holder from the mirror assembly.
- (2) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

- (1) Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

- (2) Align the mirror glass holder's attaching fingers to the mirror motor housing.

SIDE VIEW MIRROR GLASS (Continued)

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

(3) Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

(4) Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

HINGE

REMOVAL

- (1) Open hood and support the side that requires hinge replacement.
- (2) Mark all bolt and hinge attachment locations with a grease pencil or equivalent to provide reference marks for installation.
- (3) Remove nuts attaching hood to hinge (Fig. 1).
- (4) Remove bolts attaching hood hinge to cowl.
- (5) Separate hinge from vehicle.

INSTALLATION

- (1) If necessary, paint new hinge before installation.
- (2) Position hinge on vehicle.
- (3) Align all marks
- (4) Install bolts attaching hood hinge to cowl.
- (5) Install nuts attaching hood to hinge.

Fig. 1 Hood Hinge

- 1 - HOOD
- 2 - COWL
- 3 - HINGE

HOOD

REMOVAL

- (1) Disconnect the under hood lamp wire connector.
- (2) Disconnect the air temperature sensor wire connector, if equipped.
- (3) Mark all bolt and hinge attachment locations with a grease pencil or equivalent to provide reference marks for installation.
- (4) Remove top nuts attaching hood to hinge and loosen bottom nuts until they can be removed by hand (Fig. 2).
- (5) With assistance of a helper at the opposite side of the vehicle to support the hood, remove the bottom nuts. Separate the hood from the vehicle.

INSTALLATION

- (1) With assistance of a helper, position hood on vehicle loosely install bottom nuts.
Align all marks, install top nuts and tighten bottom nuts. The hood should be aligned to 5 mm (0.2 in.) gap to the front fenders and flush across the top surfaces along fenders.
- (2) Connect the air temperature sensor wire connector, if equipped.
- (3) Connect the under hood lamp wire connector.

ADJUSTMENTS

ADJUSTMENT

- (1) Loosen the hinge arm-to-hood panel bolts at each side of the vehicle.

Fig. 2 Hood

- 1 - HOOD
2 - HOOD HINGE
3 - FENDER

- (2) Loosen the hood latch screws.
- (3) Close the hood. Adjust the fore/aft position.
- (4) Raise the hood. Tighten the hinge arm-to-hood panel bolts.
- (5) Tighten the latch screws.
- (6) Lower the hood. Inspect clearance between the hood and the cowl cover.

LATCH

REMOVAL

- (1) Remove bolts attaching hood latch to radiator closure panel crossmember (Fig. 3).
- (2) Separate hood latch from crossmember.
- (3) Disconnect release cable from hood latch.

INSTALLATION

- (1) Connect release cable to hood latch.
- (2) Position hood latch on crossmember.
- (3) Install bolts attaching hood latch to radiator closure panel crossmember.

ADJUSTMENTS

ADJUSTMENT

- (1) Loosen the hood latch screws.
- (2) Move the latch to the correct location and lightly tighten the screws.
- (3) Close the hood slowly and observe the latching operation.
- (4) As necessary, re-adjust the latch position and tighten the screws.

Fig. 3 Hood Latch

LATCH RELEASE CABLE

REMOVAL

- (1) Remove hood latch (Refer to 23 - BODY/HOOD/LATCH - REMOVAL).
- (2) Disconnect release cable from hood latch.
- (3) Detach the release cable from the retainer clips in the engine compartment.
- (4) Separate the release cable grommet from the dash panel hole.
- (5) From the inside of the vehicle, remove the screws attaching the hood release handle to the bottom of the instrument panel (Fig. 4).
- (6) Pull/route the hood release cable through the dash panel hole and remove it via the inside of the vehicle.

Fig. 4 Hood Release Handle

- 1 - INSTRUMENT PANEL
2 - HOOD RELEASE HANDLE
3 - HOOD RELEASE CABLE

INSTALLATION

NOTE: If replacement hood latch is also being installed, ensure that it is thoroughly lubricated.

- (1) From inside the vehicle, pull/route the hood release cable through the dash panel hole and into the engine compartment.
- (2) Install the hood release handle.
- (3) Install the cable grommet in the dash panel hole.
- (4) Attach the release cable to the retainer clips in the engine compartment.
- (5) Attach release cable to hood latch.
- (6) Install hood latch (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION).
- (7) Test the hood latch release cable for proper operation.

LATCH STRIKER

REMOVAL

- (1) Open hood.
- (2) Remove bolts attaching hood latch striker to hood (Fig. 5).
- (3) Separate hood latch striker from hood.

INSTALLATION

- (1) Position hood latch striker on hood.
- (2) Install bolts attaching hood latch striker to hood.

ADJUSTMENTS

ADJUSTMENT

- (1) Open the hood.
- (2) Loosen the latch striker screws.
- (3) Slowly close the hood and observe the latching operation. As necessary, re-adjust the striker position. Tighten the screws.

SAFETY LATCH

REMOVAL

- (1) Open hood.
- (2) Remove bolts attaching hood safety catch to hood (Fig. 5) and (Fig. 6).
- (3) Separate safety catch from hood.

- 4 - RELEASE HANDLE
- 5 - STRIKER
- 6 - HANDLE - TO - LATCH ROD

(3) Connect air temperature sensor connector, if equipped.

(4) Connect underhood lamp wire connector.

INSTALLATION

- (1) Position safety catch on hood.
- (2) Engage catch rod to catch.
- (3) Install bolts attaching hood safety catch to hood.

SILENCER PAD

REMOVAL

- (1) Disconnect underhood lamp wire connector.
- (2) Disconnect air temperature sensor connector, if equipped.
- (3) Remove push-in fasteners holding silencer to hood (Fig. 7).
- (4) Separate hood silencer from hood.

INSTALLATION

- (1) Position hood silencer on hood.
- (2) Install push-in fasteners holding silencer to hood.

INSTRUMENT PANEL SYSTEM

DESCRIPTION

The instrument panel is located at the front of the passenger compartment. This instrument panel is molded from a blend of various plastics that are mechanically attached to the vehicle. Colors are molded into the plastic components to minimize appearance degradation from scratches or abrasions. The panel components are internally ribbed and riveted to steel reinforcements for additional structural integrity and dimensional stability. The instrument panel surface components are designed to deform upon impact without breaking. This type of construction provides improved energy absorption which, in conjunction with the dual airbags and seat belts, helps to improve occupant protection.

The top of the instrument panel is secured to the top of the dash panel near the base of the windshield using screws. An end bracket integral to each end of the instrument panel structure is secured to each cowl side inner panel with a screw. A stamped metal bracket supports the center of the instrument panel by securing it to the top of the floor panel transmission tunnel below the instrument panel with screws. The instrument cluster, radio, heater-air conditioner control, passenger airbag, glove box, electrical junc-

tion block, Central Timer Module (CTM), accessory switches, ash receiver, cigar lighter, accessory power outlet, park brake release handle, inside hood release handle, as well as numerous other components are secured to and supported by this unit.

The instrument panel for this vehicle includes the following major features:

- **Cluster Bezel** - This molded plastic bezel is secured with snap clips to the instrument panel supporting structure. It trims out the edges of the headlamp switch, instrument cluster, radio, heater-air conditioner controls, passenger airbag on-off switch, and the heated seat switches on vehicles so equipped. On vehicles without the heated seat option, a small storage cubby bin is provided in the cluster bezel. This bezel also incorporates three completely adjustable panel outlets for the climate control system, and fills the opening between the instrument cluster and the top of the steering column where it passes through the instrument panel.

- **Cup Holder/Storage Bin** - Vehicles equipped with an automatic transmission feature a latching fold-down, adjustable cup holder located on the lower instrument panel between the glove box and the ash receiver. Vehicles equipped with a manual transmission have a lighted storage bin on the instrument panel in place of the cup holder.

INSTRUMENT PANEL SYSTEM (Continued)

- **Glove Box** - The hinged bin-type glove box in the passenger side of the instrument panel features a recessed paddle-operated latch handle. Three molded hook formations on the lower edge of the glove box door are engaged with and pivot on three hinge pins integral to the lower edge of the instrument panel support structure. The glove box door also serves as the passenger side knee blocker. A honeycomb structure between the inner and outer glove box door panels helps to absorb the impact load and distribute it to the instrument panel structure.

- **Steering Column Opening Cover** - The steering column opening cover serves as the driver side knee blocker. This molded plastic cover has an integral ribbed plastic liner concealed behind it, for increased strength and integrity. The steering column opening cover transfers impact loads to the instrument panel structural support.

- **Top Cover** - The instrument panel top cover or base trim is the molded, grained, and color impregnated plastic outer skin of the instrument panel structural support.

Hard wired circuitry connects the electrical components on the instrument panel to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the instrument panel components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes complete circuit diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

OPERATION

The instrument panel serves as the command center of the vehicle, which necessarily makes it a very complex unit. The instrument panel is designed to house the controls and monitors for standard and optional powertrains, climate control systems, audio systems, safety systems, and many other comfort or convenience items. When the components of the instrument panel structural support are properly assembled and secured in the vehicle they provide superior instrument panel stiffness and integrity to help reduce buzzes, squeaks, and rattles. This type of construction also provides improved energy absorption which, in conjunction with the dual airbags and seat belts, helps to improve occupant protection.

The instrument panel is also designed so that all of the various controls can be safely reached and the monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access to each of these items for service. Modular instrument panel construction allows all of the gauges and controls to be serviced from the front of the panel. In addition, most of the instrument panel electrical components can be accessed without complete instrument panel removal. However, if necessary, the instrument panel can be removed from the vehicle as an assembly.

The steering column opening cover with its integral knee blocker located on the driver side of the instrument panel works in conjunction with the airbag system in a frontal vehicle impact to keep the driver properly positioned for an airbag deployment. In addition, removal of this component provides access to the steering column mounts, the steering column wiring, the Junction Block (JB) (removal of a snap-fit fuse access panel on the left end of the instrument panel allows access to the fuses and circuit breakers), the Central Timer Module (CTM), the Infinity speaker filter choke and relay unit, much of the instrument panel wiring, and the gear selector indicator cable (automatic transmission).

In a frontal collision, the glove box door on the passenger side of the instrument panel provides the same function for the front seat passenger as the knee blocker does for the driver. The glove box door also incorporates a recessed latch handle. Removal of the glove box provides access to the passenger airbag, the glove box lamp and switch, the radio antenna coaxial cable, the heating and air conditioning vacuum harness connector, and additional instrument panel wiring.

Removal of the instrument panel cluster bezel allows access to the headlamp switch, instrument cluster, radio, passenger airbag on-off switch, heated seat switches (if equipped), and the heating and air conditioning control. Removal of the instrument cluster allows access to the cluster illumination and indicator bulbs, and more of the instrument panel wiring. Complete instrument panel removal is required for service of most components internal to the heating and air conditioning system housing, including the heater core and the evaporator.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the components and systems mounted on or in the instrument panel.

ASH RECEIVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Open the instrument panel ash receiver.
- (3) From the open position, close the ash receiver slightly and pull it straight back far enough to disengage it from the pivot pins in the lower instrument panel.
- (4) Remove the three screws that secure the ash receiver flame shield to the lower instrument panel (Fig. 1).

Fig. 1 Instrument Panel Ash Receiver Remove/Install

- 1 - SCREW
2 - ASH RECEIVER
3 - FLAME SHIELD

(6) Lower the flame shield from the instrument panel far enough to access the ash receiver lamp and hood.

(7) Squeeze the ash receiver lamp and hood bracket to disengage the unit from the mounting hole in the flame shield.

(8) Remove the ash receiver flame shield from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the ash receiver flame shield to the instrument panel (Fig. 1).
- (2) Squeeze the ash receiver lamp and hood bracket and engage the unit to the mounting hole in the flame shield.
- (3) Insert the two retaining tabs on the top of the ash receiver flame shield into the mounting holes in the instrument panel, then push the shield forward to engage the tabs with the instrument panel.
- (4) Install and tighten the three screws that secure the ash receiver flame shield to the instrument panel. Tighten the screws to 2 N·m (20 in. lbs.).
- (5) Align the pivot receptacles on each side of the ash receiver with the pivot pins in the lower instrument panel.
- (6) Push the ash receiver forward onto the pivot pins in the instrument panel until the open ash receiver snaps into place.
- (7) Reconnect the battery negative cable.

(5) Pull the ash receiver flame shield out from the instrument panel far enough to disengage the two retaining tabs on the top of the shield from the mounting holes in the instrument panel.

CLUSTER BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) If the vehicle is equipped with an automatic transmission, turn the ignition switch to the Off position (not Lock), set the parking brake, and place the automatic transmission gear selector lever in the Low position.

(3) If the vehicle is so equipped, set the tilt steering column in its lowest position.

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry around the perimeter of the cluster bezel to disengage the snap clips from their receptacles in the instrument panel (Fig. 2).

80b89824

Fig. 2 Cluster Bezel Remove/Install

1 - CLUSTER BEZEL

(5) Remove the cluster bezel from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the cluster bezel to the instrument panel (Fig. 2).

(2) Align the snap clips on the cluster bezel with the receptacles in the instrument panel.

(3) Press firmly on the cluster bezel over each of the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Reconnect the battery negative cable.

CUBBY BIN

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the three screws that secure the cubby bin to the instrument panel (Fig. 3).

(4) Remove the cubby bin from the instrument panel.

CUBBY BIN (Continued)

80b89827

Fig. 3 Instrument Panel Cubby Bin Remove/Install

1 - SCREW (3)

2 - CUBBY BIN

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the cubby bin to the instrument panel (Fig. 3).

(2) Install and tighten the three screws that secure the cubby bin to the instrument panel. Tighten the screws to 2 N·m (20 in. lbs.).

(3) Install the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(4) Reconnect the battery negative cable.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Unlatch and fold the cup holder down from the instrument panel to its open position.

(4) Remove the six screws that secure the cup holder to the instrument panel (Fig. 4).

80b170eb

Fig. 4 Instrument Panel Cup Holder

1 - SCREW

2 - INSTRUMENT PANEL

3 - CUP HOLDER

CUP HOLDER

REMOVAL

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

(5) Pull the cup holder away from the instrument panel far enough to access the illumination lamp and hood unit.

(6) Disengage the illumination lamp and hood retainer clip from the back of the instrument panel cup holder unit.

(7) Remove the cup holder unit from the instrument panel.

CUP HOLDER (Continued)

INSTALLATION

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the cup holder unit near the instrument panel.

(2) Engage the illumination lamp and hood retainer clip to the back of the instrument panel cup holder unit.

(3) Position the cup holder unit onto the instrument panel (Fig. 4).

(4) Install and tighten the six screws that secure the cup holder to the instrument panel. Tighten the screws to 2 N·m (20 in. lbs.).

(5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(6) Reconnect the battery negative cable.

GLOVE BOX

REMOVAL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE

TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box.

(3) While holding the glove box door securely with one hand, push the center of the glove box bin towards the front of the vehicle (Fig. 5). Flex the center of the glove box bin far enough so that the glove box stops on each side of the bin will clear the sides of the instrument panel glove box opening.

Fig. 5 Glove Box

- 1 - GLOVE BOX STOPS
- 2 - GLOVE BOX BIN
- 3 - GLOVE BOX DOOR
- 4 - PUSH

(4) Roll the glove box downward until the stop bumpers are beyond the sides of the instrument panel glove box opening, then release the bin.

(5) Lift the bottom of the glove box upward to disengage the three glove box hinge hooks from the three hinge pins on the instrument panel.

DISASSEMBLY - GLOVE BOX

The only serviced component of the glove box is the glove box bin. If any other component of the glove box is faulty or damaged, the entire glove box assembly must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

(3) Remove the two screws that secure each outboard flange of the glove box bin to the glove box door (Fig. 6).

(4) Pull the top of the bin away from the top of the glove box door.

GLOVE BOX (Continued)

**Fig. 6 Glove Box Disassemble/Assemble**

- 1 - SCREWS
- 2 - GLOVE BOX DOOR
- 3 - HOOKS
- 4 - GLOVE BOX BIN

(5) Disengage the five hook formations on the bottom of the glove box bin from the slots near the bottom of the inner glove box door.

(6) Remove the glove box bin from the glove box door.

ASSEMBLY - GLOVE BOX

(1) Position the glove box bin onto the glove box door.

(2) Engage the five hook formations on the bottom of the glove box bin with the slots near the bottom of the inner glove box door (Fig. 6).

(3) Position the top of the bin to the top of the glove box door.

(4) Install and tighten the two screws that secure each outboard flange of the glove box bin to the glove box door. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reinstall the glove box onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(6) Reconnect the battery negative cable.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE

WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the glove box to the instrument panel.

(2) Engage the three hinge hooks near the bottom of the glove box door with the three hinge pins on the instrument panel.

(3) While holding the glove box door securely with one hand, push the center of the glove box bin towards the front of the vehicle (Fig. 5). Flex the center of the glove box bin far enough so that the glove box stops on each side of the bin will clear the sides of the instrument panel glove box opening.

(4) Roll the glove box upward until the stop bumpers are beyond the sides of the instrument panel glove box opening, then release the bin.

(5) Close the glove box.

(6) Reconnect the battery negative cable.

GLOVE BOX LATCH STRIKER**REMOVAL**

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim from the upper glove box opening. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX OPENING UPPER TRIM - REMOVAL).

(3) Remove the two screws that secure the latch striker to the instrument panel glove box opening upper reinforcement (Fig. 7).

(4) Remove the latch striker from the instrument panel glove box opening upper reinforcement.

GLOVE BOX LATCH STRIKER (Continued)

80b1b381

Fig. 7 Glove Box Latch Striker Remove/Install

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the latch striker onto the instrument panel glove box opening upper reinforcement (Fig. 7).

(2) Install and tighten the two screws that secure the latch striker to the instrument panel glove box opening upper reinforcement. Tighten the screws to 2 N·m (20 in. lbs.).

(3) Reinstall the trim onto the upper glove box opening. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX OPENING UPPER TRIM - INSTALLATION).

(4) Reconnect the battery negative cable.

GLOVE BOX OPENING UPPER TRIM

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING

COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box.

(3) Remove the three screws that secure the trim to the instrument panel glove box opening upper reinforcement (Fig. 8).

80b1b380

Fig. 8 Glove Box Opening Upper Trim Remove/Install

- 1 - LATCH STRIKER
- 2 - TRIM STRIP
- 3 - SCREWS

(4) Remove the trim from the instrument panel glove box opening upper reinforcement.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the trim onto the instrument panel glove box opening upper reinforcement (Fig. 8).

GLOVE BOX OPENING UPPER TRIM (Continued)

(2) Install and tighten the three screws that secure the trim to the instrument panel glove box opening upper reinforcement. Tighten the mounting screws to 2 N·m (20 in. lbs.).

(3) Close the glove box.

(4) Reconnect the battery negative cable.

INSTRUMENT PANEL TOP COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the passenger airbag from the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL).

(4) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(5) Place the instrument panel on a suitable work surface. Be certain to take the proper precautions to protect the instrument panel from any possible cosmetic damage.

(6) Remove the screws around the perimeter of the top cover that secure it to the instrument panel structural support, the defroster duct, and the demister ducts.

(7) Lift the top cover off of the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SER-

VICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the top cover onto the instrument panel.

(2) Install and tighten the screws around the perimeter of the top cover that secure it to the instrument panel structural support, the defroster duct, and the demister ducts. Tighten the screws to 2 N·m (20 in. lbs.).

(3) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(4) Reinstall the passenger airbag into the instrument panel. (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).

(5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(6) Reconnect the battery negative cable.

STEERING COLUMN OPENING COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the three screws that secure the lower edge of the steering column opening cover to the lower instrument panel reinforcement (Fig. 9).

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the upper edge of the

STEERING COLUMN OPENING COVER (Continued)

80b170ee

Fig. 9 Steering Column Opening Cover Remove/Install

- 1 - STEERING COLUMN
- 2 - INSTRUMENT PANEL
- 3 - SCREW
- 4 - STEERING COLUMN OPENING COVER

steering column opening cover just below the cluster bezel on each side of the steering column away from the instrument panel far enough to disengage the snap clip retainers from their receptacles in the instrument panel.

(4) Remove the steering column opening cover from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the steering column opening cover to the instrument panel (Fig. 9).

(2) Align the snap clip retainers on the steering column opening cover with their receptacles in the instrument panel.

(3) Press firmly and evenly on the steering column opening cover over the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Install and tighten the three screws that secure the lower edge of the steering column opening cover to the lower instrument panel reinforcement. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reconnect the battery negative cable.

STORAGE BIN

REMOVAL

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the two screws that secure the top of the storage bin to the instrument panel (Fig. 10).

(4) Lower the top of the storage bin away from the instrument panel far enough to access the illumination lamp and hood unit.

(5) Disengage the illumination lamp and hood retainer clip from the back of the instrument panel storage bin unit.

(6) Remove the storage bin unit from the instrument panel.

INSTALLATION

Vehicles equipped with an automatic transmission have a lighted fold-down cup holder installed on the

STORAGE BIN (Continued)

Fig. 10 Instrument Panel Storage Bin Remove/Install

- 1 - SCREWS
- 2 - STORAGE BIN (RAISED)
- 3 - STORAGE BIN (LOWERED)

instrument panel just inboard of the glove box. Vehicles equipped with a manual transmission have a lighted storage bin installed on the instrument panel in place of the fold-down cup holder.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the storage bin unit onto the instrument panel (Fig. 10).
- (2) Engage the illumination lamp and hood retainer clip to the back of the instrument panel storage bin unit.
- (3) Raise and position the top of the storage bin to the instrument panel.
- (4) Install and tighten the two screws that secure the top of the storage bin unit to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
- (6) Reconnect the battery negative cable.

INSTRUMENT PANEL ASSEMBLY

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the Airbag Control Module (ACM) and bracket from the floor panel transmission tunnel. (Refer to 8 - ELECTRICAL/RESTRAINTS/AIRBAG CONTROL MODULE - REMOVAL).
- (3) Remove the trim from the left and right cowl side inner panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
- (4) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
- (5) Remove the two screws that secure the inside hood latch release handle to the instrument panel lower reinforcement and lower the release handle to the floor.
- (6) Disconnect the clockspring pigtail wire connector from the instrument panel wire harness connector located on the instrument panel lower reinforcement.
- (7) If the vehicle is so equipped, disconnect the overdrive lockout switch pigtail wire connector from the instrument panel wire harness connector near the instrument panel lower reinforcement.
- (8) Remove the steering column from the vehicle, but do not remove the driver airbag, the steering wheel, or the switches from the column. Be certain that the steering wheel is locked and secured from rotation to prevent the loss of clockspring centering. (Refer to 19 - STEERING/COLUMN - REMOVAL).
- (9) From under the driver side of the instrument panel, perform the following:
 - (a) Disengage the park brake release handle linkage rod from the park brake mechanism on the

INSTRUMENT PANEL ASSEMBLY (Continued)

left cowl side inner panel. (Refer to 5 - BRAKES/PARKING BRAKE/RELEASE - REMOVAL).

(b) Disconnect the instrument panel wire harness connector from the park brake switch on the park brake mechanism.

(c) Disconnect the three connectors (one from the body wire harness, and two from the headlamp and dash wire harness) from the three connector receptacles located closest to the dash panel on the back of the Junction Block (JB).

(d) Remove the screw from the center of the headlamp and dash wire harness to instrument panel wire harness bulkhead connector and disconnect the connector.

(e) Disconnect the instrument panel wire harness to door wire harness connector located directly below the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(f) If the vehicle is equipped with the Infinity sound system option, disconnect the Infinity wire harness connector from the instrument panel wire harness connector that is secured to the outboard side of the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(g) Disconnect the instrument panel wire harness connector from the stop lamp switch.

(h) Disconnect the heater-A/C housing vacuum harness connector from the heater-A/C control vacuum harness connector located near the left end of the heater-A/C housing.

(10) From under the passenger side of the instrument panel, disconnect the two halves of the radio antenna coaxial cable connector.

(11) Loosen the right and left instrument panel cowl side roll-down bracket screws about 13 mm (0.50 inch) (Fig. 11).

(12) Remove the five screws that secure the top of the instrument panel to the top of the dash panel, removing the center screw last.

(13) Roll down the instrument panel and install a temporary hook in the center hole on top of the instrument panel. Secure the other end of the hook to the center hole in the top of the dash panel. The hook should support the instrument panel in its rolled down position about 46 cm (18 inches) from the dash panel.

(14) With the instrument panel supported in the roll-down position, disconnect the instrument panel

80ae83ba

Fig. 11 Instrument Panel Assembly Remove/Install

1 - PLASTIC NUT
2 - SCREWS

3 - SCREWS

INSTRUMENT PANEL ASSEMBLY (Continued)

wire harness connectors from the heater-A/C housing wire harness connectors.

(15) With the aid of an assistant, remove the temporary hook and lift the instrument panel assembly off of the roll-down bracket screws and remove it from the vehicle.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) With the aid of an assistant, load the instrument panel assembly onto the roll-down bracket screws on the cowl side inner panels in the vehicle (Fig. 11). Install a temporary hook in the center hole on top of the instrument panel. Secure the other end of the hook to the center hole in the top of the dash panel. The hook should support the instrument panel in its rolled down position about 46 cm (18 inches) from the dash panel.

(2) With the instrument panel supported in the roll-down position, reconnect the instrument panel wire harness connectors to the heater-A/C housing wire harness connectors.

(3) Remove the temporary hook from the instrument panel and roll the instrument panel up to its installed position against the dash panel.

(4) Install and tighten the five screws that secure the top of the instrument panel to the top of the dash panel. Tighten the screws to 3.2 N·m (28 in. lbs.).

(5) Tighten the right and left instrument panel cowl side roll-down bracket screws. Tighten the screws to 11.9 N·m (105 in. lbs.).

(6) From under the passenger side of the instrument panel, reconnect the two halves of the radio antenna coaxial cable connector.

(7) From under the driver side of the instrument panel, perform the following:

(a) Engage the park brake release handle linkage rod with the park brake mechanism on the left cowl side inner panel. (Refer to 5 - BRAKES/PARKING BRAKE/RELEASE - INSTALLATION).

(b) Reconnect the instrument panel wire harness connector to the park brake switch on the park brake mechanism.

(c) Reconnect the three connectors (one from the body wire harness, and two from the headlamp and dash wire harness) to the three connector receptacles located closest to the dash panel on the back of the Junction Block (JB).

(d) Reconnect the headlamp and dash wire harness to instrument panel wire harness bulkhead connector and tighten the screw in the center of the connector. Tighten the screw to 3.5 N·m (31 in. lbs.).

(e) Reconnect the instrument panel wire harness to door wire harness connector located directly below the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(f) If the vehicle is equipped with the Infinity sound system option, reconnect the Infinity wire harness connector to the instrument panel wire harness connector that is secured to the outboard side of the instrument panel wire harness to headlamp and dash wire harness bulkhead connector.

(g) Reconnect the instrument panel wire harness connector to the stop lamp switch.

(h) Reconnect the heater-A/C housing vacuum harness connector to the heater-A/C control vacuum harness connector located near the left end of the heater-A/C housing.

(8) Reinstall the steering column into the vehicle. Be certain that the steering wheel was locked and secured from rotation to prevent the loss of clockspring centering. (Refer to 19 - STEERING/COLUMN - INSTALLATION).

(9) If the vehicle is so equipped, reconnect the overdrive lockout switch pigtail wire connector to the instrument panel wire harness connector near the instrument panel lower reinforcement.

(10) Reconnect the clockspring pigtail wire connector to the instrument panel wire harness connector at the instrument panel lower reinforcement.

(11) Position the inside hood latch release handle to the instrument panel lower reinforcement.

(12) Install and tighten the two screws that secure the inside hood latch release handle to the instrument panel lower reinforcement. Tighten the screws to 2.8 N·m (25 in. lbs.).

(13) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(14) Reinstall the trim onto the left and right cowl side inner panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

(15) Reinstall the Airbag Control Module (ACM) and bracket onto the floor panel transmission tunnel. (Refer to 8 - ELECTRICAL/RESTRAINTS/AIRBAG CONTROL MODULE - INSTALLATION).

(16) Reconnect the battery negative cable.

INTERIOR

CAUTION

CAUTION: Do not attempt to remove interior trim panels/moldings without first removing the neces-

sary adjacent panels. To avoid damaging the panels, ensure that all the screws and clips are removed before attempting to remove an interior trim panel/molding. Trim panels are somewhat flexible but can be damaged if handled improperly.

A-PILLAR GRAB HANDLE

REMOVAL

- (1) Using a small flat blade screw driver, pry trim plugs from A-pillar grab handle.
- (2) Remove screws attaching grab handle to A-pillar (Fig. 1).
- (3) Separate A-pillar grab handle from vehicle.

Fig. 1 A-pillar Grab Handle (4X4)

- 1 - A-PILLAR TRIM
- 2 - TRIM PLUG
- 3 - GRAB HANDLE

INSTALLATION

- (1) Position grab handle on A-pillar.
- (2) Install screws attaching grab handle to A-pillar (Fig. 1).
- (3) Install trim plugs in A-pillar grab handle.

A-PILLAR TRIM

REMOVAL

- (1) Remove A-pillar grab handle, if equipped (Refer to 23 - BODY/INTERIOR/A-PILLAR GRAB HANDLE - REMOVAL).
- (2) Grasp A-pillar trim at top and pull outward/downward to disengage upper spring clip (Fig. 2).
- (3) Carefully pull bottom of A-pillar trim outward to disengage lower spring clip.
- (4) Disengage speaker harness connector, if equipped.
- (5) Separate A-pillar trim from vehicle.

INSTALLATION

- (1) Position A-pillar trim in vehicle.
- (2) Engage speaker harness connector, if equipped.
- (3) Align spring clips and press into place.

80b171dc

Fig. 2 A-pillar Trim

- 1 - A-PILLAR TRIM
- 2 - SPRING CLIPS

- (4) Install A-pillar grab handle, if equipped (Refer to 23 - BODY/INTERIOR/A-PILLAR GRAB HANDLE - INSTALLATION).

COWL TRIM COVER

REMOVAL

- (1) Remove front door sill trim cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (2) Grasp center upper edge of cowl trim cover (Fig. 3) and pull outward allowing cowl trim cover to bow in the center releasing trim cover retaining tab (Fig. 4).
- (3) Separate cowl trim cover from lower cowl.

INSTALLATION

- (1) Position cowl trim cover on lower cowl.
- (2) Press into place.
- (3) Install front door sill trim cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

B-PILLAR TRIM**REMOVAL**

- (1) Remove rear floor stowage tray, If equipped. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL).
- (2) Remove door sill cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (3) Remove bolt attaching seat belt anchor to floor.
- (4) Snap turning loop cover up and remove bolt attaching turning loop to B-pillar.
- (5) Remove seat belt exit plug (Fig. 5).
- (6) Disengage clips attaching B-pillar trim to upper B-pillar.
- (7) Separate B-pillar trim from B-pillar.
- (8) Route seat belt webbing through opening in B-pillar trim.

INSTALLATION

- (1) Route seat belt webbing through opening in B-pillar trim.
- (2) Position B-pillar trim at B-pillar.
- (3) Starting at the top, engage clips attaching B-pillar trim to upper B-pillar.
- (4) Install seat belt exit plug.

**Fig. 5 B-Pillar Trim**

- 1 - B-PILLAR
- 2 - TURNING LOOP
- 3 - B-PILLAR TRIM
- 4 - SEAT BELT ANCHOR
- 5 - EXIT PLUG

- (5) Install bolt attaching turning loop to B-pillar and reposition turning loop cover.
- (6) Install bolt attaching seat belt anchor to floor.
- (7) Install door sill cover (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).
- (8) Install rear floor stowage tray (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION).

REAR CLOSURE PANEL TRIM**REMOVAL**

- (1) Remove B-pillar trim panels (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).
- (2) Remove rear floor stowage tray, if equipped. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL).
- (3) Remove screws attaching bottom of rear closure panel trim to floor pan (Fig. 6).
- (4) Remove screws attaching rear closure panel trim to cab back panel.
- (5) Disengage clips attaching top of rear closure panel trim to cab back panel.
- (6) Separate rear closure panel trim from vehicle.

REAR CLOSURE PANEL TRIM (Continued)

80b171e5

Fig. 6 Rear Closure Panel Trim

- 1 - REAR TRIM PANEL
- 2 - REAR FLOOR STORAGE TRAY
- 3 - CAB BACK PANEL
- 4 - STOWAGE BINS

INSTALLATION

- (1) Position rear closure panel trim in vehicle.
- (2) Align and engage clips attaching top of rear closure panel trim to cab back panel.
- (3) Install screws attaching rear closure panel trim to cab back panel.
- (4) Install screws attaching bottom of rear closure panel trim to floor pan (Fig. 6).
- (5) Install rear floor stowage tray, if equipped. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION).
- (6) Install B-pillar trim panels (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

REAR FLOOR STOWAGE TRAY**REMOVAL**

- (1) Move seat tracks to forward position.
- (2) Remove screws attaching rear floor stowage tray to floor (Fig. 7).
- (3) Disengage hooks on stowage tray from slots in rear closure panel trim.
- (4) Separate rear floor stowage tray from vehicle.

INSTALLATION

- (1) Position rear floor stowage tray in vehicle.

80b171e6

Fig. 7 Rear Floor Stowage Tray

- 1 - REAR CLOSURE PANEL TRIM
- 2 - REAR FLOOR STOWAGE TRAY

- (2) Engage hooks on stowage tray into slots in rear closure panel trim.
- (3) Install screws attaching rear floor stowage tray to floor.

DOOR SILL TRIM**REMOVAL**

- (1) Remove screws attaching door sill trim cover to door sill (Fig. 8).
- (2) Separate door sill trim cover from door sill.

80b171e9

Fig. 8 Door Sill Trim Cover

- 1 - DOOR SILL TRIM

INSTALLATION

- (1) Position door sill trim cover on door sill.
- (2) install screws attaching door sill trim cover to door sill.

SHIFT BOOT - MANUAL TRANSMISSION

REMOVAL

- (1) Using a trim stick C-4755 or equivalent, pry the corner of the shift boot up to expose the fasteners.
- (2) Remove the screws attaching the shift boot to the console.
- (3) Remove the insert from the shift knob, remove nut attaching knob to the lever, and remove the shift knob.
- (4) Lift floor shift boot off shifter.

INSTALLATION

- (1) Install shift boot over the shift lever, position boot on console and install the fasteners attaching boot to console.
- (2) Install the shift knob, shift knob nut, and tighten to 27 N·m (20 ft.lbs) torque.
- (3) Install the shift knob insert.

80b897c0

Fig. 9 4WD Transfer Case Shift Boot - Automatic Transmission

- 1 - KNOB
- 2 - BOOT
- 3 - RETAINER
- 4 - BASE
- 5 - NUT
- 6 - INSERT

4WD FLOOR SHIFT BOOT

REMOVAL

- (1) Remove insert from shift knob.
- (2) Remove nut attaching shift knob to shift lever.
- (3) Remove shift knob.
- (4) Using a trim stick C-4755 or equivalent, disengage retainers attaching boot to shifter base (Fig. 9). Automatic transmission vehicle shown, manual transmission similar.
- (5) Lift floor shift boot off shift lever.

INSTALLATION

- (1) Place shift boot over shifter.
- (2) Engage retainers attaching boot to shifter base.
- (3) Position shift knob on shift lever.
- (4) Install nut attaching shift knob to shift lever.
- (5) Install insert on shift knob.

CENTER CONSOLE

REMOVAL

- (1) Remove the transfer case shift boot, if equipped. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - REMOVAL).
- (2) Remove the transmission shifter boot. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT - REMOVAL).
- (3) Remove the screws attaching the console to mounting brackets (Fig. 10).
- (4) Lift the console upward.
- (5) Disengage wire harness connector, if equipped.
- (6) Separate console from vehicle.

80b5cb96

Fig. 10 Floor Console W/Cup Holder

- 1 - CUP HOLDER
- 2 - FLOOR CONSOLE

INSTALLATION

- (1) Position console in vehicle.
- (2) Engage wire harness connector, if equipped.
- (3) Position the console on the floor.

CENTER CONSOLE (Continued)

(4) Install the screws attaching the console to mounting brackets.

(5) Install the transmission shifter boot. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT - INSTALLATION).

(6) Install the transfer case shifter boot, if equipped. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT - INSTALLATION).

(7) Install cup holder in console, if equipped.

CARPETS AND FLOOR MATS

REMOVAL

STANDARD CAB

(1) Remove seat (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or(Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL).

(2) Remove door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove cowl trim covers (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).

(4) Remove center console, if equipped.(Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)

(5) If not equipped with a center console remove the transfer case shifter boot (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - REMOVAL).

(6) Remove rear stowage tray (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL).

(7) Remove rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(8) Fold carpet or mat toward center of cab.

(9) Remove carpet or mat through door opening (Fig. 11).

QUAD/CLUB CABS

(1) Remove front and rear seats. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or(Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL) and (Refer to 23 - BODY/SEATS/REAR SEAT - REMOVAL)

(2) Remove door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove center console, if equipped.(Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)

(4) If not equipped with a center console remove the transfer case shifter boot (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - REMOVAL).

(5) Remove emergency jack tool kit.

Fig. 11 Floor Carpet or Mat

- 1 - CARPET OR MAT
- 2 - FLOOR PAN
- 3 - REAR/INNER SEAT MOUNT
- 4 - POWER SEAT HARNESS

(6) Remove rear seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - REMOVAL)

(7) Remove rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(8) Remove C-pillar trim panels. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)

(9) Remove the quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)

(10) Fold carpet or mat toward center of cab.

(11) Remove carpet or mat through door opening.

INSTALLATION

STANDARD CAB

(1) Position carpet or mat in vehicle and align all holes (Fig. 11).

(2) Install rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

(3) Install rear stowage tray (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION).

(4) Install the transfer case shifter boot if not equipped with a center console. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - INSTALLATION)

(5) Install the center console, if equipped. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

(6) Install cowl trim covers (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

CARPETS AND FLOOR MATS (Continued)

(7) Install door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(8) Install seat, (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT/SPLIT BENCH - INSTALLATION).

QUAD/CLUB CABS

(1) Position carpet or mat in vehicle.

(2) Install quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)

(3) Install rear seat belt buckles.

(4) Install the C-pillar trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(5) Install rear closure panel trim (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

(6) Install the rear seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)

(7) Install emergency jack tool kit.

(8) Install the transfer case shifter boot if not equipped with a center console. (Refer to 23 - BODY/INTERIOR/SHIFT BOOT/TRANSFER CASE - INSTALLATION)

(9) Install the center console, if equipped. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

(10) Install floor shift boot, if equipped.

(11) Install cowl trim covers (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).

(12) Install door sill covers (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(13) Install front and rear seats. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION) and (Refer to 23 - BODY/SEATS/REAR SEAT - INSTALLATION)

ASSIST HANDLE

REMOVAL

(1) Disengage tabs attaching assist handle end covers to assist handle.

(2) Remove screws attaching overhead assist handle to roof rail (Fig. 12).

(3) Separate overhead assist handle from vehicle.

INSTALLATION

(1) Position assist handle on vehicle.

(2) Install screws attaching overhead assist handle to roof rail (Fig. 12).

(3) Install tabs attaching assist handle end covers to assist handle.

J9423-74

Fig. 12 Overhead Assist Handle

- 1 - CAB ASSEMBLY
- 2 - SCREW
- 3 - ASSIST HANDLE
- 4 - TRIM COVER

COAT HOOK

REMOVAL

(1) Insert a small flat blade into the tip of the hook.

(2) Carefully pry outward to separate the coat hook from coat hook base.

(3) Pull coat hook out of roof panel (Fig. 13). Extended cab shown, standard cab similar.

80ae848d

Fig. 13 Coat Hook—Club/Quad Cab

- 1 - COAT HOOK

COAT HOOK (Continued)

INSTALLATION

- (1) Position coat hook in roof panel.
- (2) Push the coat hook cover inward and secure the coat hook to roof panel.

HEADLINER

REMOVAL

- (1) Remove sun visors and visor hooks. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
- (2) Remove overhead assist handle. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL).
- (3) Remove coat hook(s). (Refer to 23 - BODY/INTERIOR/COAT HOOK - REMOVAL)
- (4) Remove overhead console, if equipped. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
- (5) Remove A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
- (6) Remove B-pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).
- (7) Remove the C-pillar trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)
- (8) Remove the quarter trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL)
- (9) Remove dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL).
- (10) If equipped, disengage push-in fasteners attaching headliner to roof panel (Fig. 15). Extended cab shown, standard cab similar.
- (11) Separate headliner from roof panel (Fig. 14).
- (12) Extract headliner through door opening.

Fig. 14 Headliner

- 1 - HEADLINER
2 - COAT HOOK

Fig. 15 Headliner Push-In Fasteners

- 1 - HEADLINER
2 - PUSH-IN FASTENER

INSTALLATION

- (1) Position headliner on roof panel (Fig. 14). Extended cab shown, standard cab similar.
- (2) Install passenger side sun visor hook. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).
- (3) Install driver's side coat hook. (Refer to 23 - BODY/INTERIOR/COAT HOOK - INSTALLATION).
- (4) Install driver side sun visor hook.
- (5) Install dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - INSTALLATION).
- (6) Install the C-pillar trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)
- (7) Install the quarter trim panels, if equipped. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION)
- (8) Install B-pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).
- (9) Install A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
- (10) Install overhead console, if equipped. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
- (11) Install overhead assist handle. (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION).
- (12) Install sun visors.

BODY VENT

REMOVAL

- (1) Open door.
- (2) Pull outward at top of vent to disengage clips attaching vent to door jamb (Fig. 16).
- (3) Separate vent from door jamb.

Fig. 16 Body Vent

- 1 - B-PILLAR
2 - DOOR STRIKER
3 - BODY VENT

INSTALLATION

- (1) Position vent from in jamb.
- (2) Press vent inward to engage clips.

REAR VIEW MIRROR

REMOVAL

- (1) If equipped, disconnect mirror harness wire connector (Fig. 17).
- (2) Loosen the mirror base setscrew (Fig. 18).
- (3) Slide the mirror base upward and off the bracket.

INSTALLATION

INSTALLATION

- (1) Position the mirror base at the bracket and slide it downward onto the support bracket.
- (2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.

80b5cbcf

Fig. 17 Rearview Mirror Connector

- 1 - CONNECTOR
2 - MIRROR
3 - SCREW

J9123-463

Fig. 18 Rearview Mirror

- 1 - REARVIEW MIRROR
2 - WINDSHIELD GLASS
3 - SUPPORT BRACKET
4 - SCREW

- (3) If equipped, connect mirror harness wire connector.

INSTALLATION - REARVIEW MIRROR SUPPORT BRACKET

- (1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
- (2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.

REAR VIEW MIRROR (Continued)

(3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.

(4) Apply accelerator to the surface on the bracket according to the following instructions:

- (a) Crush the vial to saturate the felt applicator.
- (b) Remove the paper sleeve.
- (c) Apply accelerator to the contact surface on the bracket.
- (d) Allow the accelerator to dry for five minutes.
- (e) Do not touch the bracket contact surface after the accelerator has been applied.

(5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.

(6) Install the bracket according to the following instructions:

- (a) Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
- (b) Apply an even coat of adhesive to the contact surface on the bracket.
- (c) Align the bracket with the marked position on the windshield glass.
- (d) Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

(7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

(8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

SUN VISOR

REMOVAL

- (1) Remove screws attaching sunvisor to roof (Fig. 19).
- (2) If equipped, disengage lighted vanity mirror connector.
- (3) Separate sunvisor from roof.
- (4) Remove screw attaching sun visor hook to roof.
- (5) Separate sunvisor hook from roof.

Fig. 19 Sunvisor

- 1 - BODY
2 - CLIP
3 - SUNVISOR

INSTALLATION

- (1) Position sunvisor hook on roof.
- (2) Install screw attaching sunvisor hook to roof.
- (3) Position sunvisor on roof.
- (4) If equipped, engage lighted vanity mirror connector.
- (5) Install screws attaching sunvisor to roof (Fig. 19).

QUARTER TRIM PANEL

REMOVAL

- (1) Remove rear seat. (Refer to 23 - BODY/SEATS/ REAR SEAT - REMOVAL)
- (2) Remove door sill cover as necessary to clear quarter trim.
- (3) Remove lower seat belt anchor bolt (Fig. 20).
- (4) Remove seat belt turning loop anchor bolt.
- (5) Disengage clips attaching quarter trim panel from quarter panel.
- (6) Route seat belt webbing through opening in quarter trim panel and remove panel from vehicle.

Fig. 20 Quarter Trim Panel — Club Cab

- 1 - TURNING LOOP COVER
- 2 - BELT ASSEMBLY
- 3 - TRIM PANEL

INSTALLATION

- (1) Position trim panel in vehicle and route seat belt webbing through opening in quarter trim panel.
- (2) Open quarter vent window.
- (3) Position trim panel on quarter panel and engage clips on upper portion of panel.
- (4) Engage clips attaching lower portion of quarter trim panel to quarter panel.
- (5) Install lower seat belt anchor bolt.
- (6) Install door sill cover as necessary.
- (7) Install rear seat. (Refer to 23 - BODY/SEATS/ REAR SEAT - INSTALLATION)

C-PILLAR TRIM

REMOVAL

- (1) Remove rear floor stowage tray. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - REMOVAL)
- (2) Remove door sill cover as necessary to clear C-pillar trim.
- (3) Remove bolt attaching seat belt anchor to floor.
- (4) Unsnap turning loop, push cover up and remove bolt attaching turning loop to C-pillar.
- (5) Remove seat belt exit plug.
- (6) Disengage clips attaching C-pillar trim to upper C-pillar.
- (7) Separate C-pillar trim from C-pillar.
- (8) Route seat belt webbing through opening in C-pillar trim.

INSTALLATION

- (1) Route seat belt webbing through opening in C-pillar trim.
- (2) Position C-pillar trim at C-pillar.
- (3) Starting at the top, engage clips attaching C-pillar trim to upper C-pillar.
- (4) Install seat belt exit plug.
- (5) Install bolt attaching turning loop to C-pillar and position turning loop cover. Snap turning loop cover into place.
- (6) Install bolt attaching seat belt anchor to floor.
- (7) Install door sill cover.
- (8) Install rear floor stowage tray. (Refer to 23 - BODY/INTERIOR/REAR FLOOR STOWAGE TRAY - INSTALLATION)

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. The plate is located on the floor pan under the passenger seat or attached to the front face of the radiator closure panel. Refer to the Introduction section at the front of this manual for body code plate description. The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers.

BASE COAT/CLEAR COAT FINISH

DESCRIPTION

The original equipment finish is a multi-step process that involves cleaning, electrodeposition (e-coat), base coat, and clear coat steps. Additionally, selected areas of the vehicle may be coated with an anti-chip finish.

OPERATION

On most vehicles a two-part paint application (base coat/clear coat) is used. Color paint that is applied to primer is called base coat. The clear coat protects the base coat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. Refer to Introduction group of this manual for Body Code Plate information.

WARNING: USE AN OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

OPERATION

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

(5) On vehicles without clear coat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clear coat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT. AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

WET SANDING/BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clear coat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clear coat finish, if equipped. Base coat paint must retain clear coat for durability.

SEATS

DESCRIPTION

Seat modules are made up of a seat frame, seat cushion, seat back cushion, a covering material, and the electrical components used for power operation, if equipped. Some seat systems also contain seat belt components and supplemental restraint systems.

OPERATION

Seat assemblies transport the occupants in comfort and safety. Seat assemblies also help position occupants correctly in the event of airbag deployment. Seat cushions, coverings, and electrical components are serviceable. Refer to the appropriate group in this manual.

CENTER CONSOLE LID

REMOVAL

- (1) Open console lid.
- (2) Using a small flat blade screwdriver, disengage locking tabs located under the console lid trim bezel.
- (3) Separate bezel from lid.
- (4) Move driver and passenger seat to full forward position.
- (5) Using a small drift and hammer, tap out console lid hinge pin.
- (6) Separate lid from console.

CENTER CONSOLE LID (Continued)

INSTALLATION

- (1) Align console lid with console. Verify lid tension spring is in position.
- (2) Install hinge pin.
- (3) Position trim bezel on lid and snap into place.

**CENTER SEAT ARMREST/
CONSOLE****REMOVAL**

- (1) Remove bolts on driver and passenger seat inboard seat tracks.
- (2) Separate center section.

INSTALLATION

- (1) Position and align center section on driver and passenger seat inboard seat tracks.
- (2) Install bolts. Tighten to 19.5 N·m (14 ft. lbs.) torque.

**CENTER SEAT ARMREST/
LATCH COVER****REMOVAL**

- (1) With the seat back fully forward, move the driver's seat to a full forward position.
- (2) Place the center arm rest in a full up position.
- (3) Remove the fastener securing the cover to the inertia latch.
- (4) Disengage the front edge of the cover, then lower the arm rest.
- (5) Remove the inertia latch cover by pulling the cover rearwards (Fig. 1).

80b76fab

Fig. 1 Armrest Inertia Latch Cover

1 - INERTIA LATCH COVER

INSTALLATION

- (1) Slide the inertia latch cover onto the latch arm.
- (2) Raise the armrest, then engage the front edge of the cover.
- (3) Install the lower strap into the center armrest's lower track (Fig. 2).
- (4) Slide back the armrest trim to visually ensure the lower strap is properly installed.
- (5) Slowly cycle the armrest to ensure the strap moves freely in the track.
- (6) Install the upper strap into the center armrest's upper track (Fig. 3).
- (7) Slowly cycle the armrest to ensure the strap moves freely in the track.
- (8) Secure the armrest inertia latch cover and tighten the fastener to 4N·m (35 in. lbs.).

Fig. 2 Inertia Latch Cover Lower Strap Installation**LUMBAR SUPPORT****REMOVAL**

- (1) Remove the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REMOVAL).
- (2) Disengage the heated seat connectors.
- (3) Partially separate the seat back foam to access the lumbar frame clips.
- (4) Separate the lumbar assembly from the seat frame.

LUMBAR SUPPORT (Continued)

**Fig. 3 Inertia Latch Cover Upper Strap****INSTALLATION**

- (1) Position the lumbar assembly on the seat back frame.
- (2) Engage the retaining clips on the seat frame.
- (3) Route the lumbar wire harness through seat assembly.
- (4) Engage the heated seat wire connectors.
- (5) Install the seat back cover. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - INSTALLATION).
- (6) Perform a function check on the seat operations.

SEAT - BENCH SEAT**REMOVAL**

- (1) Move seat track to forward position.
- (2) Hinge seat backs forward.
- (3) Remove nuts attaching rear of seat tracks to floor (Fig. 4).
- (4) Move seat track to rearward position.
- (5) Remove bolts attaching front of seat tracks to floor.
- (6) Separate seat from vehicle.

INSTALLATION

NOTE: Seat adjustment latch must be engaged and in equal positions prior to seat installation. Verify inboard and outboard seat latch operation.

- (1) Position seat in vehicle.
- (2) Install bolts attaching front of seat tracks to floor. Tighten bolts to 54 N·m (40 ft. lbs.) torque.
- (3) Move seat track to forward position.

**Fig. 4 Bench Seat**

- 1 - BENCH SEAT
- 2 - NUT
- 3 - STUD
- 4 - FLOOR PAN
- 5 - SCREW

- (4) Hinge seat backs forward.
- (5) Install nuts attaching rear of seat tracks to floor. Tighten inboard nuts to 40 N·m (30 ft. lbs.) torque. Tighten outboard nuts to 54 N·m (40 ft. lbs.) torque.

SEAT - SPLIT BENCH**REMOVAL****STANDARD CAB**

- (1) Move seat track to forward position.
- (2) Hinge seat back forward.
- (3) Remove nuts holding outboard and inboard tracks to floor (Fig. 5).
- (4) Move seat track to forward position.
- (5) Remove bolt holding inboard seat track to bottom of center occupant seat.
- (6) Remove bolts holding front of seat tracks to floor.
- (7) Disengage power seat wire connector from body harness, if equipped (Fig. 5).
- (8) Lift center occupant seat upward to clear rear attachment stud.
- (9) Separate seat from vehicle.

SEAT - SPLIT BENCH (Continued)

**Fig. 5 Split Bench Seat**

- 1 - SEAT
2 - POWER SEAT HARNESS CONNECTOR

QUAD CAB

- (1) Clamp seat belt to prevent belt from retracting.
- (2) Move seats to full rearward position.
- (3) Remove bolts attaching front of seat tracks to floor.
- (4) Move seats to full forward position.
- (5) Remove bolts attaching rear of outboard seat tracks to floor (Fig. 6).
- (6) Remove nuts attaching inboard seat tracks to floor.
- (7) Disengage wire connectors from body harness.
- (8) Lift seats upward to clear rear studs.
- (9) With the aid of a helper, separate seat from vehicle.

INSTALLATION**STANDARD CAB**

- (1) Position seat in vehicle.
- (2) Connect power seat wire connector to body harness, if equipped.
- (3) Install bolts holding front of seat tracks to floor. Tighten the bolts to 40 N·m (30 ft. lbs.) torque.
- (4) Install bolt holding inboard seat track to bottom of center occupant seat. Tighten the bolt to 28 N·m (21 ft. lbs) torque.

**Fig. 6 Split Bench Seat—Club/Quad Cab**

- 1 - SEAT

- (5) Install nuts holding outboard and inboard tracks to floor. Tighten the inboard nuts to 40 N·m (30 ft. lbs.) torque. Tighten the outer nuts to 54 N·m (40 ft. lbs. torque).

QUAD CAB

- (1) Position seat in vehicle.

CAUTION: Verify that power is not being supplied when engaging connector.

- (2) Engage driver's seat belt buckle wire connector. Engage power seat wire connector to body harness, if equipped.
- (3) Ensure seats are in full forward position.
- (4) Install outboard bolts attaching rear of seat tracks to floor (Fig. 6). Tighten the bolts to 54 N·m (40 ft. lbs.) torque.
- (5) Install nuts attaching inboard seat tracks to floor. Tighten the nuts to 40 N·m (30 ft. lbs.) torque.
- (6) Move seats to full forward position.
- (7) Install bolts attaching front of seat tracks to floor. Tighten the bolts to 54 N·m (40 ft. lbs.) torque.

SEAT BACK - BENCH SEAT

REMOVAL

- (1) Move seat to the full forward position.
- (2) Release J-Strap and peel back side of cover (corner flap) (Fig. 8).
- (3) Remove bolts attaching seat back to seat cushion and separate seat back from seat cushion (Fig. 7).

805dd84e

Fig. 7 Seat Back Removal/Installation

- 1 - SEAT BACK
2 - SEAT CUSHION

INSTALLATION

J9523-155

Fig. 8 J-Strap Corner Removal/Installation

- 1 - SEAT CUSHION
2 - J—STRAP
3 - PLASTIC COVER
4 - SEAT BACK
5 - PIN
6 - LATCH

- (1) Align seat cushion with seat back.

(2) Install bolts through seat back latch into seat cushion frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.

(3) Pull side of cover (corner flap) facing rear of the cushion over and secure J-Strap (Fig. 8).

(4) Plastic cover on side cover (corner flap) at rear of cushion must be over the pin on the inertia latches.

SEAT BACK - SPLIT BENCH

REMOVAL

STANDARD CAB

(1) Disconnect power seat switch connector, if equipped.

(2) Remove center seat/console armrest. (Refer to 23 - BODY/SEATS/CENTER SEAT ARMREST / CONSOLE - REMOVAL).

(3) Disconnect rear end flap J-Straps and peel back rear J-Strap.

(4) Remove bolts attaching seat back to seat cushion frame.

(5) Separate seat back from seat cushion (Fig. 9).

805dd848

Fig. 9 Seat Back Removal

- 1 - SEAT BACK
2 - RELEASE LATCH KNOB
3 - SHOULDER BOLT
4 - END FLAP J—STRAP
5 - SEAT CUSHION
6 - LUMBAR HANDLE

QUAD CAB

(1) Remove screw attaching recliner handle and pull handle to remove.

(2) Remove seat dump handle, 2-door "BE" vehicles only.

(3) Remove screws attaching side shield to seat track adjuster.

SEAT BACK - SPLIT BENCH (Continued)

- (4) Remove seat dump handle.
- (5) Pull shoulder belt out completely and clamp shoulder belt to prevent shoulder belt from retracting (Fig. 10).
- (6) Remove shoulder belt anchor bolt.
- (7) From the underside of the seat, remove the inboard pivot bolt (Fig. 11).

WARNING: DO NOT REMOVE UPPER RECLINER HANDLE, PULL ON UPPER RECLINER HANDLE OR RECLINER CABLE END. THE RECLINER LEAD SCREW IS SPRING LOADED AND WILL EJECT IF EITHER THE HANDLE OR CABLE IS PULLED BEFORE THE LEAD SCREW IS REMOVED.

- (8) Remove clip attaching recliner cable (Fig. 12) to seat track adjuster and separate the cable from the seat track adjuster.
- (9) Remove the inboard and outboard pivot bolts attaching the frame to the seat track adjuster (Fig. 13).
- (10) Remove recliner lower bolt.
- (11) Separate seat back from seat track adjuster.

80aef256

Fig. 10 Shoulder Belt Clamp

- 1 - CLAMP
- 2 - SEAT BACK
- 3 - SHOULDER BELT

INSTALLATION**STANDARD CAB**

- (1) Align seat cushion with seat back and install shoulder bolt through seat back into seat cushion frame on inboard side. Tighten bolt to 49 N·m (36 ft. lbs.) torque.
- (2) Install bolts through seat back latch into seat cushion frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.
- (3) Connect rear end flap J-Straps and pull rear J-Strap up and secure to frame.

80b0d715

- 6 - SEAT RISER
- 7 - SEAT TRACK ADJUSTER

- (4) Install seat in vehicle.
- (5) Connect power seat switch connector, if equipped.

SEAT BACK - SPLIT BENCH (Continued)

Fig. 13 Recliner

- 1 - SEAT BACK
- 2 - RECLINER
- 3 - SEAT TRACK

QUAD CAB

- (1) Position seat back on seat track adjuster.
- (2) Install the inboard and outboard pivot bolts attaching the frame to the seat track adjuster (Fig. 11).
- (3) Install the bolt attaching the lower recliner to the seat track adjuster.
- (4) Position the recliner cable on seat track adjuster and install **new** clip.
- (5) Install shoulder belt anchor bolt. Tighten bolt to 45 N·m (33 ft. lbs.) torque.
- (6) Remove clamp (Fig. 10).
- (7) Install side shield.
- (8) Install recliner handle.
- (9) Install seat dump handle, if removed.

SEAT BACK COVER

REMOVAL

- (1) Remove seat back from vehicle. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - REMOVAL)

- (2) Disengage J-Straps from base of seat back.
- (3) Remove hogrings, if equipped.
- (4) With seat back in a normal vertical position, roll cover upwards and remove.

INSTALLATION

- (1) With seat back in a normal vertical position, roll cover downwards over seat back.
- (2) Install hogrings, if equipped.
- (3) Secure J-Straps at base of seat back.
- (4) Install seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - INSTALLATION)

SEAT BACK COVER - SPLIT BENCH

REMOVAL

- (1) Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)
- (2) Using a trim stick or equivalent tool, pry off lumbar handle, if equipped (Fig. 14). (Damage to lumbar handle may occur during removal, verify availability of replacement handle before removing.)
- (3) Remove latch release knob (Fig. 14).
- (4) Remove latch release bezel.
- (5) Disengage J-Straps from base of seat back.
- (6) Remove hog rings, if equipped.
- (7) With seat back in a normal vertical position, roll cover upwards and remove.

Fig. 14 Lumbar Handle Removal

- 1 - LUMBAR CAM
- 2 - BEZEL
- 3 - RELEASE LATCH KNOB
- 4 - LUMBAR HANDLE

INSTALLATION

- (1) With seat back in a normal vertical position, roll cover downwards over seat back.
- (2) Install hog rings, if equipped.

SEAT BACK COVER - SPLIT BENCH (Continued)

- (3) Engage J-Straps at base of seat back.
- (4) Align lumbar handle with lumbar cam and tap on with rubber mallet until seated.
- (5) Install latch release bezel.
- (6) Install latch release knob.
- (7) Install seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

SEAT BACK RECLINER

REMOVAL

- (1) Remove seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)
- (2) Disengage J-straps at base of seat back and roll seat back cover upward to access rubber bellows push-in fasteners.

NOTE: Notice the routing of the recliner cable for installation.

- (3) Remove the push-in fasteners attaching upper rubber bellows to the seat back frame.
- (4) Remove rubber bellows.
- (5) Remove seat dump handle, 2-door "BE" vehicles only.

WARNING: Do not pull on upper recliner handle or recliner cable end. The recliner lead screw is spring loaded and will eject if either the handle or cable is pulled before the lead screw is removed.

- (6) Remove the bolts attaching upper recliner to seat back frame (Fig. 15).

(7)

Separate the recliner from the seat back.

INSTALLATION

- (1) Install seat dump handle, if removed.
- (2) Position the recliner in the seat back.
- (3) Install the bolts attaching upper recliner to seat back frame (Fig. 15).
- (4) Install rubber bellows.
- (5) Roll seat back cover upward and engage J-straps at base of seat back.
- (6) Ensure recliner cable is correctly routed.
- (7) Install seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

SEAT CUSHION

REMOVAL

- (1) Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)

80aef288

Fig. 15 Seat Back Recliner

- (2) Remove the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - REMOVAL) or (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)

(3) From the underside of the seat, remove the bolts attaching the cushion frame to the mounting brackets.

- (4) Disengage wire harness connector, if equipped.
- (5) Remove the cushion from the seat tracks.

INSTALLATION

- (1) Position the cushion frame on the seat tracks.
- (2) Ensure that the cushion frame is aligned with the mounting brackets (Fig. 16).
- (3) Engage wire harness connector, if equipped.
- (4) Install the bolts attaching the seat cushion frame to the mounting brackets. Tighten bolts to 25 N·m (18 ft. lbs.) torque.
- (5) Install the seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

SEAT CUSHION (Continued)

80aef27c

Fig. 16 Seat Cushion Mounting Frame

- 1 - SEAT CUSHION FRAME
2 - MOUNTING BRACKET

SEAT CUSHION COVER

REMOVAL

- (1) Remove seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)
- (2) Position seat cushion on a suitable work surface with frame side up.
- (3) Remove seat track. (Refer to 23 - BODY/SEATS/SEAT TRACK - REMOVAL)
- (4) Remove left and right side J-Straps.
- (5) Remove rear J-Strap.
- (6) Remove front J-Strap.
- (7) Roll trim cover off of front and rear corners and separate from foam cushion.

INSTALLATION

- (1) Position cushion cover on cushion and roll cover over front and rear corners.
- (2) Secure front J-Strap (Fig. 17).

- (3) Secure rear J-Strap.
- (4) Secure left and right side J-Straps.
- (5) Verify stitching lines are straight, correct as necessary.
- (6) Install the seat track. (Refer to 23 - BODY/SEATS/SEAT TRACK - INSTALLATION)
- (7) Install seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

Fig. 17 J-Strap Installation

SEAT CUSHION COVER - SPLIT BENCH

REMOVAL

STANDARD CAB

- (1) Remove seat tracks. (Refer to 23 - BODY/SEATS/SEAT TRACK - SPLIT BENCH - REMOVAL)
- (2) Remove seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - REMOVAL)
- (3) Remove left and right J-straps.
- (4) Position seat cushion on a suitable work surface with frame side up.
- (5) Remove rear J-strap.
- (6) Remove front J-strap.
- (7) Roll cushion cover off of foam cushion.

QUAD CAB

- (1) Remove seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)
- (2) Disengage the J-straps attaching the cushion cover to the cushion frame (Fig. 18).
- (3) Peel the cushion cover and disengage the hook and loop fasteners (Fig. 19).
- (4) Disengage the electrical connectors for the heated seat grid, if equipped.

SEAT CUSHION COVER - SPLIT BENCH (Continued)

(5) Disengage the hog rings attaching the cushion cover to the cushion frame (Fig. 20).

(6) Separate the cover from the cushion.

- 3 - SEAT CUSHION

Fig. 21 J-Strap Installation

- 1 - J—STRAP
- 2 - FRAME

INSTALLATION

STANDARD CAB

(1) Position cushion cover on cushion and roll cover over front and rear corners. Verify stitching lines are straight, correct as necessary.

(2) Pull front J-strap up, align cover to foam notches and secure front J-strap to frame (Fig. 21).

(3) Install seat backs. (Refer to 23 - BODY/SEATS/SEAT BACK - SPLIT BENCH - INSTALLATION)

(4) Pull the left J-strap up and secure to frame. Verify cover is straight.

QUAD CAB

(1) Position the cover on the cushion.

(2) Engage the hog rings attaching the cushion cover to the cushion frame.

(3) Engage the hook and loop fasteners.

(4) Engage the electrical connectors for the heated seat grid, if equipped.

(5) Engage the J-straps attaching the cushion cover to the cushion frame.

(6) Install seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

SEAT RISER

REMOVAL

- (1) Disconnect seat harness connector.
- (2) Remove the seat from the vehicle. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)
- (3) Remove the bolts attaching the seat track adjuster to the seat riser (Fig. 22).
- (4) Separate the seat track adjuster from the riser.

Fig. 22 Seat Riser

- 1 - SEAT TRACK ADJUSTER
2 - RISER

INSTALLATION

- (1) Position the seat track adjuster on the riser.
- (2) Install the bolts attaching the seat track adjuster to the seat riser. Tighten front bolts to 54 N·m (40 ft. lbs.) torque. Tighten rear inboard bolt to 40 N·m (30 ft. lbs.) torque. Tighten rear outboard bolt to 54 N·m (40 ft. lbs.) torque.
- (3) Install the seat in the vehicle. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION) or (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)
- (4) Connect seat harness connector.

SEAT TRACK

REMOVAL

- (1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - REMOVAL)
- (2) Remove inboard seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - REMOVAL)
- (3) Remove bolts attaching seat track to seat cushion frame (Fig. 23).
- (4) Separate seat track from seat cushion frame.

Fig. 23 Seat Track Removal

- 1 - SEAT TRACK
2 - SLIDER BAR

INSTALLATION

- (1) Position seat track on seat cushion frame.
- (2) Ensure seat track and slider bar are aligned.
- (3) Install rear seat track bolts. Tighten seat track bolts to 25 N·m (18 ft. lbs.) torque.
- (4) Install inboard seat belt buckles. (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT BUCKLE - INSTALLATION)
- (5) Pull seat release and move track rearward.
- (6) Install front seat track bolts. Tighten seat track bolts to 25 N·m (18 ft. lbs.) torque.
- (7) Align slider bars and install bolts. Tighten slider bar bolts to 10 N·m (89 in. lbs.) torque.
- (8) Install seat. (Refer to 23 - BODY/SEATS/SEAT - BENCH SEAT - INSTALLATION)

SEAT TRACK - SPLIT BENCH

REMOVAL

- (1) Remove seat from vehicle. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)
- (2) Remove bolts from crossbrace to seat cushion frame and power track (Fig. 24).
- (3) Remove bolts attaching center seat to seat frame and remove center seat.
- (4) Remove bolts attaching seat track to seat frame (Fig. 25) and (Fig. 26).

80b898ee

Fig. 25 Power Seat Track

- 1 - SEAT SWITCH

J9523-158

Fig. 26 Seat Track Removal/Installation

- 1 - RELEASE HANDLE
2 - SEAT TRACK

INSTALLATION

- (1) Install bolts attaching seat track to seat frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.
- (2) Install bolts into crossbrace and seat cushion frame to power track and torque to 10 N·m (8.5–11.5 ft. lbs.).
- (3) Install bolts attaching center seat to seat frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.
- (4) Install seat. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)
- (5) Power adjuster on power seat must be cycled in all 6 functions to ensure the adjuster is working properly.

EASY ENTRY SEAT TRACK

REMOVAL

- (1) Remove front passenger seat. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - REMOVAL)
- (2) Remove recliner handle.
- (3) Remove side shield.
- (4) Disengage seat track latch release cables.
- (5) Remove bolts attaching seat adjuster track to easy entry seat track. (Fig. 27).
- (6) Remove inboard seat back pivot bolt.
- (7) Disengage latch release cable from pulley.
- (8) Separate seat adjuster track from seat back.

Fig. 27 EASY ENTRY SEAT TRACK

- 1 - SEAT ADJUSTER TRACK
- 2 - RISER
- 3 - EASY ENTRY SEAT TRACK
- 4 - SEAT CUSHION

INSTALLATION

- (1) Position inboard easy entry seat track at seat back.
- (2) Engage latch release cable around pulley.
- (3) Install inboard seat back pivot bolt. Tighten bolt to 50 N·m (36 ft. lbs.) torque.
- (4) Install screws attaching seat adjuster track to seat cushion frame. Tighten screws to 25 N·m (18 ft. lbs.) torque.
- (5) Install bolts attaching easy entry seat track to seat adjuster track. Tighten front bolts to 17 N·m (12 ft. lbs.) torque. Tighten rear inboard bolts to 21 N·m (16 ft. lbs.) torque. Tighten rear outboard bolts to 45 N·m (33 ft. lbs.) torque.
- (6) Engage seat track latch release cables.
- (7) Install front passenger seat. (Refer to 23 - BODY/SEATS/SEAT - SPLIT BENCH - INSTALLATION)
- (8) Install side shield.
- (9) Install recliner handle.

SEAT TRACK ADJUSTER

REMOVAL

- (1) Remove the seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)
- (2) Unwind recliner spring from seat back. Use care not to lose upper spring seat.

WARNING: DO NOT PULL THE RECLINER CABLE OR THE RECLINER HANDLE. THE RECLINER LEAD SCREW IS SPRING LOADED AND WILL EJECT IF EITHER THE HANDLE, CABLE, OR TOWEL BAR IS PULLED BEFORE THE LEAD SCREW IS REMOVED.

- (3) Remove right and left risers.

INSTALLATION

- (1) Install the left and right risers.
- (2) Install the recliner lead screw and spring in the seat back.
- (3) Install seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)

STANCHION COVER

REMOVAL

- (1) Remove push-in fasteners attaching stanchion cover to seat stanchion (Fig. 28).
- (2) Separate cover from seat stanchion.

Fig. 28 Stanchion Cover

- 1 - PUSH-IN FASTENER
- 2 - SEAT STANCHION
- 3 - FLOOR PAN
- 4 - STANCHION COVER

INSTALLATION

- (1) Position cover on seat stanchion.
- (2) Install push-in fasteners attaching stanchion cover to seat stanchion (Fig. 28).

REAR SEAT

REMOVAL

- (1) Move front seat track to full forward position.
- (2) Turn release handle on underside of rear seat (Fig. 29) to disengage seat cushion and move seat to the stowed position.
- (3) Remove side support bracket screws and lift seat to disengage from cab (Fig. 30) .

J9523-136

Fig. 29 Rear Seat Release Handle

- 1 - SEAT CUSHION
- 2 - RELEASE HANDLE
- 3 - ALIGNMENT TAB

INSTALLATION

- (1) Position seat in vehicle.
- (2) Align seatback hooks with loops on cab rear panel (Fig. 31).
- (3) Align side support alignment tabs, and lower seat into place.
- (4) Install side support bracket screws. Tighten the screws to 28 N·m (21 ft. lbs.) torque.
- (5) Turn release handle to disengage seat from stowed position and push seat cushion downward to lock into place.

STATIONARY GLASS

DESCRIPTION

Windshields are made of two pieces of glass with a plastic inner layer. Windshields and selected stationary glass are structural members of the vehicle. The windshield glass is bonded to the windshield frame with urethane adhesive.

OPERATION

Windshields and other stationary glass protect the occupants from the effects of the elements. Windshields are also used to retain some airbags in position during deployment. Urethane bonded glass is difficult to salvage during removal. The urethane bonding is difficult to cut or clean from any surface. Before removing the glass, check the availability of replacement components.

BACKLITE

REMOVAL

It is difficult to salvage the backlite during the removal operation. The backlite is part of the structural support for the roof. The urethane bonding used to secure the glass to the fence is difficult to cut or clean from any surface. Since the molding is set in urethane, it is unlikely it would be salvaged. Before removing the backlite, check the availability from the parts supplier.

The backlite is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the backlite.

- (1) Roll down door glass.
- (2) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
- (3) Remove rear closer panel trim. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).
- (4) Bend backlite retaining tabs (Fig. 1) inward against glass.
- (5) Using a suitable pneumatic knife from inside the vehicle, cut urethane holding backlite frame to opening fence.
- (6) Separate glass from vehicle.

Fig. 1 Backlite Tabs

- 1 - BACKLITE
- 2 - TAB

INSTALLATION

- (1) Clean urethane adhesive from around backlite opening fence.

BACKLITE (Continued)

(2) If necessary, apply black-out primer to outer edge of replacement backlite frame.

(3) If black-out primer was pre-applied on backlite, clean bonding surface with Isopropyl alcohol and clean lint free cloth. Allow 3 minutes for drying time.

(4) Apply black-out primer to backlite opening fence.

(5) Apply a 13 mm (0.5 in.) bead of urethane around the perimeter of the window frame bonding surface (Fig. 2).

(6) Set glass on lower fence and move glass forward into opening (Fig. 3).

(7) Firmly push glass against rear window glass opening fence.

(8) Bend tabs around edges of backlite opening fence to retain glass.

(9) Clean excess urethane from exterior with MOPAR, Super Clean or equivalent.

(10) Allow urethane to cure at least 24 hours (full cure is 72 hours).

(11) Water test to verify repair before returning vehicle to service.

(12) Install rear closer panel trim. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

(13) Install the headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

BACKLITE LATCH AND KEEPER

REMOVAL

- (1) Disengage latch and keeper.
- (2) Remove latch/keeper screws.

J9523-133

Fig. 3 Backlite Installation

1 - BACKLITE

- (3) Separate Latch/keeper from glass panel.

INSTALLATION

- (1) Position Latch/keeper on glass panel.
- (2) Install screws. Tighten the screws with 1.5 N·m (15 in. lbs.) torque.
- (3) Engage latch and keeper to verify operation.

BACKLITE VENT GLASS

REMOVAL

- (1) Close and latch sliding vent glass.
- (2) Remove rear closure panel trim, if necessary. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).
- (3) Grasp end of lower run channel.
- (4) Roll corners of lower run channel outward (Fig. 4).
- (5) Disengage enough of the lower run channel from the backlite frame lower rail and firmly pull/slide lower run channel outward (Fig. 5).
- (6) Disengage vent glass from upper run channel.
- (7) Separate vent glass from backlite frame.

INSTALLATION

- (1) Remove excess sealer from backlite frame lower rail.
- (2) Clean bond area with hand scuff pad.
- (3) Clean bond area with Mopar® Tar and Oil Remover or equivalent.
- (4) Using a lint free cloth, clean bond area with 50/50 mixture of Isopropyl alcohol and water.
- (5) Apply a 0.5 mm bead of pumpable grade butyl along entire length of the lip retainer in lower run channel (Fig. 6).
- (6) Slide vent glass panels into lower run channel.

BACKLITE VENT GLASS (Continued)

**Fig. 4 Lower Run Channel**

- 4 - SLIDE OUTWARD

(7) Latch vent glass panels

(8) Insert upper ends of vent glass panels into upper run channel.

NOTE: Aggressive clamp pressure is required to lock lower run channel into place.

(9) Position lower run channel on backlite frame lower rail and roll lower run channel onto backlite frame rail.

(10) Fill the ends of the run channel with Mopar GEN II Silicone Rubber Adhesive Sealant or equivalent.

(11) Verify window and latch/keeper operation.

(12) Install rear closure panel trim. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

**Fig. 6 Glass Panel Installation**

- 1 - INSERT A 0.5mm DIA. BEAD OF PUMPABLE GRADE BUTYL ALONG THE ENTIRE LENGTH OF THE LOWER RUN WINDOW CHANNEL

WINDSHIELD

DESCRIPTION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

REMOVAL

(1) Remove inside rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).

(2) Remove cowl grill. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(3) With doors open, remove windshield molding (Fig. 7). Pull outward on molding beginning at the bottom of A-pillars using pliers.

(4) Cut urethane bonding from around windshield using a suitable sharp cold knife (C-4849). A pneumatic cutting device can be used but is not recommended (Fig. 8).

(5) Separate windshield from vehicle.

WINDSHIELD (Continued)

**Fig. 7 Windshield Moldings**

- 1 - WINDSHIELD
2 - WINDSHIELD MOLDING

**Fig. 8 Cut Urethane Around Windshield**

- 1 - WINDSHIELD
2 - COLD KNIFE

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should

remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

(1) Place replacement windshield into windshield opening and position glass in the center of the opening against the support spacers. Mark the outside surface of the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening (Fig. 9).

(2) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 10).

(3) Clean inside of windshield with MOPAR Glass Cleaner and lint-free cloth.

(4) Apply clear glass primer 25 mm (1 in.) wide around perimeter of windshield and wipe with a new clean and dry lint-free cloth.

(5) Apply the molding to the windshield:

(a) Press the upper corners of the molding onto the windshield.

(b) Press the header section onto the windshield.

(c) Press the A-Pillar sections onto the windshield.

(6) Apply black-out primer onto the glass using the windshield molding as a guide. The primer should be 15 mm (5/8 in.) wide on the top and sides of the glass and 25 mm (1 in.) on the bottom of windshield. Allow at least three minutes drying time.

(7) Locate **new** support spacers on support brackets and adjust to lowest height.

(8) Position one 5 mm (3/16 in.) soft spacer (p/n 55028214) at the bottom of the windshield fence (Fig. 11).

(9) Apply a 13mm (1/2 in.) high and 10mm (3/8 in.) wide bead of urethane around the perimeter of windshield. At the bottom, apply the bead 7 mm (1/4 in.) inboard from the glass edge. On the three sides where the molding is on the glass, follow the edge of molding. The urethane bead should be shaped in a triangular cross-section, this can be achieved by notching the tip of the applicator (Fig. 12).

(10) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

(11) Slowly lower windshield glass to the fence opening guiding the lower corners into proper position. Beginning at the bottom and continuing to the top, push glass onto fence along the A-Pillars. Push windshield inward to the fence at the bottom corners (Fig. 13).

(12) Push windshield upward, snug with roof and ratchet up the adjustable support brackets. Discard tab from support spacer.

(13) Using clean water, lightly mist the support spacers.

WINDSHIELD (Continued)

(14) Clean excess urethane from exterior with MOPAR® Super Clean or equivalent.

(15) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(16) Install cowl grill. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(17) Install rear view mirror support bracket. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(18) Install rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

(19) After urethane has cured, remove tape strips and water test windshield to verify repair.

QUARTER WINDOW

REMOVAL

- (1) Remove quarter trim panel.
- (2) Remove the latch retaining screws from the cab rear side panel (Fig. 14) .
- (3) Remove the frame/hinge retaining nuts from the B-pillar.
- (4) Remove the window glass from the cab.
- (5) If necessary, remove the latch from the glass.

INSTALLATION

- (1) If removed, install the latch to the glass. Tighten the screw to 6 N·m (60 in. lbs.) torque.
- (2) Center the window glass at the opening, insert the hinge studs in the B-pillar holes, and install the retaining nuts. Tighten the nuts to 8 N·m (70 in. lbs.) torque.
- (3) Attach the latch to the rear side panel with the screws. Tighten the screws with the latch in the lock position and pushing rearward on the latch. Tighten the screws to 8 N·m (70 in. lbs.) torque.

B-PILLAR DOOR SEAL

REMOVAL

(1) Warm the seal and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull seal from painted surface (Fig. 1).

INSTALLATION

(1) Remove adhesive tape residue from painted surface of vehicle.

(2) If seal is to be reused, remove tape residue from seal. Clean back of seal with MOPAR®, Super Kleen solvent or equivalent. Wipe seal dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of seal.

(3) Clean body surface with MOPAR®, Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

(4) Remove protective cover from tape on back of seal and apply seal to body.

(5) Heat body and seal, see step one. Firmly press seal to body surface to assure adhesion (Fig. 1).

Fig. 1 B-Pillar Secondary Seal

- 1 - B—PILLAR SECONDARY SEAL
2 - DOOR

COWL WEATHERSTRIP

REMOVAL

- (1) Grasp cowl seal and pull from cowl flange.
- (2) Separate cowl seal from vehicle (Fig. 2).

Fig. 2 Cowl Seal

- 1 - COWL
2 - COWL SEAL

INSTALLATION

- (1) Position cowl seal on flange and press into place.

DOOR OPENING SEAL

REMOVAL

- (1) Remove A-pillar molding. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
- (2) Remove cowl pane. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL)
- (3) Remove sill cover. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL)
- (4) Remove B-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
- (5) Pull seal from pinch flange around door opening (Fig. 3).

INSTALLATION

- (1) Press seal onto pinch flange around door opening (Fig. 3).
- (2) Install B-pillar trim panel. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION)
- (3) Install cowl panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION)
- (4) Install sill cover. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION)

Fig. 3 Door Opening Seal—Club Cab

- 1 - DOOR SEAL

- (5) Install A-pillar molding. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

- (1) Remove inner door belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL)
- (2) Pull door glass run weatherstrip from channel around window opening (Fig. 4).

Fig. 4 Door Glass Run Weatherstrip

- 1 - GLASS RUN WEATHERSTRIP

FRONT DOOR GLASS RUN WEATHERSTRIP (Continued)

INSTALLATION

(1) Press door glass run weatherstrip into channel around window opening (Fig. 4).

(2) Install inner door belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - INSTALLATION)

FRONT DOOR INNER BELT WEATHERSTRIP**REMOVAL**

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)

(2) Lift inner door belt weatherstrip upward (Fig. 5).

(3) Separate inner door belt weatherstrip from door.

**Fig. 5 Inner Door Belt Weatherstrip**

- 1 - DOOR
2 - INNER BELTLINE WEATHERSEAL

INSTALLATION

(1) Position inner door belt weatherstrip on door.
(2) Press inner door belt weatherstrip downward to seat.

(3) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

FRONT DOOR OUTER BELT WEATHERSTRIP**REMOVAL**

- (1) Roll door glass down.
(2) Remove mirror. (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL)
(3) Using a hook tool inserted into the end of the belt weatherstrip, lift upward.

(4) Separate outer door belt weatherstrip from door (Fig. 6).

**Fig. 6 Outer Door Belt Weatherstrip**

- 1 - OUTER BELTLINE WATHERSTRIP
2 - DOOR

INSTALLATION

- (1) Position outer door belt weatherstrip on door.
(2) Press weatherstrip downward to seat.
(3) Install mirror. (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - INSTALLATION)

FRONT DOOR UPPER CORNER SEAL**REMOVAL**

- (1) Remove the push-in fasteners attaching the upper corner seal to the front door (Fig. 7).
(2) Separate the upper corner seal from the door.

**Fig. 7 Upper Corner Seal—Quad Cab**

- 1 - UPPER CORNER SEAL
2 - PUSH-IN FASTENER

FRONT DOOR UPPER CORNER SEAL (Continued)

INSTALLATION

- (1) Position the upper corner seal on the door.
- (2) Install the push-in fasteners attaching the upper corner seal to the front door (Fig. 7) .

FRONT DOOR SECOND WEATHERSTRIP**REMOVAL**

- (1) Remove the push-in fasteners attaching the secondary seal to the inner door panel.
- (2) Separate the secondary seal from the inner door panel (Fig. 8).

INSTALLATION

- (1) Position the secondary seal on the inner door panel.
- (2) Install the push-in fasteners attaching the secondary seal to the inner door panel.

HEATING & AIR CONDITIONING

DESCRIPTION - HEATER AND AIR CONDITIONER

All vehicles are equipped with a common HVAC housing assembly (Fig. 1). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted under the instrument panel. On heater-only systems, the evaporator coil and recirculation door are omitted from the housing.

Fig. 1 COMMON BLEND-AIR HEATER-AIR

- 1 - HEATER CORE
- 2 - BLEND DOOR
- 3 - EVAPORATOR (A/C ONLY)
- 4 - RECIRCULATION DOOR (A/C ONLY)
- 5 - FLOOR/PANEL DOOR
- 6 - FLOOR/DEFROST DOOR

DESCRIPTION - COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the HVAC system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or

condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Engine Cooling for more information before the opening of, or attempting any service to the engine cooling system.

DESCRIPTION - REFRIGERANT SYSTEM SERVICE PORT

The two refrigerant system service ports are used to charge, recover/recycle, evacuate, and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system, to ensure that the refrigerant system is not accidentally contaminated by the use of the wrong refrigerant (R-12), or refrigerant system service equipment.

OPERATION - HEATER AND AIR CONDITIONER

The heater and optional air conditioner are blend-air type systems. In a blend-air system, a blend door controls the amount of unconditioned air (or cooled air from the evaporator on models with air conditioning) that is allowed to flow through, or around, the heater core. A temperature control knob on the A/C Heater control panel determines the discharge air temperature by controlling an electric actuator, which moves the blend door. This allows an almost immediate control of the output air temperature of the system.

The mode control knob on the heater-only or A/C Heater control panel is used to direct the conditioned air to the selected system outlets. Both mode control switches use engine vacuum to control the mode doors, which are operated by vacuum actuators.

On air conditioned vehicles, the outside air intake can be shut off by selecting the Recirculation Mode with the mode control knob. This will operate a vacuum actuated recirculation door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

HEATING & AIR CONDITIONING (Continued)

The optional air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. This air conditioning system uses a fixed orifice tube in the middle of the liquid line to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, the a/c low pressure switch on the accumulator cycles the compressor clutch.

OPERATION - REFRIGERANT SYSTEM SERVICE PORT

The high pressure service port is located on the liquid line between the condenser and the evaporator, near the front of the engine compartment. The low pressure service port is located on the suction line, near the accumulator outlet.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

DIAGNOSIS AND TESTING - A/C PERFORMANCE

The air conditioning system is designed to provide the passenger compartment with low temperature and low humidity air. The evaporator, located in the HVAC housing on the dash panel below the instrument panel, is cooled to temperatures near the freezing point. As warm damp air passes through the cooled evaporator, the air transfers its heat to the refrigerant in the evaporator tubes and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an air conditioning system will be more effective in the recirculation mode (Max-A/C). With the system in the recirculation mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, the air conditioning system performance levels improve.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing.

This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

Before proceeding, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). The air temperature in the test room and in the vehicle must be a minimum of 21° C (70° F) for this test.

(1) Connect a tachometer and a manifold gauge set.

(2) Set the a/c heater mode control switch knob to the recirculation mode (Max-A/C) position, the temperature control knob to the full cool position, and the blower motor switch to the highest speed position.

(3) Start the engine and hold the idle speed at 1,000 rpm with the compressor clutch engaged. If the compressor clutch does not engage, (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH COIL - DIAGNOSIS AND TESTING).

(4) The engine should be at operating temperature. The doors and windows must be closed and the hood must be mostly closed.

(5) Insert a thermometer in the driver side center A/C (panel) outlet. Operate the engine for five minutes.

(6) The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, unplug the a/c low pressure switch wire harness connector from the switch located on the accumulator (Fig. 2). Place a jumper wire between the two cavities of the a/c low pressure switch wire harness connector.

HEATING & AIR CONDITIONING (Continued)

J9424-26

Fig. 2 A/C LOW PRESSURE SWITCH

1 - A/C LOW PRESSURE SWITCH
2 - ACCUMULATOR

(7) With the compressor clutch engaged, record the panel outlet discharge air temperature, the discharge pressure (high side), and the suction pressure (low side).

(8) Compare the panel outlet discharge air temperature reading to the Performance Temperature and Pressure chart. If the temperature reading is high, clamp off both heater hoses (inlet and outlet), wait five minutes and record the temperature again. Compare the second reading to the Performance Temperature and Pressure chart. If the temperature reading is now OK, see Temperature Control Cable in the Removal and Installation section and in the Adjustments section of this group. If the temperature reading is still too high, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING), and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) in this group.

Performance Temperature and Pressure						
Ambient Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)	49° C (120° F)
Center Panel OutletDischarge Air Temperature	5 to 7° C (40 to 45° F)	13 to 16° C (55 to 60° F)	16 to 21° C (60 to 70° F)	21 to 24° C (70 to 75° F)	27 to 29° C (80 to 85° F)	29 to 32° C (85 to 90° F)
*Suction Pressure (Low Side)	241 to 276 kPa (35 to 40 psi)	276 to 345 kPa (40 to 50 psi)	345 to 414 kPa (50 to 60 psi)	414 to 483 kPa (60 to 70 psi)	483 to 552 kPa (70 to 80 psi)	552 to 586 kPa (85 to 90 psi)
*Discharge Pressure (High Side)	931 to 1000 kPa (135 to 145 psi)	1207 to 1482 kPa (175 to 215 psi)	1482 to 1862 kPa (215 to 270 psi)	1862 to 2275 kPa (270 to 330 psi)	2344 to 2551 kPa (340 to 370 psi)	2758 to 2965 kPa (400 to 430 psi)
*Note: If pressures are lower than shown, but center panel outlet discharge air temperatures are OK, then the A/C system is OK.						

(9) Compare the discharge (high side) and suction (low side) pressure readings to the Performance Tem-

perature and Pressure chart. If the pressures are abnormal, see the A/C Diagnosis chart.

A/C Diagnosis		
Condition	Possible Causes	Correction
RAPID COMPRESSOR CLUTCH CYCLING (TEN OR MORE CYCLES PER MINUTE).	1. Low refrigerant system charge.	1. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.

HEATING & AIR CONDITIONING (Continued)

A/C Diagnosis		
Condition	Possible Causes	Correction
	2. Faulty a/c low pressure switch. 3. Faulty Powertrain Control Module (PCM).	2. (Refer to Controls/A/C Low Pressure Switch/Diagnosis and Testing) in this group. Test the a/c low pressure switch and replace, if required. 3. (Refer to Appropriate Diagnostic Information) for testing the PCM. Test the PCM and replace, if required.
EQUAL PRESSURES, BUT THE COMPRESSOR CLUTCH DOES NOT ENGAGE.	1. No refrigerant in the refrigerant system. 2. Faulty fuse. 3. Faulty a/c compressor clutch coil. 4. Faulty a/c compressor clutch relay. 5. Improperly installed or faulty a/c low pressure switch. 6. Faulty a/c high pressure switch. 7. Faulty Powertrain Control Module (PCM). 8. Faulty a/c heater control.	1. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. 3. (Refer to Controls/A/C Compressor Clutch Coil/Diagnosis and Testing) in this group. Test the compressor clutch coil and replace, if required. 4. (Refer to Controls/A/C Compressor Clutch Relay/Diagnosis and Testing) in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required. 5. (Refer to Controls/A/C Low Pressure Switch/Diagnosis and Testing) in this group. Test the a/c low pressure switch and tighten or replace, if required. 6. (Refer to Controls/A/C High Pressure Switch/Diagnosis and Testing) in this group. Test the a/c high pressure switch and replace, if required. 7. (Refer to Appropriate Diagnostic Information) for testing the PCM. Test the PCM and replace, if required. 8. (Refer to Controls/A/C Heater Control/Diagnosis and Testing) in this group. Test the a/c heater control and replace, if required.
NORMAL PRESSURES, BUT A/C PERFORMANCE TEST AIR TEMPERATURES AT CENTER PANEL OUTLET ARE TOO HIGH.	1. Excessive refrigerant oil in system. 2. Blend door actuator inoperative or faulty. 3. Blend door inoperative, obstructed or sealing improperly.	1. (Refer to Plumbing/Refrigerant Oil/Standard Procedure - Refrigerant Oil Level) in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required. 2. Check the Blend Door Actuator operation. Replace as required. 3. (Refer to Distribution/Blend Door/Removal/Installation) in this group. Inspect the blend door for proper operation and sealing and correct, if required.
LOW SIDE PRESSURE IS NORMAL OR SLIGHTLY LOW, AND HIGH SIDE PRESSURE IS TOO LOW.	1. Low refrigerant system charge.	1. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.

HEATING & AIR CONDITIONING (Continued)

A/C Diagnosis		
Condition	Possible Causes	Correction
	2. Refrigerant flow through the accumulator is restricted. 3. Refrigerant flow through the a/c evaporator is restricted. 4. Faulty compressor.	2. (Refer to Plumbing/Accumulator/ Removal/Installation) in this group. Replace the restricted accumulator, if required. 3. (Refer to Plumbing/A/C Evaporator/ Removal/ Installation) in this group. Replace the restricted evaporator, if required. 4. (Refer to Plumbing/A/C Compressor/ Removal/ Installation) in this group. Replace the compressor, if required.
LOW SIDE PRESSURE IS NORMAL OR SLIGHTLY HIGH, AND HIGH SIDE PRESSURE IS TOO HIGH.	1. Condenser air flow restricted. 2. Inoperative cooling fan. 3. Refrigerant system overcharged. 4. Air in the refrigerant system. 5. Engine overheating.	1. Check the condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Refer to Cooling for more information on air seals. Clean, repair, or replace components as required. 2. Refer to Cooling for more information. Test the cooling fan and replace, if required. 3. (Refer to Plumbing/Standard Procedure - Refrigerant System Charge) in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required. 4. (Refer to Plumbing/Diagnosis and Testing - Refrigerant System Leaks) in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 5. Refer to Cooling for more information. Test the cooling system and repair, if required.
LOW SIDE PRESSURE IS TOO HIGH, AND HIGH SIDE PRESSURE IS TOO LOW.	1. Accessory drive belt slipping. 2. A/C orifice tube not installed. 3. Faulty a/c compressor.	1. Refer to Cooling for more information. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. 2. (Refer to Plumbing/A/C Orifice Tube/Diagnosis and Testing) in this group. Replace the liquid line, if required. 3. (Refer to Plumbing/A/C Compressor/ Removal/ Installation) in this group. Replace the compressor, if required.
LOW SIDE PRESSURE IS TOO LOW, AND HIGH SIDE PRESSURE IS TOO HIGH.	1. Restricted refrigerant flow through the refrigerant lines. 2. Restricted refrigerant flow through the a/c orifice tube. 3. Restricted refrigerant flow through the a/c condenser.	1. (Refer to Plumbing/Caution - Refrigerant Hoses/Lines/ Tubes Precautions) in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required. 2. (Refer to Plumbing/A/C Orifice Tube/Diagnosis and Testing) in this group. Replace the liquid line, if required. 3. (Refer to Plumbing/A/C Condenser/ Removal/ Installation) in this group. Replace the restricted a/c condenser, if required.

HEATING & AIR CONDITIONING (Continued)

DIAGNOSIS AND TESTING - HEATER PERFORMANCE

Before performing the following tests, refer to Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Also be certain that the accessory vacuum supply line is connected at the engine vacuum source.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at

normal operating temperature, set the temperature control knob in the full hot position, the mode control switch knob in the floor position, and the blower motor switch knob in the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the HVAC housing floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

Temperature Reference				
Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Air Temperature at Floor Outlet	62.2° C (144° F)	63.8° C (147° F)	65.5° C (150° F)	67.2° C (153° F)

If the floor outlet air temperature is too low, refer to Cooling to check the engine coolant temperature specifications. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Cooling for the procedures.

An alternate method of checking heater performance is to use a DRBIII® scan tool to monitor the engine coolant temperature. The floor outlet air temperature reading should be no more than 4.5° C (40° F) lower than the engine coolant temperature reading.

OBSTRUCTED COOLANT FLOW Possible locations or causes of obstructed coolant flow:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

MECHANICAL PROBLEMS Possible locations or causes of insufficient heat:

- An obstructed cowl air intake.
- Obstructed heater system outlets.
- A faulty, obstructed or improperly installed blend door.
- A faulty blower system.
- A faulty a/c heater control.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob on the a/c heater control panel, the following could require service:

- A faulty a/c heater control.
- A faulty blend door actuator.
- A faulty, obstructed or improperly installed blend door.
- An obstructed cowl air intake.
- The engine cooling system.

Heater Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
INSUFFICIENT HEATER OUTPUT.	1. Incorrect engine coolant level. 2. Air trapped in engine cooling system.	1. Check the engine coolant level. Refer to Cooling for the procedures. 2. Check the operation of the coolant reserve/recovery system. Refer to Cooling for the procedures.

HEATING & AIR CONDITIONING (Continued)

Heater Diagnosis		
	3. Incorrect engine coolant temperature. 4. Blend door actuator inoperative or defective. 5. Blend door not operating properly. 6. Insufficient air flow through heater housing. 7. Improper blower motor operation.	3. Check the performance and operation of the engine cooling system including: thermostat, water pump, fan drive, accessory drive belt, coolant flow (plugged radiator or heater core, plugged or kinked coolant hoses), air flow (missing or improperly installed radiator air seals or fan shroud). Refer to Cooling for the procedures. 4. (Refer to Controls/Blend Door Actuator) in this group. 5. Check for a damaged, obstructed or improperly installed blend door or seals. (Refer to Controls/Blend Door Actuator) in this group. 6. Remove foreign material or obstructions from cowl air intake. 7. (Refer to Distribution/Blower Motor/ Diagnosis and Testing) in this group.

STANDARD PROCEDURE - DIODE REPLACEMENT

(1) Disconnect the battery negative cable and isolate it.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 3).

948W-197

Fig. 3 DIODE IDENTIFICATION

- 1 - CURRENT FLOW
 2 - BAND AROUND DIODE INDICATES CURRENT FLOW
 3 - DIODE AS SHOWN IN THE DIAGRAMS

(4) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(5) Install the new diode in the harness, making sure current flow is correct. If necessary refer to the appropriate wiring diagram for current flow.

(6) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(7) Tape the diode to the harness using electrical tape making, sure the diode is completely sealed from the elements.

(8) Re-connect the battery negative cable, and test affected systems.

CONTROLS

DIAGNOSIS AND TESTING - VACUUM SYSTEM

Vacuum control is used to operate the mode doors in the heater-only and HVAC housings. Testing of the heater-only and a/c heater mode control switch operation will determine if the vacuum, electrical, and mechanical controls are functioning. However, it is possible that a vacuum control system that operates perfectly at engine idle (high engine vacuum) may not function properly at high engine speeds or loads (low engine vacuum). This can be caused by leaks in the vacuum system, or by a faulty or improperly installed vacuum check valve.

A vacuum system test will help to identify the source of poor vacuum system performance or vacuum system leaks. Before starting this test, stop the engine and make certain that the problem is not a disconnected vacuum supply tube at the engine vacuum source or the vacuum reservoir.

Use an adjustable vacuum test set (Special Tool C-3707) and a suitable vacuum pump to test the HVAC vacuum control system. With a finger placed over the end of the vacuum test hose probe (Fig. 1), adjust the bleed valve on the test set gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

Fig. 1 ADJUST VACUUM TEST BLEED VALVE

- 1 - VACUUM PUMP TOOL C-4289
- 2 - VACUUM TEST SET C-3707
- 3 - BLEED VALVE
- 4 - PROBE

VACUUM CHECK VALVE

(1) Remove the vacuum check valve. On gasoline engines, one valve is located in the vacuum supply tube (black) at the intake manifold tap on the right side of the engine. A second check valve is located next to the tee fitting in the vacuum supply tube (black) near the dash panel in the engine compartment. On diesel engines, the vacuum check valve is integral to the engine vacuum pump nipple and is threaded into the vacuum pump. The vacuum check valve must be removed in order to perform the following tests. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/VACUUM CHECK VALVE - REMOVAL)

(2) Connect the test set vacuum supply hose to the a/c heater control side of the valve. When connected to this side of the check valve, no vacuum should pass and the test set gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to step Step 3. If not OK, replace the faulty valve.

(3) Connect the test set vacuum supply hose to the engine vacuum side of the valve. When connected to this side of the check valve, vacuum should flow through the valve without restriction. If not OK, replace the faulty valve.

A/C HEATER CONTROLS

(1) Connect the test set vacuum probe to the HVAC vacuum supply (black) tube in the engine compartment. Position the test set gauge so that it can be viewed from the passenger compartment.

(2) Place the a/c heater mode control switch knob to each mode position, one position at a time, and pause after each selection. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each selection is made. If not OK, a component or vacuum line in the vacuum circuit of the selected mode has a leak. See Locating Vacuum Leaks below.

CAUTION: Do not use lubricant on the switch ports or in the holes in the plug, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector plug holes will help the connector slide onto the switch ports.

CONTROLS (Continued)

LOCATING VACUUM LEAKS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect the vacuum harness connector located between the a/c heater control and the HVAC housing under the instrument panel.

(2) Connect the test set vacuum hose probe to each port in the HVAC housing half of the vacuum harness connector, one port at a time, and pause after each connection (Fig. 2). The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty a/c heater control. If not OK, go to step Step 3.

Fig. 2 VACUUM CIRCUIT TEST

(3) Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, see the Vacuum Circuits chart (Fig. 3).

(4) Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components. Refer to Instrument Panel System for the procedures.

(5) Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.

(6) To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end of the line. Run your fingers slowly along the line while watching the test set gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (0.125 inch) inside diameter rubber hose.

A/C COMPRESSOR CLUTCH

DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 4). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is mounted to the compressor shaft and secured with a nut.

- 7 - SNAP RING

OPERATION

The compressor clutch assembly provides the means to engage and disengage the compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the a/c heater mode control switch, the a/c loss of charge switch, the a/c pressure transducer, the compressor clutch relay, the evaporator temperature sensor and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION).

DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). The battery must be fully-charged before performing the following tests. Refer to Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the a/c heater mode control switch in any A/C mode, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within 0.2 volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within 0.2 volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRB III® scan tool and (Refer to Appropriate Diagnostic Information) for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)
- A/C Heater mode control switch
- Compressor clutch relay
- A/C High Pressure Switch
- A/C Low Pressure Switch
- Powertrain Control Module (PCM).

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is 2.0 to 3.9 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

STANDARD PROCEDURE - A/C COMPRESSOR CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C Heater control to the Recirculation Mode, the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) On models with the diesel engine option, remove the compressor from the engine. Do not

A/C COMPRESSOR CLUTCH (Continued)

remove the refrigerant lines or fittings. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL)

(3) Unplug the compressor clutch coil wire harness connector.

(4) Insert the two pins of the spanner wrench (Special Tool 6462 in Kit 6460) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 5).

J9124-27

Fig. 5 CLUTCH NUT REMOVE

1 - FRONT PLATE SPANNER

(5) Remove the clutch plate and clutch shims. On models with the diesel engine option, a puller (Special Tool 6461 in Kit 6460) is used to remove the clutch plate (Fig. 6). This compressor also uses a shaft key, which must be removed.

J8924-18

Fig. 6 CLUTCH PULLER - DIESEL MODELS

A/C COMPRESSOR CLUTCH (Continued)

(8) Install the puller through-bolts (Special Tool C-6461) through the puller flange and into the jaws of the rotor puller and tighten (Fig. 9). Turn the puller center bolt clockwise until the rotor pulley is free.

J8924-22

Fig. 9 INSTALL PULLER PLATE

- 1 - BOLT
- 2 - PULLER PLATE AND BOLT
- 3 - BOLT
- 4 - JAWS

(9) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing (Fig. 10).

(10) Remove the snap ring from the compressor hub and remove the clutch field coil (Fig. 11). Slide the clutch field coil off of the compressor hub.

INSPECTION

Examine the friction surfaces of the clutch pulley and the front plate for wear. The pulley and front plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for oil. Remove the felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

INSTALLATION

- (1) Install the clutch field coil and snap ring.

J8924-23

Fig. 10 CLUTCH COIL LEAD WIRE HARNESS

- 1 - CLIP

J8924-24

Fig. 11 CLUTCH FIELD COIL SNAP RING REMOVE

- 1 - FIELD COIL
- 2 - SNAP RING

(2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.

(3) Align the rotor assembly squarely on the front compressor housing hub.

A/C COMPRESSOR CLUTCH (Continued)

(4) Thread the handle (Special Tool 6464 in Kit 6460) into the driver (Special Tool 6143 in Kit 6460) (Fig. 12).

J8924-25

Fig. 12 ROTOR INSTALLER SET

(5) Place the driver tool assembly into the bearing cavity on the rotor. Make certain the outer edge of the tool rests firmly on the rotor bearing inner race (Fig. 13).

J8924-26

Fig. 13 ROTOR INSTALL

(6) Tap the end of the driver while guiding the rotor to prevent binding. Tap until the rotor bottoms against the compressor front housing hub. Listen for a distinct change of sound during the tapping process, to indicate the bottoming of the rotor.

(7) Install the external front rotor snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

(8) Install the original clutch shims on the compressor shaft.

(9) Install the clutch plate. On models with the diesel engine option, install the shaft key. Use the shaft protector (Special Tool 6141-2 in Kit 6460) to install the clutch plate on the compressor shaft (Fig. 14). Tap the clutch plate over the compressor shaft until it has bottomed against the clutch shims. Listen for a distinct change of sound during the tapping process, to indicate the bottoming of the clutch plate.

J8924-27

Fig. 14 CLUTCH PLATE INSTALL

(10) Install the compressor shaft hex nut. Tighten the nut to 14.4 N·m (10.5 ft. lbs.).

(11) Check the clutch air gap with a feeler gauge (Fig. 15). If the air gap does not meet the specification, add or subtract shims as required. The air gap specification is 0.41 to 0.79 millimeter (0.016 to 0.031 inch). If the air gap is not consistent around the circumference of the clutch, lightly pry up at the minimum variations. Lightly tap down at the points of maximum variation.

A/C COMPRESSOR CLUTCH (Continued)

NOTE: The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch onto a compressor that previously did not have a clutch, use 1.0, 0.50, and 0.13 millimeter (0.040, 0.020, and 0.005 inch) shims from the clutch hardware package that is provided with the new clutch.

J8924-28

Fig. 15 CHECK CLUTCH AIR GAP

1 - FEELER GAUGE

(12) On models with the diesel engine option, install the compressor on the engine. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION)

(13) Connect the battery negative cable.

A/C COMPRESSOR CLUTCH RELAY

DESCRIPTION

The a/c compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

OPERATION

The compressor clutch relay is a electromechanical device that switches battery current to the compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the a/c heater control, the a/c

loss of charge switch, the a/c pressure transducer and the evaporator fin probe.

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH RELAY

RELAY TEST

The compressor clutch relay (Fig. 16) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see the Relay Circuit Test below. If not OK, replace the faulty relay.

Fig. 16 COMPRESSOR CLUTCH RELAY

TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

A/C COMPRESSOR CLUTCH RELAY (Continued)

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C (gray) at all times. If not OK, repair the open circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 17).

Fig. 17 POWER DISTRIBUTION CENTER

1 - COVER

2 - POWER DISTRIBUTION CENTER

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC and remove it.

INSTALLATION

(1) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

A/C-HEATER CONTROL**DESCRIPTION**

Both the heater-only and a/c heater systems use a combination of electrical and vacuum controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. Refer to the owner's manual in the vehicle glove box for more information on the features, use, and suggested operation of these controls.

OPERATION

The heater-only or a/c heater control panel is located to the right of the instrument cluster on the instrument panel. The control panel contains a rotary-type temperature control knob, a rotary-type mode control switch knob, and a rotary-type blower motor speed switch knob. On models with the optional heated mirror system, a momentary push button switch and indicator lamp are located near the bottom of the a/c heater control panel. Refer to Heated Mirrors for more information on this feature.

The heater-only or a/c heater control panel cannot be repaired. If faulty or damaged, the entire unit must be replaced. The control knobs and the illumination lamps are available for service replacement.

DIAGNOSIS AND TESTING - A/C HEATER CONTROL

Satisfactory heater and air conditioner performance depends upon proper operation and adjustment of all operating controls and refrigeration system components. For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). These inspections, tests, and adjustments should be used to locate the cause of a malfunction.

Operation must be tested as described in the following sequence:

(1) Inspect and adjust the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING).

(2) Start the engine and hold the idle speed at 1,300 rpm.

A/C-HEATER CONTROL (Continued)

(3) On vehicles with air conditioning, turn the temperature control knob to the extreme counter clockwise (Cool) position, and set the mode control switch knob to the Bi-Level (A/C) position. The outside (recirculation) air door should be open to outside air. If not OK, (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - DIAGNOSIS AND TESTING - VACUUM SYSTEM).

(4) Open the vehicle windows. Test the blower motor operation in all speeds. If not OK, (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - DIAGNOSIS AND TESTING).

(5) On vehicles with air conditioning, the compressor should be running and the air conditioning system in operation unless the ambient air temperature is below about -1° C (30° F). If not OK, (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE).

(6) Check the mode control switch operation. The heater and air conditioner systems should respond as described in the owner's manual in the vehicle glove box to each mode selected. Reduce the engine speed to normal idle. The vacuum will be high at low idle and the vacuum actuators should respond quickly. If not OK, (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - DIAGNOSIS AND TESTING - VACUUM SYSTEM).

(7) If the vacuum tests, and the electrical component and circuit tests reveal no problems, disassemble the HVAC housing to inspect for mechanical misalignment or binding of the mode doors (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the instrument panel near the driver side of the floor panel transmission tunnel and

unplug the a/c heater control to HVAC housing vacuum harness connector.

(3) While still reaching under the instrument panel, disengage the retainer on the a/c heater control half of the vacuum harness from the hole in the center distribution duct (Fig. 18).

80b1b35f

Fig. 18 A/C HEATER CONTROL VACUUM HARNESS ROUTING

(4) Remove the cluster bezel from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(5) Remove the four screws that secure the a/c heater control to the instrument panel (Fig. 19).

(6) Pull the a/c heater control assembly away from the instrument panel far enough to access the connections on the back of the control.

(7) Unplug the wire harness connector from the back of the a/c heater control.

(8) On vehicles with heated mirrors, unplug the heated mirror wire harness connector from the back of the a/c heater control.

(9) Remove the a/c heater control from the instrument panel.

INSTALLATION

(1) Plug the wire harness connector(s) into the receptacle(s) on the back of the a/c heater control.

(2) Route the HVAC vacuum harness through the hole in the reinforcement below the a/c heater control opening of the instrument panel.

(3) Position the a/c heater control in the instrument panel and secure it with four screws. Tighten the screws to 2.2 N·m (20 in. lbs.).

A/C-HEATER CONTROL (Continued)

Fig. 19 A/C HEATER CONTROL REMOVE/INSTALL

- 1 - HEATED MIRROR WIRE HARNESS CONNECTOR
- 2 - WIRE HARNESS CONNECTOR
- 3 - SCREW
- 4 - HEATER-A/C CONTROL

(4) Reinstall the cluster bezel to the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(5) Reach under the instrument panel to reinstall the a/c heater control vacuum harness retainer to the side of the center distribution duct.

(6) Plug in the two halves of the a/c heater control to HVAC housing vacuum harness connector.

(7) Connect the battery negative cable.

A/C HIGH PRESSURE SWITCH

DESCRIPTION

The a/c high pressure switch is located on the discharge line near the compressor. The switch is screwed onto a fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The discharge line fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The a/c high pressure switch is connected in series electrically with the a/c low pressure switch between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This prevents compressor operation when the discharge line pressure approaches high levels.

The a/c high pressure switch contacts are open when the discharge line pressure rises above about

3100 to 3375 kPa (450 to 490 psi). The switch contacts will close when the discharge line pressure drops to about 1860 to 2275 kPa (270 to 330 psi). When checking refrigerant system pressures with a manifold gauge set, keep in mind that the indicated pressures will be about 172 kPa (25 psi) below the actual switch pressure values due to the pressure drop that occurs in the refrigerant system between the switch and the high pressure service port.

The a/c high pressure switch is a factory-calibrated unit. The switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C HIGH PRESSURE SWITCH

Before performing diagnosis of the a/c high pressure switch, verify that the refrigerant system has the correct refrigerant charge. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING)

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the a/c high pressure switch wire harness connector from the switch on the refrigerant system fitting.

(3) On the four terminal high pressure switch, check for continuity between terminals C and D. On the two terminal switch, check for continuity between both terminals of the a/c high pressure switch. There should be continuity. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the a/c high pressure switch, which is mounted to a fitting on the discharge line between the compressor and the condenser inlet.

(3) Unscrew the a/c high pressure switch from the discharge line fitting.

(4) Remove the a/c high pressure switch from the vehicle.

(5) Remove the O-ring seal from the discharge line fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING &

A/C HIGH PRESSURE SWITCH (Continued)

AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION

(2) Install and tighten the high pressure cut-off switch on the discharge line fitting. The switch should be hand-tightened onto the discharge line fitting.

(3) Plug the wire harness connector into the high pressure cut-off switch.

(4) Connect the battery negative cable.

A/C LOW PRESSURE SWITCH

DESCRIPTION

The a/c low pressure switch is located on the top of the accumulator. The switch is screwed onto an accumulator fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The accumulator fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The a/c low pressure switch is connected in series electrically with the a/c high pressure switch and the a/c heater control, between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This regulates the refrigerant system pressure and controls evaporator temperature. Controlling evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing air conditioning system air flow.

The a/c low pressure switch contacts are open when the suction pressure is about 152-165 kPa (22-24 psi) or lower. The switch contacts will close when the suction pressure rises to about 255-296 kPa (37-43 psi) or above. Lower ambient temperatures, below about -1° C (30° F), will also cause the switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The a/c low pressure switch is a factory-calibrated unit. It cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C LOW PRESSURE SWITCH

Before performing diagnosis of the a/c low pressure switch, be certain that the switch is properly installed on the accumulator fitting. If the switch is too loose it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure. Also verify that the refrigerant system has the correct refrigerant charge. (Refer to 24 -

HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

Remember that lower ambient temperatures, below about -1° C (30° F), during cold weather will open the switch contacts and prevent compressor operation due to the pressure/temperature relationship of the refrigerant. For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the a/c low pressure switch wire harness connector from the switch on the accumulator fitting.

(3) Install a jumper wire between the two cavities of the a/c low pressure switch wire harness connector.

(4) Connect a manifold gauge set to the refrigerant system service ports. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT)

(5) Connect the battery negative cable.

(6) Place the a/c heater mode control switch knob in any A/C position and start the engine.

(7) Check for continuity between the two terminals of the low pressure cycling clutch switch. There should be continuity with a suction pressure reading of 296 kPa (43 psi) or above, and no continuity with a suction pressure reading of 172 kPa (25 psi) or below. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the a/c low pressure switch on the top of the accumulator (Fig. 20).

(3) Unscrew the a/c low pressure switch from the fitting on the top of the accumulator.

(4) Remove the O-ring seal from the accumulator fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the accumulator fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

(2) Install and tighten the a/c low pressure switch on the accumulator fitting. The switch should be hand-tightened onto the accumulator fitting.

(3) Plug the wire harness connector into the a/c low pressure switch.

BLOWER MOTOR RELAY

DESCRIPTION

The blower motor relay is an International Standards Organization (ISO)-type relay. The relay is an electromechanical device that switches battery current from a fuse in the Power Distribution Center (PDC) directly to the blower motor. The relay is energized when the relay coil is provided a voltage signal by the ignition switch. This arrangement reduces the amount of battery current that must flow through the ignition switch.

OPERATION

The blower motor relay control circuit is protected by a fuse located in the junction block. When the relay is de-energized, the blower motor receives no battery current.

The blower motor relay is located in the PDC in the engine compartment. Refer to the PDC label for blower motor relay identification and location.

The blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - BLOWER MOTOR RELAY

RELAY TEST

The blower motor relay (Fig. 21) is located in the Power Distribution Center (PDC). Remove the blower motor relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test below. If not OK, replace the faulty relay.

Fig. 21 BLOWER MOTOR RELAY

TERMINAL LEGEND

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

BLOWER MOTOR RELAY (Continued)

(1) The relay common feed terminal cavity (30) is connected to fused battery feed directly from a fuse in the Power Distribution Center (PDC), and should be hot at all times. Check for battery voltage at the PDC cavity for relay terminal 30. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal cavity (87A) is not used for this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the blower motor. When the relay is energized, terminal 87 is connected to terminal 30 and provides full battery current to the blower motor feed circuit. There should be continuity between the PDC cavity for terminal 87 and the blower motor relay output circuit cavity of the blower motor wire harness connector at all times. If OK, go to Step 4. If not OK, repair the open circuit to the blower motor as required.

(4) The coil battery terminal cavity (86) is connected to the ignition switch. When the ignition switch is placed in the On position, fused ignition switch output is directed from a fuse in the junction block to the relay electromagnetic coil to energize the relay. There should be battery voltage at the PDC cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the junction block fuse as required.

(5) The coil ground terminal cavity (85) is connected to ground. This terminal supplies the ground for the relay electromagnetic coil. There should be continuity between the PDC cavity for relay terminal 85 and a good ground at all times. If not OK, repair the open circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 22).

(3) Refer to the label on the PDC for blower motor relay identification and location.

(4) Unplug the blower motor relay from the PDC and remove it.

INSTALLATION

(1) Install the blower motor relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

Fig. 22 POWER DISTRIBUTION CENTER

1 - COVER

2 - POWER DISTRIBUTION CENTER

BLOWER MOTOR RESISTOR BLOCK**DESCRIPTION**

The blower motor resistor is mounted to the bottom of the HVAC housing, under the instrument panel and just inboard of the blower motor. It can be accessed without removing any other components.

OPERATION

The resistor has multiple resistor wires, each of which will change the resistance in the blower motor ground path to change the blower motor speed. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected blower motor speed.

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR BLOCK

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

BLOWER MOTOR RESISTOR BLOCK (Continued)

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the passenger side end of the HVAC housing and unplug the wire harness connector from the blower motor resistor.

(3) Remove the screws that secure the blower motor resistor to the HVAC housing.

(4) Remove the blower motor resistor from the HVAC housing (Fig. 23).

Fig. 23 BLOWER MOTOR/RESISTOR

1 - BLOWER MOTOR

2 - BLOWER MOTOR RESISTOR

INSTALLATION

(1) Install the blower motor resistor into the HVAC housing and secure it with the mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug the wire harness connector into the blower motor resistor.

(3) Connect the battery negative cable.

BLOWER MOTOR SWITCH

DESCRIPTION

The heater-only or a/c heater blower motor is controlled by a four position rotary-type blower motor switch, mounted in the HVAC control panel. The switch allows the selection of one of four blower motor speeds, but can only be turned off by selecting the Off position with the heater-only or a/c heater control switch knob.

OPERATION

The blower motor switch directs the blower motor ground path through the mode control switch to the blower motor resistor, or directly to ground, as required to achieve the selected blower motor speed.

The blower motor switch cannot be repaired and, if faulty or damaged, the entire heater-only or a/c heater control unit must be replaced. The blower motor switch knob is serviced separately.

BLOWER MOTOR SWITCH (Continued)

DIAGNOSIS AND TESTING - BLOWER MOTOR SWITCH

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the a/c heater control from the instrument panel. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL) Check for continuity between the ground circuit cavity of the a/c heater control wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) With the a/c heater control wire harness connector unplugged, place the a/c heater mode control switch knob in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the a/c heater control as you move the blower motor switch knob to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the a/c heater control connector and the blower motor resistor as required. If not OK, replace the faulty a/c heater control unit.

REMOVAL

The blower motor switch cannot be repaired and, if faulty or damaged, the entire heater-only or a/c heater control unit must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL) The blower motor switch knob is serviced separately.

BLEND DOOR ACTUATOR**REMOVAL**

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Turn the ignition switch to the run position.
- (2) Locate the temperature control knob in the mid (12 o'clock) position.
- (3) Turn the ignition switch to the off position.
- (4) Disconnect and isolate the battery negative cable.
- (5) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
- (6) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)
- (7) Unplug the wire harness connector from the blend door actuator (Fig. 24).
- (8) Remove the two mounting screws which secure the actuator to the housing.
- (9) Slide the blend door actuator off the blend door shaft.

NOTE: A black plastic coupler may be attached to the blend door shaft. Remove the coupler and inspect for damage. Reinstall if there is no damage found.

INSTALLATION

NOTE: Before installing the blend door actuator, be certain that the blend door is not binding and is capable of full travel in both directions.

- (1) Align the actuator with the blend door shaft and rotate the actuator to align it to the mounting bosses on the HVAC housing.
- (2) Align and install the actuator screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (3) Plug in the wire harness connector to the blend door actuator.

BLEND DOOR ACTUATOR (Continued)

- 1 - DUCT
- 2 - MOUNTING SCREWS
- 3 - UNIT HOUSING
- 4 - HARNESS AND CONNECTOR
- 5 - BLEND DOOR ACTUATOR

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

(5) Install the instrument panel in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(6) Make sure the Temperature Control Knob is in the mid (12 o'clock) position to allow the actuator to automatically position itself in the mid position and come to a complete stop when powered up.

(7) Connect the battery negative cable.

MODE DOOR ACTUATOR

REMOVAL - HEAT/DEFROST DOOR ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL

AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the HVAC housing from the vehicle and place it on a work bench. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(3) Unplug the two vacuum harness connectors from the heat/defrost door actuator (Fig. 25).

Fig. 25 HEAT/DEFROST DOOR ACTUATOR

- 1 - VACUUM LINE
- 2 - DOOR PIVOT CONNECTION
- 3 - HEAT/DEFROST DOOR ACTUATOR

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the heat/defrost door crank arm off the heat/defrost door pivot.

(5) Remove the two screws that secure the heat/defrost door actuator to the HVAC housing.

(6) Remove the heat/defrost door actuator from the HVAC housing.

REMOVAL - PANEL/DEFROST DOOR ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

MODE DOOR ACTUATOR (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel assembly from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Unplug the vacuum harness connector from the panel/defrost door actuator (Fig. 26).

J9324-26

Fig. 26 PANEL/DEFROST DOOR ACTUATOR

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel/defrost door crank arm off the panel/defrost door pivot.

(5) Remove the two screws that secure the panel/defrost door actuator to the HVAC housing.

(6) Remove the panel/defrost door actuator from the HVAC housing.

INSTALLATION - HEAT/DEFROST DOOR ACTUATOR

NOTE: Before installing the heat/defrost door actuator, be certain that the heat/defrost door is not binding.

(1) Install the heat/defrost door actuator from the HVAC housing. Tighten the actuator mounting screws to 2.2 N·m (20 in. lbs.).

(2) Carefully snap the heat/defrost door crank arm on the heat/defrost door pivot.

(3) Plug in the two vacuum harness connectors to the heat/defrost door actuator.

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

(5) Connect the battery negative cable.

INSTALLATION - PANEL/DEFROST DOOR ACTUATOR

NOTE: Before installing the panel/defrost door actuator, be certain that the panel/defrost door is not binding.

(1) Install the panel/defrost door actuator on the HVAC housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Carefully snap the panel/defrost door crank arm on the panel/defrost door pivot.

(3) Plug the vacuum harness connector to the panel/defrost door actuator.

(4) Install the instrument panel assembly in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Connect the battery negative cable.

RECIRCULATION DOOR ACTUATOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

RECIRCULATION DOOR ACTUATOR (Continued)

(3) Reach through the glove box opening to access and unplug the vacuum harness connector from the recirculation door actuator (Fig. 27).

Fig. 27 RECIRCULATION DOOR ACTUATOR

- 1 - DOOR SHAFT RETAINER
- 2 - RECIRCULATING AIR DOOR
- 3 - ROD CLIP
- 4 - BLOWER MOTOR ELECTRICAL CONNECTOR
- 5 - ACTUATOR
- 6 - BLOWER MOTOR
- 7 - VACUUM LINE

(4) Loosen the two nuts that secure the recirculation door actuator to the mounting bracket on the HVAC housing.

(5) Slide the two actuator mounting studs out of the slots in the actuator mounting bracket.

(6) Pull the recirculation door actuator downward far enough to access the clip that retains the actuator link to the recirculation door lever.

(7) Unsnap the clip from the recirculation door actuator link and disengage the link from the recirculation door lever.

(8) Remove the recirculation door actuator from the HVAC housing.

INSTALLATION

NOTE: When reinstalling the recirculation door actuator, insert a screwdriver or another suitable tool through the recirculation air intake grille to prop the recirculation air door up in the open position far enough to access the recirculation air door lever through the instrument panel glove box opening.

NOTE: Before installing the blend door actuator, be certain that the blend door is not binding.

(1) Snap the clip on the recirculation door actuator link to engage the link to the recirculation door lever.

(2) Slide the two actuator mounting studs into the slots in the actuator mounting bracket.

(3) Install the two nuts that secure the recirculation door actuator to the mounting bracket on the HVAC housing. Tighten the mounting nuts until the recirculation air door actuator is seated to the mounting bracket.

(4) Plug in the vacuum harness connector to the recirculation door actuator.

(5) Install the glove box in the instrument panel- (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(6) Connect the battery negative cable.

VACUUM CHECK VALVE

DESCRIPTION

On models with a gasoline engine, a vacuum check valve is installed in the accessory vacuum supply line near the vacuum tap on the right side of the engine intake manifold. On models with a diesel engine, a vacuum check valve is installed on the engine vacuum pump. The vacuum check valve is designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits.

OPERATION

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected HVAC mode and vehicle speed control settings. On gasoline engine models, it prevents the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation. On diesel engine models, it prevents oil from contaminating the vacuum supply system by maintaining vacuum in the pump after the engine is shut-off.

On gasoline engine models, a second vacuum check valve is installed in the accessory vacuum supply line at the tee fitting near the dash panel in the engine compartment. This check valve also helps to maintain the system vacuum needed to retain the selected HVAC mode settings, but isolates the HVAC vacuum circuit from the vehicle speed control vacuum circuit. It prevents the vehicle speed control servo from bleeding down the HVAC system vacuum during extended heavy engine load operation.

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

VACUUM CHECK VALVE (Continued)

REMOVAL

(1) On models with a gasoline engine, unplug the vacuum supply line connector at the vacuum check valve (Fig. 28). On models with a diesel engine, remove the clamp from the vacuum supply line connector and unplug the connector from the vacuum check valve (Fig. 29).

80b1b34f

Fig. 28 VACUUM CHECK VALVES - GASOLINE ENGINE

- 1 - INTAKE MANIFOLD VACUUM TAP
- 2 - VACUUM CHECK VALVES

(2) On models with a gasoline engine, note the orientation of the check valve in the vacuum supply line for correct reinstallation.

(3) On models with a gasoline engine, unplug the remaining line on the vacuum check valve from the vacuum supply line fitting. On models with a diesel engine, unscrew the check valve and nipple unit from the engine vacuum pump.

80b1b35c

Fig. 29 VACUUM CHECK VALVE - DIESEL ENGINE

- 1 - VACUUM CHECK VALVE
- 2 - VACUUM SUPPLY LINE

INSTALLATION

(1) On models with a gasoline engine, plug in the vacuum check valve to the vacuum line fittings, noting the proper orientation of the check valve in the line. On models with a diesel engine, screw the check valve and nipple unit into the engine vacuum pump. Tighten the check valve and nipple unit to 24 N·m (18 ft. lbs.).

(2) On models with a diesel engine, plug in the connector to the vacuum check valve and install the clamp from the vacuum supply line connector.

DISTRIBUTION

DESCRIPTION - HVAC SYSTEM AIRFLOW

Outside air enters the vehicle through the cowl top opening at the base of the windshield, and passes through a plenum chamber to the HVAC system blower housing (Fig. 1). Air flow velocity can then be adjusted with the blower motor switch on the a/c heater control panel. The air intake openings must be kept free of snow, ice, leaves, and other obstructions for the HVAC system to receive a sufficient volume of outside air.

It is also important to keep the air intake openings clear of debris because leaf particles and other debris that is small enough to pass through the cowl plenum screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the HVAC housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during HVAC system operation.

- 5 - PANEL OUTLET

AIR OUTLETS

REMOVAL - DEMISTER GRILLES

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the perimeter edges of the demister grille to release the snap features from the instrument panel top cover.

(2) Remove the demister grille from the instrument panel.

REMOVAL - PANEL OUTLET BARRELS

WARNING: THE PANEL OUTLET BARRELS INSTALLED IN THE PASSENGER SIDE AIRBAG DOOR PANEL OUTLET HOUSINGS MUST NEVER BE REINSTALLED FOLLOWING REMOVAL FOR ANY REASON. THEY MUST BE REPLACED WITH NEW BARRELS. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry near the center of either side of the panel outlet barrel to release the snap-fit pivots on the barrel from the pivot pins in the outlet housing of the passenger side airbag module or the instrument cluster bezel (Fig. 2).

80b1b377

Fig. 2 PANEL OUTLET BARRELS

- 1 - DEFROSTER OUTLETS
- 2 - DEMISTER OUTLET GRILLE
- 3 - PANEL OUTLET BARRELS
- 4 - DEMISTER OUTLET GRILLE

(2) Remove the barrel from the panel outlet housing.

INSTALLATION - DEMISTER GRILLES

(1) To install the demister grille, position the grille in the opening of the instrument panel top cover and press inwards firmly and evenly near the center of both sides of the grille until it snaps into place.

INSTALLATION - PANEL OUTLET BARRELS

WARNING: THE PANEL OUTLET BARRELS INSTALLED IN THE PASSENGER SIDE AIRBAG DOOR PANEL OUTLET HOUSINGS MUST NEVER BE REINSTALLED FOLLOWING REMOVAL FOR ANY REASON. THEY MUST BE REPLACED WITH NEW BARRELS. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) To install a new panel outlet barrel, position the barrel in the outlet housing and press inwards firmly and evenly near the center of both sides of the panel outlet barrel until the pivots snap into place.

BLOWER MOTOR

DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the HVAC housing, below the glove box. The blower motor controls the velocity of the air flowing through the HVAC housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and blower wheel can be serviced from the passenger compartment side of the housing.

OPERATION

The blower motor will only operate when the ignition switch is in the On position, and the a/c heater mode control switch knob is in any position, except Off. The blower motor receives a fused battery feed through the blower motor relay whenever the ignition switch is in the On position.

The blower motor battery feed circuit is protected by a fuse in the Power Distribution Center (PDC). The blower motor relay control circuit is protected by a fuse in the junction block. Blower motor speed is controlled by regulating the ground path through the a/c heater mode control switch, the blower motor switch, and the blower motor resistor.

The blower motor and blower wheel cannot be repaired and, if faulty or damaged, they must be replaced. The blower motor and blower wheel may be serviced separately, although if the motor is to be replaced, a blower wheel will come as part of a pre-balanced assembly.

BLOWER MOTOR (Continued)

DIAGNOSIS AND TESTING - BLOWER MOTOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For circuit descriptions and diagrams, (Refer to Appropriate Wiring Information). Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor switch
- Faulty a/c heater mode control switch
- Faulty blower motor.

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor switch
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor circuit wiring or wire harness connectors.

VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Blower wheel out of balance or deformed
- Blower motor faulty.

NOISE

To verify that the blower is the source of the noise, unplug the blower motor wire harness connector and operate the HVAC system. If the noise goes away, possible causes include:

- Foreign material in the HVAC housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Blower motor faulty.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the blower motor cooling tube from the nipple on the blower motor housing (Fig. 3).

Fig. 3 BLOWER MOTOR REMOVE/INSTALL

- 1 - BLOWER MOTOR HOUSING
- 2 - COOLING TUBE
- 3 - ELECTRICAL CONNECTOR

(3) Disengage the blower motor wire harness from the wire harness retainer.

(4) Unplug the blower motor wire harness connector from the HVAC housing wire harness.

(5) Remove the three screws that secure the blower motor and blower wheel assembly to the HVAC housing.

(6) Lower the blower motor and wheel assembly, and cover, from the HVAC housing.

(7) Remove the blower wheel retainer clip and remove the wheel from the blower motor shaft (Fig. 4).

INSTALLATION

(1) If installing the blower motor wheel only, press the blower wheel hub onto the blower motor shaft. Be sure the flat on the blower motor shaft is indexed to the flat on the inside of the blower wheel hub.

(2) Install the retainer clip over the blower wheel hub. The ears of the retainer clip must be indexed over the flats on the blower motor shaft and blower wheel hub.

BLOWER MOTOR (Continued)

J9324-92

Fig. 4 BLOWER MOTOR WHEEL REMOVE/INSTALL

- 1 - BLOWER MOTOR WHEEL
2 - RETAINER CLIP

(3) Be certain that the blower motor seal is installed on the blower motor housing (Fig. 5).

J9324-33

Fig. 5 BLOWER MOTOR SEAL

- 1 - BLOWER MOTOR SEAL

(4) Install the blower motor and wheel assembly, and cover in the HVAC housing with three mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(5) Plug the blower motor wire harness connector into the HVAC housing wire harness.

(6) Install the blower motor wire harness into the wire harness retainer.

(7) Connect the blower motor cooling tube to the nipple on the blower motor housing.

(8) Connect the battery negative cable.

DEFROSTER DUCTS

REMOVAL - DEFROSTER AND DEMISTER DUCTS

The defroster duct and the main demister duct are a single molded plastic unit. The defroster outlet grilles are heat-staked to the defroster outlets and cannot be serviced separately. The demister tubes on each end of the main demister duct are only serviced in the instrument panel assembly.

(1) Remove the instrument panel top cover from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(2) Remove the screws that secure the defroster and demister ducts to the instrument panel brackets (Fig. 6).

(3) Disengage the demister tubes from each end of the main demister duct.

(4) Remove the defroster and demister duct unit from the instrument panel.

REMOVAL - DEFROSTER AND DEMISTER DUCT ADAPTER

(1) Roll the instrument panel assembly down, but do not remove it from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the perimeter edges of the defroster and demister duct adapter to release the snap features from the top of the HVAC housing (Fig. 7).

(3) Remove the defroster and demister duct adapter from the top of the HVAC housing.

INSTALLATION - DEFROSTER AND DEMISTER DUCTS

(1) Place the defroster and demister duct unit in position.

(2) Engage the demister tubes with each end of the main demister duct.

(3) Install the screws that secure the defroster and demister ducts to the instrument panel brackets. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(4) Install the instrument panel top cover on the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

INSTALLATION - DEFROSTER AND DEMISTER DUCT ADAPTER

(1) Snap the defroster and demister duct adapter from the top of the HVAC housing.

DEFROSTER DUCTS (Continued)

(2) Roll the instrument panel assembly up, and fasten it properly to the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

HVAC HOUSING

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

The HVAC housing assembly must be removed from the vehicle and disassembled for service access of the heater core, a/c evaporator, and each of the various mode control doors.

HVAC HOUSING (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) If the vehicle is not equipped with air conditioning, go to Step 6. If the vehicle is equipped with air conditioning, recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.

(4) Disconnect the liquid line refrigerant line fitting from the evaporator inlet tube. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS) Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL) Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE) and (Refer to 7 - COOLING - STANDARD PROCEDURE).

(7) Disconnect the heater hoses from the heater core tubes. Refer to Cooling for the procedures. Install plugs in, or tape over the opened heater core tubes.

(8) Remove the Powertrain Control Module (PCM) from the dash panel and set it aside, but do not unplug the PCM wire harness connectors. Refer to Electronic Control Modules for the procedures.

(9) Remove the nuts from the HVAC housing mounting studs on the engine compartment side of the dash panel.

(10) Remove the nuts that secure the HVAC housing to the mounting studs on the passenger compartment side of the dash panel (Fig. 8).

(11) Pull the HVAC housing rearward far enough for the mounting studs and the evaporator condensate drain tube to clear the dash panel holes.

(12) Remove the HVAC housing from the vehicle.

REMOVAL - HVAC HOUSING INLET BAFFLE

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Slide the HVAC housing inlet baffle (Fig. 9) all the way to one side of the cowl plenum opening.

(3) Pull downwards sharply and firmly on the opposite side of the HVAC housing inlet baffle to disengage the snap features from the cowl plenum opening.

(4) Remove the HVAC housing inlet baffle from the cowl plenum panel.

Fig. 8 HVAC HOUSING REMOVE/INSTALL

- 1 - BODY ASSEMBLY
- 2 - HVAC HOUSING

80b1b379

Fig. 9 HVAC HOUSING INLET BAFFLE REMOVE/INSTALL

- 1 - RIGHT A-PILLAR
- 2 - INLET BAFFLE
- 3 - COWL PLENUM OPENING

DISASSEMBLY

(1) Place the HVAC housing upside down on a work bench.

(2) Remove the screw that secures the floor duct to the bottom of the HVAC housing and slide the floor duct off of the center heat duct adaptor.

(3) Unsnap the center heat duct adaptor from the bottom of the HVAC housing and remove the screw that was hidden by the adaptor.

(4) Remove the remaining screws on the bottom of the HVAC housing that secure the two housing halves together.

HVAC HOUSING (Continued)

(5) Place the HVAC housing right side up on the work bench.

(6) Separate the top half of the HVAC housing from the bottom half and set it aside.

ASSEMBLY

(1) Position the top half of the HVAC housing over the bottom half. Be certain that the mode door pivot pins are properly inserted in their pivot holes.

(2) Place the HVAC housing upside down on the work bench.

(3) Install and tighten the screws on the bottom of the HVAC housing that secure the two housing halves together. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) Snap the center heat duct adaptor onto the bottom of the HVAC housing.

(5) Slide the floor duct onto the center heat duct adaptor and secure it with a screw to the bottom of the HVAC housing. Tighten the mounting screw to 2.2 N·m (20 in. lbs.).

INSTALLATION

(1) Position the HVAC housing to the dash panel. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct mounting holes.

(2) Install the nuts that secure the HVAC housing to the mounting studs on the passenger compartment side of the dash panel. Tighten the nuts to 4.5 N·m (40 in. lbs.).

(3) Install and tighten the nuts onto the HVAC housing mounting studs on the engine compartment side of the dash panel. Tighten the nuts to 7 N·m (60 in. lbs.).

(4) Unplug or remove the tape from the heater core tubes. Connect the heater hoses to the heater core tubes and fill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE) and (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) If the vehicle is not equipped with air conditioning, go to Step 10. If the vehicle is equipped with air conditioning, install the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - INSTALLATION) Connect the accumulator inlet tube coupler to the evaporator outlet tube. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(6) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line coupler to the evaporator inlet tube. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(9) Reinstall the PCM to the dash panel. Refer to Electronic Control Modules for the procedures.

(10) Reinstall the instrument panel in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(11) Connect the battery negative cable.

(12) Start the engine and check for proper operation of the heating and air conditioning systems.

INSTALLATION - HVAC HOUSING INLET Baffle

(1) Install the HVAC housing inlet baffle in the cowl plenum panel.

(2) Slide the HVAC housing inlet baffle to engage the snap features.

(3) Make certain that the snap features on each side of the adapter are fully engaged with the sides of the plenum panel opening. This must be a water tight connection to prevent leaks.

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

INSTRUMENT PANEL DEMISTER DUCTS**REMOVAL**

The defroster duct and the main demister duct are a single molded plastic unit. The defroster outlet grilles are heat-staked to the defroster outlets and cannot be serviced separately. The demister tubes on each end of the main demister duct are only serviced in the instrument panel assembly. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - REMOVAL)

INSTALLATION

The defroster duct and the main demister duct are a single molded plastic unit. The defroster outlet grilles are heat-staked to the defroster outlets and cannot be serviced separately. The demister tubes on each end of the main demister duct are only serviced in the instrument panel assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - INSTALLATION).

INSTRUMENT PANEL DUCTS

REMOVAL

The panel and center distribution ducts (Fig. 10) are only serviced as part of the instrument panel assembly. Refer to Instrument Panel System for the service procedures.

80b1b376

Fig. 10 PANEL AND CENTER DISTRIBUTION DUCTS

- 1 - BRACKET
- 2 - SCREW
- 3 - CENTER DISTRIBUTION DUCT

- 5 - PANEL DUCTS

INSTALLATION

The panel and center distribution ducts are only serviced as part of the instrument panel assembly. Refer to Instrument Panel System for the service procedures.

BLEND DOOR

REMOVAL

(1) Remove the HVAC housing from the vehicle, and disassemble the housing halves. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Lift the blend door pivot shaft out of the pivot hole in the bottom of the HVAC housing (Fig. 11).

J9324-18

Fig. 11 BLEND DOOR

- 1 - HEAT/DEFROST DOOR
- 2 - TEMP/BLEND AIR DOOR

INSTALLATION

(1) Install the blend door pivot shaft in the bottom of the HVAC housing.

(2) Assemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY)

(3) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

MODE DOOR

REMOVAL - HEAT/DEFROST DOOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

MODE DOOR (Continued)

WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Remove and disassemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Remove the heat/defrost door actuator from the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)

(3) Remove the heat/defrost door from the HVAC housing.

REMOVAL - PANEL/DEFROST DOOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel assembly from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Remove the panel/defrost door actuator from the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)

(4) Remove the defroster and demister duct adapter from the HVAC housing. ***L***

(5) Lift the panel/defrost door out of the top opening of the HVAC housing.

INSTALLATION - HEAT/DEFROST DOOR

(1) Install the heat/defrost door in the HVAC housing.

(2) Assemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY)

(3) Install the heat/defrost door actuator on the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - INSTALLATION)

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

INSTALLATION - PANEL/DEFROST DOOR

(1) Install the panel/defrost door through the top opening of the HVAC housing.

(2) Install the defroster and demister duct adapter on the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - INSTALLATION)

(3) Install the panel/defrost door actuator on the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR ACTUATOR - REMOVAL)

(4) Install the instrument panel assembly in the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(5) Connect the battery negative cable.

RECIRCULATION DOOR**REMOVAL**

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: IF THE VEHICLE IS EQUIPPED WITH AIR CONDITIONING, REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

RECIRCULATION DOOR (Continued)

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Unsnap the recirculation door vacuum actuator link clip and disengage the link from the recirculation door lever. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - REMOVAL)

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the retainer off of the recirculation door pivot shaft.

(4) Remove the recirculation door through the outside air intake opening on the top of the HVAC housing.

INSTALLATION

(1) Install the recirculation door through the outside air intake opening on the top of the HVAC housing.

(2) Install the retainer on the recirculation door pivot shaft.

(3) Engage the recirculation door vacuum actuator link clip with the recirculation door lever. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RECIRCULATION DOOR ACTUATOR - INSTALLATION)

(4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

PLUMBING

DESCRIPTION - A/C LINE COUPLERS

Spring-lock type refrigerant line couplers are used to connect many of the refrigerant lines and other components to the refrigerant system. These couplers require a special tool for disengaging the two coupler halves.

DESCRIPTION- REFRIGERANT LINES

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

PLUMBING (Continued)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

OPERATION - A/C LINE COUPLERS

The spring-lock coupler is held together by a garter spring inside a circular cage on the male half of the fitting (Fig. 1). When the two coupler halves are connected, the flared end of the female fitting slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage.

Two O-rings on the male half of the fitting are used to seal the connection. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

Secondary clips are installed over the two connected coupler halves at the factory for added blowoff protection. In addition, some models have a plastic ring that is used at the factory as a visual indicator to confirm that these couplers are connected. After the coupler is connected, the plastic indicator ring is no longer needed; however, it will remain on the refrigerant line near the coupler cage.

OPERATION- REFRIGERANT LINES

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to

80a7e303

Fig. 1 SPRING-LOCK COUPLER - TYPICAL

- 1 - MALE HALF SPRING-LOCK COUPLER
- 2 - FEMALE HALF SPRING-LOCK COUPLER
- 3 - SECONDARY CLIP
- 4 - CONNECTION INDICATOR RING
- 5 - COUPLER CAGE
- 6 - GARTER SPRING
- 7 - COUPLER CAGE
- 7 - "O" RINGS

inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled with other components of the HVAC system with peanut-block style fittings. A stat-O seal type flat steel gasket with a captured compressible O-ring, is used to mate plumbing lines with A/C components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

PLUMBING (Continued)

SERVICE WARNINGS

WARNING:

THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.

AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.

DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.

IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION. THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.

THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

SERVICE CAUTIONS

CAUTION: Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.

R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.

Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.

Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.

Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

Do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

The refrigerant system must always be evacuated before charging.

Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.

Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.

Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.

Do not remove the sealing caps from a replacement component until it is to be installed.

When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.

Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.

When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.

PLUMBING (Continued)

**CAUTION - REFRIGERANT HOSES/LINES/
TUBES PRECAUTIONS**

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.
- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines

and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

**DIAGNOSIS AND TESTING - REFRIGERANT
SYSTEM LEAKS**

WARNING: (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) BEFORE PERFORMING THE FOLLOWING OPERATION.

If the air conditioning system is not cooling properly, determine if the refrigerant system is fully-charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE) If the refrigerant system is low or empty; a leak at a refrigerant line, connector fitting, component, or component seal is likely.

An electronic leak detector designed for R-134a refrigerant, or a fluorescent R-134a leak detection dye and a black light are recommended for locating and confirming refrigerant system leaks. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

An oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general location of a possible refrigerant leak. However, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement.

To detect a leak in the refrigerant system with an electronic leak detector, perform one of the following procedures:

SYSTEM EMPTY

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(3) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(4) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detec-

PLUMBING (Continued)

tor probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(5) To inspect the evaporator for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode.

SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run with the air conditioning system turned on for five minutes.

(3) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode.

STANDARD PROCEDURE - A/C LINE COUPLERS

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

REMOVAL

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Remove the secondary clip from the spring-lock coupler.

(3) Fit the proper size A/C line disconnect tool (Special Tool Kit 7193) over the spring-lock coupler cage (Fig. 2).

(4) Close the two halves of the A/C line disconnect tool around the spring-lock coupler.

(5) Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring. Once the garter spring is expanded and while still pushing the disconnect tool into the open side of the coupler cage, pull on the refrigerant line attached to

Fig. 2 REFRIGERANT LINE SPRING-LOCK COUPLER DISCONNECT

the female half of the coupler fitting until the flange on the female fitting is separated from the garter spring and cage on the male fitting within the disconnect tool.

INSTALLATION

(1) Check to ensure that the garter spring is located within the cage of the male coupler fitting, and that the garter spring is not damaged.

(a) If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.

(b) If the garter spring is damaged, remove it from the coupler cage with a small wire hook (DO NOT use a screwdriver) and install a new garter spring.

(2) Clean any dirt or foreign material from both halves of the coupler fitting.

(3) Install new O-rings on the male half of the coupler fitting.

CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak intermittently during vehicle operation.

(4) Lubricate the male fitting and O-rings, and the inside of the female fitting with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(5) Fit the female half of the coupler fitting over the male half of the fitting.

PLUMBING (Continued)

(6) Push together firmly on the two halves of the coupler fitting until the garter spring in the cage on the male half of the fitting snaps over the flanged end on the female half of the fitting.

(7) Ensure that the spring-lock coupler is fully engaged by trying to separate the two coupler halves. This is done by pulling the refrigerant lines on either side of the coupler away from each other.

(8) Reinstall the secondary clip over the spring-lock coupler cage.

STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 3). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line between the accumulator outlet and the compressor.

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the discharge line between the compressor and the condenser inlet.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set

80add30c

Fig. 3 MANIFOLD GAUGE SET - TYPICAL

- 1 - HIGH PRESSURE GAUGE
- 2 - VALVE
- 3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
- 4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
- 5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
- 6 - VALVE
- 7 - LOW PRESSURE GAUGE

are opened, the refrigerant in the system will escape through this hose.

STANDARD PROCEDURE - REFRIGERANT RECOVERY

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

PLUMBING (Continued)

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. To evacuate the refrigerant system, use the following procedure:

(1) Connect a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 and a manifold gauge set to the refrigerant system of the vehicle.

(2) Open the low and high side valves and start the charging station vacuum pump. When the suction gauge reads 88 kPa (26 in. Hg.) vacuum or greater, close all of the valves and turn off the vacuum pump.

(a) If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS)

(b) If the refrigerant system maintains the specified vacuum for five minutes, restart the vacuum pump, open the suction and discharge valves and evacuate the system for an additional ten minutes.

(3) Close all of the valves, and turn off the charging station vacuum pump.

(4) The refrigerant system is now ready to be charged with R-134a refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

SPECIFICATIONS**SPECIFICATIONS**

The R-134a refrigerant system charge capacity for this vehicle is: 0.907 kilograms (32 ounces).

A/C COMPRESSOR**DESCRIPTION**

The air conditioning system uses a Sanden SD7H15 seven cylinder, reciprocating wobble plate-type compressor on all models. This compressor has a fixed displacement of 150 cubic centimeters (9.375 cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

DESCRIPTION - HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be

A/C COMPRESSOR (Continued)

replaced. The compressor clutch, pulley and clutch coil are available for service.

OPERATION - HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

DIAGNOSIS AND TESTING - A/C COMPRESSOR

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine operating temperature, and any other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension before beginning this procedure (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING).

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. (Refer to 24 - HEATING & AIR

CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - INSTALLATION)

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(5) If the noise is from opening and closing of the high pressure relief valve, recover, evacuate, and recharge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) If the high pressure relief valve still does not seat properly, replace the compressor.

(6) If the noise is from liquid slugging on the suction line, replace the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL) Check the refrigerant oil level and the refrigerant system charge. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY) If the liquid slugging condition continues following accumulator replacement, replace the compressor.

(7) If the noise continues, replace the compressor and repeat Step 1.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

The compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch or clutch coil, the engine, the cylinder head, or the generator.

(1) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDI-

A/C COMPRESSOR (Continued)

TIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL), (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Unplug the compressor clutch coil wire harness connector.

(5) Remove the bolt that secures the refrigerant line manifold to the compressor. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the four bolts that secure the compressor to the mounting bracket (Fig. 4) or (Fig. 5).

(7) Remove the a/c compressor from the mounting bracket.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

(1) Install the compressor to the mounting bracket. Tighten the four mounting bolts to 24 N·m (210 in. lbs.).

(2) Remove the tape or plugs from all of the opened refrigerant line fittings. Install the suction and discharge line manifold to the compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C SUCTION AND DISCHARGE LINE - INSTALLATION)

(3) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION), (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Plug in the compressor clutch coil wire harness connector.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

A/C CONDENSER

DESCRIPTION

The condenser is located in the air flow in front of the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins, thus causing the refrigerant to change to a liquid state.

OPERATION

When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or condenser service.

The condenser cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the nut that secures the block fitting to the stud on the condenser inlet, and disconnect the discharge line from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(4) Disconnect the refrigerant line fitting that secures the liquid line to the condenser outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLER) Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) On gasoline engine models:

(a) Remove the two screws that secure the condenser upper mounting brackets to the outside of the upper radiator crossmember (Fig. 6).

A/C CONDENSER (Continued)

(b) Tilt the condenser away from the engine compartment far enough to grasp the top of the condenser with both hands.

(c) Lift the condenser far enough to remove the two lower condenser locators from the isolators in the holes of the lower crossmember.

(d) Remove the condenser from the vehicle.

Fig. 6 CONDENSER REMOVE/INSTALL - GASOLINE ENGINE

- 1 - CONDENSER
- 2 - LOCATOR
- 3 - ISOLATOR
- 4 - SCREW

(6) On diesel engine models:

(a) Remove the two screws that secure the brackets on the passenger side end of the condenser to the charge air cooler (Fig. 7).

(b) Remove the two nuts that secure the driver side end of the condenser to the studs on the charge air cooler.

(c) Remove the condenser from the vehicle.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

(1) On gasoline engine models:

(a) Insert the two lower condenser locators into the isolators in the holes of the lower crossmember.

Fig. 7 CONDENSER REMOVE/INSTALL - DIESEL ENGINE

- 1 - CHARGE AIR COOLER
- 2 - NUT
- 3 - CONDENSER
- 4 - SCREW

(b) Tilt the condenser up towards the engine compartment far enough to align the upper mounting bracket holes with the holes in the upper radiator crossmember.

(c) Install the two screws that secure the condenser upper mounting brackets to the outside of the upper radiator crossmember. Tighten the mounting screws to 10.5 N·m (95 in. lbs.).

(2) On diesel engine models:

(a) Install the driver side condenser mounting brackets over the two studs on the charge air cooler.

(b) Install the two screws that secure the brackets on the passenger side end of the condenser to the charge air cooler. Tighten the mounting screws to 10.5 N·m (95 in. lbs.).

(c) Install the two nuts that secure the driver side end of the condenser to the studs on the charge air cooler. Tighten the mounting nuts to 10.5 N·m (95 in. lbs.).

(3) Remove the plugs or tape from the refrigerant line fittings on the liquid line and the condenser outlet. Connect the liquid line to the condenser outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(4) Install a new gasket and the discharge line block fitting over the stud on the condenser inlet. Tighten the mounting nut to 20 N·m (180 in. lbs.).

(5) Check that all of the condenser and radiator air seals are in their proper locations.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

A/C CONDENSER (Continued)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

SUCTION AND DISCHARGE LINE

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Unplug the wire harness connector from the a/c high pressure switch.

(4) Disconnect the suction line refrigerant line coupler at the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLER) Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the nut that secures the block fitting to the stud on the condenser inlet and disconnect the discharge line from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) On models with a gasoline engine, remove the nut that secures the refrigerant line support bracket to the stud on the compressor mounting bracket.

(7) Remove the bolt that secures the refrigerant line manifold to the compressor (Fig. 8) or (Fig. 9). Install plugs in, or tape over all of the opened refrigerant line fittings.

A/C EVAPORATOR

DESCRIPTION

The a/c evaporator is located in the HVAC housing, under the instrument panel. The evaporator coil is positioned in the HVAC housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator coil fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator coil tubes.

OPERATION

Refrigerant enters the evaporator from the fixed orifice tube as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the evaporator.

The evaporator coil cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Remove the HVAC housing from the vehicle, and disassemble the housing halves. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Lift the a/c evaporator out of the HVAC housing (Fig. 11).

J9324-14

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

(1) Insert the evaporator coil into the bottom of the HVAC housing.

A/C EVAPORATOR (Continued)

(2) Reassemble and reinstall the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

NOTE: If the evaporator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.

A/C ORIFICE TUBE

DESCRIPTION

The fixed orifice tube is installed in the liquid line between the outlet of the condenser and the inlet of the evaporator. The fixed orifice tube is only serviced as an integral part of the liquid line.

OPERATION

The inlet end of the fixed orifice tube has a nylon mesh filter screen, which filters the refrigerant and helps to reduce the potential for blockage of the metering orifice by refrigerant system contaminants (Fig. 12). The outlet end of the tube has a nylon mesh diffuser screen. The O-rings on the plastic body of the fixed orifice tube seal the tube to the inside of the liquid line and prevent the refrigerant from bypassing the fixed metering orifice.

Fig. 12 FIXED ORIFICE TUBE - TYPICAL

- 1 - DIFFUSER SCREEN
- 2 - "O" RINGS
- 3 - INLET FILTER SCREEN
- 4 - ORIFICE

The fixed orifice tube is used to meter the flow of liquid refrigerant into the evaporator coil. The high-pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the fixed orifice tube.

The fixed orifice tube cannot be repaired and, if faulty or plugged, the liquid line assembly must be replaced.

DIAGNOSIS AND TESTING - FIXED ORIFICE TUBE

The fixed orifice tube can be checked for proper operation using the following procedure. However, the fixed orifice tube is only serviced as a part of the liquid line unit. If the results of this test indicate that the fixed orifice tube is obstructed or missing, the entire liquid line unit must be replaced.

WARNING: THE LIQUID LINE BETWEEN THE CONDENSER OUTLET AND THE FIXED ORIFICE TUBE CAN BECOME HOT ENOUGH TO BURN THE SKIN. USE EXTREME CAUTION WHEN PERFORMING THE FOLLOWING TEST.

(1) Confirm that the refrigerant system is properly charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

(2) Start the engine. Turn on the air conditioning system and confirm that the compressor clutch is engaged.

(3) Allow the air conditioning system to operate for five minutes.

(4) Lightly and cautiously touch the liquid line near the condenser outlet at the front of the engine compartment. The liquid line should be hot to the touch.

(5) Touch the liquid line near the evaporator inlet at the rear of the engine compartment. The liquid line should be cold to the touch.

(6) If there is a distinct temperature differential between the two ends of the liquid line, the orifice tube is in good condition. If there is little or no detectable temperature differential between the two ends of the liquid line, the orifice tube is obstructed or missing and the liquid line must be replaced.

REMOVAL

The fixed orifice tube is located in the liquid line, between the condenser and the evaporator coil. If the fixed orifice tube is faulty or plugged, the liquid line assembly must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL)

INSTALLATION

The fixed orifice tube is located in the liquid line, between the condenser and the evaporator coil. If the fixed orifice tube is faulty or plugged, the liquid line assembly must be replaced (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - INSTALLATION).

ACCUMULATOR

DESCRIPTION

The accumulator is mounted in the engine compartment between the a/c evaporator outlet tube and the compressor inlet.

OPERATION

Refrigerant enters the accumulator canister as a low pressure vapor through the inlet tube. Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system (Fig. 13).

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

- (1) Disconnect and isolate the battery negative cable.
- (2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)
- (3) Remove the a/c low pressure switch from the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C LOW PRESSURE SWITCH - REMOVAL)
- (4) Loosen the screw that secures the accumulator retaining band to the support bracket on the dash panel.
- (5) Disconnect the suction line refrigerant line fitting from the accumulator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS) Install plugs in, or tape over all of the opened refrigerant line fittings.
- (6) Disconnect the accumulator inlet refrigerant line fitting from the evaporator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE) Install plugs in, or tape over all of the opened refrigerant line fittings.
- (7) Pull the accumulator out of the retaining band.
- (8) Remove the accumulator from the engine compartment.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

- (1) Install the accumulator in the retaining band.
- (2) Remove the tape or plugs from the refrigerant line fittings on the accumulator inlet and the evaporator outlet. Connect the accumulator inlet refrigerant line coupler to the evaporator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

ACCUMULATOR (Continued)

(3) Tighten the accumulator retaining band screw to 4.5 N·m (40 in. lbs.).

(4) Remove the tape or plugs from the refrigerant line fittings on the suction line and the accumulator outlet. Connect the suction line refrigerant line coupler to the accumulator outlet. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - A/C LINE COUPLERS)

(5) Reinstall the a/c low pressure switch on the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C LOW PRESSURE SWITCH - INSTALLATION)

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(8) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

NOTE: If the accumulator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

HEATER CORE

DESCRIPTION

The heater core is located in the HVAC housing, under the instrument panel. It is a heat exchanger made of rows of tubes and fins.

The heater core is not repairable and if damaged it must be replaced.

OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend door allows control of the heater output air temperature by controlling how much of the air flowing through the HVAC housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Remove the screws and retainers that secure the heater core to the HVAC housing.

(3) Lift the heater core straight up and out of the heater-A/C housing (Fig. 14).

Fig. 14 HEATER CORE REMOVE/INSTALL

- 1 - HEATER CORE LINES
- 2 - HEATER CORE

INSTALLATION

(1) Lower the heater core into the HVAC housing.

(2) Position the retainers over the heater core tubes. Install and tighten the screws that secure the heater core and retainers to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Reinstall the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

REFRIGERANT (Continued)

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The SD7H15 compressor used in this vehicle is designed to use an SP-20 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The accumulator, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an accumulator, evaporator coil, or condenser are replaced. See the Refrigerant Oil Capacities chart. When a compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

Refrigerant Oil Capacities		
Component	ml	fl oz
A/C System	210	6.2
Accumulator	60	2
Condenser	30	1
Evaporator	60	2
Compressor	drain and measure the oil from the old compressor - see text.

EMISSIONS CONTROL

DESCRIPTION

DESCRIPTION - DIESEL

Two different modules are used for powertrain control with the diesel engine. The Powertrain Control Module (PCM) is used primarily for charging system, transmission, A/C compressor clutch operation and speed control functions. The Engine Control Module (ECM) is used to control the **fuel and emissions systems**. The PCM is located in the right/rear of engine compartment (Fig. 1). The ECM is bolted to the left side of the engine cylinder block (Fig. 2).

DESCRIPTION - STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect

Fig. 1 Powertrain Control Module (PCM) Location

- 1 - PCM MOUNTING BOLTS (3)
- 2 - POWERTRAIN CONTROL MODULE (PCM)
- 3 - (3) 32-WAY CONNECTORS

the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

EMISSIONS CONTROL (Continued)

Fig. 2 Engine Control Module (ECM) Location

- 1 - ENGINE CONTROL MODULE (ECM)
- 2 - HEX HEADED BOLT
- 3 - FUEL TRANSFER PUMP
- 4 - MOUNTING BOLTS (3)
- 5 - 50-WAY CONNECTOR

DESCRIPTION - CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device,

its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

DESCRIPTION - DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

NOTE: For a list of DTC's, refer to the charts in this section.

BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

OBTAINING DTC'S USING DRB SCAN TOOL

(1) Connect the DRB scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

(2) Turn the ignition switch on and access the "Read Fault" screen.

(3) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(4) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

EMISSIONS CONTROL (Continued)

P0137 (M)	1/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0138 (M)	1/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0139 (M)	1/2 O2 Sensor Slow Response	Oxygen sensor response not as expected.
P0140 (M)	1/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0141 (M)	1/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0143 (M)	1/3 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0144 (M)	1/3 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0145 (M)	1/3 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0146 (M)	1/3 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0147 (M)	1/3 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0151 (M)	2/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0152 (M)	2/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage sustained above normal operating range.
P0153 (M)	2/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0154 (M)	2/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0155 (M)	2/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0157 (M)	2/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0158 (M)	2/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0159	2/2 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0160 (M)	2/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0161 (M)	2/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0165	Starter Relay Circuit	Problem detected in starter relay circuit.
P0168	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P0171 (M)	1/1 Fuel System Lean	A lean air/fuel mixture has been indicated by an abnormally rich correction factor.
P0172 (M)	1/1 Fuel System Rich	A rich air/fuel mixture has been indicated by an abnormally lean correction factor.
P0174 (M)	2/1 Fuel System Lean	A lean air/fuel mixture has been indicated by an abnormally rich correction factor.
P0175 (M)	2/1 Fuel System Rich	A rich air/fuel mixture has been indicated by an abnormally lean correction factor.
P0176	Loss of Flex Fuel Calibration Signal	No calibration voltage present from flex fuel sensor.
P0177	Water In Fuel	Excess water found in fuel by water-in-fuel sensor.
P0178	Flex Fuel Sensor Volts Too Low	Flex fuel sensor input below minimum acceptable voltage.
P0178	Water In Fuel Sensor Voltage Too Low	Loss of water-in-fuel circuit or sensor.
P0179	Flex Fuel Sensor Volts Too High	Flex fuel sensor input above maximum acceptable voltage.
P0181	Fuel Injection Pump Failure	Low power, engine derated, or engine stops.
P0182 (M)	CNG Temp Sensor Voltage Too Low	Compressed natural gas temperature sensor voltage below acceptable voltage.
P0183 (M)	CNG Temp Sensor Voltage Too High	Compressed natural gas temperature sensor voltage above acceptable voltage.
P0201 (M)	Injector #1 Control Circuit	An open or shorted condition detected in control circuit for injector #1 or the INJ 1 injector bank.
P0202 (M)	Injector #2 Control Circuit	An open or shorted condition detected in control circuit for injector #2 or the INJ 2 injector bank.
P0203 (M)	Injector #3 Control Circuit	An open or shorted condition detected in control circuit for injector #3 or the INJ 3 injector bank.
P0204 (M)	Injector #4 Control Circuit	Injector #4 or INJ 4 injector bank output driver stage does not respond properly to the control signal.
P0205 (M)	Injector #5 Control Circuit	Injector #5 output driver stage does not respond properly to the control signal.
P0206 (M)	Injector #6 Control Circuit	Injector #6 output driver stage does not respond properly to the control signal.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0207 (M)	Injector #7 Control Circuit	Injector #7 output driver stage does not respond properly to the control signal.
P0208 (M)	Injector #8 Control Circuit	Injector #8 output driver stage does not respond properly to the control signal.
P0209 (M)	Injector #9 Control Circuit	Injector #9 output driver stage does not respond properly to the control signal.
P0210 (M)	Injector #10 Control Circuit	Injector #10 output driver stage does not respond properly to the control signal.
P0215	Fuel Injection Pump Control Circuit	Failure in fuel pump relay control circuit.
P0216 (M)	Fuel Injection Pump Timing Failure	High fuel supply restriction, low fuel pressure or possible wrong or incorrectly installed pump keyway.
P0217	Decreased Engine Performance Due To Engine Overheat Condition	Engine overheating. ECM will derate engine performance.
P0219	Crankshaft Position Sensor Overspeed Signal	Engine has exceeded rpm limits.
P0222 (M)	Idle Validation Signals Both Low	Problem detected with idle validation circuits within APPS.
P0223 (M)	Idle Validation Signals Both High (Above 5 Volts)	Problem detected with idle validation circuits within APPS.
P0230	Transfer Pump (Lift Pump) Circuit Out of Range	Problem detected in fuel transfer pump circuits.
P0232	Fuel Shutoff Signal Voltage Too High	Fuel shut-off signal voltage too high from ECM to fuel injection pump.
P0234 (M)	Turbo Boost Limit Exceeded	Problem detected in turbocharger wastegate.
P0236 (M)	Map Sensor Too High Too Long	Problem detected in turbocharger wastegate.
P0237 (M)	Map Sensor Voltage Too Low	MAP sensor voltage input below the minimum acceptable voltage.
P0238 (M)	Map Sensor Voltage Too High	MAP sensor voltage input above the maximum acceptable voltage.
PO243	Wastegate Solenoid Circuit	
P0251 (M)	Fuel Inj. Pump Mech. Failure Fuel Valve Feedback Circuit	Problem sensed with fuel circuit internal to fuel injection pump.
P0253 (M)	Fuel Injection Pump Fuel Valve Open Circuit	Problem sensed with fuel circuit internal to fuel injection pump.
P0254	Fuel Injection Pump Fuel Valve Current Too High	Problem caused by internal fuel injection pump failure.
P0300 (M)	Multiple Cylinder Mis-fire	Misfire detected in multiple cylinders.
P0301 (M)	CYLINDER #1 MISFIRE	Misfire detected in cylinder #1.
P0302 (M)	CYLINDER #2 MISFIRE	Misfire detected in cylinder #2.
P0303 (M)	CYLINDER #3 MISFIRE	Misfire detected in cylinder #3.
P0304 (M)	CYLINDER #4 MISFIRE	Misfire detected in cylinder #4.
P0305 (M)	CYLINDER #5 MISFIRE	Misfire detected in cylinder #5.
P0306 (M)	CYLINDER #6 MISFIRE	Misfire detected in cylinder #6.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0307 (M)	CYLINDER #7 MISFIRE	Misfire detected in cylinder #7
P0308 (M)	CYLINDER #8 MISFIRE	Misfire detected in cylinder #8.
P0309 (M)	CYLINDER #9 MISFIRE	Misfire detected in cylinder #9.
P0310 (M)	CYLINDER #10 MISFIRE	Misfire detected in cylinder #10.
P0320 (M)	No Crank Reference Signal at PCM	No reference signal (crankshaft position sensor) detected during engine cranking.
P0320 (M)	No RPM Signal to PCM (Crankshaft Position Sensor Signal to JTEC)	A CKP signal has not been detected at the PCM.
P0325	Knock Sensor #1 Circuit	Knock sensor (#1) signal above or below minimum acceptable threshold voltage at particular engine speeds.
P0330	Knock Sensor #2 Circuit	Knock sensor (#2) signal above or below minimum acceptable threshold voltage at particular engine speeds.
P0336 (M)	Crankshaft Position (CKP) Sensor Signal	Problem with voltage signal from CKP.
P0340 (M)	No Cam Signal At PCM	No fuel sync
P0341 (M)	Camshaft Position (CMP) Sensor Signal	Problem with voltage signal from CMP.
P0350	Ignition Coil Draws Too Much Current	A coil (1-5) is drawing too much current.
P0351 (M)	Ignition Coil # 1 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0352 (M)	Ignition Coil # 2 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0353 (M)	Ignition Coil # 3 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time.
P0354 (M)	Ignition Coil # 4 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (High Impedance).
P0355 (M)	Ignition Coil # 5 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (High Impedance).
P0356 (M)	Ignition Coil # 6 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0357 (M)	Ignition Coil # 7 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0358 (M)	Ignition Coil # 8 Primary Circuit	Peak primary circuit current not achieved with maximum dwell time (high impedance).
P0370	Fuel Injection Pump Speed/Position Sensor Sig Lost	Problem caused by internal fuel injection pump failure.
P0380 (M)	Intake Air Heater Relay #1 Control Circuit	Problem detected in #1 air heater solenoid/relay circuit (not heater element)
P0381 (M)	Wait To Start Lamp Inoperative	Problem detected in wait-to-start bulb circuit.
P0382 (M)	Intake Air Heater Relay #2 Control Circuit	Problem detected in #2 air heater solenoid/relay circuit (not heater element)
P0387	Crankshaft Position Sensor Supply Voltage Too Low	CKP sensor voltage input below the minimum acceptable voltage.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0388	Crankshaft Position Sensor Supply Voltage Too High	CKP sensor voltage input above the maximum acceptable voltage.
PO0400	Diesel EGR System Failure	
P0401	EGR System Failure	Required change in air/fuel ration not detected during diagnostic test.
P0403	EGR Solenoid Circuit	An open or shorted condition detected in the EGR solenoid control circuit.
P0404	EGR Position Sensor Rationality	EGR position sensor signal does not correlate to EGR duty cycle.
P0405	EGR Position Sensor Volts Too Low	EGR position sensor input below the acceptable voltage range.
P0406	EGR Position Sensor Volts Too High	EGR position sensor input above the acceptable voltage range.
P0412	Secondary Air Solenoid Circuit	An open or shorted condition detected in the secondary air (air switching/aspirator) solenoid control circuit.
P0420 (M)	1/1 Catalytic Converter Efficiency	Catalyst 1/1 efficiency below required level.
P0432 (M)	1/2 Catalytic Converter Efficiency	Catalyst 2/1 efficiency below required level.
P0441 (M)	Evap Purge Flow Monitor	Insufficient or excessive vapor flow detected during evaporative emission system operation.
P0442 (M)	Evap Leak Monitor Medium Leak Detected	A small leak has been detected in the evaporative system.
P0443 (M)	Evap Purge Solenoid Circuit	An open or shorted condition detected in the EVAP purge solenoid control circuit.
P0455 (M)	Evap Leak Monitor Large Leak Detected	A large leak has been detected in the evaporative system.
P0456 (M)	Evap Leak Monitor Small Leak Detected	Leak has been detected in the evaporative system.
P0460	Fuel Level Unit No Change Over Miles	During low fuel
P0460	Fuel Level Unit No Change Over Miles	Fuel level sending unit voltage does not change for more than 40 miles.
PO061	Fuel Level Unit No Change Over Time	
P0462	Fuel Level Sending Unit Volts Too Low	Fuel level sensor input below acceptable voltage.
P0462 (M)	Fuel Level Sending Unit Volts Too Low	Open circuit between PCM and fuel gauge sending unit.
P0463	Fuel Level Sending Unit Volts Too High	Fuel level sensor input above acceptable voltage.
P0463 (M)	Fuel Level Sending Unit Volts Too High	Circuit shorted to voltage between PCM and fuel gauge sending unit.
P0500 (M)	No Vehicle Speed Sensor Signal	No vehicle speed sensor signal detected during road load conditions.
P0500 (M)	No Vehicle Speed Sensor Signal	A vehicle speed signal was not detected.
P0505 (M)	Idle Air Control Motor Circuits	
P0508 (M)	IAC Motor Sense Circuit Low	

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0509 (M)	IAC Motor Sense Circuit High	
P0521	Oil Pressure Switch Rationality	
P0522	Oil Pressure Voltage Too Low	Oil pressure sending unit (sensor) voltage input below the minimum acceptable voltage.
P0523	Oil Pressure Voltage Too High	Oil pressure sending unit (sensor) voltage input above the maximum acceptable voltage.
P0524	Oil Pressure Too Low	Engine oil pressure is low. Engine power derated.
P0545	A/C Clutch Relay Circuit	Problem detected in air conditioning clutch relay control circuit.
P0551	Power Steering Switch Failure	Incorrect input state detected for the power steering switch circuit. PL: High pressure seen at high speed.
P0562	Charging System Voltage Too Low	Supply voltage sensed at ECM too low.
P0563	Charging System Voltage Too High	Supply voltage sensed at ECM too high.
P0572	Brake Switch Input #1 Signal Missing	
P0573	Brake Switch Input #2 Signal Missing	
P0575	Cruise Control Switch Voltage Low	
P0576	Cruise Control Switch Voltage High	
P0577	Cruise Control Switch Voltage High	
P0600	PCM Failure SPI Communications	No communication detected between co-processors in the control module.
P0601 (M)	Internal Controller Failure	Internal control module fault condition (check sum) detected.
P0602 (M)	ECM Fueling Calibration Error	ECM Internal fault condition detected.
P0604	RAM Check Failure	Transmission control module RAM self test fault detected. -Aisin transmission
P0605	ROM Check Failure	Transmission control module ROM self test fault detected -Aisin transmission
P0606 (M)	ECM Failure	ECM Internal fault condition detected.
P0615	Starter Relay Control Circuit	An open or shorted condition detected in the starter relay control circuit.
P0622 (G)	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
P0645	A/C Clutch Relay Circuit	An open or shorted condition detected in the A/C clutch relay control circuit.
P0700	EATX Controller DTC Present	This SBEC III or JTEC DTC indicates that the EATX or Aisin controller has an active fault and has illuminated the MIL via a CCD (EATX) or SCI (Aisin) message. The specific fault must be acquired from the EATX via CCD or from the Aisin via ISO-9141.
P0703	Brake Switch Stuck Pressed or Released	Incorrect input state detected in the brake switch circuit. (Changed from P1595)
P0703	Brake Switch Sense Circuit	

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0711 (M)	Trans Temp Sensor, No Temp Rise After Start	Relationship between the transmission temperature and overdrive operation and/or TCC operation indicates a failure of the Transmission Temperature Sensor. OBD II Rationality. Was MIL code 37.
P0712	Trans Temp Sensor Voltage Too Low	Transmission fluid temperature sensor input below acceptable voltage. Was MIL code 37.
P0712 (M)	Trans Temp Sensor Voltage Too Low	Voltage less than 1.55 volts (4-speed auto. trans. only).
P0713	Trans Temp Sensor Voltage Too High	Transmission fluid temperature sensor input above acceptable voltage. Was MIL code 37.
P0713 (M)	Trans Temp Sensor Voltage Too High	Voltage greater than 3.76 volts (4-speed auto. trans. only).
P0720 (M)	Low Output SPD Sensor RPM, Above 15 MPH	The relationship between the Output Shaft Speed Sensor and vehicle speed is not within acceptable limits.
P0720 (M)	Low Output Spd Sensor RPM Above 15 mph	Output shaft speed is less than 60 rpm with vehicle speed above 15 mph (4-speed auto. trans. only).
P0740 (M)	Torq Con Clu, No RPM Drop at Lockup	Relationship between engine and vehicle speeds indicated failure of torque converter clutch lock-up system (TCC/PTU solenoid)
P0743 (M)	Torque Converter Clutch Solenoid/Trans Relay Circuits	An open or shorted condition detected in the torque converter clutch (part throttle unlock) solenoid control circuit. Shift solenoid C electrical fault - Aisin transmission
P0743 (M)	Torque Converter Clutch Solenoid/Trans Relay Circuits	An open or shorted condition detected in the torque converter part throttle unlock solenoid control circuit (3 or 4-speed auto. trans. only).
P0748 (M)	Governor Pressur Sol Control/Trans Relay Circuits	An open or shorted condition detected in the Governor Pressure Solenoid circuit or Trans Relay Circuit in JTEC RE transmissions.
P0748 (M)	Governor Pressure Sol Control/Trans Relay Circuits	An open or shorted condition detected in the governor pressure solenoid or relay circuits (4-speed auto. trans. only).
P0751 (M)	O/D Switch Pressed (Lo) More Than 5 Minutes	Overdrive override switch input is in a prolonged depressed state.
P0751 (M)	O/D Switch Pressed (LO) More Than 5 Min	Overdrive Off switch input too low for more than 5 minutes (4-speed auto. trans. only).
P0753 (M)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the overdrive solenoid control circuit or Trans Relay Circuit in JTEC RE transmissions. Was MIL code 45.
P0753 (M)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the transmission 2-4 shift solenoid circuit (4-speed auto. trans. only).
P0756	AW4 Shift Sol B (2-3) Functional Failure	Shift solenoid B (2-3) functional fault - Aisin transmission
P0783 (M)	3-4 Shift Sol, No RPM Drop at Lockup	The overdrive solenoid is unable to engage the gear change from 3rd gear to the overdrive gear.
P0801	Reverse Gear Lockout Circuit Open or Short	An open or shorted condition detected in the transmission reverse gear lock-out solenoid control circuit.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0830	Clutch Depressed Switch Circuit	Problem detected in clutch switch circuit.
P0833	Clutch Released Switch Circuit	Problem detected in clutch switch circuit.
P0836	4WD Mux Switch Circuit	
P0837	4WD Mux Switch Performance	
P1110	Decrease Engine Performance Due To High Intake Air Temperature	Intake manifold air temperature is above the engine protection limit. Engine power will be derated.
P1180	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P1192	Intake Air Temp Sensor Voltage Low	
P1193	Intake Air Temp Sensor Voltage High	
P1194	O2 Heater Performance	
P1195 (M)	1/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/1 during catalyst monitor test. (Also see SCI DTC \$66) (was P0133)
P1196 (M)	2/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 2/1 during catalyst monitor test. (Also see SCI DTC \$7A) (was P0153)
P1197	1/2 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/2 during catalyst monitor test. (Also see SCI DTC \$68) (was P0139)
P1198	Radiator Temperature Sensor Volts Too High	Radiator coolant temperature sensor input above the maximum acceptable voltage.
P1199	Radiator Temperature Sensor Volts Too Low	Radiator coolant temperature sensor input below the minimum acceptable voltage.
P1280	Fuel System Relay Circuit	
P1281	Engine is Cold Too Long	Engine coolant temperature remains below normal operating temperatures during vehicle travel (Thermostat).
P1282	Fuel Pump/System Relay Control Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P1283	Idle Select Signal Invalid	ECM or fuel injection pump module internal fault condition detected.
P1284 (M)	Fuel Injection Pump Battery Voltage Out-Of-Range	Fuel injection pump module internal fault condition detected. Engine power will be derated.
P1285 (M)	Fuel Injection Pump Controller Always On	Fuel injection pump module relay circuit failure detected. Engine power will be derated.
P1286	Accelerator Position Sensor (APPS) Supply Voltage Too High	High voltage detected at APPS.
P1287	Fuel Injection Pump Controller Supply Voltage Low	ECM or fuel injection pump module internal fault condition detected. Engine power will be derated.
P1288	Intake Manifold Short Runner Solenoid Circuit	An open or shorted condition detected in the short runner tuning valve circuit.
P1289	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1290	High Pressure Solenoid Relay Ckt.	CNG Fuel System Pressure Too High—Compressed natural gas system pressure above normal operating range.
P1291	No Temp Rise Seen From Intake Heaters	Energizing Heated Air Intake does not change intake air temperature sensor an acceptable amount.
P1291 (M)	No Temperature Rise Seen From Intake Air Heaters	Problem detected in intake manifold air heating system.
P1292	CNG Pressure Sensor Voltage Too High	Compressed natural gas pressure sensor reading above acceptable voltage.
P1293	CNG Pressure Sensor Voltage Too Low	Compressed natural gas pressure sensor reading below acceptable voltage.
P1294 (M)	Target Idle Not Reached	Target RPM not achieved during drive idle condition. Possible vacuum leak or IAC (AIS) lost steps.
P1295 (M)	No 5 Volts to TP Sensor	Loss of a 5 volt feed to the Throttle Position Sensor has been detected.
P1295 (M)	Accelerator Position Sensor (APPS) Supply Voltage Too Low	APPS supply voltage input below the minimum acceptable voltage.
P1296	No 5 Volts to MAP Sensor	Loss of a 5 volt feed to the MAP Sensor has been detected.
P1297 (M)	No Change in MAP From Start To Run	No difference is recognized between the MAP reading at engine idle and the stored barometric pressure reading.
P1298	Lean Operation at Wide Open Throttle	A prolonged lean condition is detected during Wide Open Throttle
P1299	Vacuum Leak Found (IAC Fully Seated)	MAP Sensor signal does not correlate to Throttle Position Sensor signal. Possible vacuum leak.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the auto shutdown relay circuit.
P1389	No ASD Relay Output Voltage At PCM	No Z1 or Z2 voltage sensed when the auto shutdown relay is energized.
P1389 (M)	No ASD Relay Output Voltage at PCM	An open condition detected In the ASD relay output circuit.
P1390	Timing Belt Skipped 1 Tooth or More	Relationship between Cam and Crank signals not correct
P1391 (M)	Intermittent Loss of CMP or CKP	Loss of the Cam Position Sensor or Crank Position sensor has occurred. For PL 2.0L
P1398 (M)	Mis-Fire Adaptive Numerator at Limit	PCM is unable to learn the Crank Sensor's signal in preparation for Misfire Diagnostics. Probable defective Crank Sensor
P1399	Wait To Start Lamp Cicuit	An open or shorted condition detected in the Wait to Start Lamp circuit.
P1403	No 5V to EGR Sensor	Loss of 5v feed to the EGR position sensor.
P01475	Aux 5 Volt Supply Voltage High	Sensor supply voltage for ECM sensors is too high.
P1476	Too Little Secondary Air	Insufficient flow of secondary air injection detected during aspirator test (was P0411)

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1477	Too Much Secondary Air	Excessive flow of secondary air injection detected during aspirator test (was P0411).
P1478	Battery Temp Sensor Volts Out of Limit	Internal temperature sensor input voltage out of an acceptable range.
P1479	Transmission Fan Relay Circuit	An open or shorted condition detected in the transmission fan relay circuit.
P1480	PCV Solenoid Circuit	An open or shorted condition detected in the PCV solenoid circuit.
P1481	EATX RPM Pulse Perf	EATX RPM pulse generator signal for misfire detection does not correlate with expected value.
P1482	Catalyst Temperature Sensor Circuit Shorted Low	Catalyst temperature sensor circuit shorted low.
P1483	Catalyst Temperature Sensor Circuit Shorted High.	Catalyst temperature sensor circuit shorted high.
P1484	Catalytic Converter Overheat Detected	A catalyst overheat condition has been detected by the catalyst temperature sensor.
P1485	Air Injection Solenoid Circuit	An open or shorted condition detected in the air assist solenoid circuit.
P1486	Evap Leak Monitor Pinched Hose Found	LDP has detected a pinched hose in the evaporative hose system.
P1487	Hi Speed Rad Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the #2 high speed radiator fan control relay.
P1488	Auxiliary 5 Volt Supply Output Too Low	Auxiliary 5 volt sensor feed is sensed to be below an acceptable limit.
P1488	5 Volt Supply Voltage Low	Sensor supply voltage for ECM sensors is too low.
P1489	High Speed Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the high speed radiator fan control relay.
P1490	Low Speed Fan CTRL Relay Circuit	An open or shorted condition detected in control circuit of the low speed radiator fan control relay.
P1491	Rad Fan Control Relay Circuit	An open or shorted condition detected in the radiator fan control relay control circuit. This includes PWM solid state relays.
P1492	Ambient/Batt Temp Sen Volts Too High	External temperature sensor input above acceptable voltage.
P1492 (M)	Ambient/Batt Temp Sensor Volts Too High	Battery temperature sensor input voltage above an acceptable range.
P1493 (M)	Ambient/Batt Temp Sen Volts Too Low	External temperature sensor input below acceptable voltage.
P1493 (M)	Ambient/Batt Temp Sen Volts Too Low	Battery temperature sensor input voltage below an acceptable range.
P1494 (M)	Leak Detection Pump Sw or Mechanical Fault	Incorrect input state detected for the Leak Detection Pump (LDP) pressure switch.
P1495	Leak Detection Pump Solenoid Circuit	An open or shorted condition detected in the Leak Detection Pump (LDP) solenoid circuit.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1496	5 Volt Supply, Output Too Low	5 volt sensor feed is sensed to be below an acceptable limit. (less than 4v for 4 sec)
P1498	High Speed Rad Fan Ground CTRL Rly Circuit	An open or shorted condition detected in the control circuit of the #3 high speed radiator fan control relay.
P1499	Hydraulic cooling fan solenoid circuit	An open or shorted condition detected in the cooling fan control solenoid circuit.
P1594 (G)	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1594	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in either of the speed control vacuum or vent solenoid control circuits.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in the speed control vacuum or vent solenoid circuits.
P1596	Speed Control Switch Always High	Speed control switch input above maximum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below minimum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below the minimum acceptable voltage.
P1598	A/C Pressure Sensor Volts Too High	A/C pressure sensor input above maximum acceptable voltage.
P1598	A/C Sensor Input Hi	Problem detected in air conditioning electrical circuit.
P1599	A/C Pressure Sensor Volts Too Low	A/C pressure sensor input below minimum acceptable voltage.
P1599	A/C Sensor Input Lo	Problem detected in air conditioning electrical circuit.
P1602	PCM not programmed	
P1680	Clutch Released Switch Circuit	Problem detected in clutch switch electrical circuit.
P1681	No I/P Cluster CCD/J1850 Messages Received	No CCD/J1850 messages received from the cluster control module.
P1682 (G)	Charging System Voltage Too Low	Battery voltage sense input below target charging voltage during engine operation and no significant change in voltage detected during active test of generator output circuit.
P1682	Charging System Voltage Too Low	Charging system output voltage low.
P1683	SPD CTRL PWR Relay; or S/C 12v Driver CKT	An open or shorted condition detected in the speed control servo power control circuit.
P1683	Spd ctrl pwr rly, or s/c 12v driver circuit	An open or shorted condition detected in the speed control servo power control circuit.
P1684	Batt Loss (disconnected) in last 50 Starts	The battery has been disconnected within the last 50 starts
P1685	SKIM Invalid Key - (Wrong or Invalid Key MSG Received From SKIM)	The engine controller has received an invalid key from the SKIM.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1686	No SKIM BUS Messages Received	No CCD/J1850 messages received from the Smart Key Immobilizer Module (SKIM).
P1687	No MIC BUS Message (No Cluster BUS Message)	No CCD/J1850 messages received from the Mechanical Instrument Cluster (MIC) module.
P1688 (M)	Internal Fuel Injection Pump Controller Failure	Internal problem within the fuel injection pump. Low power, engine derated, or engine stops.
P1689 (M)	No Communication Between ECM and Injection Pump Module	Data link circuit failure between ECM and fuel injection pump. Low power, engine derated, or engine stops.
P1690 (M)	Fuel Injection Pump CKP Sensor Does Not Agree With ECM CKP Sensor	Problem in fuel sync signal. Possible injection pump timing problem. Low power, engine derated, or engine stops.
P1691	Fuel Injection Pump Controller Calibration Error	Internal fuel injection pump failure. Low power, engine derated, or engine stops.
P1692	DTC Set In ECM	A "Companion DTC" was set in both the ECM and PCM.
P1693 (M)	DTC Detected in Companion Module	A fault has been generated in the companion engine control module.
P1693 (M)	DTC Detected in PCM/ECM or DTC Detected in ECM	A "Companion DTC" was set in both the ECM and PCM.
P1694	Fault In Companion Module	No CCD/J1850 messages received from the powertrain control module-Aisin transmission
P1694 (M)	No BUS (CCD) Messages received from ECM	Bus communication failure to PCM.
P1695	No CCD/J1850 Message From Body Control Module	No CCD/J1850 messages received from the body control module.
P1696	PCM Failure EEPROM Write Denied	Unsuccessful attempt to write to an EEPROM location by the control module.
P1697	PCM Failure SRI Mile Not Stored	Unsuccessful attempt to update Service Reminder Indicator (SRI or EMR) mileage in the control module EEPROM.
P1698	No CCD/J1850 Message From TCM	No CCD/J1850 messages received from the electronic transmission control module (EATX) or the Aisin transmission controller.
P1698	No CCD Messages received from PCM	Bus communication failure to PCM. A "Companion DTC" was set in both the ECM and PCM.
P1699	No Climate Control Bus Messages	
P1719	Skip Shift Solenoid Circuit	An open or shorted condition detected in the transmission 2-3 gear lock-out solenoid control circuit.
P1740	TCC or OD Sol Perf	A rationality error has been detected in either the TCC solenoid or overdrive solenoid systems.
P1740 (M)	TCC OR O/D Solenoid Performance	Problem detected in transmission convertor clutch and/or overdrive circuits (diesel engine with 4-speed auto. trans. only).
P1756 (M)	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear. (Mid Pressure Malfunction)

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1756 (M)	Governor Pressure Not Equal to Target @ 15-20 PSI	Governor sensor input not between 10 and 25 psi when requested (4-speed auto. trans. only).
P1757	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear (Zero Pressure Malfunction)
P1757 (M)	Governor Pressure Above 3 PSI In Gear With 0 MPH	Governor pressure greater than 3 psi when requested to be 0 psi (4-speed auto. trans. only).
P1762 (M)	Gov Press Sen Offset Volts Too Lo or High	The Governor Pressure Sensor input is greater than a calibration limit or is less than a calibration limit for 3 consecutive park/neutral calibrations.
P1762 (M)	Governor Press Sen Offset Volts Too Low or High	Sensor input greater or less than calibration for 3 consecutive Neutral/Park occurrences (4-speed auto. trans. only).
P1763	Governor Pressure Sensor Volts Too Hi	The Governor Pressure Sensor input is above an acceptable voltage level.
P1763 (M)	Governor Pressure Sensor Volts Too HI	Voltage greater than 4.89 volts (4-speed auto. trans. only).
P1764 (M)	Governor Pressure Sensor Volts Too Low	The Governor Pressure Sensor input is below an acceptable voltage level.
P1764 (M)	Governor Pressure Sensor Volts Too Low	Voltage less than .10 volts (4-speed auto. trans. only).
P1765 (M)	Trans 12 Volt Supply Relay CTRL Circuit	An open or shorted condition is detected in the Transmission Relay control circuit. This relay supplies power to the TCC
P1765 (M)	Trans 12 Volt Supply Relay Ctrl Circuit	Current state of solenoid output port is different than expected (4-speed auto. trans. only).
P1830	Clutch Override Relay Circuit	Problem detected in clutch pedal switch override relay circuit.
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch.
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch (3 or 4-speed auto. trans. only).

EMISSIONS CONTROL (Continued)

DESCRIPTION - TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is called the 'Task Manager'.

DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

The following is an operation and description of each system monitor :

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault MUST be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

EMISSIONS CONTROL (Continued)

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" H2O. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the O2 control system. If fuel vapor, indicated by a shift in the O2 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic converter damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O2S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O2S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

EMISSIONS CONTROL (Continued)

The catalyst monitor uses dual oxygen sensors (O₂S's) to monitor the efficiency of the converter. The dual O₂S's sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O₂S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O₂S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O₂S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O₂S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O₂S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O₂S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O₂S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O₂S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

DESCRIPTION - TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Continuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

DESCRIPTION - COMPONENT MONITORS - GAS ENGINES

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater, and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks, or any component that has an associated limp-in, will set a fault after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

EMISSIONS CONTROL (Continued)

DESCRIPTION - COMPONENT MONITORS - DIESEL ENGINES

There are several electrical components that will affect vehicle emissions if they malfunction. If one of these components is malfunctioning, a Diagnostic Trouble Code (DTC) will be set by either the Powertrain Control Module (PCM) or the Engine Control Module (ECM). The Malfunction Indicator Lamp (MIL) will then be illuminated when the engine is running.

These electrically operated components have input (rationality) and output (functionality) checks. A check is done by one or more components to check the operation of another component.

Example: The Intake Manifold Air Temperature (IAT) sensor is used to monitor intake manifold air temperature over a period of time after a cold start. If the temperature has not risen to a certain specification during a specified time, a Diagnostic Trouble Code (DTC) will be set for a problem in the manifold air heater system.

All open/short circuit checks, or any component that has an associated limp-in will set a DTC and trigger the MIL after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

OPERATION**OPERATION - GAS ENGINES**

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon (graphic) on the instrument panel. Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates

above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector (Fig. 3).

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16-way data link connector to erase all DTC's and extinguish the MIL.

80a77421

Fig. 3 16-WAY DATA LINK CONNECTOR

1 - DATA LINK CONNECTOR

OPERATION - DIESEL

The PCM and ECM monitor many different circuits in the powertrain system. If the ECM or PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the ECM's or PCM's memory. With certain DTC's, if the problem is repaired or ceases to exist, the ECM or PCM cancels the code after 40 warm-up cycles. Certain other DTC's may be cancelled after 1 or 2 good "trips". Refer to Trip Definition. DTC's that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). The MIL is displayed as an engine icon (graphic) on the instrument panel. Refer to Malfunction Indicator Lamp.

EMISSIONS CONTROL (Continued)

Certain DTC's will set a "companion DTC" in the opposite control module. This means that after repair, the DTC must be erased from **both** modules.

Certain criteria must be met before the ECM or PCM will store a DTC in memory. The criteria may be a specific range of engine RPM, throttle opening, engine temperature or input voltage.

The ECM or PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the DTC criteria requires the ECM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the ECM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the ECM will not store a DTC.

There are several operating conditions for which the ECM and PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector (Fig. 3). Refer to the Diagnostic Trouble Code chart (list). **Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.**

Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, disconnecting a relay or removing an electrical connector while the engine is running. When a repair is completed and verified, connect the DRB scan tool to the 16-way data link connector to erase all ECM and PCM DTC's and extinguish the MIL.

OPERATION - TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

EMISSIONS CONTROL (Continued)

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 — Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are auto-

matically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ± 375 RPM and load is within $\pm 10\%$ of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)
- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.

EMISSIONS CONTROL (Continued)

- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute

MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** —

An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.

- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

EMISSIONS CONTROL (Continued)

- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.

- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.

- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.

- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

- **Misfire Data**— Data collected during test.

- **Test Done This Trip**— Indicates YES when the test is done.

OPERATION - NON-MONITORED CIRCUITS - GAS ENGINES

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. **EXAMPLE:** a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

OPERATION - NON-MONITORED CIRCUITS - DIESEL

The PCM and/or the ECM will not monitor certain malfunctioning circuits or components that could cause driveability problems. Also, a Diagnostic Trouble Code (DTC) might not be stored for these malfunctions. However, problems with these circuits or components may cause the PCM/ECM to store DTC's for other circuits or components. **EXAMPLES:** A cylinder with low compression will not set a DTC

EMISSIONS CONTROL (Continued)

directly, but may cause an engine misfire. This in turn may cause the ECM to set a DTC for an engine misfire. Or, a dirty or plugged air filter will not set a DTC directly, but may cause lack of turbocharger boost. This in turn may cause the ECM to set a DTC for a boost pressure malfunction.

FUEL PRESSURE

Primary fuel pressure from the fuel tank to the fuel injection pump is supplied by the low-pressure fuel transfer pump. High-pressure to the fuel injectors is supplied by the fuel injection pump. The ECM cannot detect actual fuel pressure, a clogged fuel filter, clogged fuel screen, or a pinched fuel supply or return line. However, a DTC may be set due to an engine misfire.

CYLINDER COMPRESSION

The ECM cannot detect uneven, low, or high engine cylinder compression. However, these could result in a possible misfire which may set a DTC.

EXHAUST SYSTEM

The ECM cannot detect a plugged, restricted or leaking exhaust system. However, DTC's may be set for engine misfire, high intake manifold temperature, high engine coolant temperature, turbocharger overboost or turbocharger underboost.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The ECM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector

is installed. However, these could result in a possible misfire which may set a DTC.

EXCESSIVE OIL CONSUMPTION

The ECM cannot determine excessive oil consumption. However, if excess oil consumption is high enough, it could result in a possible engine misfire which may set a DTC.

AIR FLOW

The ECM cannot detect a clogged, restricted or dirty air filter element, or a restriction in the air inlet system. However, these could result in a possible misfire which may set a DTC.

AIR PRESSURE LEAKS

The ECM cannot detect leaks or restrictions in the air intake system. However, these could cause the ECM to store a Manifold Air Pressure (MAP) sensor DTC (boost pressure problem detected).

PCM/ECM SYSTEM GROUNDS

The PCM/ECM cannot directly determine poor system grounds. However, one or more DTC's may be generated as a result of poor grounds.

PCM/ECM CONNECTOR ENGAGEMENT

The PCM/ECM may not be able to determine spread, damaged or corroded connector pins. However, it might store DTC's as a result of spread connector pins (circuits that are open).

AIR INJECTION

DESCRIPTION - AIR INJECTION SYSTEM

The air injection system (Fig. 1), (Fig. 2) or (Fig. 3) is used on 5.9L V-8 and 8.0L V-10 heavy duty cycle (HDC) gas powered engines only. The air injection system consists of:

- A belt-driven air injection (AIR) pump

- Two air pressure relief valves
- Rubber connecting air injection hoses with clamps
- Metal connecting air tubes
- Two one-way check valves
- A replaceable injection pump air filter (8.0L V-10 engine only)

- 1 - AIR FILTER HOUSING
- 2 - AIR INLET TUBE
- 3 - INLET AIR FITTING
- 4 - AIR INJECTION PUMP
- 5 - OUTLET AIR FITTING

OPERATION - AIR INJECTION SYSTEM

The air injection system adds a controlled amount of air to the exhaust gases aiding oxidation of hydrocarbons and carbon monoxide in the exhaust stream. The system does not interfere with the ability of the EGR system (if used) to control nitrous oxide (NOx) emissions.

5.9L HDC ENGINE: Air is drawn into the pump through a rubber tube that is connected to a fitting on the air cleaner housing (Fig. 2).

8.0L V-10 ENGINE: Air is drawn into the pump through a rubber tube that is connected to a fitting on the air injection pump filter housing (Fig. 3). Air is drawn into the filter housing from the front of the vehicle with rubber tube. This tube is used as a silencer to help prevent air intake noise at the opening to the pump filter housing. An air filter is located within the air pump filter housing (Fig. 3).

Air is then compressed by the air injector pump. It is expelled from the pump and routed into a rubber tube where it reaches the air pressure relief valve (Fig. 1). Pressure relief holes in the relief valve will

Fig. 3 Air Inlet and Air Pump Air

- 5 - HOSE CLAMPS
- 6 - AIR INJECTION PUMP
- 7 - AIR INLET REDUCER
- 8 - LID

prevent excess downstream pressure. If excess downstream pressure occurs at the relief valve, it will be vented into the atmosphere.

Air is then routed (Fig. 1) from the relief valve, through a tube, down to a "Y" connector, through the two one-way check valves and injected at both of the catalytic convertors (referred to as downstream).

The two one-way check valves (Fig. 1) protect the hoses, air pump and injection tubes from hot exhaust gases backing up into the system. Air is allowed to flow through these valves in one direction only (towards the catalytic convertors).

Downstream air flow assists the oxidation process in the catalyst, but does not interfere with EGR operation (if EGR system is used).

AIR INJECTION PUMP

DESCRIPTION

The air pump is mounted on the front of the engine and driven by a belt connected to the crankshaft pulley (Fig. 4) .

J9425-15

Fig. 4 Air Injection Pump Mounting—Typical

- 1 - PUMP PULLEY
- 2 - AIR PUMP
- 3 - AUTOMATIC BELT TENSIONER
- 4 - PUMP MOUNTING BOLTS (2)
- 5 - PULLEY BOLTS

OPERATION

Refer to Air Injection System Description and Operation for information.

DIAGNOSIS AND TESTING - AIR INJECTION PUMP

The air injection system and air injection pump is not completely noiseless. Under normal conditions, noise rises in pitch as engine speed increases. To determine if excessive noise is fault of air injection system, disconnect accessory drive belt and temporarily operate engine. **Do not allow engine to overheat when operating without drive belt.**

CAUTION: Do not attempt to lubricate the air injection pump. Oil in the pump will cause rapid deterioration and failure.

AIR INJECTION PUMP (Continued)

EXCESSIVE BELT NOISE	1. Loose belt or defective automatic belt tensioner. 2. Seized pump.	1. Refer to Cooling System. 2. Replace pump.
EXCESSIVE PUMP NOISE CHIRPING	1. Insufficient break-in.	1. Recheck for noise after 1600 km (1,000 miles) of operation.
EXCESSIVE PUMP NOISE CHIRPING, RUMBLING, OR KNOCKING	1. Leak in hose. 2. Loose hose. 3. Hose touching other engine parts. 4. Relief valve inoperative. 5. Check valve inoperative. 6. Pump mounting fasteners loose. 7. Pump failure.	1. Locate source of leak using soap solution and correct. 2. Reassemble and replace or tighten hose clamp. 3. Adjust hose position. 4. Replace relief valve. 5. Replace check valve. 6. Tighten mounting screws as specified. 7. Replace pump.
NO AIR SUPPLY. ACCELERATE ENGINE TO 1500 RPM AND OBSERVE AIR FLOW FROM HOSES. IF FLOW INCREASES AS RPM'S INCREASE, PUMP IS FUNCTIONING NORMALLY. IF NOT, CHECK POSSIBLE CAUSE.	1. Loose drive belt. 2. Leaks in supply hose. 3. Leak at fitting(s). 4. Check valve inoperative. 5. Plugged inlet air filter (8.0L).	1. Refer to Cooling System. 2. Locate leak and repair or replace as required. 3. Tighten and replace clamps. 4. Replace check valve. 5. Replace filter

REMOVAL

The air injection pump does not have any internal serviceable parts.

(1) Disconnect both of the hoses (tubes) at the air injection pump.

(2) Loosen, but do not remove at this time, the three air pump pulley mounting bolts (Fig. 4).

(3) Relax the automatic belt tensioner and remove the engine accessory drive belt. Refer to Cooling System. See Belt Removal/Installation.

(4) Remove the three air pump pulley bolts and remove pulley from pump.

(5) Remove the two air pump mounting bolts (Fig. 4) and remove pump from mounting bracket.

INSTALLATION

(1) Position air injection pump to mounting bracket.

(2) Install two pump mounting bolts to mounting bracket. Tighten bolts to 40 N·m (30 ft. lbs.) torque.

(3) Install pump pulley and three mounting bolts. Tighten bolts finger tight.

(4) Relax tension from automatic belt tensioner and install drive belt. Refer to Cooling System. See Belt Removal/Installation.

(5) Tighten pump pulley bolts to 11 N·m (105 in. lbs.) torque.

(6) Install hoses and hose clamps at pump.

AIR PUMP FILTER**REMOVAL**

The air filter for the air injection pump is located inside a housing located in right-front side of engine compartment (Fig. 3). A rubber hose connects the filter housing to air injection pump. The filter is used with 8.0L V-10 engines only.

(1) Remove rubber tubes at filter housing.

(2) Remove filter housing mounting nut and remove housing.

(3) Remove lid from filter housing (snaps off).

(4) Remove filter from housing.

INSTALLATION

The air filter for the air injection pump is located inside a housing located in right-front side of engine compartment (Fig. 3). A rubber hose connects the filter housing to air injection pump. The filter is used with 8.0L V-10 engines only.

AIR PUMP FILTER (Continued)

- (1) Clean inside of housing and lid before installing new filter.
- (2) Install filter into housing.
- (3) Install lid to filter housing (snaps on).
- (4) Position filter housing to fender.
- (5) Install mounting nut and tighten to 11 N·m (8 ft. lbs.) torque.
- (6) Install rubber tubes and cap at filter housing.

ONE WAY CHECK VALVE

DESCRIPTION

For air injection systems: A pair of one-way check valves is used with the air injection system. The check valves (Fig. 1) are located on each of the air injection downstream tubes.

OPERATION

Each one-way check valve has a one-way diaphragm which prevents hot exhaust gases from backing up into the air injection hose and air injection pump. The check valve will protect the system if the

air injection pump belt fails, an air hose ruptures or exhaust system pressure becomes abnormally high.

DIAGNOSIS AND TESTING - ONE-WAY CHECK VALVE

The one-way check valves are not repairable. To determine condition of valve, remove the rubber air tube from the inlet side of each check valve. Start the engine. If exhaust gas is escaping through the inlet side of check valve, it must be replaced.

REMOVAL

- (1) Remove the hose clamp at inlet side of valve.
- (2) Remove hose from valve.
- (3) Remove valve from catalyst tube (unscrew). **To prevent damage to catalyst tube, a backup wrench must be used on the tube.**

INSTALLATION

- (1) Install valve to catalyst tube. Tighten to 33 N·m (25 ft. lbs.) torque.
- (2) Install hose and hose clamp to valve.

EVAPORATIVE EMISSIONS

DESCRIPTION - EVAP SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes into the two charcoal filled evaporative canisters. The canisters temporarily hold the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

All 5.9L/8.0L gasoline powered engines use a duty cycle purge system. The PCM controls vapor flow by

operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid for additional information.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system. This pump is used as part of OBD II requirements. Refer to Leak Detection Pump in this group for additional information.

NOTE: The hoses used in this system are specially manufactured. If replacement becomes necessary, it is important to use only fuel resistant hose.

CCV HOSE

DESCRIPTION - 8.0L

The 8.0L V-10 engine is equipped with a Crankcase Ventilation (CCV) system. The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled valve (PCV valve).

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 1) of a calibrated size 2.6 mm (0.10 inches).

Fig. 1 Fixed Orifice Fitting—8.0L V-10 Engine—Typical

- 1 - VACUUM TUBE
- 2 - FIXED ORIFICE FITTING
- 3 - COIL PACKS
- 4 - ORIFICE FITTING HOSE CONNECTIONS

OPERATION - 8.0L

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 1) of a calibrated size 2.6 mm (0.10 inches). The fitting meters the amount of crankcase vapors drawn out of the engine. **The fixed orifice fitting is grey in color.** A similar fitting (but does not contain a fixed orifice) is used on the left cylinder head (valve) cover. This fitting is black in color. Do not interchange these two fittings.

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Manifold vacuum draws the vapor/air mixture through the fixed orifice and into the intake manifold. The vapors are then consumed during engine combustion.

EVAP/PURGE SOLENOID

DESCRIPTION

All 5.9L/8.0L gasoline powered engines use a duty cycle EVAP canister purge solenoid. The solenoid reg-

ulates the rate of vapor flow from the EVAP canister to the throttle body.

OPERATION

The Powertrain Control Module (PCM) operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM energizes and de-energizes the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time the solenoid energizes. The PCM adjusts solenoid pulse width based on engine operating condition.

REMOVAL

The duty cycle solenoid is attached to a bracket mounted to the right inner fender (Fig. 2).

(1) Disconnect electrical wiring connector at solenoid (Fig. 2).

Fig. 2 Duty Cycle EVAP Canister Purge Solenoid Location

- (2) Disconnect vacuum harness at solenoid.
- (3) Remove solenoid from support bracket.

EVAP/PURGE SOLENOID (Continued)

INSTALLATION

- (1) Install solenoid assembly to support bracket.
- (2) Connect vacuum harness.
- (3) Connect wiring connector.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a Leak Detection Pump (LDP), the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

REMOVAL/INSTALLATION

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

LEAK DETECTION PUMP

DESCRIPTION

The Leak Detection Pump (LDP) is used only with certain emission packages.

The LDP is a device used to detect a leak in the evaporative system.

The pump contains a 3 port solenoid, a pump that contains a switch, a spring loaded canister vent valve seal, 2 check valves and a spring/diaphragm.

OPERATION

Immediately after a cold start, engine temperature between 40°F and 86°F, the 3 port solenoid is briefly energized. This initializes the pump by drawing air

into the pump cavity and also closes the vent seal. During non-test conditions, the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling. This is due to the operation of the 3 port solenoid which prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized, allowing atmospheric pressure to enter the pump cavity. This permits the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de-energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

PUMP MODE: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test time.

TEST MODE: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5 inches of water.

When the pump starts, the cycle rate is quite high. As the system becomes pressurized pump rate drops. If there is no leak the pump will quit. If there is a leak, the test is terminated at the end of the test mode.

If there is no leak, the purge monitor is run. If the cycle rate increases due to the flow through the purge system, the test is passed and the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

REMOVAL

The LDP and LDP filter are attached to a bracket mounted to the right-inner fender (Fig. 2). The LDP and LDP filter are replaced (serviced) as one unit.

- (1) Carefully remove hose at LDP filter.
- (2) Remove LDP filter mounting bolt and remove from vehicle.
- (3) Carefully remove vapor/vacuum lines at LDP.
- (4) Disconnect electrical connector at LDP (Fig. 2).
- (5) Remove LDP mounting screws and remove LDP from vehicle.

INSTALLATION

The LDP and LDP filter are attached to a bracket mounted to the right-inner fender (Fig. 2). The LDP and LDP filter are replaced (serviced) as one unit.

- (1) Install LDP to mounting bracket. Tighten screws to 1 N·m (11 in. lbs.) torque.

LEAK DETECTION PUMP (Continued)

(2) Install LDP filter to mounting bracket. Tighten bolt to 7 N·m (65 in. lbs.) torque.

(3) Carefully install vapor/vacuum lines to LDP, and install hose to LDP filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

(4) Connect electrical connector to LDP.

PCV VALVE

DESCRIPTION - V-8 ENGINES

All 5.9L V-8 gas powered engines are equipped with a closed crankcase ventilation system and a positive crankcase ventilation (PCV) valve. The 8.0L V-10 engine is not equipped with a PCV valve. Refer to Crankcase Ventilation System—8.0L V-10 Engine for information.

This system consists of a PCV valve mounted on the cylinder head (valve) cover with a hose extending from the valve to the intake manifold (Fig. 3). Another hose connects the opposite cylinder head (valve) cover to the air cleaner housing to provide a source of clean air for the system. A separate crankcase breather/filter is not used.

Fig. 3 Typical PCV Valve/Hose (Non-California Shown)

- 1 - PCV VALVE
- 2 - PCV VALVE HOSE CONNECTIONS

OPERATION - V-8 ENGINES

The PCV system operates by engine intake manifold vacuum (Fig. 4). Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

Fig. 4 Typical Closed Crankcase Ventilation System

- 1 - THROTTLE BODY
- 2 - AIR CLEANER
- 3 - AIR INTAKE
- 4 - PCV VALVE
- 5 - COMBUSTION CHAMBER
- 6 - BLOW-BY GASES
- 7 - CRANKCASE BREATHER/FILTER

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat (Fig. 5). This will prevent vapors from flowing through the valve.

Fig. 5 Engine Off or Engine Pop-Back—No Vapor Flow

PCV VALVE (Continued)

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve (Fig. 6). In this position there is minimal vapor flow through the valve.

J8925-14

Fig. 6 High Intake Manifold Vacuum—Minimal Vapor Flow

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve (Fig. 7).

J8925-15

Fig. 7 Moderate Intake Manifold Vacuum—Maximum Vapor Flow

DIAGNOSIS AND TESTING - PCV VALVE - 5.9L

(1) With engine idling, remove the PCV valve from cylinder head (valve) cover. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. Also, a strong vacuum should be felt at the valve inlet (Fig. 8).

(2) Return the PCV valve into the valve cover. Remove the fitting and air hose at the opposite valve cover. Loosely hold a piece of stiff paper, such as a parts tag, over the opening (rubber grommet) at the valve cover (Fig. 9).

(3) The paper should be drawn against the opening in the valve cover with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

J9325-16

- 3 - VALVE COVER
- 4 - FITTING REMOVED FROM VALVE COVER
- 5 - AIR TUBE

PCV VALVE (Continued)

(4) Turn engine off and remove PCV valve from valve cover. The valve should rattle when shaken (Fig. 10).

Fig. 10 Shake PCV

- 1 - PCV VALVE GROMMET
- 2 - PCV VALVE
- 3 - PCV VALVE MUST RATTLE WHEN SHAKEN

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.**

(6) If the paper is not held against the opening in valve cover after new valve is installed, the PCV valve hose may be restricted and must be replaced. The passage in the intake manifold must also be checked and cleaned.

(7) To clean the intake manifold fitting, turn a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

VACUUM LINES

DESCRIPTION

A vacuum schematic for emission related items can be found on the VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

VAPOR CANISTER

DESCRIPTION

Two, maintenance free, EVAP canisters are used with all 5.9L/8.0L gasoline powered engines. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 11).

Fig. 11 Location of EVAP Canisters

- 1 - MOUNTING NUTS
- 2 - FRAME RAIL (RIGHT)
- 3 - FRONT EVAP CANISTER
- 4 - REAR EVAP CANISTER

OPERATION

Two, maintenance free, EVAP canisters are used with all 5.9L/8.0L gasoline powered engines. The EVAP canisters are filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canisters are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canisters. Fuel vapors are temporarily held in the canisters until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canisters to be purged at predetermined times and at certain engine operating conditions.

VAPOR CANISTER (Continued)

REMOVAL

Two EVAP canisters are used. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 12).

Fig. 12 EVAP Canister Location

- 1 - MOUNTING NUTS
- 2 - FRAME RAIL (RIGHT)
- 3 - FRONT EVAP CANISTER
- 4 - REAR EVAP CANISTER

(1) Remove fuel tubes/lines at each EVAP canister. Note location of tubes/lines before removal for easier installation.

(2) Remove mounting nuts at each canister (Fig. 12).

(3) Remove each canister from mounting bracket.

INSTALLATION

Two EVAP canisters are used. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 12) .

(1) Place each canister to mounting bracket (Fig. 12) .

(2) Install nuts and tighten to 9 N·m (80 in. lbs.) torque.

(3) Install fuel tubes/lines to each canister.

SENSOR/SWITCH - REMOVAL, OIL PRESSURE	9-181	SHIFT BOOT - MANUAL TRANSMISSION - REMOVAL	23-122	SILENCER PAD - REMOVAL	23-104
SEPARATOR - DESCRIPTION, FUEL FILTER / WATER	14-63	SHIFT BOOT - REMOVAL, 4WD FLOOR	23-122	SILL TRIM - INSTALLATION, DOOR	23-121
SEPARATOR - INSTALLATION, FUEL FILTER / WATER	14-65	SHIFT COVER - NV4500 - INSTALLATION	21-45	SILL TRIM - REMOVAL, DOOR	23-121
SEPARATOR - OPERATION, FUEL FILTER / WATER	14-63	SHIFT COVER - NV4500 - REMOVAL	21-45	SINGLE CARDAN UNIVERSAL JOINTS - ASSEMBLY	3-9
SEPARATOR - REMOVAL, FUEL FILTER / WATER	14-64	SHIFT COVER - NV5600 - INSTALLATION	21-86	SINGLE CARDAN UNIVERSAL JOINTS - DISASSEMBLY	3-8
SERVO - ASSEMBLY, FRONT	21-164,21-335	SHIFT COVER - NV5600 - REMOVAL	21-86	SINGLE CARDAN UNIVERSAL JOINTS - INSTALLATION	3-35
SERVO - ASSEMBLY, REAR	21-207,21-379	SHIFT INDICATOR (TRANSFER CASE) - DESCRIPTION	8J-28	SINGLE CARDAN UNIVERSAL JOINTS - REMOVAL	3-34
SERVO - CLEANING, FRONT	21-164,21-334	SHIFT INDICATOR (TRANSFER CASE) - OPERATION	8J-28	SKID PLATE - INSTALLATION, TRANSFER CASE	13-11
SERVO - CLEANING, REAR	21-207,21-379	SHIFT LEVER - ADJUSTMENT	21-463,21-500	SKID PLATE - REMOVAL, TRANSFER CASE	13-11
SERVO - DESCRIPTION, FRONT	21-164,21-334	SHIFT LEVER - INSTALLATION	21-462,21-500	SLAM BUMPER - INSTALLATION	23-67
SERVO - DESCRIPTION, REAR	21-207,21-378	SHIFT LEVER - INSTALLATION, GEAR	19-15	SLAM BUMPER - REMOVAL	23-67
SERVO - DESCRIPTION, SPEED CONTROL	8P-6	SHIFT LEVER - REMOVAL	21-462,21-499	SMOKE DIAGNOSIS CHARTS - DIAGNOSIS AND TESTING	9-118
SERVO - DISASSEMBLY, FRONT	21-164,21-334	SHIFT LEVER - REMOVAL, GEAR	19-14	SOLENOID - DESCRIPTION	21-208,21-380
SERVO - DISASSEMBLY, REAR	21-207,21-378	SHIFT MECHANISM - DESCRIPTION	21-208,21-379	SOLENOID - DESCRIPTION, EVAP/PURGE	25-33
SERVO - INSPECTION, FRONT	21-164,21-335	SHIFT MECHANISM - NV4500 - INSTALLATION	21-44	SOLENOID - INSTALLATION, EVAP/PURGE	25-34
SERVO - OPERATION, FRONT	21-164,21-334	SHIFT MECHANISM - NV4500 - REMOVAL	21-43	SOLENOID - OPERATION	21-209,21-381
SERVO - OPERATION, REAR	21-207,21-378	SHIFT MECHANISM - OPERATION	21-208,21-379	SOLENOID - OPERATION, EVAP/PURGE	25-33
SERVO - OPERATION, SPEED CONTROL	8P-6	SHOCK - DIAGNOSIS AND TESTING	2-11,2-22	SOLENOID - REMOVAL, EVAP/PURGE	25-33
SEVERAL LOADS - STANDARD PROCEDURE, TESTING FOR A SHORT TO GROUND ON FUSES POWERING	8W-01-9	SHOCK - DIAGNOSIS AND TESTING, SPRING	2-25	SOLID LIFTERS/TAPPETS - CLEANING	9-164
SHAFT - ASSEMBLY, PLANETARY GEARTRAIN/OUTPUT	21-199,21-371	SHOCK - INSTALLATION	2-11,2-22,2-27	SOLID LIFTERS/TAPPETS - INSPECTION	9-165
SHAFT - DESCRIPTION, PLANETARY GEARTRAIN/OUTPUT	21-197,21-369	SHOCK - REMOVAL	2-11,2-22,2-27	SOLID LIFTERS/TAPPETS - INSTALLATION	9-165
SHAFT - DIAGNOSIS AND TESTING, PROPELLER	3-1	SHOES - ADJUSTMENT, PARKING BRAKE	5-33	SOLID LIFTERS/TAPPETS - REMOVAL	9-164
SHAFT - DISASSEMBLY, PLANETARY GEARTRAIN/OUTPUT	21-198,21-369	SHOES - INSTALLATION	5-32	SPARE TIRE - DESCRIPTION	22-10
SHAFT - FRONT - INSTALLATION, PROPELLER	3-7	SHOES - REMOVAL	5-32	SPARE TIRE - TEMPORARY - DESCRIPTION	22-6
SHAFT - FRONT - REMOVAL, PROPELLER	3-6	SHORT TO GROUND - STANDARD PROCEDURE, TESTING FOR A	8W-01-9	SPARK PLUG - CLEANING	8I-20
SHAFT - INSPECTION, PLANETARY GEARTRAIN/OUTPUT	21-199,21-371	SHUTFACE HANDLE - INSTALLATION	23-83	SPARK PLUG - DESCRIPTION	8I-16
SHAFT - INSTALLATION, PITMAN	19-25	SHUTFACE HANDLE - REMOVAL	23-83	SPARK PLUG - INSTALLATION	8I-20
SHAFT - INSTALLATION, WORM	19-31	SIDE MOLDINGS - INSTALLATION, BODY	23-87	SPARK PLUG - OPERATION	8I-16
SHAFT - OPERATION, PLANETARY GEARTRAIN/OUTPUT	21-197,21-369	SIDE MOLDINGS - REMOVAL, BODY	23-86	SPARK PLUG - REMOVAL	8I-19
SHAFT - REAR - INSTALLATION, PROPELLER	3-7	SIDE PANEL SPEAKER - INSTALLATION, REAR CAB	8A-20	SPARK PLUG CABLE - DESCRIPTION	8I-20
SHAFT - REAR - REMOVAL, PROPELLER	3-7	SIDE PANEL SPEAKER - REMOVAL, REAR CAB	8A-20	SPARK PLUG CABLE - INSTALLATION	8I-21
SHAFT - REMOVAL, PITMAN	19-24	SIDE VIEW MIRROR - INSTALLATION	23-98	SPARK PLUG CABLE - OPERATION	8I-20
SHAFT - REMOVAL, WORM	19-30	SIDE VIEW MIRROR - LOW MOUNTED - INSTALLATION	23-98	SPARK PLUG CABLE - REMOVAL	8I-21
SHAFT - STANDARD PROCEDURES, PROPELLER	3-3	SIDE VIEW MIRROR - LOW MOUNTED - REMOVAL	23-98	SPARK PLUG CABLE ORDER, 8.0L V-10 ENGINE	8I-3
SHAFT FRONT BEARING - INSTALLATION, OUTPUT	21-171,21-342	SIDE VIEW MIRROR - REMOVAL	23-97	SPARK PLUG CABLE RESISTANCE, SPECIFICATIONS	8I-3
SHAFT FRONT BEARING - REMOVAL, OUTPUT	21-171,21-342	SIDE VIEW MIRROR FLAG - INSTALLATION	23-75	SPARK PLUG CABLES - DIAGNOSIS AND TESTING	8I-20
SHAFT REAR BEARING - INSTALLATION, OUTPUT	21-172,21-343	SIDE VIEW MIRROR FLAG - REMOVAL	23-74	SPARK PLUG CONDITIONS - DIAGNOSIS AND TESTING	8I-17
SHAFT REAR BEARING - REMOVAL, OUTPUT	21-171,21-343	SIDE VIEW MIRROR GLASS - INSTALLATION	23-98	SPARK PLUGS, SPECIFICATIONS	8I-3
SHAFT SEAL - INSTALLATION, FRONT OUTPUT	21-461,21-498	SIDEVIEW MIRROR - DESCRIPTION	8N-14	SPEAKER - DESCRIPTION	8A-17
SHAFT SEAL - INSTALLATION, PITMAN	19-26	SIDEVIEW MIRROR - DIAGNOSIS AND TESTING	8N-14	SPEAKER - DIAGNOSIS AND TESTING	8A-17
SHAFT SEAL - REMOVAL, FRONT OUTPUT	21-461,21-498	SIDEVIEW MIRROR - OPERATION	8N-14	SPEAKER - INSTALLATION, A-PILLAR TWEETER	8A-19
SHAFT SEAL - REMOVAL, PITMAN	19-25	SIDEVIEW MIRROR - REMOVAL	8N-15	SPEAKER - INSTALLATION, FRONT DOOR	8A-19
SHAFT SEALS - INSTALLATION, AXLE	3-31	SIGNAL & HAZARD WARNING SYSTEM - DESCRIPTION, TURN	8L-2	SPEAKER - INSTALLATION, REAR CAB SIDE PANEL	8A-20
SHAFT SEALS - REMOVAL, AXLE	3-31	SIGNAL & HAZARD WARNING SYSTEM - DIAGNOSIS AND TESTING, TURN	8L-3	SPEAKER - INSTALLATION, REAR DOOR	8A-21
SHAFT, SPECIAL TOOLS - PROPELLER	3-6	SIGNAL & HAZARD WARNING SYSTEM - OPERATION, TURN	8L-2	SPEAKER - OPERATION	8A-17
SHAFT, SPECIFICATIONS - PROPELLER	3-6	SIGNAL CANCEL CAM - DESCRIPTION, TURN	8L-31	SPEAKER - REMOVAL, A-PILLAR TWEETER	8A-18
SHAFTS - INSTALLATION, AXLE	3-123,3-29,3-62,3-94	SIGNAL CANCEL CAM - OPERATION, TURN	8L-31	SPEAKER - REMOVAL, FRONT DOOR	8A-19
SHAFTS - INTERMEDIATE - REMOVAL, AXLE	3-30	SIGNAL GROUND - DESCRIPTION	8E-17	SPEAKER - REMOVAL, REAR CAB SIDE PANEL	8A-20
SHAFTS - REMOVAL, AXLE	3-123,3-29,3-62,3-94	SIGNAL INDICATOR - DESCRIPTION, TURN	8J-32	SPEAKER - REMOVAL, REAR DOOR	8A-20
SHIELD - INSTALLATION, REAR SPLASH	23-96	SIGNAL INDICATOR - DIAGNOSIS AND TESTING, TURN	8J-32	SPECIAL TOOL, SPECIAL TOOLS - OVERHEAD CONSOLE	8M-9
SHIELD - REMOVAL, REAR SPLASH	23-96			SPECIFICATIONS - 2002 BR/BE PAINT COLOR CODES	23-129
SHIELDS - DESCRIPTION, HEAT	11-10			SPECIFICATIONS - 5.9L DIESEL	9-127

Description	Group-Page	Description	Group-Page	Description	Group-Page
SPECIFICATIONS - BODY GAP AND FLUSH MEASUREMENTS	23-56	SPEEDS - DESCRIPTION, TIRE PRESSURE FOR HIGH	22-7	STEERING COLUMN OPENING COVER - REMOVAL	23-113

VARIATION ADJUSTMENT - STANDARD PROCEDURE, COMPASS	8M-4	WARNING SYSTEM - DIAGNOSIS AND TESTING, TURN SIGNAL & HAZARD	8L-3	WATER SEPARATOR - REMOVAL, FUEL FILTER	14-64
VEHICLE EMISSION CONTROL INFORMATION (VECI) - DESCRIPTION	Intro-3	WARNING SYSTEM - OPERATION, CHIME	8B-1	WATER TO OIL COOLER - REMOVAL	7-86
VEHICLE IDENTIFICATION NUMBER - DESCRIPTION	Intro-1	WARNING SYSTEM - OPERATION, TURN SIGNAL & HAZARD	8L-2	WATERDAM - INSTALLATION	23-76,23-85
VEHICLE SAFETY CERTIFICATION LABEL - DESCRIPTION	Intro-1	WARNINGS, GENERAL	8W-01-7	WATERDAM - REMOVAL	23-76,23-85
VEHICLE SPEED INPUT - DESCRIPTION	8P-2	WARNINGS, PLUMBING - SERVICE	24-42	WATER-IN-FUEL INDICATOR - DESCRIPTION	8J-36
VEHICLE THEFT SECURITY - DESCRIPTION	8Q-1	WARNINGS, WARNING - SAFETY PRECAUTIONS	23-1	WATER-IN-FUEL INDICATOR - OPERATION	8J-36
VEHICLE THEFT SECURITY - OPERATION	8Q-2	WASHER FLUID INDICATOR - DESCRIPTION	8J-35	WEAR INDICATORS - DIAGNOSIS AND TESTING, TREAD	22-8
VEHICLE THEFT SECURITY SYSTEM - DIAGNOSIS AND TESTING	8Q-3	WASHER FLUID INDICATOR - DIAGNOSIS AND TESTING	8J-35	WEAR PATTERNS - DIAGNOSIS AND TESTING, TIRE	22-8
VENT - INSTALLATION, BODY	23-126	WASHER FLUID INDICATOR - OPERATION	8J-35	WEATHERSTRIP - INSTALLATION, COWL	23-152
VENT - INSTALLATION, EXHAUST	23-79	WASHER FLUID LEVEL SWITCH - DESCRIPTION	8R-7	WEATHERSTRIP - INSTALLATION, FRONT DOOR GLASS RUN	23-153
VENT - REMOVAL, BODY	23-126	WASHER FLUID LEVEL SWITCH - INSTALLATION	8R-8	WEATHERSTRIP - INSTALLATION, FRONT DOOR INNER BELT	23-153
VENT - REMOVAL, EXHAUST	23-79	WASHER FLUID LEVEL SWITCH - OPERATION	8R-7	WEATHERSTRIP - INSTALLATION, FRONT DOOR OUTER BELT	23-153
VENT GLASS - INSTALLATION, BACKLITE	23-146	WASHER FLUID LEVEL SWITCH - REMOVAL	8R-8	WEATHERSTRIP - INSTALLATION, FRONT DOOR SECOND	23-154
VENT GLASS - REMOVAL, BACKLITE	23-146	WASHER HOSES/TUBES - DESCRIPTION	8R-8	WEATHERSTRIP - REMOVAL, COWL	23-152
VENT WINDOW - INSTALLATION	23-85	WASHER HOSES/TUBES - OPERATION	8R-8	WEATHERSTRIP - REMOVAL, FRONT DOOR GLASS RUN	23-152
VENT WINDOW - REMOVAL	23-85	WASHER NOZZLE - DESCRIPTION	8R-9	WEATHERSTRIP - REMOVAL, FRONT DOOR INNER BELT	23-153
VIBRATION - DIAGNOSIS AND TESTING, TIRE NOISE OR	22-9	WASHER NOZZLE - INSTALLATION	8R-9	WEATHERSTRIP - REMOVAL, FRONT DOOR OUTER BELT	23-153
VIBRATION DAMPER - INSPECTION	9-172	WASHER NOZZLE - OPERATION	8R-9	WEATHERSTRIP - REMOVAL, FRONT DOOR SECOND	23-154
VIBRATION DAMPER - INSTALLATION	9-173, 9-40,9-97	WASHER NOZZLE - REMOVAL	8R-9	WELD LOCATIONS, SPECIFICATIONS	23-4
VIBRATION DAMPER - REMOVAL	9-172,9-40, 9-96	WASHER PUMP/MOTOR - DESCRIPTION	8R-9	WET SANDING/BUFFING & POLISHING - DESCRIPTION	23-130
VIEW MIRROR - INSTALLATION, SIDE	23-98	WASHER PUMP/MOTOR - INSTALLATION	8R-10	WHEEL - INSTALLATION, STEERING	19-15
VIEW MIRROR - LOW MOUNTED - INSTALLATION, SIDE	23-98	WASHER PUMP/MOTOR - OPERATION	8R-9	WHEEL - REMOVAL, STEERING	19-15
VIEW MIRROR - LOW MOUNTED - REMOVAL, SIDE	23-98	WASHER PUMP/MOTOR - REMOVAL	8R-10	WHEEL ALIGNMENT - DESCRIPTION	2-1
VIEW MIRROR - REMOVAL, REAR	23-126	WASHER RESERVOIR - DESCRIPTION	8R-10	WHEEL ALIGNMENT - OPERATION	2-2
VIEW MIRROR - REMOVAL, SIDE	23-97	WASHER RESERVOIR - INSTALLATION	8R-11	WHEEL BALANCE - STANDARD PROCEDURE, TIRE	22-4
VIEW MIRROR FLAG - INSTALLATION, SIDE	23-75	WASHER RESERVOIR - OPERATION	8R-11	WHEEL COVER - REMOVAL	22-12
VIEW MIRROR FLAG - REMOVAL, SIDE	23-74	WASHER RESERVOIR - REMOVAL	8R-10	WHEEL INSPECTION, DIAGNOSIS AND TESTING	22-11
VIEW MIRROR GLASS - INSTALLATION, SIDE	23-98	WASHER SYSTEM - CLEANING, WIPER	8R-6	WHEEL INSTALLATION - STANDARD PROCEDURE, DUAL REAR	22-11
VIEW MIRROR GLASS - REMOVAL, SIDE	23-98	WASHER SYSTEM - DIAGNOSIS AND TESTING, WIPER	8R-3	WHEEL RUNOUT - DIAGNOSIS AND TESTING, TIRE	22-1
VISCOUS CLUTCH - 5.9L DIESEL - DESCRIPTION, FAN DRIVE	7-56	WASHER SYSTEM - INSPECTION, WIPER	8R-6	WHEEL SPEED SENSOR - DESCRIPTION, FRONT	5-38
VISCOUS CLUTCH - 5.9L DIESEL - OPERATION, FAN DRIVE	7-56	WATER DRAINING AT FUEL FILTER - STANDARD PROCEDURES	14-61	WHEEL SPEED SENSOR - DIAGNOSIS AND TESTING, REAR	5-40
VISCOUS CLUTCH - 5.9L/8.0L - DESCRIPTION, FAN DRIVE	7-55	WATER IN FUEL SENSOR - DESCRIPTION	14-89	WHEEL SPEED SENSOR - INSTALLATION, REAR	5-40
VISCOUS CLUTCH - 5.9L/8.0L - OPERATION, FAN DRIVE	7-55	WATER IN FUEL SENSOR - OPERATION	14-89	WHEEL SPEED SENSOR - OPERATION, FRONT	5-38
VISCOUS FAN DRIVE - DIAGNOSIS AND TESTING	7-55,7-57	WATER IN FUEL SENSOR - REMOVAL	14-89	WHEEL SPEED SENSOR - REMOVAL, REAR	5-40
VISOR - INSTALLATION, SUN	23-127	WATER LEAKS - DIAGNOSIS AND TESTING	23-2	WHEELHOUSE LINER - INSTALLATION, REAR	23-96
VISOR - REMOVAL, SUN	23-127	WATER PUMP - 5.9L - CLEANING	7-68	WHEELHOUSE LINER - REMOVAL, REAR	23-96
VISUAL INSPECTION, 5.9L ENGINES	14-29	WATER PUMP - 5.9L - DESCRIPTION	7-66	WHEELS - DESCRIPTION	22-10
VISUAL INSPECTION, 8.0L ENGINE	14-32	WATER PUMP - 5.9L - INSPECTION	7-68	WHEELS - OPERATION	22-10
VOLT SUPPLIES - DESCRIPTION, 5	8E-17	WATER PUMP - 5.9L - INSTALLATION	7-68	WIND NOISE - DIAGNOSIS AND TESTING	23-3
VOLT SUPPLIES - OPERATION, 5	8E-19	WATER PUMP - 5.9L - OPERATION	7-66	WINDOW - INSTALLATION, QUARTER	23-150
VOLTAGE DROP - STANDARD PROCEDURE, TESTING FOR A	8W-01-9	WATER PUMP - 5.9L - REMOVAL	7-66	WINDOW - INSTALLATION, VENT	23-85
VOLTAGE GAUGE - DESCRIPTION	8J-33	WATER PUMP - 5.9L DIESEL - CLEANING	7-72	WINDOW - REMOVAL, QUARTER	23-150
VOLTAGE GAUGE - OPERATION	8J-33	WATER PUMP - 5.9L DIESEL - DESCRIPTION	7-72	WINDOW - REMOVAL, VENT	23-85
VOLTAGE POTENTIAL - STANDARD PROCEDURE, TESTING OF	8W-01-8	WATER PUMP - 5.9L DIESEL - INSPECTION	7-72	WINDOW MOTOR - DESCRIPTION	8N-26
VOLTAGE REGULATOR - DESCRIPTION	8F-30	WATER PUMP - 5.9L DIESEL - INSTALLATION	7-72	WINDOW MOTOR - DIAGNOSIS AND TESTING	8N-26
VOLTAGE REGULATOR - OPERATION	8F-30	WATER PUMP - 5.9L DIESEL - OPERATION	7-72	WINDOW MOTOR - REMOVAL	8N-26
VOLTAGE TEST - STANDARD PROCEDURE, OPEN-CIRCUIT	8F-12	WATER PUMP - 5.9L DIESEL - REMOVAL	7-72	WINDOW REGULATOR - INSTALLATION	23-76
VOLUME CHECK - STANDARD PROCEDURE, OIL PUMP	21-166,21-336	WATER PUMP - 8.0L - CLEANING	7-71	WINDOW REGULATOR - REMOVAL	23-76
VTSS INDICATOR - DESCRIPTION	8Q-3	WATER PUMP - 8.0L - INSPECTION	7-71	WINDOW SWITCH - DESCRIPTION, POWER	8N-24
VTSS INDICATOR - DIAGNOSIS AND TESTING	8Q-4	WATER PUMP - 8.0L - INSTALLATION	7-71	WINDOW SWITCH - DIAGNOSIS AND TESTING, POWER	8N-24
VTSS INDICATOR - OPERATION	8Q-3	WATER PUMP - 8.0L - REMOVAL	7-69	WINDOW SWITCH - INSTALLATION, POWER	8N-26
WAIT-TO-START INDICATOR - DESCRIPTION	8J-34	WATER PUMP - DIAGNOSIS AND TESTING	7-66,7-69,7-72	WINDOW SWITCH - OPERATION, POWER	8N-24
WAIT-TO-START INDICATOR - OPERATION	8J-34	WATER PUMP BYPASS HOSE WITH AIR CONDITIONING - INSTALLATION	7-76		
WARNING - SAFETY PRECAUTIONS AND WARNINGS	23-1	WATER PUMP BYPASS HOSE WITH AIR CONDITIONING - REMOVAL	7-73		
WARNING, CLUTCH	6-2	WATER PUMP BYPASS HOSE WITHOUT AIR CONDITIONING - INSTALLATION	7-77
