VEHICLE SAFETY CERTIFICATION LABEL

DESCRIPTION

A vehicle safety certification label (Fig. 1) is attached to every Chrysler Corporation vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Safety Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

80ab36d5

Fig. 1 Vehicle Safety Certification Label

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

VIN CODING/LOCATIONS

The Vehicle Identification Number (VIN) plate is located on the lower windshield fence near the left A-pillar (Fig. 2). The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The Vehicle Identification Number is also imprinted on the:

- Body Code Plate.
- Equipment Identification Plate.
- Vehicle Safety Certification Label.
- Frame rail.

VEHICLE IDENTIFICATION NUMBER (Continued)

J94IN-23

Fig. 2 Vehicle

1 - INSTRUMENT PANEL

2 - VEHICLE IDENTIFICATION NUMBER PLATE VIN

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

VEHICLE EMISSION CONTROL INFORMATION (VECI)

DESCRIPTION

Vehicles equipped with 5.9L V-8 LDC-gas powered engines have a vehicle emission control information (VECI) label.

The label combines both emission control information and vacuum hose routing. This label is located in the engine compartment in front of the radiator (Fig. 3).

There are unique VECI labels for vehicles built for sale in the country of Canada and Heavy Duty Cycle (HDC) engines. Canadian labels are written in both the English and French languages. For all Canadian vehicles, the label is split into two different labels.

The VECI labels are permanently attached and cannot be removed without defacing information and destroying label.

The VECI label contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

Fig. 3 VECI Label Location

- 1 - VEHICLE EMISSION CONTROL INFORMATION (VECI) LABEL
 2 - VECI LABEL (5.9L HDC FOR CANADA ONLY)
 3 - VECI LABEL (5.9L HDC ONLY) (INCLUDES CANADA)

The 5.9L HDC-gas powered engine will have two labels. One of the labels is located in front of the radiator in the engine compartment (Fig. 3) and will contain vacuum hose routing only. The other is attached to the drivers side of the engine air cleaner housing (Fig. 3).

The VECI label for the 5.9L HDC-gas powered engine will contain the following:

- Engine family and displacement
- Evaporative family
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label for the 8.0L V-10 HDC-gas powered engine is also located in the engine compartment. It is attached to a riveted metal plate located to the right side of the generator (Fig. 4).

EQUIPMENT IDENTIFICATION PLATE

DESCRIPTION

The Equipment Identification Plate (Fig. 5) is located at the left, front of the inner hood panel. The plate lists information concerning the vehicle as follows:

- The model.
- The wheelbase.
- The VIN (Vehicle Identification Number).
- The T.O.N. (order number).
- The optional and special equipment installed on the vehicle.

Refer to the information listed on the plate when ordering replacement parts.

J901N-37

Fig. 5 Equipment Identification Plate

BODY CODE PLATE

DESCRIPTION

The Body Code Plate (Fig. 6) is located on the floor pan under the passenger seat or attached to the front face of the radiator closure panel. There are seven lines of information on the body code plate. Lines 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 4 in the center of the plate to line 1 at the bottom of the plate.

The last code imprinted on a vehicle code plate will be followed by the imprinted word END. When two vehicle code plates are required, the last available spaces on the first plate will be imprinted with the letters CTD (for continued).

When a second vehicle code plate is necessary, the first four spaces on each row will not be used because of the plate overlap.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts (Fig. 7) and (Fig. 8).

FASTENER USAGE

DESCRIPTION

WARNING: USE OF AN INCORRECT FASTENER MAY RESULT IN COMPONENT DAMAGE OR PERSONAL INJURY.

Figure art, specifications and torque references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

THREADED HOLE REPAIR

DESCRIPTION

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

METRIC SYSTEM

DESCRIPTION

The metric system is based on quantities of one, ten, one hundred, one thousand and one million.

The following chart will assist in converting metric units to equivalent English and SAE units, or vice versa.

INTERNATIONAL SYMBOLS

DESCRIPTION

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations (Fig. 1).

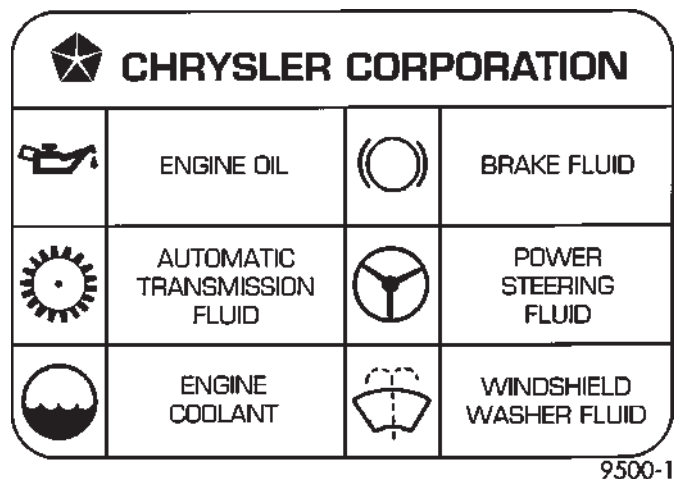

Fig. 1 International Symbols

PARTS & LUBRICANT RECOMMENDATION

STANDARD PROCEDURE - CLASSIFICATION OF LUBRICANTS

Only lubricants that are endorsed by the following organization should be used to service a DaimlerChrysler Corporation vehicle.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API) (Fig. 6)
- National Lubricating Grease Institute (NLGI) (Fig. 2)

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol (Fig. 2) on the label. At the bottom NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter "G". Chassis lubricant is identified by the latter "L". The letter following the usage letter indicates the quality of the lubricant. The following symbols indicate the highest quality.

Fig. 2 NLGI Symbol

- 1 - WHEEL BEARINGS
- 2 - CHASSIS LUBRICATION
- 3 - CHASSIS AND WHEEL BEARINGS

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

FLUID TYPES

DESCRIPTION - FUEL REQUIREMENTS - GAS ENGINES

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as "reformulated" gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly supports the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasolines free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

FLUID TYPES (Continued)

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.

- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.

- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.

- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

DESCRIPTION - FUEL REQUIREMENTS - DIESEL ENGINE

DESCRIPTION

WARNING: Do not use alcohol or gasoline as a fuel blending agent. They can be unstable under certain conditions and hazardous or explosive when mixed with diesel fuel.

Use good quality diesel fuel from a reputable supplier in your Dodge truck. For most year-round service, number 2 diesel fuel meeting ASTM specification D-975 will provide good performance. If the vehicle is exposed to extreme cold (below 0°F/-18°C), or is required to operate at colder-than-normal conditions for prolonged periods, use climatized No. 2 diesel fuel or dilute the No. 2 diesel fuel with 50% No. 1 diesel fuel. This will provide better protection from fuel gelling or wax-plugging of the fuel filters.

Diesel fuel is seldom completely free of water. To prevent fuel system trouble, including fuel line freezing in winter, drain the accumulated water from the fuel/water separator using the fuel/water separator drain provided. If you buy good-quality fuel and follow the cold-weather advice above, fuel conditioners should not be required in your vehicle. If available in your area, a high cetane "premium" diesel fuel may

offer improved cold starting and warm-up performance.

DESCRIPTION - ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

FLUID TYPES (Continued)

COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water-Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol-The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water-Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION AND ADDITIVES

NOTE: Refer to the vehicle's coolant bottle to identify HOAT or Non-HOAT coolant. Non-HOAT coolant is green in color.

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

DESCRIPTION—ENGINE OIL

API SERVICE GRADE CERTIFIED

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Standard engine-oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans.

In diesel engines, use an engine oil that conforms to API Service Grade CF-4 or CG-4/SH (Fig. 3). MOPAR® provides an engine oil that conforms to this particular grade.

Fig. 3 API Service Grade Certification Label—Diesel Engine Oil

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. SAE 15W-40 specifies a multiple viscosity engine oil.

When choosing an engine oil, consider the range of temperatures the vehicle will be operated in before the next oil change. Select an engine oil that is best suited to your area's particular ambient temperature range and variation. For diesel engines, refer to (Fig. 4).

FLUID TYPES (Continued)

**Fig. 4 Engine Oil Viscosity Recommendation—
Diesel Engines**

DESCRIPTION - ENGINE OIL

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These oils are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 5).

Fig. 5 Temperature/Engine Oil Viscosity

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 6).

9400-9

Fig. 6 API Symbol

DESCRIPTION - AXLE LUBRICATION

A multi-purpose, hypoid gear lubricant which conforms to the following specifications should be used. Mopar Hypoid Gear Lubricant conforms to these specifications.

NOTE: Trac-lok® and Powr-lok® equipped axles require a friction modifier be added to the lubricant.

FRONT AXLE

- The lubricant should have MIL-L-2105C and API GL 5 quality specifications.
- Lubricant is a thermally stable SAE 80W90.

REAR AXLE

- The lubricant should have MIL-L-2105C and API GL 5 quality specifications.
- Lubricant is a thermally stable SAE 90W.

DESCRIPTION - TRANSFER CASE - NV241

Recommended lubricant for the NV241 transfer case is Mopar® ATF+4, type 9602, Automatic Transmission Fluid.

DESCRIPTION - MANUAL TRANSMISSION

Mopar® Manual Transmission Lubricant is recommended or equivalent for use in the manual transmissions.

FLUID TYPES (Continued)

DESCRIPTION - AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to the maintenance schedules in this group for the recommended maintenance (fluid/filter change) intervals for this transmission.

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® ATF +4, type 9602, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, type 9602, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

OPERATION - AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation,

transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

FLUID CAPACITIES

MAINTENANCE SCHEDULES

DESCRIPTION

"Maintenance Schedule Information not included in this section, is located in the appropriate Owner's Manual."

JUMP STARTING

STANDARD PROCEDURE - JUMP STARTING

WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS IN GROUP 8A, BATTERY/STARTING/CHARGING SYSTEMS DIAGNOSTICS.

- DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.
 - DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS YELLOW OR BRIGHT COLOR.
 - DO NOT JUMP START A VEHICLE WHEN THE BATTERY FLUID IS BELOW THE TOP OF LEAD PLATES.
 - DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.
 - DO NOT USE OPEN FLAME NEAR BATTERY.
 - REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.
 - WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS. REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.
- FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.**

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

JUMP STARTING (Continued)

TO JUMP START A DISABLED VEHICLE:

(1) Raise hood on disabled vehicle and visually inspect engine compartment for:

- Battery cable clamp condition, clean if necessary.
- Frozen battery.
- Yellow or bright color test indicator, if equipped.
- Low battery fluid level.
- Generator drive belt condition and tension.
- Fuel fumes or leakage, correct if necessary.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

(2) When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.

(3) On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.

(4) Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.

(5) On disabled vehicle, connect RED jumper cable clamp to positive (+) terminal. Connect BLACK jumper cable clamp to engine ground as close to the ground cable attaching point as possible (Fig. 7) and (Fig. 8).

(6) Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

(7) Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.

Fig. 7 Jumper Cable Clamp Connections—Gas Engine

- 1 - NEGATIVE OR GROUND CABLE CONNECTION
2 - POSITIVE CABLE CONNECTION
3 - BATTERY

Fig. 8 Jumper Cable Clamp Connections—Diesel Engine

- 1 - POSITIVE CABLE CONNECTION
2 - BATTERY
3 - NEGATIVE OR GROUND CABLE CONNECTION

• When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.

• Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

HOISTING

STANDARD PROCEDURE - HOISTING

Refer to the Owner's Manual for emergency vehicle lifting procedures.

WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN A CHASSIS OR DRIVETRAIN COMPONENT IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT (Fig. 9) OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.

Fig. 9 Safety Stands

1 - SAFETY STANDS

FLOOR JACK

When properly positioned, a floor jack can be used to lift a vehicle (Fig. 10). Support the vehicle in the raised position with jack stands at the front and rear ends of the frame rails (Fig. 9).

CAUTION: Do not lift vehicle with a floor jack positioned under:

- An axle tube.
- A body side sill.
- A steering linkage component.
- A drive shaft.
- The engine or transmission oil pan.
- The fuel tank.
- A front suspension arm.

NOTE: Use the correct frame rail lifting locations only (Fig. 11).

HOIST

A vehicle can be lifted with:

- A single-post, frame-contact hoist.
- A twin-post, chassis hoist.
- A ramp-type, drive-on hoist.

NOTE: When a frame-contact type hoist is used, verify that the lifting pads are positioned properly (Fig. 10). The forward lifting pads should be positioned a minimum of 5 inches forward of the cross-member bolt access holes (Fig. 11).

Fig. 10 Vehicle Lifting Locations

J9500-5

HOISTING (Continued)

**Fig. 11 Front Lift Pad Location**

- 1 - SHIPPING TIE DOWN SLOT
- 2 - CROSSMEMBER BOLT ACCESS HOLE
- 3 - LIFTARM
- 4 - LIFT PAD EXTENSION
- 5 - FRAME RAIL

TOWING

STANDARD PROCEDURE - TOWING

A vehicle equipped with SAE approved sling-type towing equipment can be used to tow all vehicles. When towing a 4WD vehicle using a wheel-lift towing device, use tow dollies under the opposite end of the vehicle. A vehicle with flat-bed device can also be used to transport a disabled vehicle (Fig. 12).

A wooden crossbeam may be required for proper connection when using the sling-type, front-end towing method.

SAFETY PRECAUTIONS

CAUTION: The following safety precautions must be observed when towing a vehicle:

- Secure loose and protruding parts.
- Always use a safety chain system that is independent of the lifting and towing equipment.
- Do not allow towing equipment to contact the disabled vehicle's fuel tank.
- Do not allow anyone under the disabled vehicle while it is lifted by the towing device.
- Do not allow passengers to ride in a vehicle being towed.
- Always observe state and local laws regarding towing regulations.
- Do not tow a vehicle in a manner that could jeopardize the safety of the operator, pedestrians or other motorists.

J9500-6

Fig. 12 Tow Vehicles With Approved Equipment

- 1 - SLING TYPE
- 2 - WHEEL LIFT
- 3 - FLAT BED

- Do not attach tow chains, T-hooks, J-hooks, or a tow sling to a bumper, steering linkage, drive shafts or a non-reinforced frame hole.

- Do not tow a heavily loaded vehicle. Damage to the cab, cargo box or frame may result. Use a flatbed device to transport a loaded vehicle.

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until lifted wheels are a minimum 100 mm (4 in) from the ground. Be sure there is adequate ground clearance at the opposite end of the vehicle, especially when towing over rough terrain or steep rises in the road. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the opposite end of the vehicle. Install lug nuts on wheel attaching studs to retain brake drums or rotors.

RAMP ANGLE

If a vehicle with flat-bed towing equipment is used, the approach ramp angle should not exceed 15 degrees.

TOWING (Continued)

TOWING WHEN KEYS ARE NOT AVAILABLE

When the vehicle is locked and keys are not available, use a flat bed hauler. A Wheel-lift or Sling-type device can be used on 4WD vehicles provided **all the wheels are lifted off the ground using tow dollies.**

FOUR-WHEEL-DRIVE VEHICLE TOWING

Chrysler Corporation recommends that a vehicle be transported on a flat-bed device. A Wheel-lift or Sling-type device can be used provided **all the wheels are lifted off the ground using tow dollies.**

WARNING: WHEN TOWING A DISABLED VEHICLE AND THE DRIVE WHEELS ARE SECURED IN A WHEEL LIFT OR TOW DOLLIES, ENSURE THE TRANSMISSION IS IN THE PARK POSITION (AUTOMATIC TRANSMISSION) OR A FORWARD DRIVE GEAR (MANUAL TRANSMISSION).

CAUTION: Many vehicles are equipped with air dams, spoilers, and/or ground effect panels. To avoid component damage, a wheel-lift towing vehicle or a flat-bed hauling vehicle is recommended.

WHEEL ALIGNMENT

DESCRIPTION

Wheel alignment is the positioning of the wheels in relation to the vehicle. This is accomplished through suspension and steering linkage adjustments. An alignment is essential for efficient steering, good directional stability and to minimize tire wear. The most important measurements of an alignment are caster, camber and toe position (Fig. 1)and (Fig. 2).

CAUTION: Do not attempt to modify any suspension or steering components by heating and bending.

NOTE: Periodic lubrication of the front suspension/steering system components may be required. Rubber bushings must never be lubricated. Refer to Lubrication And Maintenance for the recommended maintenance schedule.

Fig. 1 Alignment Angles - Independent Front Suspension

Fig. 2 Alignment Angles - Link/Coil

- 1 - WHEEL CENTERLINE
- 2 - NEGATIVE CAMBER ANGLE
- 3 - PIVOT CENTERLINE
- 4 - SCRUB RADIUS

- 5 - TRUE VERTICAL
- 6 - KING PIN
- 7 - VERTICAL
- 8 - POSITIVE CASTER

OPERATION

• **CASTER** is the forward or rearward tilt of the steering knuckle from vertical. Tilting the top of the knuckle rearward provides positive caster. Tilting the top of the knuckle forward provides negative caster. Caster is a directional stability angle which enables the front wheels to return to a straight ahead position after turns.

• **CAMBER** is the inward or outward tilt of the wheel relative to the center of the vehicle. Tilting the top of the wheel inward provides negative camber. Tilting the top of the wheel outward provides positive camber. Incorrect camber will cause wear on the inside or outside edge of the tire.

• **WHEEL TOE POSITION** is the difference between the leading inside edges and trailing inside edges of the front tires. Incorrect wheel toe position is the most common cause of unstable steering and uneven tire wear. The wheel toe position is the **final** front wheel alignment adjustment.

DIAGNOSIS AND TESTING - PRE-ALIGNMENT

Before starting wheel alignment, the following inspection and necessary corrections must be completed. Refer to Suspension and Steering System Diagnosis Chart for additional information.

- (1) Inspect tires for size and tread wear.
- (2) Set tire air pressure.
- (3) Inspect front wheel bearings for wear.
- (4) Inspect front wheels for excessive radial or lateral runout and balance.
- (5) Inspect ball studs, linkage pivot points and steering gear for looseness, roughness or binding.
- (6) Inspect suspension components for wear and noise.
- (7) Road test the vehicle.

WHEEL ALIGNMENT (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURES - ALIGNMENT I.F.S.

Before each alignment reading the vehicle should be jounced (rear first, then front). Grasp each bumper at the center and jounce the vehicle up and down several times. Always release the bumper in the down position. **Set the front end alignment to specifications while the vehicle is in its NORMALLY LOADED CONDITION.**

Camber and caster angle adjustments involve changing the position of the upper suspension arm pivot bar (Fig. 3). Refer to the Alignment Specification Chart for the correct setting.

Fig. 3 Caster Camber Adjustment Location

- 1 - PIVOT BAR
- 2 - UPPER SUSPENSION ARM
- 3 - SUSPENSION ARM FRAME MOUNT
- 4 - ADJUSTMENT SLOTS

CASTER: Move the rear position of the pivot bar in or out. This will change the caster angle significantly and camber angle only slightly. To retain camber move the forward pivot very slightly in the opposite direction.

NOTE: For example, to increase a positive caster angle, move the rear position of the pivot bar

inward (toward the engine). Move the front of pivot bar outward (away from the engine) slightly until the original camber angle is obtained.

CAMBER: Move the forward position of the pivot bar in or out. This will change the camber angle significantly and caster angle only slightly. The camber angle should be adjusted as close as possible to the **preferred service specification**. After adjustment is made tighten pivot bar nuts to specifications.

TOE POSITION: The wheel toe position adjustment should be the final adjustment.

(1) Start the engine and turn wheels both ways before straightening the wheels. Center and secure the steering wheel and turn off engine.

(2) Loosen the tie rod adjustment sleeve clamp bolts/nuts.

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

(3) Adjust the wheel toe position by turning the tie rod adjustment sleeves as necessary.

STANDARD PROCEDURE - CASTER CORRECTION MEASUREMENT

NOTE: To determine the correct caster alignment angle for Cab-Chassis vehicles the following procedure must be performed.

NOTE: 4x2 11000 GVW has a solid front axle and uses a 4x4 frame.

(1) Take a height measurement to the center of the front gauge hole in the frame. Take another measurement to the center of the rear spring hanger bolt (Fig. 4). Take these measurements on both sides of the vehicle.

(2) Subtract the front measurement from the rear measurement and use the average between the right and left side. Use this number (caster correlation value) with the Corrected Caster Chart to obtain the preferred caster angle.

STANDARD PROCEDURE - ALIGNMENT
LINK/COIL SUSPENSION

Before each alignment reading the vehicle should be jounced (rear first, then front). Grasp each bumper at the center and jounce the vehicle up and down several times. Always release the bumper in the down position. **Set the front end alignment to specifications while the vehicle is in its NORMALLY LOADED CONDITION.**

CAMBER: The wheel camber angle is preset and is not adjustable.

CASTER: Check the caster of the front axle for correct angle. Be sure the axle is not bent or twisted.

Road test the vehicle and make left and right turn. Observe the steering wheel return-to-center position. Low caster will cause poor steering wheel returnability.

Caster can be adjusted by rotating the cams on the lower suspension arm (Fig. 5). (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

J9302-59

Fig. 5 Adjustment Cam

- 1 - ADJUSTMENT CAM
- 2 - AXLE BRACKET
- 3 - BRACKET REINFORCEMENT
- 4 - LOWER SUSPENSION ARM

TOE POSITION: The wheel toe position adjustment should be the final adjustment.

(1) Start the engine and turn wheels both ways before straightening the wheels. Center and Secure the steering wheel and turn off engine.

(2) Loosen the adjustment sleeve clamp bolts.

(3) Adjust the right wheel toe position with the drag link. Turn the sleeve until the right wheel is at the correct TOE-IN position. Position clamp bolts to their original position and tighten to specifications. **Make sure the toe setting does not change during clamp tightening.**

(4) Adjust left wheel toe position with tie rod at left knuckle. Turn the sleeve until the left wheel is at the correct TOE-IN position. Position clamp bolts to their original position and tighten to specifications. **Make sure the toe setting does not change during clamp tightening.**

(5) Verify the right toe setting.

WHEEL ALIGNMENT (Continued)

FRONT - 2WD

DESCRIPTION

DESCRIPTION

The independent front suspension (IFS) is comprised of (Fig. 1) and (Fig. 2):

- Shock absorbers
- Coil springs
- Upper and lower suspension arms
- Stabilizer bar
- Steering Knuckles
- Jounce Bumpers

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

- 4 - STABILIZER BAR
- 5 - SUSPENSION ARM
- 6 - LINK

FRONT - 2WD (Continued)

**Fig. 2 Independent Front Suspension**

- 1 - SHOCK
2 - JOUNCE BUMPER

CAUTION: Suspension components with rubber/urethane bushings (except stabilizer bar) should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

DESCRIPTION

The upper suspension arm bolts on frame brackets through the arm pivot shaft. The frame brackets have slotted holes which allow the arms to be adjusted for caster and camber. Pivot shaft bushings are not replaceable.

The lower suspension arms bolt to the lower frame brackets and pivot through bushings, these bushings are not replaceable.

The suspension arms have lube for life riveted ball studs.

SPECIAL TOOLS

INDEPENDENT FRONT SUSPENSION

6011a3ec

Remover, Tie Rod End MB-990635**Puller Tie Rod C-3894-A**

HUB / BEARING

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the caliper adapter bolts from the steering knuckle and remove caliper adapter assembly (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

NOTE: Do not allow brake hose to support caliper adapter assembly.

- (4) Remove the rotor from the hub/bearing wheel studs.

- (5) Remove the hub/bearing nut (Fig. 3) and slide the hub/bearing off the spindle. On 3500 HD models the hub spindle shaft must be removed (Fig. 4).

CAUTION: The hub/bearing nut can not be re-used.

INSTALLATION

- (1) On models with all-wheel antilock system (ABS), check condition of tone wheel on hub/bearing. If teeth on wheel are damaged, hub/bearing assembly will have to be replaced (tone wheel is not serviced separately).

- (2) Slide the hub/bearing onto the spindle. On 3500 HD slide the spindle stub shaft into the hub/bearing and tighten.

- 2 - SPINDLE

80a54f62

Fig. 4 SPINDLE STUB SHAFT

- 1 - Hub/Bearing
- 2 - Knuckle
- 3 - Spindle Stub Shaft

- (3) Install the **new** hub/bearing nut and tighten to:

- 2500/3500: 380 N·m (280 ft lbs.)

- (4) Install the rotor onto hub/bearing wheel studs.

- (5) Install the caliper adapter assembly (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION), and tighten adapter bolts to:

- 2500/3500: 285 N·m (210 ft lbs.)

- (6) Install the wheel and tire assembly and lower the vehicle, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

- (7) Apply brakes several times to seat brake shoes. Be sure to obtain firm pedal before moving vehicle.

KNUCKLE

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the brake caliper and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (4) Remove the cotter pin and nut from the tie-rod end. Remove the tie rod end from the knuckle with Puller C-3894-A.
- (5) Remove the cotter pins and nuts from the upper and lower ball joints. Separate upper ball joint from knuckle with remover MD-990635. Separate lower ball joint with remover C-4150A and remove knuckle.

INSTALLATION

- (1) Position the knuckle on the ball joints and install the ball joint nuts.
- (2) Tighten the upper ball joint nut to 81 N·m (60 ft. lbs.) and install cotter pin.
- (3) Tighten the lower ball joint nut to:
 - 149 N·m (110 ft. lbs.) Install the cotter pin.
- (4) Install the tie rod end on the steering knuckle and tighten the nut to 108 N·m (80 ft. lbs.). Install cotter pin.
- (5) Install the brake rotor and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
- (6) Install wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
- (7) Remove support and lower vehicle.

LOWER BALL JOINT

DIAGNOSIS AND TESTING - LOWER BALL JOINT

- (1) Raise the front of the vehicle. Place safety floor stands under both lower suspension arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.

NOTE: The upper suspension arms must not be in maximum rebound position.

- (2) Remove the tire and wheel assembly.
- (3) Mount a dial indicator solidly under the lower suspension arm.
- (4) Position indicator plunger against the bottom of the steering knuckle lower ball joint boss.

NOTE: The dial Indicator plunger must be perpendicular to the machined surface of the steering knuckle lower ball joint boss.

- (5) Position a pry bar over the top of the upper suspension arm and under the pivot bar of the upper suspension arm. Pry down on the upper suspension arm and then zero the dial indicator.

- (6) Reposition the pry bar under the upper suspension arm and on top of the frame rail. Pry up on the upper suspension arm and record the dial indicator reading.

- (7) If the travel exceeds 0.8 mm (0.030 in.) replace the suspension arm.

LOWER CONTROL ARM

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the tire and wheel assembly.
- (3) Remove the brake caliper assembly and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (4) Remove the cotter pin and nut from the tie rod. Remove the tie rod end from the steering knuckle with Puller C-3894-A.
- (5) Remove the stabilizer bar link from lower suspension arm.
- (6) Support the lower suspension arm outboard end with jack. Place a jack under the arm in the front of the shock mount.
- (7) Remove the cotter pin and nut from the lower ball joint. Separate the ball joint with Remover C-4150A.
- (8) Remove the lower shock bolt from the suspension arm.
- (9) Lower the jack and suspension arm until spring tension is relieved. Remove spring and rubber isolator (Fig. 6).
- (10) Remove bolts mounting suspension arm to crossmember and remove arm.

INSTALLATION

- (1) Position the suspension arm on the crossmember and install the bolts and nuts snug.
- (2) Install the rubber isolator on top of the spring. Position the spring into upper spring seat.
- (3) Raise the lower suspension arm with a jack and position the spring into the lower suspension arm mount.
- (4) Install the lower shock bolt and tighten to 142 N·m (105 ft. lbs.).
- (5) Install the steering knuckle on the lower ball joint. Install the lower ball joint nut and tighten to:

LOWER CONTROL ARM (Continued)

- 136 N·m (110 ft. lbs.) Install the lower ball joint cotter pin.

(6) Install the stabilizer bar link on the lower suspension arm. Install the grommet, retainer and nut and tighten to 37 N·m (27 ft. lbs.).

(7) Install the tie rod end on the steering knuckle and tighten nut to 108 N·m (80 ft. lbs.). Install cotter pin.

(8) Install the brake rotor and caliper assembly, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

(9) Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(10) Remove the support and lower the vehicle.

(11) Tighten the suspension arm crossmember nuts to 169 N·m (125 ft. lbs.).

SHOCK

DIAGNOSIS AND TESTING - SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove shock upper nut and remove retainer and grommet.
- (3) Remove lower mounting bolt from suspension arm and remove shock (Fig. 5).

INSTALLATION

- (1) Extend shock fully, install retainer and grommet on top of shock absorber. Check grommets and retainer for wear.

Fig. 5 Shock

- 1 - SHOCK
2 - JOUNCE BUMPER

(2) Guide shock up through upper suspension arm bracket. Install top grommet, retainer and nut. Tighten nut to 54 N·m (40 ft. lbs.).

(3) Align bottom end of shock into lower suspension arm and install mounting bolt. Tighten bolt to 142 N·m (105 ft. lbs.).

(4) Remove support and lower vehicle.

SPRING

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the tire and wheel assembly.
- (3) Remove the brake caliper assembly and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (4) Remove the cotter pin and nut from the tie rod. Remove the tie rod end from the steering knuckle with Puller C-3894-A.
- (5) Remove the stabilizer bar link from the lower suspension arm.
- (6) Support the lower suspension arm outboard end with a jack. Place a jack under the arm in front of the shock mount.
- (7) Remove the cotter pin and nut from the lower ball joint. Separate the ball joint with Remover C-4150A.
- (8) Remove the lower shock bolt from the suspension arm.
- (9) Lower the jack and suspension arm until spring tension is relieved. Remove spring and rubber isolator (Fig. 6).

SPRING (Continued)

**Fig. 6 Coil Spring**

- 1 - COIL SPRING
- 2 - RUBBER ISOLATER

INSTALLATION

(1) Install the rubber isolator on top of the spring. Position the spring into the upper spring seat.

(2) Raise the lower suspension arm with a jack and position the spring into the lower suspension arm mount.

(3) Install the lower shock bolt and tighten to 142 N·m (105 ft. lbs.).

(4) Install the steering knuckle on the lower ball joint. Install the lower ball joint nut and tighten to:

- 136 N·m (110 ft. lbs.)

Install the lower ball joint cotter pin.

(5) Install the stabilizer bar link on the lower suspension arm. Install the grommet, retainer and nut and tighten to 37 N·m (27 ft. lbs.).

(6) Install the tie rod end on the steering knuckle and tighten nut to 108 N·m (80 ft. lbs.). Install cotter pin.

(7) Install the brake rotor and caliper assembly, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

(8) Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(9) Remove the support and lower the vehicle.

STABILIZER BAR**REMOVAL**

(1) Raise and support the vehicle.

(2) Remove the link nuts, retainers and grommets from lower suspension arm and stabilizer bar (Fig. 7).

(3) Remove the stabilizer bar clamps from the frame rails. Remove the stabilizer bar.

**Fig. 7 STABILIZER BAR**

- 1 - STABILIZER BAR
- 2 - GROMMET
- 3 - GROMMET
- 4 - LINK

INSTALLATION

(1) Position the stabilizer bar on the frame rail and install the clamps and bolts. Ensure the bar is centered with equal spacing on both sides. Tighten the bolts to 54 N·m (40 ft. lbs.).

(2) Install links on stabilizer bar and lower suspension arm. Install grommets, retainers and nuts. Tighten nuts to 37 N·m (27 ft. lbs.).

(3) Remove the supports and lower the vehicle.

UPPER BALL JOINT**DIAGNOSIS AND TESTING - UPPER BALL JOINT**

(1) Position a floor jack under the lower suspension arm. Raise the wheel and allow the tire to lightly contact the floor (vehicle weight relieved from the tire).

(2) Mount a dial indicator solidly on the upper suspension arm.

(3) Position the indicator plunger against the upper ball stud boss of the steering knuckle.

(4) Grasp the top of the tire and apply force in and out. Look for movement at the ball joint between the upper suspension arm and steering knuckle.

(5) If lateral movement is greater than 0.8 mm (0.030 in.), replace the suspension arm.

UPPER CONTROL ARM

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove tire and wheel assembly.
- (3) Support lower suspension arm at outboard end with jack stand.
- (4) Remove upper ball joint cotter pin and nut.
- (5) Separate ball joint from knuckle with remover MB-990635.
- (6) Remove pivot bar bolts from upper suspension arm bracket and remove arm from vehicle (Fig. 8).

INSTALLATION

- (1) Position the upper suspension arm on the bracket and install the pivot bar bolts. Tighten to 169 N·m (125 ft. lbs.).
- (2) Install the ball joint in the knuckle. Install the nut and tighten to 81 N·m (60 ft. lbs.) and replacement the cotter pin.
- (3) Remove the jack from the lower suspension arm.
- (4) Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
- (5) Remove the support and lower the vehicle.

FRONT - 4WD

DESCRIPTION

DESCRIPTION

The link/coil suspension allows each wheel to adapt to different road surfaces. The suspension is comprised of (Fig. 1) :

- Shock absorbers
- Coil springs
- Upper and lower suspension arms
- Stabilizer bar
- Track bar
- Steering Knuckles
- Jounce Bumper

Fig. 1 Link/Coil Suspension

- 1 - STABILIZER BAR
- 2 - SHOCK ABSORBER
- 3 - COIL SPRING
- 4 - UPPER SUSPENSION ARM
- 5 - LOWER SUSPENSION ARM
- 6 - TRACK BAR

FRONT - 4WD (Continued)

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

CAUTION: Suspension components with rubber bushings (except stabilizer bar) should be tightened with the vehicle at normal height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are

not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

DESCRIPTION

The upper and lower suspension arms use bushings to isolate road noise. The suspension arms are bolted to the frame and axle through the rubber bushings. The lower suspension arm uses cam bolts at the axle to allow for caster and pinion angle adjustment.

*Puller C-3894-A**Remover, Wheel Stud C-4150A*

HUB / BEARING

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the hub extension mounting nuts and remove the extension from the rotor if equipped (Fig. 2).

*Fig. 2 Hub Extension*

- 1 - HUB EXTENSION
- 2 - HUB

- (4) Remove the brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

- (5) Remove the cotter pin and the hub nut from the axle shaft (Fig. 3).

*Fig. 3 Hub Nut Cotter Pin*

- 1 - HUB NUT
- 2 - COTTER PIN

- (6) Disconnect the ABS wheel speed sensor wire from under the hood. Remove the sensor wire from the frame and steering knuckle if equipped.

- (7) Back off the hub/bearing mounting bolts 1/4 inch each (Fig. 4). Then tap the bolts with a hammer to loosen the hub/bearing from the steering knuckle.

- (8) Remove the hub/bearing mounting bolts and remove the hub/bearing.

*Fig. 4 Hub/Bearing Mounting Bolts*

- 1 - SOCKET AND EXTENSION
- 2 - ROTOR AND HUB
- 3 - STEERING KNUCKLE

HUB / BEARING (Continued)

(9) Remove the rotor assembly (Fig. 5), brake shield and spacer from the steering knuckle.

Fig. 5 Rotor Hub/Bearing Assembly

- 1 - ROTOR AND HUB
2 - UNIT BEARING ASSEMBLY
3 - SEAL

(10) Press out the wheel studs/hub extension studs and separate the rotor from the hub (Fig. 6).

Fig. 6 Rotor And Hub/Bearing

- 1 - HUB BEARING
2 - ROTOR

(11) Remove the wheel speed sensor (Fig. 7) from the hub bearing if equipped.

Fig. 7 Wheel Speed Sensor

- 1 - HUB BEARING
2 - WHEEL SPEED SENSOR

INSTALLATION

(1) Install the wheel speed sensor in the hub bearing if equipped.

(2) Position the rotor on the hub/bearing.

(3) Press the wheel studs/hub extension studs through the back side of the rotor and through the hub bearing flange (Fig. 8).

Fig. 8 Rotor, Hub/Bearing And Stud

- 1 - HUB BEARING
2 - ROTOR
3 - STUD

HUB / BEARING (Continued)

(4) Apply a liberal quantity of anti-seize compound to the splines of the front drive shaft.

(5) Insert the two rearmost, top and bottom rotor hub bolts in the steering knuckle. Insert the bolts through the back side of the knuckle so they extend out the front face as shown.

(6) Position the hub spacer (Fig. 9) and brake shield (Fig. 10) on bolts just installed in knuckle.

NOTE: If the vehicle is equipped with a wheel speed sensor the brake shield must be positioned on the hub bearing (Fig. 11).

Fig. 9 Hub Spacer

- 1 - ROTOR HUB BOLTS
- 2 - HUB SPACER (POSITION FLAT TO REAR)
- 3 - APPLY ANTI-SEIZE COMPOUND TO SPLINES

(7) Align the rotor hub with the drive shaft and start the shaft into the rotor hub splines.

NOTE: Position wheel speed sensor wire at the top of the knuckle if equipped.

(8) Align the bolt holes in the hub bearing flange with the bolts installed in the knuckle. Then thread the bolts into the bearing flange far enough to hold the assembly in place.

(9) Install the remaining bolts. Tighten the hub/bearing bolts to 166 N·m (122 ft. lbs.).

(10) Install the washer and hub nut and tighten to 245 N·m (180 ft. lbs.).

(11) Install a new cotter pin in the hub nut. Tighten the nut as needed to align the cotter pin hole in the shaft with the opening in nut.

(12) Install the brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

(13) Install the sensor wire to the steering knuckle and frame and if equipped. Connect the wheel speed sensor wire under the hood.

Fig. 10 Brake Shield

- 1 - BRAKE SHIELD
- 2 - HUB BEARING BOLTS
- 3 - STEERING KNUCKLE

Fig. 11 Brake Shield With Wheel Speed Sensor

- 1 - WHEEL SPEED SENSOR
- 2 - HUB BEARING
- 3 - SHIELD

(14) Install the wheel and tire assemblies, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(15) Remove the support and lower the vehicle.

(16) Apply the brakes several times to seat the brake shoes and caliper piston. Do not move the vehicle until a firm brake pedal is obtained.

KNUCKLE

REMOVAL

- (1) Remove hub bearing and axle shaft.
- (2) Remove tie-rod or drag link end from the steering knuckle arm.
- (3) Remove the ABS sensor wire and bracket from knuckle. Refer to Brakes, for proper procedures.
- (4) Remove the cotter pin from the upper ball stud nut. Remove the upper and lower ball stud nuts.
- (5) Strike the steering knuckle with a brass hammer to loosen.
- (6) Remove knuckle from axle tube yokes.

INSTALLATION

- (1) Position the steering knuckle on the ball studs.
- (2) Install and tighten lower ball stud nut to 47 N·m (35 ft. lbs.) torque. Do not install cotter pin at this time.
- (3) Install and tighten upper ball stud nut to 94 N·m (70 ft. lbs.) torque. Advance nut to next slot to line up hole and install new cotter pin.
- (4) Retorque lower ball stud nut to 190–217 N·m (140–160 ft. lbs.) torque. Advance nut to next slot to line up hole and install new cotter pin.
- (5) Install the hub bearing and axle shaft.
- (6) Install tie-rod or drag link end onto the steering knuckle arm.
- (7) Install the ABS sensor wire and bracket to the knuckle. Refer to Brakes, for proper procedure.

UPPER CONTROL ARM

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the upper suspension arm nut and bolt at the axle bracket (Fig. 12).
- (3) Remove the nut and bolt at the frame rail and remove the upper suspension arm.

INSTALLATION

- (1) Position the upper suspension arm at the axle and frame rail.
- (2) Install the bolts and finger tighten the nuts.
- (3) Remove the supports and lower the vehicle.
- (4) Tighten nut at the axle bracket to 163 N·m (120 ft. lbs.). Tighten nut at frame bracket to 163 N·m (120 ft. lbs.).

LOWER CONTROL ARM

REMOVAL

- (1) Raise and support the vehicle.
- (2) Paint or scribe alignment marks on the cam adjusters and suspension arm for installation reference (Fig. 16).

Fig. 16 Cam Adjuster

- 1 - ADJUSTMENT CAM
- 2 - AXLE BRACKET
- 3 - BRACKET REINFORCEMENT
- 4 - LOWER SUSPENSION ARM

(3) Remove the lower suspension arm nut, cam and cam bolt from the axle.

(4) Remove the nut and bolt from the frame rail bracket and remove the lower suspension arm (Fig. 12).

INSTALLATION

- (1) Position the lower suspension arm at the axle bracket and frame rail bracket.
- (2) Install the rear bolt and finger tighten the nut.
- (3) Install the cam bolt, cam and nut in the axle and align the reference marks.
- (4) Remove support and lower the vehicle.
- (5) Tighten cam nut at the axle bracket to 190 N·m (140 ft. lbs.). Tighten rear nut at the frame bracket to 190 N·m (140 ft. lbs.).

SHOCK

DIAGNOSIS AND TESTING - SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

REMOVAL

(1) Remove the nut, retainer and grommet from the upper stud in the engine compartment.

(2) Remove three nuts from the upper shock bracket (Fig. 22).

J9402-46

Fig. 22 Shock Absorber and Bracket

- 1 - GROMMET
- 2 - RETAINER
- 3 - BRACKET
- 4 - RETAINER
- 5 - SHOCK
- 6 - GROMMET

(3) Remove the lower bolt from the axle bracket (Fig. 23). Remove the shock absorber from engine compartment.

INSTALLATION

(1) Position the lower retainer and grommet on the upper stud. Insert the shock absorber through the spring from engine compartment.

(2) Install the lower bolt and tighten to 135 N·m (100 ft. lbs.).

(3) Install the upper shock bracket and three nuts. Tighten nuts to 75 N·m (55 ft. lbs.).

(4) Install upper grommet and retainer. Install upper shock nut and tighten to 47 N·m (35 ft. lbs.).

SHOCK (Continued)

80aef279

Fig. 23 Shock Absorber Axle Mount

- 1 - SHOCK
- 2 - SPRING
- 3 - FLAG NUT
- 4 - SHOCK BOLT

SPRING

REMOVAL

- (1) Raise and support the vehicle. Position a hydraulic jack under the axle to support it.
- (2) Paint or scribe alignment marks on lower suspension arm cam adjusters and axle bracket for installation reference.
- (3) Remove the upper suspension arm and loosen lower suspension arm bolts.
- (4) Mark and disconnect the front propeller shaft from the axle 4x4 models.
- (5) Disconnect the track bar from the frame rail bracket.
- (6) Disconnect the drag link from pitman arm.
- (7) Disconnect the stabilizer bar link and shock absorber from the axle.
- (8) Lower the axle until the spring is free from the upper mount. Remove the coil spring.

INSTALLATION

- (1) Position the coil spring on the axle pad.
- (2) Raise the axle into position until the spring seats in the upper mount.
- (3) Connect the stabilizer bar links and shock absorbers to the axle bracket. Connect the track bar to the frame rail bracket.
- (4) Install the upper suspension arm.
- (5) Install the front propeller shaft to the axle 4x4 model.

(6) Install drag link to pitman arm and tighten nut to specifications. Install new cotter pin.

(7) Remove the supports and lower the vehicle.

(8) Tighten the following suspension components to specifications:

- Link to stabilizer bar nut.
- Lower shock bolt.
- Track bar bolt at axle shaft tube bracket.
- Upper suspension arm nut at axle bracket.
- Upper suspension nut at frame bracket.
- Align lower suspension arm reference marks and tighten cam nut.
- Lower suspension nut at frame bracket.

STABILIZER BAR

REMOVAL

- (1) Raise and support the vehicle.
- (2) Hold the stabilizer link shafts with a wrench and remove the link nuts at the stabilizer bar.
- (3) Remove the retainers and grommets from the stabilizer bar links.
- (4) Remove the stabilizer bar link nuts from the axle brackets.
- (5) Remove the links from the axle brackets with Puller C-3894-A (Fig. 24).
- (6) Remove the stabilizer bar clamps from the frame rails and remove the stabilizer bar.

80aff575

Fig. 24 Stabilizer Link

- 1 - PULLER
- 2 - LINK

INSTALLATION

- (1) Position the stabilizer bar on the frame rail and install the clamps and bolts. Ensure the bar is centered with equal spacing on both sides.
- (2) Tighten the clamp bolts to 54 N·m (40 ft. lbs.).
- (3) Install links to the axle bracket and tighten nut to 47 N·m (35 ft. lbs.).

STABILIZER BAR (Continued)

(4) Install links, retainers, grommets and nuts to the stabilizer bar. Hold the link shaft with a wrench and tighten the nuts to 37 N·m (27 ft. lbs.).

(5) Remove the supports and lower the vehicle.

TRACK BAR

DIAGNOSIS AND TESTING - TRACK BAR

(1) Turn the front wheel 90° to the left of center.

(2) Mount a dial indicator to the left frame rail in front of the track bar ball joint (Fig. 25).

(3) Position the dial indicator plunger on the ball joint end cap next to the grease fitting and zero the indicator.

NOTE: Dial indicator plunger must be perpendicular to the ball joint end cap.

(4) Turn the front wheel 180° to the right and record the dial indicator reading. Repeat this step three times and record all readings.

(5) If any of the readings exceed 2.03 mm (0.080 in) replace the track bar.

Fig. 25 Dial Indicator Location

1 - TRACK BAR BALL JOINT

REMOVAL

(1) Raise and support the vehicle.

(2) Remove the cotter pin and nut from the ball stud end at the frame rail bracket (Fig. 26).

(3) Remove ball stud from bracket with Puller C-4150A (Fig. 27).

(4) Remove the bolt and flag nut from the axle bracket and remove the track bar (Fig. 26).

Fig. 26 Track Bar

1 - AXLE BRACKET
2 - FRAME BRACKET
3 - TRACK BAR
4 - FLAG NUT

Fig. 27 Track Bar Puller

1 - TRACK BAR
2 - PULLER

INSTALLATION

(1) Install the track bar at axle bracket. Loosely install the retaining bolt and flag nut.

(2) Pry the axle assembly over to install the track bar at the frame rail bracket.

(3) Install the retaining nut on the stud. Tighten the ball stud nut to 95 N·m (70 ft. lbs.). Install a new cotter pin.

(4) Remove the supports and lower the vehicle.

(5) Tighten the bolt at the axle bracket to 176 N·m (130 ft. lbs.).

REAR

DESCRIPTION

The rear suspension is comprised of:

- Shock Absorbers
- Jounce Bumpers
- Stabilizer Bar (optional)
- Leaf Springs
- Drive Axle

CAUTION: A vehicle should always be loaded so the vehicle weight center-line is located immediately forward of the rear axle. Correct vehicle loading provides proper front tire-to-road contact. This results in maximum vehicle handling stability and safety. Incorrect vehicle weight distribution can cause excessive tire tread wear, spring fatigue or failure, and erratic steering.

CAUTION: Suspension components with rubber/urethane bushings (except stabilizer bar) should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

DIAGNOSIS AND TESTING - SPRING AND SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The spring eye and shock absorber bushings do not require any type of lubrication. Do not attempt to stop spring bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing rubber.

If the vehicle is used for severe, off-road operation, the springs should be examined periodically. Check for broken and shifted leaves, loose and missing clips, and broken center bolts. Refer to Spring and Shock Absorber Diagnosis chart for additional information.

REAR (Continued)

SPRING AND SHOCK ABSORBER

CONDITION	POSSIBLE CAUSES	CORRECTION
SPRING SAGS	1. Broken leaf. 2. Spring fatigue.	1. Replace spring. 2. Replace spring.
SPRING NOISE	1. Loose spring clamp bolts. 2. Worn bushings. 3. Worn or missing spring tip inserts.	1. Tighten to specification. 2. Replace bushings. 3. Replace spring tip inserts.
SHOCK NOISE	1. Loose mounting fastener. 2. Worn bushings. 3. Leaking shock.	1. Tighten to specification. 2. Replace shock. 3. Replace shock.

REAR (Continued)

SPECIAL TOOLS

SUSPENSION-REAR

Puller C-3894-A

BUSHINGS

REMOVAL

- (1) Remove the spring from the vehicle.
- (2) Position the spring eye in a press.
- (3) Press the bushing out with an appropriate size driver.

INSTALLATION

- (1) Press new bushing into the spring eye with an appropriate size driver. The bushing should be centered in the spring eye.
- (2) Install the spring on the vehicle.

SHOCK

REMOVAL

- (1) Raise vehicle and support axle.
- (2) Remove the bolt and flag nut from the frame crossmember bracket (Fig. 1).
- (3) Remove the bolt and nut from the axle bracket.
- (4) Remove the rear shock absorber from the vehicle.

INSTALLATION

- (1) Position the shock absorber in the brackets.
- (2) Install the bolts through the brackets and the shock. Install the flag nut on the top bolt and nut on lower bolt.
- (3) Tighten the upper and lower bolt/nuts. Tighten to 136 N.m (100 ft. lbs.)
- (4) Remove the support and lower the vehicle.

80add399

Fig. 1 Shock Absorber

- 1 - FLAG NUT
2 - AXLE
3 - SHOCK

SPRING

REMOVAL

- (1) Raise the vehicle and support the axle to remove all weight from the springs.
- (2) Remove the nuts and spring clamp bolts that attach the spring to the axle (Fig. 2) and (Fig. 3) and (Fig. 4).
- (3) Remove the nuts and bolts from the spring front and rear shackle eyes. **Note: To remove front eye bolt on left side spring fuel tank must be removed, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).**
- (4) Remove the spring from the vehicle.
- (5) Remove the shackle from the spring.

SPRING (Continued)

**Fig. 2 Rear Spring - 4x2**

- 3 - SPRING
- 4 - SHACKLE
- 5 - SPRING PLATE
- 6 - SPACER

(2) Position spring on axle shaft tube so spring center bolt is inserted into the locating hole in the axle tube spring pad or spacer.

(3) Align spring front eye with bolt hole in the front bracket. Install the eye pivot bolt and nut.

(4) Align shackle eye with bolt hole in rear bracket. Install bolt and nut.

(5) Tighten the spring front and rear eye pivot bolt snug do not torque.

(6) Install spring clamp bolts and the retaining nuts.

(7) Align the auxiliary spring with the primary spring if equipped. Tighten the nuts until they force the plate flush against the axle tube.

(8) Remove the supports and lower the vehicle so that the weight is being supported by the tires.

(9) Tighten the spring clamp retaining nuts to specifications

(10) Tighten spring front and rear eye pivot bolt nuts and shackle eye to specifications.

INSTALLATION

(1) Install shackle on rear spring eye and install bolt and nut.

STABILIZER BAR

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove nuts from the links at the stabilizer bar and separate the links with Puller C-3894-A (Fig. 5).
- (3) Remove stabilizer bar retainer nuts and retainers (Fig. 6).
- (4) Remove stabilizer bar and replace worn, cracked or distorted bushings.
- (5) Remove links upper mounting nuts and bolts and remove links.

Fig. 5 Stabilizer Link

- 1 - LINK
2 - PULLER

Fig. 6 Stabilizer Bar Mounting Bolts And

- 1 - STABILIZER BAR
2 - RETAINERS

INSTALLATION

- (1) Install link into frame brackets and install mounting nuts and bolts.
- (2) Install the stabilizer bar and center it with equal spacing on both sides. Install stabilizer bar retainers and tighten nuts to 54 N·m (40 ft. lbs.).
- (3) Install stabilizer link ball studs into the bar and tighten nuts to 68 N·m (50 ft. lbs.).
- (4) Remove support and lower vehicle.
- (5) Tighten upper link mounting nuts to 68 N·m (50 ft. lbs.).

PROPELLER SHAFT

DIAGNOSIS AND TESTING - PROPELLER
SHAFT

VIBRATION

Tires that are out-of-round or wheels that are unbalanced will cause a low frequency vibration. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

Brake drums that are unbalanced will cause a harsh, low frequency vibration. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

Driveline vibration can also result from loose or damaged engine mounts.

Propeller shaft vibration increases as the vehicle speed is increased. A vibration that occurs within a specific speed range is not usually caused by a propeller shaft being unbalanced. Defective universal joints or an incorrect propeller shaft angle, are usually the cause of such a vibration.

PROPELLER SHAFT (Continued)

DRIVELINE VIBRATION

Drive Condition	Possible Cause	Correction
Propeller Shaft Noise	1) Undercoating or other foreign material on shaft. 2) Loose U-joint clamp screws. 3) Loose or bent U-joint yoke or excessive runout. 4) Incorrect driveline angularity. 5) Rear spring center bolt not in seat. 6) Worn U-joint bearings. 7) Propeller shaft damaged or out of balance. 8) Broken rear spring. 9) Excessive runout or unbalanced condition. 10) Excessive drive pinion gear shaft runout. 11) Excessive axle yoke deflection. 12) Excessive transfer case runout.	1) Clean exterior of shaft and wash with solvent. 2) Install new clamps and screws and tighten to proper torque. 3) Install new yoke. 4) Measure and correct driveline angles. 5) Loosen spring u-bolts and seat center bolt. 6) Install new U-joint. 7) Install new propeller shaft. 8) Install new rear spring. 9) Re-index propeller shaft, test, and evaluate. 10) Re-index propeller shaft and evaluate. 11) Inspect and replace yoke if necessary. 12) Inspect and repair as necessary.
Universal Joint Noise	1) Loose U-joint clamp screws. 2) Lack of lubrication.	1) Install new clamps and screws and tighten to proper torque. 2) Replace as U-joints as necessary.

BALANCE

NOTE: Removing and re-indexing the propeller shaft 180° relative to the yoke may eliminate some vibrations.

If propeller shaft is suspected of being unbalanced, it can be verified with the following procedure:

- (1) Raise the vehicle.
- (2) Clean all the foreign material from the propeller shaft and the universal joints.
- (3) Inspect the propeller shaft for missing balance weights, broken welds and bent areas. **If the propeller shaft is bent, it must be replaced.**
- (4) Inspect the universal joints to ensure that they are not worn, properly installed and correctly aligned with the shaft.
- (5) Check the universal joint clamp screws torque.
- (6) Remove the wheels and tires. Install the wheel lug nuts to retain the brake drums or rotors.
- (7) Mark and number the shaft six inches from the yoke end at four positions 90° apart.

(8) Run and accelerate the vehicle until vibration occurs. Note the intensity and speed the vibration occurred. Stop the engine.

(9) Install a screw clamp at position 1 (Fig. 1).

(10) Start the engine and re-check for vibration. If there is little or no change in vibration, move the clamp to one of the other three positions. Repeat the vibration test.

(11) If there is no difference in vibration at the other positions, the source of the vibration may not be propeller shaft.

(12) If the vibration decreased, install a second clamp (Fig. 2) and repeat the test.

(13) If the additional clamp causes an additional vibration, separate the clamps (1/2 inch above and below the mark). Repeat the vibration test (Fig. 3).

(14) Increase distance between the clamp screws and repeat the test until the amount of vibration is at the lowest level. Bend the slack end of the clamps so the screws will not loosen.

PROPELLER SHAFT (Continued)

**Fig. 1 Clamp Screw At Position 1**

- 1 - CLAMP
2 - SCREWDRIVER

**Fig. 2 Two Clamp Screws At The Same Position****Fig. 3 Clamp Screws Separated**

- 1 - 1/2 INCH

- (15) If the vibration remains unacceptable, apply the same steps to the front end of the propeller shaft.
(16) Install the wheel and tires. Lower the vehicle.

RUNOUT

- (1) Remove dirt, rust, paint and undercoating from the propeller shaft surface where the dial indicator will contact the shaft.
(2) The dial indicator must be installed perpendicular to the shaft surface.
(3) Measure runout at the center and ends of the shaft sufficiently far away from weld areas to ensure that the effects of the weld process will not enter into the measurements.
(4) Refer to Runout Specifications chart.
(5) If propeller shaft runout is out of specification, remove the propeller shaft, index the shaft 180° and re-install the propeller shaft. Measure shaft runout again.
(6) If propeller shaft runout is now within specifications, mark the shaft and yokes for proper orientation.
(7) If the propeller shaft runout is not within specifications, verify that the runout of the transmission/transfer case and axle are within specifications. Correct as necessary and re-measure propeller shaft runout.
(8) Replace the propeller shaft if the runout still exceeds the limits.

RUNOUT SPECIFICATIONS

Front of Shaft	0.020 in. (0.50 mm)
Center of Shaft	0.025 in. (0.63 mm)
Rear of Shaft	0.020 in. (0.50 mm)
note: Measure front/rear runout approximately 3 inches (76 mm) from the weld seam at each end of the shaft tube for tube lengths over 30 inches. For tube lengths under 30 inches, the maximum allowed runout is 0.020 in. (0.50 mm) for the full length of the tube.	

STANDARD PROCEDURES

To accurately check driveline alignment, raise and support the vehicle at the axles as level as possible. Allow the wheels and propeller shaft to turn.

- (1) Remove any external bearing snap rings, if equipped from universal joint so protractor base sits flat.
(2) Rotate the shaft until transmission/transfer case output yoke bearing is facing downward.

NOTE: Always make measurements from front to rear and from the same side of the vehicle.

PROPELLER SHAFT (Continued)

(3) Place Inclinator 7663 on yoke bearing (A) parallel to the shaft (Fig. 4). Center bubble in sight glass and record measurement.

This measurement will give you the transmission or Output Yoke Angle (A).

J9216-13

Fig. 4 Front (Output) Angle Measurement (A)

- 1 - SLIP YOE BEARING CAP
2 - INCLINOMETER

(4) Rotate propeller shaft 90 degrees and place Inclinator on yoke bearing parallel to the shaft (Fig. 5). Center bubble in sight glass and record measurement. This measurement can also be taken at the rear end of the shaft.

This measurement will give you the Propeller Shaft Angle (C).

(5) Subtract smaller figure from larger (C minus A) to obtain Transmission Output Operating Angle.

(6) Rotate propeller shaft 90 degrees and place Inclinator on pinion yoke bearing parallel to the shaft (Fig. 6). Center bubble in sight glass and record measurement.

This measurement will give you the pinion shaft or Input Yoke Angle (B).

(7) Subtract smaller figure from larger (C minus B) to obtain axle Input Operating Angle.

Refer to rules given below and the example in (Fig. 7) for additional information.

- Good cancellation of U-joint operating angles (within 1°).

- Operating angles less than 3°.
- At least 1/2 of one degree continuous operating (propeller shaft) angle.

Front Shaft Axle Yoke	19	14	-
Rear Shaft Axle Yoke	29	22	-

SPECIAL TOOLS

PROPELLER SHAFT

Inclinometer - 7663

Bearing Splitter - 1130

Installer, Bearing - 6052

PROPELLER SHAFT - FRONT

REMOVAL

(1) Shift the transmission and transfer case to their neutral positions.

(2) Raise and support vehicle and remove skid plate, if equipped.

(3) Mark a line across the companion flange at the transfer case and propeller shaft flange yoke for installation reference.

(4) Mark a line across the propeller shaft yoke and the pinion shaft yoke for installation reference.

(5) Remove the universal joint strap bolts at the pinion shaft yoke (Fig. 9).

(6) Remove the bolts holding the propeller shaft to the transfer case companion flange.

(7) Remove the propeller shaft.

Fig. 9 Front Propeller Shaft

- 3 - AXLE YOKE
- 4 - SLIP YOKE BOOT
- 5 - STRAP
- 6 - FLANGE YOKE/COMPANION FLANGE

PROPELLER SHAFT - FRONT (Continued)

INSTALLATION

- (1) Position front propeller shaft under vehicle with rear universal joint over the transfer case companion flange.
- (2) Place front universal joint into the axle pinion yoke.
- (3) Align the mark on the flange yoke to the mark on the transfer case companion flange.
- (4) Loosely install bolts to hold universal joint to transfer case companion flange.
- (5) Align mark on front universal joint to the mark on the axle pinion yoke.
- (6) Install bolts to hold front universal joint to axle pinion yoke. Tighten bolts to 19 N·m (14 ft. lbs.).
- (7) Tighten bolts to hold universal joint to transfer case companion flange to 88 N·m (65 ft. lbs.).
- (8) Install skid plate, if equipped.
- (9) Lower vehicle and road test to verify repair.

PROPELLER SHAFT - REAR

REMOVAL

- (1) Shift transmission into Neutral.
- (2) Raise and support vehicle on safety stands.
- (3) Mark a line across the axle pinion yoke or companion flange and propeller shaft or flange yoke for installation reference.
- (4) Mark the outline of the center bearing on the frame crossmember for installation reference, if equipped.
- (5) Remove bolts that attach the center bearing to the support bracket (Fig. 10), if equipped.
- (6) Remove the bolts holding the universal joint clamps to the pinion yoke (Fig. 11).
- (7) Slide the slip yoke off of the transmission, or transfer case, output shaft and remove the propeller shaft (Fig. 11).

INSTALLATION

- (1) Slide the slip yoke onto the transmission or transfer case output shaft.
- (2) Align the reference marks on the propeller shaft yoke/flange yoke and pinion yoke/companion flange.
- (3) Align and install the center bearing to the support bracket, if necessary.
- (4) Install the bolts and tighten to 68 N·m (50 ft. lbs.).
- (5) Position universal joint into pinion yoke and tighten strap bolts to 29 N·m (22 ft. lbs.).
- (6) Lower the vehicle.

CENTER BEARING

REMOVAL

- (1) Remove rear propeller shaft.
- (2) Remove slip joint boot clamp and separate the two half-shafts.
- (3) Use hammer and punch to tap slinger away from shaft to provide room for bearing splitter.
- (4) Position Bearing Splitter Tool 1130 between slinger and shaft.

CAUTION: Do not damage shaft spline during removal of center bearing.

- (5) Set shaft in press and press bearing off the shaft.

INSTALLATION

NOTE: Two types of center bearings are used and are not interchangeable. Install the same type as the vehicle was built with.

- (1) Install new slinger on shaft and drive into position with appropriate installer tool.
- (2) Install new center bearing on shaft with Bearing Installer Tool 6052. Drive on shaft with hammer until bearing is seated.
- (3) Clean shaft splines and apply a coat of multi-purpose grease.
- (4) Align master splines and slide front and rear half-shafts together. Reposition slip yoke boot and install new clamp.
- (5) Install propeller shaft in vehicle.

ADJUSTMENTS

ADJUSTMENT - CENTER BEARING

Launch shudder is a vibration that occurs at first acceleration from a stop. Shudder vibration usually peaks at the engines highest torque output. Shudder is a symptom associated with vehicles using a two-piece propeller shaft. To decrease shudder, lower the center bearing in 1/8 inch increments. Use shim stock or fabricated plates. Plate stock must be used to maintain compression of the rubber insulator around the bearing. Do not use washers. Replace the original bolts with the appropriate increased length bolts.

SINGLE CARDAN UNIVERSAL JOINTS

DISASSEMBLY

Individual components of cardan universal joints are not serviceable. If worn or leaking, they must be replaced as an assembly.

- (1) Remove the propeller shaft.
- (2) With a soft drift, tap the outside of the bearing cap assembly to loosen snap ring.
- (3) Remove snap rings from both sides of yoke (Fig. 12).

Fig. 12 Remove Snap Ring

1 - SNAP RING

- (4) Set the yoke in an arbor press or vise with a socket whose inside diameter is large enough to receive the bearing cap positioned beneath the yoke.

- (5) Position the yoke with the grease fitting, if equipped, pointing up.

- (6) Place a socket with an outside diameter smaller than the upper bearing cap on the upper bearing cap and press the cap through the yoke to release the lower bearing cap (Fig. 13).

SINGLE CARDAN UNIVERSAL JOINTS (Continued)

**Fig. 13 Press Out Bearing**

- 1 - PRESS
2 - SOCKET

**Fig. 14 Press Out Remaining Bearing**

- 1 - CROSS
2 - BEARING CAP

(7) If the bearing cap will not pull out of the yoke by hand after pressing, tap the yoke ear near the bearing cap to dislodge the cap.

(8) Turn the yoke over and straighten the cross in the open hole. Carefully press the end of the cross until the remaining bearing cap can be removed (Fig. 14).

CAUTION: If cross or bearing cap are not straight during installation, the bearing cap will score the walls of the yoke bore and damage can occur.

ASSEMBLY

CAUTION: If the cross or bearing cap are not straight during installation, the bearing cap will score the walls of the yoke bore and damage can occur.

(1) Apply extreme pressure (EP) N.L.G.I. Grade 1 or 2 grease to inside of yoke bores to aid in installation.

(2) Position the cross in the yoke with its lube fitting if equipped, pointing up (Fig. 15).

**Fig. 15 Install Cross In Yoke**

- 1 - CROSS
2 - YOKE

SINGLE CARDAN UNIVERSAL JOINTS (Continued)

(3) Place a bearing cap over the trunnion and align the cap with the yoke bore (Fig. 16). Keep the needle bearings upright in the bearing assembly.

Fig. 16 Install Bearing On Trunnion

- 1 - BEARING CAP
2 - TRUNNION

(4) Press the bearing cap into the yoke bore enough to install a snap ring.

(5) Install a snap ring.

(6) Repeat Step 3 and Step 4 to install the opposite bearing cap. If the joint is stiff or binding, strike the yoke with a soft hammer to seat the needle bearings.

(7) Add grease to lube fitting, if equipped.

(8) Install the propeller shaft.

DOUBLE CARDAN UNIVERSAL JOINTS

DISASSEMBLY

NOTE: Individual components of cardan universal joints are not serviceable they must be replaced as an assembly.

(1) Remove the propeller shaft.

(2) Mark the propeller shaft, link yoke and flange yoke for assembly reference.

(3) Tap the outside of the bearing cap assembly with drift to loosen snap rings.

(4) Remove all the bearing cap snap rings (Fig. 17).

(5) Remove any grease fittings if equipped.

J9316-5

Fig. 17 SNAP RINGS

(6) Position a socket on the press with an inside diameter large enough to receive the bearing cap under the link yoke.

(7) Place another socket with an outside diameter smaller than the bearing cap on the upper bearing cap.

(8) Press one bearing cap from the outboard side of the link yoke enough to grasp the cap with vise jaws (Fig. 18).

J9316-6

Fig. 18 PRESS OUT BEARING

DOUBLE CARDAN UNIVERSAL JOINTS (Continued)

(9) Grasp protruding bearing cap with vise jaws and tap link yoke with a mallet and drift to remove bearing cap (Fig. 19).

J9316-7

Fig. 19 REMOVE BEARING FROM YOKE

(10) Flip assembly and repeat Step 6, Step 7, Step 8 and Step 9 to remove the opposite bearing cap.

(11) Remove the cross centering kit assembly and spring (Fig. 20).

J9316-8

Fig. 20 REMOVE CENTERING KIT

(12) Press the remaining bearing caps out the other end of the link yoke as described above to complete the disassembly.

ASSEMBLY

CAUTION: All alignment marks on the link yoke and propeller shaft yoke must be aligned during assembly.

(1) Apply extreme pressure (EP) N.L.G.I. Grade 1 or 2 grease to inside of yoke bores.

(2) Fit a cross into the propeller shaft yoke (Fig. 21).

J9316-9

Fig. 21 INSTALL CROSS IN YOKE

(3) Place a bearing cap over the trunnion and align the cap with the yoke bore (Fig. 22). Keep needle bearings upright in the bearing cap.

J9316-10

Fig. 22 INSTALL BEARING CAP

DOUBLE CARDAN UNIVERSAL JOINTS (Continued)

(4) Press bearing cap into the yoke bore enough to clear snap ring groove (Fig. 23).

(5) Install a snap ring.

Fig. 23 PRESS BEARING CAP

(6) Flip propeller shaft yoke and install other bearing cap onto the opposite trunnion and install a snap ring (Fig. 24).

Fig. 24 PRESS BEARING CAP

(7) Fit the link yoke onto the remaining trunnions and press both bearing caps into place and install snap rings (Fig. 25).

Fig. 25 INSTALL LINK YOKE

(8) Install centering kit assembly inside the link yoke (Fig. 26).

NOTE: Making sure the spring is properly positioned.

Fig. 26 CENTERING KIT

DOUBLE CARDAN UNIVERSAL JOINTS (Continued)

(9) Place two bearing caps on opposite trunnions of the remaining cross. Fit the open trunnions into the link yoke bores and the bearing caps into the centering kit (Fig. 27).

J9316-15

Fig. 27 REMAINING CROSS

(10) Press the remaining two bearing caps into place and install snap rings (Fig. 28).

J9316-16

Fig. 28 PRESS BEARING CAP

(11) Tap the snap rings to seat them into the grooves (Fig. 29).

J9316-17

Fig. 29 SEAT SNAP RINGS

(12) Verify for proper assembly. Flexing the joint beyond center, the joint should snap over-center in both directions if correctly assembled (Fig. 30).

J9316-18

Fig. 30 VERIFY ASSEMBLY

(13) Install the propeller shaft.

FRONT AXLE - 248FBI

DESCRIPTION

The Front Beam-design Iron (FBI) axle consists of a cast iron center casting differential housing with axle shaft tubes extending from each side. The tubes are pressed into the differential housing and welded. The axles is equipped with semi-floating axle shafts, meaning that loads are supported by the hub bearings.

The differential case is a one-piece design. Differential bearing preload and ring gear backlash is adjusted by the use of shims located between the differential bearing cones and case. Pinion bearing pre-

load is set and maintained by the use of a collapsible spacer. The stamped steel cover provides a means for inspection and servicing the differential.

OPERATION

The axle receives power from the transfer case through the front propeller shaft. The front propeller shaft is connected to the pinion gear which rotates the differential through the gear mesh with the ring gear bolted to the differential case. The engine power is transmitted to the axle shafts through the pinion mate and side gears. The side gears are splined to the axle shafts.

FRONT AXLE - 248FBI (Continued)

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it (Fig. 1).

J9303-13

Fig. 1 DIFFERENTIAL-STRAIGHT AHEAD DRIVING

- 1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
- 2 - PINION GEAR
- 3 - SIDE GEAR
- 4 - PINION GEARS ROTATE WITH CASE

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds (Fig. 2). In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

DIAGNOSIS AND TESTING - AXLE**GEAR NOISE**

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the

J9303-14

Fig. 2 DIFFERENTIAL-ON TURNS

- 1 - PINION GEARS ROTATE ON PINION SHAFT

peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

FRONT AXLE - 248FBI (Continued)

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

(Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 3. End-play in pinion bearings. 4. Excessive gear backlash between the ring gear and pinion. 5. Improper adjustment of pinion gear bearings. 6. Loose pinion yoke nut. 7. Scuffed gear tooth contact surfaces. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary. 3. Refer to pinion pre-load information and correct as necessary. 4. Check adjustment of the ring gear and pinion backlash. Correct as necessary. 5. Adjust the pinion bearings pre-load. 6. Tighten the pinion yoke nut. 7. Inspect and replace as necessary.

FRONT AXLE - 248FBI (Continued)

Condition	Possible Causes	Correction
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal. 6. Remove, clean, and re-seal cover.
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.

FRONT AXLE - 248FBI (Continued)

Condition	Possible Causes	Correction
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	<ol style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Mis-aligned or sprung ring gear. 8. Loose differential bearing cap bolts. 9. Housing not machined properly. 	<ol style="list-style-type: none"> 1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove wheels and tires.
- (3) Remove brake calipers and rotors. Refer to 5 Brakes for procedures.
- (4) Remove ABS wheel speed sensors, if equipped. Refer to 5 Brakes for procedures.
- (5) Disconnect axle vent hose.
- (6) Disconnect vacuum hose and electrical connector at disconnect housing.
- (7) Remove front propeller shaft.
- (8) Disconnect stabilizer bar links at the axle brackets.
- (9) Disconnect shock absorbers from axle brackets.
- (10) Disconnect track bar from the axle bracket.
- (11) Disconnect tie rod and drag link from the steering knuckles.
- (12) Position suitable lifting device under the axle assembly.

- (13) Secure axle to lifting device.
- (14) Mark suspension alignment cams for installation reference.
- (15) Disconnect upper and lower suspension arms from the axle bracket.
- (16) Lower the axle. The coil springs will drop with the axle.
- (17) Remove the coil springs from the axle bracket.

INSTALLATION

CAUTION: Suspension components with rubber bushings should be tightened with the weight of the vehicle on the suspension, at normal height. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur. Rubber bushings must never be lubricated.

- (1) Support the axle on a suitable lifting device.

FRONT AXLE - 248FBI (Continued)

- (2) Secure axle to lifting device.
- (3) Position the axle under the vehicle.
- (4) Install springs, retainer clip and bolts.
- (5) Raise axle and align it with the spring pads.
- (6) Position upper and lower suspension arms in the axle brackets. Install bolts, nuts and align the suspension alignment cams to the reference marks. Do not tighten at this time.
- (7) Connect track bar to the axle bracket and install the bolt. Do not tighten at this time.
- (8) Install shock absorber and tighten bolts to 121 N·m (89 ft. lbs.).
- (9) Install stabilizer bar link to the axle bracket. Tighten the nut to 37 N·m (27 ft. lbs.).
- (10) Install drag link and tie rod to the steering knuckles and tighten the nuts to 88 N·m (65 ft. lbs.).
- (11) Install ABS wheel speed sensors, if equipped. Refer to 5 Brakes for procedures.
- (12) Install rotors and brake calipers, refer to 5 Brakes for procedures.
- (13) Connect the vent hose to the tube fitting.
- (14) Connect vacuum hose and electrical connector to disconnect housing.
- (15) Install front propeller shaft.
- (16) Check and add differential lubricant, if necessary. Refer to Lubricant Specifications for lubricant requirements.
- (17) Install wheel and tire assemblies.
- (18) Remove supports and lower the vehicle.
- (19) Tighten upper suspension arm nuts at axle to 121 N·m (89 ft. lbs.). Tighten upper suspension arm nuts at frame to 84 N·m (62 ft. lbs.).
- (20) Tighten lower suspension arm nuts at axle to 84 N·m (62 ft. lbs.). Tighten the lower suspension arm nuts at frame to 119 N·m (88 ft. lbs.).
- (21) Tighten track bar bolt at the axle bracket to 176 N·m (130 ft. lbs.).
- (22) Check front wheel alignment.

ADJUSTMENTS

Ring and pinion gears are supplied as matched sets only. The identifying numbers for the ring and pinion gear are etched into the face of each gear (Fig. 3). A plus (+) number, minus (-) number or zero (0) is etched into the face of the pinion gear. This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard setting from the center line of the ring gear to the back face of the pinion is 127 mm (5.00 in.). The standard depth provides the best gear tooth contact pattern. Refer to Backlash and Contact Pattern in this section for additional information.

**Fig. 3 PINION GEAR ID NUMBERS**

- 1 - PRODUCTION NUMBERS
- 2 - PINION GEAR DEPTH VARIANCE
- 3 - GEAR MATCHING NUMBER

Compensation for pinion depth variance is achieved with a select shim/slinger. The shims are placed between the rear pinion bearing and the pinion gear head (Fig. 4).

80c07134

Fig. 4 SHIM LOCATIONS

- 1 - PINION GEAR DEPTH SHIM/SLINGER
- 2 - DIFFERENTIAL BEARING SHIM

FRONT AXLE - 248FBI (Continued)

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion. Add or subtract this number from the thickness of the original depth shim/oil slinger to compensate for the difference in the depth variances. Refer to the Depth Variance chart.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

Note the etched number on the face of the pinion gear head (-1, -2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim. If the number is 0 no change is necessary.

PINION GEAR DEPTH VARIANCE

- 7 - SCOOTER BLOCK
- 8 - ARBOR DISC

(1) Assemble Pinion Height Block 6739, Pinion Block 6736 and rear pinion bearing onto Screw 6741 (Fig. 5).

(2) Insert assembled height gauge components, rear bearing and screw into the housing through pinion bearing cups (Fig. 6).

(3) Install front pinion bearing and Cone-nut 6740 hand tight (Fig. 5).

(4) Place Arbor Disc 6732 on Arbor D-115-3 in position in the housing side bearing cradles (Fig. 7).

NOTE: Arbor Discs 6732 has different step diameters to fit other axles. Choose proper step for axle being serviced.

(5) Install differential bearing caps on arbor discs and snug the bearing cap bolts. Then cross tighten cap bolts to 108 N·m (80 ft. lbs.).

(6) Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

J9403-39

Fig. 6 PINION HEIGHT BLOCK

J9403-37

Fig. 7 GAUGE TOOLS IN HOUSING

- 1 - ARBOR DISC
- 2 - PINION BLOCK
- 3 - ARBOR
- 4 - PINION HEIGHT BLOCK

(7) Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator.

(8) Slowly slide the scooter block across the pinion height block over to the arbor (Fig. 8). Move the scooter block till dial indicator crests the arbor, then record the highest reading.

(9) Select a shim/slinger equal to the dial indicator reading plus the pinion depth variance number etched in the face of the pinion (Fig. 3). For example, if the depth variance is -2, add +0.002 in. to the dial indicator reading.

FRONT AXLE - 248FBI (Continued)

**Fig. 8 PINION GEAR DEPTH MEASUREMENT**

- 1 - ARBOR
- 2 - SCOOTER BLOCK
- 3 - DIAL INDICATOR

DIFFERENTIAL SIDE BEARING PRELOAD AND GEAR BACKLASH

Differential side bearing preload and gear backlash is achieved by selective shims positioned behind the differential side bearing cones. The proper shim thickness can be determined using slip-fit Dummy Bearings D-343 in place of the differential side bearings and a Dial Indicator C-3339. Before proceeding with the differential bearing preload and gear backlash measurements, measure the pinion gear depth and prepare the pinion for installation. Establishing proper pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After the overall shim thickness to take up differential side play is measured, the pinion is installed, and the gear backlash shim thickness is measured. The overall shim thickness is the total of the dial indicator reading and the preload specification added together. The gear backlash measurement determines the thickness of the shim used on the ring gear side of the differential case. Subtract the gear backlash shim thickness from the total overall shim thickness and select that amount for the pinion gear side of the differential (Fig. 9). Differential shim measurements are performed with spreader W-129-B removed.

SHIM SELECTION

NOTE: It is difficult to salvage the differential side bearings during the removal procedure. Install replacement bearings if necessary.

(1) Remove differential side bearings from differential case.

80c07134

Fig. 9 SHIM LOCATIONS

- 1 - PINION GEAR DEPTH SHIM/SLINGER
- 2 - DIFFERENTIAL BEARING SHIM

- (2) Remove factory installed shims from differential case.
- (3) Install ring gear on differential case and tighten bolts to specification.
- (4) Install dummy side bearings D-343 on differential case.
- (5) Install differential case in the housing.
- (6) Install the marked bearing caps in their correct positions and snug the bolts (Fig. 10).

80a534d1

Fig. 10 BEARING CAP BOLTS

- 1 - BEARING CAP
- 2 - DIFFERENTIAL HOUSING
- 3 - DIFFERENTIAL CASE

FRONT AXLE - 248FBI (Continued)

(7) Using a dead-blow hammer, seat the differential dummy bearings to each side of the housing (Fig. 11) and (Fig. 12).

80a534d2

- 4 - DIAL INDICATOR FACE

FRONT AXLE - 248FBI (Continued)

(11) Push and hold differential case to ring gear side of the housing and record the dial indicator reading (Fig. 15).

80a534d5

Fig. 15 DIFFERENTIAL CASE RING GEAR SIDE

- 1 - DIAL INDICATOR
- 2 - DIFFERENTIAL CASE TO RING GEAR SIDE
- 3 - DIFFERENTIAL HOUSING

(12) Add 0.38 mm (0.015 in.) to the zero end play total. This total represents the thickness of shims needed to preload the new bearings when the differential is installed.

(13) Rotate dial indicator out of the way on the pilot stud.

(14) Remove differential case and dummy bearings from the housing.

(15) Install the pinion gear in the housing. Install the pinion yoke and establish the correct pinion rotating torque.

(16) Install differential case and dummy bearings D-343 in the housing (without shims), install bearing caps and tighten bolts snug.

(17) Seat ring gear side dummy bearing (Fig. 12).

(18) Position dial indicator plunger on a flat surface between the ring gear bolt heads (Fig. 13).

(19) Push and hold differential case toward pinion gear and zero the dial indicator (Fig. 16).

(20) Push and hold differential case to ring gear side of the housing and record dial indicator reading (Fig. 17). This is the shim thickness needed on the ring gear side of the differential case for proper backlash.

(21) Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the housing.

(22) Rotate dial indicator out of the way on pilot stud.

(23) Remove differential case and dummy bearings from the housing.

80a534d7

Fig. 16 DIFFERENTIAL CASE PINION GEAR SIDE

80a534d8

Fig. 17 DIFFERENTIAL CASE RING GEAR SIDE

- 1 - DIAL INDICATOR
- 2 - DIFFERENTIAL CASE TO RING GEAR SIDE
- 3 - PINION GEAR
- 4 - DIFFERENTIAL HOUSING
- 5 - DIFFERENTIAL CASE

(24) Install selected side bearing shims onto the differential case hubs.

(25) Install side bearings on differential case hubs with Install C-4487-1 and Handle C-4171.

(26) Install bearing cups on differential.

(27) Install Spreader W-129-B and some items from Adapter Set 6987 on the housing and spread open enough to receive differential case.

FRONT AXLE - 248FBI (Continued)

CAUTION: Never spread housing over 0.50 mm (0.020 in.). The housing can be damaged if over-spread.

- (28) Install differential case into the housing.
- (29) Remove spreader from the housing.
- (30) Rotate differential case several times to seat the side bearings.
- (31) Position indicator plunger against a ring gear tooth (Fig. 18).
- (32) Push and hold ring gear upward while not allowing the pinion gear to rotate.
- (33) Zero dial indicator face to pointer.
- (34) Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other (Fig. 19).

(35) Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

Fig. 18 RING GEAR BACKLASH

1 - DIAL INDICATOR

Fig. 19 BACKLASH SHIM

GEAR CONTACT PATTERN

The ring and pinion gear contact patterns will show if the pinion depth is correct. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

(1) Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.

(2) Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.

(3) With a boxed end wrench on the ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeeze the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart (Fig. 20) and adjust pinion depth and gear backlash as necessary.

- (1) Raise and support the vehicle.
- (2) Remove wheel and tire assembly.
- (3) Remove brake caliper, rotor and ABS wheel speed sensor if equipped. Refer to 5 Brakes for procedures.
- (4) Remove the cotter pin and axle hub nut.
- (5) Remove hub bearing bolts (Fig. 21) and remove hub bearing from the steering knuckle.

J9402-58

Fig. 21 HUB AND KNUCKLE

- 1 - KNUCKLE
2 - HUB BEARING

- (6) Remove brake dust shield from knuckle.
- (7) Remove axle shaft from the housing. Avoid damaging the axle shaft oil seal.

INSTALLATION

- (1) Clean axle shaft and apply a thin film of Mopar Wheel Bearing Grease to the shaft splines, seal contact surface, hub bore.
- (2) Install axle shaft into the housing and differential side gears. Avoid damaging axle shaft oil seals in the differential.
- (3) Install dust shield and hub bearing on knuckle.
- (4) Install hub bearing bolts and tighten to 170 N·m (125 ft. lbs.).
- (5) Install axle washer and nut, tighten nut to 237 N·m (175 ft. lbs.). Align nut to next cotter pin hole and install new cotter pin.
- (6) Install ABS wheel speed sensor, brake rotor and caliper. Refer to Brakes for proper procedures.
- (7) Install wheel and tire assembly.
- (8) Remove support and lower the vehicle.

AXLE SHAFTS - INTERMEDIATE

REMOVAL

- (1) Remove vacuum shift motor housing.
- (2) Remove outer axle shaft.
- (3) Remove inner axle shaft seal from the shift motor housing with a long drift or punch. Be careful not to damage housing.
- (4) Remove intermediate axle shaft and shift collar.
- (5) Assemble intermediate axle shaft bushing tools (Fig. 22).
- (6) Remove intermediate axle shaft bushing.

CAUTION: Apply all-purpose lubricant to the axle shaft splines to prevent damage to the seal during axle shaft installation.

- (8) Insert axle shaft into the tube and engage the splined end of the shaft with the shift collar.
- (9) Install the vacuum shift motor housing.

AXLE SHAFT SEALS

REMOVAL

- (1) Remove hub bearings and axle shafts.
- (2) Remove axle shaft seal from the differential housing with a long drift or punch. **Be careful not to damage housing.**
- (3) Clean the inside perimeter of the differential housing with fine crocus cloth.

INSTALLATION

- (1) Apply a light film of oil to the inside lip of the new axle shaft seal.
- (2) Install the inner axle seal (Fig. 25).

AXLE VACUUM MOTOR

DESCRIPTION

The disconnect axle control system consists of:

- Shift motor.
- Indicator switch.
- Vacuum switch.
- Vacuum harness (Fig. 26).

J9202-55

Fig. 26 VACUUM CONTROL SYSTEM

- 1 - CHECK VALVE
- 2 - CONTROL SWITCH ON TRANSFER CASE
- 3 - AIR VENT FILTER
- 4 - AXLE SHIFT MOTOR
- 5 - INDICATOR SWITCH

OPERATION

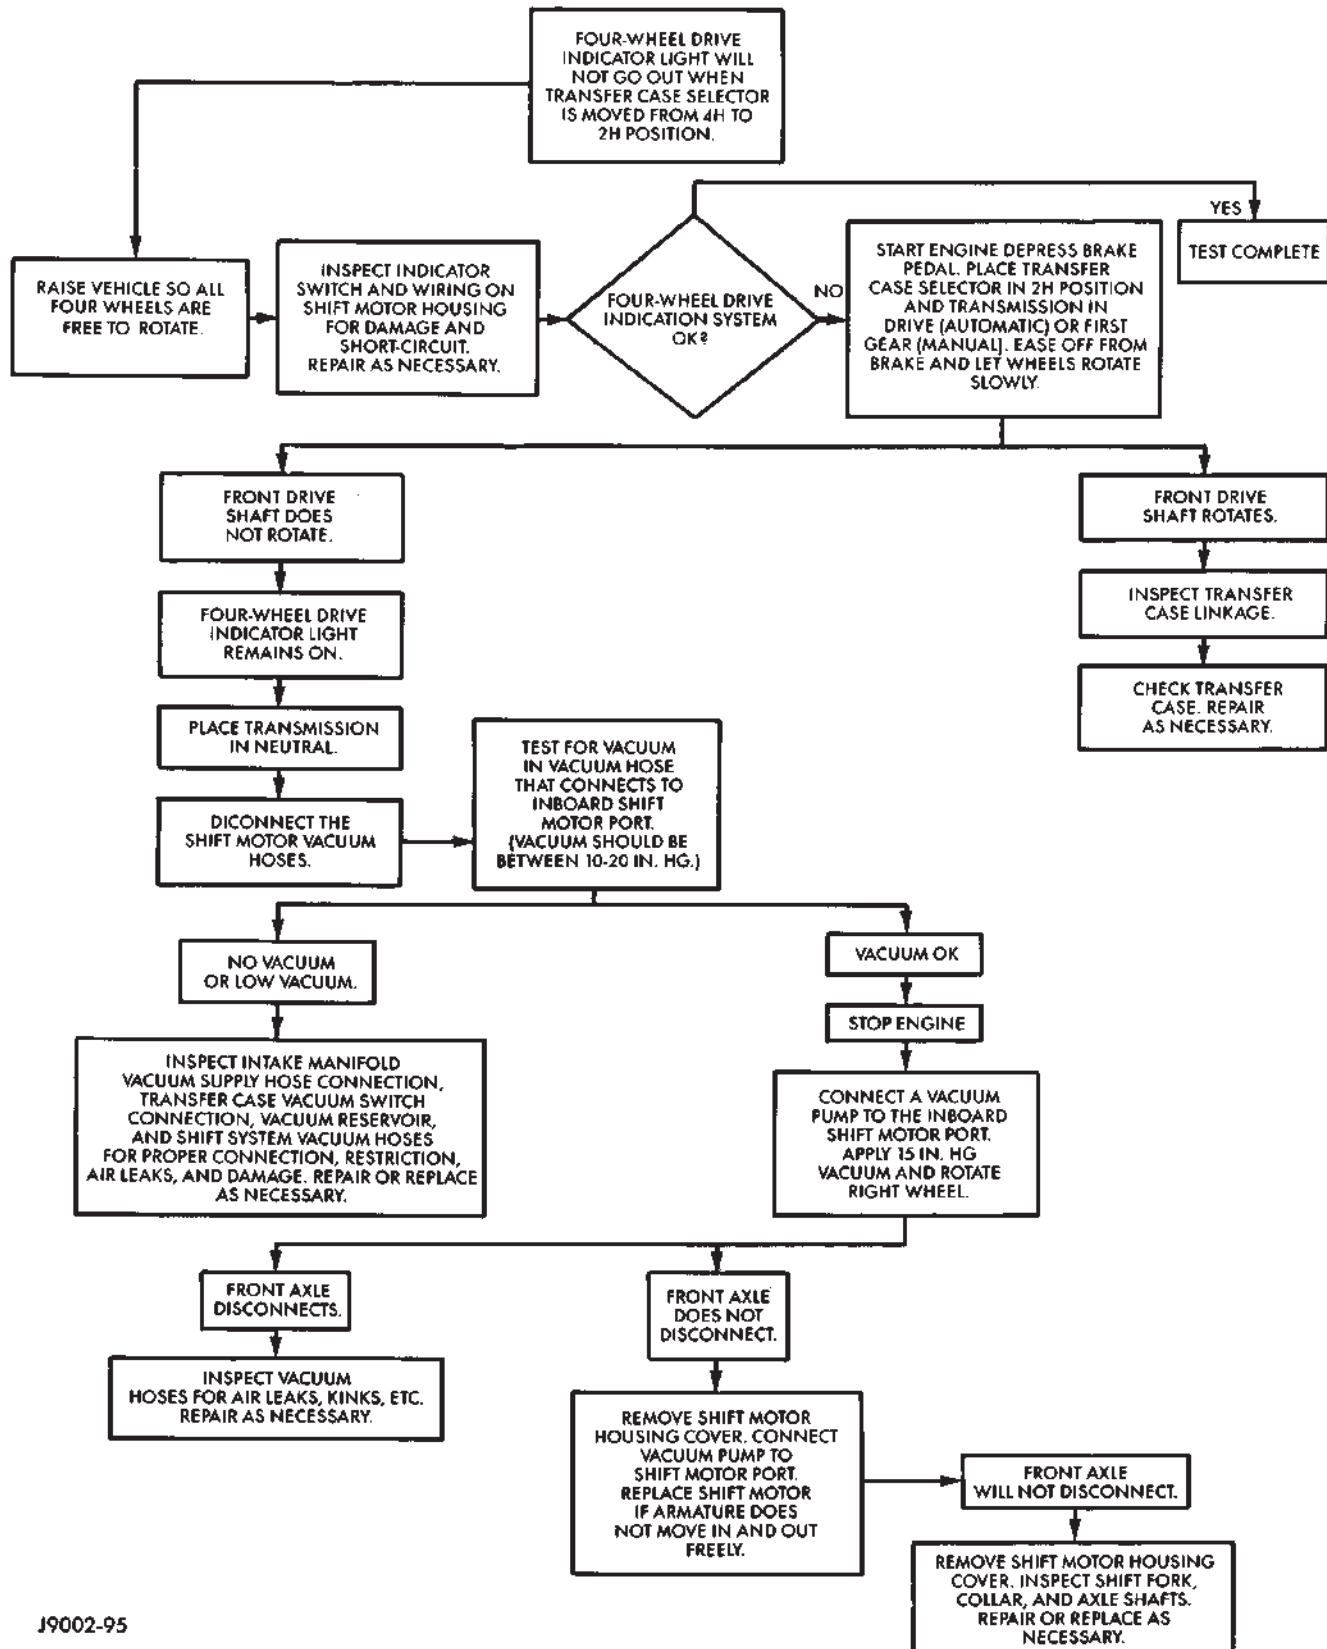

The shift motor receives a vacuum signal from the switch mounted on the transfer case when the vehicle operator wants to switch from two wheel drive mode to four wheel drive mode, or vice versa. When this signal is received, the shift motor begins to move the shift fork and collar within the axle housing. In the four wheel drive mode, the shift collar connects the axle intermediate shaft to the axle shaft to supply engine power to both front wheels. In two wheel drive mode, the shift collar is disengaged from the intermediate shaft and the intermediate shaft is allowed to free-spin. When the two shafts are disengaged, the load on the engine is reduced, thereby providing better fuel economy and road handling.

- 6 - SHIFT COLLAR
- 7 - SHIFT FORK
- 8 - BEARING
- 9 - INTERMEDIATE AXLE SHAFT

DISASSEMBLY

- (1) Remove E-clips from the shift motor housing and shaft. Remove shift motor and shift fork from the housing (Fig. 28).
- (2) Remove O-ring seal from the shift motor shaft.
- (3) Clean and inspect all components. Replace any component that is excessively worn or damaged.

ASSEMBLY

- (1) Install a new O-ring seal on the shift motor shaft.
- (2) Insert shift motor shaft through the hole in the housing and shift fork. The shift fork offset should be toward the differential.
- (3) Install E-clips on the shift motor shaft and housing.

INSTALLATION

- (1) Install shift motor housing gasket.
- (2) Guide the shift fork onto the shift collar groove, while install the shift motor housing cover.
- (3) Install shift motor housing shield and tighten the bolts to 11 N·m (96 in. lbs.).

**Fig. 28 SHIFT MOTOR COMPONENTS**

- 2 - E-CLIP
- 3 - O-RING
- 4 - SHIFT MOTOR
- 5 - SHIFT FORK
- 6 - VACUUM PORTS
- 7 - DISCONNECT HOUSING AND GASKET

(4) Add 148 ml (5 ounces) of API grade GL 5 hypoid gear lubricant to the shift motor housing. Add lubricant through indicator switch mounting hole.

(5) Install indicator switch, electrical connector and vacuum harness.

SINGLE CARDAN UNIVERSAL JOINTS

REMOVAL

Single cardan U-joint components are not serviceable. If defective they must be replaced as a unit.

CAUTION: Clamp only the narrow forged portion of the yoke in the vise. To avoid distorting the yoke, do not over tighten the vise jaws.

- (1) Remove axle shaft.
- (2) Remove the bearing cap retaining snap rings (Fig. 29).

NOTE: Saturate the bearing caps with penetrating oil prior to removal.

(3) Locate a socket with an inside diameter is larger than the bearing cap. Place the socket (receiver) against the yoke and around the perimeter of the bearing cap to be removed.

(4) Locate a socket with an outside diameter is smaller than the bearing cap. Place the socket (driver) against the opposite bearing cap.

SINGLE CARDAN UNIVERSAL JOINTS (Continued)

J8902-15

- 3 - SNAP RINGS
- 4 - BEARING CAP
- 5 - SPINDLE YOKE
- 6 - BEARING
- 7 - BEARING CAP
- 8 - SNAP RINGS
- 9 - BEARING CAP

(5) Position the yoke with the sockets in a vise (Fig. 30).

(6) Tighten the vise jaws to force the bearing cap into the larger socket (receiver).

(7) Release the vise jaws. Remove the sockets and bearing cap that was partially forced out of the yoke.

(8) Repeat the above procedure for the remaining bearing cap and remove spider from the propeller shaft yoke.

INSTALLATION

(1) Pack the bearing caps 1/3 full of wheel bearing lubricant. Apply extreme pressure (EP), lithium-base lubricant to aid in installation.

(2) Position the spider in the yoke. Insert the seals and bearings. Tap the bearing caps into the yoke bores far enough to hold the spider in position.

(3) Place the socket (driver) against one bearing cap. Position the yoke with the socket in a vise.

(4) Tighten the vise to force the bearing caps into the yoke. Force the caps enough to install the retaining clips.

(5) Install the bearing cap retaining clips.

(6) Install axle shaft.

J8902-16

Fig. 30 YOKE BEARING CAP

- 1 - LARGE-DIAMETER SOCKET WRENCH

PINION SEAL**REMOVAL**

(1) Raise and support the vehicle.

(2) Remove wheel and tire assemblies.

(3) Remove brake calipers and rotors

(4) Mark the propeller shaft and pinion yoke for installation reference.

(5) Remove the propeller shaft from the yoke.

(6) Rotate the pinion gear three or four times.

(7) Measure the amount of torque necessary to rotate the pinion gear with a (in. lbs.) dial-type torque wrench. Record the torque reading for installation reference.

(8) Remove the pinion yoke nut and washer. Use Remover C-452 and Wrench C-3281 to remove the pinion yoke (Fig. 31).

(9) Use suitable pry tool or slide hammer mounted screw to remove the pinion shaft seal.

INSTALLATION

(1) Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with an appropriate installer (Fig. 32).

(2) Install yoke on the pinion gear with Installer C-3718 and Holder 6719 (Fig. 33).

CAUTION: Do not exceed the minimum tightening torque when installing the pinion yoke retaining nut. Damage to collapsible spacer or bearings may result.

PINION SEAL (Continued)

**Fig. 33 PINION YOKE**

- 1 - INSTALLER
- 2 - YOKE HOLDER

**Fig. 32 Pinion Seal Installation**

- 1 - HANDLE
- 2 - INSTALLER

(3) Install a new nut on the pinion gear. Tighten the nut only enough to remove the shaft end play.

(4) Rotate the pinion shaft using an inch pound torque wrench. Rotating torque should be equal to the reading recorded during removal, plus an additional 0.56 N·m (5 in. lbs.) (Fig. 34).

(5) If the rotating torque is too low, use Holder 6719 to hold the pinion yoke (Fig. 35), and tighten the pinion shaft nut in 6.8 N·m (5 ft. lbs.) until proper rotating torque is achieved.

(6) Align the installation reference marks and attach the propeller shaft to the yoke.

(7) Check and add lubricant to axle, if necessary. Refer to Lubricant Specifications in this section for lubricant requirements.

(8) Install brake rotors and calipers.

(9) Install wheel and tire assemblies.

(10) Lower the vehicle.

DIFFERENTIAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove lubricant fill hole plug from the differential housing cover.
- (3) Remove differential housing cover and drain the lubricant from the housing.
- (4) Clean the housing cavity with a flushing oil, light engine oil or lint free cloth. **Do not use water, steam, kerosene or gasoline for cleaning.**
- (5) Remove hub bearings and axle shafts.
- (6) Note the installation reference letters stamped on the bearing caps and housing machined sealing surface (Fig. 36).
- (7) Remove the differential bearing caps.
- (8) Position Spreader W-129-B with the tool dowel pins seated in the locating holes (Fig. 37).
- (9) Install the hold down clamps and tighten the spreader turnbuckle finger-tight.
- (10) Install Pilot Stud C-3288-B to the left side of the differential housing and attach dial indicator to the pilot stud. Load the indicator plunger against the opposite side of the housing (Fig. 37) and zero the dial indicator.
- (11) Spread the housing enough to remove the case from the housing. Measure the distance with the dial indicator (Fig. 37).

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If the housing is over-spread it could be distorted or damaged.

- (12) Remove the dial indicator.

**Fig. 37 SPREAD DIFFERENTIAL HOUSING**

- 1 - SPREADER

DIFFERENTIAL (Continued)

(13) Pry the differential case loose from the housing. To prevent damage, pivot on housing with the end of the pry bar against spreader (Fig. 38).

Fig. 38 DIFFERENTIAL REMOVAL

- 1 - DIFFERENTIAL
- 2 - PRY BAR

(14) Remove the case from housing.

(15) Remove and tag bearing cups to indicate their location.

DISASSEMBLY

- (1) Remove roll-pin holding mate shaft in housing.
- (2) Remove pinion gear mate shaft (Fig. 39).
- (3) Rotate differential side gears and remove pinion mate gears and thrust washers (Fig. 40).
- (4) Remove differential side gears and thrust washers.

ASSEMBLY

- (1) Install differential side gears and thrust washers.
- (2) Install pinion mate gears and thrust washers.
- (3) Install pinion gear mate shaft.
- (4) Align hole in the pinion gear mate shaft with hole in the differential case.
- (5) Install and seat pinion mate shaft roll-pin in the differential case and mate shaft with a punch and hammer (Fig. 41). Peen the edge of the roll-pin hole in the differential case slightly in two places 180° apart.
- (6) Lubricate all differential components with hypoid gear lubricant.

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer to Adjustments (Differential Bearing Preload and Gear Backlash) procedures to determine proper shim selection.

(1) Position Spreader W-129-B with the tool dowel pins seated in the locating holes. Install the hold down clamps and tighten the tool turnbuckle finger-tight.

(2) Install a Pilot Stud C-3288-B at the left side of the differential housing and attach dial indicator to the pilot stud. Load the indicator plunger against the opposite side of the housing and zero the dial indicator.

(3) Spread the housing enough to install the case in the housing. Measure the distance with the dial indicator.

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If housing is over-spread, it could be distorted or damaged.

(4) Remove the dial indicator.

(5) Install differential into the housing. Tap the differential case with a rawhide/rubber hammer to ensure the bearings are seated in housing (Fig. 42).

(6) Remove the spreader.

J9302-19

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied or adhesion quality will be compromised.

(11) Install the cover and tighten bolts in a criss-cross pattern to 47 N·m (35 ft. lbs.).

(12) Fill the differential with Mopar Hypoid Gear Lubricant or equivalent to bottom of the fill plug hole.

(13) Install fill hole plug and tighten to 34 N·m (25 ft. lbs.).

(14) Remove support and lower vehicle.

DIFFERENTIAL CASE BEARINGS

REMOVAL

(1) Remove differential case from axle housing.

(2) Remove bearings from the differential case with Puller/Press C-293-PA, Adapters C-293-62 and Step Plate C-4487-1 (Fig. 45).

80a9834a

PINION GEAR/RING GEAR

REMOVAL

NOTE: The ring and pinion gears are service in a matched set. Do not replace the ring gear without replacing the match pinion gear.

- (1) Remove differential from housing.
- (2) Place differential case in a vise with soft metal jaw.
- (3) Remove ring gear bolts from differential case.
- (4) Drive ring gear from differential case with a soft hammer (Fig. 47).
- (5) Mark pinion yoke and propeller shaft for installation alignment.

Fig. 47 RING GEAR

- 1 - CASE
- 2 - RING GEAR
- 3 - HAMMER

(6) Remove propeller shaft from pinion yoke and tie propeller shaft to underbody.

(7) Hold pinion yoke with Holder 6719A and remove pinion yoke nut and washer.

(8) Remove pinion yoke with Puller C-452 and Flange Wrench C-3281 (Fig. 48).

- 3 - ADAPTERS
- 4 - PINION SHAFT

(16) Remove pinion depth shims from the pinion shaft and record thickness.

INSTALLATION

NOTE: Pinion depth shims are placed between the rear pinion bearing cone and pinion gear to achieve proper ring and pinion gear mesh. If ring and pinion gears are reused, the original pinion depth shim can be used. Refer to Adjustments (Pinion Gear Depth) to select the proper shim thickness if ring and pinion gears are replaced.

(1) Apply Mopar Door Ease stick lubricant or equivalent to outside surface of bearing cups.

(2) Install rear pinion bearing cup with Installer D-111 and Handle C-4171 (Fig. 54) and verify cup is seated.

(3) Install front pinion bearing cup with Installer D-146 and Handle C-4171 (Fig. 55) and verify cup is seated.

(4) Install pinion front bearing, oil slinger. Apply a light coating of gear lubricant on the lip of pinion seal.

PINION GEAR/RING GEAR (Continued)

(11) Install yoke washer and a **new** nut on the pinion gear. Tighten the nut to 291 N·m (215 ft. lbs.) minimum. **Do not over-tighten.** Maximum torque is 678 N·m (500 ft. lbs.).

CAUTION: Never loosen pinion gear nut to decrease pinion preload torque and never exceed specified preload torque. If preload torque is exceeded a new collapsible spacer must be installed.

(12) Use Yoke Holder 6719A to hold the yoke (Fig. 60) and tighten the nut in 6.8 N·m (5 ft. lbs.) until the rotating torque is achieved. Measure the preload torque frequently to avoid over-tightening the nut.

Fig. 60 PINION NUT

- 1 - PINION FLANGE
- 2 - YOKE HOLDING
- 3 - DIFFERENTIAL HOUSING

(13) Check bearing preload torque with an inch pound torque wrench (Fig. 61). The torque to rotate the pinion gear should be:

- Original Bearings: 1 to 2 N·m (10 to 20 in. lbs.).
- New Bearings: 2.26 to 4.52 N·m (20 to 40 in. lbs.).

(14) Invert differential case in a vise and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.

(15) Install **new** ring gear bolts and alternately tighten to 176 N·m (130 ft. lbs.). (Fig. 62).

CAUTION: Never reuse the ring gear bolts. The bolts can fracture causing extensive damage.

(16) Install differential in axle housing and verify gear mesh and contact pattern. Refer to Adjustments (Gear Contact Pattern).

(17) Install differential cover and fill with lubricant.

REAR AXLE - 248RBI

DESCRIPTION

The Rear Beam-design Iron (RBI) axle housings consist of an iron center casting (differential housing) with axle shaft tubes extending from either side. The tubes are pressed into the differential housing and welded. The axles are equipped with full-floating axle shafts, meaning that loads are supported by the axle housing tubes.

The differential case for the standard differentials and the Trac-lok® differential are a one-piece design. Differential bearing preload and ring gear backlash are adjusted by the use of shims located between the differential bearing cones and case. Pinion bearing preload is set and maintained by the use of a collapsible spacer. The removable, stamped steel cover provides a means for inspection and service.

OPERATION

STANDARD DIFFERENTIAL

The axle receives power from the transmission/transfer case through the rear propeller shaft. The rear propeller shaft is connected to the pinion gear which rotates the differential through the gear mesh with the ring gear bolted to the differential case. The engine power is transmitted to the axle shafts

through the pinion mate and side gears. The side gears are splined to the axle shafts.

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it (Fig. 1).

Fig. 1 STRAIGHT AHEAD DRIVING

- J9303-13
- 1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
 - 2 - PINION GEAR
 - 3 - SIDE GEAR
 - 4 - PINION GEARS ROTATE WITH CASE

REAR AXLE - 248RBI (Continued)

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds (Fig. 2). In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

Fig. 2 DIFFERENTIAL ON TURNS

1 - PINION GEARS ROTATE ON PINION SHAFT

TRAC-LOK® DIFFERENTIAL

The differential clutches are engaged by two concurrent forces. The first being the preload force exerted through Belleville spring washers within the clutch packs. The second is the separating forces generated by the side gears as torque is applied through the ring gear (Fig. 3).

This design provides the differential action needed for turning corners and for driving straight ahead during periods of unequal traction. When one wheel loses traction, the clutch packs transfer additional torque to the wheel having the most traction. The differential resists wheel spin on bumpy roads and provide more pulling power when one wheel loses traction. Pulling power is provided continuously until both wheels lose traction. If both wheels slip due to unequal traction, Trac-lok® operation is normal. In extreme cases of differences of traction, the wheel with the least traction may spin.

DIAGNOSIS AND TESTING - AXLE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth

Fig. 3 TRAC-LOK LIMITED SLIP DIFFERENTIAL

- 1 - CASE
- 2 - RING GEAR
- 3 - DRIVE PINION
- 4 - PINION GEAR

- 7 - SIDE GEAR
- 8 - CLUTCH PACK

contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehi-

REAR AXLE - 248RBI (Continued)

cle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged drive shaft.

- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged), can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

REAR AXLE - 248RBI (Continued)

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary.
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.

REAR AXLE - 248RBI (Continued)

Condition	Possible Causes	Correction
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal. 6. Remove, clean, and re-seal cover.
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	<ol style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Mis-aligned or sprung ring gear. 8. Loose differential bearing cap bolts. 9. Housing not machined properly. 	<ol style="list-style-type: none"> 1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REAR AXLE - 248RBI (Continued)

REMOVAL

- (1) Raise and support the vehicle.
- (2) Position an axle lift under the axle and secure it to the axle.
- (3) Remove the wheels and tires.
- (4) Remove RWAL sensor from the differential housing, if necessary.
- (5) Remove brake hose from the axle junction block.
- (6) Disconnect parking brake cables and cable brackets.
- (7) Remove vent hose from the axle shaft tube.
- (8) Mark propeller shaft and yoke for installation alignment reference.
- (9) Remove propeller shaft.
- (10) Remove shock absorbers from the axle brackets.
- (11) Remove spring clamps and spring brackets.
- (12) Remove axle from the vehicle.

INSTALLATION

- (1) Raise axle with lift and align to the leaf spring centering bolts.
- (2) Install spring clamps and spring brackets.
- (3) Install shock absorbers and tighten to specifications.
- (4) Install RWAL sensor to the differential housing, if necessary.
- (5) Install parking brake cables and cable brackets.
- (6) Install brake hose to the axle junction block.
- (7) Install axle vent hose.
- (8) Install propeller shaft with reference marks aligned.
- (9) Install wheels and tires assemblies.
- (10) Add gear lubricant, if necessary.
- (11) Remove lift from the axle and lower the vehicle.

ADJUSTMENTS

Ring and pinion gears are supplied as matched sets only. The identifying numbers for the ring and pinion gear are etched into the face of each gear (Fig. 4). A plus (+) number, minus (-) number or zero (0) is etched into the face of the pinion gear. This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard setting from the center line of the ring gear to the back face of the pinion is 127 mm (5.00 in.). The standard depth provides the best gear tooth contact pattern. Refer to Backlash and Contact Pattern in this section for additional information.

Compensation for pinion depth variance is achieved with a select shim. The shims are placed between the rear pinion bearing and the pinion gear head (Fig. 5).

**Fig. 4 PINION GEAR ID NUMBERS**

- 1 - PRODUCTION NUMBERS
- 2 - PINION GEAR DEPTH VARIANCE
- 3 - GEAR MATCHING NUMBER

**Fig. 5 SHIM LOCATIONS**

- 1 - PINION GEAR DEPTH SHIM
- 2 - DIFFERENTIAL BEARING SHIM

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion. Add or subtract this number from the thickness of the original depth shim/oil slinger to compensate for the difference in the depth variances. Refer to the Depth Variance chart.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

REAR AXLE - 248RBI (Continued)

Note the etched number on the face of the pinion gear head (-1, -2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the

required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim. If the number is 0 no change is necessary.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	-4	-3	-2	-1	0	+1	+2	+3	+4

PINION DEPTH MEASUREMENT AND ADJUSTMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (Fig. 6).

(1) Assemble Pinion Height Block 6739, Pinion Block 6736 and rear pinion bearing onto Screw 6741 (Fig. 6).

(2) Insert assembled height gauge components, rear bearing and screw into the housing through pinion bearing cups (Fig. 7).

(3) Install front pinion bearing and Cone-nut 6740 hand tight (Fig. 6).

(4) Place Arbor Disc 6732 on Arbor D-115-3 in position in the housing side bearing cradles (Fig. 8).

NOTE: Arbor Discs 6732 has different step diameters to fit other axles. Choose proper step for axle being serviced.

(5) Install differential bearing caps on arbor discs and snug the bearing cap bolts. Then cross tighten cap bolts to 108 N·m (80 ft. lbs.).

(6) Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

(7) Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator.

(8) Slowly slide the scooter block across the pinion height block over to the arbor (Fig. 9). Move the

scooter block till dial indicator crests the arbor, then record the highest reading.

(9) Select a shim equal to the dial indicator reading plus the pinion depth variance number etched in the face of the pinion (Fig. 4). For example, if the depth variance is -2, add +0.002 in. to the dial indicator reading.

DIFFERENTIAL SIDE BEARING PRELOAD AND GEAR BACKLASH

Differential side bearing preload and gear backlash is achieved by selective shims positioned behind the differential side bearing cones. The proper shim

thickness can be determined using slip-fit Dummy Bearings D-343 in place of the differential side bearings and a Dial Indicator C-3339. Before proceeding with the differential bearing preload and gear backlash measurements, measure the pinion gear depth and prepare the pinion for installation. Establishing proper pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After the overall shim thickness to take up differential side play is measured, the pinion is installed, and the gear backlash shim thickness is measured. The overall shim thickness is the total of the dial indicator reading and the preload specification added together. The gear backlash measurement determines the thickness of the shim used on the ring gear side of the differential case. Subtract the gear backlash shim thickness from the total overall shim thickness and select that amount for the pinion gear side of the differential (Fig. 10). Differential shim measurements are performed with spreader W-129-B removed.

SHIM SELECTION

NOTE: It is difficult to salvage the differential side bearings during the removal procedure. Install replacement bearings if necessary.

- (1) Remove differential side bearings from differential case.
- (2) Remove factory installed shims from differential case.
- (3) Install ring gear on differential case and tighten bolts to specification.
- (4) Install dummy side bearings D-343 on differential case.

- (9) Attach the Dial Indicator C-3339 to pilot stud. Position the dial indicator plunger on a flat surface between the ring gear bolt heads (Fig. 14).

- (10) Push and hold differential case to pinion gear side of the housing and zero dial indicator (Fig. 15).

- (11) Push and hold differential case to ring gear side of the housing and record the dial indicator reading (Fig. 16).

- (12) Add 0.38 mm (0.015 in.) to the zero end play total. This total represents the thickness of shims needed to preload the new bearings when the differential is installed.

REAR AXLE - 248RBI (Continued)

- 4 - DIAL INDICATOR FACE

(13) Rotate dial indicator out of the way on the pilot stud.

(14) Remove differential case and dummy bearings from the housing.

80a534d5

Fig. 16 DIFFERENTIAL CASE TO RING GEAR SIDE

- 1 - DIAL INDICATOR
- 2 - DIFFERENTIAL CASE TO RING GEAR SIDE
- 3 - DIFFERENTIAL HOUSING

(15) Install the pinion gear in the housing. Install the pinion yoke and establish the correct pinion rotating torque.

(16) Install differential case and dummy bearings D-343 in the housing (without shims), install bearing caps and tighten bolts snug.

(17) Seat ring gear side dummy bearing (Fig. 13).

(18) Position the dial indicator plunger on a flat surface between the ring gear bolt heads (Fig. 14).

(19) Push and hold differential case toward pinion gear and zero the dial indicator (Fig. 17).

80a534d7

Fig. 17 DIFFERENTIAL CASE TO PINION GEAR SIDE

REAR AXLE - 248RBI (Continued)

(20) Push and hold differential case to ring gear side of the housing and record dial indicator reading (Fig. 18).

Fig. 18 DIFFERENTIAL CASE TO RING GEAR SIDE

- 1 - DIAL INDICATOR
- 2 - DIFFERENTIAL CASE TO RING GEAR SIDE
- 3 - PINION GEAR
- 4 - DIFFERENTIAL HOUSING
- 5 - DIFFERENTIAL CASE

(21) This is the shim thickness needed on the ring gear side of the differential case for proper backlash.

(22) Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the housing.

(23) Rotate dial indicator out of the way on pilot stud.

(24) Remove differential case and dummy bearings from the housing.

(25) Install the selected side bearing shims onto the differential case hubs.

(26) Install side bearings on differential case hubs with Install C-4487-1 and Handle C-4171.

(27) Install bearing cups on differential.

(28) Install Spreader W-129-B and some items from Adapter Set 6987 on the housing and spread open enough to receive differential case.

CAUTION: Never spread housing over 0.50 mm (0.020 in.). The housing can be damaged if over-spread.

(29) Install differential case into the housing.

(30) Remove spreader from the housing.

(31) Rotate the differential case several times to seat the side bearings.

(32) Position the indicator plunger against a ring gear tooth (Fig. 19).

(33) Push and hold ring gear upward while not allowing the pinion gear to rotate.

(34) Zero dial indicator face to pointer.

(35) Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other (Fig. 20).

(36) Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

Fig. 19 RING GEAR BACKLASH MEASUREMENT

- 1 - DIAL INDICATOR

REAR AXLE - 248RBI (Continued)

**Fig. 20 BACKLASH SHIM****GEAR CONTACT PATTERN**

The ring and pinion gear contact patterns will show if the pinion depth is correct. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

(1) Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.

(2) Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.

(3) With a boxed end wrench on the ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeeze the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart (Fig. 21) and adjust pinion depth and gear backlash as necessary.

AXLE SHAFTS

REMOVAL

- (1) Remove the axle shaft flange bolts.
- (2) Slide the axle shaft out from the axle tube.

INSTALLATION

- (1) Clean the gasket contact surface area on the flange with an appropriate solvent. Install a new flange gasket and slide the axle shaft into the tube.
- (2) Install the bolts and tighten to 129 N·m (95 ft. lbs.).

AXLE BEARINGS

REMOVAL

- (1) Remove wheel and tire assembly.
- (2) Remove brake drum.
- (3) Remove the axle shaft.
- (4) Remove the lock wedge and adjustment nut. Use Socket DD-1241-JD to remove the adjustment nut.
- (5) Remove the hub assembly. The outer axle bearing will slide out as the hub is being removed.
- (6) Remove inner grease seal and discard. Use Installer 5064 and Handle C-4171 to drive grease seal and inner axle bearing from the hub.
- (7) Remove the bearing cups from the hub bore. Use a brass drift, or an appropriate removal tool, to tap out the cups.

INSTALLATION

- (1) Thoroughly clean both axle bearings and interior of the hub with an appropriate cleaning solvent.
- (2) Install bearing cups with Installer 8151 and Handle C-4171.
- (3) **Pack inner and outer bearings with Mopar wheel bearing grease or equivalent.**
- (4) Apply grease to inner and outer bearing cup surfaces.
- (5) Install inner axle bearing in the hub.
- (6) Install **new** grease seal in hub with Installer 8149 and Handle C-4171.
- (7) Inspect bearing and seal contact surfaces on the axle tube for burrs/roughness. Remove all the rough contact surfaces from the axle tube.
- (8) Carefully slide the hub onto the axle.

CAUTION: Do not let grease seal contact axle tube threads during installation.

- (9) Install outer axle bearing.
- (10) Install hub bearing adjustment nut with Socket DD-1241-JD.
- (11) Tighten adjustment nut to 163-190 N·m (120-140 ft. lbs.) while rotating the wheel. Then loosen adjustment nut 1/8 to 1/3 of-a-turn to provide 0.025-0.250mm (0.001-0.009 in.) wheel bearing end play.
- (12) Tap locking wedge into the spindle keyway and adjustment nut.

NOTE: Located locking wedge in a new position in the adjustment nut.

- (13) Install axle shaft and brake drum.
- (14) Install the wheel and tire assembly.

PINION SEAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Mark universal joint, pinion yoke and shaft for installation reference.
- (3) Disconnect the propeller shaft from the pinion yoke.
- (4) Remove the wheel and tire assemblies.
- (5) Remove brake calipers to prevent any drag that may cause a false bearing preload torque measurement.
- (6) Rotate pinion yoke three or four times.
- (7) Record pinion gear rotating torque with an inch pound torque wrench (Fig. 22).

Fig. 22 PINION ROTATING TORQUE

- 1 - TORQUE WRENCH
2 - PINION YOKE

- (8) Hold yoke with Yoke Holder 6719A and remove the pinion shaft nut and washer.
- (9) Remove yoke with Remover C-452 (Fig. 23).
- (10) Remove pinion seal with pry tool or slide-hammer mounted screw.

INSTALLATION

- (1) Apply a light coating of gear lubricant on the lip of pinion seal.
- (2) Install **new** pinion seal with an appropriate installer (Fig. 24).
- (3) Install yoke on pinion shaft with Installer C-3718 and Yoke Holder 6719.

J9403-18

Fig. 23 PINION YOKE REMOVER

- 1 - PINION YOKE
2 - REMOVER

80a98349

Fig. 24 PINION SEAL INSTALLER

- 1 - HANDLE
2 - INSTALLER

- (4) Install pinion yoke washer with the **concave surface** against the yoke end.
- (5) Install **new** pinion nut.

CAUTION: Never exceed the minimum tightening torque when installing the pinion yoke retaining nut at this point. Damage to collapsible spacer, if equipped, or bearings may result.

- (6) Hold pinion yoke with Yoke Holder 6719 and tighten shaft nut to 291.5 N·m (215 ft. lbs.) (Fig. 25). Rotate pinion shaft several revolutions to ensure the bearing rollers are seated.

- (7) Rotate pinion shaft with a inch pound torque wrench. Rotating torque should be equal to the reading recorded during removal, plus an additional 0.56 N·m (5 in. lbs.) (Fig. 26).

PINION SEAL (Continued)

Fig. 25 TIGHTEN PINION NUT

- 1 - DIFFERENTIAL HOUSING
2 - YOKE HOLDER
3 - TORQUE WRENCH

Fig. 26 PINION ROTATING TORQUE

- 1 - TORQUE WRENCH
2 - PINION YOKE

CAUTION: Never loosen pinion gear nut to decrease pinion rotating torque and never exceed specified preload torque. If preload torque is exceeded a new pin-

ion nut and collapsible spacer, if equipped, must be installed.

(8) If rotating torque is low, use Yoke Holder 6719 to hold the pinion yoke (Fig. 25) and tighten the pinion shaft nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

(9) Install propeller shaft with reference marks aligned.

(10) Add gear lubricant to the differential housing, if necessary.

(11) Install wheel and tire assemblies and lower the vehicle.

(12) Pump the brake pedal before moving the vehicle.

DIFFERENTIAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove fill hole plug from the differential housing cover.
- (3) Remove differential housing cover and drain lubricant from the housing.
- (4) Clean the housing cavity with a flushing oil, light engine oil or lint free cloth. **Do not use water, steam, kerosene or gasoline for cleaning.**
- (5) Remove axle shafts.
- (6) Note the orientation of the installation reference letters stamped on the bearing caps and housing machined sealing surface (Fig. 27).

Fig. 27 BEARING CAP IDENTIFICATION

- 1 - REFERENCE LETTERS
2 - REFERENCE LETTERS

DIFFERENTIAL (Continued)

- (7) Remove the differential bearing caps.
- (8) Position Spreader W-129-B with the tool dowel pins seated in the locating holes (Fig. 28).
- (9) Install the hold down clamps and tighten the tool turnbuckle finger-tight.

**Fig. 28 SPREAD DIFFERENTIAL HOUSING**

- 1 - SPREADER
- 2 - DIAL INDICATOR
- 3 - DIFFERENTIAL
- 4 - DIFFERENTIAL HOUSING
- 5 - PILOT STUD

(10) Install a Pilot Stud C-3288-B at the left side of the differential housing. Attach dial indicator to housing pilot stud. Load the indicator plunger against the opposite side of the housing (Fig. 28) and zero the indicator.

(11) Spread the housing enough to remove the case from the housing. Measure the distance with the dial indicator (Fig. 28).

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If housing is over-spread, it could be distorted or damaged.

- (12) Remove the dial indicator.
- (13) Pry the differential case loose from the housing. To prevent damage, pivot on housing with the end of the pry bar against spreader (Fig. 29).
- (14) Remove the case from housing. Tag bearing cups to indicate their location.

DISASSEMBLY

- (1) Remove roll-pin holding mate shaft in housing.
- (2) Remove pinion gear mate shaft (Fig. 30).
- (3) Rotate the differential side gears and remove the pinion mate gears and thrust washers (Fig. 31).

**Fig. 29 DIFFERENTIAL REMOVAL**

- 1 - DIFFERENTIAL
- 2 - PRY BAR

**Fig. 30 PINION MATE SHAFT**

DIFFERENTIAL (Continued)

**Fig. 31 PINION MATE/SIDE GEAR**

- 1 - THRUST WASHER
- 2 - SIDE GEAR
- 3 - PINION MATE GEAR

(4) Remove the differential side gears and thrust washers.

ASSEMBLY

- (1) Install the differential side gears and thrust washers.
- (2) Install the pinion mate gears and thrust washers.
- (3) Install the pinion gear mate shaft.
- (4) Align the hole in the pinion gear mate shaft with the hole in the differential case.
- (5) Install and seat the pinion mate shaft roll-pin in the differential case and mate shaft with a punch and hammer (Fig. 32). Peen the edge of the roll-pin hole in the differential case slightly in two places, 180° apart.
- (6) Lubricate all differential components with hypoid gear lubricant.

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer to Adjustments (Differential Bearing Preload and Gear Backlash) procedures to determine proper shim selection.

**Fig. 32 PINION MATE SHAFT ROLL-PIN**

- 1 - PUNCH
- 2 - PINION MATE SHAFT
- 3 - MATE SHAFT LOCKPIN

(1) Position Spreader W-129-B with the tool dowel pins seated in the locating holes. Install the hold down clamps and tighten the tool turnbuckle finger-tight.

(2) Install a Pilot Stud C-3288-B at the left side of the differential housing and attach dial indicator to the pilot stud. Load the indicator plunger against the opposite side of the housing and zero the dial indicator.

(3) Spread the housing enough to install the case in the housing. Measure the distance with the dial indicator.

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If housing is over-spread, it could be distorted or damaged.

- (4) Remove the dial indicator.
- (5) Install differential into the housing. Tap the differential case with a rawhide/rubber hammer to ensure the bearings are seated in housing (Fig. 33).
- (6) Remove the spreader.
- (7) Install bearing caps in their original locations (Fig. 34) and tighten bearing cap bolts in a criss-cross pattern to 109 N·m (80 ft. lbs.).
- (8) Install axle shafts.
- (9) Install the hub bearings.
- (10) Apply a bead of red Mopar Silicone Rubber Sealant or equivalent to the housing cover (Fig. 35).

DIFFERENTIAL (Continued)

J9302-19

Fig. 33 DIFFERENTIAL CASE

1 - RAWHIDE HAMMER

J9003-92

Fig. 34 Bearing Cap Reference

1 - REFERENCE LETTERS
2 - REFERENCE LETTERS

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied or adhesion quality will be compromised.

(11) Install the cover and tighten bolts in a criss-cross pattern to 47 N·m (35 ft. lbs.).

(12) Fill the differential with Mopar Hypoid Gear Lubricant or equivalent to bottom of the fill plug hole.

J9302-30

Fig. 35 DIFFERENTIAL COVER - TYPICAL

1 - SEALANT SURFACE
2 - SEALANT
3 - SEALANT THICKNESS

(13) Install fill hole plug and tighten to 34 N·m (25 ft. lbs.).

(14) Remove support and lower vehicle.

DIFFERENTIAL - TRAC-LOK**DIAGNOSIS AND TESTING - TRAC-LOK®**

The most common problem is a chatter noise when turning corners. Before removing the unit for repair, drain, flush and refill the axle with the specified lubricant. A container of Mopar Trac-lok® Lubricant (friction modifier) should be added after repair service or during a lubricant change.

After changing the lubricant, drive the vehicle and make 10 to 12 slow, figure-eight turns. This maneuver will pump lubricant through the clutches. This will correct the condition in most instances. If the chatter persists, clutch damage could have occurred.

DIFFERENTIAL TEST

The differential can be tested without removing the differential case by measuring rotating torque. Make sure brakes are not dragging during this measurement.

(1) Place blocks in front and rear of both front wheels.

(2) Raise one rear wheel until it is completely off the ground.

DIFFERENTIAL - TRAC-LOK (Continued)

(3) Engine off, transmission in neutral, and parking brake off.

(4) Remove wheel and bolt Special Tool 6790 or equivalent tool to studs.

(5) Use torque wrench on special tool to rotate wheel and read rotating torque (Fig. 36).

80a4d327

Fig. 36 ROTATING TORQUE TEST

- 1 - SPECIAL TOOL WITH BOLT IN CENTER HOLE
2 - TORQUE WRENCH

(6) If rotating torque is less than 41 N·m (56 ft. lbs.) or more than 271 N·m (200 ft. lbs.) on either wheel the unit should be serviced.

DISASSEMBLY

(1) Clamp side gear Holding Fixture 6965 in a vise and position the differential case on the Holding Fixture (Fig. 37).

(2) Remove ring gear if the ring gear is to be replaced. The Trac-lok® differential can be serviced with the ring gear installed.

(3) Remove pinion gear mate shaft roll pin.

(4) Remove pinion gear mate shaft with a drift and hammer.

(5) Install and lubricate Step Plate C-6960-3 (Fig. 38).

80a7e2ae

DIFFERENTIAL - TRAC-LOK (Continued)

(10) Insert Turning Bar C-6960-2 into the pinion mate shaft hole in the case (Fig. 42).

(11) Loosen the Forcing Screw in small increments until the clutch pack tension is relieved and the differential case can be turned using Turning Bar.

(12) Rotate differential case until the pinion gears can be removed.

(13) Remove pinion gears from differential case.

Fig. 42 PINION GEAR

- 1 - PINION GEARS
- 2 - TURNING BAR

(14) Remove Forcing Screw, Step Plate and Threaded Adapter.

(15) Remove top side gear, clutch pack retainer and clutch pack. Keep plates in correct order during removal (Fig. 43).

(16) Remove differential case from the Holding Fixture. Remove side gear, clutch pack retainer and clutch pack. Keep plates in correct order during removal.

ASSEMBLY

Clean all components in cleaning solvent and dry components with compressed air. Inspect clutch pack plates for wear, scoring or damage. Replace both clutch packs if any one component in either pack is damaged. Inspect side gears and pinions. Replace any gear that is worn, cracked, chipped or damaged. Inspect differential case and pinion shaft. Replace if worn or damaged.

(1) Lubricate each component with gear lubricant before assembly.

(2) Assemble the clutch discs into packs and secure disc packs with retaining clips (Fig. 44).

NOTE: New Plates and discs with fiber coating (no grooves or lines) must be presoaked in Friction Modifier before assembly. Soak plates and discs for a minimum of 20 minutes.

Fig. 43 SIDE GEAR & CLUTCH PACK

DIFFERENTIAL - TRAC-LOK (Continued)

(3) Position assembled clutch disc packs on the side gear hubs.

(4) Install clutch pack and side gear in the ring gear side of the differential case (Fig. 45). **Be sure clutch pack retaining clips remain in position and are seated in the case pockets.**

80bd270c

Fig. 45 Clutch Pack and Lower Side Gear

- 1 - DIFFERENTIAL CASE
2 - LOWER SIDE GEAR AND CLUTCH PACK

(5) Position the differential case on the Holding Fixture 6965.

(6) Install lubricated Step Plate C-6960-3 in lower side gear (Fig. 46).

(7) Install the upper side gear and clutch disc pack (Fig. 46).

(8) Hold assembly in position. Insert Threaded Adapter C-6960-1 into top side gear.

(9) Install Forcing Screw C-6960-4 and tighten screw to slightly compress clutch disc.

(10) Place pinion gears in position in side gears and verify that the pinion mate shaft hole is aligned.

80bd2786

Fig. 46 Clutch Pack and Upper Side Gear

- 1 - SIDE GEAR AND CLUTCH PACK
2 - DIFFERENTIAL CASE
3 - STEP PLATE - C-6960-3

(11) Rotate case with Turning Bar C-6960-2 until the pinion mate shaft holes in pinion gears align with holes in case. It may be necessary to slightly tighten the forcing screw in order to install the pinion gears.

(12) Tighten forcing screw to 122 N·m (90 ft. lbs.) maximum to compress the Belleville springs.

(13) Lubricate and install thrust washers behind pinion gears and align washers with a small screw driver. Insert mate shaft into each pinion gear to verify alignment.

(14) Remove Forcing Screw, Step Plate and Threaded Adapter.

(15) Install pinion gear mate shaft and align holes in shaft and case.

(16) Install pinion mate shaft roll pin. Peen the edge of the roll pin hole in the case slightly in two places 180° apart.

(17) Lubricate all differential components with hypoid gear lubricant.

DIFFERENTIAL CASE BEARINGS

REMOVAL

- (1) Remove differential case from the housing.
- (2) Remove bearings from the differential case with Puller/Press C-293-PA, Adapters C-293-62 and Step Plate 8139-2 (Fig. 47).

80a9834a

Fig. 47 DIFFERENTIAL CASE BEARING

- 1 - PULLER
- 2 - ADAPTERS
- 3 - STEP PLATE
- 4 - BEARING
- 5 - DIFFERENTIAL CASE

INSTALLATION

- (1) Install differential side bearings with installer C-4190 and Handle C-4171 (Fig. 48).

80a9834b

Fig. 48 CASE BEARING INSTALLER

- 1 - HANDLE
- 2 - DIFFERENTIAL CASE
- 3 - BEARING
- 4 - INSTALLER

- (2) Install differential case into the housing.

PINION GEAR/RING GEAR/ TONE RING

REMOVAL

NOTE: The ring and pinion gears are service as a matched set. Never replace ring gear without replacing the matched pinion gear.

- (1) Remove differential from housing.
- (2) Place differential case in a suitable vise with soft metal jaw protectors. (Fig. 49)
- (3) Remove bolts holding ring gear to differential case.
- (4) Drive ring gear from the differential case with a soft hammer (Fig. 49).

Fig. 49 RING GEAR

- 1 - DIFFERENTIAL CASE
- 2 - RING GEAR
- 3 - RAWHIDE HAMMER

- (5) Remove exciter ring from the differential case by slowly tapping the ring with a brass drift.

- (6) Mark pinion yoke and propeller shaft for installation alignment.

- (7) Disconnect propeller shaft from pinion yoke and tie propeller shaft to underbody.

- (8) Hold yoke with Yoke Holder 6719A and remove pinion yoke nut and washer.

- (9) Remove pinion yoke with Remover C-452 and Flange Wrench C-3281 (Fig. 50).

- (10) Remove pinion gear from housing (Fig. 51).

- (11) Remove pinion seal with a slide hammer or suitable pry bar.

- (12) Remove oil slinger, if equipped, and front pinion bearing.

- (13) Remove front pinion bearing cup with Remover D-158 and Handle C-4171 (Fig. 52).

PINION GEAR/RING GEAR/TONE RING (Continued)

INSTALLATION

(1) Apply Mopar Door Ease stick or equivalent lubricant to outside surface of bearing cups.

(2) Install rear pinion bearing cup with Installer D-111 and Handle C-4171 (Fig. 56) and verify cup is seated.

Fig. 56 REAR PINION BEARING CUP

1 - INSTALLER
2 - HANDLE

(3) Install front pinion bearing cup with Installer D-146 and Handle C-4171 (Fig. 57) and verify cup is seated.

Fig. 57 FRONT PINION BEARING CUP

1 - INSTALLER
2 - HANDLE

(4) Install front pinion bearing and oil slinger, if equipped.

(5) Apply a light coating of gear lubricant on the lip of pinion seal. Install **new** pinion seal with an appropriate installer (Fig. 58).

Fig. 58 PINION SEAL INSTALLER

90a98349

1 - HANDLE
2 - INSTALLER

NOTE: Pinion depth shims are placed between the rear pinion bearing cone and pinion gear to achieve proper ring and pinion gear mesh. If ring and pinion gears are reused, the pinion depth shim should not require replacement. Refer to Adjustments (Pinion Gear Depth) to select the proper thickness shim before installing rear pinion bearing cone.

(6) Place the proper thickness pinion depth shim on the pinion gear.

(7) Install rear pinion bearing on the pinion gear with Installer C-3095-A (Fig. 59).

Fig. 59 REAR PINION BEARING

J9003-67

PINION GEAR/RING GEAR/TONE RING (Continued)

(8) Install a **new** collapsible preload spacer on pinion shaft (Fig. 60).

(9) Install pinion gear into the housing.

J9302-66

Fig. 60 COLLASIBLE SPACER

- 1 - COLLAPSIBLE SPACER
- 2 - SHOULDER
- 3 - PINION GEAR
- 4 - OIL SLINGER
- 5 - REAR PINION BEARING

(10) Install yoke with Installer C-3718 and Yoke Holder 6719A (Fig. 61).

(11) Install pinion yoke washer with **concave surface** against the yoke end.

(12) Install a **new** nut on the pinion gear. Tighten the nut to 292 N·m (215 ft. lbs.) minimum. **Do not over-tighten.** Maximum torque is 447 N·m (330 ft. lbs.).

CAUTION: Never loosen pinion gear nut to decrease pinion preload torque and never exceed specified preload torque. If preload torque is exceeded a new pinion nut and collapsible spacer must be installed.

(13) Tighten pinion nut with Yoke Holder 6719A, and a torque wrench set at 447 N·m (330 ft. lbs.). Crush collapsible spacer until bearing end play is taken up. Slowly tighten the nut in 6.8 N·m (5 ft. lbs.) increments until the rotating torque is achieved. Measure the rotating torque frequently to avoid over crushing the collapsible spacer (Fig. 62).

(14) Check bearing rotating torque with an inch pound torque wrench (Fig. 62). Pinion rotating torque should be:

J9402-61

PINION GEAR/RING GEAR/TONE RING (Continued)

(16) Position exciter ring on differential case slowly and evenly tap the exciter ring into position with a brass drift.

(17) Install ring gear and start two ring gear bolts to provide case-to-ring gear bolt hole alignment.

(18) Invert differential case in the vise.

(19) Install **new** ring gear bolts and alternately tighten to 176 N·m (130 ft. lbs.) (Fig. 63).

CAUTION: Never reuse ring gear bolts, the bolts can fracture causing extensive damage.

(20) Install differential into the housing and verify gear mesh and contact pattern.

(21) Install axle shafts.

(22) Install differential cover and fill differential with gear lubricant.

REAR AXLE - 267RBI

DESCRIPTION

The Rear Beam-design Iron (RBI) axle housings consist of an iron center casting (differential housing) with axle shaft tubes extending from either side. The tubes are pressed into the differential housing and welded. The axles are full-floating axle shafts, supported by the axle housing tubes. The full-float shafts are retained by bolts attached to the hub.

The differential case for the standard differential is a one-piece design. Differential bearing preload and ring gear backlash are adjusted by the use of shims located between the differential bearing cones and case. Pinion bearing preload is set and maintained by the use of a solid shims. The differential cover provides a means for inspection and service.

Axles equipped with a Powr-lok® differential are optional. The differential has a two-piece differential

case. The differential contains four pinion gears and a two-piece pinion mate cross shaft to provide increased torque to the non-slipping wheel through a ramping motion in addition to the standard Trac-lok® components.

OPERATION

STANDARD DIFFERENTIAL

The axle receives power from the transmission/transfer case through the rear propeller shaft. The rear propeller shaft is connected to the pinion gear which rotates the differential through the gear mesh with the ring gear bolted to the differential case. The engine power is transmitted to the axle shafts through the pinion mate and side gears. The side gears are splined to the axle shafts.

REAR AXLE - 267RBI (Continued)

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it (Fig. 1).

Fig. 1 Differential Operation - Straight Ahead Driving

- 1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
- 2 - PINION GEAR
- 3 - SIDE GEAR
- 4 - PINION GEARS ROTATE WITH CASE

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds (Fig. 2). In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

POWR-LOK® DIFFERENTIAL

The differential clutches are engaged by two concurrent forces. The first being the preload force exerted through Belleville spring washers within the clutch packs. The second is the separating forces generated by the side gears as torque is applied through the ring gear (Fig. 3).

This design provide the differential action needed for turning corners and for driving straight ahead during periods of unequal traction. When one wheel loses traction, the clutch packs transfer additional torque to the wheel having the most traction. The Powr-lok® differential additionally utilizes a ramping action supplied by the cross shafts to increase the force applied to the clutch packs to increase the

torque supplied to the non-slipping wheel. The differential resist wheel spin on bumpy roads and provide more pulling power when one wheel loses traction. Pulling power is provided continuously until both wheels lose traction. If both wheels slip due to unequal traction, operation is normal. In extreme cases of differences of traction, the wheel with the least traction may spin.

DIAGNOSIS AND TESTING - AXLE**GEAR NOISE**

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear-end vibration. Do not overlook engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged), can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

REAR AXLE - 267RBI (Continued)

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary.
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal. 6. Remove, clean, and re-seal cover.

REAR AXLE - 267RBI (Continued)

Condition	Possible Causes	Correction
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	<ol style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Mis-aligned or sprung ring gear. 8. Loose differential bearing cap bolts. 9. Housing not machined properly. 	<ol style="list-style-type: none"> 1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Position an axle lift under the axle and secure it to the axle.
- (3) Remove the wheels and tires.
- (4) Remove RWAL sensor from the differential housing, if necessary.
- (5) Remove brake hose from the axle junction block.
- (6) Disconnect parking brake cables and cable brackets.
- (7) Remove vent hose from the axle shaft tube.

- (8) Mark propeller shaft and yoke for installation alignment reference.

- (9) Remove propeller shaft.
- (10) Remove shock absorbers from the axle brackets.
- (11) Remove spring clamps and spring brackets.
- (12) Remove axle from the vehicle.

INSTALLATION

- (1) Raise axle with lift and align to the leaf spring centering bolts.
- (2) Install spring clamps and spring brackets.

REAR AXLE - 267RBI (Continued)

- (3) Install shock absorbers and tighten to specifications.
- (4) Install RWAL sensor to the differential housing, if necessary.
- (5) Install parking brake cables and cable brackets
- (6) Install brake hose to the axle junction block.
- (7) Install axle vent hose.
- (8) Install propeller shaft with reference marks aligned.
- (9) Install wheels and tires assemblies.
- (10) Add gear lubricant, if necessary.
- (11) Remove lift from the axle and lower the vehicle.

ADJUSTMENTS

Ring and pinion gears are supplied as matched sets only. The identifying numbers for the ring and pinion gear are etched onto each gear (Fig. 4). A plus (+) number, minus (-) number or zero (0) is etched onto the pinion gear. This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard setting from the center line of the ring gear to the back face of the pinion is 136.53 mm (5.375 in.). The standard depth provides the best gear tooth contact pattern. Refer to Backlash and Contact Pattern in this section for additional information.

Compensation for pinion depth variance is achieved with a select shim/oil baffle. The shims are placed between the rear pinion bearing and the pinion gear head (Fig. 5).

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion. Add or subtract this number from the thickness of the original depth shim/oil slinger to compensate for the difference in the depth variances. Refer to the Depth Variance chart.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

Note the etched number on the face of the pinion gear head (-1, -2, 0, +1, +2, etc.). The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim. If the number is 0 no change is necessary.

- 2 - ARBOR
- 3 - PINION HEIGHT BLOCK
- 4 - CONE
- 5 - SCREW
- 6 - PINION BLOCK
- 7 - SCOOTER BLOCK
- 8 - ARBOR DISC

(1) Assemble Pinion Height Block 6739, Pinion Block 6737 and rear pinion bearing onto Screw 6741 (Fig. 6).

(2) Insert assembled height gauge components, rear bearing and screw into the housing through pinion bearing cups (Fig. 7).

(3) Install front pinion bearing and Cone-nut 6740 hand tight (Fig. 6).

J9403-39

Fig. 7 PINION HEIGHT BLOCK

- 1 - PINION BLOCK
- 2 - PINION HEIGHT BLOCK

(4) Place Arbor Disc 6732 on Arbor D-115-3 in position in the housing side bearing cradles (Fig. 8).

NOTE: Arbor Discs 6732 has different step diameters to fit other axles. Choose proper step for axle being serviced.

REAR AXLE - 267RBI (Continued)

(5) Install differential bearing caps on arbor discs and snug the bearing cap bolts. Then cross tighten cap bolts to 108 N·m (80 ft. lbs.).

Fig. 8 GAUGE TOOLS IN HOUSING

- 1 - ARBOR DISC
- 2 - PINION BLOCK
- 3 - ARBOR
- 4 - PINION HEIGHT BLOCK

(6) Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

(7) Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator.

(8) Slowly slide the scooter block across the pinion height block over to the arbor (Fig. 9). Move the scooter block till dial indicator crests the arbor, then record the highest reading.

(9) Select a shim/oil baffle equal to the dial indicator reading plus the pinion depth variance number etched in the face of the pinion (Fig. 4). For example, if the depth variance is -2, add +0.002 in. to the dial indicator reading.

DIFFERENTIAL SIDE BEARING PRELOAD AND GEAR BACKLASH

Differential side bearing preload and gear backlash is achieved by selective shims positioned behind the differential side bearing cones. The proper shim thickness can be determined using slip-fit Dummy Bearings D-343 in place of the differential side bearings and a Dial Indicator C-3339. Before proceeding with the differential bearing preload and gear backlash measurements, measure the pinion gear depth and prepare the pinion for installation. Establishing proper pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After the overall shim thickness to take up differential side play is measured, the pinion is installed, and the gear backlash shim thickness is measured. The overall shim thickness is the total of the dial indicator reading and the preload specification added

Fig. 9 PINION GEAR DEPTH MEASUREMENT

- 1 - ARBOR
- 2 - SCOOTER BLOCK
- 3 - DIAL INDICATOR

together. The gear backlash measurement determines the thickness of the shim used on the ring gear side of the differential case. Subtract the gear backlash shim thickness from the total overall shim thickness and select that amount for the pinion gear side of the differential (Fig. 10). Differential shim measurements are performed with spreader W-129-B removed.

Fig. 10 SHIM LOCATIONS

REAR AXLE - 267RBI (Continued)

SHIM SELECTION

NOTE: It is difficult to salvage the differential side bearings during the removal procedure. Install replacement bearings if necessary.

- (1) Remove differential side bearings from differential case.
- (2) Remove factory installed shims from differential case.
- (3) Install ring gear on differential case and tighten bolts to specification.
- (4) Install dummy side bearings D-343 on differential case.
- (5) Install differential case in the housing.
- (6) Install the marked bearing caps in their correct positions and snug the bolts (Fig. 11).

Fig. 11 BEARING CAP BOLTS

- 1 - BEARING CAP
- 2 - DIFFERENTIAL HOUSING
- 3 - DIFFERENTIAL CASE

- (7) Using a dead-blow hammer, seat the differential dummy bearings to each side of the housing (Fig. 12) and (Fig. 13).

- (8) Thread Pilot Stud C-3288-B into rear cover bolt hole below ring gear (Fig. 14).

- (9) Attach the Dial Indicator C-3339 to pilot stud. Position the dial indicator plunger on a flat surface between the ring gear bolt heads (Fig. 14).

- (10) Push and hold differential case to pinion gear side of the housing and zero dial indicator (Fig. 15).

- (11) Push and hold differential case to ring gear side of the housing and record the dial indicator reading (Fig. 16).

- (12) Add 0.38 mm (0.015 in.) to the zero end play total. This total represents the thickness of shims needed to preload the new bearings when the differential is installed.

- 3 - DIFFERENTIAL CASE

- (13) Rotate dial indicator out of the way on the pilot stud.

- (14) Remove differential case and dummy bearings from the housing.

- (15) Install the pinion gear in the housing. Install the pinion yoke and establish the correct pinion rotating torque.

- (16) Install differential case and dummy bearings D-343 in the housing (without shims), install bearing caps and tighten bolts snug.

- (17) Seat ring gear side dummy bearing (Fig. 13).

- (18) Position the dial indicator plunger on a flat surface between the ring gear bolt heads (Fig. 14).

(21) This is the shim thickness needed on the ring gear side of the differential case for proper backlash.

(22) Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the housing.

(23) Rotate dial indicator out of the way on pilot stud.

(24) Remove differential case and dummy bearings from the housing.

(25) Install the selected side bearing shims onto the differential case hubs.

(26) Install side bearings on differential case hubs with Install C-4487-1 and Handle C-4171.

(27) Install bearing cups on differential.

(28) Install Spreader W-129-B and some items from Adapter Set 6987 on the housing and spread open enough to receive differential case.

CAUTION: Never spread housing over 0.50 mm (0.020 in.). The housing can be damaged if over-spread.

(29) Install differential case into the housing.

(30) Remove spreader from the housing.

(31) Rotate differential case several times to seat the side bearings.

(32) Position the indicator plunger against a ring gear tooth (Fig. 19).

(33) Push and hold ring gear upward while not allowing the pinion gear to rotate.

(34) Zero dial indicator face to pointer.

(35) Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the housing to the other (Fig. 20).

(36) Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

Fig. 19 RING GEAR BACKLASH

- 1 - DIAL INDICATOR

Fig. 20 BACKLASH SHIM

REAR AXLE - 267RBI (Continued)

GEAR CONTACT PATTERN

The ring and pinion gear contact patterns will show if the pinion depth is correct. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

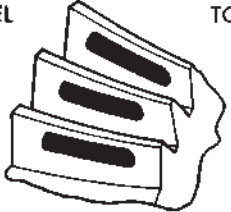

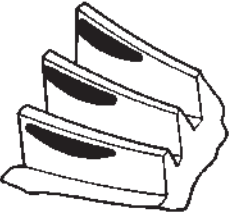

(1) Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.

(2) Wrap, twist and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.

(3) With a boxed end wrench on the ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart (Fig. 21) and adjust pinion depth and gear backlash as necessary.

AXLE SHAFTS

REMOVAL

- (1) Remove the axle shaft flange bolts.
- (2) Slide the axle shaft out from the axle tube.

INSTALLATION

- (1) Clean the gasket contact surface area on the flange with an appropriate solvent. Install a new flange gasket and slide the axle shaft into the tube.
- (2) Install the bolts and tighten to 129 N·m (95 ft. lbs.).

AXLE BEARINGS

REMOVAL

- (1) Remove wheel and tire assembly.
- (2) Remove brake drum.
- (3) Remove the axle shaft.
- (4) Remove the lock wedge and adjustment nut. Use Socket DD-1241-JD to remove the adjustment nut.
- (5) Remove the hub assembly. The outer axle bearing will slide out as the hub is being removed.
- (6) Remove inner grease seal and discard. Use Installer 5064 and Handle C-4171 to drive grease seal and inner axle bearing from the hub.
- (7) Remove the bearing cups from the hub bore. Use a brass drift, or an appropriate removal tool, to tap out the cups.

INSTALLATION

- (1) Thoroughly clean both axle bearings and interior of the hub with an appropriate cleaning solvent.
- (2) Install bearing cups with Installer 8151 and Handle C-4171.
- (3) **Pack inner and outer bearings with Mopar wheel bearing grease or equivalent.**
- (4) Apply grease to inner and outer bearing cup surfaces.
- (5) Install inner axle bearing in the hub.
- (6) Install **new** grease seal in hub with Installer 8149 and Handle C-4171.
- (7) Inspect bearing and seal contact surfaces on the axle tube for burrs/roughness. Remove all the rough contact surfaces from the axle tube.
- (8) Carefully slide the hub onto the axle.

CAUTION: Do not let grease seal contact axle tube threads during installtion.

- (9) Install outer axle bearing.
- (10) Install hub bearing adjustment nut with Socket DD-1241-JD.

(11) Tighten adjustment nut to 163-190 N·m (120-140 ft. lbs.) while rotating the wheel. Then loosen adjustment nut 1/8 to 1/3 of-a-turn to provide 0.025-0.250mm (0.001-0.009 in.) wheel bearing end play.

(12) Tap locking wedge into the spindle keyway and adjustment nut.

NOTE: Located locking wedge in a new position in the adjustment nut.

- (13) Install axle shaft and brake drum.
- (14) Install the wheel and tire assembly.

PINION SEAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Mark universal joint, pinion yoke and shaft for installation reference.
- (3) Disconnect the propeller shaft from the pinion yoke.
- (4) Remove the wheel and tire assemblies.
- (5) Remove brake calipers to prevent any drag that may cause a false bearing preload torque measurement.
- (6) Rotate pinion yoke three or four times.
- (7) Record pinion gear rotating torque with an inch pound torque wrench (Fig. 22).

Fig. 22 PINION ROTATING TORQUE

- 1 -TORQUE WRENCH
- 2 - PINION YOKE

PINION SEAL (Continued)

(8) Hold yoke with Yoke Holder 6719A and remove the pinion shaft nut and washer.

(9) Remove yoke with Remover C-452 (Fig. 23).

Fig. 23 PINION YOKE REMOVER

- 1 - PINION YOKE
2 - REMOVER

(10) Remove pinion seal with pry tool or slide-hammer mounted screw.

INSTALLATION

(1) Apply a light coating of gear lubricant on the lip of pinion seal.

(2) Install **new** pinion seal with an appropriate installer.

(3) Install yoke with Installer D-191 and Yoke Holder 6719A (Fig. 24).

(4) Install pinion yoke washer and nut.

(5) Hold pinion yoke with Yoke Holder 6719A and tighten shaft nut to 289-380 N·m (220-280 ft. lbs.) (Fig. 25). Rotate pinion shaft several revolutions to ensure the bearing rollers are seated.

(6) Rotate the pinion shaft using an inch pound torque wrench. Rotating resistance torque should be equal to the reading recorded, plus a small amount for the drag the new seal will have (Fig. 26).

NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

(7) Install propeller shaft with the installation reference marks aligned.

(8) Install the brake drums.

(9) Add gear lubricant to the differential housing, if necessary.

(10) Install wheel and tire assemblies and lower the vehicle.

DIFFERENTIAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove fill hole plug from the differential housing cover.
- (3) Remove differential housing cover and drain lubricant from the housing.
- (4) Clean the housing cavity with a flushing oil, light engine oil or lint free cloth. **Do not use water, steam, kerosene or gasoline for cleaning.**
- (5) Remove axle shafts.
- (6) Note the orientation of the installation reference letters stamped on the bearing caps and housing machined sealing surface (Fig. 27).
- (7) Remove the differential bearing caps.
- (8) Position Spreader W-129-B with the tool dowel pins seated in the locating holes (Fig. 28).
- (9) Install the hold down clamps and tighten the tool turnbuckle finger-tight.
- (10) Install a Pilot Stud C-3288-B at the left side of the differential housing. Attach dial indicator to housing pilot stud. Load the indicator plunger against the opposite side of the housing (Fig. 28) and zero the indicator.
- (11) Spread the housing enough to remove the case from the housing. Measure the distance with the dial indicator (Fig. 28).

**Fig. 27 BEARING CAP IDENTIFICATION**

2 - DIAL INDICATOR
3 - DIFFERENTIAL
4 - DIFFERENTIAL HOUSING
5 - PILOT STUD

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If housing is over-spread, it could be distorted or damaged.

- (12) Remove the dial indicator.
- (13) Pry the differential case loose from the housing. To prevent damage, pivot on housing with the end of the pry bar against spreader (Fig. 29).
- (14) Remove the case from housing. Tag bearing cups to indicate their location.

DIFFERENTIAL (Continued)

- 2 - PRY BAR

**Fig. 31 Pinion Mate/Side Gear**

- 1 - THRUST WASHER
- 2 - SIDE GEAR
- 3 - PINION MATE GEAR

DISASSEMBLY

- (1) Remove roll-pin holding mate shaft in housing.
- (2) Remove pinion gear mate shaft (Fig. 30).
- (3) Rotate differential side gears and remove pinion mate gears and thrust washers (Fig. 31).

**Fig. 30 PINION MATE SHAFT**

- 1 - PINION MATE GEAR
- 2 - PINION MATE SHAFT
- 3 - SIDE GEAR
- 4 - DRIFT

- (4) Remove differential side gears and thrust washers.

ASSEMBLY

- (1) Install differential side gears and thrust washers.
- (2) Install pinion mate gears and thrust washers.
- (3) Install pinion gear mate shaft.
- (4) Align hole in the pinion gear mate shaft with hole in the differential case.
- (5) Install and seat pinion mate shaft roll-pin in the differential case and mate shaft with a punch and hammer (Fig. 32). Peen the edge of the roll-pin hole in the differential case slightly in two places 180° apart.
- (6) Lubricate all differential components with hypoid gear lubricant.

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer to Adjustments (Differential Bearing Preload and Gear Backlash) procedures to determine proper shim selection.

- (1) Position Spreader W-129-B with the tool dowel pins seated in the locating holes. Install the hold

DIFFERENTIAL (Continued)

**Fig. 32 Pinion Mate Shaft Roll-Pin**

- 1 - PUNCH
- 2 - PINION MATE SHAFT
- 3 - MATE SHAFT LOCKPIN

down clamps and tighten the tool turnbuckle finger-tight.

(2) Install a Pilot Stud C-3288-B at the left side of the differential housing and attach dial indicator to the pilot stud. Load the indicator plunger against the opposite side of the housing and zero the dial indicator.

(3) Spread the housing enough to install the case in the housing. Measure the distance with the dial indicator.

CAUTION: Do not spread over 0.50 mm (0.020 in). If the housing is over-spread, it could be distorted or damaged.

- (4) Remove the dial indicator.
- (5) Install differential into the housing. Tap the differential case with a rawhide/rubber hammer to ensure the bearings are seated in housing (Fig. 33).
- (6) Remove the spreader.
- (7) Install bearing caps in their original locations (Fig. 34) and tighten bearing cap bolts in a criss-cross pattern to 109 N·m (80 ft. lbs.).
- (8) Install axle shafts.
- (9) Install the hub bearings.
- (10) Apply a bead of red Mopar Silicone Rubber Sealant or equivalent to the housing cover (Fig. 35).

**Fig. 33 DIFFERENTIAL CASE**

- 1 - RAWHIDE HAMMER

**Fig. 34 BEARING CAP IDENTIFICATION**

- 1 - REFERENCE LETTERS
- 2 - REFERENCE LETTERS

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied or adhesion quality will be compromised.

(11) Install the cover and any identification tag. Tighten the cover bolts in a criss-cross pattern to 47 N·m (35 ft. lbs.).

(12) Fill the differential with Mopar Hypoid Gear Lubricant or equivalent to bottom of the fill plug hole.

DIFFERENTIAL (Continued)

J9302-30

- 1 - SEALANT SURFACE
- 2 - SEALANT
- 3 - SEALANT THICKNESS

(13) Install the fill hole plug and tighten to 34 N·m (25 ft. lbs.).

(14) Remove support and lower vehicle.

DIFFERENTIAL - POWR-LOK

DIAGNOSIS AND TESTING - POWR-LOK®

WARNING: WHEN SERVICING VEHICLES WITH A POWR-LOK® DIFFERENTIAL DO NOT USE THE ENGINE TO TURN THE AXLE AND WHEELS. BOTH REAR WHEELS MUST BE RAISED AND THE VEHICLE SUPPORTED. THE AXLE CAN EXERT ENOUGH FORCE IF ONE WHEEL IS IN CONTACT WITH A SURFACE TO CAUSE THE VEHICLE TO MOVE.

The differential can be tested without removing the differential case by measuring rotating torque. Make sure brakes are not dragging during this measurement.

(1) Place blocks in front and rear of both front wheels.

(2) Raise one rear wheel until it is completely off the ground.

(3) Engine off, transmission in neutral, and parking brake off.

(4) Remove wheel and bolt Special Tool 6790 or equivalent to wheel studs.

(5) Use torque wrench on special tool to rotate wheel and read rotating torque (Fig. 36).

80a4d327

Fig. 36 POWR-LOK TEST -TYPICAL

- 1 - SPECIAL TOOL
- 2 - TORQUE WRENCH

(6) If rotating torque is less than 22 N·m (30 ft. lbs.) or more than 271 N·m (200 ft. lbs.) on either wheel the unit should be serviced.

DISASSEMBLY

The Powr-Lok® differential has a two-piece cross shaft and uses 2 disc and 3 plates for each clutch pack. One plate and one disc in each clutch pack is dished.

NOTE: Pay close attention to the clutch pack arrangement during this procedure. Note the direction of the concave and convex side of the plates and discs.

(1) Mark the ring gear half and cover half for installation reference (Fig. 37).

(2) Remove the case attaching bolts and remove the button cover half (Fig. 38).

(3) Remove top clutch pack (Fig. 39).

(4) Remove top side gear clutch ring.

(5) Remove top side gear.

(6) Remove pinion mate gears and cross shafts.

(7) Remove the same parts listed above from the ring gear flange half of the case. Keep these parts with the flange cover half for correct installation in their original positions.

ASSEMBLY

The Powr-Lok® differential has a two-piece cross shaft and uses 2 disc and 3 plates for each clutch pack. One plate and one disc in each clutch pack is dished.

DIFFERENTIAL - POWR-LOK (Continued)

NOTE: The clutch discs are replaceable as complete sets only. If one clutch disc pack is damaged, both packs must be replaced.

(1) Saturate the clutch plates with Mopar® Hypoid Gear Lubricant or Additive (Fig. 40). Assemble clutch packs into the side gear plate in exactly the same position as removed (Fig. 39).

Fig. 40 CLUTCH PACK PRE-LUBRICATION

- 1 - CLUTCH PLATES
- 2 - SIDE GEAR
- 3 - CLUTCH RING

(2) Line up the plate ears and install the assembled pack into the flange half (Fig. 41). Ensure that the clutch plate lugs enter the slots in the case. Also ensure that the clutch pack bottoms out on the case.

(3) Install pinion mate shafts and pinion mate gears (Fig. 42). **Make sure shafts are correctly installed according to the alignment marks.**

(4) Lubricate and install the other side gear and clutch pack (Fig. 41).

(5) Correctly align and assemble button half to flange half. Install case body screws finger tight.

(6) Tighten body screws alternately and evenly. Tighten screws to 89-94 N·m (65-70 ft. lbs.) (Fig. 43).

If bolt heads have 7 radial lines or the number 180 stamped on the head, tighten these bolts to 122-136 N·m (90-100 ft. lbs.).

PINION GEAR/RING GEAR/ TONE RING

REMOVAL

NOTE: The ring and pinion gears are service in a matched set. Do not replace the ring gear without replacing the matched pinion gear.

- (1) Remove differential from axle housing.
- (2) Place differential case in a vise with soft metal jaw protectors. (Fig. 46)
- (3) Remove bolts holding ring gear to differential case.
- (4) Drive ring gear from differential case with a soft hammer (Fig. 46).

Fig. 46 RING GEAR

- 1 - DIFFERENTIAL CASE
- 2 - RING GEAR
- 3 - HAMMER

- (5) Remove exciter ring from the differential case with a brass drift and a hammer.

- (6) Mark pinion yoke and propeller shaft for installation alignment.

- (7) Disconnect propeller shaft from pinion yoke. Tie propeller shaft to underbody.

- (8) Hold pinion yoke with Yoke Holder 6719A and remove pinion yoke nut and washer.

- (9) Remove pinion yoke from pinion with Remover C-452 and Wrench C-3281 (Fig. 47).

- (10) Remove pinion gear from housing (Fig. 48).

- (11) Remove pinion seal with a slide hammer or pry bar.

- (12) Remove oil slinger, if equipped, and the front pinion bearing.

- (13) Remove front pinion bearing cup with Remover D-158 and Handle C-4171 (Fig. 49).

Fig. 47 PINION YOKE REMOVER

**Fig. 50 REAR BEARING CUP**

- 1 - REMOVER
2 - HANDLE

INSTALLATION

(1) Apply Mopar Door Ease stick lubricant or equivalent to the outside surface of bearing cups.

**Fig. 52 REAR PINION BEARING CUP**

- 1 - INSTALLER
2 - HANDLE

PINION GEAR/RING GEAR/TONE RING (Continued)

(3) Install front pinion bearing cup with Installer D-146 and Handle C-4171 (Fig. 53) and verify cup is seated.

Fig. 53 FRONT PINION BEARING CUP

- 1 - INSTALLER
2 - HANDLE

(4) Install pinion front bearing and oil slinger, if equipped. Apply a light coating of gear lubricant on the lip of pinion seal.

(5) Install a **new** pinion seal with an appropriate installer (Fig. 54).

NOTE: Pinion depth shims are placed between the rear pinion bearing cone and pinion gear to achieve proper ring and pinion gear mesh. If ring and pinion gears are reused, the pinion depth shim should not require replacement. If the ring and pinion gears are replaced refer to Adjustments (Pinion Gear Depth) to select the proper thickness shim.

Fig. 54 PINION SEAL

- 1 - HANDLE
2 - INSTALLER

(6) Place the proper thickness pinion depth shim on the pinion gear.

(7) Install rear bearing and oil slinger, if equipped on the pinion gear with Installer C-3095-A and a press (Fig. 55).

Fig. 55 REAR PINION BEARING

- 1 - PRESS
2 - INSTALLER
3 - PINION GEAR
4 - PINION BEARING

(8) Install original solid shims on pinion gears.

(9) Install yoke with Installer C-3718 and Yoke Holder 6719A (Fig. 56).

(10) Install the yoke washer and **new** nut on the pinion gear. Tighten the nut to 298-380 N·m (220-280 ft. lbs.).

(11) Check bearing rotating torque with an inch pound torque wrench (Fig. 57). Pinion rotating torque should be:

- Original Bearings: 1 to 3 N·m (10 to 20 in. lbs.).
- New Bearings: 2.3 to 5.1 N·m (20 to 45 in. lbs.).

(12) If rotating torque is less than the desired rotating torque, remove the pinion yoke and decrease the thickness of the solid shim pack if greater increase shim pack. Changing the shim pack thickness by 0.025 mm (0.001 in.) will change the rotating torque approximately 0.9 N·m (8 in. lbs.).

REAR AXLE - 286RBI

DESCRIPTION

The Rear Beam-design Iron (RBI) axle housings consist of an iron center casting (differential housing) with axle shaft tubes extending from either side. The tubes are pressed into the differential housing and welded. The axles are full-floating axle shafts, that are supported by the axle housing tubes. The full-float axle shafts are retained by bolts attached to the hub.

The differential case for the standard differential is a one-piece design. Differential bearing preload and ring gear backlash are adjusted by the use of shims located between the differential bearing cones and

case. Outboard protective spacers are located between the differential bearing cup and housing. Pinion bearing preload is set and maintained by the use of shims. Pinion height is controlled by a shim pack located under the inner pinion bearing cup. The differential cover provides a means for inspection and service.

Axles equipped with a Trac-Lok® differential are optional. The differential contains two clutch packs, four pinion gears, and a one-piece pinion mate cross shaft to provide increased torque to the non-slipping wheel in addition to the standard differential components. A Trac-lok® differential for the has a two-piece differential case.

REAR AXLE - 286RBI (Continued)

OPERATION

STANDARD DIFFERENTIAL

The axle receives power from the transmission/transfer case through the rear propeller shaft. The rear propeller shaft is connected to the pinion gear which rotates the differential through the gear mesh with the ring gear bolted to the differential case. The engine power is transmitted to the axle shafts through the pinion mate and side gears. The side gears are splined to the axle shafts.

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it (Fig. 1).

Fig. 1 STRAIGHT AHEAD DRIVING

- 1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
 2 - PINION GEAR
 3 - SIDE GEAR
 4 - PINION GEARS ROTATE WITH CASE

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds (Fig. 2). In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

TRAC-LOK™ DIFFERENTIAL

The Trac-lok™ clutches are engaged by two concurrent forces. The first being the preload force exerted through Belleville spring washers within the clutch packs. The second is the separating forces generated

Fig. 2 ON TURNS

- 1 - PINION GEARS ROTATE ON PINION SHAFT

by the side gears as torque is applied through the ring gear (Fig. 3).

The Trac-lok™ design provides the differential action needed for turning corners and for driving straight ahead during periods of unequal traction. When one wheel loses traction, the clutch packs transfer additional torque to the wheel having the most traction. Trac-lok™ differentials resist wheel spin on bumpy roads and provide more pulling power when one wheel loses traction. Pulling power is provided continuously until both wheels lose traction. If both wheels slip due to unequal traction, Trac-lok™ operation is normal. In extreme cases of differences of traction, the wheel with the least traction may spin.

DIAGNOSIS AND TESTING - AXLE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause

REAR AXLE - 286RBI (Continued)

J9303-15

- 4 - PINION GEAR
- 5 - MATE SHAFT
- 6 - CLUTCH PACK
- 7 - SIDE GEAR
- 8 - CLUTCH PACK

noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is

similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joint(s).
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged), can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

REAR AXLE - 286RBI (Continued)

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.

Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REAR AXLE - 286RBI (Continued)

REMOVAL

- (1) Raise and support the vehicle.
- (2) Position a suitable lifting device under the axle.
- (3) Secure axle to device.
- (4) Remove the wheels and tires.
- (5) Remove the RWAL sensor from the differential housing, if necessary.
- (6) Disconnect the brake hose at the axle junction block.
- (7) Disconnect the parking brake cables and cable brackets.
- (8) Disconnect the vent hose from the axle shaft tube.
- (9) Mark the propeller shaft and companion flange for installation alignment reference.
- (10) Remove propeller shaft.
- (11) Disconnect shock absorbers from axle.
- (12) Remove the spring clamps and spring brackets.
- (13) Separate the axle from the vehicle.

INSTALLATION

- (1) Raise the axle with lifting device and align to the leaf spring centering bolts.
- (2) Install the spring clamps and spring brackets.
- (3) Install the shock absorbers.
- (4) Install the RWAL sensor to the differential housing, if necessary.
- (5) Install the parking brake cables and cable brackets.
- (6) Install the brake hose to the axle junction block.
- (7) Install axle vent hose.
- (8) Install the propeller shaft with reference marks aligned.
- (9) Install the wheels and tires.
- (10) Add gear lubricant, if necessary. Refer to Specifications for lubricant requirements.
- (11) Remove lifting device from axle and lower the vehicle.

ADJUSTMENTS

Ring and pinion gears are supplied as matched sets only. The identifying numbers for the ring and pinion gear are etched into the face of each gear (Fig. 4). A plus (+) number, minus (-) number or zero (0) is etched into the face of the pinion gear. This number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion etched with a (0). The standard setting from the center line of the ring gear to the back face of the pinion is 147.625 mm (5.812 in.). The standard depth provides the best teeth contact pattern. Refer to Backlash and Contact Pattern Analysis Paragraph in this section for additional information.

Compensation for pinion depth variance is achieved with select shims. The shims are placed under the inner pinion bearing cone (Fig. 5).

J9003-100

Fig. 4 PINION GEAR ID NUMBERS

J9403-64

Fig. 5 SHIM LOCATIONS

- 1 - PINION BEARING PRELOAD SHIM
- 2 - DIFFERENTIAL BEARING SHIM
- 3 - PINION GEAR DEPTH SHIM

If a new gear set is being installed, note the depth variance etched into both the original and replacement pinion gear. Add or subtract the thickness of the original depth shims to compensate for the difference in the depth variances. Refer to the Depth Variance charts.

Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus amount needed.

Note the etched number on the face of the drive pinion gear (-1, -2, 0, +1, +2, etc.). The numbers represent

REAR AXLE - 286RBI (Continued)

thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shim(s). If the number is posi-

tive, subtract that value from the thickness of the depth shim(s). If the number is 0 no change is necessary. Refer to the Pinion Gear Depth Variance Chart.

PINION DEPTH MEASUREMENT AND ADJUSTMENT

Measurements are taken with pinion cups and pinion bearings installed in housing. Take measurements with a Pinion Gauge Set 6730 and Dial Indicator C-3339 (Fig. 6).

(1) Assemble Pinion Height Block 6739, Pinion Block 6738 and rear pinion bearing onto Screw 6741 (Fig. 6).

(2) Insert assembled height gauge components, rear bearing and screw into the housing through pinion bearing cups (Fig. 7).

(3) Install front pinion bearing and Cone 6740 hand tight (Fig. 6).

(4) Place Arbor Disc 6732 on Arbor D-115-3 in position in the housing side bearing cradles (Fig. 8). Install differential bearing caps on Arbor Discs and snug the bearing cap bolts. Then tighten cap bolts in a criss-cross pattern to 108 N·m (80 ft. lbs.).

NOTE: Arbor Discs 6732 have different step diameters to fit other axle sizes. Pick correct size step for axle being serviced.

(5) Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.

(6) Position Scooter Block/Dial Indicator flush on the pinion height block. Hold scooter block and zero the dial indicator.

(7) Slowly slide the scooter block across the pinion height block over to the arbor (Fig. 9). Move the scooter block till dial indicator crests the arbor, then record the highest reading.

(8) Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number etched in the face of the pinion gear (Fig. 4) using the opposite sign on the variance number. For example, if the depth variance is -2, add +0.002 in. to the dial indicator reading.

(9) Remove the pinion depth gauge components from the axle housing

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

Differential side bearing preload and gear backlash is achieved by selective shims positioned behind the

differential side bearing cones. The proper shim thickness can be determined using slip-fit dummy bearings D-346 in place of the differential side bearings and a dial indicator C-3339. Before proceeding with the differential bearing preload and gear backlash measurements, measure the pinion gear depth and prepare the pinion gear for installation. Establishing proper pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After the overall shim thickness to take up differential side play is measured, the pinion gear is installed, and the gear backlash shim thickness is measured. The overall shim thickness is the total of the dial indicator reading and the preload specification added together. The gear backlash measurement determines the thickness of the shim used on the ring gear side of the differential case. Subtract the gear backlash shim thickness from the total overall shim thickness and select that amount for the pinion gear side of the differential (Fig. 10). Differential shim measurements are performed with axle spreader W-129-B removed.

SHIM SELECTION

NOTE: It is difficult to salvage the differential side bearings during the removal procedure. Install replacement bearings if necessary.

- (1) Remove differential side bearings from differential case.
- (2) Remove factory installed shims from differential case.
- (3) Install ring gear on differential case and tighten bolts to specification, if necessary.

REAR AXLE - 286RBI (Continued)

(22) This is the thickness shim required on the ring gear side of the differential case to achieve proper backlash.

(23) Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the housing.

(24) Rotate dial indicator out of the way on pilot stud.

(25) Remove differential case and dummy bearings from the housing.

(26) Install side bearing shims on differential case hubs.

(27) Install side bearings and cups on differential case.

(28) Install spreader W-129-B on the housing and spread housing enough to install differential case.

CAUTION: Do not spread over 0.50 mm (0.020 in). If the housing is over-spread, it could be distorted or damaged.

(29) Install differential case in the housing.

(30) Remove spreader from the housing.

(31) Rotate the differential case several times to seat the side bearings.

(32) Position the indicator plunger against a ring gear tooth (Fig. 19).

J9202-32

Fig. 19 RING GEAR BACKLASH

- 1 - DIAL INDICATOR

REAR AXLE - 286RBI (Continued)

(33) Push and hold ring gear upward while not allowing the pinion gear to rotate.

(34) Zero dial indicator face to pointer.

(35) Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the axle housing to the other (Fig. 20).

(36) Verify differential case and ring gear runout by measuring ring to pinion gear backlash at several locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform Gear Contact Pattern Analysis procedure.

Fig. 20 BACKLASH SHIM ADJUSTMENT

GEAR CONTACT PATTERN ANALYSIS

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the axle housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

(1) Apply a thin coat of hydrated ferric oxide, or equivalent, to the drive and coast side of the ring gear teeth.

(2) Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.

(3) Using a boxed end wrench on a ring gear bolt, Rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeeze the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart (Fig. 21) and adjust pinion depth and gear backlash as necessary.

AXLE SHAFTS

REMOVAL

- (1) Remove the axle shaft flange bolts.
- (2) Slide the axle shaft out from the axle tube.

INSTALLATION

- (1) Clean the gasket contact surface area on the flange with an appropriate solvent. Install a new flange gasket and slide the axle shaft into the tube.
- (2) Install the bolts and tighten to 129 N·m (95 ft. lbs.).

AXLE BEARINGS

REMOVAL

- (1) Remove wheel and tire assembly.
- (2) Remove brake drum.
- (3) Remove the axle shaft.
- (4) Remove the lock wedge and adjustment nut. Remove adjustment nut with Socket DD-1241-JD.
- (5) Remove the hub assembly. The outer axle bearing will slide out as the hub is being removed.
- (6) Drive grease seal and inner bearing out of the hub with Installer 5064 and Handle C-4171.
- (7) Remove bearing cups from the hub with a brass drift and a hammer.

INSTALLATION

- (1) Thoroughly clean both axle bearings and interior of the hub with an appropriate cleaning solvent.
- (2) Install bearing cups with Installer 8153 and Handle C-4171.
- (3) Pack inner and outer bearings with Mopar wheel bearing grease or equivalent.
- (4) Apply lubricant to surface area of the bearing cup.
- (5) Install inner axle bearing in the hub.
- (6) Install a **new** bearing grease seal with Installer 8152 and Handle C-4171.
- (7) Inspect bearing and seal contact surfaces on the axle tube spindle for burrs and/or roughness. Remove all the rough contact surfaces from the axle spindle.

CAUTION: Do not let grease seal contact the axle tube threads during installation.

- (8) Carefully slide the hub onto the axle.
- (9) Install outer axle bearing.
- (10) Install hub bearing adjustment nut with Socket DD-1241-JD.
- (11) Tighten adjustment nut to 163-190 N·m (120-140 ft. lbs.) while rotating the wheel.

- (12) Loosen adjustment nut 1/8 of-a-turn to provide 0.001-inch to 0.010-inch wheel bearing end play.
- (13) Tap the locking wedge into the spindle key-way and adjustment nut.

NOTE: Locate locking wedge in a new position in the adjustment nut.

- (14) Install axle shaft and brake drum.
- (15) Install wheel and tire assembly.

PINION SEAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Mark the universal joint, pinion yoke, and pinion shaft for installation reference.
- (3) Disconnect the propeller shaft from the pinion yoke. Secure the propeller shaft in an upright position to prevent damage to the rear universal joint.
- (4) Remove wheel and tire assemblies.
- (5) Remove brake calipers to prevent any drag. The drag may cause a false bearing preload torque measurement.
- (6) Rotate pinion yoke three or four times.
- (7) Record the amount of torque necessary to rotate the pinion gear with an inch pound dial-type torque wrench.
- (8) Hold the yoke with Holder 6719A and remove the pinion shaft nut and washer.
- (9) Remove yoke from the pinion with Remover C-452 (Fig. 22).

J9403-18

Fig. 22 Yoke Removal

- 1 - PINION YOKE
2 - REMOVER

- (10) Remove pinion shaft seal with suitable pry tool or slide-hammer mounted screw.

PINION SEAL (Continued)

INSTALLATION

- (1) Clean the seal contact surface in the housing bore.
- (2) Apply a light coating of gear lubricant on the lip of pinion seal.
- (3) Install **new** pinion shaft seal with an appropriate Installer.
- (4) Position pinion yoke on the end of the shaft with the reference marks aligned.
- (5) Install the yoke with Installer D-191 and Yoke Holder 6719A (Fig. 23).

J9402-61

Fig. 23 Pinion Yoke Installation

- 1 - INSTALLER
- 2 - YOKE HOLDER

- (6) Install the pinion yoke washer and nut.
- (7) Hold pinion yoke with Yoke Holder 6719A and tighten shaft nut to 597 N·m (440 ft. lbs.) (Fig. 24). Rotate pinion shaft several revolutions to ensure the bearing rollers are seated.
- (8) Rotate pinion shaft using an inch pound torque wrench. Rotating resistance torque should be equal to the reading recorded, plus a small amount for the drag the new seal will have (Fig. 25).

NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

- (9) Install propeller shaft with the installation reference marks aligned.
- (10) Install the brake calipers.

J9402-62

Fig. 25 Pinion Rotating Torque

- 1 - TORQUE WRENCH
- 2 - PINION YOKE

- (11) Add gear lubricant to the differential housing, if necessary.

PINION SEAL (Continued)

(12) Install wheel and tire assemblies and lower the vehicle.

DIFFERENTIAL

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove fill hole plug from the differential housing cover.
- (3) Remove differential housing cover and drain lubricant from the housing.
- (4) Clean the housing cavity with a flushing oil, light engine oil or lint free cloth. **Do not use water, steam, kerosene or gasoline for cleaning.**
- (5) Remove axle shafts.
- (6) Note the orientation of the installation reference letters stamped on the bearing caps and housing machined sealing surface (Fig. 26).

Fig. 26 BEARING CAP IDENTIFICATION

- 1 - REFERENCE LETTERS
- 2 - REFERENCE LETTERS

- (7) Remove the differential bearing caps.
- (8) Position Spreader W-129-B with the tool dowel pins seated in the locating holes (Fig. 27).
- (9) Install the hold down clamps and tighten the tool turnbuckle finger-tight.
- (10) Install a Pilot Stud C-3288-B at the left side of the differential housing. Attach dial indicator to housing pilot stud. Load the indicator plunger against the opposite side of the housing (Fig. 27) and zero the indicator.
- (11) Spread the housing enough to remove the case from the housing. Measure the distance with the dial indicator (Fig. 27).

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If housing is over-spread, it could be distorted or damaged.

Fig. 27 SPREAD DIFFERENTIAL HOUSING

- 1 - SPREADER
- 2 - DIAL INDICATOR
- 3 - DIFFERENTIAL
- 4 - DIFFERENTIAL HOUSING
- 5 - PILOT STUD

- (12) Remove the dial indicator.
- (13) Pry the differential case loose from the housing. To prevent damage, pivot on housing with the end of the pry bar against spreader (Fig. 28).

Fig. 28 DIFFERENTIAL REMOVAL

- 1 - DIFFERENTIAL
- 2 - PRY BAR

DIFFERENTIAL (Continued)

(14) Remove the case from housing. Tag bearing cups to indicate their location.

DISASSEMBLY

- (1) Remove roll-pin holding mate shaft in housing.
- (2) Remove pinion gear mate shaft (Fig. 29).
- (3) Rotate differential side gears and remove pinion mate gears and thrust washers (Fig. 30).

**Fig. 29 PINION MATE SHAFT**

- 1 - PINION MATE GEAR
- 2 - PINION MATE SHAFT
- 3 - SIDE GEAR
- 4 - DRIFT

(4) Remove differential side gears and thrust washers.

ASSEMBLY

- (1) Install differential side gears and thrust washers.
- (2) Install pinion mate gears and thrust washers.
- (3) Install pinion gear mate shaft.
- (4) Align hole in the pinion gear mate shaft with hole in the differential case.
- (5) Install and seat pinion mate shaft roll-pin in the differential case and mate shaft with a punch and hammer (Fig. 31). Peen the edge of the roll-pin hole in the differential case slightly in two places 180° apart.
- (6) Lubricate all differential components with hypoid gear lubricant.

INSTALLATION

NOTE: If replacement differential bearings or differential case are being installed, differential side bearing shim requirements may change. Refer to Adjustments (Differential Bearing Preload and Gear

J9203-61

Fig. 30 Pinion Mate/Side Gear

- 1 - THRUST WASHER

Backlash) procedures to determine proper shim selection.

DIFFERENTIAL (Continued)

(1) Position Spreader W-129-B with the tool dowel pins seated in the locating holes. Install the hold down clamps and tighten the tool turnbuckle finger-tight.

(2) Install a Pilot Stud C-3288-B at the left side of the differential housing and attach dial indicator to the pilot stud. Load the indicator plunger against the opposite side of the housing and zero the dial indicator.

(3) Spread the housing enough to install the case in the housing. Measure the distance with the dial indicator.

CAUTION: Never spread the housing over 0.50 mm (0.020 in). If housing is over-spread, it could be distorted or damaged.

(4) Remove the dial indicator.

(5) Install differential into the housing. Tap the differential case with a rawhide/rubber hammer to ensure the bearings are seated in housing (Fig. 32).

(6) Remove the spreader.

J9302-19

Fig. 32 DIFFERENTIAL CASE

1 - RAWHIDE HAMMER

(7) Install bearing caps in their original locations (Fig. 33) and tighten bearing cap bolts in a criss-cross pattern to 109 N·m (80 ft. lbs.).

(8) Install axle shafts.

(9) Install the hub bearings.

(10) Apply a bead of red Mopar Silicone Rubber Sealant or equivalent to the housing cover (Fig. 34).

J9003-92

3 - SEALANT THICKNESS

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied or adhesion quality will be compromised.

(11) Install the cover and tighten bolts in a criss-cross pattern to 47 N·m (35 ft. lbs.).

DIFFERENTIAL (Continued)

(12) Fill the differential with Mopar Hypoid Gear Lubricant or equivalent to bottom of the fill plug hole.

(13) Install fill hole plug and tighten to 34 N·m (25 ft. lbs.).

(14) Remove support and lower vehicle.

DIFFERENTIAL - TRAC-LOK

DIAGNOSIS AND TESTING - TRAC-LOK®

The most common problem is a chatter noise when turning corners. Before removing a Trac-lok™ unit for repair, drain, flush and refill the axle with the specified lubricant. A container of Mopar Trac-lok™ Lubricant (friction modifier) should be added after repair service or during a lubricant change.

After changing the lubricant, drive the vehicle and make 10 to 12 slow, figure-eight turns. This maneuver will pump lubricant through the clutches. This will correct the condition in most instances. If the chatter persists, clutch damage could have occurred.

DIFFERENTIAL TEST

The differential can be tested without removing the differential case by measuring rotating torque. Make sure brakes are not dragging during this measurement.

(1) Place blocks in front and rear of both front wheels.

(2) Raise one rear wheel until it is completely off the ground.

(3) Engine off, transmission in neutral, and parking brake off.

(4) Remove wheel and bolt Special Tool 6790 or equivalent tool to studs.

(5) Use torque wrench on special tool to rotate wheel and read rotating torque.

(6) If rotating torque is less than 22 N·m (30 ft. lbs.) or more than 271 N·m (200 ft. lbs.) on either wheel the unit should be serviced.

DISASSEMBLY

The Trac-Lok® differential on this axle has a one-piece cross shaft and uses one dished disc, regular 5 disc and 7 plates.

NOTE: Pay attention to the clutch pack arrangement during disassembly. Note the direction of the concave and convex side of the plates and discs.

(1) Mark the ring gear half and cover half for installation reference (Fig. 35).

(2) Remove case attaching bolts and remove the button cover half (Fig. 36).

(3) Remove top clutch pack.

(4) Remove top side gear clutch ring.

(7) Remove the same parts listed above from the ring gear flange half of the case. Keep these parts

DIFFERENTIAL - TRAC-LOK (Continued)

with the flange cover half for installation in their original positions.

ASSEMBLY

The Trac-Lok® differential for this axle has a one-piece cross shaft and uses one dished disc, 5 regular disc and 7 plates for each clutch pack.

NOTE: The clutch discs are replaceable as complete sets only. If one clutch disc pack is damaged, both packs must be replaced.

Lubricate each component with gear lube before assembly and installation.

(1) Saturate the clutch plates with Mopar Hypoid Gear Lubricant or Additive.

(2) Assemble the discs and plates on the side gear (Fig. 37) in the following order.

- (a) Install dished disc on side gear.
- (b) Install one disc on side gear.
- (c) Install one plate on side gear.
- (d) Install one disc on side gear.
- (e) Install one plate on side gear.
- (f) Install three discs on side gear.
- (g) Install five plates on side gear.

Fig. 37 CLUTCH PACK ASSEMBLY

- 1 - CLUTCH PLATES
- 2 - SIDE GEAR
- 3 - CLUTCH RING

(3) Line up the plate ears and install the assembled pack into the flange half (Fig. 38). Verify clutch plate lugs enter the slots in the case and clutch pack bottoms out in the case.

Fig. 38 CLUTCH PACK

- 1 - LUGS
- 2 - FLANGE HALF
- 3 - SIDE GEAR

(4) Install pinion mate shafts and pinion mate gears (Fig. 39). **Verify shafts are correctly installed according to the alignment marks.**

(5) Lubricate and install the other side gear and clutch pack (Fig. 38).

(6) Correctly align and assemble button half to flange half. Install case body screws finger tight.

(7) Tighten body screws alternately and evenly to 122-136 N·m (90-100 ft. lbs.) (Fig. 40).

DIFFERENTIAL CASE BEARINGS

REMOVAL

- (1) Remove differential case from the housing.
- (2) Remove bearings from the differential case with bridge and bearing splitter (Fig. 41).

INSTALLATION

- (1) Install differential bearings with Installer C-4190 and Handle C-4171 (Fig. 42).
- (2) Install differential in the housing.

PINION GEAR/RING GEAR/ TONE RING

REMOVAL

NOTE: The ring and pinion gears are service as a matched set. Never replace the ring gear without replacing the matched pinion gear.

- (1) Remove differential from the housing.
- (2) Place differential case in a vise with soft metal jaw protectors. (Fig. 43)
- (3) Remove the ring gear bolts.
- (4) Drive ring gear from differential case with a soft hammer (Fig. 43).

Fig. 43 RING GEAR

- 1 - DIFFERENTIAL CASE
- 2 - RING GEAR
- 3 - HAMMER

- (5) Remove the exciter ring from the differential case by tapping it off with a brass drift.

- (6) Hold the pinion yoke with Holder 6719A and remove pinion yoke nut and washer.

- (7) Remove pinion yoke with Remover C-452 and Wrench C-3281 (Fig. 44).

- (8) Remove pinion gear from housing (Fig. 45).

- (9) Remove pinion seal with a slide hammer or pry bar.

- (10) Remove oil slinger, if equipped, and the front pinion bearing.

(12) Remove rear bearing cup with Remover D-159 and Handle C-4171 (Fig. 47).

(13) Remove pinion depth shims under rear bearing cup in the housing bore.

(14) Remove rear bearing from the pinion with Puller/Press C-293-PA and Adapters DD-914-95 (Fig. 48).

INSTALLATION

(1) Apply Mopar Door Ease stick lubricant or equivalent to outside surface of bearing cups.

(2) Install proper thickness pinion depth shims in the housing bore and install rear pinion bearing cup with Installer C-4204 and Handle C-4171 (Fig. 49) and verify cup is seated.

(3) Install pinion front bearing cup with Installer C-4308 and Handle C-4171 (Fig. 50) and verify cup is seated.

2 - HANDLE

(4) Install pinion front bearing and oil slinger, if equipped. Apply a light coating of gear lubricant on the lip of pinion seal.

(5) Install **new** pinion seal with an appropriate installer (Fig. 51).

NOTE: Pinion depth shims are placed between the rear pinion bearing cone and pinion gear to achieve proper ring and pinion gear mesh. If ring and pinion

gears are reused, the pinion depth shim should not require replacement or adjustment. If the ring and pinion gears are replaced refer to Adjustments to select the proper thickness shim.

80a98349

(7) Install original solid shims on pinion gears.

(8) Install yoke with Installer C-3718 and Yoke Holder 6719A (Fig. 53).

(9) Install yoke washer and **new** nut on the pinion gear. Tighten the nut to 637 N·m (470 ft. lbs.).

PINION GEAR/RING GEAR/TONE RING (Continued)

J9402-61

Fig. 53 PINION YOKE

- 1 - INSTALLER
2 - HOLDER

80a534a7

Fig. 54 Pinion Rotating Torque

- 1 - TORQUE WRENCH
2 - PINION YOKE

(10) Check bearing rotating torque with an inch pound torque wrench (Fig. 54). Pinion rotating torque should be:

- Original Bearings: 1 to 3 N·m (10 to 20 in. lbs.).
- New Bearings: 2.8 to 5.1 N·m (25 to 45 in. lbs.).

(11) If rotating torque is less than the desired rotating torque, remove the pinion yoke and decrease the thickness of the solid shim pack if greater increase shim pack. Changing the shim pack thickness by 0.025 mm (0.001 in.) will change the rotating torque approximately 0.9 N·m (8 in. lbs.).

(12) Invert the differential case.

(13) Position exciter ring on differential case and tap onto the case with a brass drift slowly and evenly.

(14) Invert differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.

(15) Invert the differential case in the vise.

(16) Install **new** ring gear bolts and alternately tighten to 298 N·m (220 ft. lbs.) (Fig. 55).

CAUTION: Never reuse the ring gear bolts. The bolts can fracture causing extensive damage.

(17) Install differential in housing and verify gear mesh and contact pattern.

J9202-77

HYDRAULIC/MECHANICAL

DESCRIPTION

This vehicle is equipped with front disc brakes and rear drum brakes also certain vehicles have four wheel disc brakes. The front and rear disc brakes consist of dual piston calipers and ventilated rotors. The rear brakes are dual brake shoe, internal expanding units with cast brake drums. The parking brake mechanism is cable operated and connected to the rear brake trailing shoes. Power brake assist is standard equipment. A vacuum operated power brake booster is used on gas engine vehicles. A hydraulic booster is used on diesel engine vehicles.

Two antilock brake systems are used on this vehicle. A rear wheel antilock (RWAL) brake system and all-wheel antilock brake system (ABS). The RWAL and ABS systems are designed to retard wheel lockup while braking. Retarding wheel lockup is accomplished by modulating fluid pressure to the wheel brake units. Both systems are monitored by a microprocessor which controls the operation of the systems.

WARNING

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. USE A VACUUM CLEANER SPECIFICALLY DESIGNED FOR THE REMOVAL OF ASBESTOS FIBERS FROM BRAKE COMPONENTS. IF A SUITABLE VACUUM CLEANER IS NOT AVAILABLE, CLEANING SHOULD BE DONE WITH A WATER DAMPENED CLOTH. DO NOT SAND, OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DISPOSE OF ALL RESIDUE CONTAINING ASBESTOS FIBERS IN SEALED BAGS OR CONTAINERS TO MINIMIZE EXPOSURE TO YOURSELF AND OTHERS. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION AND THE ENVIRONMENTAL PROTECTION AGENCY FOR THE HANDLING, PROCESSING, AND DISPOSITION OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

HYDRAULIC/MECHANICAL (Continued)

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean the system components. These fluids damage rubber cups and seals. Use only fresh brake fluid or Mopar brake cleaner to clean or flush brake system components. These are the only cleaning materials recommended. If system contamination is suspected, check the fluid for dirt, discoloration, or separation into distinct layers. Also check the reservoir cap seal for distortion. Drain and flush the system with new brake fluid if contamination is suspected.

CAUTION: Use Mopar brake fluid, or an equivalent quality fluid meeting SAE/DOT standards J1703 and DOT 3. Brake fluid must be clean and free of contaminants. Use fresh fluid from sealed containers only to ensure proper antilock component operation.

CAUTION: Use Mopar multi-mileage or high temperature grease to lubricate caliper slide surfaces, drum brake pivot pins, and shoe contact points on the backing plates. Use multi-mileage grease or GE 661 or Dow 111 silicone grease on caliper slide pins to ensure proper operation.

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM

Base brake components consist of the brake shoes, calipers, wheel cylinders, brake drums, rotors, brake lines, master cylinder, booster, and parking brake components.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, or vacuum operated component.

The first diagnosis step is the preliminary check.

PRELIMINARY BRAKE CHECK

(1) Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.

(2) If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.

(3) Inspect brake fluid level and condition. Note that the brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**

(a) If fluid level is abnormally low, look for evidence of leaks at calipers, wheel cylinders, brake lines, and master cylinder.

(b) If fluid appears contaminated, drain out a sample to examine. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals and cups will also have to be replaced after flushing. Use clean brake fluid to flush the system.

(4) Check parking brake operation. Verify free movement and full release of cables and pedal. Also note if vehicle was being operated with parking brake partially applied.

(5) Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.

(6) Check booster vacuum check valve and hose.

(7) If components checked appear OK, road test the vehicle.

ROAD TESTING

(1) If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.

(2) Check brake pedal response with transmission in Neutral and engine running. Pedal should remain firm under constant foot pressure.

(3) During road test, make normal and firm brake stops in 25-40 mph range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.

(4) Attempt to stop the vehicle with the parking brake only and note grab, drag, noise, etc.

PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak. The leak point could be at a brake line, fitting, hose, or caliper/wheel cylinder. If leakage is severe, fluid will be evident at or around the leaking component.

Internal leakage (seal by-pass) in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

An internal leak in the ABS or RWAL system may also be the problem with no physical evidence.

LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up, worn linings, rotors, drums, or rear brakes out of adjustment are the most likely causes. The proper course of action is to inspect and replace all worn component and make the proper adjustments.

HYDRAULIC/MECHANICAL (Continued)

SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However, thin brake drums or substandard brake lines and hoses can also cause a spongy pedal. The proper course of action is to bleed the system, and replace thin drums and substandard quality brake hoses if suspected.

HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn. The power booster or check valve could also be faulty.

PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation, or out of round brake drums. Other causes are loose wheel bearings or calipers and worn or damaged tires.

NOTE: Some pedal pulsation may be felt during ABS/EBD activation.

BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake shoe release. Drag can be minor or severe enough to overheat the linings, rotors and drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and drums from the overheat-cool down process. In most cases, the rotors, drums, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors and drums to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Common causes of brake drag are:

- Seized or improperly adjusted parking brake cables
- Loose/worn wheel bearing
- Seized caliper or wheel cylinder piston
- Caliper binding on damaged or missing anti-rattle clips or bushings
- Loose caliper mounting
- Drum brake shoes binding on worn/damaged support plates
- Mis-assembled components

- Long booster output rod

If brake drag occurs at all wheels, the problem may be related to a blocked master cylinder return port, or faulty power booster (binds-does not release).

BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to the Brake Drag information in this section for causes.

BRAKE PULL

Front brake pull condition could result from:

- Contaminated lining in one caliper
- Seized caliper piston
- Binding caliper
- Loose caliper
- Damaged anti-rattle clips
- Improper brake shoes
- Damaged rotor

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

REAR BRAKE GRAB OR PULL

Rear grab or pull is usually caused by improperly adjusted or seized parking brake cables, contaminated lining, bent or binding shoes and support plates, or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or proportioning valve could be at fault.

BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a

HYDRAULIC/MECHANICAL (Continued)

mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and/or replacement will be necessary.

BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers or wheel cylinders, worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem.

A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. A tire with internal damage such as a severe bruise, cut, or ply separation can cause pull and vibration.

BRAKE NOISES

Some brake noise is common with rear drum brakes and on some disc brakes during the first few stops after a vehicle has been parked overnight or stored. This is primarily due to the formation of trace corrosion (light rust) on metal surfaces. This light corrosion is typically cleared from the metal surfaces after a few brake applications causing the noise to subside.

BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake shoes in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors and drums can become so scored that replacement is necessary.

BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

THUMP/CLUNK NOISE

Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components. However, calipers that bind on the slide surfaces can generate a thump or clunk noise. In addition, worn out, improperly adjusted, or improperly assembled rear brake shoes can also produce a thump noise.

STANDARD PROCEDURE

STANDARD PROCEDURE - MANUAL BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

- (1) Remove reservoir filler caps and fill reservoir.
- (2) If calipers, or wheel cylinders were overhauled, open all caliper and wheel cylinder bleed screws. Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.
- (3) Attach one end of bleed hose to bleed screw and insert opposite end in glass container partially filled with brake fluid (Fig. 1). Be sure end of bleed hose is immersed in fluid.

Fig. 1 Bleed Hose Setup

J8905-18

1 - BLEED HOSE

2 - FLUID CONTAINER PARTIALLY FILLED WITH FLUID

- (4) Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down close the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.

HYDRAULIC/MECHANICAL (Continued)

STANDARD PROCEDURE - PRESSURE BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

If pressure bleeding equipment will be used, the front brake metering valve will have to be held open to bleed the front brakes. The valve stem is located in the forward end or top of the combination valve. The stem must either be pressed inward, or held outward slightly. A spring clip tool or helper is needed to hold the valve stem in position.

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system. Use adapter provided with the equipment or Adapter 6921.

BRAKE LINES**STANDARD PROCEDURE****STANDARD PROCEDURE - DOUBLE INVERTED FLARING**

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

- (1) Cut off damaged tube with Tubing Cutter.
- (2) Ream cut edges of tubing to ensure proper flare.
- (3) Install replacement tube nut on the tube.
- (4) Insert tube in flaring tool.
- (5) Place gauge form over the end of the tube.
- (6) Push tubing through flaring tool jaws until tube contacts recessed notch in gauge that matches tube diameter.
- (7) Tighten the tool bar on the tube
- (8) Insert plug on gauge in the tube. Then swing compression disc over gauge and center tapered flaring screw in recess of compression disc (Fig. 2).
- (9) Tighten tool handle until plug gauge is squarely seated on jaws of flaring tool. This will start the inverted flare.
- (10) Remove the plug gauge and complete the inverted flare.

RH222

Fig. 2 Inverted Flare Tools**STANDARD PROCEDURE - ISO FLARING**

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

To make a ISO flare use an ISO flaring tool kit.

- (1) Cut off damaged tube with Tubing Cutter.
- (2) Remove any burrs from the inside of the tube.
- (3) Install tube nut on the tube.
- (4) Position the tube in the flaring tool flush with the top of the tool bar (Fig. 3). Then tighten the tool bar on the tube.
- (5) Install the correct size adaptor on the flaring tool yoke screw.
- (6) Lubricate the adaptor.
- (7) Align the adaptor and yoke screw over the tube (Fig. 3).
- (8) Turn the yoke screw in until the adaptor is squarely seated on the tool bar.

COMBINATION VALVE**DESCRIPTION**

The combination valve/rear brake proportioning valve are not repairable and must be replaced as an assembly.

The pressure differential switch is connected to the brake warning lamp.

COMBINATION VALVE (Continued)

**Fig. 3 ISO Flaring**

- 1 - ADAPTER
- 2 - LUBRICATE HERE
- 3 - PILOT
- 4 - FLUSH WITH BAR
- 5 - TUBING
- 6 - BAR ASSEMBLY

OPERATION**PRESSURE DIFFERENTIAL SWITCH**

The switch is triggered by movement of the switch valve. The purpose of the switch is to monitor fluid pressure in the separate front/rear brake hydraulic circuits.

A decrease or loss of fluid pressure in either hydraulic circuit will cause the switch valve to shuttle forward or rearward in response to the pressure differential. Movement of the switch valve will push the switch plunger upward. This closes the switch internal contacts completing the electrical circuit to the warning lamp. The switch valve may remain in an actuated position until repair restores system pressures to normal levels.

DIAGNOSIS AND TESTING - COMBINATION VALVE**Pressure Differential Switch**

- (1) Have helper sit in drivers seat to apply brake pedal and observe red brake warning light.
- (2) Raise vehicle on hoist.

(3) Connect bleed hose to a rear wheel cylinder and immerse hose end in container partially filled with brake fluid.

(4) Have helper press and hold brake pedal to floor and observe warning light.

(a) If warning light illuminates, switch is operating correctly.

(b) If light fails to illuminate, check circuit fuse, bulb, and wiring. The parking brake switch can be used to aid in identifying whether or not the brake light bulb and fuse is functional. Repair or replace parts as necessary and test differential pressure switch operation again.

(5) If warning light still does not illuminate, switch is faulty. Replace combination valve assembly, bleed brake system and verify proper switch and valve operation.

REMOVAL

(1) Remove pressure differential switch wire connector (Fig. 4) from the valve.

(2) Remove the brake lines from the valve.

(3) Remove the valve mounting bolt and remove the valve from the bracket.

**Fig. 4 Pressure**

- 1 - COMBINATION VALVE
- 2 - BRAKE LINES
- 3 - MOUNTING BOLT
- 4 - PRESSURE DIFFERENTIAL SWITCH

INSTALLATION

(1) Position the valve on the bracket and install the mounting bolt. Tighten the mounting bolt to 23 N·m (210 in. lbs.).

(2) Install the brake lines into the valve and tighten to 19-23 N·m (170-200 in. lbs.).

COMBINATION VALVE (Continued)

(3) Connect the pressure differential switch wire connector.

(4) Bleed base brake system, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).

DISC BRAKE CALIPERS

DESCRIPTION

The caliper is a one-piece casting. The piston bores are located in the inboard side. A square-cut piston seal is located in a machined groove in the cylinder bore.

The caliper pistons dust boot prevents dirt, water and road splash from entering the piston bore. The boot is seated in a groove machined at the outer end of the caliper piston. The boot retaining flange is seated in a counterbore machined in the outer end of the caliper piston bore.

Ventilated disc brake rotors are used for all applications. The rotors are serviceable and can be machined to restore surface finish when necessary.

OPERATION

When the brakes are applied fluid pressure is exerted against the caliper piston. The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal (Fig. 5).

Fluid pressure applied to the piston is transmitted directly to the inboard brake shoe. This forces the shoe lining against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake shoe lining into contact with the outer surface of the disc brake rotor.

In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake shoes do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal controls the amount of piston extension needed to compensate for normal lining wear.

Fig. 5 Brake Caliper Operation

- 1 - CALIPER
- 2 - PISTON
- 3 - PISTON BORE
- 4 - SEAL
- 5 - INBOARD SHOE
- 6 - OUTBOARD SHOE

During brake application, the seal is deflected outward by fluid pressure and piston movement (Fig. 6). When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston.

The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake shoe.

REMOVAL

REMOVAL - REAR

- (1) Raise and support the vehicle.
- (2) Remove the tire and wheel assembly.
- (3) Compress the disc brake caliper using tool #C4212F.
- (4) Remove the caliper pin bolts.
- (5) Remove the banjo bolt and discard the copper washer.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose with result. Provide a suitable support to hang the caliper securely.

- (6) Remove the rear disc brake caliper (Fig. 7).

- 2 - Caliper Pin Bolts

REMOVAL - FRONT

- (1) Raise and support vehicle.
- (2) Remove front wheel and tire assembly.
- (3) Remove caliper brake hose bolt, washers and hose (Fig. 8).
- (4) Remove caliper mounting bolts.
- (5) Tilt the top of the caliper up and remove it from the adapter.
- (6) Remove anti-rattle springs.

NOTE: Upper and lower anti-rattle springs are not interchangeable.

DISASSEMBLY

- (1) Drain the brake fluid from caliper.
- (2) C-clamp a block of wood over one piston (Fig. 9).

80ac2c5a

Fig. 9 C-Clamp One Piston

- 1 - BLOCK OF WOOD
- 2 - C-CLAMP
- 3 - CALIPER

(3) Take another piece of wood and pad it with one-inch thickness of shop towels. Place this piece in the outboard shoe side of the caliper in front of the other piston. This will cushion and protect caliper piston during removal (Fig. 10).

(4) To remove the caliper piston direct **short bursts of low pressure air** with a blow gun through the caliper brake hose port. Use only enough air pressure to ease the piston out.

DISC BRAKE CALIPERS (Continued)

**Fig. 10 Protect Caliper Piston**

- 1 - CALIPER
- 2 - PADDED BLOCK OF WOOD
- 3 - C-CLAMP

CAUTION: Do not blow the piston out of the bore with sustained air pressure. This could result in a cracked piston.

WARNING: NEVER ATTEMPT TO CATCH THE PISTON AS IT LEAVES THE BORE. THIS COULD RESULT IN PERSONAL INJURY.

(5) Remove the C-clamp and block of wood from the caliper and clamp it over the dust boot of the first piston removed. This will seal the empty piston bore.

(6) Move the padded piece of wood in front of the other piston.

(7) Remove the second piston using the same procedure with **short bursts of low pressure air**.

(8) Remove piston dust boots with a suitable pry tool (Fig. 11).

(9) Remove piston seals from caliper (Fig. 12).

CAUTION: Do not scratch piston bore while removing the seals.

(10) Push caliper mounting bolt bushings out of the boot seals and remove the boot seals from the caliper (Fig. 13).

(11) Remove caliper bleed screw.

CLEANING

Clean the caliper components with clean brake fluid or brake clean only. Wipe the caliper and piston dry with lint free towels or use low pressure compressed air.

**Fig. 11 Piston Dust Boot Removal**

- 1 - CALIPER
- 2 - DUST BOOT

**Fig. 12 Piston Seal**

- 1 - CALIPER
- 2 - PISTON BORE
- 3 - PISTON SEAL

CAUTION: Do not use gasoline, kerosene, thinner, or similar solvents. These products may leave a residue that could damage the piston and seal.

INSPECTION

The piston is made from a phenolic resin (plastic material) and should be smooth and clean.

The piston must be replaced if cracked or scored. Do not attempt to restore a scored piston surface by sanding or polishing.

DISC BRAKE CALIPERS (Continued)

**Fig. 13 Bushings And Boot Seals**

- 1 - CALIPER
- 2 - BUSHING
- 3 - BOOT SEAL

CAUTION: If the caliper piston is replaced, install the same type of piston in the caliper. Never interchange phenolic resin and steel caliper pistons. The pistons, seals, seal grooves, caliper bore and piston tolerances are different.

The bore can be **lightly** polished with a brake hone to remove very minor surface imperfections (Fig. 14). The caliper should be replaced if the bore is severely corroded, rusted, scored, or if polishing would increase bore diameter more than 0.025 mm (0.001 inch).

**Fig. 14 Polishing Piston Bore**

- 1 - HONE
- 2 - CALIPER
- 3 - PISTON BORE

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Insure assembly area is clean and dry.

(1) Lubricate caliper pistons, piston seals and piston bores with clean, fresh brake fluid.

(2) Install new piston seals into caliper bores (Fig. 15).

NOTE: Verify seal is fully seated and not twisted.

**Fig. 15 Piston Seal**

- 1 - CALIPER
- 2 - PISTON BORE
- 3 - PISTON SEAL

(3) Lightly lubricate lip of new boot with silicone grease. Install boot on piston and work boot lip into the groove at the top of piston.

(4) Stretch boot rearward to straighten boot folds, then move boot forward until folds snap into place.

(5) Install piston into caliper bore and press piston down to the bottom of the caliper bore by hand or with hammer handle (Fig. 16).

(6) Seat dust boot in caliper (Fig. 17) with Handle C-4171 and Installer:

- HD 56 mm caliper: Installer C-4340
- LD 54 mm caliper: Installer C-3716-A

(7) Install the second piston and dust boot.

(8) Lubricate caliper mounting bolt bushings, boot seals and bores with Mopar brake grease or Dow Corning® 807 grease only.

CAUTION: Use of alternative grease may cause damage to the boots seals.

(9) Install the boot seals into the caliper seal bores and center the seals in the bores.

DISC BRAKE CALIPERS (Continued)

**Fig. 16 Caliper Piston Installation**

- 1 - CALIPER
- 2 - DUST BOOT
- 3 - PISTON

**Fig. 17 Seating Dust Boot**

- 1 - HANDLE
- 2 - CALIPER
- 3 - DUST BOOT INSTALLER

(10) Install mounting bolt bushings into the boot seals and insure seal lip is engaged into the bushing grooves at either end of the bushing.

(11) Install caliper bleed screw.

INSTALLATION

INSTALLATION - REAR

NOTE: Install a new copper washers on the banjo bolt when installing

(1) Install the rear disc brake caliper (Fig. 18).

(2) Install the banjo bolt with new copper washers to the caliper. tighten to 38 N·m (28 ft. lbs.)

(3) Install the caliper pin bolts. tighten to 33 N·m (25 ft. lbs.)

**Fig. 18 REAR CALIPER INSTALL**

- 1 - ROTOR
- 2 - BRAKE SHOES
- 3 - DISC BRAKE CALIPER

(4) Bleed the base brake system, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).

(5) Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(6) Lower the vehicle.

INSTALLATION - FRONT

(1) Clean the caliper mounting adapter and the anti-rattle springs and grease with Mopar brake grease or Dow Corning® 807 grease only.

(2) Install the anti-rattle springs.

(3) Tilt the bottom of the caliper over the rotor and under the adapter. Then push the top of the caliper down onto the adapter.

(4) Install the caliper mounting bolts and tighten to 33 N·m (24 ft. lbs.).

(5) Install the brake hose to caliper with **new seal washers** and tighten fitting bolt to 24 N·m (18 ft. lbs.).

CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.

(6) Bleed the base brake system, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).

(7) Install the wheel and tire assemblies, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

DISC BRAKE CALIPERS (Continued)

- (8) Remove the supports and lower the vehicle.
- (9) Verify a firm pedal before moving the vehicle.

FLUID

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

STANDARD PROCEDURE - BRAKE FLUID LEVEL

Always clean the master cylinder reservoir and caps before checking fluid level. If not cleaned, dirt could enter the fluid.

The fluid fill level is indicated on the side of the master cylinder reservoir (Fig. 19).

The correct fluid level is to the FULL indicator on the side of the reservoir. If necessary, add fluid to the proper level.

Fig. 19 Master Cylinder Fluid Level - Typical

- 1 - INDICATOR
2 - RESERVOIR

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

FLUID RESERVOIR

REMOVAL

- (1) Remove reservoir cap and empty fluid into drain container.
- (2) Clamp cylinder body in vise with brass protective jaws.
- (3) Remove pins that retain reservoir to master cylinder. Use hammer and pin punch to remove pins (Fig. 20).
- (4) Loosen reservoir from grommets with pry tool (Fig. 21).
- (5) Remove reservoir by rocking it to one side and pulling free of grommets (Fig. 22).
- (6) Remove old grommets from cylinder body (Fig. 23).

INSTALLATION

CAUTION: Do not use any type of tool to install the grommets. Tools may cut, or tear the grommets creating a leak problem after installation. Install the grommets using finger pressure only.

- (1) Lubricate new grommets with clean brake fluid and Install new grommets in cylinder body (Fig. 24). Use finger pressure to install and seat grommets.
- (2) Start reservoir in grommets. Then rock reservoir back and forth while pressing downward to seat it in grommets.

PEDAL

DESCRIPTION

The brake booster is operated by a suspended type brake pedal. The pedal pivots on a shaft located in a mounting bracket attached to the dash panel. The pedal shaft is supported by bushings in the pedal and mounting bracket. The brake pedal is attached to the booster push rod.

OPERATION

When the pedal is depressed, the primary booster push rod is depressed which move the booster secondary rod. The booster secondary rod depress the master cylinder piston.

REMOVAL

- (1) Remove knee bolster, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
- (2) Remove brake lamp switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).
- (3) Remove switches from tabs on brake lamp switch bracket.
- (4) Remove brake lamp switch bracket bolts and remove bracket (Fig. 25).

Fig. 25 Brake Lamp Switch Bracket

- 1 - PEDAL BRACKET
- 2 - BRAKELIGHT SWITCH BRACKET
- 3 - BRACKET SCREWS (2)

- (5) Remove clip and washer attaching booster push rod and slide push rod off pedal.

- (6) Remove E-clip from passenger side of pedal shaft (Fig. 26). Use flat blade screwdriver to pry clip out of shaft groove.

- (7) Push shaft toward driver side of bracket just enough to expose opposite E-clip. Then remove E-clip with flat blade screwdriver.

- (8) Push pedal shaft back and out of passenger side of bracket (Fig. 26).

- (9) Remove pedal shaft, brake pedal, wave washer and bushings from vehicle.

Fig. 26 Brake Pedal Mounting (With Automatic Transmission)

- 1 - PEDAL SHAFT
- 2 - SHAFT RETAINING E-CLIPS (2)
- 3 - BRAKE PEDAL
- 4 - PEDAL BUSHING (2)
- 5 - PEDAL MOUNTING BRACKET

INSTALLATION

- (1) Replace bracket and pedal bushings if necessary. Lubricate shaft bores in bracket and pedal before installing bushings with Mopar Multi-mileage silicone grease.

- (2) Apply liberal quantity of Mopar multi-mileage grease to pedal shaft and to pedal and bracket bushings.

- (3) Position brake pedal in mounting bracket.

- (4) Slide pedal shaft into bracket and through pedal from passenger side.

- (5) Push pedal shaft out driver side of mounting bracket just enough to allow installation of retaining E-clip.

- (6) Install the wave washer between the bracket and the pedal bushing on the passenger side.

- (7) Push pedal shaft back toward passenger side of bracket and install remaining E-clip on pedal shaft.

- (8) Install booster push rod on brake pedal. Secure push rod to pedal with washer and retaining clip.

- (9) Install brake lamp switch bracket and switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING -

PEDAL (Continued)

EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION).

(10) Install knee bolster, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

POWER BRAKE BOOSTER

DIAGNOSIS AND TESTING - HYDRAULIC BOOSTER

The hydraulic booster uses hydraulic pressure from the power steering pump. Before diagnosing a booster problem, first verify the power steering pump is operating properly. Perform the following checks.

- Check the power steering fluid level.
- Check the brake fluid level.
- Check all power steering hoses and lines for leaks and restrictions.
- Check power steering pump pressure.

NOISES

The hydraulic booster unit will produce certain characteristic booster noises. The noises may occur when the brake pedal is used in a manner not associated with normal braking or driving habits.

HISSING

A hissing noise may be noticed when above normal brake pedal pressure is applied, 40 lbs. or above. The noise will be more noticeable if the vehicle is not moving. The noise will increase with the brake pedal pressure and an increase of system operating temperature.

CLUNK-CHATTER-CLICKING

A clunk-chatter-clicking may be noticed when the brake pedal is released quickly, after above normal brake pedal pressure is applied 50-100 lbs..

BOOSTER FUNCTION TEST

With the engine off depress the brake pedal several times to discharge the accumulator. Then depress the brake pedal using 40 lbs. of force and start the engine. The brake pedal should fall and then push back against your foot. This indicates the booster is operating properly.

ACCUMULATOR LEAKDOWN

(1) Start the engine, apply the brakes and turn the steering wheel from lock to lock. This will ensure the accumulator is charged. Turn off the engine and let the vehicle sit for one hour. After one hour there should be at least two power assisted brake application with the engine off. If the system does not retain a charge the booster must be replaced.

(2) With the engine off depress the brake pedal several times to discharge the accumulator. Grasp the accumulator and see if it wobbles or turns. If it does the accumulator has lost a gas charge and the booster must be replaced.

SEAL LEAKAGE

If the booster leaks from any of the seals the booster assembly must be replaced (Fig. 27).

- **INPUT ROD SEAL:** Fluid leakage from rear end of the booster.
- **PISTON SEAL:** Fluid leakage from vent at front of booster.
- **HOUSING SEAL:** Fluid leakage between housing and housing cover.
- **SPOOL VALVE SEAL:** Fluid leakage near spool plug.
- **RETURN PORT FITTING SEAL:** Fluid leakage from port fitting.

POWER BRAKE BOOSTER (Continued)

HYDRAULIC BOOSTER DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Slow Brake Pedal Return	1. Excessive seal friction in booster. 2. Faulty spool valve action. 3. Restriction in booster return hose. 4. Damaged input rod.	1. Replace booster. 2. Replace booster. 3. Replace hose. 4. Replace booster.
Excessive Brake Pedal Effort.	1. Internal or external seal leakage. 2. Faulty steering pump.	1. Replace booster. 2. Replace pump.
Brakes Self Apply	1. Dump valve faulty. 2. Contamination in hydraulic system. 3. Restriction in booster return hose.	1. Replace booster. 2. Flush hydraulic system and replace booster. 3. Replace hose.
Booster Chatter, Pedal Vibration	1. Slipping pump belt. 2. Low pump fluid level.	1. Replace power steering belt. 2. Fill pump and check for leaks.
Grabbing Brakes	1. Low pump flow. 2. Faulty spool valve action.	1. Test and repair/replace pump. 2. Replace booster.

STANDARD PROCEDURE - BLEEDING

The hydraulic booster is generally self-bleeding, this procedure will normally bleed the air from the booster. Normal driving and operation of the unit will remove any remaining trapped air.

- (1) Fill power steering pump reservoir.
- (2) Disconnect fuel shutdown relay and crank the engine for several seconds, Refer to Fuel System for relay location and WARNING.
- (3) Check fluid level and add if necessary.
- (4) Connect fuel shutdown relay and start the engine.
- (5) Turn the steering wheel slowly from lock to lock twice.
- (6) Stop the engine and discharge the accumulator by depressing the brake pedal 5 times.
- (7) Start the engine and turn the steering wheel slowly from lock to lock twice.
- (8) Turn off the engine and check fluid level and add if necessary.

NOTE: If fluid foaming occurs, wait for foam to dissipate and repeat steps 7 and 8.

REMOVAL

NOTE: If the booster is being replaced because the power steering fluid is contaminated, flush the power steering system before replacing the booster.

- (1) With engine off depress the brake pedal 5 times to discharge the accumulator.
- (2) Remove brake lines from master cylinder.
- (3) Remove mounting nuts from the master cylinder.
- (4) Remove the bracket from the hydraulic booster lines and master cylinder mounting studs.
- (5) Remove the master cylinder.
- (6) Remove the return hose and the two pressure lines from the hydraulic booster (Fig. 28).
- (7) Remove the booster push rod clip, washer and rod remove from the brake pedal. (Fig. 29).
- (8) Remove the mounting nuts from the hydraulic booster and remove the booster (Fig. 30).

INSTALLATION

- (1) Install the hydraulic booster and tighten the mounting nuts to 28 N·m (21 ft. lbs.).
- (2) Install the booster push rod, washer and clip onto the brake pedal.
- (3) Install the master cylinder on the mounting studs. and tighten the mounting nuts to 23 N·m (17 ft. lbs.).
- (4) Install the brake lines to the master cylinder and tighten to 19-200 N·m (170-200 in. lbs.).
- (5) Install the hydraulic booster line bracket onto the master cylinder mounting studs.
- (6) Install the master cylinder mounting nuts and tighten to 23 N·m (17 ft. lbs.).

(7) Install the hydraulic booster pressure lines to the bracket and booster.

(8) Tighten the pressure lines to 41 N·m (30 ft. lbs.).

NOTE: Inspect o-rings on the pressure line fittings to insure they are in good condition before installation. Replace o-rings if necessary.

(9) Install the return hose to the booster.

(10) Bleed base brake system, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).

(11) Fill the power steering pump with fluid, (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

CAUTION: Use only MOPAR power steering fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

(12) Bleed the hydraulic booster.

ROTORS

DIAGNOSIS AND TESTING

DISC BRAKE ROTOR

The rotor braking surfaces should not be refinished unless necessary.

Light surface rust and scale can be removed with a lathe equipped with dual sanding discs. The rotor surfaces can be restored by machining with a disc brake lathe if surface scoring and wear are light.

Replace the rotor for the following conditions:

- Severely Scored
- Tapered
- Hard Spots
- Cracked
- Below Minimum Thickness

ROTORS (Continued)

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if below minimum thickness, or if machining would reduce thickness below the allowable minimum.

Rotor minimum thickness is usually specified on the rotor hub. The specification is either stamped or cast into the hub surface.

ROTOR RUNOUT

Check rotor lateral runout with dial indicator C-3339 (Fig. 31) . Excessive lateral runout will cause brake pedal pulsation and rapid, uneven wear of the brake shoes. Position the dial indicator plunger approximately 25.4 mm (1 in.) inward from the rotor edge.

NOTE: Be sure wheel bearing has zero end play before checking rotor runout.

Maximum allowable rotor runout is 0.127 mm (0.005 in.).

Fig. 31 Checking Rotor Runout And Thickness Variation

1 - DIAL INDICATOR

ROTOR THICKNESS VARIATION

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at 6 to 12 points around the rotor face (Fig. 32) .

Position the micrometer approximately 25.4 mm (1 in.) from the rotor outer circumference for each measurement.

Thickness should not vary by more than 0.025 mm (0.001 in.) from point-to-point on the rotor. Machine or replace the rotor if necessary.

Fig. 32 Measuring Rotor Thickness

1 - MICROMETER

2 - ROTOR

REMOVAL

REMOVAL - REAR

- (1) Raise and support the vehicle
- (2) Remove the tire and wheel assembly.
- (3) Remove the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (4) Remove the caliper adapter bolts.
- (5) Remove the rear axle shaft from the housing on dual rear wheels, (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 286RBI/AXLE SHAFTS - REMOVAL).
- (6) Remove the hub and rotor assembly (C3500 only) (Fig. 33).

Fig. 33 ROTOR / HUB REMOVAL

ROTORS (Continued)

REMOVAL - FRONT - 2500

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the caliper from the steering knuckle, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL) and remove caliper adapter assembly (Fig. 34).

NOTE: Do not allow brake hose to support caliper adapter assembly.

Fig. 34 Caliper Adapter Assembly

- 1 - KNUCKLE
2 - CALIPER
3 - ROTOR

- (4) Remove the rotor from the hub/bearing wheel studs.

REMOVAL - FRONT - 3500

- (1) Raise and support the vehicle.
- (2) Remove the wheel and tire assembly.
- (3) Remove the hub extension mounting nuts and remove the extension from the rotor if equipped.
- (4) Remove the brake caliper adapter assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (5) Remove the rotor assembly.

INSTALLATION**INSTALLATION - REAR**

- (1) Install the hub to the rotor. Tighten the bolts to 128 N·m (95 ft. lbs.) (Fig. 35).

809eb125

Fig. 35 ROTOR TO HUB

- 1 - Hub Bolts
2 - Socket

- (2) Install the hub and rotor assembly.
- (3) Install the rear axle shaft to the housing with dual wheels, (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 286RBI/AXLE SHAFTS - INSTALLATION).
- (4) Install the caliper adapter bolts.
- (5) Install the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION). (Fig. 36).

809eb11d

Fig. 36 ROTOR INSTALLED

- (6) Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
- (7) Lower the vehicle.

ROTORS (Continued)

INSTALLATION - FRONT - 2500

(1) On models with all-wheel antilock system (ABS), check condition of tone wheel on hub/bearing. If teeth on wheel are damaged, hub/bearing assembly will have to be replaced (tone wheel is not serviced separately).

(2) Install rotor onto the hub/bearing wheel studs.

(3) Install the caliper adapter assembly, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION) and tighten adapter bolts to:

- LD 1500: 176 N·m (130 ft lbs.)
- HD 2500: 285 N·m (210 ft lbs.)

(4) Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE) and lower vehicle.

(5) Apply brakes several times to seat brake shoes. Be sure to obtain firm pedal before moving vehicle.

INSTALLATION - FRONT - 3500

(1) Position the rotor on the hub/bearing.

(2) Install the brake caliper adapter assembly (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION) and tighten adapter bolts to 285 N·m (210 ft. lbs).

(3) Install the wheel and tire assemblies, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(4) Remove the support and lower the vehicle.

(5) Apply brakes several times to seat brake shoes and caliper piston. Do not move vehicle until firm brake pedal is obtained.

BRAKE PADS/SHOES**REMOVAL****REMOVAL - REAR**

- (1) Raise and support the vehicle.
- (2) Remove the rear wheel and tire assemblies.
- (3) Compress the caliper.
- (4) Remove caliper mounting bolts

NOTE: Do not allow brake hose to support caliper assembly.

(5) Remove the caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL) and then tilt the top up and off the caliper adapter (Fig. 37).

(6) Remove inboard brake shoe from the caliper adapter (Fig. 38).

(7) Remove outboard brake shoe from caliper adapter (Fig. 39).

INSTALLATION**INSTALLATION - REAR**

- (1) Clean caliper mounting adapter and anti-rattle springs.
- (2) Lubricate anti-rattle springs with Mopar brake grease.
- (3) Install anti-rattle springs.

NOTE: Anti-rattle springs are not interchangeable.

- (4) Install inboard brake shoe in adapter.
- (5) Install outboard brake shoe in adapter.
- (6) Tilt the bottom of the caliper over rotor and under adapter. Then push the top of the caliper down onto the adapter.

BRAKE PADS/SHOES (Continued)

(7) Install caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

(8) Install wheel and tire assemblies and lower vehicle, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(9) Apply brakes several times to seat caliper pistons and brake shoes and obtain firm pedal.

(10) Top off master cylinder fluid level.

INSTALLATION - FRONT

(1) Bottom pistons in caliper bore with C-clamp. Place an old brake shoe between a C-clamp and caliper piston.

(2) Clean caliper mounting adapter and anti-rattle springs.

(3) Lubricate anti-rattle springs with Mopar brake grease.

(4) Install anti-rattle springs.

NOTE: Anti-rattle springs are not interchangeable.

(5) Install inboard brake shoe in adapter.

(6) Install outboard brake shoe in adapter.

(7) Tilt the bottom of the caliper over rotor and under adapter. Then push the top of the caliper down onto the adapter.

(8) Install caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

(9) Install wheel and tire assemblies and lower vehicle, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(10) Apply brakes several times to seat caliper pistons and brake shoes and obtain firm pedal.

(11) Top off master cylinder fluid level.

MASTER CYLINDER

DESCRIPTION

A two-piece master cylinder is used on all models. The cylinder body containing the primary and secondary pistons is made of aluminum. The removable fluid reservoir is made of nylon reinforced with glass fiber. The reservoir stores reserve brake fluid for the hydraulic brake circuits. The reservoir is the only serviceable component.

The fluid compartments of the nylon reservoir are interconnected to permit fluid level equalization. However, the equalization feature does not affect circuit separation in the event of a front or rear brake malfunction. The reservoir compartments will retain enough fluid to operate the functioning hydraulic circuit.

Care must be exercised when removing/installing the master cylinder connecting lines. The threads in the cylinder fluid ports can be damaged if care is not exercised. Start all brake line fittings by hand to avoid cross threading.

The cylinder reservoir can be replaced when necessary. However, the aluminum body section of the master cylinder is not a repairable component.

NOTE: If diagnosis indicates that an internal malfunction has occurred, the aluminum body section must be replaced as an assembly.

OPERATION

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes.

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

(1) Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding.

(2) Stop engine and shift transmission into Neutral.

(3) Pump brake pedal until all vacuum reserve in booster is depleted.

(4) Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage).

(5) Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.

(6) If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 rpm, close the throttle and immediately turn off ignition to stop engine.

(7) Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

POWER BOOSTER VACUUM TEST

(1) Connect vacuum gauge to booster check valve with short length of hose and T-fitting (Fig. 47).

(2) Start and run engine at curb idle speed for one minute.

(3) Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.

MASTER CYLINDER (Continued)

(4) Clamp hose shut between vacuum source and check valve.

(5) Stop engine and observe vacuum gauge.

(6) If vacuum drops more than one inch HG (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

J9005-81

Fig. 47 Typical Booster Vacuum Test Connections

- 1 - TEE FITTING
- 2 - SHORT CONNECTING HOSE
- 3 - CHECK VALVE
- 4 - CHECK VALVE HOSE
- 5 - CLAMP TOOL
- 6 - INTAKE MANIFOLD
- 7 - VACUUM GAUGE

POWER BOOSTER CHECK VALVE TEST

(1) Disconnect vacuum hose from check valve.
(2) Remove check valve and valve seal from booster.

(3) Use a hand operated vacuum pump for test.

(4) Apply 15-20 inches vacuum at large end of check valve (Fig. 48).

(5) Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

(1) Mount master cylinder in vise.

(2) Attach bleed tubes to cylinder outlet ports. Then position each tube end into reservoir (Fig. 49).

8031e866

Fig. 48 Vacuum Check Valve And Seal

- 1 - BOOSTER CHECK VALVE
- 2 - APPLY TEST VACUUM HERE
- 3 - VALVE SEAL

(3) Fill reservoir with fresh brake fluid.
(4) Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.

80aa01e0

Fig. 49 Master Cylinder Bleeding-Typical

- 1 - BLEEDING TUBES
- 2 - RESERVOIR

REMOVAL

(1) Pump the brake pedal several times to deplete booster vacuum reserve.

(2) Remove brake lines from the master cylinder (Fig. 50) .

(3) Remove mounting nuts from the master cylinder (Fig. 50) .

(4) Remove the master cylinder.

MASTER CYLINDER (Continued)

- 3 - RETURN SPRINGS
- 4 - SPLASH SHIELD
- 5 - HOLD DOWNS

INSTALLATION

NOTE: If master cylinder is replaced, bleed cylinder before installation.

- (1) Install master cylinder on the booster mounting studs.
- (2) Install mounting nuts and tighten to 23 N·m (17 ft. lbs.).
- (3) Install brake lines and tighten to 19-23 N·m (170-200 in. lbs.).
- (4) Bleed base brake system, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE)

PARKING BRAKE**DESCRIPTION**

The parking brakes are operated by a system of cables and levers attached to a primary and secondary shoe positioned within the drum section of the rotor.

The drum-in-hat design utilizes an independent set of shoes to park the vehicle (Fig. 51).

OPERATION

To apply the parking brake the pedal is depressed. This creates tension in the cable which pulls forward on the park brake lever. The lever pushes the park brake shoes outward and into contact with the drum section of the rotor. The contact of shoe to rotor parks the vehicle.

A torsion locking mechanism is used to hold the pedal in an applied position. Parking brake release is accomplished by the hand release.

A parking brake switch is mounted on the parking brake lever and is actuated by movement of the lever. The switch, which is in circuit with the red warning light in the dash, will illuminate the warning light whenever the parking brake is applied.

Parking brake adjustment is controlled by a cable tensioner mechanism. The cable tensioner, once adjusted at the factory, should not need further adjustment under normal circumstances. Adjustment may be required if a new tensioner, or cables are installed, or disconnected.

PEDAL**REMOVAL**

- (1) Release the parking brake.
- (2) Raise the vehicle.
- (3) Loosen the cable tensioner nut at the equalizer to create slack in the front cable.
- (4) Lower the vehicle.
- (5) Remove the knee bolster, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
- (6) Disconnect the brake lamp wire from the switch on the pedal assembly.
- (7) Roll the carpet back, loosen the front cable grommet from the floorpan and the cable retainer.
- (8) Disengage the cable end connector (Fig. 52) from the arm on the pedal assembly.

PEDAL (Continued)

(9) Remove the bolts/nuts from the pedal assembly and remove the assembly.

Fig. 52 Parking Brake Pedal Assembly

- 1 - PARK BRAKE PEDAL
- 2 - FRONT CABLE

INSTALLATION

- (1) Position the replacement pedal assembly on the dash and cowl.
- (2) Install the bolts/nuts and tighten to 28 N·m (21 ft. lbs.).
- (3) Connect the front cable to the arm on the pedal assembly.
- (4) Tighten the front cable grommet to the floorpan and the cable retainer, roll the carpet back.
- (5) Connect the wires to the brake lamp switch.
- (6) Install the knee bolster, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
- (7) Raise the vehicle.
- (8) Adjust the parking brake cable tensioner.

CABLES

REMOVAL

REMOVAL - REAR PARK BRAKE CABLE

- (1) Raise and support the vehicle.
- (2) Lockout the parking brake cable (Fig. 53).
- (3) Loosen cable adjuster nut.
- (4) Remove the rear park brake cable from the intermediate park brake cable.

Fig. 53 LOCK OUT PARKING CABLE

- 1 - LOCKING PLIERS
- 2 - PARKING BRAKE CABLE

(5) Compress tabs on cable end fitting on the rear park brake cable to the frame mount bracket. Then pull the cable through the bracket.

(6) Disengage the park brake cable from behind the rotor assembly. (Fig. 54).

Fig. 54 DISENGAGEMENT OF CABLE

- 1 - LEVER
- 2 - CABLE END

(7) Compress cable tabs on each cable end fitting at the brake cable support plate.

(8) Remove the cables from the brake cable support plates.

REMOVAL - FRONT PARKING BRAKE CABLE

- (1) Raise and support vehicle.
- (2) Loosen adjusting nut to create slack in front cable.

CABLES (Continued)

(3) Remove the front cable from the cable connector.

(4) Compress cable end fitting at underbody bracket and remove the cable from the bracket.

(5) Lower vehicle.

(6) Push ball end of cable out of pedal clevis with small screwdriver.

(7) Compress cable end fitting at the pedal bracket and remove the cable (Fig. 55).

Fig. 55 Parking Brake Pedal

1 - PARK BRAKE PEDAL

2 - FRONT CABLE

(8) Remove the left cowl trim and sill plate.

(9) Pull up the carpet and remove the cable from the body clip.

(10) Pull up on the cable and remove the cable with the body grommet.

INSTALLATION

INSTALLATION - REAR PARK BRAKE CABLE

(1) Push each cable end through the brake cable support plate hole until the cable end fitting tabs lock into place.

NOTE: Pull on the cable to ensure it is locked into place.

(2) Push the cable through the frame bracket.

(3) Lock the left cable end fitting tabs into the frame bracket hole.

(4) Install the rear cables into the tensioner rod behind the rear of the brake assembly.

(5) Install the cable to the intermediate cable connector.

(6) Release and remove the lock out device.

(7) Perform the park brake adjustment procedure, (Refer to 5 - BRAKES/PARKING BRAKE/CABLE TENSIONER - ADJUSTMENTS).

(8) Remove the supports and lower the vehicle.

INSTALLATION - FRONT PARKING BRAKE CABLE

(1) From inside the vehicle, insert the cable end fitting into the hole in the pedal assembly.

(2) Seat the cable retainer in the pedal assembly.

(3) Engage the cable ball end in clevis on the pedal assembly.

(4) Route the cable along the top of the wheel well and clip in place.

(5) Route the cable through the floorpan and install the body grommet.

(6) Place the carpet down and install the left cowl trim and sill plate.

(7) Raise and support the vehicle.

(8) Route the cable through the underbody bracket and seat the cable housing retainer in the bracket.

(9) Connect the cable to the cable connector.

(10) Perform the park brake adjustment procedure, (Refer to 5 - BRAKES/PARKING BRAKE/CABLE TENSIONER - ADJUSTMENTS).

(11) Lower the vehicle.

CABLE TENSIONER

ADJUSTMENTS

ADJUSTMENT

NOTE: Tensioner adjustment is only necessary when the tensioner, or a cable has been replaced or disconnected for service. When adjustment is necessary, perform adjustment only as described in the following procedure. This is necessary to avoid faulty park brake operation.

(1) Raise the vehicle.

(2) Back off the cable tensioner adjusting nut to create slack in the cables.

(3) Remove the rear wheel/tire assemblies. Then remove the brake drum in hat assembly.

(4) Verify the brakes are in good condition and operating properly.

(5) Verify the park brake cables operate freely and are not binding, or seized.

(6) Check the rear brake shoe adjustment with standard brake gauge.

CABLE TENSIONER (Continued)

(7) Install the drum in hat assembly and verify that the rotor rotates freely without drag.

(8) Install the wheel/tire assemblies, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(9) Lower the vehicle enough for access to the park brake foot pedal. Then fully apply the park brakes.

NOTE: Leave park brakes applied until adjustment is complete.

(10) Raise the vehicle again.

(11) Mark the tensioner rod 6.35 mm (1/4 in.) from edge of the tensioner (Fig. 56).

(12) Tighten the adjusting nut on the tensioner rod until the mark is no longer visible.

CAUTION: Do not loosen, or tighten the tensioner adjusting nut for any reason after completing adjustment.

(13) Lower the vehicle until the rear wheels are 15-20 cm (6-8 in.) off the shop floor.

(14) Release the park brake foot pedal and verify that rear wheels rotate freely without drag. Then lower the vehicle.

30b2b80c

Fig. 56 Adjustment Mark

- 1 - TENSIONER CABLE BRACKET
- 2 - TENSIONER
- 3 - CABLE CONNECTOR

RELEASE HANDLE

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the driver side outboard end of the instrument panel to access and unsnap the plastic

retainer clip that secures the park brake release linkage rod to the park brake mechanism on the left cowl side inner panel.

(3) Disengage the park brake release linkage rod end from the park brake mechanism.

(4) Lift the park brake release handle to access and unsnap the plastic retainer clip that secures the park brake release linkage rod to the lever on the back of the park brake release handle.

(5) Lower the park brake release handle and reach under the driver side outboard end of the instrument panel to disengage the park brake release linkage rod end from the lever on the back of the park brake release handle.

(6) Lift the park brake release handle to access the handle mounting bracket.

(7) Using a trim stick or another suitable wide flat-bladed tool, gently pry each of the park brake release handle mounting bracket latch tabs away from the retaining notches in the instrument panel receptacle (Fig. 57).

(8) With both of the park brake release handle mounting bracket latches released, slide the handle and bracket assembly down and out of the instrument panel receptacle.

RELEASE HANDLE (Continued)

INSTALLATION

(1) Position the park brake release handle to the instrument panel.

(2) Slide the handle and bracket assembly up into the instrument panel receptacle until both of the park brake release handle mounting bracket latches are engaged with the notches in the instrument panel receptacle.

(3) Lower the park brake release handle and reach under the driver side outboard end of the instrument panel to engage the park brake release linkage rod end with the lever on the back of the park brake release handle.

(4) Lift the park brake release handle to access and snap the plastic retainer clip that secures the park brake release linkage rod to the lever on the back of the park brake release handle over the linkage rod.

(5) Reach under the driver side outboard end of the instrument panel to access and engage the park brake release linkage rod end to the park brake mechanism.

(6) Snap the plastic retainer clip that secures the park brake release linkage rod to the park brake mechanism on the left cowl side inner panel over the linkage rod.

(7) Reconnect the battery negative cable.

SHOES**REMOVAL**

(1) Raise and support the vehicle.

(2) Remove the tire and wheel assembly.

(3) Remove the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL)

(4) Remove the disc brake rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)

(5) Lockout the parking brake cable (Fig. 58).

(6) Disengage the park brake cable from behind the rotor assembly to allow easier disassembly of the park brake shoes (Fig. 59).

(7) Disassemble the rear park brake shoes (Fig. 60).

INSTALLATION

(1) Reassemble the rear park brake shoes (Fig. 61).

(2) Release the parking brake cable.

(3) Adjust the rear park brake shoes (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).

Fig. 58 LOCK OUT PARKING CABLE

1 - LOCKING PLIERS

2 - PARKING BRAKE CABLE

Fig. 59 DISENGAGEMENT OF CABLE

1 - LEVER

2 - CABLE END

(4) Install the disc brake rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

(5) Install the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

(6) Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

(7) Lower the vehicle.

ADJUSTMENTS

ADJUSTMENT - PARKING BRAKE SHOES

CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.

- (1) Raise vehicle.
- (2) Remove tire and wheel.
- (3) Remove disc brake caliper from caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (4) Remove rotor from the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

- (5) Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, **accurately** measure the inside diameter of the park brake drum portion of the rotor (Fig. 62).

**Fig. 62 Measuring Park Brake Drum Diameter**

- (6) Using a ruler that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool (Fig. 63).

**Fig. 63 Reading Park Brake Drum Diameter**

SHOES (Continued)

(7) Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 or the equivalent used, so that the outside measurement jaws are set to the reduced measurement (Fig. 64).

Fig. 64 Setting Gauge To Park Brake Shoe Measurement

(8) Place Gauge, Brake Shoe, Special Tool C-3919, or equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.

(9) Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.

(10) Repeat step 8 above and measure shoes in both directions.

(11) Install brake rotor on the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION) .

(12) Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.

(13) Install disc brake caliper on caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

(14) Install wheel and tire.

(15) Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified torque. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).

(16) Lower vehicle.

(17) Apply and release the park brake pedal one time. This will seat and correctly adjust the park brake cables.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

(18) Road test the vehicle to ensure proper function of the vehicle's brake system.

BRAKES - ABS

DESCRIPTION

The antilock brake system (ABS) is an electronically operated, all wheel brake control system. 2500 and 3500 vehicles have Electronic Brake Distribution (EBD) designed into the system which eliminates the combination/proportioning valve.

The system is designed to prevent wheel lockup and maintain steering control during periods of high wheel slip when braking. Preventing lockup is accomplished by modulating fluid pressure to the wheel brake units.

The hydraulic system is a three channel design. The front wheel brakes are controlled individually and the rear wheel brakes in tandem (Fig. 1). The ABS electrical system is separate from other electrical circuits in the vehicle. A specially programmed controller antilock brake unit operates the system components.

ABS system major components include:

- Controller Antilock Brakes (CAB)
- Hydraulic Control Unit (HCU)
- Wheel Speed Sensors (WSS)

- ABS Warning Light

- 11 - CAB/HCU

BRAKES - ABS (Continued)

OPERATION

Battery voltage is supplied to the CAB when a speed of 15 miles per hour is reached. The CAB performs a system initialization procedure at this point. Initialization consists of a static and dynamic self check of system electrical components.

The static and dynamic checks occurs at ignition start up. During the dynamic check, the CAB briefly cycles the pump and solenoids to verify operation. An audible noise may be heard during this self check. This noise should be considered normal.

If an ABS component exhibits a fault during initialization, the CAB illuminates the amber warning light and registers a fault code in the microprocessor memory.

The CAB monitors wheel speed sensor inputs continuously while the vehicle is in motion. However, the CAB will not activate any ABS components as long as sensor inputs indicate normal braking.

During normal braking, the master cylinder, power booster and wheel brake units all function as they would in a vehicle without ABS. The HCU components are not activated.

The purpose of the antilock system is to prevent wheel lockup during periods of high wheel slip. Preventing lockup helps maintain vehicle braking action and steering control.

The antilock CAB activates the system whenever sensor signals indicate periods of wheel slip. Periods of wheel slip occur when brake stops involve high pedal pressure and rate of vehicle deceleration.

The antilock system prevents lockup during a wheel slip condition by modulating fluid apply pressure to the wheel brake units.

Brake fluid apply pressure is modulated according to wheel speed, degree of slip and rate of deceleration. Sensors at each front wheel convert wheel speed into electrical signals. These signals are transmitted to the CAB for processing and determination of wheel slip and deceleration rate.

The ABS system has three fluid pressure control channels. The front brakes are controlled separately and the rear brakes in tandem. A speed sensor input signal indicating a wheel slip condition activates the CAB antilock program.

There are Two solenoid valves (Isolation and Dump valve) which are used in each antilock control channel. The valves are all located within the HCU valve body and work in pairs to either increase, hold, or decrease apply pressure as needed in the individual control channels.

During an ABS stop the ISO valve actuates, Stopping anymore pressure build —up to the calipers. Then the Dump valve dumps off pressure until the wheel unlocks. This will continue until the wheels quit slipping altogether.

DIAGNOSIS AND TESTING - ANTILOCK BRAKES

The ABS brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The CAB monitors the systems input and output circuits to verify the system is operating correctly. If the on board diagnostic system senses that a circuit is malfunctioning the system will set a trouble code in its memory.

NOTE: An audible noise may be heard during the self-test. This noise should be considered normal.

NOTE: The MDS or DRB III scan tool is used to diagnose the ABS system. For additional information refer to the Antilock Brake section in Group 8W. For test procedures refer to the Chassis Diagnostic Manual.

STANDARD PROCEDURE

STANDARD PROCEDURE - RWAL SERVICE PRECAUTIONS

The RWAL uses an electronic control module, the CAB. This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the CAB circuits. **In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.** These circuits should only be tested using a high impedance multi-meter or the DRB tester as described in this section. Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of after-market electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, ect.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

STANDARD PROCEDURE - BLEEDING ABS BRAKE SYSTEM

ABS system bleeding requires conventional bleeding methods plus use of the DRB scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the

BRAKES - ABS (Continued)

HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

(1) Perform the base brake bleeding, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).

(2) Connect the scan tool to the Data Link Connector.

(3) Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.

(4) Perform base brake bleeding a second time, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).

(5) Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

FRONT WHEEL SPEED SENSOR

DESCRIPTION

The ABS brake system uses 3 wheel speed sensors. A sensor is mounted to each front steering knuckles. The third sensor is mounted on top of the rear axle differential housing.

OPERATION

The Wheel Speed Sensor consists of a magnet surrounded by windings from a single strand of wire. The sensor sends a small AC signal to the CAB. This signal is generated by magnetic induction. The magnetic induction is created when a toothed sensor ring (exciter ring or tone wheel) passes the stationary magnetic WSS.

When the ring gear is rotated, the exciter ring passes the tip of the WSS. As the exciter ring tooth approaches the tip of the WSS, the magnetic lines of force expand, causing the magnetic field to cut across the sensor's windings. This, in turn causes current to flow through the WSS circuit (Fig. 2) in one direction. When the exciter ring tooth moves away from the sensor tip, the magnetic lines of force collapse cutting the winding in the opposite direction. This causes the current to flow in the opposite direction. Every time a tooth of the exciter ring passes the tip of the WSS, an AC signal is generated. Each AC signal (positive to negative signal or sinewave) is interpreted by the CAB. It then compares the frequency of the sinewave to a time value to calculate vehicle speed. The CAB continues to monitor the frequency to determine a deceleration rate that would indicate a possible wheel-locking tendency.

The signal strength of any magnetic induction sensor is directly affected by:

- Magnetic field strength; the stronger the magnetic field, the stronger the signal
- Number of windings in the sensor; more windings provide a stronger signal
- Exciter ring speed; the faster the exciter ring/tone wheel rotates, the stronger the signal will be
- Distance between the exciter ring teeth and WSS; the closer the WSS is to the exciter ring/tone wheel, the stronger the signal will be

The rear WSS is not adjustable. A clearance specification has been established for manufacturing tolerances. If the clearance is not within these specifications, then either the WSS or other components may be damaged. The clearance between the WSS and the exciter ring is 0.005 – 0.050 in.

The assembly plant performs a "Rolls Test" on every vehicle that leaves the assembly plant. One of the test performed is a test of the WSS. To properly

8020cd59

- 2 - CAB
- 3 - AIR GAP
- 4 - EXCITER RING
- 5 - COIL

test the sensor, the assembly plant connects test equipment to the Data Link Connector (DLC). This connector is located to the right of the steering column and attached to the lower portion of the instrument panel (Fig. 3). The rolls test terminal is spliced to the WSS circuit. The vehicle is then driven on a set of rollers and the WSS output is monitored for proper operation.

REMOVAL

REMOVAL - 4X2

- (1) Raise and support vehicle.
- (2) Disconnect the ABS wheel speed sensor wire from under the hood. Remove sensor wire from the frame, brake hose and steering knuckle.
- (3) Remove sensor bolt from the backside of the steering knuckle and remove the sensor (Fig. 4).

Fig. 4 Wheel Speed Sensor - 4x2

- 1 - KNUCKLE
2 - SENSOR

REMOVAL - 4X4

- (1) Disconnect the ABS wheel speed sensor wire from under the hood.
- (2) Raise and support the vehicle.
- (3) Remove the tire and wheel assembly.
- (4) Remove the sensor wire from the clips on the brake hose.
- (5) Remove the brake caliper. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (6) Remove the disc brake rotor and adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (7) Bend the tab on the dust shield upwards to allow access to the bolt.
- (8) Remove the bolt attaching the sensor to the hub bearing. (Fig. 5)
- (9) Remove the sensor wire.

80ca45eb

Fig. 5 WHEEL SPEED SENSOR - 4X4

- 1 - HUB/BEARING
2 - WHEEL SPEED SENSOR

INSTALLATION

INSTALLATION - 4X2

- (1) Position sensor in knuckle.
- (2) Install and tighten sensor bolt to 23 N·m (17 ft. lbs.). **Use original or replacement sensor bolt only. The bolt is special and must not be substituted.**
- (3) Install sensor wire to the steering knuckle, brake hose and frame. Connect the wheel speed sensor wire under the hood.
- (4) Check sensor wire routing. Be sure wire is clear of all chassis components and is not twisted or kinked at any spot.
- (5) Remove support and lower the vehicle.
- (6) Verify sensor operation with scan tool.

INSTALLATION - 4X4

NOTE: Use original or replacement sensor bolts only. The bolts are special and must not be substituted.

- (1) Install the sensor in the hub bearing and tighten the bolt to 14 N·m (11 ft. lbs.). (Fig. 5)
- (2) Bend the dust shield tab back downwards into position.
- (3) Install the disc brake rotor and caliper adapter. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
- (4) Install the brake caliper. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (5) Route the wire into the clips.

FRONT WHEEL SPEED SENSOR (Continued)

NOTE: Check the sensor wire routing. Be sure the wire is clear of all chassis components and is not twisted or kinked at any spot.

- (6) Install the tire and wheel assembly.
- (7) Remove the support and lower the vehicle.
- (8) Reconnect the ABS wheel speed sensor wire electrical connector inside the engine compartment.
- (9) Apply the brakes several times to seat the brake shoes and caliper piston. Do not move the vehicle until a firm brake pedal is obtained.
- (10) Verify the wheel speed sensor operation with a scan tool.

REAR WHEEL SPEED SENSOR

DIAGNOSIS AND TESTING - REAR WHEEL SPEED SENSOR

Diagnosis of base brake conditions which are mechanical in nature should be performed first. This includes brake noise, lack of power assist, parking brake, or vehicle vibration during normal braking.

The Antilock brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The CAB monitors the system inputs and outputs circuits to verify the system is operating properly. If the CAB senses a malfunction in the system it will set a DTC into memory and trigger the warning lamp.

NOTE: The MDS or DRB III scan tool is used to diagnose the Antilock Brake system. For test procedures refer to the Chassis Diagnostic Manual.

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove brake line mounting nut and remove the brake line from the sensor stud.
- (3) Remove mounting stud from the sensor and shield (Fig. 6) .
- (4) Remove sensor and shield from differential housing.
- (5) Disconnect sensor wire harness and remove sensor.

INSTALLATION

- (1) Connect harness to sensor. **Be sure seal is securely in place between sensor and wiring connector.**
- (2) Install O-ring on sensor (if removed).
- (3) Insert sensor in differential housing.
- (4) Install sensor shield.
- (5) Install the sensor mounting stud and tighten to 24 N·m (18 ft. lbs.).

30b04f8a

Fig. 6 Rear Speed Sensor Mounting

- 1 - WHEEL SPEED SENSOR
2 - AXLE

- (6) Install the brake line on the sensor stud and install the nut.
- (7) Lower vehicle.

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) consists of a valve body, pump, two accumulators and a motor. The assembly is mounted on the driverside inner fender under the hood.

OPERATION

The pump, motor, and accumulators are combined into an assembly attached to the valve body. The accumulators store the extra fluid which had to be dumped from the brakes. This is done to prevent the wheels from locking up. The pump provides the fluid volume needed and is operated by a DC type motor. The motor is controlled by the CAB.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system.

The valve body contains the solenoid valves. The valves modulate brake pressure during antilock braking and are controlled by the CAB.

The HCU provides three channel pressure control to the front and rear brakes. One channel controls the rear wheel brakes in tandem. The two remaining channels control the front wheel brakes individually.

HCU (HYDRAULIC CONTROL UNIT) (Continued)

During antilock braking, the solenoid valves are opened and closed as needed. The valves are not static. They are cycled rapidly and continuously to modulate pressure and control wheel slip and deceleration.

During antilock braking, solenoid valve pressure modulation occurs in three stages, pressure decrease, pressure hold, and pressure increase. The valves are all contained in the valve body portion of the HCU.

PRESSURE DECREASE

The inlet valve is closed and the outlet valve is opened during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the CAB closes the inlet to prevent the driver from further increasing the brake pressure and locking the brakes. The CAB then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the CAB closes the outlet valve and begins a pressure increase or hold cycle as needed.

PRESSURE HOLD

Both solenoid valves are closed in the pressure hold cycle. Fluid apply pressure in the control channel is maintained at a constant rate. The CAB maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

PRESSURE INCREASE

The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to counteract unequal wheel speeds. This cycle controls re-application of fluid apply pressure due to changing road surfaces or wheel speed.

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Push the harness connector locks to release the locks, then remove the connectors from the CAB.
- (3) Disconnect brake lines from HCU (Fig. 7).
- (4) Remove the two mounting bolts on either side of the assembly which attach the assembly to the mounting bracket.
- (5) Tilt the assembly upward where the brake lines attach and remove the assembly from the mounting bracket.

Fig. 7 Brake Lines

- 1 - BRAKE LINES
2 - HCU

INSTALLATION

- (1) Install the assembly into the mounting bracket.
- (2) Install the mounting bolts and tighten to 12 N·m (102 in. lbs.).
- (3) Connect the CAB harnesses.
- (4) Connect the brake lines to the HCU. Tighten brake line fittings to 19-23 N·m (170-200 in. lbs.).
- (5) Connect battery.
- (6) Bleed brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).

CLUTCH

DESCRIPTION

The clutch mechanism consists of a flywheel, dry-type disc, diaphragm style pressure plate (Fig. 1) and hydraulic linkage. The flywheel is bolted to the rear flange of the crankshaft. The clutch pressure plate is bolted to the flywheel with the clutch disc between these two components. The clutch system provides the mechanical, link between the engine and the transmission. The system is designed to transfer the torque output of the engine, to the transmission while isolating the transmission from the engine firing pulses to minimize concerns such as gear rattle.

80be45e9

Fig. 1 ENGINE POWERFLOW

CLUTCH (Continued)

OPERATION

When the clutch pedal is depressed, it actuates the clutch master cylinder. This sends hydraulic pressure to the clutch slave cylinder. The release fork is then actuated by the slave cylinder mounted on the transmission housing. The release fork pivots on a ball stud mounted in the transmission housing and pushes the release bearing. The release bearing then depresses the pressure plate spring fingers, thereby releasing pressure on the clutch disc and allowing the engine crankshaft to spin independently of the transmission input shaft (Fig. 2).

WARNING

WARNING: EXERCISE CARE WHEN SERVICING CLUTCH COMPONENTS. FACTORY INSTALLED CLUTCH DISCS DO NOT CONTAIN ASBESTOS FIBERS. DUST AND DIRT ON CLUTCH PARTS MAY CONTAIN ASBESTOS FIBERS FROM AFTERMARKET COMPONENTS. BREATHING EXCESSIVE CONCENTRATIONS OF THESE FIBERS CAN CAUSE SERIOUS BODILY HARM. WEAR A RESPIRATOR DURING SERVICE AND NEVER CLEAN CLUTCH COMPONENTS WITH COMPRESSED AIR OR WITH A DRY BRUSH. EITHER CLEAN THE COMPONENTS

WITH A WATER DAMPENED RAGS OR USE A VACUUM CLEANER SPECIFICALLY DESIGNED FOR REMOVING ASBESTOS FIBERS AND DUST. DO NOT CREATE DUST BY SANDING A CLUTCH DISC. REPLACE THE DISC IF THE FRICTION MATERIAL IS DAMAGED OR CONTAMINATED. DISPOSE OF ALL DUST AND DIRT CONTAINING ASBESTOS FIBERS IN SEALED BAGS OR CONTAINERS. THIS WILL HELP MINIMIZE EXPOSURE TO YOURSELF AND TO OTHERS. FOLLOW ALL RECOMMENDED SAFETY PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL SAFETY AGENCY (EPA), FOR THE HANDLING AND DISPOSAL OF PRODUCTS CONTAINING ASBESTOS.

DIAGNOSIS AND TESTING - CLUTCH

A road test and component inspection (Fig. 3) is recommended to determine a clutch problem.

During a road test, drive the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If the clutch chatters, grabs, slips or does not release properly, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed as the transmission or another driveline component may be at fault.

CLUTCH CONTAMINATION

Fluid contamination is a frequent cause of clutch malfunctions. Oil, water or clutch fluid on the clutch disc and pressure plate surfaces will cause chatter, slip and grab.

During inspection, note if any components are contaminated with oil, hydraulic fluid or water/road splash.

Oil contamination indicates a leak at either the rear main seal or transmission input shaft. Oil leakage produces a residue of oil on the housing interior and on the clutch cover and flywheel. Heat buildup caused by slippage between the cover, disc and flywheel, can sometimes bake the oil residue onto the components. The glaze-like residue ranges in color from amber to black.

Road splash contamination means dirt/water is entering the clutch housing due to loose bolts, housing cracks or through hydraulic line openings. Driving through deep water puddles can force water/road splash into the housing through such openings.

Clutch fluid leaks are usually from damaged slave cylinder push rod seals.

CLUTCH (Continued)

1 Check clutch housing bolts. Tighten if loose. Be sure housing is fully seated on engine block.

2 Check flywheel. Scuff sand face to remove glaze. Clean surface with wax and grease remover. Replace flywheel if severely scored, worn or cracked. Secure flywheel with new bolts (if removed). Do not reuse old bolts. Use Mopar Lock N'Seal on bolts.

3 Tighten clutch cover bolts 2-3 threads at a time, alternately and evenly (in a star pattern) to specified torque. Failure to do so could warp the cover.

4 Check release fork. Replace fork if bent or worn. Make sure pivot and bearing contact surfaces are lubricated.

5 Check release fork pivot (in housing). Be sure pivot is secure and ball end is lubricated.

6 Transmission input shaft bearing will cause noise, chatter, or improper release if damaged. Check condition before installing transmission.

7 Check slave cylinder. Replace it if leaking. Be sure cylinder is properly secured in housing and cylinder piston is seated in release fork.

8 Check input shaft seal if clutch cover and disc were oil covered. Replace seal if worn, or cut.

9 Inspect release bearing slide surface of trans. front bearing retainer. Surface should be smooth, free of nicks, scores. Replace retainer if necessary. Lubricate slide surface before installing release bearing.

10 Do not replace release bearing unless actually faulty. Replace bearing only if seized, noisy, or damaged.

11 Check clutch cover diaphragm spring and release fingers. Replace cover if spring or fingers are bent, warped, broken, cracked. Do not tamper with factory spring setting as clutch problems will result.

12 Check condition of clutch cover. Replace clutch cover if plate surface is deeply scored, warped, worn, or cracked. Be sure cover is correct size and properly aligned on disc and flywheel.

13 Inspect clutch housing. Be sure bolts are tight. Replace housing if damaged.

14 Verify that housing alignment dowels are in position before installing housing.

15 Clean engine block surface before installing clutch housing. Dirt, grime can produce misalignment.

16 Check rear main seal if clutch disc and cover were oil covered. Replace seal if necessary.

17 Check crankshaft flange (if flywheel is removed). Be sure flange is clean and flywheel bolt threads are in good condition.

18 Check pilot bearing. Replace bearing if damaged. Lube with Mopar high temp. bearing grease before installation.

19 Check transmission input shaft. Disc must slide freely on shaft splines. Lightly grease splines before installation. Replace shaft if splines or pilot bearing hub are damaged.

20 Check flywheel bolt torque. If bolts are loose, replace them. Use Mopar Lock N'Seal to secure new bolts.

21 Check clutch disc facing. Replace disc if facing is charred, scored, flaking off, or worn. Also check runout of new disc. Runout should not exceed 0.5 mm (0.02 in.).

Fig. 3 CLUTCH COMPONENTS AND INSPECTION

CLUTCH (Continued)

IMPROPER RELEASE OR CLUTCH ENGAGEMENT

Clutch release or engagement problems are caused by wear or damage to one or more clutch components. A visual inspection of the release components will usually reveal the problem part.

Release problems can result in hard shifting and noise. Items to look for are: leaks at the clutch cylinders and interconnecting line; loose slave cylinder bolts; worn/loose release fork and pivot stud; damaged release bearing; and a worn clutch disc, or pressure plate.

Normal condensation in vehicles that are stored or out of service for long periods of time can generate enough corrosion to make the disc stick to the flywheel, or pressure plate. If this condition is experienced, correction only requires that the disc be loosened manually through the inspection plate opening.

Engagement problems usually result in slip, chatter/shudder, and noisy operation. The primary causes are clutch disc contamination; clutch disc wear; misalignment, or distortion; flywheel damage; or a combination of the foregoing. A visual inspection is required to determine the part actually causing the problem.

CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

CLUTCH COVER AND DISC RUNOUT

Check the clutch disc before installation. Axial (face) runout of a **new** disc should not exceed 0.50 mm (0.020 in.). Measure runout about 6 mm (1/4 in.) from the outer edge of the disc facing. Obtain another disc if runout is excessive.

Check condition of the clutch before installation. A warped cover or diaphragm spring will cause grab and incomplete release or engagement. Be careful when handling the cover and disc. Impact can distort the cover, diaphragm spring, release fingers and the hub of the clutch disc.

Use an alignment tool when positioning the disc on the flywheel. The tool prevents accidental misalignment which could result in cover distortion and disc damage.

A frequent cause of clutch cover distortion (and consequent misalignment) is improper bolt tightening.

DIAGNOSIS CHART

The clutch inspection chart (Fig. 3) outlines items to be checked before and during clutch installation. Use the chart as a check list to help avoid overlooking potential problem sources during service operations.

The diagnosis charts Diagnosis Chart describe common clutch problems, causes and correction. Fault conditions are listed at the top of each chart. Conditions, causes and corrective action are outlined in the indicated columns.

The charts are provided as a convenient reference when diagnosing faulty clutch operation.

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Disc facing worn out	<ol style="list-style-type: none"> 1. Normal wear. 2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear. 3. Insufficient clutch cover diaphragm spring tension. 	<ol style="list-style-type: none"> 1. Replace cover and disc. 2. Replace cover and disc. 3. Replace cover and disc.
Clutch disc facing contaminated with oil, grease, or clutch fluid.	<ol style="list-style-type: none"> 1. Leak at rear main engine seal or transmission input shaft seal. 2. Excessive amount of grease applied to the input shaft splines. 3. Road splash, water entering housing. 4. Slave cylinder leaking. 	<ol style="list-style-type: none"> 1. Replace appropriate seal. 2. Remove grease and apply the correct amount of grease. 3. Replace clutch disc. Clean clutch cover and reuse if in good condition. 4. Replace hydraulic clutch linkage.

CLUTCH (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
Clutch is running partially disengaged.	1. Release bearing sticking or binding and does not return to the normal running position.	1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary.
Flywheel below minimum thickness specification.	1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal.	1. Replace flywheel.
Clutch disc, cover and/or diaphragm spring warped or distorted.	1. Rough handling. Impact bent cover, spring, or disc. 2. Improper bolt tightening procedure.	1. Replace disc or cover as necessary. 2. Tighten clutch cover using proper procedure.
Facing on flywheel side of disc torn, gouged, or worn.	1. Flywheel surface scored or nicked. 2. Clutch disc sticking or binding on transmission input shaft.	1. Correct surface condition if possible. Replace flywheel and disc as necessary. 2. Inspect components and correct/replace as necessary.
Clutch disc facing burnt. Flywheel and cover pressure plate surfaces heavily glazed.	1. Frequent operation under high loads or hard acceleration conditions. 2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover.	1. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause. 2. Correct condition of flywheel and pressure plate surface. Replace clutch cover and disc. Alert driver to problem cause.
Clutch disc binds on input shaft splines.	1. Clutch disc hub splines damaged during installation. 2. Input shaft splines rough, damaged, or corroded.	1. Clean, smooth, and lubricate hub splines if possible. Replace disc if necessary. 2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary.
Clutch disc rusted to flywheel and/or pressure plate.	1. Clutch not used for and extended period of time (e.g. long term vehicle storage).	1. Sand rusted surfaces with 180 grit sanding paper. Replace clutch cover and flywheel if necessary.
Pilot bearing seized, loose, or rollers are worn.	1. Bearing cocked during installation. 2. Bearing defective. 3. Bearing not lubricated. 4. Clutch misalignment.	1. Install and lubricate a new bearing. 2. Install and lubricate a new bearing. 3. Install and lubricate a new bearing. 4. Inspect clutch and correct as necessary. Install and lubricate a new bearing.

CLUTCH (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
Clutch will not disengage properly.	<ol style="list-style-type: none"> 1. Low clutch fluid level. 2. Clutch cover loose. 3. Clutch disc bent or distorted. 4. Clutch cover diaphragm spring bent or warped. 5. Clutch disc installed backwards. 6. Release fork bent or fork pivot loose or damaged. 7. Clutch master or slave cylinder failure. 	<ol style="list-style-type: none"> 1. Add Fluid / Replace hydraulic linkage assembly. 2. Follow proper bolt tightening procedure. 3. Replace clutch disc. 4. Replace clutch cover. 5. Remove and install clutch disc correctly. 6. Replace fork or pivot as necessary. 7. Replace hydraulic linkage assembly.
Clutch pedal squeak.	<ol style="list-style-type: none"> 1. Pivot pin loose. 2. Master cylinder bushing not lubricated. 3. Pedal bushings worn out or cracked. 	<ol style="list-style-type: none"> 1. Tighten pivot pin if possible. Replace clutch pedal if necessary. 2. Lubricate master cylinder bushing. 3. Replace and lubricate bushings.
Clutch master or slave cylinder plunger dragging and/or binding	<ol style="list-style-type: none"> 1. Master or slave cylinder components worn or corroded. 	<ol style="list-style-type: none"> 1. Replace clutch hydraulic linkage assembly.
Release bearing is noisy.	<ol style="list-style-type: none"> 1. Release bearing defective or damaged. 	<ol style="list-style-type: none"> 1. Replace release bearing.
Contact surface of release bearing damaged.	<ol style="list-style-type: none"> 1. Clutch cover incorrect or release fingers bent or distorted. 2. Release bearing defective or damaged. 3. Release bearing misaligned. 	<ol style="list-style-type: none"> 1. Replace clutch cover and release bearing. 2. Replace the release bearing. 3. Check and correct runout of clutch components. Check front bearing sleeve for damage/alignment. Repair as necessary.
Partial engagement of clutch disc. One side of disc is worn and the other side is glazed and lightly worn.	<ol style="list-style-type: none"> 1. Clutch pressure plate position incorrect. 2. Clutch cover, spring, or release fingers bent or distorted. 3. Clutch disc damaged or distorted. 4. Clutch misalignment. 	<ol style="list-style-type: none"> 1. Replace clutch disc and cover. 2. Replace clutch disc and cover. 3. Replace clutch disc. 4. Check alignment and runout of flywheel, disc, pressure plate, and/or clutch housing. Correct as necessary.

CLUTCH (Continued)

SPECIFICATIONS - CLUTCH

TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Nut, slave cylinder	19-26	14-19	170-230
Bolt, clutch cover-5/16 in.	23	17	-

CLUTCH DISC

REMOVAL

- (1) Raise and support vehicle.
- (2) Support engine with wood block and adjustable jack stand, so engine mounts are not strained (Fig. 4).

**Fig. 4 Supporting Engine -Diesel Model Shown**

- 1 - WOOD BLOCK
- 2 - ADJUSTABLE JACK STAND

- (3) Remove transmission and transfer case, if equipped. Refer to 21 Transmission and Transfer Case for procedures.

- (4) If pressure plate will be reused, mark position of cover on flywheel with paint or scribe (Fig. 5).

**Fig. 5 Marking Pressure Plate Position**

- 1 - FLYWHEEL
- 2 - ALIGNMENT MARKS
- 3 - PRESSURE PLATE

- (5) Insert clutch alignment tool through clutch disc and into pilot bushing, to hold disc in place.

CLUTCH DISC (Continued)

(6) If pressure plate will be reused, loosen cover bolts evenly only few threads at a time in a diagonal pattern (Fig. 6). This relieves cover spring tension evenly to avoid warping.

Fig. 6 Bolt Loosening/Tightening Pattern

(7) Remove bolts completely and remove plate, disc and alignment tool.

INSTALLATION

(1) Check runout and free operation of new clutch disc.

(2) Insert clutch alignment tool in pressure plate and clutch disc.

(3) Insert alignment tool in pilot bearing and position plate and disc on flywheel (Fig. 7).

NOTE: Raised side of disc hub faces away from the flywheel.

(4) Install cover bolts finger tight.

(5) Tighten cover bolts evenly and a few threads at a time.

CAUTION: Cover bolts must be tightened evenly to avoid distorting cover.

(6) Tighten clutch cover bolts to:

- 5/16 in. diameter bolts to 23 N·m (17 ft. lbs.).
- 3/8 in. diameter bolts to 41 N·m (30 ft. lbs.).

Fig. 7 Pressure Plate And Disc Alignment

- 1 - FLYWHEEL
- 2 - PRESSURE PLATE AND DISC
- 3 - CLUTCH DISC ALIGNMENT TOOL

(7) Remove release lever and release bearing from clutch housing. Apply Mopar high temperature bearing grease or equivalent to bore of release bearing, release lever contact surfaces and release lever pivot stud (Fig. 8).

(8) Apply light coat of Mopar high temperature bearing grease or equivalent to splines of transmission input shaft (or drive gear) and to release bearing slide surface of the transmission front bearing retainer (Fig. 9).

CAUTION: Do not over lubricate shaft splines. This can result in grease contamination of disc.

(9) Install release lever and bearing in clutch housing. Be sure spring clips that retain fork on pivot ball and release bearing on fork are secure (Fig. 10). Also verify that the release lever is installed properly.

NOTE: Release lever is installed correctly, when lever part number is toward the bottom of the transmission. Also a stamped "I" in the lever goes towards the pivot ball side of the transmission.

(10) Install transmission. Refer to 21 Transmission and Transfer Case for procedures.

(11) Check fluid level in clutch master cylinder.

CLUTCH HOUSING

DIAGNOSIS AND TESTING - CLUTCH HOUSING

The clutch housing maintains alignment between the crankshaft and transmission input shaft. Misalignment can cause clutch noise, hard shifting, incomplete release and chatter. Also premature pilot bearing, cover release fingers and clutch disc wear. In severe cases, it can cause premature wear of the transmission input shaft and front bearing.

NOTE: Only the NV4500 clutch housing can be checked using the following bore and face runout procedures. The NV5600 clutch housing is a integral part of the transmission and can only be checked off the vehicle.

CLUTCH HOUSING BORE RUNOUT

CAUTION: On diesel engines if housing bore runout exceeds 0.015 inch, the clutch housing/transmission adapter plate must be replaced. On gas engines if housing bore runout exceeds 0.053 in. the clutch housing must be replaced.

NOTE: Offset dowels are available for gas engines to correct housing bore runout. They are not available for diesel engines.

- (1) Remove the clutch housing and strut.
- (2) Remove the clutch cover and disc.

CLUTCH HOUSING (Continued)

(3) Replace one of the flywheel bolts with an appropriate size threaded rod that is 10 in. (25.4 cm) long (Fig. 11). The rod will be used to mount the dial indicator.

J9006-25

Fig. 11 Dial Indicator Mounting Stud Or Rod

- 1 - 7/16 - 20 THREAD
- 2 - NUT
- 3 - STUD OR THREADED ROD
- 4 - 10 INCHES LONG

- (4) Remove release fork from the clutch housing.
- (5) Install clutch housing. Tighten the housing bolts nearest the alignment dowels first.
- (6) Mount dial indicator on the threaded rod and position indicator plunger on the clutch housing bore (Fig. 12).

J9006-26

Fig. 12 CLUTCH HOUSING BORE RUNOUT

- 1 - MOUNTING STUD OR ROD
- 2 - DIAL INDICATOR
- 3 - INDICATOR PLUNGER
- 4 - CLUTCH HOUSING BORE

(7) Rotate crankshaft until indicator plunger is at the top of the housing bore. Zero the indicator at this point.

(8) Rotate crankshaft and record indicator readings at eight points (45° apart) around the bore (Fig. 13). Take measurement at least twice for accuracy.

J9006-27

Fig. 13 MEASUREMENT POINTS AND READINGS

1 - CLUTCH HOUSING BORE CIRCLE

(9) Subtract each reading from the one 180° opposite to determine runout and direction. Bore runout example (Fig. 13):

- $0.000 - (-0.007) = 0.007$ in.
- $+0.002 - (-0.010) = 0.012$ in.
- $+0.004 - (-0.005) = 0.009$ in.
- $-0.001 - (+0.001) = -0.002$ in.

In this example the largest or total indicator reading (TIR) difference is 0.012 inch. This means the housing bore is offset from the crankshaft centerline by 0.006 in. which is 1/2 of 0.012 inch. The dowels needed to correct this have an offset of 0.007 in. (Fig. 14).

Remove housing and install dowels with the slotted side facing out so they can be turned with a screwdriver. Then install the housing and mount the dial indicator and check bore runout again. Rotate the dowels until the TIR is less than 0.010 inch.

Clutch Housing Face Runout

(1) Position dial indicator towards the housing face (Fig. 15) with indicator plunger on the rim of the housing bore.

(2) Rotate crankshaft until indicator plunger is at the 10 O'clock position and zero the dial indicator.

(3) Measure and record face runout readings at four points 90° apart (Fig. 16). Take measurement at least twice for accuracy.

(4) Subtract lowest reading from highest to determine total runout. If low reading was **minus** 0.004 in. and highest reading was **plus** 0.009 in. the total runout is 0.013 inch.

NOTE: Maximum acceptable face runout is 0.010 inch.

CLUTCH HOUSING (Continued)

DOWEL SELECTION

J9206-7

Fig. 14 Housing Bore Alignment Dowel Selection

- 1 - SLOT DIRECTION OF OFFSET
2 - OFFSET DOWEL

TIR VALUE	OFFSET DOWEL REQUIRED
0.011 - 0.021 inch	0.007 inch
0.022 - 0.035 inch	0.014 inch
0.036 - 0.052 inch	0.021 inch

J9006-29

Fig. 15 DIAL INDICATOR LOCATION

- 1 - INDICATOR PLUNGER
2 - DIAL INDICATOR
3 - CLUTCH HOUSING FACE
4 - INDICATOR MOUNTING STUD OR ROD

To correct this example (Fig. 16) the shims needed between the clutch housing and transmission are:

- 0.009 in. at the 0.000 corner
- 0.012 in. at the -0.003 corner
- 0.013 in. at the -0.004 corner

After installing the clutch assembly and housing, tighten the housing bolts nearest the alignment dowels first.

J9006-30

Fig. 16 MEASUREMENT POINTS AND READINGS

1 - CLUTCH HOUSING FACE CIRCLE (AT RIM OF BORE)

NOTE: Shims can be made from shim stock or similar materials of the required thickness (Fig. 17).

J9006-31

Fig. 17 ALIGNMENT SHIMS

- 1 - CUT/DRILL BOLT HOLE TO SIZE
2 - SHIM STOCK
3 - MAKE SHIM 1-INCH DIAMETER

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove transmission and transfer case, if equipped. Refer to 21 Transmission and Transfer Case for proper procedures.
- (3) Remove the starter from the clutch housing.
- (4) Remove the clutch housing dust shield from the clutch housing.
- (5) Remove clutch housing bolts and remove housing from engine (Fig. 18) and (Fig. 19).

INSTALLATION

- (1) Clean housing mounting surface of engine block with wax and grease remover.
- (2) Verify that clutch housing alignment dowels are in good condition and properly seated.

CLUTCH HOUSING (Continued)

J9406-16

Fig. 18 Transmission/Clutch Housing - NV4500

80c0710c

Fig. 19 Clutch Housing Installation - NV4500

- 1 - ENGINE BLOCK
2 - CLUTCH DISC AND COVER
3 - CLUTCH HOUSING
4 - DUST COVER

(3) Transfer slave cylinder, release fork and boot, fork pivot stud and wire/hose brackets to new housing.

(4) Lubricate release fork and pivot contact surfaces with Mopar High Temperature wheel bearing grease or equivalent before installation.

(5) Align and install clutch housing on transmission (Fig. 19). Tighten housing bolts closest to alignment dowels first and to the following torque values:

- 1/4in. diameter "A" bolts - 4.5 N·m (40 in.lb.).
- 3/8in. diameter "A" bolts - 47.5 N·m (35 ft.lb.).
- 7/16in. diameter "A" bolts - 68 N·m (50 ft.lb.).
- "B" bolts for 5.2L/5.9L applications - 41 N·m (30 ft.lb.).
- "B" bolts for 5.9L TD/8.0L applications - 47.5 N·m (35 ft.lb.).
- "C" bolts for 5.2/5.9L applications - 68 N·m (50 ft.lb.).
- "C" bolts for 5.9L TD applications - 47.5 N·m (35 ft.lb.).
- "C" bolts for 8.0L applications - 74.5 N·m (55 ft.lb.).

(6) Install transmission-to-engine strut after installing clutch housing. Tighten bolt attaching strut to clutch housing first and engine bolt last.

(7) Install the starter to the clutch housing.

(8) Install the clutch housing dust shield to the clutch housing. Tighten the bolts to

(9) Install transmission and transfer case, if equipped. Refer to 21 Transmission and Transfer Case for proper procedures.

CLUTCH RELEASE BEARING

REMOVAL

(1) Remove transmission and transfer case, if equipped. Refer to 21 Transmission and Transfer Case for procedures.

(2) Remove clutch housing, for NV4500 equipped vehicles.

(3) Disconnect release bearing from release fork and remove bearing (Fig. 20).

INSTALLATION

NOTE: Inspect bearing slide surface on transmission front bearing retainer. Replace retainer if slide surface is scored, worn or cracked. Inspect release lever and pivot stud. Be sure stud is secure and in good condition. Be sure fork is not distorted or worn. Replace fork spring clips if bent or damaged.

(1) Lubricate input shaft splines, bearing retainer slide surface, lever pivot ball stud and release lever pivot surface with Mopar high temperature bearing grease or equivalent.

CLUTCH RELEASE BEARING (Continued)

- 2 - FORK
- 3 - SLAVE CYLINDER OPENING
- 4 - BEARING

(3) Install clutch housing, if removed.

(4) Install transmission and transfer case, if equipped. Refer to 21 Transmission and Transfer Case for procedures.

FLYWHEEL

DIAGNOSIS AND TESTING - FLYWHEEL

Check flywheel runout whenever misalignment is suspected. Flywheel runout should not exceed 0.08 mm (0.003 in.). Measure runout at the outer edge of the flywheel face with a dial indicator. Mount the indicator on a stud installed in place of one of the flywheel bolts.

Common causes of runout are:

- heat warpage
- improper machining
- incorrect bolt tightening
- improper seating on crankshaft flange shoulder
- foreign material on crankshaft flange

Flywheel machining is not recommended. The flywheel clutch surface is machined to a unique contour and machining will negate this feature. Minor flywheel scoring can be cleaned up by hand with 180 grit emery or with surface grinding equipment. Remove only enough material to reduce scoring (approximately 0.001 - 0.003 in.). Heavy stock removal is **not recommended**. Replace the flywheel if scoring is severe and deeper than 0.076 mm (0.003 in.). Excessive stock removal can result in flywheel cracking or warpage after installation; it can also weaken the flywheel and interfere with proper clutch release.

Clean the crankshaft flange before mounting the flywheel. Dirt and grease on the flange surface may cock the flywheel causing excessive runout. Use new bolts when remounting a flywheel and secure the bolts with Mopar Lock And Seal or equivalent. Tighten flywheel bolts to specified torque only. Over-tightening can distort the flywheel hub causing runout.

DISASSEMBLY

NOTE: If the teeth are worn or damaged, the flywheel should be replaced as an assembly. This is the recommended repair. In cases where a new flywheel is not readily available, (V10/Diesel Engine only) a replacement ring gear can be installed. The following procedure must be observed to avoid damaging the flywheel and replacement gear.

WARNING: WEAR PROTECTIVE GOGGLES OR SAFETY GLASSES WHILE CUTTING RING GEAR.

FLYWHEEL (Continued)

(1) Mark position of the old gear for alignment reference on the flywheel. Use a scribe for this purpose.

(2) Remove the old gear by cutting most of the way through it (at one point) with an abrasive cut-off wheel. Then complete removal with a cold chisel or punch.

ASSEMBLY

NOTE: The ring gear is a shrink fit on the flywheel. This means the gear must be expanded by heating in order to install it. The method of heating and expanding the gear is extremely important. Every surface of the gear must be heated at the same time to produce uniform expansion. An oven or similar enclosed heating device must be used. Temperature required for uniform expansion is approximately 375° F.

CAUTION: Do not use an oxy/acetylene torch to remove the old gear, or to heat and expand a new gear. The high temperature of the torch flame can cause localized heating that will damage the flywheel. In addition, using the torch to heat a replacement gear will cause uneven heating and expansion. The torch flame can also anneal the gear teeth resulting in rapid wear and damage after installation.

WARNING: WEAR PROTECTIVE GOGGLES OR SAFETY GLASSES AND HEAT RESISTENT GLOVES WHEN HANDLING A HEATED RING GEAR.

(1) The heated gear must be installed evenly to avoid misalignment or distortion.

(2) Position and install the heated ring gear on the flywheel with a shop press and a suitable press plates.

(3) Place flywheel on work bench and let it cool in normal shop air. Allow the ring gear to cool down completely before installation it on the engine.

CAUTION: Do not use water or compressed air to cool the flywheel. The rapid cooling produced by water or compressed air will distort or crack the new gear.

PILOT BEARING

REMOVAL

(1) Remove transmission, transfer case, if equipped and clutch housing. Refer to 21 Transmission and Transfer Case for procedures.

(2) Remove pressure plate and disc.

(3) Using a suitable blind hole puller to remove pilot bearing.

INSTALLATION

(1) Clean bearing bore with solvent and wipe dry with shop towel.

(2) Install new bearing with clutch alignment tool (Fig. 22). Keep bearing straight and tap bearing into place until flush with edge of bearing bore. Do not recess bearing.

80c0710d

Fig. 22 Installing Pilot Bearing

1 - PILOT BEARING

2 - ALIGNMENT TOOL

3 - LETTER SIDE MUST FACE TRANSMISSION

(3) Install clutch cover and disc.

(4) Install clutch housing, transmission and transfer case, if equipped. Refer to 21 Transmission and Transfer Case for procedures.

CLUTCH PEDAL

REMOVAL

- (1) Remove knee bolster for access to pedal pivot shaft.
- (2) Remove brake lamp switch.
- (3) Remove retaining clips that secure the brake and clutch pedals to the push rods (Fig. 23).

80c07122

Fig. 23 Clutch Cylinder And Push Rod

- 1 - PIN
- 2 - CLUTCH INTERLOCK WIRE
- 3 - PUSH ROD
- 4 - CLIP

(4) Remove the brake and clutch master cylinder pushrods from the pedals.

(5) Remove retainer from passenger side of pedal pivot shaft (Fig. 24).

(6) Push pedal pivot shaft toward driver side of support only enough to remove clutch pedal. It is not necessary to remove shaft from pedal support entirely.

(7) Remove clutch pedal.

INSTALLATION

Inspect bushings in clutch and brake pedals (Fig. 24). Replace bushings if worn, cracked, or distorted.

(1) Lubricate pedal shaft, pedal shaft bore (Fig. 24) and all bushings with Mopar Multi Mileage or high temperature bearing grease.

(2) Position clutch pedal in support. Align pedal with pivot shaft and slide shaft through pedal bushings. Then repeat process for brake pedal.

80c07124

Fig. 24 Clutch/Brake Pedal Mounting

- 2 - SHAFT RETAINER
- 3 - BRAKE PEDAL
- 4 - CLUTCH PEDAL
- 5 - SHAFT RETAINER
- 6 - PEDAL PIVOT SHAFT
- 7 - BUSHINGS

(3) Slide pedal shaft through support and install shaft retainer.

(4) Secure push rods to clutch and brake pedals.

(5) Install brake lamp switch in bracket.

(6) Install knee bolster.

LINKAGE

REMOVAL

NOTE: The factory installed hydraulic linkage has a quick disconnect at the slave cylinder. This fitting should not be disconnected, the hydraulic linkage is serviced as an assembly only, but it comes as two pieces to ease installation. Once the clutch hydraulic line is connected to the slave cylinder, it should not be disconnected.

(1) Raise and support vehicle.

(2) Remove nuts attaching slave cylinder to studs on clutch housing (Fig. 25).

(3) Remove slave cylinder from clutch housing.

(4) Remove the plastic clip securing the hydraulic line to the dash panel from the lower dash panel flange.

LINKAGE (Continued)

(5) Remove the plastic clip securing the hydraulic line to the dash panel from the upper dash panel stud.

(6) Lower vehicle.

(7) Disconnect clutch pedal interlock switch wires.

Fig. 25 Hydraulic Clutch Linkage

- 1 - DASH PANEL
- 2 - CYLINDER RESERVOIR
- 3 - CLUTCH MASTER CYLINDER
- 4 - SLAVE CYLINDER
- 5 - CLUTCH HYDRAULIC LINE

(8) Remove retaining clip (Fig. 26).

(9) Slide clutch master cylinder push rod off pedal pin.

(10) Inspect condition of bushing in the clutch master cylinder pushrod (Fig. 26). Replace the clutch hydraulic linkage if bushing is worn or damaged.

(11) Verify that cap on clutch master cylinder reservoir is tight. This will avoid spillage during removal.

(12) Remove the nuts holding the clutch master cylinder to the dash panel.

(13) Remove screws that attach clutch fluid reservoir to dash panel.

(14) Remove the clutch master cylinder from the dash panel.

(15) Remove clutch cylinders, reservoir and connecting lines from vehicle.

Fig. 26 Clutch Cylinder Push Rod Attachment

- 1 - PIN
- 2 - CLUTCH INTERLOCK WIRE
- 3 - PUSH ROD
- 4 - CLIP

INSTALLATION

NOTE: The factory installed hydraulic linkage has a quick disconnect at the slave cylinder, this fitting should not be disconnected. The hydraulic linkage is serviced as an assembly only, but it comes as two pieces to ease installation. Once the clutch hydraulic line is connected to the slave cylinder, it should not be disconnected.

(1) Tighten cap on clutch fluid reservoir to avoid spillage during installation.

(2) Position cylinders, connecting lines and reservoir in vehicle engine compartment. Locate the clutch hydraulic line against the dash panel and behind all engine hoses and wiring.

(3) Insert clutch master cylinder in dash panel. Install and tighten the nuts to hold the clutch master cylinder to the dash panel.

(4) Apply a light coating of grease to the inside and outside diameter of the master cylinder bushing.

(5) Install clutch master cylinder push rod on clutch pedal pin. Secure rod with retaining clip.

(6) Connect clutch pedal position (interlock) switch wires.

LINKAGE (Continued)

(7) Position clutch fluid reservoir on dash panel and install reservoir screws. Tighten screws to 5 N·m (40 in. lbs.).

(8) Install the plastic clip securing the hydraulic line to the dash panel into the lower dash panel flange.

(9) Install the plastic clip securing the hydraulic line to the dash panel onto the upper dash panel stud.

(10) Raise vehicle.

(11) Install slave cylinder. Be sure cap at end of cylinder rod is seated in release lever. Check this before installing cylinder attaching nuts.

NOTE: If new linkage is being installed, do not remove the plastic shipping strap from slave cylinder push rod. The shipping strap will break on its own upon the first clutch application.

(12) Install and tighten slave cylinder attaching nuts to 23 N·m (200 in. lbs.).

(13) If a new clutch linkage is being installed, connect the clutch hydraulic line (Fig. 27) to the clutch slave cylinder.

80c07123

Fig. 27 Clutch Slave Cylinder

- 1 - CLUTCH HYDRAULIC LINE
- 2 - CLUTCH SLAVE CYLINDER

(14) Lower vehicle.

(15) Operate linkage several times to verify proper operation.

CLUTCH PEDAL POSITION SWITCH

DESCRIPTION

A clutch pedal position (interlock) switch is in the starter relay circuit and is mounted on the clutch master cylinder push rod (Fig. 28). The switch is actuated by clutch pedal movement.

80c07122

Fig. 28 Clutch Pedal Position (Interlock) Switch

- 1 - PIN
- 2 - CLUTCH INTERLOCK WIRE
- 3 - PUSH ROD
- 4 - CLIP

OPERATION

The switch, which is in circuit with the starter solenoid, requires that the clutch pedal be fully depressed in order to start the engine. Switch circuitry and operation is provided in section 8W of Group 8.

The position switch is an integral part of the clutch master cylinder push rod and is not serviced separately.

COOLING

DESCRIPTION

DESCRIPTION - COOLING SYSTEM FLOW - 5.9L ENGINE

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

An optional factory installed maximum duty cooling package is available on most models. This package will provide additional cooling capacity for vehicles used under extreme conditions such as trailer towing in high ambient temperatures (Fig. 1).

DESCRIPTION—COOLING SYSTEM FLOW - 5.9L DIESEL

The diesel engine cooling system consists of (Fig. 2):

- Cross-flow radiator
- Belt driven water pump
- Belt driven mechanical cooling fan
- Thermal viscous fan drive
- Fan shroud
- Radiator pressure cap
- Vertically mounted thermostat
- Coolant reserve/recovery system
- Transmission oil cooler
- Coolant

Coolant flow circuits for the 5.9L diesel engine are shown in (Fig. 3).

COOLING (Continued)

DESCRIPTION—HOSE CLAMPS

The cooling system utilizes both worm drive and spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only a original equipment clamp with matching number or letter (Fig. 4).

80b76ee

Fig. 4 Spring Clamp Size Location

1 - SPRING CLAMP SIZE LOCATION

OPERATION**OPERATION—HOSE CLAMPS**

The worm type hose clamp uses a specified torque value to maintain proper tension on a hose connection.

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, only use constant tension clamp pliers designed to compress the hose clamp.

OPERATION—COOLING SYSTEM

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

An optional factory installed maximum duty cooling package is available on most models. This pack-

age will provide additional cooling capacity for vehicles used under extreme conditions such as trailer towing in high ambient temperatures.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - PRELIMINARY CHECKS****ENGINE COOLING SYSTEM OVERHEATING**

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- PROLONGED IDLE
- VERY HIGH AMBIENT TEMPERATURE
- SLIGHT TAIL WIND AT IDLE
- SLOW TRAFFIC
- TRAFFIC JAMS
- HIGH SPEED OR STEEP GRADES

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed for more air flow is recommended.

TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

AIR CONDITIONING; ADD-ON OR AFTER MARKET:

A maximum cooling package should have been ordered with vehicle if add-on or after market A/C is installed. If not, maximum cooling system components should be installed for model involved per manufacturer's specifications.

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, (Refer to 7 - COOLING - DIAGNOSIS AND TESTING)

COOLING (Continued)

DIAGNOSIS AND TESTING—ON-BOARD DIAGNOSTICS (OBD)**COOLING SYSTEM RELATED DIAGNOSTICS**

The powertrain control module (PCM) has been programmed to monitor certain cooling system components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicated an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

ERASING TROUBLE CODES

After the problem has been repaired, use the DRB scan tool to erase a DTC. Refer to the appropriate Powertrain Diagnostic Procedures service information for operation of the DRB scan tool.

DIAGNOSIS AND TESTING - COOLING SYSTEM LEAKS**ULTRAVIOLET LIGHT METHOD**

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist (Fig. 5).

PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

Fig. 5 Leak Detection Using Black Light—Typical

1 - TYPICAL BLACK LIGHT TOOL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING.

Carefully remove radiator pressure cap from filler neck and check coolant level. Push down on cap to disengage it from stop tabs. Wipe inside of filler neck and examine lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on outside of filler neck. If cams are damaged, seating of pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) to radiator filler neck (Fig. 6).

Operate tester pump to apply 103.4 kPa (15 psi) pressure to system. If hoses enlarge excessively or bulges while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

Holds Steady: If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator,

COOLING (Continued)

Fig. 6 Pressure Testing Cooling System—Typical

1 - TYPICAL COOLING SYSTEM PRESSURE TESTER

hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect transmission dipstick for water globules and transmission fluid cooler for leakage.

WARNING: WITH RADIATOR PRESSURE TESTER TOOL INSTALLED ON RADIATOR, DO NOT ALLOW PRESSURE TO EXCEED 110 KPA (20 PSI). PRESSURE WILL BUILD UP QUICKLY IF A COMBUSTION LEAK IS PRESENT. TO RELEASE PRESSURE, ROCK TESTER FROM SIDE TO SIDE. WHEN REMOVING TESTER, DO NOT TURN TESTER MORE THAN 1/2 TURN IF SYSTEM IS UNDER PRESSURE.

Operate engine without pressure cap on radiator until thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a

combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN-CK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

Drain sufficient coolant to allow thermostat removal. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of top of thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open drain-cock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 rpm while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

COOLING (Continued)

DIAGNOSIS AND TESTING - COOLING SYSTEM GAS ENGINE

COOLING SYSTEM DIAGNOSIS—GASOLINE ENGINE

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	<p>1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?</p> <p>2. Is the temperature sending unit connected?</p> <p>3. Is the temperature gauge operating OK?</p> <p>4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.</p> <p>5. Improper operation of internal heater doors or heater controls.</p>	<p>1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for On-Board Diagnostics and DTC information. Replace thermostat if necessary.</p> <p>2. Check the temperature sensor connector. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATIC - ELECTRICAL) Repair connector if necessary.</p> <p>3. Check gauge operation. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ENGINE TEMPERATURE GAUGE - DESCRIPTION). Repair as necessary.</p> <p>4. Check coolant level in the coolant reserve/overflow tank and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section of the manual text for WARNINGS and CAUTIONS associated with removing the radiator cap.</p> <p>5. Inspect heater and repair as necessary. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING) for procedures.</p>

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	<p>1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.</p> <p>2. Is the temperature gauge reading correctly?</p> <p>3. Is the temperature warning illuminating unnecessarily?</p> <p>4. Coolant low in coolant reserve/overflow tank and radiator?</p> <p>5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.</p> <p>6. Poor seals at the radiator cap.</p> <p>7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools</p>	<p>1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. Refer to Possible Causes (2-20).</p> <p>2. Check gauge. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATIC - ELECTRICAL). Repair as necessary.</p> <p>3. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATIC - ELECTRICAL).</p> <p>4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>5. Tighten cap</p> <p>6. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.</p> <p>7. (a) Check condition of radiator cap and cap seals. Refer to Radiator Cap in this Group. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. (c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.</p>

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	8. Incorrect coolant concentration	8. Check coolant. (Refer to LUBRICATION & MAINTENANCE/ FLUID TYPES - DESCRIPTION).
	9. Coolant not flowing through system	9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.
	10. Radiator or A/C condenser fins are dirty or clogged.	10. Remove insects and debris. (Refer to 7 - COOLING - STANDARD PROCEDURE).
	11. Radiator core is corroded or plugged.	11. Have radiator re-cored or replaced.
	12. Aftermarket A/C installed without proper radiator.	12. Install proper radiator.
	13. Fuel or ignition system problems.	13. Refer to 14 - Fuel System or 8 - Electrical for diagnosis and testing procedures.
	14. Dragging brakes.	14. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) for correct procedures.
	15. Bug screen or cardboard is being used, reducing airflow.	15. Remove bug screen or cardboard.
	16. Thermostat partially or completely shut.	16. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).
	17. Viscous fan drive not operating properly.	17. Check fan drive operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
	18. Cylinder head gasket leaking.	18. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	19. Heater core leaking.	19. Check heater core for leaks. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING). Repair as necessary.

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	<ol style="list-style-type: none"> 1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. 2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit. 3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running) 4. Gauge reading high after re-starting a warmed up (hot) engine. 5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late). 6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late. 7. Water pump impeller loose on shaft. 8. Loose accessory drive belt. (water pump slipping) 9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late. 	<ol style="list-style-type: none"> 1. A normal condition. No correction is necessary. 2. Check operation of gauge and repair if necessary. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). 3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven. 4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation. 5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). 6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary. 7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL). 8. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). Check and correct as necessary. 9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK	<ol style="list-style-type: none"> 1. Pressure relief valve in radiator cap is defective. 	<ol style="list-style-type: none"> 1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary.

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating. 2. Freeze point of coolant not correct. Mixture is too rich or too lean.	1. Check reason for overheating and repair as necessary. 2. Check coolant concentration. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace if necessary (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
NOISY VISCOUS FAN/DRIVE	1. Fan blades loose. 2. Fan blades striking a surrounding object. 3. Air obstructions at radiator or air conditioning condenser. 4. Thermal viscous fan drive has defective bearing. 5. A certain amount of fan noise may be evident on models equipped with a thermal viscous fan drive. Some of this noise is normal.	1. Replace fan blade assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) 2. Locate point of fan blade contact and repair as necessary. 3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser. 4. Replace fan drive. Bearing is not serviceable. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL). 5. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DESCRIPTION) for an explanation of normal fan noise.

COOLING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE HEATER PERFORMANCE. THERMOSTAT FAILED IN OPEN POSITION	<ol style="list-style-type: none"> 1. Has a Diagnostic trouble Code (DTC) been set? 2. Coolant level low 3. Obstructions in heater hose/ fittings 4. Heater hose kinked 5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation. 	<ol style="list-style-type: none"> 1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for correct procedures and replace thermostat if necessary 2. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). 3. Remove heater hoses at both ends and check for obstructions 4. Locate kinked area and repair as necessary 5. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - REMOVAL). If a slipping belt is detected, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). If heater core obstruction is detected, (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING/HEATER CORE - REMOVAL).
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	<ol style="list-style-type: none"> 1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away. 	<ol style="list-style-type: none"> 1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	<ol style="list-style-type: none"> 1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant. 	<ol style="list-style-type: none"> 1. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	<ol style="list-style-type: none"> 1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures. 	<ol style="list-style-type: none"> 1. A normal condition. No repair is necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - DRAINING COOLING SYSTEM 5.9L/8.0L ENGINES

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN- COCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

- (1) Remove radiator pressure cap.
- (2) Loosen radiator petcock.
- (3) Remove cylinder block drain plugs. Refer to (Fig. 7).

STANDARD PROCEDURE—DRAINING COOLING SYSTEM 5.9L DIESEL ENGINE

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN PLUG WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

- (1) Start the engine and place the heater control temperature selector in the Full-On position. Vacuum is needed to actuate the heater controls.

Fig. 7 Cylinder Block Drain Plug - 5.9L Engines

1 - BLOCK DRAIN PLUG

- (2) Turn the ignition off.
- (3) Do not remove radiator cap when draining coolant from reserve/overflow tank. Open radiator drain plug and when tank is empty, remove radiator cap. If the coolant reserve/overflow tank does not drain, (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). The coolant need not be removed from tank unless the system is being refilled with fresh mixture.
- (4) Remove radiator pressure cap.

COOLING (Continued)

STANDARD PROCEDURE - REFILLING COOLING SYSTEM 5.9L/8.0L ENGINES

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN-COCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

Clean cooling system prior to refilling. (Refer to 7 - COOLING - STANDARD PROCEDURE).

(1) Install cylinder block drain plugs. Coat the threads with Mopar® Thread Sealant with Teflon.

(2) Close radiator petcock.

(3) Fill cooling system with a 50/50 mixture of water and antifreeze.

(4) Fill coolant reserve/overflow tank to FULL mark on indicator stick.

(5) Start and operate engine until thermostat opens (upper radiator hose warm to touch).

(6) If necessary, add a 50/50 water and antifreeze mixture to the coolant reserve/overflow tank. This is done to maintain coolant level between the FULL and ADD marks. The level in the reserve/overflow tank may drop below the ADD mark after three or four warm-up and cool-down cycles.

STANDARD PROCEDURE—REFILLING COOLING SYSTEM 5.9L DIESEL ENGINE

Clean cooling system prior to refilling (Refer to 7 - COOLING - STANDARD PROCEDURE).

(1) Close radiator drain plug.

CAUTION: Due to the use of the one-way check valve, the engine must not be operating when refilling the cooling system.

NOTE: The diesel engine is equipped with a one-way check valve (jiggle pin). The check valve is used as a servicing feature and will vent air when the system is being filled. Water pressure (or flow) will hold the valve closed.

(2) Fill the cooling system with a 50/50 mixture of water and antifreeze.

(3) Fill coolant reserve/overflow tank to the FULL mark.

(4) Start and operate engine until thermostat opens. Upper radiator hose should be warm to touch.

(5) If necessary, add 50/50 water and antifreeze mixture to the coolant reserve/overflow tank to maintain coolant level. This level should be between the ADD and FULL marks. The level in the reserve/overflow tank may drop below the ADD mark after three or four warm-up and cool-down cycles.

STANDARD PROCEDURE - ADDING ADDITIONAL COOLANT

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

STANDARD PROCEDURE—COOLANT LEVEL CHECK

NOTE: Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle.

80bcb0a

Fig. 8 COOLANT RESERVE/OVERFLOW TANK—ALL EXCEPT 8.0L V-10 ENGINE

- 1 - T-SLOTS
- 2 - ALIGNMENT PIN
- 3 - FAN SHROUD
- 4 - COOLANT RESERVE/OVERFLOW TANK

COOLING (Continued)

The coolant reserve/overflow system provides a quick method for determining coolant level without removing radiator pressure cap. With engine not running, open the coolant recovery bottle cap and remove coolant level indicator dipstick to observe coolant level in coolant recovery bottle. The coolant level should be between ADD and FULL marks. If the coolant level is at or below the ADD mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark (Fig. 8).

STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING**CLEANING**

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain cooling system. Remove thermostat housing and thermostat. Install thermostat housing. Disconnect radiator upper hose from radiator and attach flushing gun to hose. Disconnect radiator lower hose from water pump and attach a lead-away hose to water pump inlet fitting.

CAUTION: On vehicles equipped with a heater water control valve, be sure heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering heater core.

Connect water supply hose and air supply hose to flushing gun. Allow engine to fill with water. When engine is filled, apply air in short blasts, allowing system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove lead away hose, flushing gun, water supply hose and air supply hose. Remove thermostat housing and install thermostat. Install thermostat housing with a replacement gasket. Refer to Thermostat Replacement. Connect radiator hoses. Refill cooling system with correct antifreeze/water mixture. Refer to Refilling the Cooling System.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

STANDARD PROCEDURE - COOLANT SELECTION - ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

BELT TENSIONERS - 5.9L

DESCRIPTION

Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension on the 5.9L engines. These engines are equipped with an automatic belt tensioner (Fig. 1). The tensioner maintains correct belt tension at all times. Due to use of this belt tensioner, do not attempt to use a belt tension gauge on 5.9L engines.

OPERATION

The automatic belt tensioner maintains belt tension by using internal spring pressure, a pivoting arm and pulley to press against the drive belt.

REMOVAL

WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY (EXCEPT FOR PULLEY).

Fig. 1 Automatic Belt Tensioner - 5.9L Engines

- 1 - AUTOMATIC TENSIONER
- 2 - COIL AND BRACKET
- 3 - SCREW AND WASHER

(1) Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Disconnect wiring and secondary cable from ignition coil.

(3) Remove ignition coil from coil mounting bracket (two bolts). Do not remove coil mounting bracket from cylinder head.

BELT TENSIONERS - 5.9L (Continued)

(4) Remove tensioner assembly from mounting bracket (one nut) (Fig. 2).

Fig. 2 Tensioner Indexing Marks and Mounting Nut

- 1 - TENSIONER ASSEMBLY
- 2 - TENSIONER MOUNTING NUT
- 3 - INDEXING ARROW
- 4 - INDEXING MARK

(5) Remove pulley bolt. Remove pulley from tensioner.

INSTALLATION

(1) Install pulley and pulley bolt to tensioner. Tighten bolt to 61 N·m (45 ft. lbs.) torque.

(2) Install tensioner assembly to mounting bracket. An indexing tab is located on back of tensioner. Align this tab to slot in mounting bracket. Tighten nut to 67 N·m (50 ft. lbs.) torque.

(3) Connect all wiring to ignition coil.

CAUTION: To prevent damage to coil case, coil mounting bolts must be torqued.

(4) Install coil to coil bracket. If nuts and bolts are used to secure coil to coil bracket, tighten to 11 N·m (100 in. lbs.) torque. If coil mounting bracket has been tapped for coil mounting bolts, tighten bolts to 5 N·m (50 in. lbs.) torque.

(5) Install drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Check belt indexing marks (Fig. 2).

BELT TENSIONERS - 8.0L

DESCRIPTION

CAUTION: Do not attempt to check belt tension with a belt tension gauge on vehicles equipped with an automatic belt tensioner.

Drive belts on 8.0L engines are equipped with a spring loaded automatic belt tensioner (Fig. 3) This belt tensioner will be used with all belt configurations, such as with or without power steering or air conditioning.

The tensioner is equipped with an indexing arrow (Fig. 4) on back of tensioner and an indexing mark on tensioner housing.

Fig. 3 Belt Tensioner—8.0L V-10 Engines

**Fig. 4 Indexing Marks—8.0L Engines Typical**

- 1 - TENSIONER ASSEMBLY
- 2 - TENSIONER MOUNTING NUT
- 3 - INDEXING ARROW
- 4 - INDEXING MARK

OPERATION

WARNING: THE AUTOMATIC BELT TENSIONER ASSEMBLY IS SPRING LOADED. DO NOT ATTEMPT TO DISASSEMBLE THE TENSIONER ASSEMBLY.

The automatic belt tensioner maintains correct belt tension using a coiled spring within the tensioner housing. The spring applies pressure to the tensioner arm pressing the arm into the belt, tensioning the belt.

If a new belt is being installed, the arrow must be within approximately 3 mm (1/8 in.) of indexing mark (point B-) (Fig. 5). Belt is considered new if it has been used 15 minutes or less. If this specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory

- Belt incorrectly routed.

A used belt should be replaced if tensioner indexing arrow has moved to point-A (Fig. 5). Tensioner travel stops at point-A.

**Fig. 5 Indexing Marks—8.0L Engines Typical**

- 1 - TENSIONER ASSEMBLY
- 2 - TENSIONER MOUNTING NUT
- 3 - INDEXING ARROW
- 4 - INDEXING MARK

REMOVAL

WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY (EXCEPT FOR PULLEY).

CAUTION: If the pulley is to be removed from the tensioner, its mounting bolt has left-hand threads.

(1) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove tensioner mounting bolt (Fig. 6) and remove tensioner.

BELT TENSIONERS - 8.0L (Continued)

**Fig. 6 Belt Tensioner**

- 1 - PULLEY BOLT
- 2 - IDLER PULLEY
- 3 - TENSIONER PULLEY
- 4 - TENSIONER
- 5 - TENSIONER MOUNTING BOLT

INSTALLATION

CAUTION: If the pulley is to be removed from the tensioner, its mounting bolt has left-hand threads.

(1) Install pulley and pulley bolt to tensioner. Tighten bolt to 88 N·m (65 ft. lbs.) torque.

(2) Install tensioner assembly to mounting bracket. A dowel pin is located on back of tensioner (Fig. 7). Align this to dowel hole (Fig. 8) in tensioner mounting bracket. Tighten bolt to 41 N·m (30 ft. lbs.) torque.

(3) Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

**Fig. 7 Tensioner Dowel Pin**

- 2 - DOWEL PIN

**Fig. 8 Tensioner Dowel Hole**

- 1 - DOWEL PIN HOLE
- 2 - TENSIONER MOUNTING BRACKET

BELT TENSIONERS - 5.9L DIESEL

DESCRIPTION

Drive belts on all engines are equipped with a spring loaded automatic belt tensioner (Fig. 9). This tensioner maintains constant belt tension at all times and requires no maintenance or adjustment.

CAUTION: Do not attempt to check belt tension with a belt tension gauge on vehicles equipped with an automatic belt tensioner.

Fig. 9 Belt

- 1 - WATER PUMP
- 2 - ACCESSORY DRIVE BELT
- 3 - AUTOMATIC BELT TENSIONER
- 4 - 3/8" SQUARE BOLT
- 5 - MOUNT. BOLT

OPERATION

WARNING: THE AUTOMATIC BELT TENSIONER ASSEMBLY IS SPRING LOADED. DO NOT ATTEMPT TO DISASSEMBLE THE TENSIONER ASSEMBLY.

The automatic belt tensioner maintains correct belt tension using a coiled spring within the tensioner housing. The spring applies pressure to the tensioner arm pressing the arm into the belt, tensioning the belt.

If a new belt is being installed, the arrow must be within approximately 3 mm (1/8 in.) of indexing mark. Belt is considered new if it has been used 15 minutes or less. If this specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)

- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

REMOVAL

WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY.

(1) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove tensioner mounting bolt (Fig. 10) and remove tensioner.

Fig. 10 Automatic Belt Tensioner Diesel Engine—Typical

- 1 - WATER PUMP
- 2 - ACCESSORY DRIVE BELT
- 3 - AUTOMATIC BELT TENSIONER
- 4 - 3/8" SQUARE BOLT
- 5 - MOUNT. BOLT

INSTALLATION

(1) Install tensioner assembly to mounting bracket. A dowel is located on back of tensioner. Align this dowel to hole in tensioner mounting bracket. Tighten bolt to 41 N·m (30 ft. lbs.) torque.

(2) Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

DRIVE BELTS - 5.9L

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib (Fig. 11), are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced (Fig. 11). Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to ACCESSORY DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

DRIVE BELTS - 5.9L (Continued)

REMOVAL

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

CAUTION: Do not attempt to check belt tension with a belt tension gauge on vehicles equipped with an automatic belt tensioner. Refer to Automatic Belt Tensioner in this group.

Drive belts on these engines are equipped with a spring loaded automatic belt tensioner (Fig. 12). This belt tensioner will be used on all belt configurations, such as with or without power steering or air conditioning. For more information, (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - DESCRIPTION).

Fig. 12 Belt Tensioner - 5.9L Gas Engines

- 1 - IDLER PULLEY
- 2 - TENSIONER
- 3 - FAN BLADE

(1) Attach a socket/wrench to pulley mounting bolt of automatic tensioner (Fig. 12).

(2) Rotate tensioner assembly clockwise (as viewed from front) until tension has been relieved from belt.

(3) Remove belt from idler pulley first.

(4) Remove belt from vehicle.

INSTALLATION

CAUTION: When installing the accessory drive belt, the belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to (Fig. 13) (Fig. 14) for correct engine belt routing. The correct belt with correct length must be used.

(1) Position drive belt over all pulleys **except** idler pulley. This pulley is located between generator and A/C compressor.

(2) Attach a socket/wrench to pulley mounting bolt of automatic tensioner (Fig. 12).

(3) Rotate socket/wrench clockwise. Place belt over idler pulley. Let tensioner rotate back into place. Remove wrench. Be sure belt is properly seated on all pulleys.

(4) Check belt indexing marks.

REMOVAL

Drive belts are equipped with a spring loaded automatic belt tensioner (Fig. 16). This belt tensioner will be used on all belt configurations, such as with or without power steering or air conditioning. For more information, refer to Automatic Belt Tensioner, proceeding in this group.

(1) Attach a socket/wrench to pulley mounting bolt of automatic tensioner (Fig. 16). The threads on the pulley mounting bolt are left- hand.

(2) Relax the tension from the belt by rotating the tensioner counterclockwise (as viewed from front) (Fig. 16). When all belt tension has been relaxed, remove belt from tensioner pulley first and other pulleys last.

INSTALLATION

CAUTION: When installing the accessory drive belt, the belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to (Fig. 17) (Fig. 18) for correct engine belt routing. The correct belt with correct length must be used.

CAUTION: If the pulley is to be removed from the tensioner, its mounting bolt has left-hand threads.

Fig. 16 Belt Tensioner

DRIVE BELTS - 5.9L DIESEL

DIAGNOSIS AND TESTING—ACCESSORY DRIVE BELT

VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib (Fig. 19), are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced (Fig. 19). Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to ACCESSORY DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

J9007-44

Fig. 19 Belt Wear Patterns

- 1 - NORMAL CRACKS BELT OK
- 2 - NOT NORMAL CRACKS REPLACE BELT

DRIVE BELTS - 5.9L DIESEL (Continued)

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to

resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION

REMOVAL

CAUTION: Do not attempt to check belt tension with a belt tension gauge on vehicles equipped with an automatic belt tensioner. Refer to Automatic Belt Tensioner in this group.

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

Drive belts on diesel engines are equipped with a spring loaded automatic belt tensioner (Fig. 20). (Fig. 20) displays the tensioner for vehicles without air conditioning.

This belt tensioner will be used on all belt configurations, such as with or without air conditioning. For more information, (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - DESCRIPTION).

(1) A 3/8 inch square hole is provided in the automatic belt tensioner (Fig. 20). Attach a 3/8 inch drive-long handle ratchet to this hole.

(2) Rotate ratchet and tensioner assembly counter-clockwise (as viewed from front) until tension has been relieved from belt.

(3) Remove belt from water pump pulley first.

(4) Remove belt from vehicle.

INSTALLATION

CAUTION: When installing the accessory drive belt, the belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to (Fig. 21) (Fig. 22) for correct engine belt routing. The correct belt with correct length must be used.

(1) Position drive belt over all pulleys **except** water pump pulley.

(2) Attach a 3/8 inch ratchet to tensioner.

VACUUM PUMP - 5.9L DIESEL

DESCRIPTION

The vacuum pump and the power steering pump are combined into a single assembly on diesel engine models (Fig. 23). Both pumps are operated by a drive gear attached to the vacuum pump shaft. The shaft gear is driven by the camshaft gear.

The vacuum pump is a constant displacement, vane-type pump. Vacuum is generated by four vanes mounted in the pump rotor. The rotor is located in the pump housing and is pressed onto the pump shaft.

The vacuum and steering pumps are operated by a single drive gear pressed onto the vacuum pump shaft. The drive gear is operated by the engine camshaft gear.

The vacuum and power steering pump shafts are connected by a coupling. Each pump shaft has an adapter with drive lugs that engage in the coupling.

The vacuum pump rotating components are lubricated by engine oil. Lubricating oil is supplied to the pump through an oil line at the underside of the pump housing.

VACUUM PUMP - 5.9L DIESEL (Continued)

The complete assembly must be removed in order to service either pump. However, the power steering pump can be removed and serviced separately when necessary.

80a611d3

Fig. 23 Diesel Vacuum & Power Steering Pump Assembly

- 1 - VACUUM PUMP
- 2 - POWER STEERING PUMP
- 3 - PUMP ADAPTER
- 4 - DRIVE GEAR

The vacuum pump is not a serviceable component. If diagnosis indicates a pump malfunction, the pump must be replaced as an assembly. Do not disassemble or attempt to repair the pump.

The combined vacuum and steering pump assembly must be removed for access to either pump. However, the vacuum pump can be removed without having to disassemble the power steering pump.

If the power steering pump requires service, simply remove the assembly and separate the two pumps. Refer to the pump removal and installation procedures in this section.

OPERATION

Vacuum pump output is transmitted to the HEVAC, speed control, systems through a supply hose. The hose is connected to an outlet port on the pump housing and uses an in-line check valve to retain system vacuum when vehicle is not running.

Pump output ranges from a minimum of 8.5 to 25 inches vacuum.

The pump rotor and vanes are rotated by the pump drive gear. The drive gear is operated by the camshaft gear.

DIAGNOSIS AND TESTING—VACUUM PUMP OUTPUT

The vacuum pump supplies necessary vacuum to components in the following systems:

- HEVAC system
- Speed Control System

A quick check to determine if the vacuum pump is the cause of the problem in any of these systems is to road test the vehicle and verify that all of these systems are functioning properly. If only one of these has a vacuum related failure, then it is likely the vacuum pump is not the cause.

A standard vacuum gauge can be used to check pump output when necessary. Simply disconnect the pump supply hose and connect a vacuum gauge to the outlet port for testing purposes. With the engine running, vacuum output should be a minimum of 25 inches, depending on engine speed.

DIAGNOSING LOW VACUUM OUTPUT CONDITION

If the vacuum pump is suspected of low vacuum output, check the pump and vacuum harnesses as follows:

- (1) Visually inspect the vacuum harness for obvious failures (i.e. disconnected, cracks, breaks etc.)
- (2) Disconnect the vacuum supply hose at the vacuum pump check valve. Connect vacuum gauge to this valve and run engine at various throttle openings. Output should be a minimum 25 inches of vacuum. If vacuum is consistently below 25 inches, the vacuum pump should be replaced. If output is within specified limits, the vacuum harness should be suspected as the cause.
- (3) Disconnect and isolate the vacuum supply harness. Cap off open ends and apply roughly 15 inches of vacuum to the harness. If the vacuum gauge does not hold its reading, then there is an open in the harness and it should be repaired or replaced.
- (4) If the vacuum loss is still not detected at this point, then the pump and harness are not the cause of the low vacuum condition. Apply vacuum to the related components of the vacuum supply system (i.e. valves, servos, solenoids, etc.) to find the source of the vacuum loss.

REMOVAL

- (1) Disconnect battery negative cables.
- (2) Position drain pan under power steering pump.
- (3) Disconnect vacuum and steering pump hoses.
- (4) Disconnect lubricating oil feed line from fitting at underside of vacuum pump (Fig. 24).
- (5) Remove lower bolt that attaches pump assembly to engine block (Fig. 25).

VACUUM PUMP - 5.9L DIESEL (Continued)

(6) Remove bottom, inboard nut that attaches adapter to steering pump. This nut secures a small bracket to engine block. Nut and bracket must be removed before pump assembly can be removed from block.

Fig. 24 Vacuum Pump Oil Feed Line

- 1 - ENGINE BLOCK
- 2 - VACUUM PUMP
- 3 - VACUUM PUMP OIL FEED LINE

(7) Remove upper bolt that attaches pump assembly to engine block (Fig. 26).

(8) Remove pump assembly from vehicle.

NOTE: The vacuum pump and adapter are serviced as an assembly and must not be separated.

(9) Remove the remaining three power steering pump to adapter mounting nuts (Fig. 27).

(10) Gently, remove the steering pump from the adapter. Use caution not to damage the oil seal in the adapter body (Fig. 28).

- 4 - OIL SEAL
- 5 - MOUNTING BRACKET
- 6 - DRIVE DOG
- 7 - PUMP SPACERS

INSTALLATION

NOTE: Make sure the two pump spacers are present before assembling power steering pump to adapter.

(1) Aline the steering pump drive dog with the slot in the vacuum pump drive assembly, slide the steering pump into place on the adapter. **Use care not to damage the oil seal in the adapter body.**

(2) Install the three steering pump to adapter nuts, do not install the lower inboard mounting nut at this time. Tighten nuts to 24 N·m (18 ft. lbs.).

(3) Position new gasket on vacuum pump mounting flange (Fig. 29). Use Mopar® Perfect Seal, or silicone adhesive/sealer to hold gasket in place.

(4) Insert pump assembly upper attaching bolt in mounting flange and gasket. Use sealer or grease to hold bolt in place if necessary.

(5) Position pump assembly on engine and install upper bolt (Fig. 30). Tighten upper bolt only enough to hold assembly in place at this time.

J9105-103

Fig. 29 Pump Mounting Flange Gasket

VACUUM PUMP - 5.9L DIESEL (Continued)

Fig. 30 Installing Pump Assembly On Engine

- 1 - PUMP ASSEMBLY
- 2 - PUMP GASKET
- 3 - DRIVE GEAR

(6) Working from under vehicle, install pump assembly lower attaching bolt. Then tighten upper and lower bolt to 77 N·m (57 ft. lbs.).

(7) Position bracket on steering pump inboard stud. Then install remaining adapter attaching nut on stud. Tighten nut to 24 N·m (18 ft. lbs.).

(8) Connect oil feed line to vacuum pump connector and tighten line fitting.

(9) Connect steering pump pressure and return lines to pump. Tighten pressure line fitting to 30 N·m (22 ft. lbs.).

(10) Connect vacuum hose to vacuum pump.

(11) Connect battery cables, if removed.

(12) Fill power steering pump reservoir and Purge air from steering pump lines (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

COOLANT

DESCRIPTION - ENGINE COOLANT

ETHYLENE-GLYCOL MIXTURES

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The recommended mixture of 50/50 ethylene-glycol and water will provide protection against freezing to -37 deg. C (-35 deg. F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7 deg. C (-90 deg. F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require

the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149 deg. C (300 deg. F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22 deg. C (-8 deg. F).

PROPYLENE-GLYCOL MIXTURES

It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32 deg. C (-26 deg. F), 5 deg. C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125 deg. C (257 deg. F) at 96.5 kPa (14 psi), compared to 128 deg. C (263 deg. F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

COOLANT (Continued)

OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

COOLANT RECOVERY CONTAINER - 3.9L/5.2L/5.9L/ 5.9L DIESEL

DESCRIPTION

The coolant reserve/overflow tank is mounted to the side of the fan shroud (Fig. 1), and is made of high temperature plastic.

Fig. 1 Coolant Reserve/Overflow Tank

- 1 - T-SLOTS
- 2 - ALIGNMENT PIN
- 3 - FAN SHROUD
- 4 - COOLANT RESERVE/OVERFLOW TANK

OPERATION

The coolant reserve/overflow system works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. It also provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure. This is done without removing the radiator pressure cap. The system also provides some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

REMOVAL

- (1) Remove overflow hose from radiator.
- (2) Unsnap the coolant reserve/overflow tank from fan shroud. Lift straight up. The fan shroud is equipped with T-shaped slots (Fig. 2) to attach the tank. An alignment pin is located on the side of tank.

**Fig. 2 COOLANT RESERVE/OVERFLOW TANK—ALL
EXCEPT 8.0L V-10 ENGINE**

- 3 - FAN SHROUD
- 4 - COOLANT RESERVE/OVERFLOW TANK

COOLANT RECOVERY CONTAINER - 3.9L/5.2L/5.9L/5.9L DIESEL (Continued)

INSTALLATION

- (1) Snap the tank into the two T-slots and the alignment pin on fan shroud (Fig. 3).
- (2) Connect overflow hose to radiator.

Fig. 3 COOLANT RESERVE/OVERFLOW TANK—ALL EXCEPT 8.0L V-10 ENGINE

- 1 - T-SLOTS
- 2 - ALIGNMENT PIN
- 3 - FAN SHROUD
- 4 - COOLANT RESERVE/OVERFLOW TANK

COOLANT RECOVERY CONTAINER - 8.0L

DESCRIPTION

On the 8.0L V-10 engine the tank is mounted to right inner fender (Fig. 4), and is made of high temperature plastic.

OPERATION

The coolant reserve/overflow system works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. It also provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure. This is done without removing the radiator pressure cap. The system also provides some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Cool-

Fig. 4 Coolant Reserve/Overflow Tank—8.0L V-10 Engine

- 1 - COOLANT RESERVE/OVERFLOW TANK
- 2 - TANK MOUNTING BOLTS (3)
- 3 - ICM MOUNTING BOLTS (2)
- 4 - IGNITION CONTROL MODULE (ICM)

ant will then be drawn from the coolant tank and returned to a proper level in the radiator.

RADIATOR FAN - 5.9L/8.0L

REMOVAL

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

- (1) Disconnect negative battery cable from battery.
- (2) Remove throttle cable at top of fan shroud.
- (3) All Except 8.0L V-10 Engine: Unsnap coolant reserve/overflow tank from fan shroud and lay aside. The tank is held to shroud with T-shaped slots. Do not disconnect hose or drain coolant from tank.
- (4) The thermal viscous fan drive/fan blade assembly is attached (threaded) to water pump hub shaft (Fig. 6). Remove fan blade/viscous fan drive assembly from water pump by turning mounting nut counter-clockwise as viewed from front. Threads on viscous fan drive are **RIGHT-HAND**. A Snap-On 36 MM Fan Wrench (number SP346 from Snap-On Cummins Diesel Tool Set number 2017DSP), Special Tool 6958 Spanner Wrench and Adapter Pins 8346 should be used to prevent pulley from rotating (Fig. 5).

RADIATOR FAN - 5.9L/8.0L (Continued)

**Fig. 5 Using Special Tool 6958 Spanner Wrench**

- 1 - SPECIAL TOOL 6958 SPANNER WRENCH WITH ADAPTER PINS 8346
2 - FAN

(5) Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.

**Fig. 6 Fan Blade/Viscous Fan Drive - Gas Engines - Typical**

- 1 - WATER PUMP BYPASS HOSE
2 - FAN BLADE ASSEMBLY
3 - VISCOUS FAN DRIVE
4 - WATER PUMP AND PULLEY

(6) Do not unbolt fan blade assembly (Fig. 6) from viscous fan drive at this time.

(7) Remove four fan shroud-to-radiator mounting bolts.

(8) Remove fan shroud and fan blade/viscous fan drive assembly as a complete unit from vehicle.

(9) After removing fan blade/viscous fan drive assembly, **do not** place viscous fan drive in horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

CAUTION: Do not remove water pump pulley-to-water pump bolts. This pulley is under spring tension.

(10) Remove four bolts securing fan blade assembly to viscous fan drive (Fig. 6).

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word **REVERSE** to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

WARNING: DO NOT ATTEMPT TO BEND OR STRAIGHTEN FAN BLADES IF FAN IS NOT WITHIN SPECIFICATIONS.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

(1) Remove fan blade assembly from viscous fan drive unit (four bolts).

(2) Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.

(3) Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

INSTALLATION

(1) Install fan blade assembly to viscous fan drive. Tighten bolts (Fig. 6) to 23 N·m (17 ft. lbs.) torque.

(2) Position fan shroud and fan blade/viscous fan drive assembly to vehicle as a complete unit.

(3) Install fan shroud.

RADIATOR FAN - 5.9L/8.0L (Continued)

(4) Install fan blade/viscous fan drive assembly to water pump shaft (Fig. 6).

(5) Except 8.0L V-10 Engine: Install coolant reserve/overflow tank to fan shroud. Snaps into position.

(6) Install throttle cable to fan shroud.

(7) Connect negative battery cable.

NOTE:

Viscous Fan Drive Fluid Pump Out Requirement: After installing a new viscous fan drive, bring the engine speed up to approximately 2000 rpm and hold for approximately two minutes. This will ensure proper fluid distribution within the drive.

RADIATOR FAN - 5.9L DIESEL

REMOVAL

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

- (1) Disconnect the battery negative cables.
- (2) Remove the fan shroud mounting bolts. Position fan shroud towards engine.

CAUTION: Do not remove the fan pulley bolts. This pulley is under spring tension.

(3) The thermal viscous fan drive/fan blade assembly is attached (threaded) to the fan hub shaft (Fig. 7). Remove the fan blade/fan drive assembly from fan pulley by turning the mounting nut clockwise (as viewed from front). Threads on the viscous fan drive are **LEFT-HAND**. A Snap-On 36 MM Fan Wrench (number SP346 from Snap-On Cummins Diesel Tool Set number 2017DSP) can be used. Place a bar or screwdriver between the fan pulley bolts to prevent pulley from rotating.

(4) Remove the fan shroud and the fan blade/viscous drive as an assembly from vehicle.

(5) Remove fan blade-to-viscous fan drive mounting bolts.

(6) Inspect the fan for cracks, loose rivets, loose or bent fan blades.

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word

Fig. 7 Fan Blade/Viscous Fan Drive

- 1 - THREADED SHAFT
- 2 - BOLT (4)
- 3 - FAN BLADE
- 4 - THREADED NUT
- 5 - VISCOUS FAN DRIVE

REVERSE to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

WARNING: DO NOT ATTEMPT TO BEND OR STRAIGHTEN FAN BLADES IF FAN IS NOT WITHIN SPECIFICATIONS.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

(1) Remove fan blade assembly from viscous fan drive unit (four bolts).

(2) Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.

(3) Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

RADIATOR FAN - 5.9L DIESEL (Continued)

INSTALLATION

(1) Install fan blade assembly to viscous fan drive. Tighten mounting bolts to 23 N·m (17 ft. lbs.) torque.

(2) Position the fan shroud and fan blade/viscous fan drive to the vehicle as an assembly.

(3) Install viscous fan drive assembly on fan hub shaft (Fig. 7). Tighten mounting nut to 57 N·m (42 ft. lbs.) torque.

(4) Install fan shroud bolts into position and tighten the mounting bolts to 6 N·m (50 in. lbs.) torque.

(5) Connect the battery negative cables.

NOTE:

Viscous Fan Drive Fluid Pump Out Requirement: After installing a new viscous fan drive, bring the engine speed up to approximately 2000 rpm and hold for approximately two minutes. This will ensure proper fluid distribution within the drive.

Fig. 8 Engine Block Heater

- 1 - FREEZE PLUG HOLE
- 2 - BLOCK HEATER
- 3 - SCREW
- 4 - POWER CORD (120V AC)
- 5 - HEATING COIL
- 6 - OIL FILTER

ENGINE BLOCK HEATER - 5.9L

DESCRIPTION

WARNING: DO NOT OPERATE ENGINE UNLESS BLOCK HEATER CORD HAS BEEN DISCONNECTED FROM POWER SOURCE AND SECURED IN PLACE. THE POWER CORD MUST BE SECURED IN ITS RETAINING CLIPS AND ROUTED AWAY FROM EXHAUST MANIFOLDS AND MOVING PARTS.

An optional engine block heater is available on all models. The heater is equipped with a power cord. The heater is mounted in a core hole of the engine cylinder block (in place of a freeze plug) with the heating element immersed in engine coolant. The cord is attached to an engine compartment component with tie-straps.

The 5.9L gas powered engine has the block heater located on the right side of engine next to the oil filter (Fig. 8).

OPERATION

The heater warms the engine coolant providing easier engine starting and faster warm-up in low temperatures. Connecting the power cord to a grounded 110-120 volt AC electrical outlet with a grounded three wire extension cord provides the electricity needed to heat the element..

REMOVAL

(1) Disconnect battery negative cable.

(2) Drain coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove power cord from heater by unplugging (Fig. 9).

(4) Loosen (but do not completely remove) the screw at center of block heater (Fig. 9).

(5) Remove block heater by carefully prying from side-to-side. Note direction of heating element coil (up or down). Element coil must be installed correctly to prevent damage.

INSTALLATION

(1) Clean and inspect the block heater hole.

(2) Install new O-ring seal(s) to heater in gasoline engines.

(3) Insert block heater into cylinder block.

(4) With heater fully seated, tighten center screw to 2 N·m (17 in. lbs.).

(5) Fill cooling system with recommended coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).

(6) Start and warm the engine.

(7) Check block heater for leaks.

ENGINE BLOCK HEATER - 8.0L

DESCRIPTION

An optional engine block heater is available on all models. The heater is equipped with a power cord. The heater is mounted in a core hole of the engine cylinder block (in place of a freeze plug) with the heating element immersed in engine coolant. The cord is attached to an engine compartment component with tie-straps.

The 8.0L V-10 engine has the block heater located on the right side of engine next to the engine oil dipstick tube (Fig. 10).

WARNING: DO NOT OPERATE ENGINE UNLESS BLOCK HEATER CORD HAS BEEN DISCONNECTED FROM POWER SOURCE AND SECURED IN PLACE. THE POWER CORD MUST BE SECURED IN ITS RETAINING CLIPS AND ROUTED AWAY FROM EXHAUST MANIFOLDS AND MOVING PARTS.

OPERATION

The heater warms the engine coolant providing easier engine starting and faster warm-up in low temperatures. Connecting the power cord to a

grounded 110-120 volt AC electrical outlet with a grounded three wire extension cord provides the electricity needed to heat the element..

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Drain coolant from radiator and cylinder block (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove power cord from heater by unplugging (Fig. 11).
- (4) Loosen (but do not completely remove) the screw at center of block heater (Fig. 11).
- (5) Remove block heater by carefully prying from side-to-side. Note direction of heating element coil (up or down). Element coil must be installed correctly to prevent damage.

INSTALLATION

- (1) Clean and inspect the block heater hole.
- (2) Install new O-ring seal(s) to heater in gasoline engines.
- (3) Insert block heater into cylinder block.
- (4) With heater fully seated, tighten center screw to 2 N·m (17 in. lbs.).

(7) Check block heater for leaks.

ENGINE BLOCK HEATER - 5.9L DIESEL

DESCRIPTION

WARNING: DO NOT OPERATE ENGINE UNLESS BLOCK HEATER CORD HAS BEEN DISCONNECTED FROM POWER SOURCE AND SECURED IN PLACE. THE POWER CORD MUST BE SECURED IN ITS RETAINING CLIPS AND ROUTED AWAY FROM EXHAUST MANIFOLDS AND MOVING PARTS.

An optional engine block heater is available on all models. The heater is equipped with a power cord. The heater is mounted in a threaded hole of the engine cylinder block with the heating element immersed in engine coolant. The cord is attached to an engine compartment component with tie-straps.

The 5.9L diesel engine has the block heater located on the right side of the engine below the exhaust manifold next to the oil cooler (Fig. 12).

80604116

Fig. 12 Engine Block Heater—5.9L Diesel Engine

1 - BLOCK HEATER

OPERATION

The heater warms the engine coolant providing easier engine starting and faster warm-up in low temperatures. Connecting the power cord to a grounded 110-120 volt AC electrical outlet with a grounded three wire extension cord provides the electricity needed to heat the element..

REMOVAL

- (1) Disconnect the battery negative cables.
- (2) Drain coolant from radiator and cylinder block (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Unscrew the power cord retaining cap and disconnect cord from heater element.
- (4) Using a suitable size socket, loosen and remove the block heater element (Fig. 13).

INSTALLATION

- (1) Clean and inspect the threads in the cylinder block.
- (2) Coat heater element threads with Mopar® Thread Sealer with Teflon.
- (3) Screw block heater into cylinder block and tighten to 43 N·m (32 ft. lbs.).
- (4) Connect block heater cord and tighten retaining cap.
- (5) Fill cooling system with recommended coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (6) Start and warm the engine.
- (7) Check block heater for leaks.

ENGINE COOLANT TEMP
SENSOR - 5.9L

DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)

- Target idle speed

REMOVAL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR. REFER TO GROUP 7, COOLING.

- (1) Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (2) Remove air cleaner assembly.
- (3) Disconnect electrical connector from sensor (Fig. 14).
- (4) **Engines with air conditioning:** When removing the connector from sensor, do not pull directly on wiring harness. Fabricate an L-shaped hook tool from a coat hanger (approximately eight inches long). Place the hook part of tool under the connector for removal. The connector is snapped onto the sensor. It is not equipped with a lock type tab.
- (5) Remove sensor from intake manifold.

80b1b217

Fig. 14 Engine Coolant Temperature

- 1 - GENERATOR
- 2 - A/C COMPRESSOR
- 3 - ENGINE COOLANT TEMPERATURE SENSOR
- 4 - ELEC. CONN.

INSTALLATION

- (1) Install sensor.
- (2) Tighten to 6–8 N·m (55–75 in. lbs.) torque.
- (3) Connect electrical connector to sensor. The sensor connector is symmetrical (not indexed). It can be installed to the sensor in either direction.
- (4) Install air cleaner assembly.
- (5) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

ENGINE COOLANT THERMOSTAT - 5.9L

DESCRIPTION

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

The thermostat on the 5.9L gas powered engine is located beneath the thermostat housing at the front of the intake manifold (Fig. 15).

The thermostat is a wax pellet driven, reverse poppet choke type.

Coolant leakage into the pellet container will cause the thermostat to fail in the open position. Thermostats very rarely stick. Do not attempt to free a thermostat with a prying device.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation that can result in sludge formation.

J9207-14

Fig. 15 Thermostat - 5.9L Gas Powered Engines

- 1 - THERMOSTAT HOUSING
- 2 - GASKET
- 3 - INTAKE MANIFOLD
- 4 - THERMOSTAT
- 5 - MACHINED GROOVE

OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the

pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.

DIAGNOSIS AND TESTING—THERMOSTAT

ON-BOARD DIAGNOSTICS

All **gasoline powered models** are equipped with On-Board Diagnostics for certain cooling system components. Refer to On-Board Diagnostics (OBD) in the Diagnosis section of this group for additional information. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC) in the PCM memory. Do not change a thermostat for lack of heat as indicated by the instrument panel gauge or by poor heater performance unless a DTC is present. Refer to the Diagnosis section of this group for other probable causes. For other DTC numbers, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

The DTC can also be accessed through the DRB scan tool. Refer to the appropriate Powertrain Diagnostic Procedures information for diagnostic information and operation of the DRB scan tool.

REMOVAL

WARNING: DO NOT LOOSEN RADIATOR DRAIN-CKOCK WITH SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN OCCUR.

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

Factory installed thermostat housings on 3.9L, 5.2L and 5.9L engines are installed on a gasket with an anti-stick coating. This will aid in gasket removal and clean-up.

(1) Disconnect negative battery cable at battery.

(2) Drain cooling system until coolant level is below thermostat (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Air Conditioned vehicles: Remove support bracket (generator mounting bracket-to-intake manifold) located near rear of generator (Fig. 16).

NOTE: On air conditioning equipped vehicles, the generator must be partially removed.

(4) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) (Fig. 17).

(5) Remove two generator mounting bolts. Do not remove any wiring at generator. If equipped with 4WD, unplug 4WD indicator lamp wiring harness (located near rear of generator).

(6) Remove generator. Position generator to gain access for thermostat gasket removal.

**Fig. 17 Automatic Belt Tensioner—5.9L Engines**

- 1 - IDLER PULLEY
- 2 - TENSIONER
- 3 - FAN BLADE

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS

WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps (Fig. 18). If replacement is necessary, use only an original equipment clamp with matching number or letter.

80b76ee

Fig. 18 SPRING CLAMP SIZE LOCATION

- 1 - SPRING CLAMP SIZE LOCATION

(7) Remove radiator upper hose clamp and upper hose at thermostat housing.

(8) Position wiring harness (behind thermostat housing) to gain access to thermostat housing.

(9) Remove thermostat housing mounting bolts, thermostat housing, gasket and thermostat (Fig. 19). Discard old gasket.

INSTALLATION

(1) Clean mating areas of intake manifold and thermostat housing.

(2) Install thermostat (spring side down) into recessed machined groove on intake manifold (Fig. 19).

(3) Install gasket on intake manifold and over thermostat (Fig. 19).

(4) Position thermostat housing to intake manifold. Note the word **FRONT** stamped on housing (Fig. 20). For adequate clearance, this **must** be placed towards front of vehicle. The housing is slightly angled forward after installation to intake manifold.

(5) Install two housing-to-intake manifold bolts. Tighten bolts to 23 N·m (200 in. lbs.) torque.

(6) Install radiator upper hose to thermostat housing.

ENGINE COOLANT THERMOSTAT - 5.9L (Continued)

- 2 - GASKET
- 3 - INTAKE MANIFOLD
- 4 - THERMOSTAT
- 5 - MACHINED GROOVE

**Fig. 20 Thermostat Position—5.9L Engines**

CAUTION: When installing the serpentine accessory drive belt, the belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to (Fig. 21) for correct 3.9L, 5.2L and 5.9L engine belt routing. The correct belt with correct length must be used.

(7) Air Conditioned vehicles; Install generator. Tighten bolts to 41 N·m (30 ft. lbs.).

(8) Install support bracket (generator mounting bracket-to-intake manifold) (Fig. 16). Tighten bolts to 54 N·m (40 ft. lbs.) torque.

(9) Install accessory drive belt (Fig. 17)(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

***IF VEHICLE IS NOT EQUIPPED WITH POWER STEERING, THIS WILL BE AN IDLER PULLEY.**

(10) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(11) Connect battery negative cable.

(12) Start and warm the engine. Check for leaks.

ENGINE COOLANT THERMOSTAT - 8.0L

DESCRIPTION

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

The thermostat on all gas powered engines is located beneath the thermostat housing at the front of the intake manifold (Fig. 22).

The thermostat is a moveable sleeve type.

Coolant leakage into the pellet container will cause the thermostat to fail in the open position. Thermostats very rarely stick. Do not attempt to free a thermostat with a prying device.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation that can result in sludge formation.

OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.

DIAGNOSIS AND TESTING—THERMOSTAT

ON-BOARD DIAGNOSTICS

All **gasoline powered models** are equipped with On-Board Diagnostics for certain cooling system components. Refer to On-Board Diagnostics (OBD) in the Diagnosis section of this group for additional information. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC) in the PCM memory. Do not change a thermostat for lack of heat as indicated by the instrument panel gauge or by poor heater performance unless a DTC is present. Refer to the Diagnosis section of this group for other probable causes. For other DTC numbers, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

The DTC can also be accessed through the DRB scan tool. Refer to the appropriate Powertrain Diagnostic Procedures information for diagnostic information and operation of the DRB scan tool.

REMOVAL

WARNING: DO NOT LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND PRES-

- 3 - BOLTS (6)
- 4 - HOUSING WITH INTEGRAL SEAL
- 5 - THERMOSTAT
- 6 - RUBBER LIP SEAL
- 7 - TEMP. GAUGE SENDING UNIT

INSTALLATION

(1) Clean mating areas of intake manifold and thermostat housing.

(2) Check the condition (for tears or cracks) of the rubber thermostat seal located in the intake manifold (Fig. 23) (Fig. 25). The thermostat should fit snugly into the rubber seal.

(3) If seal replacement is necessary, coat the outer (metal) portion of the seal with Mopar® Gasket Maker. Install the seal into the manifold using Special Seal Tool number C-3995-A with handle tool number C-4171.

ENGINE COOLANT THERMOSTAT - 8.0L (Continued)

- (4) Install thermostat into recessed machined groove on intake manifold (Fig. 25).
- (5) Install thermostat housing (Fig. 25).
- (6) Install housing-to-intake manifold bolts. Tighten bolts to 25 N·m (220 in. lbs.) torque.

CAUTION: Housing bolts should be tightened evenly to prevent damage to housing and to prevent leaks.

- (7) Connect the wiring to both sensors.
- (8) Install the upper radiator hose and hose clamp to thermostat housing.
- (9) Install support rod.
- (10) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (11) Connect negative battery cable to battery.
- (12) Start and warm engine. Check for leaks.

ENGINE COOLANT THERMOSTAT - 5.9L DIESEL

DESCRIPTION

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing. An engine with the thermostat removed will operate in the radiator bypass mode, causing an overheat condition.

The thermostat of the 5.9L diesel engine is located in the front of the cylinder head, underneath the water outlet connector (Fig. 26).

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation that can result in sludge formation.

OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.

DIAGNOSIS AND TESTING—THERMOSTAT

The cooling system used with the diesel engine provides the extra coolant capacity and extra cooling protection needed for higher GVWR (Gross Vehicle Weight Rating) and GCWR (Gross Combined Weight Rating) vehicles.

This system capacity will not effect warm up or cold weather operating characteristics if the thermo-

80b4fb46

Fig. 26 Thermostat—5.9L Diesel—Typical

- 1 - WATER OUTLET CONNECTOR
- 2 - THERMOSTAT HOUSING
- 3 - THERMOSTAT

stat is operating properly. This is because coolant will be held in the engine until it reaches the thermostat "set" temperature.

Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded. Because of this, lower temperature gauge readings for diesel versus gasoline engines may, at times be normal.

Typically, complaints of low engine coolant temperature are observed as low heater output when combined with cool or cold outside temperatures.

To help promote faster engine warm-up, the electric engine block heater must be used with cool or cold outside temperatures. This will help keep the engine coolant warm when the vehicle is parked. Use the block heater if the outside temperature is below 4°C (40°F). **Do not use the block heater if the outside temperature is above 4°C (40°F).**

A "Cold Weather Cover" is available from the parts department through the Mopar Accessories product line. This accessory cover is designed to block airflow entering the radiator and engine compartment to promote faster engine warm-up. It attaches to the front of the vehicle at the grill opening. **The cover is to be used with cool or cold temperatures only. If used with high outside temperatures, serious engine damage could result.** Refer to the literature supplied with the cover for additional information.

ENGINE COOLANT THERMOSTAT - 5.9L DIESEL (Continued)

(1) To determine if the thermostat is defective, it must be removed from the vehicle (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).

(2) After the thermostat has been removed, examine the thermostat and inside of thermostat housing for contaminants. If contaminants are found, the thermostat may already be in a "stuck open" position. Flush the cooling system before replacing thermostat (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Place the thermostat into a container filled with water.

(4) Place the container on a hot plate or other suitable heating device.

(5) Place a commercially available radiator thermometer into the water.

(6) Apply heat to the water while observing the thermostat and thermometer.

(7) When the water temperature reaches 83°C (181°F) the thermostat should start to open (valve will start to move). If the valve starts to move before this temperature is reached, it is opening too early. Replace thermostat. The thermostat should be fully open (valve will stop moving) at 95°C (203°F). If the valve is still moving when the water temperature reaches 203°, it is opening too late. Replace thermostat. If the valve refuses to move at any time, replace thermostat.

REMOVAL

WARNING: DO NOT LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(1) Disconnect the battery negative cables.

(2) Drain cooling system until coolant level is below thermostat (Refer to 7 - COOLING - STANDARD PROCEDURE).

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

(3) Remove radiator hose clamp and hose from thermostat housing.

(4) Remove the three (3) water outlet-to-cylinder head bolts and remove the water outlet connector (Fig. 27).

(5) Clean the mating surfaces of the water outlet connector and clean the thermostat seat groove at the top of the thermostat housing (Fig. 27).

80b4fb46

Fig. 27 Thermostat Removal/Installation

- 1 - WATER OUTLET CONNECTOR
- 2 - THERMOSTAT HOUSING
- 3 - THERMOSTAT

INSTALLATION

(1) Install the thermostat into the groove in the top of the thermostat housing (Fig. 27).

(2) Install the water outlet connector and bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Install the radiator upper hose and clamp.

(4) Fill the cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Connect the battery negative cables.

(6) Start the engine and check for coolant leaks. Run engine to check for proper thermostat operation.

FAN DRIVE VISCOUS CLUTCH - 5.9L/8.0L

DESCRIPTION

The thermal viscous fan drive (Fig. 28) is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

Fig. 28 Viscous Fan

- 1 - WATER PUMP BYPASS HOSE
- 2 - FAN BLADE ASSEMBLY
- 3 - VISCOUS FAN DRIVE
- 4 - WATER PUMP AND PULLEY

OPERATION

A thermostatic bimetallic spring coil is located on the front face of the viscous fan drive unit (a typical viscous unit is shown in (Fig. 29). This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, the fan will remain at a reduced rpm regardless of engine speed.

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

Fig. 29 Viscous Fan Drive—Typical

- 1 - VISCOUS FAN DRIVE
- 2 - THERMOSTATIC SPRING
- 3 - MOUNTING NUT TO WATER PUMP HUB

DIAGNOSIS AND TESTING - VISCOUS FAN DRIVE

NOISE

NOTE: It is normal for fan noise to be louder (roaring) when:

- The underhood temperature is above the engagement point for the viscous drive coupling. This may occur when ambient (outside air temperature) is very high.
- Engine loads and temperatures are high such as when towing a trailer.
- Cool silicone fluid within the fan drive unit is being redistributed back to its normal disengaged (warm) position. This can occur during the first 15 seconds to one minute after engine start-up on a cold engine.

LEAKS

Viscous fan drive operation is not affected by small oil stains near the drive bearing. If leakage appears excessive, replace the fan drive unit.

VISCOUS DRIVE

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: BE SURE THAT THERE IS ADEQUATE FAN BLADE CLEARANCE BEFORE DRILLING.

FAN DRIVE VISCOUS CLUTCH - 5.9L/8.0L (Continued)

(1) Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.

(2) Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18° to 105°C (0° to 220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.

(3) Connect a tachometer and an engine ignition timing light. The timing light is to be used as a strobe light. This step cannot be used on the diesel engine.

(4) Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator (or air conditioner condenser). Use tape at the top to secure the plastic and be sure that the air flow is blocked.

(5) Be sure that the air conditioner (if equipped) is turned off.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(6) Start the engine and operate at 2400 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 88° C (190° F). Fan drive **engagement** should start to occur at/between:

- 5.9L gas engines — 79° C (175° F)
 - 8.0L engine — 88° to 96° C (190° to 205° F)
 - 5.9L diesel engine — 71° to 82° C (160° to 179° F)
- Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan (non-diesel only).

(7) When viscous drive engagement is verified, remove the plastic sheet. Fan drive **disengagement** should start to occur at between 57° to 79° C (135° to 175° F). A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word **REVERSE** to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are

found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

FAN DRIVE VISCOUS CLUTCH - 5.9L DIESEL

DESCRIPTION

The thermal viscous fan drive (Fig. 30) is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

FAN DRIVE VISCOUS CLUTCH - 5.9L DIESEL (Continued)

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word **REVERSE** to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

RADIATOR - 5.9L

DESCRIPTION

The radiator is a aluminum cross-flow design with horizontal tubes through the radiator core and vertical plastic side tanks (Fig. 32).

This radiator contains an internal transmission oil cooler only on the V-10 gas engine and the 5.9L diesel engine combinations.

Fig. 32 Cross Flow Radiator—Typical

- 1 - COOLING TUBES
2 - TANKS

OPERATION

The radiator supplies sufficient heat transfer using the cooling fins interlaced between the horizontal tubes in the radiator core to cool the engine.

DIAGNOSIS AND TESTING—RADIATOR COOLANT FLOW

Use the following procedure to determine if coolant is flowing through the cooling system.

(1) Idle engine until operating temperature is reached. If the upper radiator hose is warm to the touch, the thermostat is opening and coolant is flowing to the radiator.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. USING A RAG TO COVER THE RADIATOR PRESSURE CAP, OPEN RADIATOR CAP SLOWLY TO THE FIRST STOP. THIS WILL ALLOW ANY BUILT-UP PRESSURE TO VENT TO THE RESERVE/OVERFLOW TANK. AFTER PRESSURE BUILD-UP HAS BEEN RELEASED, REMOVE CAP FROM FILLER NECK.

(2) Drain a small amount of coolant from the radiator until the ends of the radiator tubes are visible through the filler neck. Idle the engine at normal operating temperature. If coolant is flowing past the exposed tubes, the coolant is circulating.

REMOVAL

(1) Disconnect battery negative cables.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

RADIATOR - 5.9L (Continued)

- (3) Remove hose clamps and hoses from radiator.
- (4) Remove coolant reserve/overflow tank hose from radiator filler neck nipple.
- (5) Remove the coolant reserve/overflow tank from the fan shroud (pull straight up). The tank slips into T-slots on the fan shroud (Fig. 33).

**Fig. 33 Coolant Recovery Bottle**

- 1 - T-SLOTS
- 2 - ALIGNMENT PIN
- 3 - FAN SHROUD
- 4 - COOLANT RESERVE/OVERFLOW TANK

(6) Disconnect electrical connectors at windshield washer reservoir tank and remove tank.

(7) Remove the four fan shroud mounting bolts (Fig. 34). Position shroud rearward over the fan blades towards engine.

(8) Remove the plastic clips retaining the rubber shields to the sides of radiator. Position rubber shields to the side.

(9) Remove the two radiator upper mounting bolts (Fig. 35).

(10) Lift radiator straight up and out of engine compartment. The bottom of the radiator is equipped with two alignment dowels that fit into holes in the lower radiator support panel (Fig. 35). Rubber biscuits (insulators) are installed to these dowels. Take care not to damage cooling fins or tubes on the radiator and air conditioning condenser when removing.

CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris

**Fig. 34 Fan Shroud Mounting - 5.9L Engines**

- 1 - RADIATOR SUPPORT
- 2 - RADIATOR

- 3 - ALIGNMENT DOWELS (2)
- 4 - RADIATOR SUPPORT

has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

RADIATOR - 5.9L (Continued)

INSPECTION

Inspect the radiator side tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

(1) Position fan shroud over the fan blades rearward towards engine.

(2) Install rubber insulators to alignment dowels at lower part of radiator.

(3) Lower the radiator into position while guiding the two alignment dowels into lower radiator support. Different alignment holes are provided in the lower radiator support for each engine application.

(4) Install two upper radiator mounting bolts. Tighten bolts to 11 N·m (95 in. lbs.) torque.

(5) Position the rubber shields to the sides of radiator. Install the plastic clips retaining the rubber shields to the sides of radiator.

(6) Connect both radiator hoses and install hose clamps.

(7) Install windshield washer reservoir tank.

(8) Position fan shroud to flanges on sides of radiator. Install fan shroud mounting bolts (Fig. 34). Tighten bolts to 6 N·m (50 in. lbs.) torque.

(9) Install coolant reserve/overflow tank hose to radiator filler neck nipple.

(10) Install coolant reserve/overflow tank to fan shroud (fits into T-slots on shroud).

(11) Install battery negative cables.

(12) Position heater controls to **full heat** position.

(13) Fill cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Operate engine until it reaches normal temperature. Check cooling system fluid levels.

RADIATOR - 8.0L

DESCRIPTION

The radiator is a aluminum cross-flow design with horizontal tubes through the radiator core and vertical plastic side tanks (Fig. 36).

This radiator contains an internal transmission oil cooler only on the V-10 gas engine and the 5.9L diesel engine combinations.

OPERATION

The radiator supplies sufficient heat transfer using the cooling fins interlaced between the horizontal tubes in the radiator core to cool the engine.

(5) Connect both radiator hoses and install hose clamps.

(6) Install windshield washer reservoir tank.

(7) Position fan shroud to flanges on sides of radiator. Install fan shroud mounting bolts (Fig. 37). Tighten bolts to 6 N·m (50 in. lbs.) torque.

(8) Install coolant reserve/overflow tank hose to radiator filler neck nipple.

(9) Connect the overflow hose to the radiator.

(10) Install battery negative cables.

(11) Position heater controls to **full heat** position.

(12) Fill cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(13) Operate engine until it reaches normal temperature. Check cooling system fluid levels.

Fig. 39 Cross Flow Radiator—Typical

1 - COOLING TUBES

2 - TANKS

RADIATOR - 5.9L DIESEL

DESCRIPTION

The radiator is a aluminum cross-flow design with horizontal tubes through the radiator core and vertical plastic side tanks (Fig. 39).

This radiator contains an internal transmission oil cooler only on the V-10 gas engine and the 5.9L diesel engine combinations.

OPERATION

The radiator supplies sufficient heat transfer using the cooling fins interlaced between the horizontal tubes in the radiator core to cool the engine.

DIAGNOSIS AND TESTING—RADIATOR COOLANT FLOW

Use the following procedure to determine if coolant is flowing through the cooling system.

(1) Idle engine until operating temperature is reached. If the upper radiator hose is warm to the touch, the thermostat is opening and coolant is flowing to the radiator.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. USING A RAG TO COVER THE RADIATOR PRESSURE CAP, OPEN RADIATOR CAP SLOWLY TO THE FIRST STOP. THIS WILL ALLOW ANY BUILT-UP PRESSURE TO VENT TO THE RESERVE/OVERFLOW TANK. AFTER PRES-

SURE BUILD-UP HAS BEEN RELEASED, REMOVE CAP FROM FILLER NECK.

(2) Drain a small amount of coolant from the radiator until the ends of the radiator tubes are visible through the filler neck. Idle the engine at normal operating temperature. If coolant is flowing past the exposed tubes, the coolant is circulating.

REMOVAL

(1) Disconnect both battery negative cables. Remove the nuts retaining the positive cable to the top of radiator. Position positive battery cable to rear of vehicle.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

RADIATOR - 5.9L DIESEL (Continued)

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

(3) Remove hose clamps and hoses from radiator.

(4) Remove coolant reserve/overflow tank hose from radiator filler neck nipple.

(5) Remove the coolant reserve/overflow tank from the fan shroud (pull straight up). The tank slips into T-slots on the fan shroud (Fig. 40). The coolant recovery/reservoir does not require removal. Disconnect the overflow hose from the radiator.

CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

Inspect the radiator side tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

(1) Position fan shroud over the fan blades rearward towards engine.

(2) Install rubber insulators to alignment dowels at lower part of radiator.

(3) Lower the radiator into position while guiding the two alignment dowels into lower radiator support. Different alignment holes are provided in the lower radiator support for each engine application.

(4) Install two upper radiator mounting bolts. Tighten bolts to 11 N·m (95 in. lbs.) torque.

(5) Connect both radiator hoses and install hose clamps.

(6) Connect transmission cooler lines to radiator tank. Inspect quick connect fittings for debris and install until an audible "click" is heard. Pull apart to verify connection.

(7) Install windshield washer reservoir tank.

(8) Position fan shroud to flanges on sides of radiator. Install fan shroud mounting bolts (Fig. 41). Tighten bolts to 6 N·m (50 in. lbs.) torque.

(9) Install metal clips to top of fan shroud.

(10) Install coolant reserve/overflow tank hose to radiator filler neck nipple.

(11) Install coolant reserve/overflow tank to fan shroud (fits into T-slots on shroud).

(12) Install battery negative cables.

(13) Install positive battery cable to top of radiator. Tighten radiator-to-battery cable mounting nuts.

(14) Position heater controls to **full heat** position.

(15) Fill cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(16) Operate engine until it reaches normal temperature. Check cooling system and automatic transmission (if equipped) fluid levels.

RADIATOR PRESSURE CAP

DESCRIPTION

Radiators are equipped with a pressure cap, which releases pressure at some point within a range of 97-124 kPa (14-18 psi). The pressure relief point (in pounds) is engraved on top of cap.

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity.

A rubber gasket seals radiator filler neck to prevent leakage. This is done to keep system under pressure. It also maintains vacuum during coolant cool-down allowing coolant to return from reserve/overflow tank.

Fig. 43 Radiator Pressure Cap and Filler Neck—Typical

- 1 - STAINLESS-STEEL SWIVEL TOP
- 2 - RUBBER SEALS
- 3 - VENT VALVE
- 4 - RADIATOR TANK
- 5 - FILLER NECK
- 6 - OVERFLOW NIPPLE
- 7 - MAIN SPRING
- 8 - GASKET RETAINER

OPERATION

The cap (Fig. 43) contains a spring-loaded pressure relief valve that opens when system pressure reaches release range of 97-124 kPa (14-18 psi).

A vent valve in the center of cap allows a small coolant flow through cap when coolant is below boiling temperature. The valve is completely closed when boiling point is reached. As the coolant cools, it contracts and creates a vacuum in the cooling system. This causes the vacuum valve to open and coolant in the reserve/overflow tank to be drawn through its connecting hose into radiator. If the vacuum valve is stuck shut, the radiator hoses will collapse on cool-down. Clean the vent valve (Fig. 43).

RADIATOR PRESSURE CAP (Continued)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING—RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool 7700 (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at a minimum of 55 kPa (8 psi).

WARNING: THE WARNING WORDS —DO NOT OPEN HOT— ON RADIATOR PRESSURE CAP, ARE A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, RADIATOR CAP SHOULD NOT BE REMOVED WHILE SYSTEM IS HOT AND/OR UNDER PRESSURE.

Do not remove radiator cap at any time **except** for the following purposes:

- Check and adjust antifreeze freeze point
- Refill system with new antifreeze
- Conducting service procedures
- Checking for vacuum leaks

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT AT LEAST 15 MINUTES BEFORE REMOVING RADIATOR CAP. WITH A RAG, SQUEEZE RADIATOR UPPER HOSE TO CHECK IF SYSTEM IS UNDER PRESSURE. PLACE A RAG OVER CAP AND WITHOUT PUSHING CAP DOWN, ROTATE IT COUNTER-CLOCKWISE TO FIRST STOP. ALLOW FLUID TO ESCAPE THROUGH THE COOLANT RESERVE/OVERFLOW HOSE INTO RESERVE/OVERFLOW TANK. SQUEEZE RADIATOR UPPER HOSE TO DETERMINE WHEN PRESSURE HAS BEEN RELEASED. WHEN COOLANT AND STEAM STOP BEING PUSHED INTO TANK AND SYSTEM PRESSURE DROPS, REMOVE RADIATOR CAP COMPLETELY.

DIAGNOSIS AND TESTING—RADIATOR CAP

Remove cap from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap on pressure tester 7700 or an equivalent (Fig. 44).

J9507-3

Fig. 44 Pressure Testing Radiator Cap—Typical Tester

1 - PRESSURE CAP

2 - TYPICAL COOLING SYSTEM PRESSURE TESTER

NOTE: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

Operate tester pump to bring pressure to 104 kPa (15 psi) on gauge. If pressure cap fails to hold pressure of at least 97 kPa (14 psi) replace cap.

The pressure cap may test properly while positioned on tool 7700 (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CLEANING

Clean radiator pressure cap using a mild soap and water mixture. **DO NOT** use any chemicals stronger than mild soap, damage to the seal can occur.

RADIATOR PRESSURE CAP (Continued)

INSPECTION

Hold cap at eye level, right side up. The vent valve (Fig. 45) at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Fig. 45 Radiator Pressure Cap

- 1 - STAINLESS-STEEL SWIVEL TOP
- 2 - RUBBER SEALS
- 3 - VENT VALVE
- 4 - RADIATOR TANK
- 5 - FILLER NECK
- 6 - OVERFLOW NIPPLE
- 7 - MAIN SPRING
- 8 - GASKET RETAINER

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

WATER PUMP - 5.9L

DESCRIPTION

The water pump is located on the engine front cover, and has an integral pulley attached (Fig. 46).

The water pump impeller is pressed onto the rear of a shaft that rotates in a bearing pressed into the water pump body. The body has a small hole for ventilation. The water pump seals are lubricated by antifreeze in the coolant mixture. Additional lubrication is not necessary.

OPERATION

A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core,

Fig. 46 Water Pump Location—Typical

- 1 - WATER PUMP BYPASS HOSE
- 2 - FAN BLADE ASSEMBLY
- 3 - VISCOUS FAN DRIVE
- 4 - WATER PUMP AND PULLEY

this coolant absorbs the heat generated when the engine is running. The pump is driven by the engine crankshaft via a drive belt.

DIAGNOSIS AND TESTING—WATER PUMP

A quick test to determine if pump is working is to check if heater warms properly. A defective water pump will not be able to circulate heated coolant through the long heater hose to the heater core.

REMOVAL

The water pump on all models can be removed without discharging the air conditioning system (if equipped).

The water pump on all gas powered engines is bolted directly to the engine timing chain case/cover.

On the 5.9L gas powered engine, a gasket is used as a seal between the water pump and timing chain case/cover.

If water pump is replaced because of bearing/shaft damage or leaking shaft seal, the mechanical cooling fan assembly should also be inspected. Inspect for fatigue cracks, loose blades or loose rivets that could have resulted from excessive vibration. Replace fan if any of these conditions are found. Also check condition of the thermal viscous fan drive (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DIAGNOSIS AND TESTING).

(1) Disconnect negative cable from battery.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WATER PUMP - 5.9L (Continued)

(3) Remove windshield washer reservoir tank from radiator fan shroud.

(4) Disconnect the coolant reserve/overflow tank-to-radiator hose at the tank.

(5) Remove the four fan shroud mounting bolts at the radiator (Fig. 47). Do not attempt to remove shroud from vehicle at this time.

Fig. 47 Typical Fan Shroud Mounting

- 1 - RADIATOR SUPPORT
- 2 - RADIATOR
- 3 - BOLTS (4)
- 4 - FAN SHROUD

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

(6) Remove upper radiator hose at radiator.

(7) The thermal viscous fan drive is attached (threaded) to the water pump hub shaft (Fig. 49). Remove the fan/fan drive assembly from water pump by turning the mounting nut counterclockwise (as viewed from front). Threads on the fan drive are **RIGHT-HAND**. A Snap-On 36 MM Fan Wrench (number SP346 from Snap-On Cummins Diesel Tool Set number 2017DSP) can be used with Special Tool 6958 Spanner Wrench and Adapter Pins 8346 (Fig. 48) to prevent the pulley from rotating.

Fig. 48 Using Special Tool 6958 Spanner Wrench and Adapter Pins 8346

- 1 - SPECIAL TOOL 6958 SPANNER WRENCH WITH ADAPTER PINS 8346
- 2 - FAN

(8) If water pump is being replaced, do not unbolt fan blade assembly (Fig. 49) from the thermal control fan drive.

(9) Remove fan blade/fan drive and fan shroud as an assembly from vehicle.

(10) After removing fan blade/fan drive assembly, **do not** place the thermal viscous fan drive in the horizontal position. If stored horizontally, the silicone fluid in the viscous drive could drain into its bearing assembly and contaminate the bearing lubricant.

(11) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) (Fig. 50).

(12) Remove the lower radiator hose and heater hose from water pump.

(13) Loosen heater hose coolant return tube mounting bolt (Fig. 51) and remove tube from water pump. Discard the old tube O-ring.

(14) Remove the seven water pump mounting bolts (Fig. 52).

(15) Loosen the clamp at the water pump end of bypass hose (Fig. 49). Slip the bypass hose from the water pump while removing pump from vehicle. Do not remove the clamp from the bypass hose.

(16) Discard old gasket.

CAUTION: Do not pry the water pump at timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

CLEANING

Clean gasket mating surfaces as necessary.

INSPECTION

Visually inspect the water pump and replace if it has any of the following conditions:

- The body is cracked or damaged

• Water leaks from the shaft seal. This is evident by traces of coolant below the vent hole

• Loose or rough turning bearing. Also inspect thermal fan drive

- Impeller rubbing the pump body

INSTALLATION

- (1) Clean gasket mating surfaces.

WATER PUMP - 5.9L (Continued)

(2) Using a new gasket, install water pump to engine as follows: Guide water pump nipple into bypass hose as pump is being installed. Install water pump bolts (Fig. 52). Tighten water pump mounting bolts to 40 N·m (30 ft. lbs.) torque.

(3) Position bypass hose clamp to bypass hose.

(4) Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.

(5) Install a new o-ring to the heater hose coolant return tube (Fig. 51). Coat the new o-ring with anti-freeze before installation.

(6) Install coolant return tube and its mounting bolt to engine (Fig. 51). Be sure the slot in tube bracket is bottomed to mounting bolt. This will properly position return tube.

(7) Connect radiator lower hose to water pump.

(8) Connect heater hose and hose clamp to coolant return tube.

(9) Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) (Fig. 50).

(10) Position fan shroud and fan blade/viscous fan drive assembly to vehicle as a complete unit.

(11) Install fan shroud.

(12) Install fan blade/viscous fan drive assembly to water pump shaft.

(13) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect negative battery cable.

(15) Start and warm the engine. Check for leaks.

WATER PUMP - 8.0L

DIAGNOSIS AND TESTING—WATER PUMP

A quick test to determine if pump is working is to check if heater warms properly. A defective water pump will not be able to circulate heated coolant through the long heater hose to the heater core.

REMOVAL

NOTE:

The water pump on all models can be removed without discharging the air conditioning system (if equipped).

The water pump on all gas powered engines is bolted directly to the engine timing chain case/cover.

On the 8.0L V-10 engine, a rubber o-ring (instead of a gasket) is used as a seal between the water pump and timing chain case/cover.

If water pump is replaced because of bearing/shaft damage or leaking shaft seal, the mechanical cooling fan assembly should also be inspected. Inspect for fatigue cracks, loose blades or loose rivets that could

have resulted from excessive vibration. Replace fan if any of these conditions are found. Also check condition of the thermal viscous fan drive (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DIAGNOSIS AND TESTING).

(1) Disconnect negative battery cable from battery.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

(3) Remove windshield washer reservoir tank from radiator fan shroud.

(4) Remove the four fan shroud mounting bolts at the radiator (Fig. 53). Do not attempt to remove shroud from vehicle at this time.

Fig. 53 Typical Fan Shroud Mounting

2 - O-RING SEAL

(15) Remove the heater hose fitting from water pump if pump replacement is necessary. Note position (direction) of fitting before removal. Fitting must be re-installed to same position.

CAUTION: Do not pry the water pump at timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

CLEANING

Clean gasket mating surfaces as necessary.

INSPECTION

Visually inspect the water pump and replace if it has any of the following conditions:

- The body is cracked or damaged
- Water leaks from the shaft seal. This is evident by traces of coolant below the vent hole
- Loose or rough turning bearing. Also inspect thermal fan drive
- Impeller rubbing the pump body

INSTALLATION

(1) If water pump is being replaced, install the heater hose fitting to the pump. Tighten fitting to 16 N·m (144 in. lbs.) torque. After fitting has been torqued, position fitting as shown in (Fig. 59). When positioning fitting, do not back off (rotate counter-clockwise). Use a sealant on the fitting such as Mopar® Thread Sealant With Teflon. Refer to the directions on the package.

CAUTION: This heater hose fitting must be installed to pump before pump is installed to engine.

J9407-17

Fig. 59 Heater Hose Fitting Position—8.0L V-101 - HEATER HOSE FITTING
2 - WATER PUMP

(2) Clean the o-ring mating surfaces at rear of water pump and front of timing chain/case cover.

(3) Apply a small amount of petroleum jelly to o-ring (Fig. 58). This will help retain o-ring to water pump.

WATER PUMP - 8.0L (Continued)

(4) Install water pump to engine as follows: Guide water pump fitting into bypass hose as pump is being installed. Install water pump bolts (Fig. 57). Tighten water pump mounting bolts to 40 N·m (30 ft. lbs.) torque.

(5) Position bypass hose clamp to bypass hose.

(6) Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.

(7) Connect radiator lower hose to water pump.

(8) Connect heater hose and hose clamp to heater hose fitting.

(9) Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) (Fig. 56).

(10) Position fan shroud and fan blade/viscous fan drive assembly to vehicle as a complete unit.

(11) Install fan shroud to radiator. Tighten bolts to 6 N·m (50 in. lbs.) torque.

(12) Install fan blade/viscous fan drive assembly to water pump shaft.

(13) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(14) Connect negative battery cable.

(15) Start and warm the engine. Check for leaks.

Fig. 60 Water Pump—5.9L Diesel—Typical (non-A/C shown)

- 1 - WATER PUMP
- 2 - ACCESSORY DRIVE BELT
- 3 - AUTOMATIC BELT TENSIONER
- 4 - MOUNT BOLT
- 5 - 3/8" SQUARE HOLE

WATER PUMP - 5.9L DIESEL

DESCRIPTION

The water pump is mounted to the engine front cover between the automatic belt tensioner and the fan drive pulley (Fig. 60).

The water pump impeller is pressed onto the rear of a shaft that rotates in a bearing pressed into the water pump body. The body has a small hole for ventilation. The water pump seals are lubricated by antifreeze in the coolant mixture. Additional lubrication is not necessary.

OPERATION

The diesel engine water pump draws coolant from radiator outlet and circulates it through engine, heater core and back to radiator inlet. The crankshaft pulley drives the water pump with a serpentine drive belt (Fig. 60).

DIAGNOSIS AND TESTING—WATER PUMP

A quick test to determine if pump is working is to check if heater warms properly. A defective water pump will not be able to circulate heated coolant through the long heater hose to the heater core.

REMOVAL

(1) Disconnect battery negative cables.

(2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(3) Remove the bolt retaining the wiring harness near the top of water pump. Position wire harness to the side.

(4) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(5) Remove water pump mounting bolts (Fig. 61).

(6) Clean water pump sealing surface on cylinder block.

CLEANING

Clean gasket mating surfaces as necessary.

INSPECTION

Visually inspect the water pump and replace if it has any of the following conditions:

- The body is cracked or damaged
- Water leaks from the shaft seal. This is evident by traces of coolant below the vent hole
- Loose or rough turning bearing. Also inspect thermal fan drive
- Impeller rubbing the pump body

INSTALLATION

(1) Install new O-ring seal in groove on water pump (Fig. 62).

(2) Install water pump. Tighten mounting bolts to 24 N·m (18 ft. lbs.) torque.

(3) Install accessory drive belt. Refer to procedure in this group.

WATER PUMP - 5.9L DIESEL (Continued)

**Fig. 61 Water Pump Removal/Installation**

- 3 - WATER PUMP

(4) Install the bolt retaining the wiring harness near top of water pump.

(5) Fill cooling system. Refer to Refilling Cooling System in this section.

(6) Connect both battery cables.

(7) Start and warm the engine. Check for leaks.

WATER PUMP INLET TUBE - 5.9L

REMOVAL

REMOVAL - WATER PUMP BYPASS HOSE WITH AIR CONDITIONING

If equipped with A/C, the generator and A/C compressor along with their common mounting bracket (Fig. 63) must be partially removed. Removing the generator or A/C compressor from their mounting bracket is not necessary. Also, discharging the A/C system is not necessary. **Do not** remove any refrigerant lines from A/C compressor.

**Fig. 63 Generator - A/C Compressor Mounting Bracket - Typical**

WARNING: THE A/C SYSTEM IS UNDER PRESSURE EVEN WITH THE ENGINE OFF. REFER TO REFRIGERANT WARNINGS IN 24 - HEATING AND AIR CONDITIONING.

WATER PUMP INLET TUBE - 5.9L (Continued)

(1) Disconnect negative battery cable from battery.
 (2) Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(3) Remove upper radiator hose clamp at radiator. A special clamp tool must be used to remove the constant tension clamps. Remove hose at radiator.

(4) Disconnect throttle cable from clip at radiator fan shroud.

(5) Unplug wiring harness from A/C compressor.

(6) Remove the air cleaner assembly.

(7) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(8) **5.9L V-8 LDC-Gas:** The drive belt idler pulley must be removed to gain access to one of the A/C compressor/generator bracket mounting bolts. Remove the idler pulley bolt and remove idler pulley (Fig. 64).

Fig. 64 Idler Pulley - 5.9L V-8 LDC-Gas Engine

(9) **5.9L HDC-Gas:** The automatic belt tensioner/pulley assembly must be removed to gain access to one of the A/C compressor/generator bracket mounting bolts. Remove the tensioner mounting bolt (Fig. 65) and remove tensioner.

Fig. 65 Belt Tensioner - 5.9L HDC-Gas Engine

- 1 - PULLEY BOLT
- 2 - IDLER PULLEY
- 3 - TENSIONER PULLEY
- 4 - TENSIONER
- 5 - TENSIONER MOUNTING BOLT

(10) Remove the engine oil dipstick tube mounting bolt at the side of the A/C-generator mounting bracket.

(11) Disconnect throttle body control cables.

(12) Remove heater hose coolant return tube mounting bolt (Fig. 66) (Fig. 67) and remove tube from engine. Discard the old tube O-ring.

(13) Remove bracket-to-intake manifold bolts (number 1 and 2 (Fig. 63).

(14) Remove remaining bracket-to-engine bolts (Fig. 68) (Fig. 69).

WATER PUMP INLET TUBE - 5.9L (Continued)

(15) Lift and position generator and A/C compressor (along with their common mounting bracket) to gain access to bypass hose. A block of wood may be used to hold assembly in position.

(16) Loosen and position both hose clamps to the center of bypass hose. A special clamp tool must be used to remove the constant tension clamps. Remove hose from vehicle.

REMOVAL - WATER PUMP BYPASS HOSE WITHOUT AIR CONDITIONING

A water pump bypass hose (Fig. 70) is used between the intake manifold and water pump on all gas powered engines. To test for leaks, (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

Fig. 70 Water Pump Bypass Hose - Typical

- 1 - WATER PUMP BYPASS HOSE
- 2 - FAN BLADE ASSEMBLY
- 3 - VISCOUS FAN DRIVE
- 4 - WATER PUMP AND PULLEY

(1) Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

(2) Loosen both bypass hose clamps and position to the center of hose.

(3) Remove hose from vehicle.

INSTALLATION

INSTALLATION - WATER PUMP BYPASS HOSE WITH AIR CONDITIONING

(1) Position bypass hose clamps to the center of hose.

(2) Install bypass hose to engine.

(3) Secure both hose clamps.

(4) Install generator-A/C mounting bracket assembly to engine. Tighten bolt number 1 (Fig. 63) to 41 N·m (30 ft. lbs.) torque. Tighten bolt number 2 (Fig. 63) to 28 N·m (20 ft. lbs.) torque. Tighten bracket mounting bolts (Fig. 68) (Fig. 69) to 40 N·m (30 ft. lbs.) torque.

(5) Install a new O-ring to the heater hose coolant return tube (Fig. 66) (Fig. 67). Coat the new O-ring with antifreeze before installation.

(6) Install coolant return tube and its mounting bolt to engine (Fig. 66) (Fig. 67).

(7) Connect throttle body control cables.

(8) Install oil dipstick mounting bolt.

(9) **/5.9L V-8 LDC-Gas Engine:** Install idler pulley. Tighten bolt to 41 N·m (30 ft. lbs.) torque.

WATER PUMP INLET TUBE - 5.9L (Continued)

(10) **5.9L HDC-Gas:** Install automatic belt tensioner assembly to mounting bracket. A dowel pin is located on back of tensioner (Fig. 71). Align this to dowel hole (Fig. 72) in tensioner mounting bracket. Tighten bolt to 41 N·m (30 ft. lbs.) torque.

Fig. 71 Tensioner Dowel Pin - 5.9L HDC-Gas Engine

- 1 - BELT TENSIONER
- 2 - DOWEL PIN

Fig. 72 Tensioner Mounting

- 1 - DOWEL PIN HOLE
- 2 - TENSIONER MOUNTING BRACKET

(11) Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

CAUTION: When installing the serpentine accessory drive belt, the belt must be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). The correct belt with the correct length must be used.

- (12) Install air cleaner assembly.
- (13) Install upper radiator hose to radiator.
- (14) Connect throttle cable to clip at radiator fan shroud.
- (15) Connect wiring harness to A/C compressor.
- (16) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (17) Start and warm the engine. Check for leaks.

INSTALLATION - WATER PUMP BYPASS HOSE WITHOUT AIR CONDITIONING

- (1) Position bypass hose clamps to the center of hose.
- (2) Install bypass hose to engine.
- (3) Secure both hose clamps.
- (4) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Start and warm the engine. Check for leaks.

TRANS COOLER - 5.9L

DESCRIPTION

An air-to-oil transmission oil cooler is standard on all engine packages. the cooler is located between the radiator and air conditioning condenser (Fig. 1).

OPERATION

The transmission oil is routed through the cooler where heat is removed from the transmission oil before returning to the transmission. The cooler has an internal thermostat that controls fluid flow through the cooler. When the transmission fluid is cold (less than operating temperature) the fluid is routed through the cooler bypass. when the transmission fluid reaches operating temperatures and above, the thermostat closes off the bypass allowing fluid flow through the cooler. The thermostat MUST be

removed from the cooler before the cooler can be flushed. The thermostat is serviceable.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUSHING
COOLERS AND TUBES - WITH RADIATOR
IN-TANK TRANSMISSION OIL COOLER

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906-B Cooler Flusher.

TRANS COOLER - 5.9L (Continued)

WARNING:

WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1-1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES. KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

(1) Remove cover plate filler plug on Tool 6906-B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906-B.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUT-LET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Turn pump ON for two to three minutes to flush cooler(s) and lines.

(8) Turn pump OFF.

(9) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(10) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(11) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(12) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(13) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES - WITHOUT RADIATOR IN-TANK TRANSMISSION OIL COOLER

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

(1) Remove cover plate filler plug on Tool 6906B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

TRANS COOLER - 5.9L (Continued)

- (2) Reinstall filler plug on Tool 6906B.
- (3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.
- (4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

- (5) Connect the BLUE pressure line to the OUTLET (From) cooler line.
- (6) Connect the CLEAR return line to the INLET (To) cooler line
- (7) Remove the transmission oil cooler from the vehicle. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL)
- (8) Remove the transmission oil cooler thermostat. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - DISASSEMBLY)
- (9) Re-install the thermostat cover onto the oil cooler and install the snap-ring.
- (10) Re-connect the oil cooler to the transmission cooler lines.
- (11) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the bypass circuit of the cooler only.

- (12) Turn pump OFF.
- (13) Remove the thermostat cover from the oil cooler.
- (14) Install Special Tool Cooler Plug 8414 into the transmission oil cooler.
- (15) Re-install the thermostat cover onto the oil cooler and install the snap-ring.
- (16) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the main oil cooler core passages only.

- (17) Turn pump OFF.
- (18) Remove the thermostat cover from the oil cooler.
- (19) Remove Special Tool Cooler Plug 8414 from the transmission oil cooler.

(20) Install a new thermostat spring, thermostat, cover, and snap-ring into the transmission oil cooler. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - ASSEMBLY)

(21) Install the transmission oil cooler onto the vehicle. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION)

(22) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(23) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(24) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission fluid.

(25) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(26) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Place a drain pan under the oil cooler lines.
- (3) Disconnect the transmission oil cooler line quick-connect fitting at the cooler outlet using the quick connect release tool 6935. Loosen clamp from inlet connection and slide hose off of nipple. Plug cooler lines to prevent oil leakage.
- (4) Remove the oil cooler lower mounting bolt (oil cooler-to-vehicle body) (Fig. 2).
- (5) Remove three bolts (radiator support bracket-to-body). Remove this A-shaped support bracket and the transmission oil cooler as an assembly from the vehicle. Take care not to damage the radiator core or A/C condenser fins with the cooling lines when removing.
- (6) Remove oil cooler from A-shaped support bracket by removing two upper mounting strap bolts and mounting straps at support bracket (Fig. 2).
- (7) Remove oil cooler from the A-shaped radiator support bracket.

DISASSEMBLY

NOTE: The transmission oil cooler uses an internal thermostat to control transmission oil flow through the cooler. This thermostat is servicable.

- (1) Remove the transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL).
- (2) Remove the snap ring retaining the thermostat end plug (Fig. 3).

TRANS COOLER - 5.9L (Continued)

Fig. 3 Transmission Oil Cooler Thermostat Removal/Installation

- 1 - THERMOSTAT HOUSING
- 2 - SPRING
- 3 - END PLUG
- 4 - SNAP RING
- 5 - THERMOSTAT

ASSEMBLY

(1) Thoroughly clean the thermostat bore on the transmission oil cooler.

(2) Install new spring, thermostat, end plug and snap ring.

(3) Install transmission oil cooler (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION).

INSTALLATION

(1) Install the oil cooler assembly to the A-shaped radiator support bracket using the two upper mounting bolts and mounting straps. Install the bolts but do not tighten at this time.

(2) Install the radiator support bracket and oil cooler (as an assembly) to the vehicle.

(3) Install the two lower radiator A-shaped support bracket bolts. Do not tighten bolts at this time.

(4) Slide and position the oil cooler on the A-shaped bracket until its lower mounting hole lines up with the bolt hole on the vehicle body. Tighten the oil cooler mounting strap bolts to 6 N·m (50 in. lbs.) torque.

(5) Install the upper radiator A-shaped support bracket bolt. Tighten all three radiator support bracket mounting bolts to 11 N·m (95 in. lbs.) torque.

(6) Inspect quick connect fitting for debris and install the quick-connect fitting on the cooler outler tube until an audible "click" is heard. Pull apart to verify connection.

(7) Connect battery negative cable.

(8) Start the engine and check all fittings for leaks.

(9) Check the fluid level in the automatic transmission (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 42RE/FLUID - STANDARD PROCEDURE), (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 44RE/FLUID - STANDARD PROCEDURE) or (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 46RE/FLUID - STANDARD PROCEDURE).

TRANS COOLER - 8.0L**DESCRIPTION**

The air-to-oil cooler is located in front of and to the left side of the radiator (Fig. 4). This cooler is supplied as standard equipment on all models equipped with an automatic transmission.

OPERATION

The transmission oil is routed through the cooler where the cooler removes heat from the transmission fluid, before returning to the transmission.

TRANS COOLER - 8.0L (Continued)

Fig. 4 Automatic Transmission Oil Cooler—8.0L Engine

- 1 - RADIATOR SUPPORT
- 2 - OIL COOLER MOUNTING BOLTS

- 4 - TRANSMISSION OIL COOLER LINES

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES - WITH RADIATOR IN-TANK TRANSMISSION OIL COOLER

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906-B Cooler Flusher.

WARNING:

WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1-1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES. KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

(1) Remove cover plate filler plug on Tool 6906-B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission compo-

nents. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906-B.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Turn pump ON for two to three minutes to flush cooler(s) and lines.

(8) Turn pump OFF.

(9) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(10) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(11) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(12) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(13) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES - WITHOUT RADIATOR IN-TANK TRANSMISSION OIL COOLER

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

(1) Remove cover plate filler plug on Tool 6906B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions gen-

TRANS COOLER - 8.0L (Continued)

erally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906B.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, **ALWAYS** reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Remove the transmission oil cooler from the vehicle. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL)

(8) Remove the transmission oil cooler thermostat. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - DISASSEMBLY)

(9) Re-install the thermostat cover onto the oil cooler and install the snap-ring.

(10) Re-connect the oil cooler to the transmission cooler lines.

(11) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the bypass circuit of the cooler only.

(12) Turn pump OFF.

(13) Remove the thermostat cover from the oil cooler.

(14) Install Special Tool Cooler Plug 8414 into the transmission oil cooler.

(15) Re-install the thermostat cover onto the oil cooler and install the snap-ring.

(16) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the main oil cooler core passages only.

(17) Turn pump OFF.

(18) Remove the thermostat cover from the oil cooler.

(19) Remove Special Tool Cooler Plug 8414 from the transmission oil cooler.

(20) Install a new thermostat spring, thermostat, cover, and snap-ring into the transmission oil cooler. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - ASSEMBLY)

(21) Install the transmission oil cooler onto the vehicle. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION)

(22) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(23) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(24) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission fluid.

(25) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(26) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

REMOVAL

(1) Place a drain pan under the oil cooler lines.

(2) Disconnect the two transmission lines from the oil cooler by loosening the two worm gear clamps and pulling the rubber hoses off of the oil cooler tubes (Fig. 5). Plug all oil cooler lines to prevent oil leakage.

(3) Remove three oil cooler-to-radiator support mounting bolts (Fig. 5).

(4) Remove the oil cooler and line assembly from the vehicle.

Fig. 5 Transmission Oil Cooler—8.0L Engine

- 2 - OIL COOLER MOUNTING BOLTS
- 3 - TRANSMISSION OIL COOLER
- 4 - TRANSMISSION OIL COOLER LINES

TRANS COOLER - 8.0L (Continued)

INSTALLATION

(1) Install the oil cooler and cooler line assembly to the vehicle.

(2) Install three mounting bolts and tighten to 6 N·m (50 in. lbs.) torque.

(3) Connect the transmission cooling lines to the oil cooler by pushing the rubber hoses onto the oil cooler tubes. Tighten the worm gear clamps to 2 N·m (18 in. lbs.)

(4) Start the engine and check all fittings for leaks.

(5) Check the fluid level in the automatic transmission (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - 47RE/FLUID - STANDARD PROCEDURE).

TRANS COOLER - 5.9L DIESEL

DESCRIPTION

All diesel models equipped with an automatic transmission are equipped with both a main water-to-oil cooler and a separate air-to-oil cooler. Both coolers are supplied as standard equipment on diesel engine powered models when equipped with an automatic transmission.

The main water-to-oil transmission oil cooler is mounted to a bracket on the turbocharger side of the engine (Fig. 6).

The air-to-oil cooler is located in front of and to the left side of the radiator (Fig. 7).

Fig. 6 Transmission Water-To-Oil Cooler—Diesel Engine—Typical

1 - TRANSMISSION WATER-TO-OIL COOLER

J9407-42

Fig. 7 Auxiliary Transmission Oil Cooler—Diesel Engine

- 1 - CHARGE AIR COOLER (INTERCOOLER)
- 2 - QUICK-CONNECT FITTINGS (2)
- 3 - MOUNTING NUTS (2)
- 4 - MOUNTING BOLT
- 5 - TRANSMISSION OIL COOLER

OPERATION

The transmission oil is routed through the main cooler first, then the auxiliary cooler where additional heat is removed from the transmission oil before returning to the transmission.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES - WITH RADIATOR IN-TANK TRANSMISSION OIL COOLER

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906-B Cooler Flusher.

TRANS COOLER - 5.9L DIESEL (Continued)

WARNING:

WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1-1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES. KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

(1) Remove cover plate filler plug on Tool 6906-B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906-B.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Turn pump ON for two to three minutes to flush cooler(s) and lines.

(8) Turn pump OFF.

(9) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(10) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(11) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(12) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(13) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES - WITHOUT RADIATOR IN-TANK TRANSMISSION OIL COOLER

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

(1) Remove cover plate filler plug on Tool 6906B. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906B.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Remove the transmission oil cooler from the vehicle. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - REMOVAL)

(8) Remove the transmission oil cooler thermostat. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - DISASSEMBLY)

TRANS COOLER - 5.9L DIESEL (Continued)

(9) Re-install the thermostat cover onto the oil cooler and install the snap-ring.

(10) Re-connect the oil cooler to the transmission cooler lines.

(11) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the bypass circuit of the cooler only.

(12) Turn pump OFF.

(13) Remove the thermostat cover from the oil cooler.

(14) Install Special Tool Cooler Plug 8414 into the transmission oil cooler.

(15) Re-install the thermostat cover onto the oil cooler and install the snap-ring.

(16) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the main oil cooler core passages only.

(17) Turn pump OFF.

(18) Remove the thermostat cover from the oil cooler.

(19) Remove Special Tool Cooler Plug 8414 from the transmission oil cooler.

(20) Install a new thermostat spring, thermostat, cover, and snap-ring into the transmission oil cooler. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - ASSEMBLY)

(21) Install the transmission oil cooler onto the vehicle. (Refer to 7 - COOLING/TRANSMISSION/TRANS COOLER - INSTALLATION)

(22) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(23) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(24) Place CLEAR suction line into a one quart container of Mopar® ATF +4, type 9602, Automatic Transmission fluid.

(25) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(26) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

REMOVAL

REMOVAL—AIR TO OIL COOLER

(1) Remove front bumper.

(2) Place a drain pan under the oil cooler.

(3) Raise the vehicle.

(4) Disconnect the oil cooler quick-connect fittings from the transmission lines.

(5) Remove the charge air cooler-to-oil cooler bolt (Fig. 8).

Fig. 8 Auxiliary Transmission Oil Cooler—Diesel Engine

1 - CHARGE AIR COOLER (INTERCOOLER)

2 - QUICK-CONNECT FITTINGS (2)

3 - MOUNTING NUTS (2)

4 - MOUNTING BOLT

5 - TRANSMISSION OIL COOLER

(6) Remove two mounting nuts.

(7) Remove the oil cooler and line assembly towards the front of vehicle. Cooler must be rotated and tilted into position while removing.

REMOVAL—WATER TO OIL COOLER

CAUTION: If a leak should occur in the water-to-oil cooler mounted to the side of the engine block, engine coolant may become mixed with transmission fluid. Transmission fluid may also enter engine cooling system. Both cooling system and transmission should be drained and inspected in case of oil cooler leakage.

TRANS COOLER - 5.9L DIESEL (Continued)

- (1) Disconnect both battery negative cables.
- (2) Remove air cleaner assembly and air cleaner intake hoses.
- (3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (4) Disconnect coolant lines from cooler.
- (5) Disconnect transmission oil lines from cooler. Plug cooler lines to prevent oil leakage.
- (6) Remove oil cooler mounting straps (Fig. 9).
- (7) Lift oil cooler off of mounting bracket.
- (8) If replacing cooler, make sure to transfer converter drain back valve to new cooler.

Fig. 9 Transmission Water-To- Oil Cooler—Diesel

1 - TRANSMISSION WATER-TO-OIL COOLER

INSTALLATION

INSTALLATION—AIR TO OIL COOLER

- (1) Carefully position the oil cooler assembly to the vehicle.
- (2) Install two nuts and one bolt. Tighten to 11 N·m (95 in. lbs.) torque.
- (3) Connect the quick-connect fittings to the transmission cooler lines.
- (4) Install front bumper.
- (5) Start the engine and check all fittings for leaks.
- (6) Check the fluid level in the automatic transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 47RE/FLUID - STANDARD PROCEDURE).

INSTALLATION

- (1) Position oil cooler on bracket.
- (2) Install mounting straps.
- (3) Connect transmission oil lines to cooler.
- (4) Connect coolant hoses to cooler.
- (5) Connect battery negative cables.
- (6) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (7) Check transmission oil level and fill as necessary (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 47RE/FLUID - STANDARD PROCEDURE).
- (8) Install air cleaner assembly and air cleaner intake hoses.

AUDIO

DESCRIPTION

An audio system is standard factory-installed equipment on this model, unless the vehicle is ordered with an available radio delete option. The standard equipment audio system includes an AM/FM/cassette (RAS sales code) receiver, and speakers in four locations. Several combinations of radio receivers and speaker systems are offered as optional equipment on this model. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the On or Accessory positions. The audio system includes the following components:

- Antenna
- Clockspring (with remote radio switches only)
- Filter, choke and speaker relay (with premium speaker system only)
- High-line or premium Central Timer Module (CTM) (with remote radio switches)
- Radio noise suppression components
- Radio receiver
- Remote radio switches (optional with RAZ radio receiver only)
- Speakers

Refer to Electrical, Restraints for more information on the clockspring. Refer to Electrical, Body Control/Central Control Module for more information on the Central Timer Module. Refer to the appropriate wiring information. The wiring information includes wir-

AUDIO (Continued)

ing diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. Following are general descriptions of the remaining major components in the standard and optional factory-installed audio systems.

OPERATION

See the owner's manual in the vehicle glove box for more information on the features, use and operation of each of the available audio systems.

CENTRAL TIMER MODULE

The high-line or premium Central Timer Module (CTM) can also control some features of the audio system when the vehicle is equipped with the optional RAZ radio receiver and remote radio switches. A high-line CTM is used on high-line versions of this vehicle. A premium CTM is used on vehicles equipped with the optional heated seats. The CTM combines the functions of a chime/buzzer module, an intermittent wipe module, an illuminated entry module, a remote keyless entry module, and a vehicle theft security system module in a single unit.

The high-line or premium CTM also controls and integrates many of the additional electronic functions and features included on models with this option. The RAZ radio receiver with a remote radio switch option is one of the features that the CTM controls. The CTM is programmed to send switch status mes-

sages over the Chrysler Collision Detection (CCD) data bus to control the volume, seek, and pre-set station advance functions of the RAZ radio receiver. The CTM monitors the status of the remote radio switches located on the steering wheel through a hard wired circuit. The CTM then sends the proper switch status messages to the radio receiver. The electronic circuitry within the radio receiver responds to the switch status messages it receives by adjusting the radio settings as requested.

Refer to Electrical, Body Control/Central Timer Module for more information on the high-line CTM. Refer to Remote Radio Switch in Description and Operation for more information on this component. In addition, radio receivers connected to the CCD data bus have several audio system functions that can be diagnosed using a DRBIII® scan tool. Refer to the proper Diagnostic Procedures manual for more information on DRBIII® testing of the audio systems.

DIAGNOSIS AND TESTING - AUDIO

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

	3. Radio faulty.	3. Refer to Radio in the Diagnosis and Testing section of this group.
	4. Faulty EMI or RFI noise suppression.	4. Refer to Radio Frequency Interference in the Diagnosis and Testing section of this group.
NO/POOR TAPE OPERATION	1. Faulty tape.	1. Insert known good tape and test operation.
	2. Foreign objects behind tape door.	2. Remove foreign objects and test operation.
	3. Dirty cassette tape head.	3. Clean head with Mopar Cassette Head Cleaner.
	4. Faulty tape deck.	4. Exchange or replace radio, if required.
NO COMPACT DISC OPERATION	1. Faulty CD.	1. Insert known good CD and test operation.
	2. Foreign material on CD.	2. Clean CD and test operation.
	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Faulty CD player.	4. Exchange or replace radio, if required.

AUDIO (Continued)

SPECIAL TOOLS

AUDIO SYSTEMS

Antenna Nut Wrench C-4816

ANTENNA BODY & CABLE

DESCRIPTION

The antenna body and cable are not readily visible in their installed positions in the vehicle. The most visible component of the antenna body and cable are the antenna adapter and the antenna cap nut, which are located on the top of the right front fender panel of the vehicle, near the right end of the cowl plenum. The antenna body and cable are secured below the fender panel by the antenna cap nut through a prefabricated and dedicated mounting hole in the top of the right front fender. The primary coaxial antenna cable is then routed beneath the fender sheet metal and through a prefabricated and dedicated cable entry hole in the right cowl side panel into the interior of the vehicle. Inside the vehicle, the primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the right end of the instrument panel. The secondary coaxial cable is then routed behind the instrument panel to the back of the radio.

The factory-installed radio antenna body and cable consists of the following components:

- **Antenna adapter** - The antenna adapter is sometimes also referred to as the antenna bezel or escutcheon.
- **Antenna body** - The die cast white metal antenna body is the mating structure between the antenna mast and the primary antenna coaxial cable.
- **Antenna cable** - This vehicle uses a two-piece antenna coaxial cable. The primary antenna cable is integral to the antenna body, and the secondary antenna cable connects the primary cable to the radio.
- **Antenna cap nut** - The antenna cap nut is a special, bright-plated threaded fastener that captures the antenna adapter and retains the antenna body to the fender sheet metal.

The components of the radio antenna body and cable cannot be adjusted or repaired. All factory-installed radios automatically compensate for radio antenna trim. Therefore, no antenna trimmer adjustment is required or possible after replacing the antenna body and cable or the radio. If an antenna body and cable component is damaged or faulty, it must be replaced. Other than the primary antenna cable, which is integral to the antenna body, the individual components of the antenna are available for service replacement.

OPERATION

The antenna body and cable connects the antenna mast to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna body transfers the weak electromagnetic radio waves induced into the rigid antenna mast into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers.

The antenna body includes an integral flange that mates with and grounds the antenna body to the underside of the fender panel sheet metal. Above the fender panel, the antenna body has a short nipple that is externally threaded to accept the antenna cap nut. Inside the nipple is a plastic insulator tube, and inside this insulator is an internally threaded metal receptacle that accepts the adapter stud on the bottom of the antenna mast. The antenna adapter serves as an above fender interface to mount and secure the antenna body to the vehicle. The antenna adapter is a black molded plastic component that provides a functional transition between the top of the fender and the antenna cap nut, while concealing the edges of the antenna mounting hole and protecting the painted finish of the fender from marring as the antenna cap nut is tightened. The adapter is installed over and shrouds the threaded nipple of the antenna body, which is installed from under and protrudes through the top of the mounting hole in the fender. The antenna cap nut is installed on top of the antenna adapter and tightened onto the external threads of the antenna body nipple to effectively secure and ground the antenna body to the fender.

ANTENNA BODY & CABLE (Continued)

Three notches on the outer circumference of the cap nut are engaged by matching projections of an antenna nut wrench (Special Tool C-4816) to facilitate the removal and installation of this special fastener. Proper tightening of the antenna cap nut is critical to ensuring proper grounding of the antenna body to the fender sheet metal, which is necessary for clear radio signal reception.

A short length of coaxial cable serves as the primary antenna cable. The center conductor of the cable is connected to the antenna mast receptacle. The outer wire mesh of the cable is connected to and grounded through the antenna body. One end of the primary antenna cable is securely crimped to the lower end of the antenna body, while the opposite end features a simple push/pull-type male coaxial cable connector that serves as the in-line connector to the instrument panel (secondary) antenna coaxial cable. The primary coaxial cable includes a grommet that seals the cable to an entry hole in the right cowl side outer panel where the cable passes into the passenger compartment of the vehicle. The secondary antenna cable has a push/pull-type male coaxial cable connector on the radio end, and a push/pull-type female coaxial cable connector on the opposite end, which serves as the in-line connector to the primary antenna cable. In the passenger compartment the primary cable is routed to the lower right side of the instrument panel, where it is connected to the secondary instrument panel antenna cable. The instrument panel antenna cable is routed near the instrument panel wire harness through the instrument panel structural support with small metal push-on retainers. This two-piece antenna cable arrangement allows the instrument panel or the antenna body and cable to be removed or installed without disturbing the radio.

DIAGNOSIS AND TESTING - ANTENNA

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The following four tests are used to diagnose the antenna with an ohmmeter:

- **Test 1** - Mast to ground test
- **Test 2** - Tip-of-mast to tip-of-conductor test
- **Test 3** - Body ground to battery ground test
- **Test 4** - Body ground to coaxial shield test.

The ohmmeter test lead connections for each test are shown in Antenna Tests (Fig. 1).

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate a coaxial cable problem; from the coaxial cable connection under the right end of the instrument panel near the right cowl side inner panel to the antenna base, and then from the coaxial cable connection to the radio receiver chassis connection.

Fig. 1 Antenna Tests

TEST 1

Test 1 determines if the antenna mast is insulated from the base. Proceed as follows:

- (1) Disconnect and isolate the antenna coaxial cable connector from the radio receiver chassis.
- (2) Connect one ohmmeter test lead to the tip of the antenna mast. Connect the other test lead to the antenna base. Check for continuity.
- (3) There should be no continuity. If continuity is found, replace the faulty or damaged antenna base and cable assembly.

TEST 2

Test 2 checks the antenna for an open circuit as follows:

- (1) Disconnect the antenna coaxial cable connector from the radio receiver chassis.
- (2) Connect one ohmmeter test lead to the tip of the antenna mast. Connect the other test lead to the center pin of the antenna coaxial cable connector.
- (3) Continuity should exist (the ohmmeter should only register a fraction of an ohm). High or infinite resistance indicates damage to the base and cable

ANTENNA BODY & CABLE (Continued)

assembly. Replace the faulty or damaged antenna base and cable, if required.

TEST 3

Test 3 checks the condition of the vehicle body ground connection. This test should be performed with the battery positive cable removed from the battery. Disconnect both battery cables, the negative cable first. Reconnect the battery negative cable and perform the test as follows:

(1) Connect one ohmmeter test lead to the vehicle fender. Connect the other test lead to the battery negative terminal post.

(2) The resistance should be less than one ohm.

(3) If the resistance is more than one ohm, check the braided ground strap(s) connected to the engine and the vehicle body for being loose, corroded, or damaged. Repair the ground strap connections, if required.

TEST 4

Test 4 checks the condition of the ground between the antenna base and the vehicle body as follows:

(1) Connect one ohmmeter test lead to the vehicle fender. Connect the other test lead to the outer crimp on the antenna coaxial cable connector.

(2) The resistance should be less than one ohm.

(3) If the resistance is more than one ohm, clean and/or tighten the antenna base to fender mounting hardware.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the passenger side of the instrument panel near the right cowl side inner panel to disengage the coaxial cable connector from the retainer clip located on the bottom of the heater-A/C housing (Fig. 2).

(3) Remove the foam tape to access the coaxial cable connector. Disconnect the connector by pulling it apart while twisting the metal connector halves. Do not pull on the cable.

(4) Securely tie a suitable length of cord or twine to the antenna half of the coaxial cable connector. This cord will be used to pull or "fish" the cable back into position during installation.

(5) Reach above the Powertrain Control Module (PCM) on the right side of the dash panel in the engine compartment to disengage the antenna coaxial cable grommet from the hole in the dash panel (Fig. 3).

(6) Pull the antenna coaxial cable out of the passenger compartment and into the engine compartment through the hole in the dash panel.

80b171b2

Fig. 2 Antenna Coaxial Cable Connector

- 1 - RETAINER CLIP
- 2 - TO RADIO
- 3 - TO ANTENNA
- 4 - FOAM TAPE

(7) Raise the sleeve on the antenna mast far enough to access and unscrew the antenna mast from the antenna body (Fig. 4).

(8) Remove the antenna cap nut using an antenna nut wrench (Special Tool C-4816) (Fig. 5).

(9) Remove the antenna adapter from the top of the fender.

(10) Lower the antenna body and cable assembly through the top of the fender.

(11) Pull the antenna body and cable out through the opening between the right cowl side outer panel and the top of the fender, while feeding the antenna coaxial cable out of the engine compartment through the hole in the right cowl side reinforcement.

(12) Untie the cord or twine from the antenna body and cable coaxial cable connector, leaving the cord or twine in the place of the cable through the vehicle.

(13) Remove the antenna body and cable from the vehicle.

INSTALLATION

(1) Tie the end of the cord or twine that was used during instrument panel antenna cable removal securely to the connector on the end of the antenna cable being installed into the instrument panel. This cord will be used to pull or "fish" the cable back into position.

(2) Using the cord or twine, pull the antenna cable through the radio receiver opening from under the instrument panel.

(3) Install the radio receiver onto the instrument panel.

**Fig. 5 Antenna Cap Nut Remove/Install - Typical**

- 1 - CAP NUT
- 2 - ANTENNA ADAPTER
- 3 - TOOL

(4) Reach through the glove box opening to engage the antenna cable with the retainer clips on the back of the instrument panel.

(5) Install the glove box onto the instrument panel.

(6) Untie the cord or twine from the instrument panel antenna cable connector.

(7) Reach under the passenger side of the instrument panel near the right cowl side inner panel to reconnect the two halves of the radio antenna coaxial cable connector. Wrap the connection with a piece of foam tape.

(8) Engage the coaxial cable connector with the retainer clip located on the bottom of the heater-A/C housing.

(9) Reconnect the battery negative cable.

RADIO CHOKE RELAY

DESCRIPTION

Models equipped with the Infinity premium speaker package have a filter, choke, and speaker relay unit. The filter, choke, and speaker relay unit is mounted to the lower instrument panel center brace, inboard of the Central Timer Module (CTM) and directly above the 16-way data link connector. The filter, choke, and speaker relay unit can be accessed for service without instrument panel disassembly or removal.

The filter, choke, and speaker relay unit should be checked if there is no sound output noted from the speakers. The filter, choke, and speaker relay unit cannot be repaired or adjusted and, if faulty or damaged, the unit must be replaced.

RADIO CHOKE RELAY (Continued)

OPERATION

The filter, choke, and speaker relay unit is used to control the supply of fused battery current to the front door speaker-mounted dual amplifiers. The speaker relay is energized by a fused 12 volt output from the radio receiver whenever the radio is turned on. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - RADIO CHOKE RELAY

The filter, choke and speaker relay is used to switch power to the individual speaker amplifiers used with the Infinity premium speaker package. The choke and relay are serviced only as a unit. If all of the speakers are inoperative the filter, choke and speaker relay unit should be considered suspect. However, before replacement make the following checks of the filter, choke and speaker relay circuits. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.

(3) Disconnect the instrument panel wire harness connector from the filter, choke and speaker relay unit. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector for the filter, choke and speaker relay unit. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

(4) Probe the ground circuit cavity of the instrument panel wire harness connector for the filter, choke and speaker relay unit. Check for continuity to a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open ground circuit to ground as required.

(5) Turn the ignition switch to the On position and turn the radio on. Check for battery voltage at the radio 12-volt output circuit cavity of the instrument panel wire harness connector for the filter, choke and speaker relay unit. If OK, go to Step 6. If not OK,

repair the open radio 12-volt output circuit to the radio as required.

(6) Turn the radio and ignition switches to the Off position. Reconnect the instrument panel wire harness connector to the filter, choke and speaker relay unit. Check for battery voltage at the amplified speaker (+) circuit cavity of the instrument panel wire harness connector for the filter, choke and speaker relay unit. There should be zero volts. Turn the ignition and radio switches to the On position. There should now be battery voltage. If OK, repair the open amplified speaker (+) circuits to the speaker-mounted amplifiers as required. If not OK, replace the faulty filter, choke and speaker relay unit.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the driver side of the instrument panel near the 16-way data link connector and inboard of the ash receiver to access the filter, choke, and speaker relay (Fig. 6) .

80b171b1

Fig. 6 Filter, Choke, and Speaker Relay Remove/Install

- 1 - ASH RECEIVER HOUSING
- 2 - DATA LINK CONNECTOR
- 3 - CENTER BRACE
- 4 - SCREW
- 5 - CHOKE AND RELAY
- 6 - WIRE HARNESS CONNECTORS

(3) Disconnect the instrument panel wire harness connector from the filter, choke and speaker relay wire harness connector.

RADIO CHOKE RELAY (Continued)

(4) Remove the two screws that secure the filter, choke, and speaker relay mounting bracket to the instrument panel center brace.

(5) Remove the filter, choke, and speaker relay unit from under the instrument panel.

INSTALLATION

(1) Position the filter, choke, and speaker relay unit under the instrument panel.

(2) Install and tighten the two screws that secure the filter, choke, and speaker relay mounting bracket to the instrument panel center brace. Tighten the screws to 2.7 N·m (24 in. lbs.).

(3) Reconnect the instrument panel wire harness connector to the filter, choke and speaker relay wire harness connector.

(4) Reconnect the battery negative cable.

INSTRUMENT PANEL ANTENNA CABLE

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the passenger side of the instrument panel near the right cowl side inner panel to disengage the coaxial cable connector from the retainer clip located on the bottom of the heater-A/C housing.

(3) Remove the foam tape to access the coaxial cable connector. Disconnect the connector by pulling it apart while twisting the metal connector halves. Do not pull on the cable.

(4) Securely tie a suitable length of cord or twine to the instrument panel half of the antenna coaxial cable connector. This cord will be used to pull or "fish" the cable back into position.

(5) Roll down the glove box from the instrument panel. Refer to Body, Instrument Panel for the procedures.

(6) Reach through the glove box opening to disengage the antenna cable from the retainer clips on the back of the instrument panel (Fig. 7).

(7) Remove the radio receiver from the instrument panel. Refer to Audio, Radio for the procedures.

(8) Pull the antenna cable out through the radio receiver opening in the instrument panel.

(9) Untie the cord or twine from the instrument panel antenna cable connector, leaving the cord or twine in place of the cable in the instrument panel.

(10) Remove the antenna cable from the instrument panel.

Fig. 7 ANTENNA CABLE ROUTING

1 - RETAINER CLIPS

2 - TO RADIO

3 - TO ANTENNA

INSTALLATION

(1) Tie the end of the cord or twine that was used during instrument panel antenna cable removal securely to the connector on the end of the antenna cable being installed into the instrument panel. This cord will be used to pull or "fish" the cable back into position.

(2) Using the cord or twine, pull the antenna cable through the radio receiver opening from under the instrument panel.

(3) Install the radio receiver onto the instrument panel. Refer to Audio, Radio for the procedures.

(4) Reach through the glove box opening to engage the antenna cable with the retainer clips on the back of the instrument panel.

(5) Install the glove box onto the instrument panel. Refer to Body, Instrument Panel for the procedures.

(6) Untie the cord or twine from the instrument panel antenna cable connector.

(7) Reach under the passenger side of the instrument panel near the right cowl side inner panel to reconnect the two halves of the radio antenna coaxial cable connector. Wrap the connection with a piece of foam tape.

(8) Engage the coaxial cable connector with the retainer clip located on the bottom of the heater-A/C housing.

(9) Reconnect the battery negative cable.

RADIO

DESCRIPTION

Available factory-installed radio receivers for this model include an AM/FM/cassette (RAS sales code), an AM/FM/CD/3-band graphic equalizer (RBR sales code), or an AM/FM/CD/cassette/3-band graphic equalizer (RAZ sales code). The factory-installed RAZ sales code radio receivers can also communicate on the Chrysler Collision Detection (CCD) data bus network through a separate two-way wire harness connector. All factory-installed receivers are stereo Electronically Tuned Radios (ETR) and include an electronic digital clock function.

These radio receivers can only be serviced by an authorized radio repair station. See the latest Warranty Policies and Procedures manual for a current listing of authorized radio repair stations.

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is removed when the vehicle is shipped from the factory. This fuse feeds various accessories that require battery current when the ignition switch is in the Off position, including the clock. The IOD fuse is removed to prevent battery discharge during vehicle storage.

When removing or installing the IOD fuse, it is important that the ignition switch be in the Off position. Failure to place the ignition switch in the Off position can cause the radio display to become scrambled when the IOD fuse is removed and replaced. Removing and replacing the IOD fuse again, with the ignition switch in the Off position, will correct the scrambled display condition.

The IOD fuse should be checked if the radio or clock displays are inoperative. The IOD fuse is located in the junction block. Refer to the fuse layout label on the back of the instrument panel fuse access panel for IOD fuse identification and location.

OPERATION

The radio receiver operates on fused battery current that is available only when the ignition switch is in the On or Accessory positions. The electronic digital clock function of the radio operates on fused battery current supplied through the IOD fuse, regardless of the ignition switch position.

For more information on the features, setting procedures, and control functions for each of the available factory-installed radio receivers, see the owner's manual in the vehicle glove box. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - RADIO

If the vehicle is equipped with the optional remote radio switches located on the steering wheel and the problem being diagnosed is related to one of the symptoms listed below, be certain to check the remote radio switches and circuits. Refer to Audio, Remote Radio Switch prior to attempting radio diagnosis or repair.

- Stations changing with no remote radio switch input
- Radio memory presets not working properly
- Volume changes with no remote radio switch input
- Remote radio switch buttons taking on other functions
- CD player skipping tracks
- Remote radio switch inoperative.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: The speaker output of the radio receiver is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio receiver may result.

- (1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
- (2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the Power Distribution Center (PDC) as required.
- (3) Check the fused ignition switch output (acc/run) fuse in the junction block. If OK, go to Step 4. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).
- (4) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) fuse in the junction block. If OK, go to Step 5. If not OK, repair the open fused ignition

RADIO (Continued)

switch output (acc/run) circuit to the ignition switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the radio receiver from the instrument panel, but do not disconnect the wire harness connectors. Check for continuity between the radio receiver chassis and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) circuit cavity of the left (gray) radio wire harness connector. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (acc/run) circuit to the junction block fuse as required.

(7) Turn the ignition switch to the Off position. Check for battery voltage at the fused B(+) circuit cavity of the left (gray) radio wire harness connector. If OK, replace the faulty radio receiver. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel.

(3) Remove the two screws that secure the radio receiver to the instrument panel (Fig. 8).

(4) Pull the radio receiver out from the instrument panel far enough to access the instrument panel wire harness connectors and the antenna coaxial cable connector (Fig. 9).

(5) Disconnect the instrument panel wire harness connectors and the antenna coaxial cable connector from the receptacles on the rear of the radio receiver.

(6) If so equipped, remove the screw that secures the ground wire to the back of the radio receiver chassis.

(7) Remove the radio receiver from the instrument panel.

INSTALLATION

(1) Position the radio receiver to the instrument panel.

(2) If so equipped, install and tighten the screw that secures the ground wire to the back of the radio receiver chassis. Tighten the screw to 7 N·m (65 in. lbs.).

(3) Reconnect the instrument panel wire harness connectors and the antenna coaxial cable connector to the receptacles on the rear of the radio receiver.

(4) Position the radio receiver into the mounting hole in the instrument panel.

(5) Install and tighten the two screws that secure the radio receiver to the instrument panel. Tighten the screws to 5 N·m (45 in. lbs.).

(6) Install the cluster bezel onto the instrument panel.

(7) Reconnect the battery negative cable.

RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

Radio Frequency Interference (RFI) and Electro-Magnetic Interference (EMI) noise suppression is accomplished primarily through circuitry internal to the radio receivers. These internal suppression devices are only serviced as part of the radio receiver.

External suppression devices that are used on this vehicle to control RFI or EMI noise include the following:

- Radio antenna base ground
- Radio receiver chassis ground wire or strap
- Engine-to-body ground straps
- Cab-to-bed ground strap
- Heater core ground strap
- Resistor-type spark plugs
- Radio suppression-type secondary ignition wiring.

For more information on the spark plugs and secondary ignition components, refer to Electrical, Ignition Control.

DIAGNOSIS AND TESTING - RADIO NOISE SUPPRESSION COMPONENTS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. Inspect the ground paths and connections at the following locations:

- Blower motor
- Cab-to-bed ground strap
- Electric fuel pump
- Engine-to-body ground straps
- Generator
- Ignition module
- Heater core ground strap
- Radio antenna base ground
- Radio receiver chassis ground wire or strap
- Wiper motor.

If the source of RFI or EMI noise is identified as a component on the vehicle (i.e., generator, blower motor, etc.), the ground path for that component should be checked. If excessive resistance is found in any ground circuit, clean, tighten, or repair the ground circuits or connections to ground as required before considering any component replacement.

For service and inspection of secondary ignition components, refer to Electrical, Ignition Control. Inspect the following secondary ignition system components:

- Distributor cap and rotor
- Ignition coil
- Spark plugs
- Spark plug wire routing and condition.

Reroute the spark plug wires or replace the faulty components as required.

If the source of the RFI or EMI noise is identified as two-way mobile radio or telephone equipment, check the equipment installation for the following:

- Power connections should be made directly to the battery, and fused as closely to the battery as possible.
- The antenna should be mounted on the roof or toward the rear of the vehicle. Remember that magnetic antenna mounts on the roof panel can adversely affect the operation of an overhead console compass, if the vehicle is so equipped.
- The antenna cable should be fully shielded coaxial cable, should be as short as is practical, and should be routed away from the factory-installed vehicle wire harnesses whenever possible.
- The antenna and cable must be carefully matched to ensure a low Standing Wave Ratio (SWR).

Fleet vehicles are available with an extra-cost RFI-suppressed Powertrain Control Module (PCM). This unit reduces interference generated by the PCM on some radio frequencies used in two-way radio communications. However, this unit will not resolve complaints of RFI in the commercial AM or FM radio frequency ranges.

ENGINE-TO-BODY GROUND STRAP

REMOVAL

(1) Remove the screw that secures the engine-to-body ground strap eyelet to the dash panel (Fig. 10).

(2) Remove the screw that secures the engine-to-body ground strap eyelet to the back of the engine cylinder head (Fig. 11) or (Fig. 12).

ENGINE-TO-BODY GROUND STRAP (Continued)

5 - SCREW

(3) For the right side only on vehicles equipped with a 3.9L, 5.2L or 5.9L engine, remove the nut that secures the engine-to-body ground strap eyelet to the right rear valve cover stud.

(4) Remove the engine-to-body ground strap from the engine compartment.

INSTALLATION

(1) Position the engine-to-body ground strap to the back of the engine cylinder head.

(2) Install and tighten the screw that secures the engine-to-body ground strap eyelet to the back of the engine cylinder head. Tighten the screw to 10.6 N·m (95 in. lbs.).

(3) For the right side only on vehicles equipped with a 3.9L, 5.2L or 5.9L engine, position the engine-to-body ground strap eyelet over the right rear valve cover stud.

(4) For the right side only on vehicles equipped with a 3.9L, 5.2L or 5.9L engine, install and tighten the nut that secures the engine-to-body ground strap eyelet to the right rear valve cover stud. Tighten the nut to 3.9 N·m (35 in. lbs.).

(5) Position the engine-to-body ground strap to the dash panel.

(6) Install and tighten the screw that secures the engine-to-body ground strap eyelet to the dash panel. Tighten the screw to 3.9 N·m (35 in. lbs.).

CAB-TO-BED GROUND STRAP**REMOVAL**

(1) Raise and support the vehicle.

(2) Remove the screw that secures the cab-to-bed ground strap eyelet to the front crossmember of the cargo bed (Fig. 13).

(3) Remove the screw that secures the cab-to-bed ground strap eyelet to the cab floor panel.

(4) Remove the cab-to-bed ground strap from the vehicle.

CAB-TO-BED GROUND STRAP (Continued)

**Fig. 13 Cab-To-Bed Ground Strap Remove/Install**

- 1 - BED CROSSMEMBER
- 2 - GROUND STRAP
- 3 - CAB FLOOR PANEL
- 4 - SCREWS

INSTALLATION

- (1) Position the cab-to-bed ground strap to the cab floor panel.
- (2) Install and tighten the screw that secures the cab-to-bed ground strap eyelet to the cab floor panel. Tighten the screw to 3.9 N·m (35 in. lbs.).
- (3) Position the cab-to-bed ground strap to the front crossmember of the cargo bed.
- (4) Install and tighten the screw that secures the cab-to-bed ground strap eyelet to the front crossmember of the cargo bed. Tighten the screw to 3.9 N·m (35 in. lbs.).
- (5) Lower the vehicle.

HEATER CORE GROUND STRAP**REMOVAL**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the glove box from the instrument panel. Refer to Body, Instrument Panel for the procedures.
- (3) Reach through the instrument panel glove box opening to access and remove the nut that secures the heater core ground strap eyelet to the stud on the dash panel (Fig. 14).
- (4) Remove the heater core ground strap eyelet from the stud on the dash panel.

**Fig. 14 Heater Core Ground Strap Remove/Install**

- 1 - GROUND STRAP
- 2 - NUT
- 3 - HEATER-A/C HOUSING
- 4 - DASH PANEL

- (5) Remove the screw that secures the heater core ground strap eyelet and the heater core tube retaining strap to the top of the heater-A/C housing.
- (6) Remove the heater core ground strap from the top of the heater-A/C housing.

INSTALLATION

- (1) Position the heater core ground strap and the heater core tube retaining strap to the top of the heater-A/C housing.
- (2) Install and tighten the screw that secures the heater core ground strap eyelet and the heater core tube retaining strap to the top of the heater-A/C housing. Tighten the screw to 2.2 N·m (20 in. lbs.).
- (3) Position the heater core ground strap eyelet over the stud on the dash panel.
- (4) Install and tighten the nut that secures the heater core ground strap eyelet to the stud on the dash panel. Tighten the nut to 3.9 N·m (35 in. lbs.).
- (5) Install the glove box onto the instrument panel. Refer to Body, Instrument Panel for the procedures.
- (6) Reconnect the battery negative cable.

REMOTE SWITCHES**DESCRIPTION**

A remote radio switch option is available on models equipped with the AM/FM/CD/cassette/3-band graphic equalizer (RAZ sales code) radio receiver and the high-line Central Timer Module (CTM). Refer to

REMOTE SWITCHES (Continued)

Electrical, Body Control/Central Timer Module for more information on this component.

Two rocker-type switches (Fig. 15) are mounted in the sides of the rear (instrument panel side) steering wheel trim cover. The switch on the left side is the seek switch and has seek up, seek down, and preset station advance functions. The switch on the right side is the volume control switch and has volume up, and volume down functions. The two switches are retained in mounting holes located on each side of the rear steering wheel trim cover by four latches that are integral to the switches.

80b0d6f0

Fig. 15 Remote Radio Switches

- 1 - PRESET SEEK
- 2 - UP
- 3 - SEEK
- 4 - VOLUME
- 5 - DOWN

The remote radio switches share a common steering wheel wire harness with the vehicle speed control switches. The steering wheel wire harness is connected to the instrument panel wire harness through the clockspring. Refer to Electrical, Clockspring for more information on this component.

OPERATION

The remote radio switches are resistor multiplexed units that are hard wired to the high-line or premium CTM through the clockspring. The CTM monitors the status of the remote radio switches and sends the proper switch status messages on the Chrysler Collision Detection (CCD) data bus network to the radio receiver. The electronic circuitry within the radio is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested.

For diagnosis of the CTM or the CCD data bus, the use of a DRBIII® scan tool and the proper Diagnostic

Procedures manual are recommended. For more information on the features and control functions for each of the remote radio switches, see the owner's manual in the vehicle glove box. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - REMOTE SWITCHES

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the remote radio switch(es) (Fig. 16) from the steering wheel.

80b0d6f1

Fig. 16 Remote Radio Switches

- 1 - WHITE REAR SWITCH
- 2 - BLACK REAR SWITCH

REMOTE SWITCHES (Continued)

(2) Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch Test chart. If the remote radio switch resistances check OK, go to Step 3. If not OK, replace the faulty switch.

REMOTE RADIO SWITCH TEST		
SWITCH	SWITCH POSITION	RESISTANCE
Right (White)	Volume Up	7320 Ohms
Right (White)	Volume Down	1210 Ohms
Left (Black)	Seek Up	4530 Ohms
Left (Black)	Seek Down	2050 Ohms
Left (Black)	Pre-Set Station Advance	10 Ohms

(3) Check for continuity between the ground circuit cavity of the remote radio switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 4. If not OK, repair the open ground circuit to ground as required.

(4) Disconnect the 18-way wire harness connector from the Central Timer Module (CTM). Check for continuity between the radio control mux circuit cavity of the remote radio switch wire harness connector and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted radio control mux circuit as required.

(5) Check for continuity between the radio control mux circuit cavities of the remote radio switch wire harness connector and the 18-way CTM wire harness connector. There should be continuity. If OK, refer to the proper Diagnostic Procedures manual to test the CTM and the Chrysler Collision Detection (CCD) data bus. If not OK, repair the open radio control mux circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the driver side airbag module from the steering wheel. Refer to Electrical, Restraints for the procedures.

(3) Remove the speed control switch located on the same side of the steering wheel as the remote radio switch that is being serviced. Refer to Electrical, Speed Control for the procedures.

(4) Disconnect the steering wheel wire harness connector from the connector receptacle of the remote radio switch (Fig. 17).

80b9a4f0

Fig. 17 Remote Radio Switches Remove/Install

- 1 - STEERING WHEEL
- 2 - REMOTE RADIO SWITCH
- 3 - SPEED CONTROL SWITCH
- 4 - SCREW (2)
- 5 - DRIVER SIDE AIRBAG MODULE
- 6 - SPEED CONTROL SWITCH
- 7 - REAR TRIM COVER
- 8 - SCREW (2)

(5) Disengage the four remote radio switch latches that secure the switch to the inside of the mounting hole in the steering wheel rear trim cover.

(6) From the outside of the steering wheel rear trim cover, remove the remote radio switch from the trim cover mounting hole.

INSTALLATION

(1) Position the remote radio switch to the mounting hole on the outside of the steering wheel rear trim cover. Be certain that the connector receptacle is oriented toward the bottom of the switch and pointed toward the center of the steering wheel.

(2) Press firmly and evenly on the remote radio switch until each of the switch latches is fully engaged in the mounting hole of the steering wheel rear trim cover.

(3) Reconnect the steering wheel wire harness connector to the connector receptacle of the remote radio switch.

(4) Install the speed control switch onto the steering wheel. Refer to Electrical, Speed Control for the procedures.

REMOTE SWITCHES (Continued)

(5) Install the driver side airbag module onto the steering wheel. Refer to Electrical, Restraints for the procedures.

(6) Reconnect the battery negative cable.

SPEAKER

DESCRIPTION

STANDARD

The standard equipment speaker system includes speakers in four locations. One full-range 15.2 by 22.9 centimeter (6.0 by 9.0 inch) speaker is located in each front door. There is also one full-range 13.3 centimeter (5.25 inch) diameter speaker located in each rear cab side panel for the standard cab and the club cab models, or in each rear door of the quad cab models.

PREMIUM

The optional premium speaker system features Infinity model speakers in six locations. Each of the standard front door speakers are replaced with Infinity model speakers that include integral dual 30 watt amplifiers. Each of the standard rear speakers is also replaced by an Infinity model speaker. The premium speaker system also includes an additional Infinity tweeter mounted in the A-pillar garnish molding. The total available power of the premium speaker system is about 120 watts.

OPERATION

STANDARD

Each of the four full-range speakers used in the standard speaker system is driven by the amplifier that is integral to the factory-installed radio receiver. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PREMIUM

The Infinity speakers used in the premium speaker system are driven by dual amplifiers that are integral to each of the front door speakers. One of these dual amplifiers drives the front door speaker and the A-pillar mounted tweeter for that side of the vehicle, while the other amplifier drives the rear speaker for that side of the vehicle. For complete circuit diagrams, to refer to the appropriate wiring information. The wiring information includes wiring diagrams,

proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - SPEAKER

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: The speaker output of the radio receiver is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio receiver may result.

(1) Turn the ignition switch to the On position. Turn the radio receiver on. Adjust the balance and fader controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. If only an Infinity A-pillar or an Infinity rear speaker is inoperative, go to Step 8. If any other speaker is inoperative, go to Step 2.

NOTE: If the vehicle is equipped with the Infinity premium speaker package and all of the speakers are inoperative, refer to Filter, Choke, and Speaker Relay in the Diagnosis and Testing section of this group.

(2) Turn the radio receiver off. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the radio receiver from the instrument panel. Check both the feed (+) circuit and return (-) circuit cavities for the inoperative speaker location(s) in the radio receiver wire harness connectors for continuity to ground. In each case, there should be no continuity. If OK, go to Step 3. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.

(3) If the inoperative speaker is an Infinity-amplified speaker, go to Step 5. If the vehicle is equipped with the standard speaker system, check the resistance between the speaker feed (+) circuit and return

SPEAKER (Continued)

(-) circuit cavities of the radio receiver wire harness connectors for the inoperative speaker location(s). The meter should read between 2.5 and 4 ohms (speaker resistance). If OK, go to Step 4. If not OK, go to Step 5.

(4) Install a known good radio receiver. Connect the battery negative cable. Turn the ignition switch to the On position. Turn on the radio receiver and test the speaker operation. If OK, replace the faulty radio receiver. If not OK, turn the radio receiver off, turn the ignition switch to the Off position, disconnect and isolate the battery negative cable, remove the test radio receiver, and go to Step 5.

(5) Disconnect the wire harness connector at the inoperative standard speaker system speaker or at the Infinity-amplified front door-mounted speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector for the inoperative speaker location. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector for the inoperative speaker location. In each case, there should be continuity. If OK with an Infinity-amplified front door-mounted speaker, go to Step 6. If OK with the standard speaker system, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

(6) Check for continuity between the ground circuit cavity in the body half of the wire harness connector for the Infinity-amplified front door-mounted speaker on the same side of the vehicle as the inoperative speaker and a good ground. There should be continuity. If OK, go to Step 7. If not OK, repair the open ground circuit to ground as required.

(7) Install the radio receiver. Connect the battery negative cable. Turn the ignition switch to the On position. Turn the radio receiver on. Check for battery voltage at the radio choke output circuit cavity of the wire harness connector for the Infinity-amplified front door-mounted speaker on the same side of the vehicle as the inoperative speaker. If OK, go to Step 8. If not OK, repair the open radio choke output circuit to the filter, choke, and speaker relay as required.

(8) Turn the radio receiver off. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the wire harness connector for the Infinity-amplified front door-mounted speaker on the same side of the vehicle as the inoperative speaker. Check both the amplified feed (+) circuit and amplified return (-) circuit cavities for the inoperative speaker location in the body half of the front door speaker wire harness connector for continuity to ground. In each case, there should

be no continuity. If OK, go to Step 9. If not OK, repair the shorted amplified feed (+) and/or amplified return (-) circuit(s) as required.

(9) Disconnect the wire harness connector at the inoperative speaker. Check for continuity between the amplified feed (+) circuit cavities in the body half of the wire harness connector for the Infinity-amplified front door-mounted speaker on the same side of the vehicle as the inoperative speaker and the inoperative speaker wire harness connector. Repeat the check between the amplified return (-) circuit cavities in the body half of the wire harness connector for the Infinity-amplified front door-mounted speaker on the same side of the vehicle as the inoperative speaker and the inoperative speaker wire harness connector. In each case, there should be continuity. If OK, go to Step 10. If not OK, repair the open amplified feed (+) and/or amplified return (-) circuit(s) as required.

(10) Check the resistance between the amplified feed (+) circuit and amplified return (-) circuit cavities for the inoperative speaker in the body half of the wire harness connector for the Infinity-amplified front door-mounted speaker on the same side of the vehicle as the inoperative speaker. The meter should read between 2.5 and 4 ohms (speaker resistance). If OK, replace the faulty front door-mounted Infinity speaker and amplifier unit. If not OK, replace the faulty A-pillar or rear-mounted Infinity speaker.

A-PILLAR TWEETER SPEAKER

REMOVAL

The A-pillar-mounted tweeters are used only with the optional Infinity premium speaker package.

(1) Disconnect and isolate the battery negative cable.

(2) If the vehicle is so equipped, remove the grab handle from the A-pillar. Refer to Body, Interior for the procedures.

(3) Disengage the trim from the A-pillar. Refer to Body, Interior for the procedures.

(4) Pull the trim away from the A-pillar far enough to access the tweeter wire harness connector (Fig. 18).

(5) Disconnect the body wire harness connector from the A-pillar tweeter wire harness connector.

(6) Remove the trim and tweeter from the A-pillar as a unit.

(7) Disengage the tweeter wire harness retainers from the heat stakes on the back of the A-pillar trim.

(8) Disengage the tweeter from the A-pillar trim by pushing out on the tweeter firmly and evenly from the inside of the trim until it unsnaps from the mounting hole.

A-PILLAR TWEETER SPEAKER (Continued)

80b1b308

Fig. 18 A-Pillar Tweeter Remove/Install

- 1 - NUT
- 2 - WIRE HARNESS CONNECTOR
- 3 - MOULDING
- 4 - HANDLE
- 5 - PLUG
- 6 - SCREW
- 7 - TWEETER

(9) Remove the tweeter from the mounting hole in the A-pillar trim.

INSTALLATION

(1) Position the tweeter into the mounting hole in the A-pillar trim.

(2) Install the tweeter onto the A-pillar trim by pushing in on the tweeter firmly and evenly from the outside of the trim until it snaps into the mounting hole.

(3) Use a suitable tape or adhesive to secure the tweeter wire harness to the inside of the A-pillar trim.

(4) Position the trim and tweeter to the A-pillar as a unit.

(5) Reconnect the body wire harness connector to the A-pillar tweeter wire harness connector.

(6) Engage the trim onto the A-pillar. Refer to Body, Interior for the procedures.

(7) If the vehicle is so equipped, install the grab handle onto the A-pillar. Refer to Body, Interior for the procedures.

(8) Reconnect the battery negative cable.

FRONT DOOR SPEAKER**REMOVAL**

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim panel from the front door. Refer to Body, Door Front for the procedures.

(3) Remove the four screws that secure the speaker to the front door inner panel (Fig. 19).

80b171b5

Fig. 19 Front Door Speaker Remove/Install

- 1 - CLIP
- 2 - FRONT DOOR INNER PANEL
- 3 - WIRE HARNESS CONNECTOR
- 4 - SCREW
- 5 - SPEAKER

(4) Pull the speaker away from the mounting hole in the front door inner panel far enough to access the speaker wire harness connector.

(5) Disconnect the speaker wire harness connector from the front door wire harness connector.

(6) Remove the speaker from the front door inner panel.

INSTALLATION

(1) Position the speaker to the front door inner panel.

(2) Reconnect the speaker wire harness connector to the front door wire harness connector.

(3) Position the speaker into the mounting hole in the front door inner panel.

FRONT DOOR SPEAKER (Continued)

(4) Install and tighten the four screws that secure the speaker to the front door inner panel. Tighten the screws to 4 N·m (35 in. lbs.).

(5) Install the trim panel onto the front door. Refer to Body, Door Front for the procedures.

(6) Reconnect the battery negative cable.

REAR CAB SIDE PANEL SPEAKER

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim from the rear cab side panel. Refer to Body, Interior for the procedures.

(3) Remove the two screws that secure the speaker to the cab side inner panel (Fig. 20) or (Fig. 21).

80b171b7

Fig. 20 Rear Speaker Remove/Install - Standard Cab

- 1 - CLIP
- 2 - SPEAKER
- 3 - SCREW

(4) Pull the speaker away from the mounting hole in the cab side inner panel far enough to access the body wire harness connector.

(5) Disconnect the body wire harness connector from the speaker connector receptacle.

(6) Remove the speaker from the cab side inner panel.

INSTALLATION

(1) Position the speaker to the cab side inner panel.

(2) Reconnect the body wire harness connector to the speaker connector receptacle.

80b171b6

Fig. 21 Rear Speaker Remove/Install - Club Cab

- 1 - WIRE HARNESS CONNECTOR
- 2 - CAB SIDE INNER PANEL
- 3 - SPEAKER
- 4 - SCREW
- 5 - CLIP

(3) Position the speaker into the mounting hole in the cab side inner panel.

(4) Install and tighten the two screws that secure the speaker to the cab side inner panel. Tighten the screws to 4 N·m (35 in. lbs.).

(5) Install the trim onto the rear cab side panel. Refer to Body, Interior for the procedures.

(6) Reconnect the battery negative cable.

REAR DOOR SPEAKER

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim panel from the rear door.

(3) Remove the two screws that secure the speaker to the rear door inner panel (Fig. 22).

(4) Pull the speaker away from the mounting hole in the rear door inner panel far enough to access the door wire harness connector.

(5) Disconnect the door wire harness connector from the speaker connector receptacle.

(6) Remove the speaker from the rear door inner panel.

REAR DOOR SPEAKER (Continued)

Fig. 22 Rear Door Speaker Remove/Install - Quad Cab

- 1 - REAR DOOR INNER PANEL
- 2 - WIRE HARNESS CONNECTOR

INSTALLATION

(1) Position the speaker to the rear door inner panel.

(2) Reconnect the door wire harness connector to the speaker connector receptacle.

(3) Position the speaker into the mounting hole in the rear door inner panel.

(4) Install and tighten the two screws that secure the speaker to the rear door inner panel. Tighten the screws to 4 N·m (35 in. lbs.).

(5) Install the trim panel onto the rear door.

(6) Reconnect the battery negative cable.

CHIME/BUZZER

TABLE OF CONTENTS

	page		page
CHIME WARNING SYSTEM		DIAGNOSIS AND TESTING - CHIME	
DESCRIPTION	1	WARNING SYSTEM	2
OPERATION	1		

CHIME WARNING SYSTEM

DESCRIPTION

A chime warning system is standard factory-installed equipment on this model. The chime warning system uses a single chime tone generator that is integral to the Central Timer Module (CTM) to provide an audible indication of various vehicle conditions that may require the attention of the vehicle operator. The chime warning system includes the following major components, which are described in further detail elsewhere in this service manual:

- **Central Timer Module** - The Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. The CTM contains an integral chime tone generator to provide all of the proper chime warning system features based upon the monitored inputs.
- **Door Ajar Switch** - A door ajar switch is integral to the driver side front door latch. This switch provides an input to the chime warning system indicating whether the driver side front door is open or closed.
- **Headlamp Switch** - The headlamp switch is located on the instrument panel outboard of the steering column. The headlamp switch provides an input to the chime warning system indicating when the exterior lamps are turned On or Off.
- **Ignition Switch** - A key-in ignition switch is integral to the ignition switch. The key-in ignition switch provides an input to the chime warning system indicating whether a key is present in the ignition lock cylinder.
- **Seat Belt Switch** - A seat belt switch is integral to the driver side front seat belt buckle unit. The seat belt switch provides an input to the chime warning system indicating whether the driver side front seat belt is fastened.

Hard wired circuitry connects many of the chime warning system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by

many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the chime warning system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The CTM chime warning system circuitry and the integral chime tone generator cannot be adjusted or repaired. If the CTM or the chime tone generator are damaged or faulty, the CTM unit must be replaced.

OPERATION

The chime warning system is designed to provide an audible output as an indication of various conditions that may require the attention or awareness of the vehicle operator. The chime warning system components operate on battery current received through a fused B(+) fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator under the following conditions:

- **Fasten Seat Belt Warning** - The Central Timer Module (CTM) chime tone generator will generate repetitive chime tones at a slow rate to announce that a hard wired input from the seat belt switch to the Electro-Mechanical Instrument Cluster (EMIC) indicates that the driver side front seat belt is not fastened with the ignition switch in the On position. Unless the driver side front seat belt is fastened, the chimes will continue to sound for a duration of about seven seconds each time the ignition switch is turned to the On position or until the driver side front seat belt is fastened, whichever occurs first. This chime tone is based upon a hard wired chime request input to the CTM from the EMIC, but is not related to the operation of the EMIC "Seatbelt" indicator.

CHIME WARNING SYSTEM (Continued)

- **Head/Park Lights-On Warning** - The CTM chime tone generator will generate repetitive chime tones at a fast rate to announce that hard wired inputs from the driver door ajar switch, headlamp switch, and ignition switch indicate that the exterior lamps are turned On with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.

- **Key-In-Ignition Warning** - The CTM chime tone generator will generate repetitive chime tones at a fast rate to announce that hard wired inputs from the driver door ajar switch, headlamp switch, and ignition switch indicate that the key is in the ignition lock cylinder with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.

- **Warning Chime Support** - The CTM chime tone generator will generate repetitive chime tones at a slow rate to announce that a hard wired chime request input has been received from the EMIC. These chime tones provide an audible alert to the vehicle operator that supplements certain visual indications displayed by the EMIC. Supplemented indications include the following:

- The “Airbag” indicator is illuminated. The chimes will continue to sound for a duration of about four seconds each time the indicator is illuminated or until the ignition switch is turned to the Off position, whichever occurs first.

- The “Check Gages” indicator is illuminated. The chimes will continue to sound for a duration of about two seconds each time the indicator is illuminated or until the ignition switch is turned to the Off position, whichever occurs first.

- The “Low Fuel” indicator is illuminated. The chimes will continue to sound for a duration of about two seconds each time the indicator is illuminated or until the ignition switch is turned to the Off position, whichever occurs first.

- The “Low Wash” indicator is illuminated. The chimes will continue to sound for a duration of about two seconds each time the indicator is illuminated or until the ignition switch is turned to the Off position, whichever occurs first.

- The “Trans Temp” indicator is illuminated (automatic transmission only). The chimes will continue to sound for a duration of about two seconds each time the indicator is illuminated or until the ignition switch is turned to the Off position, whichever occurs first.

- The vehicle is over a programmed speed value (Middle East Gulf Coast Country (GCC) only). The CTM chime tone generator will generate repetitive chime tones at a slow rate to announce that the vehicle speed exceeds a programmed value. The chimes will continue to sound until the vehicle speed is below the programmed value.

- The “Water-In-Fuel” indicator is illuminated (diesel engine only). The chimes will continue to sound for a duration of about two seconds each time the indicator is illuminated or until the ignition switch is turned to the Off position, whichever occurs first.

The CTM provides chime service for all available features in the chime warning system. The CTM relies upon hard wired inputs from the driver door ajar switch, the EMIC, the headlamp switch, and the key-in ignition switch (ignition switch) to provide chime service for all of the chime warning system features. Upon receiving the proper inputs, the CTM activates the integral chime tone generator to provide the audible chime tone to the vehicle operator. The chime tone generator in the CTM is capable of producing repeated chime tones at two different rates, slow or fast. The slow chime rate is about fifty chime tones per minute, while the fast chime rate is about 180 chime tones per minute. The internal programming of the CTM and the EMIC determines the priority of each chime tone request input that is received, as well as the rate and duration of each chime tone that is to be generated.

The hard wired chime warning system inputs to the CTM and the EMIC, as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures. See the owner's manual in the vehicle glove box for more information on the features provided by the chime warning system.

DIAGNOSIS AND TESTING - CHIME WARNING SYSTEM

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. The hard wired chime warning system inputs to the Central Timer Module (CTM) and the Electro-Mechanical Instrument Cluster (EMIC), as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures.

CHIME WARNING SYSTEM (Continued)

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYS-

TEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CHIME WARNING SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
SEAT BELT WARNING CHIME WITH SEAT BELT BUCKLED	1. Seat belt switch sense circuit shorted. 2. Faulty seat belt switch.	1. Disconnect the body wire harness connector for the seat belt switch and the instrument panel wire harness connector (Connector C2) for the EMIC. Check for continuity between the seat belt switch sense circuit cavity and a good ground. There should be no continuity. Repair the seat belt switch sense circuit, if required. 2. Check for continuity between the ground circuit cavity and the seat belt switch sense circuit cavity of the seat belt switch connector receptacle. There should be no continuity with the seat belt buckled. Replace the faulty seat belt, if required.
NO SEAT BELT WARNING CHIME WITH SEAT BELT UNBUCKLED, BUT OTHER CHIME FEATURES OK	1. Seat belt switch ground circuit open. 2. Seat belt switch sense circuit open. 3. Faulty seat belt switch.	1. Disconnect the body wire harness connector for the seat belt switch. Check for continuity between the ground circuit cavity of the connector for the seat belt switch and a good ground. There should be continuity. If not OK, repair the open ground circuit to ground as required. 2. With the body wire harness connector for the seat belt switch and the instrument panel wire harness connector (Connector C2) for the EMIC disconnected, there should be continuity between the seat belt switch sense circuit cavities of the two connectors. Repair the seat belt switch sense circuit, if required. 3. Check for continuity between the ground circuit cavity and the seat belt switch sense circuit cavity of the seat belt switch connector receptacle. There should be continuity with the seat belt unbuckled. Replace the faulty seat belt, if required.

CHIME WARNING SYSTEM (Continued)

CHIME WARNING SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
NO KEY-IN IGNITION WARNING CHIME, BUT OTHER CHIME FEATURES OK	1. Driver door ajar switch sense circuit open. 2. Key-in ignition switch sense circuit open. 3. Faulty ignition switch.	1. Check for continuity between the driver door ajar switch sense circuit cavities of the connector for the driver side front door ajar switch and the instrument panel wire harness connector (Connector C2) for the ignition switch. Repair the driver door ajar switch sense circuit, if required. 2. Check for continuity between the key-in ignition switch sense circuit cavities of the instrument panel wire harness connector (Connector C2) for the ignition switch and the instrument panel wire harness connector for the CTM. Repair the key-in ignition switch sense circuit, if required. 3. Check for continuity between the two terminals in the ignition switch C2 connector receptacle. There should be continuity with a key in the ignition lock cylinder. Replace the faulty ignition switch, if required.
NO HEADLAMPS-ON WARNING CHIME, BUT OTHER CHIME FEATURES OK	1. Driver door ajar switch sense circuit open. 2. Key-in ignition switch sense circuit open. 3. Faulty headlamp switch.	1. Check for continuity between the driver door ajar switch sense circuit cavities of the connector for the driver side front door ajar switch and the instrument panel wire harness connector (Connector C1) for the headlamp switch. Repair the driver door ajar switch sense circuit, if required. 2. Check for continuity between the key-in ignition switch sense circuit cavities of the instrument panel wire harness connector (Connector C1) for the headlamp switch and the instrument panel wire harness connector for the CTM. Repair the key-in ignition switch sense circuit, if required. 3. Check for continuity between the driver door ajar switch sense terminal and the key-in ignition switch sense terminal in the headlamp switch C1 connector receptacle. There should be continuity with the headlamp switch in the On position. Replace the faulty headlamp switch, if required.
CONTINUOUS CHIME WITH HEADLAMP SWITCH IN OFF POSITION AND KEY REMOVED FROM IGNITION LOCK CYLINDER	1. Key-in ignition switch sense circuit shorted. 2. Faulty CTM.	1. With the instrument panel wire harness connector (Connector C1) for the headlamp switch, the instrument panel wire harness connector (Connector C2) for the ignition switch, and the instrument panel wire harness connector for the CTM all disconnected, there should be no continuity between the key-in ignition switch sense circuit and a good ground. Repair the key-in ignition switch sense circuit, if required. 2. Replace the faulty CTM, if required.

CHIME WARNING SYSTEM (Continued)

CHIME WARNING SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
NO CHIMES AND OTHER CTM FEATURES ERRATIC OR DISABLED	1. CTM ground circuit(s) open. 2. CTM fused B(+) circuit open. 3. CTM fused ignition switch output (start-run) circuit open. 4. Faulty CTM.	1. Check for continuity between the ground circuit cavities of the instrument panel wire harness connector(s) for the CTM and a good ground. Repair the ground circuit(s), if required. 2. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector for the CTM. Repair the fused B(+) circuit, if required. 3. With the ignition switch in the On position, check for battery voltage at the fused ignition switch output circuit cavity of the instrument panel wire harness connector for the CTM. Repair the fused ignition switch output circuit, if required. 4. Replace the faulty CTM, if required.
NO WARNING CHIME SUPPORT FEATURES FOR EMIC, BUT HARD WIRED CHIMES OK	1. Tone request signal circuit open. 2. Tone request signal circuit shorted. 3. Faulty CTM. 4. Faulty EMIC.	1. Check for continuity between the tone request signal circuit cavities of the instrument panel wire harness connectors for the EMIC and the CTM. Repair the open tone request signal circuit, if required. 2. With the instrument panel wire harness connectors for the EMIC and the CTM both disconnected, there should be no continuity between the tone request signal circuit and a good ground. Repair the shorted tone request signal circuit, if required. 3. Replace the faulty CTM, if required. 4. Replace the faulty EMIC, if required.
NO CHIMES, BUT ALL OTHER CTM FEATURES OK	1. Faulty CTM.	1. Replace the faulty CTM, if required.

CENTRAL TIMER MODULE

DESCRIPTION

Three versions of the Central Timer Module (CTM) are available on this vehicle, a base version (Fig. 1), a high-line version (Fig. 2), and a premium version. Whichever version of the CTM the vehicle is equipped with, it is concealed under the driver side end of the instrument panel inboard of the instrument panel steering column opening, where it is secured to a stamped steel bracket that is integral to the instrument panel armature. The CTM is enclosed in a molded plastic housing with one (base) or two (high-line/premium) integral external connector receptacles that connect it to the vehicle electrical system through one (base) or two (high-line/premium) take outs with connectors from the instrument panel wire harness.

The base version of the CTM is used on base models of this vehicle. It is also sometimes referred to as the Integrated Electronic Module (IEM). The base version of the CTM combines the functions of a

chime module and an intermittent wipe module in a single unit. The high-line version of the CTM is used on high-line vehicles. The high-line CTM provides all of the functions of the base version of the CTM, but also is used to control and integrate many additional electronic functions and features included on high-line models. The premium version of the CTM is the same as the high-line version, but is used only on models equipped with the heated seat option.

The high-line and premium versions of the CTM utilize integrated circuitry and information carried on the Chrysler Collision Detection (CCD) data bus network along with many hard wired inputs to monitor many sensor and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the CTM allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the CCD data bus.

The features that the CTM supports or controls include the following:

- **Automatic Door Lock** - The high-line/premium CTM provides an optional automatic door lock feature (also known as rolling door locks). This is a programmable feature.

- **Central Locking** - The high-line/premium CTM provides an optional central locking/unlocking feature.

- **Chimes** - All versions of the CTM provide chime service through an integral chime tone generator.

- **Courtesy Lamps** - The high-line/premium CTM provides courtesy lamp control with timed load shedding.

- **Door Lock Inhibit** - The high-line/premium CTM provides a door lock inhibit feature.

- **Enhanced Accident Response** - The high-line/premium CTM provides an optional enhanced accident response feature. This is a programmable feature.

- **Heated Seats** - The premium CTM controls the optional heated seat system by controlling the operation of the heated seat relay.

- **Illuminated Entry** - The high-line/premium CTM provides a timed illuminated entry feature.

- **Intermittent Wipe Control** - All versions of the CTM provide control of the intermittent wipe delay, and wipe-after-wash features.

- **Panic Mode** - The high-line/premium CTM provides support for the optional RKE system panic mode features.

- **Power Lock Control** - The high-line/premium CTM provides the optional power lock system features, including support for the automatic door lock and door lock inhibit modes.

- **Programmable Features** - The high-line/premium CTM provides support for certain programmable features.

- **Remote Keyless Entry** - The high-line/premium CTM provides the optional Remote Keyless Entry (RKE) system features, including support for the RKE Lock (with optional horn chirp), Unlock, Panic, and illuminated entry modes, as well as the ability to be programmed to recognize up to four RKE transmitters. The RKE horn chirp is a programmable feature.

- **Remote Radio Switch Interface** - The high-line/premium CTM monitors and transmits the status of the optional remote radio switches.

- **Speed Sensitive Intermittent Wipe Control** - The high-line/premium CTM provides the speed sensitive intermittent wipe feature.

- **Vehicle Theft Alarm** - The high-line/premium CTM provides control of the optional Vehicle Theft Alarm features, including support for the central locking/unlocking mode.

Hard wired circuitry connects the CTM to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the

CENTRAL TIMER MODULE (Continued)

CTM through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

All versions of the CTM for this model are serviced only as a complete unit. Many of the electronic features in the vehicle controlled or supported by the high-line or premium versions of the CTM are programmable using the DRBIII® scan tool. However, if any of the CTM hardware components are damaged or faulty, the entire CTM unit must be replaced. The base version of the CTM and the hard wired inputs or outputs of all CTM versions can be diagnosed using conventional diagnostic tools and methods; however, for diagnosis of the high-line or premium versions of the CTM or the CCD data bus, the use of a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

OPERATION

The Central Timer Module (CTM) is designed to control and integrate many of the electronic features and functions of the vehicle. The base version of the CTM monitors only hard wired inputs and responds with the proper hard wired outputs. The microprocessor-based high-line/premium version of the CTM monitors many hard wired switch and sensor inputs as well as those resources it shares with other electronic modules in the vehicle through its communication over the Chrysler Collision Detection (CCD) data bus network. The internal programming and all of these inputs allow the high-line/premium CTM microprocessor to determine the tasks it needs to perform and their priorities, as well as both the standard and optional features that it should provide. The high-line/premium CTM programming then performs those tasks and provides those features through both CCD data bus communication with other electronic modules and through hard wired outputs to a number of circuits, relays, and actuators. These outputs allow the high-line/premium CTM the ability to control numerous accessory systems in the vehicle.

All versions of the CTM operate on battery current received through fuses in the Junction Block (JB) on a non-switched fused B(+) circuit, a fused ignition switch output (st-run) circuit (base version only), and a fused ignition switch output (run-acc) circuit (high-line/premium version only). This arrangement allows the CTM to provide some features regardless of the ignition switch position, while other features will

operate only with the ignition switch in the Accessory, On, and/or Start positions. All versions of the CTM are grounded through their connector and take out of the instrument panel wire harness. The high-line/premium CTM has another ground received through a second connector and take out of the instrument panel wire harness. The first ground circuit receives ground through a take out with an eyelet terminal connector of the instrument panel wire harness that is secured by a nut to a ground stud located on the left instrument panel end bracket, while the second ground circuit (high-line/premium version only) receives ground through a take out with an eyelet terminal connector of the instrument panel wire harness that is secured by a nut to a ground stud located on the back of the instrument panel armature above the inboard side of the instrument panel steering column opening.

The high-line/premium CTM monitors its own internal circuitry as well as many of its input and output circuits, and will store a Diagnostic Trouble Code (DTC) in electronic memory for any failure it detects. These DTCs can be retrieved and diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

HARD WIRED INPUTS

The hard wired inputs to the CTM include the following:

- CCD bus- - high-line/premium version only
- CCD bus+ - high-line/premium version only
- Cylinder lock switch mux - high-line premium version only
- Driver door ajar switch sense
- Fused B(+)
- Fused ignition switch output (run-acc) - high-line/premium version only
- Fused ignition switch output (st-run) - base version only
- Ground (one circuit - base version, two circuits - high-line/premium version)
- Key-in ignition switch sense
- Passenger door ajar switch sense - high-line/premium version only
- Power door lock motor B(+) lock - high-line/premium version only
- Power door lock motor B(+) unlock - high-line/premium version only
- Radio control mux - high-line/premium version only
- Tone request signal
- Washer switch sense
- Wiper park switch sense
- Wiper switch mode sense
- Wiper switch mode signal

CENTRAL TIMER MODULE (Continued)

HARD WIRED OUTPUTS

The hard wired outputs of the CTM include the following:

- CCD bus- - high-line/premium version only
- CCD bus+ - high-line/premium version only
- Courtesy lamp switch output - high-line/premium version only
- Door lock driver - high-line/premium version only
- Door unlock driver - high-line/premium version only
- Headlamp relay control - high-line/premium version only
- Heated seat relay control - premium version only
- Horn relay control - high-line/premium version only
- VTSS indicator driver - high-line/premium version only
- Wiper motor relay control

MESSAGING

The high-line/premium CTM uses the following messages received from other electronic modules over the CCD data bus:

- Airbag Deploy (ACM)
- Charging System Failure (PCM)
- Engine RPM (PCM)
- System Voltage (PCM)
- Vehicle Speed (PCM)
- Voltage Fault (PCM)

The high-line/premium CTM provides the following messages to other electronic modules over the CCD data bus:

- Engine Enable (PCM)
- Radio Seek Up (Radio)
- Radio Seek Down (Radio)
- Radio Volume Up (Radio)
- Radio Volume Down (Radio)
- Preset Scan (Radio)

DIAGNOSIS AND TESTING - CENTRAL TIMER MODULE

The hard wired inputs to and outputs from the Central Timer Module (CTM) may be diagnosed and tested using conventional diagnostic tools and methods. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the high-line/premium CTM. In order to obtain conclusive testing of the high-line/premium CTM, the Chrysler Collision

Detection (CCD) data bus network and all of the electronic modules that provide inputs to or receive outputs from the CTM must also be checked. The most reliable, efficient, and accurate means to diagnose the high-line/premium CTM, the CCD data bus network, and the electronic modules that provide inputs to or receive outputs from the high-line/premium CTM requires the use of a DRBIII® scan tool and the appropriate diagnostic information. The DRBIII® scan tool can provide confirmation that the CCD data bus network is functional, that all of the electronic modules are sending and receiving the proper messages over the CCD data bus, and that the CTM is receiving the proper hard wired inputs and responding with the proper hard wired outputs needed to perform its many functions.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: The following tests may not prove conclusive in the diagnosis of the high-line or premium versions of the Central Timer Module (CTM). The most reliable, efficient, and accurate means to diagnose the high-line or premium CTM requires the use of a DRBIII® scan tool and the appropriate diagnostic information.

(1) Check the fused B(+) fuse (Fuse 13 - 10 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse (Fuse 13 - 10 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit between the JB and the Power Distribution Center (PDC) as required.

(3) For a base version CTM, check the fused ignition switch output (st-run) fuse (Fuse 11 - 10 ampere) in the JB. For a high-line/premium version CTM, check the fused ignition switch output (run-acc) fuse (Fuse 6 - 25 ampere) in the JB. If OK, go to Step 4. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

CENTRAL TIMER MODULE (Continued)

(4) Turn the ignition switch to the On position. For a base version CTM, check for battery voltage at the fused ignition switch output (st-run) fuse (Fuse 11 - 10 ampere) in the JB. For a high-line/premium version CTM, check for battery voltage at the fused ignition switch output (run-acc) fuse (Fuse 6 - 25 ampere) in the JB. If OK, go to Step 5. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the CTM from its mounting bracket to access the CTM wire harness connector(s). Disconnect the instrument panel wire harness connector(s) for the CTM from the CTM connector receptacle(s). Check the wire harness connectors and the CTM receptacles for loose, corroded, or damaged terminals and pins. If OK, go to Step 6. If not OK, repair as required.

(6) Check for continuity between the ground circuit cavity of the instrument panel wire harness connector (Connector C1) for the CTM and a good ground. For the high-line/premium version of the CTM only, repeat the check between the ground circuit cavity of the instrument panel wire harness connector (Connector C2) for the CTM and a good ground. In each case, there should be continuity. If OK, go to Step 7. If not OK, repair the open ground circuit(s) to ground as required.

(7) Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector (Connector C1) for the CTM. If OK, go to Step 8. If not OK, repair the open fused B(+) circuit between the CTM and the JB as required.

(8) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (st-run) circuit cavity (base version) or fused ignition switch output (run-acc) circuit cavity (high-line/premium version) of the instrument panel wire harness connector (Connector C1) for the CTM. If OK with a base version CTM, replace the faulty CTM. If OK with a high-line/premium version CTM, use a DRBIII® scan tool and the appropriate diagnostic information to perform further diagnosis of the CTM. If not OK, repair the open fused ignition switch output circuit between the CTM and the JB.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYS-

TEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before replacing a high-line/premium version Central Timer Module (CTM), use a DRBIII® scan tool to retrieve the current settings for the CTM programmable features. Refer to the appropriate diagnostic information. These settings should be duplicated in the replacement high-line/premium CTM using the DRBIII® scan tool before returning the vehicle to service.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(3) Remove the two screws that secure the Central Timer Module (CTM) to the bracket on the inboard side of the instrument panel steering column opening (Fig. 3) or (Fig. 4).

80b1713a

Fig. 3 Central Timer Module (Base) Remove/Install

- 1 - SCREWS
- 2 - BRACKET
- 3 - WIRE HARNESS CONNECTOR
- 4 - CENTRAL TIMER MODULE

(4) Pull the CTM into the instrument panel steering column opening far enough to access the instrument panel wire harness connector(s).

CENTRAL TIMER MODULE (Continued)

**Fig. 4 Central Timer Module (High-Line/Premium)
Remove/Install**

- 1 - SCREWS
- 2 - BRACKET
- 3 - WIRE HARNESS CONNECTORS
- 4 - CENTRAL TIMER MODULE

(5) Disconnect the instrument panel wire harness connector(s) (one connector for the base version CTM, two connectors for the high-line/premium version) from the CTM connector receptacle(s).

(6) Remove the CTM from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before replacing a high-line/premium version Central Timer Module (CTM), use a DRBIII® scan tool to retrieve the current settings for the CTM programmable features. Refer to the appropriate diagnostic information. These settings should be duplicated in the replacement high-line/premium

CTM using the DRBIII® scan tool before returning the vehicle to service.

(1) Position the CTM to the inboard side of the instrument panel steering column opening.

(2) Reconnect the instrument panel wire harness connector(s) for the CTM (one connector for the base version CTM, two connectors for the high-line/premium version) to the CTM connector receptacle(s) (Fig. 3) or (Fig. 4).

(3) Position the CTM to the bracket on the inboard side of the instrument panel steering column opening.

(4) Install and tighten the two screws that secure the CTM to the bracket on the inboard side of instrument panel steering column opening. Tighten the screws to 1.6 N·m (15 in. lbs.).

(5) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(6) Reconnect the battery negative cable.

COMMUNICATION

DESCRIPTION - CCD DATA BUS

The Chrysler Collision Detection (also referred to as CCD or CD) data bus system is a multiplex system used for vehicle communications on many DaimlerChrysler Corporation vehicles. Within the context of the CCD system, the term "collision" refers to the system's ability to avoid collisions of the electronic data that enters the data bus from various electronic control modules at approximately the same time.

Multiplexing is a system that enables the transmission of several messages over a single channel or circuit. Many DaimlerChrysler vehicles use this principle for communication between the various microprocessor-based electronic control modules.

Many of the electronic control modules in a vehicle require information from the same sensing device. In the past, if information from one sensing device was required by several controllers, a wire from each controller needed to be connected in parallel to that sensor. In addition, each controller utilizing analog sensors required an Analog/Digital (A/D) converter in order to "read" these sensor inputs. Multiplexing reduces wire harness complexity, sensor current loads and controller hardware because each sensing device is connected to only one controller, which reads and distributes the sensor information to the other controllers over the data bus. Also, because each controller on the data bus can access the controller sensor inputs to every other controller on the data bus, more function and feature capabilities are possible.

COMMUNICATION (Continued)

In addition to reducing wire harness complexity, component sensor current loads and controller hardware, multiplexing offers a diagnostic advantage. A multiplex system allows the information flowing between controllers to be monitored using a diagnostic scan tool. The DaimlerChrysler system allows an electronic control module to broadcast message data out onto the bus where all other electronic control modules can "hear" the messages that are being sent. When a module hears a message on the data bus that it requires, it relays that message to its microprocessor. Each module ignores the messages on the data bus that are being sent to other electronic control modules.

With a diagnostic scan tool connected into the CCD circuit, a technician is able to observe many of the electronic control module function and message outputs while; at the same time, controlling many of the sensor message inputs. The CCD data bus, along with the use of a DRBIII® diagnostic scan tool and a logic-based approach to test procedures, as found in the appropriate diagnostic procedures manuals, allows the trained automotive technician to more easily, accurately and efficiently diagnose the many complex and integrated electronic functions and features found on today's vehicles.

OPERATION - CCD DATA BUS

The CCD data bus system was designed to run at a 7812.5 baud rate (or 7812.5 bits per second). In order to successfully transmit and receive binary messages over the CCD data bus, the system requires the following:

- Bus (+) and Bus (-) Circuits
- CCD Chips in Each Electronic Control Module
- Bus Bias and Termination
- Bus Messaging
- Bus Message Coding

Following are additional details of each of the above system requirements.

BUS (+) AND BUS (-) CIRCUITS

The two wires (sometimes referred to as the "twisted pair") that comprise the CCD data bus are the D1 circuit [Bus (+)], and the D2 circuit [Bus (-)]. The "D" in D1 and D2 identify these as diagnostic circuits. Transmission and receipt of binary messages on the CCD data bus is accomplished by cycling the voltage differential between the Bus (+) and Bus (-) circuits.

The two data bus wires are twisted together in order to shield the wires from the effects of any Electro-Magnetic Interference (EMI) from switched voltage sources. An induced EMI voltage can be generated in any wire by a nearby switched voltage or switched ground circuit. By twisting the data bus wires together, the induced voltage spike (either up

or down) affects both wires equally. Since both wires are affected equally, a voltage differential still exists between the Bus (+) and Bus (-) circuits, and the data bus messages can still be broadcast or received. The correct specification for data bus wire twisting is one turn for every 44.45 millimeters (1 $\frac{3}{4}$ inches) of wire.

CCD CHIPS

In order for an electronic control module to communicate on the CCD data bus, it must have a CCD chip (Fig. 5). The CCD chip contains a differential transmitter/receiver (or transceiver), which is used to send and receive messages. Each module is wired in parallel to the data bus through its CCD chip.

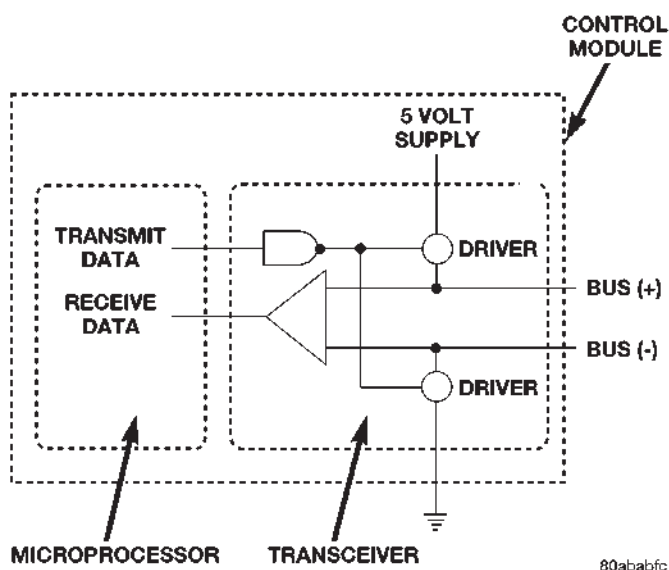

Fig. 5 CCD Chip

The differential transceiver sends messages by using two current drivers: one current source driver, and one current sink driver. The current drivers are matched and allow 0.006 ampere to flow through the data bus circuits. When the transceiver drivers are turned On, the Bus (+) voltage increases slightly, and the Bus (-) voltage decreases slightly. By cycling the drivers On and Off, the CCD chip causes the voltage on the data bus circuit to fluctuate to reflect the message.

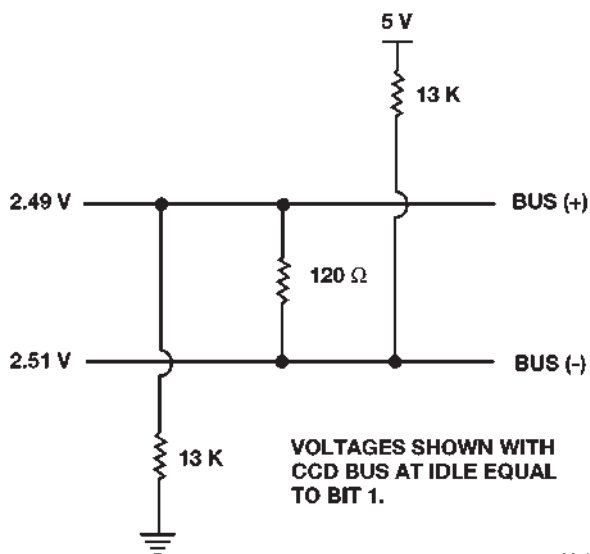

Once a message is broadcast over the CCD data bus, all electronic control modules on the data bus have the ability to receive it through their CCD chip. Reception of CCD messages is also carried out by the transceiver in the CCD chip. The transceiver monitors the voltage on the data bus for any fluctuations. When data bus voltage fluctuations are detected, they are interpreted by the transceiver as binary messages and sent to the electronic control module's microprocessor.

COMMUNICATION (Continued)

BUS BIAS AND TERMINATION

The voltage network used by the CCD data bus to transmit messages requires both bias and termination. At least one electronic control module on the data bus must provide a voltage source for the CCD data bus network known as bus bias, and there must be at least one bus termination point for the data bus circuit to be complete. However, while bias and termination are both required for data bus operation, they both do not have to be within the same electronic control module. The CCD data bus is biased to approximately 2.5 volts. With each of the electronic control modules wired in parallel to the data bus, all modules utilize the same bus bias. Therefore, based upon vehicle options, the data bus can accommodate two or twenty electronic control modules without affecting bus voltage.

The power supplied to the data bus is known as bus biasing. Bus bias is provided through a series circuit. To properly bias the data bus circuits, a 5 volt supply is provided through a 13 kilohm resistor to the Bus (-) circuit (Fig. 6). Voltage from the Bus (-) circuit flows through a 120 ohm termination resistor to the Bus (+) circuit. The Bus (+) circuit is grounded through another 13 kilohm resistor. While at least one termination resistor is required for the system to operate, most DaimlerChrysler systems use two. The second termination resistor serves as a backup (Fig. 7). The termination resistor provides a path for the bus bias voltage. Without a termination point, voltage biasing would not occur. Voltage would go to 5 volts on one bus wire and 0 volts on the other bus wire.

80ababf9

Fig. 6 Bus Biasing

The voltage drop through the termination resistor creates 2.51 volts on Bus (-), and 2.49 volts on Bus (+). The voltage difference between the two circuits is 0.02 volts. When the data bus voltage differential is a steady 0.02 volts, the CCD system is considered "idle." When no input is received from any module and the ignition switch is in the Off position for a pre-programmed length of time, the bus data becomes inactive or enters the "sleep mode." Electronic control modules that provide bus bias can be programmed to "wake up" the data bus and become active upon receiving any predetermined input or when the ignition switch is turned to the On position.

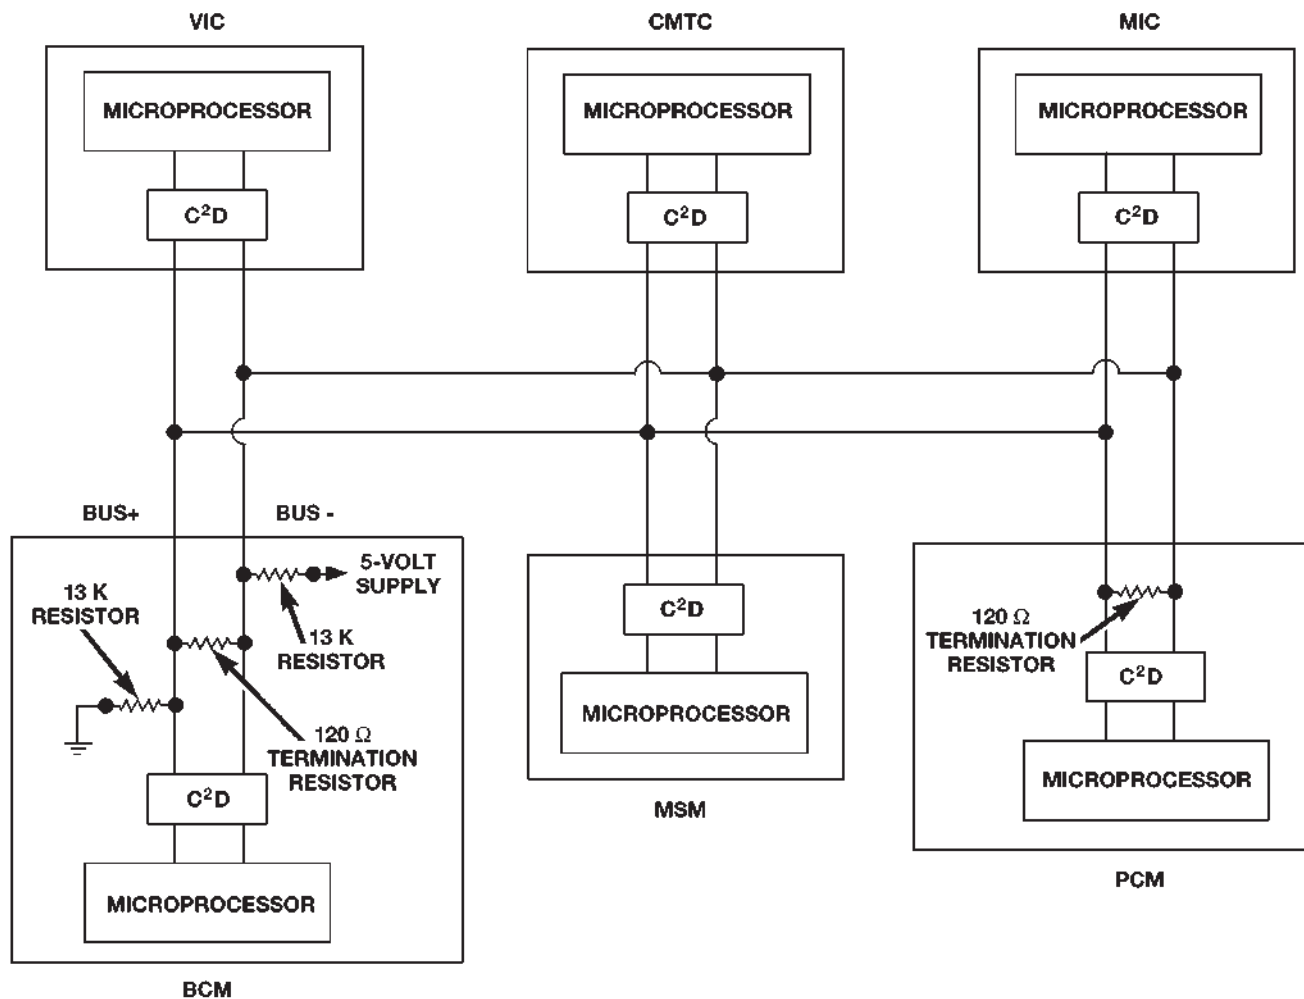

BUS MESSAGING

The electronic control modules used in the CCD data bus system contain microprocessors. Digital signals are the means by which microprocessors operate internally and communicate messages to other microprocessors. Digital signals are limited to two states, voltage high or voltage low, corresponding to either a one or a zero. Unlike conventional binary code, the CCD data bus systems translate a small voltage difference as a one (1), and a larger voltage difference as a zero (0). The use of the 0 and 1 is referred to as binary coding. Each binary number is called a bit, and eight bits make up a byte. For example: 01011101 represents a message. The controllers in the multiplex system are able to send thousands of these bytes strung together to communicate a variety of messages. Through the use of binary data transmission, all electronic control modules on the data bus can communicate with each other.

The microprocessors in the CCD data bus system translate the binary messages into Hexadecimal Code (or Hex Code). Hex code is the means by which microprocessors communicate and interpret messages. When fault codes are received by the DRBIII® scan tool, they are translated into text for display on the DRBIII® screen. Although not displayed by the DRBIII® for Body Systems, hex codes are shown by the DRBIII® for Engine System faults.

When the microprocessor signals the transceiver in the CCD chip to broadcast a message, the transceiver turns the current drivers On and Off, which cycles the voltage on the CCD data bus circuits to correspond to the message. At idle, the CCD system recognizes the 0.02 voltage differential as a binary bit 1. When the current drivers are actuated, the voltage differential from idle must increase by 0.02 volt for the CCD system to recognize a binary bit 0 (Fig. 8). The nominal voltage differential for a 0 bit is 0.100 volts. However, data bus voltage differentials can range anywhere between 0.02 and 0.120 volt.

COMMUNICATION (Continued)

80a9f127

Fig. 7 Bus Termination**BUS MESSAGE CODING**

The first part of a data bus message has an Identification (ID) byte. The ID byte contains message priority, message identification, message content and message length information. All messages sent over the data bus are coded for both priority and identification.

PRIORITY

Messages can be broadcast almost simultaneously by modules over the CCD data bus. Therefore, all messages are defined and ranked by a predetermined priority. When two CCD chips start a message at exactly the same time, non-destructive arbitration occurs between the two CCD chips. Arbitration will occur based upon the priority code, to determine which message takes priority on the data bus and to prevent data collision. If a CCD chip senses a message of higher priority being transmitted, it stops transmitting its message. The higher priority message is then transmitted in its entirety without inter-

ruption. The other CCD chips on the data bus do not allow any other messages to be broadcast.

To determine the winner in an arbitration, all messages start with an ID byte which contains the predetermined priority code. In the digital broadcast, zero is the dominant bit. All ID bytes start with a zero. This is the start of the message. With zeros being the dominant bit, messages starting with more zeros have a higher priority. For example: of the two messages below, Message #2 loses arbitration at the second bit, where Message #1 has a zero and Message #2 has a one (Fig. 9). After the message is broadcast, an idle period occurs while all microprocessors can queue, if necessary, and attempt to broadcast their messages again.

- Message #1 = 00010110
- Message #2 = 01010101

COMMUNICATION (Continued)

Fig. 8 Voltage Cycling to Correspond to Message

**MESSAGE #2 LOSES ARBITRATION AT SECOND BIT
AND THE CCD CHIP STOPS TRANSMITTING THE MESSAGE.**

80ababf8

Fig. 9 Message Arbitration

MESSAGE IDENTIFICATION

Because messages are broadcast over the data bus, all modules can receive them, yet not all modules need all messages. In order to enhance microprocessor speed, unneeded messages are filtered out. The ID byte, along with showing message priority, also

identifies the data, content and length. The electronic control module, through its CCD chip transceiver, monitors the ID code of the messages. If the message is not for that particular module, the message is simply ignored. Once the module recognizes a message that it requires, the rest of the message is monitored and processed.

TRANSMISSION VERIFICATION

Once a CCD chip transmits a message over the CCD data bus, the message is received by the transmitting module at the same time through the CCD chip differential transceiver. The module knows the message was broadcast correctly when it receives its own message back. If the message received does not match the message transmitted, the message is said to be corrupt.

Corruption occurs when the message is incorrectly transmitted on the data bus. Corruption can also occur from interference, wiring problems, or other data bus problems. In the case of a corrupt message, the module attempts to have the CCD chip re-send the message.

COMMUNICATION (Continued)

DIAGNOSIS AND TESTING - CCD DATA BUS

CCD BUS FAILURE

The CCD data bus can be monitored using the DRBIII® scan tool. However, it is possible for the data bus to pass all tests since the voltage parameters will be in "range" and false signals are being sent. There are essentially 12 "hard failures" that can occur with the CCD data bus:

- Bus Shorted to Battery
- Bus Shorted to 5 Volts
- Bus Shorted to Ground
- Bus (+) Shorted to Bus (-)
- Bus (-) and Bus (+) Open
- Bus (+) Open
- Bus (-) Open
- No Bus Bias
- Bus Bias Level Too High
- Bus Bias Level Too Low
- No Bus Termination
- Not Receiving Bus Messages Correctly

Refer to the appropriate diagnostic information for details on how to diagnose these faults using a DRBIII® scan tool.

BUS FAILURE VISUAL SYMPTOM DIAGNOSIS

The following visible symptoms or customer complaints, alone or in combination, may indicate a CCD data bus failure:

- Airbag Indicator and Malfunction Indicator Lamp (MIL) Illuminated
- Instrument Cluster Gauges (All) Inoperative
- No Compass Mini-Trip Computer (CMTC) Operation (if equipped)

CONTROLLER ANTILOCK BRAKE

DESCRIPTION

The Controller Antilock Brakes (CAB) is a micro-processor which handles testing, monitoring and controlling the ABS brake system operation (Fig. 10). The CAB functions are:

- Perform self-test diagnostics.
- Monitor the RWAL brake system for proper operation.
- Control the RWAL valve solenoids.

NOTE: If the CAB needs to be replaced, the rear axle type and tire revolutions per mile must be programmed into the new CAB. For axle type refer to Group 3 Differential and Driveline. For tire revolutions per mile, (Refer to 22 - TIRES/WHEELS/TIRES - SPECIFICATIONS) . To program the CAB refer to the Chassis Diagnostic Manual.

Fig. 10 RWAL CAB

1 - RWAL CAB

OPERATION

SYSTEM SELF-TEST

When the ignition switch is turned-on the micro-processor RAM and ROM are tested. If an error occurs during the test, a DTC will be set into the RAM memory. However it is possible the DTC will not be stored in memory if the error has occurred in the RAM module where the DTC's are stored. Also it is possible a DTC may not be stored if the error has occurred in the ROM which signals the RAM to store the DTC.

CAB INPUTS

The CAB continuously monitors the speed of the differential ring gear by monitoring signals generated by the rear wheel speed sensor. The CAB determines a wheel locking tendency when it recognizes the ring gear is decelerating too rapidly. The CAB monitors the following inputs to determine when a wheel locking tendency may exist:

- Rear Wheel Speed Sensor
- Brake Lamp Switch
- Brake Warning Lamp Switch
- Reset Switch
- 4WD Switch (If equipped)

CAB OUTPUTS

The CAB controls the following outputs for antilock braking and brake warning information:

- RWAL Valve
- ABS Warning Lamp
- Brake Warning Lamp

REMOVAL

- (1) Disconnect battery negative cable.

CONTROLLER ANTILOCK BRAKE (Continued)

(2) Push the harness connector locks to release the locks, (Fig. 11) then remove the connectors from the CAB.

(3) Disconnect the pump motor connector (Fig. 12)

(4) Remove screws attaching CAB to the HCU (Fig. 13) .

(5) Remove the CAB.

Fig. 11 Harness Connector Locks

- 1 - CONNECTOR LOCK
2 - CAB

Fig. 12 Pump

- 1 - PUMP MOTOR
2 - PUMP CONNECTOR

Fig. 13 Controller Mounting Screws

- 1 - CAB
2 - MOUNTING LOCATIONS

INSTALLATION

(1) Place the CAB onto the HCU.

NOTE: Insure the CAB seal is in position before installation.

(2) Install the mounting screws and tighten to 4-4.7 N·m (36-42 in. lbs.).

(3) Connect the pump motor harness.

(4) Connect the harnesses to the CAB and lock the connectors.

(5) Connect battery.

DATA LINK CONNECTOR

DESCRIPTION - DATA LINK CONNECTOR

The data link connector (DLC) is located at the lower edge of the instrument panel near the steering column.

OPERATION - DATA LINK CONNECTOR

The 16-way data link connector (diagnostic scan tool connector) links the Diagnostic Readout Box (DRB) scan tool or the Mopar Diagnostic System (MDS) with the Powertrain Control Module (PCM).

ENGINE CONTROL MODULE

DESCRIPTION - ECM

The ECM is bolted to the left side of the engine behind the fuel filter (Fig. 14). It is a separate component and can be serviced. The FPCM is internal to the fuel injection pump (Fig. 15) and cannot be serviced.

Fig. 14 Engine Control Module (ECM) Location

- 1 - ENGINE CONTROL MODULE (ECM)
- 2 - HEX HEADED BOLT
- 3 - 50-WAY CONNECTOR
- 4 - FUEL TRANSFER PUMP
- 5 - MOUNTING BOLTS (3)

OPERATION - ECM

The main functions of the Engine Control Module (ECM) and Fuel Injection Pump Control Module (FPCM) are to electrically control the fuel system. The Powertrain Control Module (PCM) **does not control** the fuel system.

The ECM can adapt its programming to meet changing operating conditions. **If the ECM has been replaced, flashed or re-calibrated, the ECM must learn the Accelerator Pedal Position Sensor (APPS) idle voltage. Failure to learn this voltage may result in unnecessary diagnostic trouble codes. Refer to ECM Removal/Installation for learning procedures.**

The ECM receives input signals from various switches and sensors. Based on these inputs, the ECM regulates various engine and vehicle operations through different system components. These components are referred to as **ECM Outputs**. The sensors and switches that provide inputs to the ECM are considered **ECM Inputs**.

- 2 - HIGH-PRESSURE FUEL LINES
- 3 - FITTINGS
- 4 - FUEL INJECTION PUMP
- 5 - FPCM

NOTE: ECM Inputs:

- Accelerator Pedal Position Sensor (APPS) Volts
- APPS Idle Validation Switches #1 and #2
- Battery voltage
- Camshaft Position Sensor (CMP)
- CCD bus (+) circuits
- CCD bus (-) circuits
- Crankshaft Position Sensor (CKP)
- Data link connection for DRB scan tool
- (FPCM) Fuel Injection Pump Control Module
- Engine Coolant Temperature (ECT) sensor
- Ground circuits
- Intake manifold Air Temperature (IAT) sensor
- Manifold Air Pressure Sensor (Boost Pressure Sensor)
- Oil pressure sensor
- PCM
- Power Take Off (PTO)
- Power ground
- Sensor return
- Signal ground
- Water-In-Fuel (WIF) sensor

ENGINE CONTROL MODULE (Continued)

NOTE: ECM Outputs:

After inputs are received by the ECM, certain sensors, switches and components are controlled or regulated by the ECM. These are considered **ECM Outputs**. These outputs are for:

- CCD bus (+) circuits
- CCD bus (-) circuits
- CKP and APPS outputs to the PCM
- Data link connection for DRB scan tool
- Five volt sensor supply
- Fuel injection pump
- Fuel injection pump relay
- (FPCM) Fuel Pump Control Module
- Fuel transfer (lift) pump
- Intake manifold air heater relays #1 and #2 control circuits
- Malfunction indicator lamp (Check engine lamp)
- Oil pressure gauge/warning lamp
- PCM
- Wait-to-start warning lamp
- Water-In-Fuel (WIF) warning lamp

REMOVAL

The ECM is bolted to the engine block behind the fuel filter (Fig. 16).

Fig. 16 Engine Control Module (ECM) Location and Mounting

- 1 - ENGINE CONTROL MODULE (ECM)
- 2 - HEX HEADED BOLT
- 3 - 50-WAY CONNECTOR
- 4 - FUEL TRANSFER PUMP
- 5 - MOUNTING BOLTS (3)

(1) Record any Diagnostic Trouble Codes (DTC's) found in the PCM or ECM.

To avoid possible voltage spike damage to either the Powertrain Control Module (PCM) or ECM, ignition key must be off, and negative battery cables must be disconnected before unplugging ECM connectors.

(2) Disconnect both negative battery cables at both batteries.

(3) Remove 50-way electrical connector bolt at ECM (Fig. 16). Note: Connector bolt is female 4mm hex head. To remove bolt, use a ball-hex bit or ball-hex screwdriver such as Snap-On® 4mm SDABM4 (5/32" may also be used). As bolt is being removed, very carefully remove connector from ECM.

(4) Remove three ECM mounting bolts and remove ECM from vehicle.

INSTALLATION

Do not apply paint to back of ECM. Poor ground will result.

(1) Clean ECM mounting points at engine block.

(2) Position ECM to engine block and install 3 mounting bolts. Tighten bolts to 24 N·m (18 ft. lbs.).

(3) Check pin connectors in ECM and 50-way connector for corrosion or damage. Repair as necessary.

(4) Clean pins in 50-way electrical connector with a quick-dry electrical contact cleaner.

(5) Very carefully install 50-way connector to ECM. Tighten connector hex bolt.

(6) Install battery cables.

(7) **Turn key to ON position. Without starting engine, slowly press throttle pedal to floor and then slowly release. This step must be done (one time) to ensure accelerator pedal position sensor calibration has been learned by ECM. If not done, possible DTC's may be set.**

(8) Use DRB scan tool to erase any stored companion DTC's from PCM.

POWERTRAIN CONTROL MODULE

DESCRIPTION

DESCRIPTION - PCM

The Powertrain Control Module (PCM) is located in the engine compartment (Fig. 17). The PCM is referred to as JTEC.

Fig. 17 PCM Location

- 1 - PCM MOUNTING BOLTS (3)
- 2 - POWERTRAIN CONTROL MODULE (PCM)
- 3 - (3) 32-WAY CONNECTORS

DESCRIPTION - MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop.**

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O₂S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O₂S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O₂S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON

- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O₂S sensor heater element is energized via the ASD relay. The O₂S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Starter motor relay
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within 3 seconds of cranking the engine, it will shut down the fuel injection system.

POWERTRAIN CONTROL MODULE (Continued)

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.

- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

- When engine has reached operating temperature, the PCM will begin monitoring O₂S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)

- Camshaft position sensor signal (in the distributor)
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)

- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

- The PCM monitors the O₂S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.

- The PCM adjusts ignition timing by increasing and decreasing spark advance.

- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)

- Oxygen (O₂S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.

- The PCM monitors the O₂S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.

- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

POWERTRAIN CONTROL MODULE (Continued)

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed sensor

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control

the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.

- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

DESCRIPTION - 5 VOLT SUPPLIES

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

DESCRIPTION - IGNITION CIRCUIT SENSE

This circuit ties the ignition switch to the Powertrain Control Module (PCM).

DESCRIPTION - POWER GROUNDS

The Powertrain Control Module (PCM) has 2 main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

DESCRIPTION - SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low-noise ground reference for all engine control system sensors. Refer to Power Grounds for more information.

DESCRIPTION - SIGNAL GROUND

Signal ground provides a low noise ground to the data link connector.

POWERTRAIN CONTROL MODULE (Continued)

OPERATION

OPERATION - PCM - GAS ENGINES

The PCM operates the fuel system. The PCM is a pre-programmed, triple microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

NOTE: PCM Inputs:

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- CCD bus (+) circuits
- CCD bus (-) circuits
- Camshaft position sensor signal
- Crankshaft position sensor
- Data link connection for DRB scan tool
- Engine coolant temperature sensor
- Fuel level
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
 - Intake manifold air temperature sensor
 - Leak detection pump (switch) sense (if equipped)
 - Manifold absolute pressure (MAP) sensor

- Oil pressure
- Output shaft speed sensor
- Overdrive/override switch
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Throttle position sensor
- Transmission governor pressure sensor
- Transmission temperature sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

- A/C clutch relay
- Auto shutdown (ASD) relay
- CCD bus (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
 - Data link connection for DRB scan tool
 - EGR valve control solenoid (if equipped)
 - EVAP canister purge solenoid
 - Five volt sensor supply (primary)
 - Five volt sensor supply (secondary)
 - Fuel injectors
 - Fuel pump relay
 - Generator field driver (-)
 - Generator field driver (+)
 - Generator lamp (if equipped)
 - Idle air control (IAC) motor
 - Ignition coil
 - Leak detection pump (if equipped)
 - Malfunction indicator lamp (Check engine lamp).
- Driven through CCD circuits.
 - Overdrive indicator lamp (if equipped)
 - Service Reminder Indicator (SRI) Lamp (MAINT REQ'D lamp). Driven through CCD circuits.
 - Speed control vacuum solenoid
 - Speed control vent solenoid
 - Tachometer (if equipped). Driven through CCD circuits.
 - Transmission convertor clutch circuit
 - Transmission 3-4 shift solenoid
 - Transmission relay
 - Transmission temperature lamp (if equipped)
 - Transmission variable force solenoid

OPERATION - DIESEL

Two different control modules are used: The Powertrain Control Module (PCM), and the Engine Control Module (ECM). The ECM **controls** the fuel system. The PCM **does not control** the fuel system.

The PCM's main function is to control: the vehicle charging system, speed control system, transmission, air conditioning system and certain bussed messages.

POWERTRAIN CONTROL MODULE (Continued)

The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as **PCM Outputs**. The sensors and switches that provide inputs to the PCM are considered **PCM Inputs**.

NOTE: PCM Inputs:

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Accelerator Pedal Position Sensor (APPS) output from ECM
- Auto shutdown (ASD) relay sense
- Battery temperature sensor
- Battery voltage
- Brake switch
- CCD bus (+) circuits
- CCD bus (-) circuits
- Crankshaft Position Sensor (CKP) output from ECM
- Data link connection for DRB scan tool
- Fuel level sensor
- Generator (battery voltage) output
- Ignition sense
- Output shaft speed sensor
- Overdrive/override switch
- Park/neutral switch (auto. trans. only)
- Power ground
- Sensor return
- Signal ground
- Speed control resume switch
- Speed control set switch
- Speed control on/off switch
- Transmission governor pressure sensor
- Transmission temperature sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

After inputs are received by the PCM, certain sensors, switches and components are controlled or regulated by the PCM. These are considered **PCM Outputs**. These outputs are for:

- A/C clutch relay and A/C clutch
- Auto shutdown (ASD) relay
- CCD bus (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Data link connection for DRB scan tool
- Five volt sensor supply
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)

- Malfunction indicator lamp (Check engine lamp)
- Overdrive warning lamp (if equipped)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped)
- Transmission convertor clutch circuit
- Transmission 3-4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid (governor sol.)

OPERATION - 5 VOLT SUPPLIES

Primary 5-volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supplies a reference voltage for the Throttle Position Sensor (TPS) sensor.

Secondary 5-volt supply:

- supplies the required 5 volt power source to the oil pressure sensor.
- supplies the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).
- supplies the 5 volt power source to the transmission pressure sensor (if equipped with an RE automatic transmission).

OPERATION - IGNITION CIRCUIT SENSE

The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the "ignition sense" circuit and is used to "wake up" the PCM. Voltage on the ignition input can be as low as 6 volts and the PCM will still function. Voltage is supplied to this circuit to power the PCM's 8-volt regulator and to allow the PCM to perform fuel, ignition and emissions control functions.

REMOVAL

USE THE DRB SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

The PCM is located in the engine compartment (Fig. 18).

POWERTRAIN CONTROL MODULE (Continued)

**Fig. 18 PCM Location and Mounting**

- 1 - PCM MOUNTING BOLTS (3)
- 2 - POWERTRAIN CONTROL MODULE (PCM)
- 3 - (3) 32-WAY CONNECTORS

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

- (1) Disconnect negative battery cable(s) at battery(s).
- (2) Remove cover over electrical connectors. Cover snaps onto PCM.
- (3) Carefully unplug the three 32-way connectors from PCM.
- (4) Remove three PCM mounting bolts and remove PCM from vehicle.

INSTALLATION

USE THE DRB SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

- (1) Install PCM and mounting bolts to vehicle.
- (2) Tighten bolts to 4 N·m (35 in. lbs.).
- (3) Check pin connectors in the PCM and the three 32-way connectors for corrosion or damage. Repair as necessary.
- (4) Install three 32-way connectors.
- (5) Install cover over electrical connectors. Cover snaps onto PCM.
- (6) Install battery cable(s).
- (7) Use the DRB scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

HEATED SEAT MODULE**DESCRIPTION**

80be465a

Fig. 19 Heated Seat Module

- 1 - MOUNTING TABS
- 2 - HEATED SEAT MODULE
- 3 - CONNECTOR RECEPTACLE

The heated seat module is also known as the Seat Heat Interface Module. The heated seat module (Fig. 19) is located under the front seat center cushion, where it is secured to a mounting bracket that also serves as the support for the slide-out rear seat cup holder unit. The mounting tabs that are molded into the plastic housing of the heated seat module are inserted through holes in the mounting bracket and then secured by push on retainers. The heated seat module has a single connector receptacle that allows the module to be connected to all of the required inputs and outputs through the seat wire harness.

The heated seat module is an electronic microprocessor controlled device designed and programmed to use inputs from the heated seat relay, the two heated seat switches and the two heated seat sensors to operate and control the heated seat elements in both front seats and the two heated seat indicator lamp Light-Emitting Diodes (LEDs) in each heated seat switch. The heated seat module is also programmed to perform self-diagnosis of certain heated seat system functions and provide feedback of that diagnosis through the heated seat switch indicator lamps.

The heated seat module cannot be repaired. If the heated seat module is damaged or faulty, the entire module must be replaced.

OPERATION

The heated seat module operates on fused battery current received from the heated seat relay. The module is grounded at all times through a ground screw located below the left rear speaker in the cab

HEATED SEAT MODULE (Continued)

of the vehicle. Inputs to the module include a resistor multiplexed heated seat switch request circuit for each of the two heated seat switches and the heated seat sensor inputs from the seat cushions of each front seat. In response to those inputs the heated seat module controls battery current feeds to the heated seat elements and sensors, and controls the ground for the heated seat switch indicator lamps.

NOTE: The vehicle's engine must be running in order for the heated seat system to function. This eliminates the possibility of draining the vehicles battery voltage while operating the heated seat system.

When a heated seat switch (Driver or Passenger) is depressed a signal is received by the heated seat module, the module energizes the proper indicator LED (Low or High) in the switch by grounding the indicator lamp circuit to indicate that the heated seat system is operating. At the same time, the heated seat module energizes the selected heated seat sensor circuit and the sensor provides the module with an input indicating the surface temperature of the selected seat cushion.

The Low heat set point is about 36° C (96.8° F), and the High heat set point is about 42° C (107.6° F). If the seat cushion surface temperature input is below the temperature set point for the selected temperature setting, the heated seat module energizes an N-channel Field Effect Transistor (N-FET) within the module which energizes the heated seat elements in the selected seat cushion and back. When the sensor input to the module indicates the correct temperature set point has been achieved, the module de-energizes the N-FET which de-energizes the heated seat elements. The heated seat module will continue to cycle the N-FET as needed to maintain the selected temperature set point.

If the heated seat module detects a heated seat sensor value input that is out of range or a shorted or open heated seat element circuit, it will notify the vehicle operator or the repair technician of this condition by flashing the High and/or Low indicator lamps in the affected heated seat switch. Refer to **Diagnosis and Testing Heated Seat System** in Heated Systems for flashing LED diagnosis and testing procedures. Refer to **Diagnosis and Testing Heated Seat Module** in this section for heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

DIAGNOSIS AND TESTING - HEATED SEAT MODULE

If a heated seat fails to heat and one or both of the indicator lamps on a heated seat switch flash, refer to **Heated Seat System Diagnosis and Testing** in Heated Systems for flashing LED failure identification. Refer to **Wiring Diagrams** in for complete heated seat system wiring diagrams.

(1) Remove the heated seat module from its mounting location (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/MEMORY HEATED SEAT/MIRROR MODULE - REMOVAL).

NOTE: IN ORDER TO PERFORM THE FOLLOWING TESTS IT WILL BE NECESSARY TO REMOVE THE HEATED SEAT RELAY AND INSTALL A JUMPER WIRE IN TERMINALS 87 AND 30, BYPASSING THE HEATED SEAT RELAY.

NOTE: ANY RESISTANCE VALUES (OHMS Ω) GIVEN IN THE FOLLOWING TEXT ARE SUPPLIED USING THE AUTOMATIC RANGE GENERATED BY A FLUKE® AUTOMOTIVE METER. IF ANOTHER TYPE OF MEASURING DEVICE IS USED THE VALUES GENERATED MAY NOT BE THE SAME AS THE RESULTS SHOWN HERE, OR MAY HAVE TO BE CONVERTED TO THE RANGE USED HERE.

80cb4c88

Fig. 20 Heated Seat Module Electrical Connector

HEATED SEAT MODULE (Continued)

RIGHT SEAT HEATER INOPERATIVE

(1) If a heated seat heats but one or both indicator lamps (LED's) on the heated seat switch fail to illuminate, check the driver circuit with the inoperative LED for a short to ground. If OK, replace the heated seat switch. If NOT OK repair the short to ground as required and then replace the heated seat switch.

NOTE: IF THE RIGHT SEAT CUSHION IS ALREADY WARM THE FOLLOWING STEP WILL NOT PROVE CONCLUSIVE.

(2) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #3 for battery voltage when the right heated seat switch is turned "ON", voltage should be present, If OK go to Step 3 If NOT OK, test the right heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/PASSENGER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check for continuity between the switch and control module on the MUX circuit, If OK replace the heated seat control module. If NOT OK, repair the open or shorted MUX circuit as required.

NOTE: BE CERTAIN THE BATTERY IS FULLY CHARGED BEFORE TESTING. FAILURE TO DO SO CAN RESULT IN INCORRECT READINGS.

(3) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #10 for battery voltage, while observing the voltmeter depress the right heated seat switch **low** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 4. If NOT OK check for continuity between the switch and control module on the low heat driver circuit, If OK replace the heated seat control module.

(4) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #11 for battery voltage, while observing the voltmeter depress the right heated seat switch **high** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 5. If NOT OK check for continuity between the switch and control module on the high heat driver circuit, If OK replace the heated seat control module.

(5) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #2 for approx. 5v, voltage should be present, If OK go to Step 6. If NOT OK replace the heated seat control module.

(6) Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #7 for a range in voltage from 1.72v (warm seat) – 3.0v (cold seat). It should be within this range, If OK replace the heated seat module. If NOT OK test the

Heated Seat Sensor. If NOT OK, replace the right heated seat element and sensor assembly. If the heated seat sensor tests OK, check for continuity between the right heated seat cushion connector and control module connector on the 5v supply circuit, If NOT OK, repair the open or shorted 5v supply circuit as required. If OK check for continuity between the right heated seat cushion connector and control module connector on the temperature sensor input circuit. If NOT OK, repair the open or shorted temperature sensor input circuit as required. If OK replace the heated seat control module.

LEFT SEAT HEATER INOPERATIVE

(1) If a heated seat heats but one or both indicator lamps (LED's) on the heated seat switch fail to illuminate, check the driver circuit with the inoperative LED for a short to ground. If OK, replace the heated seat switch. If NOT OK repair the short to ground as required and then replace the heated seat switch.

NOTE: IF THE LEFT SEAT CUSHION IS ALREADY WARM THE FOLLOWING STEP WILL NOT PROVE CONCLUSIVE.

(2) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #5 for battery voltage when the left heated seat switch is turned "ON", voltage should be present, If OK go to Step 3 If NOT OK, test the left heated seat switch (Refer to 8 - ELECTRICAL/HEATED SEATS/DRIVER HEATED SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check for continuity between the switch and control module on the MUX circuit, If OK replace the heated seat control module. If NOT OK, repair the open or shorted MUX circuit as required.

(3) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #12 for battery voltage, while observing the voltmeter depress the left heated seat switch **low** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 4. If NOT OK check for continuity between the switch and control module on the low heat driver circuit, If OK replace the heated seat control module.

(4) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #14 for battery voltage, while observing the voltmeter depress the left heated seat switch **high** setting twice, voltage should toggle between approx.12v and 8v, If OK go to Step 5. If NOT OK check for continuity between the switch and control module on the high heat driver circuit, If OK replace the heated seat control module.

HEATED SEAT MODULE (Continued)

(5) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #2 for approx. 5v, 5 voltage should be present, If OK go to Step 6. If NOT OK replace the heated seat control module.

(6) Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #8 for a range in voltage from 1.72v (warm seat) – 3.0v (cold seat). It should be within this range, If OK replace the heated seat control module. If NOT OK, test the Heated Seat Sensor. If NOT OK, replace the left heated seat element and sensor assembly. If the heated seat sensor tests OK, check for continuity between the left heated seat cushion connector and control module connector on the 5v supply circuit, If NOT OK, repair the open or shorted 5v supply circuit as required. If OK check for continuity between the left heated seat cushion connector and control module connector on the temperature sensor input circuit. If NOT OK, repair the open or shorted temperature sensor input circuit as required. If OK replace the heated seat control module.

BOTH SEATS INOPERATIVE

If both seats (driver and passenger) fail to heat and the indicator lamps on the heated seat switches for both seats fail to operate, test the heated seat relay and/or fuses. Refer to **Relay Diagnosis and Testing** in the Power Distribution section for heated seat relay diagnosis and testing procedures. If the heated seat relay checks OK, go to Step 1.

(1) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check for continuity between the ground circuit cavity #13 of the heated seat module connector and a good ground. If OK go to Step 2. If NOT OK, repair the open or shorted ground circuit as required.

(2) Back-probe the heated seat module wire harness connector (Fig. 20) , do not disconnect. Check cavity #4 and #6 for battery voltage, voltage should be present, If OK go to Step 3. If NOT OK repair the open or shorted fused B(+) circuit as required.

(3) Back-probe the heated seat module wire harness connector, do not disconnect. Check cavity #2 for approx. 5v, voltage should be present, replace the heated seat control module with a known good module and verify system operation.

REMOVAL

Fig. 21 Heated Seat Module Remove/Install

- 1 - MOUNTING BRACKET
- 2 - HEATED SEAT MODULE
- 3 - MOUNTING TABS
- 4 - PUSH-ON RETAINERS

(1) Working under the center front seat console, cut the tiestrap and remove the two push-on retainers that secure the mounting tabs of the heated seat module to the of the mounting bracket.

(2) Position the driver seat to the full forward and inclined position and working under the center of the front seat, from behind the seat, disconnect the seat wire harness connector from the connector receptacle on the back of the heated seat module (Fig. 21).

(3) Remove the heated seat module from under the front seat.

INSTALLATION

(1) Working under the front seat connect the seat wire harness connector to the connector receptacle on the back of the heated seat module.

(2) Position the driver seat in the full rearward and reclined position, and working under the front of the seat, install the two push-on retainers onto the heated seat module mounting tabs to secure the module to the top of the mounting bracket or install tiestrap.

BATTERY SYSTEM

DESCRIPTION

A single 12-volt battery system is standard factory-installed equipment on gasoline engine equipped models. Models equipped with a diesel engine utilize two 12-volt batteries connected in parallel. All of the

components of the battery system are located within the engine compartment of the vehicle. The service information for the battery system in this vehicle covers the following related components, which are covered in further detail elsewhere in this service manual:

BATTERY SYSTEM (Continued)

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.

- **Battery Cable** - The battery cables connect the battery terminal posts to the vehicle electrical system.

- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray in the engine compartment.

- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules and jump starting procedures, see the owner's manual in the vehicle glove box. Optionally, refer to Lubrication and Maintenance for the recommended battery maintenance schedules and for the proper battery jump starting procedures. While battery charging can be considered a maintenance procedure, the battery charging procedures and related information are located in the standard procedures section of this service manual. This was done because the battery must be fully-charged before any battery system diagnosis or testing procedures can be performed. Refer to Standard procedures for the proper battery charging procedures.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to Charging System for the proper charging system on-board diagnostic test procedures.

MIDTRONICS ELECTRICAL SYSTEM TESTER

The Midtronics® automotive battery and charging system tester is designed to help the dealership technicians diagnose the cause of a defective battery or charging system. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the midtronics electrical system tester.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is faulty.	2. Determine if the charging system is performing to specifications using the Midtronics battery and charging system tester. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Midtronics battery and charging system tester. Refer to the Standard Procedures in this section for additional test procedures. Charge the faulty battery, as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to Battery Cables for the proper battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to Battery System Specifications for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is faulty.	6. Determine the battery cranking capacity using the Midtronics battery and charging system tester. Refer to the Standard Procedures in this section for additional test procedures. Replace the faulty battery, as required.
	7. The starting system is faulty.	7. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM (Continued)

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	<ol style="list-style-type: none"> 1. The battery has an incorrect size or rating for this vehicle. 2. The battery terminal connections are loose or corroded. 3. The electrical system ignition-off draw is excessive. 4. The battery is faulty. 5. The starting system is faulty. 6. The charging system is faulty. 7. Electrical loads exceed the output of the charging system. 8. Slow driving or prolonged idling with high-amperage draw systems in use. 	<ol style="list-style-type: none"> 1. Refer to Battery System Specifications for the proper specifications. Replace an incorrect battery, as required. 2. Refer to Battery Cable for the proper cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required. 3. Repair the faulty starting system, as required. 6. Determine if the charging system is performing to specifications using the Midtronics battery and charging system tester.. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required. 7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads. 8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	<ol style="list-style-type: none"> 1. The battery is faulty. 	<ol style="list-style-type: none"> 1. Test the battery using the Midtronics battery and charging system tester.. Charge or replace the faulty battery, as required.

BATTERY SYSTEM (Continued)

ABNORMAL BATTERY DISCHARGING

Any of the following conditions can result in abnormal battery discharging:

- A faulty or incorrect charging system component. Refer to Charging System for the proper charging system diagnosis and testing procedures.
- A faulty or incorrect battery. Refer to Standard Procedures for the proper battery diagnosis and testing procedures. Refer to Battery System Specifications for the proper specifications.
- A faulty circuit or component causing excessive ignition-off draw.
- Electrical loads that exceed the output of the charging system. This can be due to equipment installed after manufacture, or repeated short trip use.
- A faulty or incorrect starting system component. Refer to Starting System for the proper starting system diagnosis and testing procedures.
- Corroded or loose battery posts and terminal clamps.
- A loose or worn generator drive belt.
- Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw systems in use.

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Clean the battery cable terminal clamps of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution (Fig. 1).

(2) Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

(3) If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film (Fig. 2). Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to Battery System Specifications for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

(4) Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

(5) Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution (Fig. 3).

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.

(2) Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.

(3) Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.

(4) Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.

80accff2

BATTERY SYSTEM (Continued)

SPECIAL TOOLS

**MIDTRONICS BATTERY AND CHARGING SYSTEM
TESTER - Micro420**

BATTERY

DESCRIPTION

A large capacity, low-maintenance storage battery (Fig. 4) is standard factory-installed equipment on this model. Refer to Battery System Specifications for the proper specifications of the factory-installed batteries available on this model. Male post type terminals made of a soft lead material protrude from the top of the molded plastic battery case to provide the means for connecting the battery to the vehicle electrical system. The battery positive terminal post is physically larger in diameter than the negative terminal post to ensure proper battery connection. The letters **POS** and **NEG** are also molded into the top of the battery case adjacent to their respective positive and negative terminal posts for identification confirmation. Refer to Battery Cables for more information on the battery cables that connect the battery to the vehicle electrical system.

The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups that are connected with lead straps to the positive terminal post, and negatively charged plate groups that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive

Fig. 4 Low-Maintenance Battery - Typical

- 10 - PLATE GROUPS
- 11 - LOW-MAINTENANCE BATTERY

and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

The factory-installed battery has a built-in test indicator (hydrometer). The color visible in the sight glass of the indicator will reveal the battery condition. Refer to Standard Procedures for the proper built-in indicator test procedures. **The factory-installed low-maintenance battery has non-removable battery cell caps.** Water cannot be added to this battery. The battery is not sealed and has vent holes in the cell caps. The chemical composition of the metal coated plates within the low-maintenance battery reduces battery gassing and water loss, at normal charge and discharge rates. Therefore, the battery should not require additional water in normal service. Rapid loss of electrolyte can be caused by an overcharging condition. Be certain to diagnose the charging system before returning the vehicle to service. (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING - BATTERY

The battery must be completely charged and the top, posts and terminal clamps should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for

BATTERY (Continued)

the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

The condition of a battery is determined by two criteria:

- **State-Of-Charge** - This can be determined by checking the specific gravity of the battery electrolyte (built-in indicator test or hydrometer test), or by checking the battery voltage (open-circuit voltage test).

- **Cranking Capacity** - This can be determined by performing a battery load test, which measures the ability of the battery to supply high-amperage current.

First, determine the battery state-of-charge. This can be done in one of three ways. If the battery has a built-in test indicator, perform the built-in indicator test to determine the state-of-charge. If the battery has no built-in test indicator but does have removable cell caps, perform the hydrometer test to determine the state-of-charge. If the battery cell caps are not removable, or a hydrometer is not available, perform the open-circuit voltage test to determine the state-of-charge. Refer to open-circuit voltage test in the Standard Procedures section of this group.

Second, determine the battery cranking capacity by performing a load test. The battery must be charged before proceeding with a load test if:

- The battery built-in test indicator has a black or dark color visible.
- The temperature corrected specific gravity of the battery electrolyte is less than 1.235.
- The battery open-circuit voltage is less than 12.4 volts.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

A battery is fully-charged when:

- All battery cells are gassing freely during charging.
- A green color is visible in the sight glass of the battery built-in test indicator.
- Three corrected specific gravity tests, taken at one-hour intervals, indicate no increase in the specific gravity of the battery electrolyte.
- Open-circuit voltage of the battery is 12.4 volts or greater.

STANDARD PROCEDURE

STANDARD PROCEDURE - BATTERY CHARGING

Battery charging can be performed fast or slow, in terms of time. **Slow** battery charging is the best means of restoring a battery to full potential. Fast battery charging should only be performed when absolutely necessary due to time restraints. A battery is fully-charged when:

- All of the battery cells are gassing freely during battery charging.
- A green color is visible in the sight glass of the battery built-in test indicator.
- Three hydrometer tests, taken at one-hour intervals, indicate no increase in the temperature-corrected specific gravity of the battery electrolyte.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: NEVER EXCEED TWENTY AMPERES WHEN CHARGING A COLD (-1° C [30° F] OR LOWER) BATTERY. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

BATTERY (Continued)

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

NOTE: Models equipped with the diesel engine option are equipped with two 12-volt batteries, connected in parallel (positive-to-positive and negative-to-negative). In order to ensure proper charging of each battery, these batteries **MUST** be disconnected from each other, as well as from the vehicle electrical system, while being charged.

Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

After the battery has been charged to 12.4 volts or greater, perform a load test to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 5). If the reading is below ten volts, the battery charging current

will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

898A-12

Fig. 5 Voltmeter - Typical

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.

BATTERY (Continued)

• **Temperature** - A longer time will be needed to charge a battery at -18°C (0°F) than at 27°C (80°F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).

• **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.

• **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21°C (70°F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

STANDARD PROCEDURE - BUILT-IN INDICATOR TEST

An indicator (hydrometer) built into the top of the battery case provides visual information for battery testing (Fig. 6). Like a hydrometer, the built-in indicator measures the specific gravity of the battery electrolyte. The specific gravity of the electrolyte reveals the battery state-of-charge; however, it will not reveal the cranking capacity of the battery. A load test must be performed to determine the battery cranking capacity. Refer to Standard Procedures for the proper battery load test procedures.

Before testing, visually inspect the battery for any damage (a cracked case or cover, loose posts, etc.) that would cause the battery to be faulty. In order to obtain correct indications from the built-in indicator, it is important that the battery be level and have a

J948A-11

Fig. 6 Built-In Indicator

- 1 - SIGHT GLASS
- 2 - BATTERY TOP
- 3 - GREEN BALL
- 4 - PLASTIC ROD

clean sight glass. Additional light may be required to view the indicator. **Do not use open flame as a source of additional light.**

To read the built-in indicator, look into the sight glass and note the color of the indication (Fig. 7). The battery condition that each color indicates is described in the following list:

• **Green** - Indicates 75% to 100% battery state-of-charge. The battery is adequately charged for further testing or return to service. If the starter will not crank for a minimum of fifteen seconds with a fully-charged battery, the battery must be load tested. Refer to Standard Procedures for the proper battery load test procedures.

• **Black or Dark** - Indicates 0% to 75% battery state-of-charge. The battery is inadequately charged and must be charged until a green indication is visible in the sight glass (12.4 volts or more), before the battery is tested further or returned to service. Refer to Standard Procedures for the proper battery charging procedures. Also refer to Diagnosis and Testing for more information on the possible causes of the discharged battery condition.

• **Clear or Bright** - Indicates a low battery electrolyte level. The electrolyte level in the battery is below the built-in indicator. A maintenance-free battery with non-removable cell caps must be replaced if the electrolyte level is low. Water must be added to a low-maintenance battery with removable cell caps before it is charged. Refer to Standard Procedures for the proper battery filling procedures. A low electrolyte level may be caused by an overcharging condition. Refer to Charging System for the proper charging system diagnosis and testing procedures.

BATTERY (Continued)

Fig. 7 Built-In Indicator Sight Glass Chart

STANDARD PROCEDURE - HYDROMETER TEST

The hydrometer test reveals the battery state-of-charge by measuring the specific gravity of the electrolyte. **This test cannot be performed on maintenance-free batteries with non-removable cell caps.** If the battery has non-removable cell caps, refer to Diagnosis and Testing for alternate methods of determining the battery state-of-charge.

Specific gravity is a comparison of the density of the battery electrolyte to the density of pure water. Pure water has a specific gravity of 1.000, and sulfuric acid has a specific gravity of 1.835. Sulfuric acid makes up approximately 35% of the battery electrolyte by weight, or 24% by volume. In a fully-charged battery the electrolyte will have a temperature-corrected specific gravity of 1.260 to 1.290. However, a specific gravity of 1.235 or above is satisfactory for the battery to be load tested and/or returned to service.

Before testing, visually inspect the battery for any damage (a cracked case or cover, loose posts, etc.) that would cause the battery to be faulty. Then remove the battery cell caps and check the electrolyte level. Add distilled water if the electrolyte level is below the top of the battery plates. Refer to Battery System Cleaning for the proper battery inspection procedures.

See the instructions provided by the manufacturer of the hydrometer for recommendations on the correct use of the hydrometer that you are using. Remove only enough electrolyte from the battery cell so that the float is off the bottom of the hydrometer barrel with pressure on the bulb released. To read the hydrometer correctly, hold it with the top surface of the electrolyte at eye level (Fig. 8).

CAUTION: Exercise care when inserting the tip of the hydrometer into a battery cell to avoid damaging the plate separators. Damaged plate separators can cause early battery failure.

80a493b9

Fig. 8 Hydrometer - Typical

- 1 - BULB
- 2 - SURFACE COHESION
- 3 - SPECIFIC GRAVITY READING
- 4 - TEMPERATURE READING
- 5 - HYDROMETER BARREL
- 6 - FLOAT

Hydrometer floats are generally calibrated to indicate the specific gravity correctly only at 26.7° C. When testing the specific gravity at any other temperature, a correction factor is required. The correction factor is approximately a specific gravity value of 0.004, which may also be identified as four points of specific gravity. For each 5.5° C above 26.7° C, add four points. For each 5.5° C below 26.7° C, subtract four points. Always correct the specific gravity for temperature variation.

EXAMPLE: A battery is tested at -12.2° C and has a specific gravity of 1.240. Determine the actual specific gravity as follows:

(1) Determine the number of degrees above or below 26.7° C: $26.7^{\circ} \text{ C} + -12.2^{\circ} \text{ C} = 14.5^{\circ} \text{ C below the } 26.7^{\circ} \text{ C specification}$

(2) Divide the result from Step 1 by 5.5° C: $14.5^{\circ} \text{ C} \div 5.5^{\circ} \text{ C} = 2.64$

(3) Multiply the result from Step 2 by the temperature correction factor (0.004): $2.64 \times 0.004 = 0.01$

(4) The temperature at testing was below 26.7° C; therefore, the temperature correction factor is subtracted: $1.240 - 0.01 = 1.23$

(5) The corrected specific gravity of the battery cell in this example is 1.23.

BATTERY (Continued)

Test the specific gravity of the electrolyte in each battery cell. If the specific gravity of all cells is above 1.235, but the variation between cells is more than fifty points (0.050), the battery should be replaced. If the specific gravity of one or more cells is less than 1.235, charge the battery at a rate of approximately five amperes. Continue charging the battery until three consecutive specific gravity tests, taken at one-hour intervals, are constant. If the cell specific gravity variation is more than fifty points (0.050) at the end of the charge period, replace the battery.

When the specific gravity of all cells is above 1.235, and the cell variation is less than fifty points (0.050), the battery may be load tested to determine its cranking capacity. Refer to Standard Procedures for the proper battery load test procedures.

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

(1) Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.

(2) Disconnect and isolate both battery cables, negative cable first.

(3) Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage (Fig. 9).

Fig. 9 Testing Open-Circuit Voltage - Typical

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

STANDARD PROCEDURE - LOAD TEST

A battery load test will verify the battery cranking capacity. The test is based on the Cold Cranking Amperage (CCA) rating of the battery. To determine the battery CCA rating, see the label affixed to the battery case or refer to Battery Specifications for the proper factory-installed specifications.

Before proceeding with this test, completely charge the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

(1) Disconnect and isolate both battery cables, negative cable first. The battery top and posts should be clean (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).

(2) Connect a suitable volt-ammeter-load tester (Fig. 10) to the battery posts (Fig. 11). See the instructions provided by the manufacturer of the tester you are using. Check the open-circuit voltage (no load) of the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE). The battery open-circuit voltage must be 12.4 volts or greater.

Fig. 10 Volt-Ammeter-Load Tester - Typical

BATTERY (Continued)

**Fig. 11 Volt-Ammeter-Load**

- 1 - INDUCTION AMMETER CLAMP
2 - NEGATIVE CLAMP
3 - POSITIVE CLAMP

(3) Rotate the load control knob (carbon pile rheostat) to apply a 300 ampere load to the battery for fifteen seconds, then return the control knob to the Off position (Fig. 12). This will remove the surface charge from the battery.

**Fig. 12 Remove Surface Charge from Battery**

(4) Allow the battery to stabilize to open-circuit voltage. It may take up to five minutes for the battery voltage to stabilize.

(5) Rotate the load control knob to maintain a load equal to 50% of the CCA rating of the battery (Fig. 13). After fifteen seconds, record the loaded voltage reading, then return the load control knob to the Off position.

(6) The voltage drop will vary with the battery temperature at the time of the load test. The battery temperature can be estimated by using the ambient temperature during the past several hours. If the battery has been charged, boosted, or loaded a few minutes prior to the test, the battery will be somewhat warmer. See the Load Test Temperature Table for the proper loaded voltage reading.

**Fig. 13 Load 50% CCA Rating - Note Voltage - Typical**

LOAD TEST TEMPERATURE TABLE		
Minimum Voltage	Temperature	
	°F	°C
9.6 volts	70° and above	21° and above
9.5 volts	60°	16°
9.4 volts	50°	10°
9.3 volts	40°	4°
9.1 volts	30°	-1°
8.9 volts	20°	-7°
8.7 volts	10°	-12°
8.5 volts	0°	-18°

(7) If the voltmeter reading falls below 9.6 volts, at a minimum battery temperature of 21° C (70° F), the battery is faulty and must be replaced.

STANDARD PROCEDURE - IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Junction Block. This will reduce battery discharging.

BATTERY (Continued)

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be

charged and returned to service after the excessive IOD condition has been corrected.

(1) Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliamperes	N/A
Central Timer Module (CTM)	No	4.75 milliamperes (max.)	N/A
Powertrain Control Module (PCM)	No	0.95 milliamperes	N/A
ElectroMechanical Instrument Cluster (EMIC)	No	0.44 milliamperes	N/A
Combination Flasher	No	0.08 milliamperes	N/A

(2) Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.

(3) Disconnect the battery negative cable.

(4) Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

(5) After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and

then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in this service manual for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliamperes scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliamperes scale selected, or the multi-meter may be damaged.

(6) Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds

BATTERY (Continued)

thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

STANDARD PROCEDURE - USING MIDTRONICS ELECTRICAL TESTER

Fig. 14 MIDTRONICS BATTERY AND CHARGING SYSTEM TESTER - Micro420

Always use the Midtronics Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: ALWAYS WEAR APPROPRIATE EYE PROTECTION AND USE EXTREME CAUTION WHEN WORKING WITH BATTERIES.

BATTERY TESTING

(1) If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.

(2) If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position**

is at the battery terminal. If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.

(3) Connect the tester to (Fig. 14) the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (-).

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

NOTE: When testing the battery in a PT Cruiser, always test at the battery terminals

(4) Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.

(5) If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

(6) While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

BATTERY (Continued)

REMOVAL

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Loosen the battery negative cable terminal clamp pinch-bolt hex nut.

(3) Disconnect the battery negative cable terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post (Fig. 15).

Fig. 15 Remove Battery Cable Terminal Clamp - Typical

- 1 - BATTERY
- 2 - BATTERY TERMINAL PULLER

(4) Loosen the battery positive cable terminal clamp pinch-bolt hex nut.

(5) Disconnect the battery positive cable terminal clamp from the battery positive terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.

(6) Remove the battery hold downs from the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY HOLDDOWN - REMOVAL).

WARNING: WEAR A SUITABLE PAIR OF RUBBER GLOVES (NOT THE HOUSEHOLD TYPE) WHEN REMOVING A BATTERY BY HAND. SAFETY GLASSES SHOULD ALSO BE WORN. IF THE BATTERY IS CRACKED OR LEAKING, THE ELECTROLYTE CAN BURN THE SKIN AND EYES.

(7) Remove the battery from the battery tray.

INSTALLATION

(1) Clean and inspect the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).

(2) Position the battery onto the battery tray. Ensure that the battery positive and negative terminal posts are correctly positioned. The battery cable terminal clamps must reach the correct battery terminal post without stretching the cables (Fig. 16).

Fig. 16 Battery Cables - Typical

- 1 - EYELET
- 2 - NUT
- 3 - POWER DISTRIBUTION CENTER
- 4 - POSITIVE CABLE
- 5 - SCREW
- 6 - NEGATIVE CABLE
- 7 - EYELET
- 8 - CLIP

(3) Reinstall the battery hold downs onto the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY HOLDDOWN - INSTALLATION).

CAUTION: Be certain that the battery cable terminal clamps are connected to the correct battery terminal posts. Reversed battery polarity may damage electrical components of the vehicle.

(4) Clean the battery cable terminal clamps and the battery terminal posts.

(5) Reconnect the battery positive cable terminal clamp to the battery positive terminal post. Tighten the terminal clamp pinch-bolt hex nut to 4 N·m (35 in. lbs.).

(6) Reconnect the battery negative cable terminal clamp to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 4 N·m (35 in. lbs.).

(7) Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.

BATTERY HOLDDOWN

DESCRIPTION

Fig. 17 Battery Hold Downs - Typical

- 1 - BATTERY TRAY
- 2 - U-NUT (2)
- 3 - BATTERY
- 4 - BOLT (2)
- 5 - HOLD DOWN STRAP

The battery hold down hardware (Fig. 17) includes two bolts, two U-nuts and a hold down strap. The battery hold down bracket consists of a formed steel rod with a stamped steel angle bracket welded to each end. The hold down bracket assembly is then plastic-coated for corrosion protection. Models equipped with the optional diesel engine have a second battery installed in a second battery tray on the right side of the engine compartment. The hold down hardware for the right side battery is mirror image of the hold down hardware used for the left side battery.

When installing a battery into the battery tray, be certain that the hold down hardware is properly installed and that the fasteners are tightened to the proper specifications. Improper hold down fastener tightness, whether too loose or too tight, can result in damage to the battery, the vehicle or both.

OPERATION

The battery holddown secures the battery in the battery tray. This holddown is designed to prevent battery movement during the most extreme vehicle operation conditions. Periodic removal and lubrica-

tion of the battery holddown hardware is recommended to prevent hardware seizure at a later date.

CAUTION: Never operate a vehicle without a battery holddown device properly installed. Damage to the vehicle, components and battery could result.

REMOVAL

All of the battery hold down hardware except for the outboard U-nut can be serviced without removal of the battery or the battery tray. The battery tray must be removed from the vehicle to service the outboard U-nut. If the outboard U-nut requires service replacement, refer to **Battery Tray** in the index of this service manual for the location of the proper battery tray removal and installation procedures.

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Loosen the battery negative cable terminal clamp pinch-bolt hex nut.

(3) Disconnect the battery negative cable terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.

(4) Remove the two battery hold down bolts from the battery hold down strap (Fig. 18).

Fig. 18 Left Battery Hold Downs Remove/Install - Typical for Right Battery

- 1 - BATTERY TRAY
- 2 - U-NUT (2)
- 3 - BATTERY
- 4 - BOLT (2)
- 5 - HOLD DOWN STRAP

BATTERY HOLDDOWN (Continued)

(5) Remove the battery hold down strap from the top of the battery case.

INSTALLATION

(1) Clean and inspect the battery hold down hardware (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).

(2) Position the battery hold down strap across the top of the battery case.

(3) Install and tighten the two battery hold down bolts through the holes on each end of the hold down strap and into the U-nuts on each side of the battery tray. Tighten the bolts to 4 N·m (35 in. lbs.).

(4) Reconnect the battery negative cable terminal clamp to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 4 N·m (35 in. lbs.).

BATTERY CABLE

DESCRIPTION

Fig. 19 Battery Cables - Typical

- 1 - EYELET
- 2 - NUT
- 3 - POWER DISTRIBUTION CENTER
- 4 - POSITIVE CABLE
- 5 - SCREW
- 6 - NEGATIVE CABLE
- 7 - EYELET
- 8 - CLIP

The battery cables (Fig. 19) are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. Refer to **Wiring Diagrams** for the location of the proper battery cable wire gauge information.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery positive cable wire harness or the battery negative cable wire harness, which may include portions of the wiring circuits for the generator and other components on some models.

GASOLINE ENGINE BATTERY CABLES

Gasoline engine models feature a stamped brass clamping type female battery terminal crimped onto one end of the battery cable wire and then solder-dipped. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. The battery positive cable also includes a red molded rubber protective cover for the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.

DIESEL ENGINE BATTERY CABLES

Diesel engine models feature a clamping type female battery terminal made of soft lead die cast onto one end of the battery cable wire. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. The pinch-bolt on the left side battery positive cable female terminal clamp also has a stud extending from the head of the bolt. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a return path for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on

BATTERY CABLE (Continued)

the top of the battery. The eyelet terminals secured to the ends of the battery cable wires opposite the female battery terminal clamps provide secure and reliable connection of the battery to the vehicle electrical system.

GASOLINE ENGINE

The battery positive cable terminal clamp is crimped onto the ends of two wires. One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Power Distribution Center (PDC), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp is also crimped onto the ends of two wires. One wire has an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a stud on the front of the left engine cylinder head. The other wire has an eyelet terminal that connects the battery negative cable to the vehicle body through a ground screw on the left front fender inner shield, just ahead of the battery. An additional ground wire with two eyelet terminals is used to provide ground to the vehicle frame. One eyelet terminal of this ground wire is installed under the head of the battery negative cable terminal clamp pinch-bolt, and the other eyelet terminal is secured with a ground screw to the outer surface of the left frame rail, below the battery.

DIESEL ENGINE

The left battery positive cable terminal clamp is die cast onto the ends of two wires. One wire has an eyelet terminal that connects the left battery positive cable to the B(+) terminal stud of the Power Distribution Center (PDC), and the other wire has an eyelet terminal that connects the left battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The right battery positive cable terminal clamp is die cast onto the end of a single wire. The eyelet terminal on the other end of the right battery positive cable is connected to the stud on the pinch-bolt of the left battery positive cable terminal clamp. This stud also provides a connection point for the eyelet terminals from the fuel heater relay and intake air heater relay jumper harness take outs. All of these eyelet terminals are secured to the left battery positive cable terminal clamp pinch-bolt stud with a single hex nut.

The left battery negative cable terminal clamp is die cast onto the ends of two wires. One wire has an eyelet terminal that connects the left battery negative cable to the vehicle powertrain through a ground screw on the left side of the engine block, below the power steering and vacuum pumps. The other wire has an eyelet terminal that connects the left battery negative cable to the vehicle body through a ground screw on the left front fender inner shield, just ahead of the left battery. An additional ground wire with two eyelet terminals is used to provide ground to the vehicle frame. One eyelet terminal of this ground wire is installed under the nut of the left battery negative cable terminal clamp pinch-bolt, and the other eyelet terminal is secured with a ground screw to the outer surface of the left frame rail, below the left battery. The right battery negative cable terminal is also die cast onto the ends of two wires. One wire has an eyelet terminal that connects the right battery negative cable to the vehicle powertrain through a ground screw on the right side of the engine block, just forward of the right engine mount. The other wire has an eyelet terminal that connects the right battery negative cable to the vehicle body through a ground screw on the right front fender inner shield, just behind the right battery.

DIAGNOSIS AND TESTING - BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cables. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

BATTERY CABLE (Continued)

VOLTAGE DROP TEST

WARNING: MODELS EQUIPPED WITH THE DIESEL ENGINE OPTION ALSO HAVE AN AUTOMATIC SHUTDOWN (ASD) RELAY LOCATED IN THE POWER DISTRIBUTION CENTER (PDC), IN THE ENGINE COMPARTMENT. HOWEVER, REMOVAL OF THE ASD RELAY MAY NOT PREVENT THE DIESEL ENGINE FROM STARTING. BE CERTAIN TO ALSO DISCONNECT THE FUEL SHUTDOWN SOLENOID WIRE HARNESS CONNECTOR ON MODELS WITH A DIESEL ENGINE. FAILURE TO DO SO MAY RESULT IN PERSONAL INJURY.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove the Automatic ShutDown (ASD) relay. The ASD relay is located in the Power Distribution Center (PDC), in the engine compartment. See the fuse and relay layout label affixed to the underside of the PDC cover for ASD relay identification and location. To prevent a diesel engine from starting, disconnect the fuel shutdown solenoid wire harness connector (Fig. 20).

(1) Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp (Fig. 21). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

NOTE: If the vehicle is equipped with a dual battery system, Step 1 must be performed twice, once for each battery.

(2) Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp (Fig. 22). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If

voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

BATTERY CABLE (Continued)

NOTE: If the vehicle is equipped with a dual battery system, Step 2 must be performed twice, once for each battery.

Fig. 22 Test Battery Positive Connection Resistance - Typical

- 1 - VOLT METER
2 - BATTERY

(3) Connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud (Fig. 23). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

NOTE: If the vehicle is equipped with a dual battery system, Step 3 must be performed on the driver side battery only.

(4) Connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block (Fig. 24). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

NOTE: If the vehicle is equipped with a dual battery system, Step 4 must be performed twice, once for each battery.

REMOVAL

POSITIVE CABLE REMOVAL - GASOLINE ENGINE

Both the battery negative cable and the battery positive cable are serviced in the battery wire harness. If either battery cable is damaged or faulty, the battery wire harness assembly must be replaced.

- (1) Remove the positive battery cable from the battery.
- (2) Remove the cover from the PDC.
- (3) Remove the positive battery cable from the PDC.

BATTERY CABLE (Continued)

- (4) Disconnect the starter motor signal wire harness connector, located on the PDC housing.
- (5) Disengage wire harness assembly pushpin retainers.
- (6) From under the vehicle, disengage wire harness assembly pushpin retainers.
- (7) Remove the positive battery cable from the starter motor B+ terminal stud.
- (8) Remove the starter motor trigger wire from the starter motor.
- (9) Remove the positive cable wire harness assembly from the vehicle.

NEGATIVE CABLE REMOVAL - GASOLINE ENGINE

Both the battery negative cable and the battery positive cable are serviced in the battery wire harness. If either battery cable is damaged or faulty, the battery wire harness unit must be replaced.

- (1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
- (2) Loosen the battery negative cable terminal clamp pinch-bolt hex nut.
- (3) Disconnect the battery negative cable terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
- (4) Remove the negative cable jumper from the left side of the radiator closure panel.
- (5) Remove the negative cable jumper from the left side of the frame assembly.
- (6) Remove the PDC cover and remove the generator output wire from the PDC.
- (7) Following the wire, remove the pushpin retainers holding the wire assembly in place.
- (8) Remove the negative cable eyelet from the power steering pump pivot bolt.
- (9) Remove the generator output wire from the generator.
- (10) Remove the negative battery cable assembly, by fishing out from under the compressor mounting bracket, if equipped.

INSTALLATION**POSITIVE CABLE INSTALLATION - GASOLINE ENGINE**

- (1) Position the battery wire harness into the engine compartment.
- (2) Install the positive battery cable on the battery.
- (3) Install the positive battery cable on the PDC.
- (4) Install the cover on the PDC.
- (5) Connect the starter motor signal wire harness connector, located on the PDC housing.

- (6) Install wire harness assembly pushpin retainers in their original position.

- (7) From under the vehicle, install wire harness assembly pushpin retainers.

- (8) Install and tighten the nut that secures the battery positive cable eyelet terminal to the B(+) terminal stud on the starter solenoid. Tighten the nut to 10 N·m (90 in. lbs.).

- (9) Connect the starter motor trigger wire on the starter motor.

- (10) Reconnect the battery positive cable terminal clamp to the battery positive terminal post. Tighten the terminal clamp pinch-bolt hex nut to 4 N·m (35 in. lbs.).

- (11) Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.

NEGATIVE CABLE INSTALLATION - GASOLINE ENGINE

- (1) Position the battery wire harness into the engine compartment and under the compressor mounting bracket, if equipped.

- (2) Install and tighten the nut that secures the battery negative cable ground eyelet terminal to the stud on the power steering pump pivot bolt.

- (3) Install the generator output cable eyelet terminal onto the generator output terminal stud.

- (4) Install and tighten the nut that secures the generator output cable eyelet terminal to the generator output terminal stud. Tighten the nut to 8.4 N·m (75 in. lbs.).

- (5) Position the cover for the generator output terminal stud housing onto the back of the generator and snap it into place.

- (6) Secure wire assembly in place with pushpin retainers in their original positions.

- (7) Install and tighten the screw that secures the battery negative cable eyelet terminal to the radiator closure panel, near the battery. Tighten the screw to 40 in. lbs.

- (8) Install and tighten the screw that secures the battery negative cable eyelet terminal to the left front side of the frame assembly. Tighten the screw to 80 in. lbs.

- (9) Install and tighten the nut that secures the battery positive cable eyelet terminal and the generator output cable eyelet terminal to the PDC B(+) terminal stud. Tighten the nut to 80 in. lbs.

- (10) Reconnect the battery negative cable terminal clamp to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 35 in. lbs.

- (11) Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.

BATTERY TRAY

DESCRIPTION

Fig. 25 Battery Tray - Typical

- 1 - STUD PLATE (2)
- 2 - NUT AND WASHER (4)
- 3 - FRONT WHEELHOUSE INNER PANEL
- 4 - SPEED CONTROL SERVO
- 5 - TRAY
- 6 - SCREW AND WASHER (2)
- 7 - BATTERY TEMPERATURE SENSOR
- 8 - U-NUT (2)
- 9 - FENDER INNER SHIELD

The battery is mounted in a molded plastic tray (Fig. 25) with an integral support located in the left front corner of the engine compartment. A U-nut held in a molded formation on each side of the battery tray provides anchor points for the battery hold down bolts. The battery tray is secured on the outboard side to the inner fender shield by two hex screws with washers, and from underneath the integral battery tray support is secured to the left front wheelhouse inner panel by two stud plates. Each stud plate has two studs and is secured by two nuts with washers. The stud plate that secures the front of the battery tray support to the wheelhouse inner panel is installed through the wheelhouse panel from the top. The stud plate that secures the rear of the battery tray support to the wheelhouse inner panel is installed through the wheelhouse panel from the bottom.

A hole in the bottom of the battery tray is fitted with a battery temperature sensor (Refer to 8 - ELECTRICAL/CHARGING/BATTERY TEMPERATURE SENSOR - DESCRIPTION). Models that are equipped with an optional vehicle speed control sys-

tem have the speed control servo secured to the integral battery tray support.

Models that are equipped with the diesel engine option have a second battery tray located in the right front corner of the engine compartment. This second battery tray and its mounting are mirror image of the standard equipment left battery tray. However, the right battery tray and support have no provisions for a battery temperature sensor or a speed control servo mounting bracket.

OPERATION

The battery tray provides a secure mounting location and supports the battery. On some vehicles, the battery tray also provides the anchor point/s for the battery holddown hardware. The battery tray and the battery holddown hardware combine to secure and stabilize the battery in the engine compartment, which prevents battery movement during vehicle operation. Unrestrained battery movement during vehicle operation could result in damage to the vehicle, the battery, or both.

REMOVAL

(1) Remove the battery from the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(2) If the left battery tray is being removed, remove the battery temperature sensor from the left battery tray (Refer to 8 - ELECTRICAL/CHARGING/BATTERY TEMPERATURE SENSOR - REMOVAL).

(3) Remove the two screws with washers that secure the outboard side of the battery tray to the inner fender shield (Fig. 26).

(4) From the engine compartment, remove the two nuts with washers that secure the rear of the battery tray support to the two studs that extend through the top of the front wheelhouse inner panel.

(5) From inside the front fender wheelhouse, remove the two nuts with washers that secure the front of the battery tray support to the two studs that extend through the underside of the front wheelhouse inner panel.

(6) From inside the front fender wheelhouse, remove the stud plate that secures the rear of the battery tray support from the underside of the front wheelhouse inner panel.

(7) From the engine compartment, remove the battery tray and the stud plate that secures the front of the battery tray support from the front wheelhouse inner panel as a unit.

(8) If the vehicle is equipped with the optional vehicle speed control package, the speed control servo must be removed from the left battery tray support to complete battery tray removal.

BATTERY TRAY (Continued)

Fig. 26 Left Battery Tray Remove/Install - Typical for Right Battery Tray

- 1 - STUD PLATE (2)
- 2 - NUT AND WASHER (4)
- 3 - FRONT WHEELHOUSE INNER PANEL
- 4 - SPEED CONTROL SERVO
- 5 - TRAY
- 6 - SCREW AND WASHER (2)
- 7 - BATTERY TEMPERATURE SENSOR
- 8 - U-NUT (2)
- 9 - FENDER INNER SHIELD

INSTALLATION

(1) Clean and inspect the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).

(2) If the vehicle is equipped with the optional vehicle speed control package, the speed control servo must be installed onto the left battery tray support to complete battery tray installation.

(3) Install the stud plate onto the front of the battery tray support.

(4) From the engine compartment, position the battery tray and the stud plate that secures the front of the battery tray support onto the front wheelhouse inner panel as a unit.

(5) From inside the front fender wheelhouse, loosely install the two nuts with washers that secure the front of the battery tray support to the two studs that extend through the underside of the front wheelhouse inner panel.

(6) From inside the front fender wheelhouse, position the stud plate that secures the rear of the battery tray support onto the underside of the front wheelhouse inner panel.

(7) From the engine compartment, loosely install the two nuts with washers that secure the rear of the battery tray support to the two studs that extend through the top of the front wheelhouse inner panel.

(8) Install and tighten the two screws with washers that secure the outboard side of the battery tray to the inner fender shield. Tighten the screws to 15.8 N·m (140 in. lbs.).

(9) Final tighten the four nuts with washers that secure the battery tray support to the stud plates on the front wheelhouse inner panel. Tighten the nuts to 15.8 N·m (140 in. lbs.).

(10) If the left battery tray is being installed, install the battery temperature sensor onto the left battery tray (Refer to 8 - ELECTRICAL/CHARGING/BATTERY TEMPERATURE SENSOR - INSTALLATION).

(11) Install the battery onto the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

DESCRIPTION	27	OPERATION	30

CHARGING

DESCRIPTION

The charging system consists of:

- Generator
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch
- Battery (refer to 8, Battery for information)
- Battery temperature sensor
- Check Gauges Lamp (if equipped)
- Voltmeter (refer to 8, Instrument Panel and Gauges for information)
- Wiring harness and connections (refer to 8, Wiring Diagrams for information)

OPERATION

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. When the ASD relay is on, voltage is supplied to the ASD relay sense circuit at the PCM. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The amount of direct current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

A battery temperature sensor, located in the battery tray housing, is used to sense battery temperature. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the

ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects. Refer to On-Board Diagnostics in 25, Emission Control System for more DTC information and a list of codes.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage**, engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The signal to activate the lamp is sent via the CCD bus circuits. The lamp is located on the instrument panel. Refer to 8, Instrument Panel and Gauges for additional information.

DIAGNOSIS AND TESTING - CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running

CHARGING (Continued)

- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test in 8, Battery for more information.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRB® scan tool. Perform the following inspections before attaching the scan tool.

(1) Inspect the battery condition. Refer to 8, Battery for procedures.

(2) Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.

(3) Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.

(4) Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications.

(5) Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications in 7, Cooling System.

(6) Inspect automatic belt tensioner (if equipped). Refer to 7, Cooling System for information.

(7) Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

BATTERY TEMPERATURE
SENSOR

DESCRIPTION

The Battery Temperature Sensor (BTS) is attached to the battery tray located under the battery.

OPERATION

The BTS is used to determine the battery temperature and control battery charging rate. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. System voltage will be higher at colder temperatures and is gradually reduced at warmer temperatures.

The PCM sends 5 volts to the sensor and is grounded through the sensor return line. As temperature increases, resistance in the sensor decreases and the detection voltage at the PCM increases.

The BTS is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled, depending upon BTS input (for example, disable purge and enable Leak Detection Pump (LDP) and O₂ sensor heater tests). Most OBD II monitors are disabled below 20°F.

REMOVAL

The battery temperature sensor is located under the vehicle battery (Fig. 1) and is attached (snapped into) a mounting hole on battery tray. On models equipped with a diesel engine (dual batteries), only one sensor is used. The sensor is located under the battery on drivers side of vehicle.

(1) Remove battery. Refer to 8, Battery for procedures.

BATTERY TEMPERATURE SENSOR (Continued)

(2) Disconnect sensor pigtail harness from engine wire harness.

(3) Pry sensor straight up from battery tray mounting hole.

INSTALLATION

The battery temperature sensor is located under the vehicle battery (Fig. 1) and is attached (snapped into) a mounting hole on battery tray. On models equipped with a diesel engine (dual batteries), only one sensor is used. The sensor is located under the battery on drivers side of vehicle.

(1) Feed pigtail harness through mounting hole in top of battery tray and press sensor into top of tray (snaps in).

(2) Connect pigtail harness.

(3) Install battery. Refer to 8A, Battery for procedures.

GENERATOR

DESCRIPTION

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The Y type stator winding connections deliver the induced alternating current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified direct current is delivered to the vehicle electrical system through the generator battery terminal.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. Refer to Generator Ratings in the Specifications section at the back of this group for amperage ratings and part numbers.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

REMOVAL

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

(1) Disconnect negative battery cable at battery. Diesel Engines: Disconnect both negative battery cables at both batteries.

(2) Remove generator drive belt. Refer to 7, Cooling System for procedure.

(3) Gasoline Engines: Remove generator pivot and mounting bolts/nut (Fig. 2) or (Fig. 3).

(4) Diesel Engines: Loosen (but do not remove) generator mounting bracket-to-engine bolt (Fig. 4).

(5) All Engines: Remove upper generator mounting bolt and lower mounting bolt/nut.

(6) Remove B+ terminal mounting nut at rear of generator (Fig. 5) or (Fig. 6). Disconnect terminal from generator.

(7) Disconnect field wire connector at rear of generator by pushing on connector tab.

(8) Remove generator from vehicle.

GENERATOR (Continued)

INSTALLATION

(1) Position generator to engine and snap field wire connector into rear of generator.

(2) Install B+ terminal eyelet to generator stud. Tighten mounting nut to 12 N·m (108 in. lbs.) torque.

(3) Install generator mounting fasteners and tighten as follows:

- Generator mounting bolt—All gas powered engines—41 N·m (30 ft. lbs.) torque.
- Generator pivot bolt/nut—All gas powered engines—41 N·m (30 ft. lbs.) torque.
- Generator mounting bolt—Diesel powered engines—54 N·m (40 ft. lbs.) torque.
- Generator pivot bolt/nut—Diesel powered engines—54 N·m (40 ft. lbs.) torque.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in Group 7, Cooling System.

(4) Install generator drive belt. Refer to 7, Cooling System for procedure.

(5) Install negative battery cable(s) to battery(s).

VOLTAGE REGULATOR

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of direct current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generator's second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature (refer to Battery Temperature Sensor for more information). It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the ground side of the generator field up to 100 times per second (100Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

DESCRIPTION	37	INSTALLATION	42

STARTING

DESCRIPTION

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliamperere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC). Refer to Emission Control. See Diagnos-

tic Trouble Codes for additional information and a list of codes.

OPERATION

The starting system components form two separate circuits. A high-amperage feed circuit that feeds the starter motor between 150 and 350 amperes (700 amperes - diesel engine), and a low-amperage control circuit that operates on less than 20 amperes. The high-amperage feed circuit components include the battery, the battery cables, the contact disc portion of the starter solenoid, and the starter motor. The low-amperage control circuit components include the ignition switch, the clutch pedal position switch (manual transmission), the park/neutral position switch (automatic transmission), the starter relay, the electromagnetic windings of the starter solenoid, and the connecting wire harness components.

If the vehicle is equipped with a manual transmission, it has a clutch pedal position switch installed in series between the ignition switch and the coil battery terminal of the starter relay. This normally open switch prevents the starter relay from being energized when the ignition switch is turned to the momentary Start position, unless the clutch pedal is depressed. This feature prevents starter motor operation while the clutch disc and the flywheel are engaged. The starter relay coil ground terminal is always grounded on vehicles with a manual transmission.

If the vehicle is equipped with an automatic transmission, battery voltage is supplied through the low-amperage control circuit to the coil battery terminal of the starter relay when the ignition switch is turned to the momentary Start position. The park/neutral position switch is installed in series between the starter relay coil ground terminal and ground.

STARTING (Continued)

This normally open switch prevents the starter relay from being energized and the starter motor from operating unless the automatic transmission gear selector is in the Neutral or Park positions.

When the starter relay coil is energized, the normally open relay contacts close. The relay contacts connect the relay common feed terminal to the relay normally open terminal. The closed relay contacts energize the starter solenoid coil windings.

The energized solenoid pull-in coil pulls in the solenoid plunger. The solenoid plunger pulls the shift lever in the starter motor. This engages the starter overrunning clutch and pinion gear with the starter ring gear on the manual transmission flywheel or on the automatic transmission torque converter or torque converter drive plate.

As the solenoid plunger reaches the end of its travel, the solenoid contact disc completes the high-amperage starter feed circuit and energizes the solenoid plunger hold-in coil. Current now flows between the solenoid battery terminal and the starter motor, energizing the starter.

Once the engine starts, the overrunning clutch protects the starter motor from damage by allowing the

starter pinion gear to spin faster than the pinion shaft. When the driver releases the ignition switch to the On position, the starter relay coil is de-energized. This causes the relay contacts to open. When the relay contacts open, the starter solenoid plunger hold-in coil is de-energized.

When the solenoid plunger hold-in coil is de-energized, the solenoid plunger return spring returns the plunger to its relaxed position. This causes the contact disc to open the starter feed circuit, and the shift lever to disengage the overrunning clutch and pinion gear from the starter ring gear.

DIAGNOSIS AND TESTING - STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these 3 systems must perform within specifications.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. Refer to Starter Relay in Diagnosis and Testing. Replace starter relay if required.
	4. Ignition switch faulty.	4. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	5. Clutch pedal position switch faulty.	5. Refer to Clutch Pedal Position Switch.
	6. Park/Neutral position switch faulty or misadjusted.	6. Refer to Park/Neutral Position Switch. Replace park/neutral position switch if required.
	7. Starter solenoid faulty.	7. Refer to Starter Motor. Replace starter motor assembly if required.
	8. Starter motor faulty.	8. If all other starting system components and circuits test OK, replace starter motor.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly.
	4. Engine seized.	4. Refer to Engine Diagnosis in the Diagnosis and Testing section of 9, Engine.

STARTING (Continued)

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to Starter Motor Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly.
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to Starter Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. Refer to Starter Relay Diagnosis and Testing. Replace starter relay if required.
	3. Ignition switch faulty.	3. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor.

INSPECTION

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO 8, PASSIVE RESTRAINT SYSTEMS, BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **Battery** in 8, Battery. **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**

- **Ignition Switch** - Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder**.

- **Clutch Pedal Position Switch** - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Clutch Pedal Position Switch** in 6, Clutch.

- **Park/Neutral Position Switch** - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections.

Refer to **Park/Neutral Position Switch** in 21, Transmission.

- **Starter Relay** - Visually inspect starter relay for indications of physical damage and loose or corroded wire harness connections.

- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.

- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.

- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to 8, Wiring Diagrams.

TESTING

COLD CRANKING TEST

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. The battery must be fully-charged and load-tested before proceeding. Refer to **Battery** in 8, Battery.

(1) Connect volt-ampere tester to battery terminals (Fig. 1). See instructions provided by manufacturer of volt-ampere tester being used. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, tester should be connected to battery on left side of vehicle only. Also, tester current reading must be taken from positive battery cable lead that connects to starter motor.**

(2) Fully engage parking brake.

(3) If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.

STARTING (Continued)

Fig. 1 Volts-Amps Tester Connections - Typical

- 1 - POSITIVE CLAMP
- 2 - NEGATIVE CLAMP
- 3 - INDUCTION AMMETER CLAMP

(4) Verify that all lamps and accessories are turned off.

(5) To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

WARNING: IF EQUIPPED WITH DIESEL ENGINE, ATTEMPT TO START ENGINE A FEW TIMES BEFORE PROCEEDING WITH FOLLOWING STEP.

(6) Rotate and hold ignition switch in Start position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.

(a) If voltage reads below 9.6 volts, refer to **Starter Motor** in Diagnosis and Testing. If starter motor is OK, refer to **Engine Diagnosis** in 9, Engine for further testing of engine. If starter motor is not OK, replace faulty starter motor.

(b) If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **Feed Circuit Test** in this section.

(c) If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **Control Circuit Testing** in this section.

(d) If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **Feed Circuit Test** in this section.

NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer 8, Wiring Diagrams.

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **Battery** in 8, Battery.
- Fully engage parking brake.
- If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

(1) Connect positive lead of voltmeter to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp (Fig. 2). Rotate and hold ignition switch in Start position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, procedure must be performed twice, once for each battery.**

(2) Connect positive lead of voltmeter to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp (Fig. 3). Rotate and hold ignition switch in Start position. Observe voltmeter. If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**

STARTING (Continued)

(3) Connect voltmeter to measure between battery positive terminal post and starter solenoid battery terminal stud (Fig. 4). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**

(4) Connect voltmeter to measure between negative battery terminal post and a good clean ground on engine block (Fig. 5). Rotate and hold ignition switch in Start position. Observe voltmeter. If read-

(5) Connect positive lead of voltmeter to starter housing. Connect negative lead of voltmeter to negative battery terminal post (Fig. 6). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact. **Note: Certain diesel equipped models use dual batteries. If equipped**

STARTING (Continued)

with dual battery system, this procedure must be performed on driver side battery only.

Fig. 6 Test Starter Ground - Typical

- 1 - STARTER MOTOR
2 - BATTERY
3 - VOLTMETER

(6) If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Rotate and hold

ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

If resistance tests detect no feed circuit problems, refer to **Starter Motor** in the Diagnosis and Testing.

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - Refer to **Starter Relay** Diagnosis and Testing.
- **Starter Solenoid** - Refer to **Starter Motor** Diagnosis and Testing.
- **Ignition Switch** - Refer to **Ignition Switch and Key Lock Cylinder**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Wire harnesses and connections** - Refer to 8, Wiring Diagrams.

STARTER MOTOR

DESCRIPTION

The starter motors used for the 5.9L diesel engine and the 8.0L gasoline engine available in this model are not interchangeable with each other, or with the starter motors used for the other available engines.

The starter motor for the 5.9L diesel engine is mounted with three screws to the flywheel housing on the left side of the engine. The starter motor for the 8.0L gasoline engine is mounted with two screws to the flange on the left rear corner of the engine block, while the starter motor for the 5.9L Gas engine is mounted with one screw, a stud and a nut to the manual transmission clutch housing or automatic transmission torque converter housing and is located on the left side of the engine.

Each of these starter motors incorporates several of the same features to create a reliable, efficient, compact, lightweight and powerful unit. The electric motors of all of these starters have four brushes contacting the motor commutator, and feature four electromagnetic field coils wound around four pole shoes. The 5.9L and 8.0L gasoline engine starter motors are rated at 1.4 kilowatts (about 1.9 horsepower) output

at 12 volts, while the 5.9L diesel engine starter motor is rated at 2.7 kilowatts (about 3.6 horsepower) output at 12 volts.

All of these starter motors are serviced only as a unit with their starter solenoids, and cannot be repaired. If either component is faulty or damaged, the entire starter motor and starter solenoid unit must be replaced.

OPERATION

These starter motors are equipped with a gear reduction (intermediate transmission) system. The gear reduction system consists of a gear that is integral to the output end of the electric motor armature shaft that is in continual engagement with a larger gear that is splined to the input end of the starter pinion gear shaft. This feature makes it possible to reduce the dimensions of the starter. At the same time, it allows higher armature rotational speed and delivers increased torque through the starter pinion gear to the starter ring gear.

The starter motors for all engines are activated by an integral heavy duty starter solenoid switch mounted to the overrunning clutch housing. This electromechanical switch connects and disconnects

STARTER MOTOR (Continued)

the feed of battery voltage to the starter motor, also engaging and disengaging the starter pinion gear with the starter ring gear.

All starter motors use an overrunning clutch and starter pinion gear unit to engage and drive a starter ring gear that is integral to the flywheel (manual transmission), torque converter or torque converter drive plate (automatic transmission) mounted on the rear crankshaft flange.

DIAGNOSIS AND TESTING - STARTER MOTOR

Correct starter motor operation can be confirmed by performing the following free running bench test. This test can only be performed with starter motor removed from vehicle. Refer to Starter Specifications for starter motor specifications.

(1) Remove starter motor from vehicle. Refer to **Starter Motor** Removal and Installation.

(2) Mount starter motor securely in a soft-jawed bench vise. The vise jaws should be clamped on mounting flange of starter motor. Never clamp on starter motor by field frame.

(3) Connect suitable volt-ampere tester and 12-volt battery to starter motor in series, and set ammeter to 100 ampere scale (250 ampere scale for diesel engine starters). See instructions provided by manufacturer of volt-ampere tester being used.

(4) Install jumper wire from solenoid terminal to solenoid battery terminal. The starter motor should operate. If starter motor fails to operate, replace faulty starter motor assembly.

(5) Adjust carbon pile load of tester to obtain free running test voltage. Refer to Specifications for the starter motor free running test voltage specifications.

(6) Note reading on ammeter and compare this reading to free running test maximum amperage draw. Refer to Specifications for starter motor free running test maximum amperage draw specifications.

(7) If ammeter reading exceeds maximum amperage draw specification, replace faulty starter motor assembly.

STARTER MOTOR SOLENOID

This test can only be performed with starter motor removed from vehicle.

(1) Remove starter motor. Refer to **Starter Motor** Removal and Installation.

(2) Disconnect wire from solenoid field coil terminal.

(3) Check for continuity between solenoid terminal and solenoid field coil terminal with continuity tester (Fig. 7). There should be continuity. If OK, go to Step 4. If not OK, replace faulty starter motor assembly.

Fig. 7 Continuity Test Between Solenoid Terminal and Field Coil Terminal - Typical

- 1 - OHMMETER
- 2 - SOLENOID TERMINAL
- 3 - FIELD COIL TERMINAL

(4) Check for continuity between solenoid terminal and solenoid case (Fig. 8). There should be continuity. If not OK, replace faulty starter motor assembly.

Fig. 8 Continuity Test Between Solenoid Terminal and Solenoid Case - Typical

REMOVAL

5.9L GASOLINE ENGINE

- (1) Disconnect and isolate negative battery cable.
- (2) Raise and support vehicle.
- (3) Remove nut and lock washer securing starter motor to mounting stud (Fig. 9).
- (4) While supporting starter motor, remove upper mounting bolt from starter motor.
- (5) If equipped with automatic transmission, slide cooler tube bracket forward on tubes far enough for starter motor mounting flange to be removed from lower mounting stud.
- (6) Move starter motor towards front of vehicle far enough for nose of starter pinion housing to clear housing. Always support starter motor during this process, do not let starter motor hang from wire harness.
- (7) Tilt nose downwards and lower starter motor far enough to access and remove nut that secures battery positive cable wire harness connector eyelet

- 3 - BATTERY TERMINAL

(6) While supporting starter motor, remove three bolts securing starter motor to flywheel housing (Fig. 10) and (Fig. 11).

(7) Remove starter motor from engine (certain diesel engines have an aluminum spacer mounted between the starter and the starter mounting flange. Note position and orientation of spacer before removal).

8.0L GASOLINE ENGINE

(1) Disconnect and isolate negative battery cable.

(2) Raise and support vehicle.

(3) Remove nut securing battery positive cable wire harness connector eyelet to solenoid battery terminal stud (Fig. 12).

(4) Remove battery positive cable connector eyelet from solenoid battery terminal stud.

(5) Disconnect battery positive cable wire harness connector from solenoid terminal connector receptacle.

1 - MOUNTING BOLT

(6) Support starter motor and remove two bolts securing starter motor to engine.

(7) Remove starter motor from engine.

INSTALLATION

5.9L GASOLINE ENGINE

(1) Connect wiring harness to starter motor and tighten eyelet nut to 25 N·m (221 in. lbs.). Do not allow starter motor to hang from wire harness.

(2) Position starter motor to starter mounting flange.

(3) If equipped with automatic transmission, slide cooler tube bracket into position.

(4) Loosely install upper bolt.

(5) Position lock washer and loosely install lower nut.

(6) Tighten upper bolt to 67.8 N·m (50 ft. lbs.).

(7) Tighten lower nut to 67.8 N·m (50 ft. lbs.).

(8) Lower vehicle.

(9) Connect battery cable.

5.9L DIESEL ENGINE

(1) If equipped, position aluminum spacer to rear of starter.

(2) Position starter motor to engine.

(3) Support starter and loosely install three mounting bolts.

(4) Tighten 3 bolts to 43.4 N·m (32 ft. lbs.).

(5) Position wiring eyelets to starter studs and install nuts. Tighten small nut to 6.2 N·m (55 in. lbs.). Tighten large nut to 13.6 N·m (120 in. lbs.).

(6) Install protective rubber boot over stud.

(7) Lower vehicle.

(8) Connect battery cables to both batteries.

8.0L GASOLINE ENGINE

(1) Support starter motor and loosely install two bolts securing starter motor to engine.

(2) Tighten 2 bolts to 67.8 N·m (50 ft. lbs.).

(3) Connect solenoid wire to solenoid terminal.

(4) Position battery cable eyelet to starter stud. Install nut and tighten to 13.6 N·m (120 in. lbs.).

(5) Lower vehicle.

(6) Connect battery cable.

STARTER MOTOR RELAY

DESCRIPTION

The starter relay is an electromechanical device that switches battery current to the pull-in coil of the starter solenoid when ignition switch is turned to Start position. The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. See PDC cover for relay identification and location.

The starter relay is a International Standards Organization (ISO) relay. Relays conforming to ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The starter relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When electromagnetic coil is energized, it draws the movable contact away from normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When electromagnetic coil is de-energized, spring pressure returns movable contact to normally closed position. The resistor or diode is connected in parallel with electromagnetic coil within relay, and helps to dissipate voltage spikes produced when coil is de-energized.

DIAGNOSIS AND TESTING - STARTER RELAY

The starter relay (Fig. 13) is located in Power Distribution Center (PDC). Refer to PDC cover for relay identification and location. For complete starter relay wiring circuit diagrams, refer to 8, Wiring Diagrams.

- (1) Remove starter relay from PDC.
- (2) A relay in de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace faulty relay.
- (3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace faulty relay.
- (4) Connect 12V battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform Relay Circuit Test that follows. If not OK, replace faulty relay.

Fig. 13 Starter Relay

TERMINAL LEGEND

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair open circuit to fuse in PDC as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to common feed terminal (30) in the energized position. This terminal supplies battery voltage to starter solenoid field coils. There should be continuity between cavity for relay terminal 87 and starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair open circuit to starter solenoid as required.

(4) The coil battery terminal (86) is connected to electromagnet in relay. It is energized when ignition switch is held in Start position. On vehicles with manual transmission, clutch pedal must be fully depressed for this test. Check for battery voltage at cavity for relay terminal 86 with ignition switch in Start position, and no voltage when ignition switch is released to On position. If OK, go to Step 5. If not OK with automatic transmission, check for open or short circuit to ignition switch and repair, if required. If circuit to ignition switch is OK, refer to **Ignition Switch and Key Lock Cylinder**. If not OK with a manual transmission, check circuit between relay and clutch pedal position switch for open or a short.

STARTER MOTOR RELAY (Continued)

If circuit is OK, refer to **Clutch Pedal Position Switch** in 6 , Clutch.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. On vehicles with manual transmission, it is grounded at all times. On vehicles with automatic transmission, it is grounded through park/neutral position switch only when gear-shift selector lever is in Park or Neutral positions. Check for continuity to ground at cavity for relay terminal 85. If not OK with manual transmission, repair circuit to ground as required. If not OK with automatic transmission, check for pen or short circuit to park/neutral position switch and repair, if required. If circuit to park/neutral position switch is OK, refer to **Park/Neutral Position Switch** in 21, Transmission.

REMOVAL

- (1) Disconnect and isolate negative battery cable (both negative cables if diesel).
- (2) Remove cover from Power Distribution Center (PDC) (Fig. 14).
- (3) Refer to PDC cover for relay identification and location.
- (4) Remove starter relay from PDC.

INSTALLATION

- (1) Position starter relay in proper receptacle in PDC.
- (2) Align starter relay terminals with terminal cavities in PDC receptacle.
- (3) Push down firmly on starter relay until terminals are fully seated in terminal cavities in PDC receptacle.

HEATED MIRRORS

DESCRIPTION - HEATED MIRROR SYSTEM

Fig. 1 HEATED MIRROR- TYPICAL

- 1 - POWER HEATED OUTSIDE REAR VIEW MIRROR
- 2 - REAR WINDOW DEFOGGER ICON

Electrically heated outside rear view mirrors are an additional factory-installed option on models that are equipped with factory-installed dual power mirrors. Vehicles with this option can be visually identified by the International Control and Display Symbol icon for rear window defogger, which appears on the lower inboard corner of each outside mirror glass (Fig. 1); or, by the heated mirror switch that is located in the lower left corner of the a/c heater control unit face plate. The heated mirror system helps the vehicle operator maintain outside rear view mirror visibility during inclement operating conditions by keeping both outside mirror glasses clear of ice, snow, or fog. The heated mirror system for this vehicle includes the following major components:

- The heated mirror switch, including the heated mirror system solid state electronic control logic and timer circuitry, the heated mirror relay and the heated mirror system indicator lamp. All of these components are integral to the a/c heater control unit on the instrument panel.
- The two outside mirror heating grids, which are integral to the power outside mirror units.

Following are general descriptions of the major components in the heated mirror system. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated mirror system.

HEATED MIRRORS (Continued)

OPERATION - HEATED MIRROR SYSTEM

The solid state electronic control logic and timer circuitry for the heated mirror system receives battery current from a fuse in the Junction Block (JB) only when the ignition switch is in the On or Start positions. After the heated mirror system is turned On, the electronic control logic and timer circuitry will automatically turn the system off after a programmed time interval of about fifteen minutes. After the initial time interval has expired, if the heated mirror switch is depressed and released a second time during the same ignition cycle, the electronic control logic and timer circuitry will automatically turn the heated mirror system off after a programmed time interval of about five minutes. The heated mirror system will be shut off automatically if the ignition switch is turned to the Off or Accessory positions. After the heated mirror system is turned On, it can also be turned off manually by depressing and releasing the heated mirror switch a second time.

When the heated mirror system is turned On, the heated mirror system control logic and timer circuitry energizes the heated mirror system indicator lamp and the heated mirror relay. When energized, the heated mirror relay supplies fused ignition switch output (run/start) current from a fuse in the JB to the outside mirror heating grids located behind the mirror glass of each of the outside rear view mirrors. When energized, each of the outside mirror heating grids produces enough heat to warm the glass of the outside rear view mirrors.

DIAGNOSIS AND TESTING - HEATED MIRROR SYSTEM

If only one of the outside mirror heating grids is inoperative, perform continuity checks on the circuits and heater grid for that mirror only. If both outside mirror heating grids are inoperative, proceed with the heated mirror system diagnosis as follows. (Refer to Appropriate Wiring Information).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The operation of the heated mirror system can be confirmed in one of the following manners:

- Turn the ignition switch to the On position. While monitoring the instrument panel voltmeter, momentarily depress and release the heated mirror switch. When the heated mirror system is turned On, a distinct voltmeter needle deflection should be noted.

- Turn the ignition switch to the On position. Momentarily depress and release the heated mirror switch to turn the heated mirror system On. The heated mirror operation can be checked by feeling the outside rear view mirror glass. A distinct difference in temperature between the unheated and heated mirror glass can be detected within three to four minutes of system operation.

The above checks will confirm system operation. Illumination of the heated mirror system indicator lamp means that there is electrical current available at the heated mirror relay, but does not confirm that the electrical current is reaching the outside mirror heating grids.

If the heated mirror system does not operate, the problem should be isolated in the following manner:

- (1) Confirm that the ignition switch is in the On position.

- (2) Check the fuses in the Power Distribution Center (PDC) and in the Junction Block (JB). The fuses must be tight in their receptacles and all electrical connections must be secure.

When the above steps have been completed and both outside mirror heating grids are still inoperative, one or more of the following is faulty:

- Heated mirror switch, electronic control logic and timer circuitry, and heated mirror relay.
- Heated mirror wire harness circuits or connectors.
- Outside mirror heating grid (both mirror grids would have to be faulty).

If turning On the heated mirror system produces a severe voltmeter deflection or fuse failures, check for a shorted circuit between the output of the heated mirror relay and the outside mirror heating grids.

MIRROR SWITCH**DESCRIPTION**

The heated mirror switch, the heated mirror system indicator lamp, the heated mirror system solid state electronic control logic and timer circuitry and the heated mirror relay are all integral to the a/c heater control, which is located between the instrument cluster and the radio near the center of the instrument cluster bezel on the instrument panel. The heated mirror switch and the heated mirror sys-

MIRROR SWITCH (Continued)

Fig. 2 HEATED MIRROR SWITCH

- 1 - A/C HEATER CONTROL
- 2 - HEATED MIRROR SWITCH
- 3 - HEATED MIRROR SYSTEM INDICATOR LAMP

tem indicator lamp are visible in the lower left corner of the a/c heater control face plate (Fig. 2).

The heated mirror switch, the heated mirror system indicator lamp, the heated mirror system solid state electronic control logic and timer circuitry and the heated mirror relay cannot be repaired. If any of these components is damaged or faulty, the entire a/c heater control must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

OPERATION

The momentary-type heated mirror switch provides a hard-wired battery current signal to the heated mirror system electronic control logic circuitry each time it is depressed. In response to the heated mirror switch input, the electronic control logic and timer circuitry energizes or de-energizes the amber heated mirror system indicator lamp next to the heated mirror switch to indicate that the heated mirror system is turned On or Off. The electronic control logic and timer circuitry also energizes or de-energizes the heated mirror relay, which controls the feed of electrical current to the outside mirror heating grids.

The heated mirror system electronic control logic and timer circuitry is programmed to turn the heated mirror system Off automatically after about fifteen minutes of operation. If the heated mirror system is turned On a second time following an initial time-out event during the same ignition switch cycle, the heated mirror system electronic control logic and timer circuit is programmed to turn the system Off

automatically after about five minutes. When the electronic control logic and timer circuit detects that a programmed time interval has elapsed, it will automatically de-energize the heated mirror system indicator lamp and the heated mirror relay. The heated mirror system will also be turned Off if the heated mirror switch is depressed while the system is turned On, or if the ignition switch is turned to the Off or Accessory positions.

DIAGNOSIS AND TESTING - HEATED MIRROR SWITCH

The heated mirror switch, the solid state electronic heated mirror system control logic and timer circuitry, the heated mirror system indicator lamp and the heated mirror relay are all integral to the a/c heater control. For circuit descriptions and diagrams (Refer to Appropriate Wiring Information).

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused ignition switch output (run/start) fuse in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the JB. If OK, go to Step 3. If not OK, repair the open circuit to the ignition switch as required.

(3) Disconnect and isolate the battery negative cable. Disconnect the 3-way instrument panel wire harness connector for the heated mirror switch from the heated mirror switch connector receptacle on the back of the a/c heater control. Check for continuity between the ground circuit cavity of the wire harness connector and a good ground. There should be continuity. If OK, go to Step 4. If not OK, repair the open ground circuit to ground as required.

(4) Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the 3-way instrument panel wire

MIRROR SWITCH (Continued)

harness connector for the heated mirror switch. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the JB as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Reconnect the 3-way instrument panel wire harness connector for the heated mirror switch to the heated mirror switch connector receptacle on the back of the a/c heater control. Reconnect the battery negative cable. Turn the ignition switch to the On position. Depress and release the heated mirror switch. The amber heated mirror system indicator lamp next to the heated mirror switch button should light. If OK, go to Step 6. If not OK, replace the faulty a/c heater control.

(6) Back probe the fused heated mirror relay output circuit cavity of the 3-way instrument panel wire harness connector for the heated mirror switch on the back of the a/c heater control and check for voltage (battery voltage less the resistance in both outside mirror heating grids). If OK, (Refer to 8 - ELECTRICAL/HEATED MIRRORS/HEATED MIRROR GRID - DIAGNOSIS AND TESTING).

HEATED MIRROR GRID

DESCRIPTION

Vehicles equipped with the optional heated mirror system have an electrically operated heating grid located behind the mirror glass of each power operated outside rear view mirror. The outside mirror heating grid consists of two thin laminations of plastic that approximate the outer dimensions and shape of the mirror glass. A single length of resistor wire weaves in a back and forth pattern between, and is held in place by the two thin laminations of plastic. The two ends of the resistor wire terminate near the inboard edge of the grid, where they are soldered to the ground feed and battery current feed wires contained in the power mirror wire harness. The heating grid is then sandwiched between the back of the molded plastic mirror glass case and the mirror glass, where it remains in direct contact with the back of the mirror glass at all times.

The outside mirror heating grids cannot be repaired and, if faulty or damaged, the entire outside power mirror unit must be replaced. Refer to Power Mirrors for the service procedures.

OPERATION

One end of the outside mirror heating grid resistor wire is connected to a ground feed at all times through a body ground screw located inside the left rear corner of the truck cab. Battery current is directed to the other end of the outside mirror heating grid resistor wire by the energized heated mirror relay when the heated mirror switch is in the On position. As electrical current passes through the heating grid, the resistance of the wire in the heating grid converts some of that electrical current into heat. The heat produced by the heating grid is then conducted through the back of the mirror glass to help keep the glass clear of ice, snow or fog.

DIAGNOSIS AND TESTING - HEATED MIRROR GRID

For circuit descriptions and diagrams (Refer to Appropriate Wiring Information).

(1) Disconnect and isolate the battery negative cable. Disconnect the door wire harness connector from the power mirror wire harness connector at the power mirror with the inoperative heating grid. Check for continuity between the ground circuit cavity in the door wire harness connector for the power mirror and a good ground. If OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.

(2) Reconnect the battery negative cable. Turn the ignition switch to the On position. Turn on the heated mirror system. Check for voltage (battery voltage less the resistance in the outside mirror heating grid that is still connected) at the fused heated mirror relay output circuit cavity in the door wire harness connector for the power mirror. If OK, go to Step 3. If not OK, repair the open fused heated mirror relay output circuit to the heater and air conditioner control unit as required.

(3) Check the outside mirror heating grid by testing for continuity between the ground circuit and the fused heated mirror relay output circuit cavities in the power mirror wire harness connector. There should be continuity. If not OK, replace the faulty power mirror. If OK, check the resistance through the outside mirror heating grid. The correct resistance should be from 10 to 16 ohms when measured at an ambient temperature of 21° C (70° F). If not OK, replace the faulty power mirror.

HEATED SEAT SYSTEM

DESCRIPTION

**Fig. 1 Heated Seat System Switches**

- 1 - Radio Receiver
2 - Heated Seat Switches

Individually controlled electrically heated front seats are available factory-installed optional equipment on the Ram quad cab models that are also equipped with the optional SLT Plus (leather) trim package. Vehicles with this option can be visually identified by the two separate heated seat switches mounted in a bezel located in the lower right corner of the instrument cluster bezel, next to the radio receiver (Fig. 1). The heated seat system allows the front seat driver and passenger to select from two different levels of supplemental electrical seat heating, or no seat heating to suit their individual comfort requirements. The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Switches** - Two heated seat switches are used per vehicle, including two Light-Emitting Diode (LED) indicator lamps and an incandescent back lighting bulb for each switch. One switch for the driver and one for the passenger front seats. The switches are mounted in the instrument panel, next to the radio.

- **Heated Seat Module** - also referred to as the Seat Heat Interface Module (SHIM), this module contains the solid state electronic control and diagnostic logic circuitry for the heated seat system. One heated seat module is used per vehicle and is mounted under the center front seat cushion. Refer to the Electronic Control Modules section of the service manual for heated seat module information.

HEATED SEAT SYSTEM (Continued)

- **Heated Seat Elements** - Four heated seat elements are used per vehicle, one for each front seat back and one for each front seat cushion. The elements are integral to the individual front seat and seat back cushions and cannot be removed once installed at the factory. Service replacement seat heating elements are available, without having to replace the entire seat cushion or trim cover. Refer to the procedure in this section.

- **Heated Seat Sensors** - Two heated seat sensors are used per vehicle, one for each front seat. The sensors are integral to the individual front seat heating elements and cannot be removed once installed at the factory. Service replacement seat heating elements with the sensors are available, without having to replace the entire seat cushion or trim cover. Refer to the procedure in this section.

- **Heated Seat Relay** - The heated seat relay controls the battery voltage and current supply to the heated seat module and the rest of the heated seat system. The heated seat relay is mounted in the junction block and is not different than the other relays used throughout the vehicle. Refer to the Power Distribution section of the service manual for more information on standard ISO relays.

Following are general descriptions of the major components in the heated seat system. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated seat system. Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

OPERATION

The heated seat module receives fused battery current through the energized heated seat relay in the Junction Block (JB) only when the engine is running. The heated seat switches receive battery current through fuse #2 in the Junction Block only when the ignition switch is in the On position. The heated seat module shares a common ground circuit with each of the heated seat elements. The heated seat elements will only operate when the surface temperature of the seat cushion is below the designed temperature set points of the system.

The heated seat system will also be turned off automatically whenever the ignition switch is turned to any position except On or if the engine quits running. If the ignition switch is turned to the Off position or if the engine quits running while a heated seat is turned ON, the heated seat will remain Off after the engine is restarted until a heated seat switch is depressed again.

The heated seat module monitors inputs from the heated seat sensors and the heated seat switches. In response to these inputs the heated seat module uses

its internal programming to control outputs to the heated seat elements in both front seats and to control the heated seat LED indicator lamps located in both of the heated seat switches. The heated seat module is also programmed to provide a self-diagnostic capability. When the module detects certain failures within the heated seat system, it will provide a visual indication of the failure by flashing the indicator lamps in the heated seat switches. The heated seat module will automatically turn off the heated seat elements if it detects a short or open in the heated seat element circuit or a heated seat sensor value that is out of range.

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

HEATED SEAT SYSTEM SELF-DIAGNOSIS

The heated seat system is capable of performing some self-diagnostics. The following table depicts the various monitored failures which will be reported to the vehicle operator or technician by flashing the individual heated seat switch Light Emitting Diode (LED) indicator lamps. Refer to the Heated Seat System Self-Diagnosis table for failure identification. The driver side heated seat switch indicator lamps will flash if a failure occurs in the driver side heated seat, and the passenger side heated seat switch indicator lamps will flash for a passenger side heated seat failure. If a monitored heated seat system failure occurs, the switch indicator lamps will flash at a pulse rate of about one-half second on, followed by about one-half second off for a duration of about one minute after the switch for the faulty heated seat is depressed in either the Low or High direction. This process will repeat every time the faulty heated seat switch is actuated until the problem has been corrected.

Heated Seat System Self-Diagnosis		
Monitored Failure	Switch High Indicator Lamp	Switch Low Indicator Lamp
Heated Seat Element Shorted	Flashing	Flashing
Heated Seat Element Open	Flashing	Off
Heated Seat Sensor Value Out of Range	Off	Flashing

HEATED SEAT SYSTEM (Continued)

If the heated seat system failure is identified by flashing heated seat switch indicator lamps, go to the appropriate diagnosis and testing procedure in this section and confirm the condition, using the step by step procedure. If the monitored failure is confirmed, replace the component. If the monitored failure is not confirmed, replace the heated seat module with a known good unit and retest the system.

HEATED SEAT SYSTEM TESTING

Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams. Before testing the individual components in the heated seat system, perform the following preliminary checks:

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- If the heated seat switch back lighting and the cluster illumination lamps do not illuminate with the headlamps or park lamps turned On, refer to the **Instrument Cluster** section of the service manual for the location of cluster illumination lamps diagnosis and testing procedures. If the heated seat switch back lighting does not illuminate, but the cluster illumination lamps do illuminate with the headlamps or park lamps turned On, refer to **Diagnosis and Testing the Heated Seat Switch** in this section for the location of the heated seat switch diagnosis and testing procedures.

- If a single indicator lamp for one heated seat switch does not operate and the heated seat elements do heat, refer to **Diagnosis and Testing the Heated Seat Switch** in this section for heated seat switch diagnosis and testing procedures.

- If both indicator lamps for a heated seat switch operate, but the heated seat elements do not heat, refer to **Diagnosis and Testing the Heated Seat Module** in Electronic Control Modules for heated seat module diagnosis and testing procedures.

- If none of the indicator lamps for both heated seat switches will operate and the heated seat elements for both seats do not heat, refer to **Diagnosis and Testing the Heated Seat Relay** in the Power Distribution section of the service manual for heated seat relay diagnosis and testing procedures.

- If the an indicator lamp on either heated seat switch remains illuminated after the heated seat has been turned Off, refer to **Diagnosis and Testing the Heated Seat Module** in Electronic Control Modules for heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

DRIVER SEAT HEATER SWITCH

DESCRIPTION

80be464d

Fig. 2 Heated Seat Switches

- 1 - Driver Switch
- 2 - Passenger Switch
- 3 - Indicator Lamps
- 4 - Heated Seat Switch Bezel

The heated seat switches are both mounted in a heated seat switch bezel (Fig. 2), which replaces the standard equipment cubby bin located in the lower right corner of the instrument cluster bezel next to the radio receiver. The two switches are snapped into the mounting holes of the heated seat switch bezel, and the heated seat switch bezel is secured with three screws to the instrument panel. The mounts for the heated seat switch bezel are concealed behind the instrument cluster bezel. The two heated seat switches are identical in appearance and construction, except for the location of a keyway in the single connector receptacle on the back of each switch. The instrument panel wire harness connectors for the heated seat switches are keyed to match the connec-

DRIVER SEAT HEATER SWITCH (Continued)

tor receptacles on the switches so that the two heated seat switches can only be connected to the proper heated seat electrical.

The momentary, bidirectional rocker-type heated seat switch provides a resistor-multiplexed signal to the heated seat module on the mux circuit. Each switch has a center neutral position and momentary Low and High positions so that both the driver and the front seat passenger can select a preferred level of seat heating. Each heated seat switch has two Light-Emitting Diode (LED) indicator lamps, which indicate the selected mode (Low or High) of the seat heater. These indicator lamps also provide diagnostic feedback for the heated seat system. Each switch also has an incandescent bulb, which provides dimmer controlled back lighting of the switch when the headlamps or park lamps are on.

The two LED indicator lamps and the incandescent bulb in each heated seat switch cannot be repaired. If the indicator lamps or back lighting bulb are faulty or damaged, the individual heated seat switch must be replaced.

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch rocker to its momentary High or Low position provides a hard-wired resistor multiplexed voltage request signal to the heated seat module to power the heated seat element of the selected seat and maintain the requested temperature setting. If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the heated seat module will change states to support the new selection. If a heated seat switch is depressed a second time to the same position as the currently selected state, the heated seat module interprets the second input as a request to turn the seat heater off. The heated seat module will then turn the heated seat elements for that seat off.

The indicator lamps in the heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. The ground side of each indicator lamp is controlled by a separate (high or low/driver or passenger) indicator lamp driver circuit by the heated seat module. The heated seat module control of the switch indicator lamps also allows the module to provide diagnostic feedback to the vehicle operator to indicate monitored heated seat system faults by flashing the indicator lamps on and off. One side of the incandescent back lighting bulb in each heated seat switch is connected to ground at all times. The other side of the incandescent bulb is con-

nected to the fused panel lamps dimmer switch signal circuit. These bulbs are energized when the park lamps or headlamps are turned on, and their illumination intensity is controlled by the panel lamps dimmer switch.

DIAGNOSIS AND TESTING - HEATED SEAT SWITCH

Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) If the problem being diagnosed involves inoperative heated seat switch back lighting and the cluster illumination lamps operate, go to Step 2. If the problem being diagnosed involves inoperative heated seat switch back lighting and the cluster illumination lamps are also inoperative, refer to **Instrument Cluster** in the index of this service manual for the proper cluster illumination lamps diagnosis and testing procedures. If the problem being diagnosed involves inoperative heated seat switch indicator lamps and the heated seat elements do not heat, refer to Step 4. If the problem being diagnosed involves inoperative heated seat switch indicator lamps and the heated seat elements do heat, go to Step 8. If the problem being diagnosed involves a heated seat switch indicator lamp that remains illuminated after the heated seat has been turned Off, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

(2) Disconnect and isolate the battery negative cable. Remove the heated seat switch and bezel unit from the instrument panel. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the heated seat switch to be tested. Check for continuity between the ground circuit cavity of the instrument panel wire harness connector for the heated seat switch and a good ground. There should be continuity. If OK, go to Step

DRIVER SEAT HEATER SWITCH (Continued)

3. If not OK, repair the open ground circuit to ground as required.

(3) Reconnect the battery negative cable. Turn the park lamps on with the headlamp switch. Rotate the panel lamps dimmer thumbwheel on the headlamp switch upward to just before the interior lamps detent. Check for battery voltage at the fused panel lamps dimmer switch signal circuit cavity of the instrument panel wire harness connector for the heated seat switch. If OK, replace the faulty heated seat switch. If not OK, repair the open fused panel lamps dimmer switch signal circuit to the fuse in the Junction Block (JB) as required.

(4) Check the fused ignition switch output (run) fuse in the Junction Block (JB). If OK, go to Step 5. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(5) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) fuse in the JB. If OK, go to Step 6. If not OK, repair the open fused ignition switch output (run) circuit to the ignition switch as required.

(6) Disconnect and isolate the battery negative cable. Remove the heated seat switch and bezel unit from the instrument panel. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the heated seat switch to be tested. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the instrument panel wire harness connector for the heated seat switch. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (run) circuit to the JB fuse as required.

(7) Check the continuity and resistance values of the heated seat switch in the Neutral, Low and High positions as shown in the Heated Seat Switch Continuity chart (Fig. 3). If OK, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures. If not OK, replace the faulty heated seat switch.

NOTE: ANY RESISTANCE VALUES (OHMS Ω) GIVEN IN THE FOLLOWING TEXT ARE SUPPLIED USING THE AUTOMATIC RANGE GENERATED BY A FLUKE® AUTOMOTIVE METER. IF ANOTHER TYPE OF MEASURING DEVICE IS USED THE VALUES GENERATED MAY NOT BE THE SAME AS THE RESULTS SHOWN HERE, OR MAY HAVE TO BE CONVERTED TO THE RANGE USED HERE.

80be464b

Fig. 3 Heated Seat Switch

Heated Seat Switch Continuity		
Switch Position	Continuity Between	Resistance
Neutral	4 & 6	2.2 Kilohms
Low	4 & 6	.415 Kilohms
High	4 & 6	33 Ohms

(8) Replace the inoperative heated seat switch with a known good unit and test the operation of the switch indicator lamps. If OK, discard the faulty heated seat switch. If not OK, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

REMOVAL

Both heated seat switches and the heated seat switch bezel are available individually for service replacement.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. Refer to **Cluster Bezel** in the index of this service manual for the location of the proper cluster bezel removal procedures.

(3) Remove the three screws that secure the heated seat switch bezel to the instrument panel (Fig. 4).

(4) Pull the heated seat switch bezel out from the instrument panel far enough to access and disconnect the two instrument panel wire harness connectors from the connector receptacles on the backs of the heated seat switches.

(5) Remove the heated seat switch bezel and both switches from the instrument panel as a unit.

DRIVER SEAT HEATER SWITCH (Continued)

80be464e

Fig. 4 Heated Seat Switch and Bezel Remove/Install

- 1 - INSTRUMENT PANEL
- 2 - SCREW (3)
- 3 - HEATED SEAT SWITCHES AND BEZEL UNIT

(6) From the back of the heated seat switch bezel, gently push the heated seat switch out through the front of the bezel.

INSTALLATION

Both heated seat switches and the heated seat switch bezel are available individually for service replacement.

NOTE: When installing the heated seat switches, be certain they are installed in the proper mounting holes of the heated seat switch bezel. Note that the driver side and passenger side switches are identical in appearance except for the keyway in the connector receptacle on the backs of the switches. The driver side switch has the keyway located near the bottom of the connector receptacle and should be installed in the left mounting hole of the heated seat switch bezel. The passenger side switch has the keyway located near the top of the connector receptacle and should be installed in the right mounting hole of the heated seat switch bezel.

(1) From the front of the heated seat switch bezel, align the back of the heated seat switch with the proper mounting hole in the heated seat switch bezel and gently push the switch into the bezel until it snaps into place.

(2) Position the heated seat switch bezel and both switches to the instrument panel as a unit.

(3) Reconnect the two instrument panel wire harness connectors to the connector receptacles on the backs of the heated seat switches.

(4) Position the heated seat switch bezel and both switches in the instrument panel mounting hole as a unit.

(5) Install and tighten the three screws that secure the heated seat switch bezel to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Install the cluster bezel onto the instrument panel. Refer to **Cluster Bezel** in the index of this service manual for the location of the proper cluster bezel installation procedures.

(7) Reconnect the battery negative cable.

HEATED SEAT ELEMENT DESCRIPTION

80c91d10

Fig. 5 HEATING ELEMENT INSTALLED

- 1 - SEAT BACK WIRE HARNESS
- 2 - HEATED SEAT WIRE HARNESS CONNECTOR
- 3 - HEATED SEAT CUSHION ELEMENT

Vehicles equipped with the optional heated seat system have two sets of electrically operated heating element grids located in each front seat, one set for the seat cushion and the other set for the seat back. Each of the heated seat element grids consists of a single length of resistor wire that is routed in a zig-zag pattern and captured between a covering and the adhesive foam rubber backing. Short pigtail wires with connectors (Fig. 5) are soldered to each end of each resistor wire element grid, which connect all of the element grids for each seating position to each other in series with the heated seat module through the seat wire harness.

HEATED SEAT ELEMENT (Continued)

One temperature sensor is used for each outboard seating position of the front seat, and it is located in the center insert area of the seat cushion cover. The heated seat sensors and their pigtail wires are also captured between a covering and the adhesive foam rubber backing. The heated seat sensors are Negative Thermal Coefficient (NTC) thermistors. The sensors for both front seats receive a voltage feed from a single output of the heated seat module, but the module receives individual sensor inputs from the driver side and passenger side sensors.

The heated seat elements and sensors should not be repaired. If damaged or faulty, the heated seat element assembly must be replaced. (Refer to 8 - ELECTRICAL/HEATED SEATS/HEATED SEAT ELEMENT - REMOVAL).

OPERATION

One end of the heated seat element resistor wire is connected to a ground feed at all times through a splice in the heated seat module ground circuit. Battery current is directed to the other end of the heated seat element resistor wire by the energized N-channel Field Effect Transistor (N-FET) located within the heated seat module. The heated seat module will energize the N-FET only when the heated seat switch is in the Low or High position and the heated seat sensor indicates that the seat cushion surface temperature is below the selected (Low or High) temperature set point. As electrical current passes through the heating element grid, the resistance of the wire used in the element disperses some of that electrical current in the form of heat. The heat produced by the heated seat element grid then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

The resistance of the heated seat sensor increases and decreases as the surface temperature of the seat cushion cover changes. The heated seat module supplies each sensor with a voltage feed, then detects the sensor resistance by monitoring the voltage of the separate sensor return circuits. The heated seat module compares the heated seat sensor resistance (seat cushion surface temperature) with the heated seat switch resistance (Low or High set point) to determine when the heated seat element grids need to be cycled on or off in order to maintain the selected temperature set point.

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT AND SENSOR

The heated seat module will self-diagnose shorted or open heated seat element circuits and sensor circuits. Refer to Heated Seat System Diagnosis and Testing in this section for additional diagnosis and testing procedures. To manually check the heated seat element and sensor circuits, proceed as follows. The wire harness connectors for the seat cushion and seat back heating elements and sensor are located under the seat, near the rear edge of the seat cushion frame (Fig. 6) . Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

Fig. 6 PASSENGER SEAT WIRE HARNESS ROUTING

- 1 - SEAT BACK HEATED SEAT WIRE HARNESS

- 3 - SEAT BACK ELEMENT CONNECTOR
- 4 - SEAT CUSHION ELEMENT CONNECTOR

HEATED SEAT ELEMENTS

- (1) Position the appropriate seat in the full forward position.
- (2) Make certain the ignition switch is in the OFF position.

HEATED SEAT ELEMENT (Continued)

(3) Using small channel locks, disengage the seat cushion trim cover J-channel from the lower seat cushion frame (Fig. 7).

(4) Disconnect the 2-way heated seat element connector which requires testing (Fig. 7) or (Fig. 8) Check for continuity between the two heated seat element circuit cavities (Fig. 9). There should be continuity. If OK, the elements within the seat assembly test OK, go to Step 5. If not OK, replace the faulty seat heating element refer to the procedure in this section.

80ca7656

Fig. 7 DRIVERS SEAT CONNECTORS

- 1 - DRIVER SEAT BACK TRIM COVER
- 2 - SEAT BACK ELEMENT CONNECTOR
- 3 - SEAT CUSHION ELEMENT CONNECTOR

(5) Test the seat wire harness between the heated seat module connector and the appropriate 2-way heated seat wire harness connector for shorted or open circuits. If OK, element are OK, proceed with testing the heated seat sensor and module. If not OK, repair the shorted or open seat wire harness as required.

HEATED SEAT SENSOR

NOTE: ANY RESISTANCE VALUES (OHMS Ω) GIVEN IN THE FOLLOWING TEXT ARE SUPPLIED USING THE AUTOMATIC RANGE GENERATED BY A FLUKE® AUTOMOTIVE METER. IF ANOTHER TYPE OF MEASURING DEVICE IS USED THE VALUES GENERATED MAY NOT BE THE SAME AS THE RESULTS SHOWN HERE, OR MAY HAVE TO BE CONVERTED TO THE RANGE USED HERE.

Fig. 10 HEATED SEAT CONNECTOR

- 1 - SEAT CUSHION FRAME
2 - HEATED SEAT CONNECTOR

(1) Position the appropriate seat in the full forward position.

(2) Make certain the ignition switch is in the OFF position.

(3) Disconnect the 4-way heated seat wire harness connector from the seat cushion frame (Fig. 10). Using an ohmmeter, check the resistance between the heated seat sensor input circuit cavity and the heated seat sensor feed circuit cavity in the 4-way heated seat wire harness connector. The heated seat sensor resistance should be between 1 kilohm and 100 kilohms. If OK, go to Step 4. If not OK, replace the faulty seat cushion heating element assembly.

(4) Test the seat wire harness between the heated seat module connector and the 4-way heated seat wire harness connector for shorted or open circuits. If OK, refer to **Diagnosis and Testing the Heated Seat Module** in Electronic Control Modules, for the proper heated seat module diagnosis and testing procedures. If not OK, repair the shorted or open heated seat wire harness as required.

REMOVAL

Do not remove the heating element from the seat or seat back cushion. The original element is permanently attached to the seat cushions and cannot be removed without damaging the cushion. The service replacement heating element is designed to be applied directly over the original seat heating element.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the appropriate seat cushion or seat back trim cover. Refer to the Body section of the service manual for the procedures.

(3) Disconnect the inoperative heated seat cushion or seat back element electrical connectors.

(4) Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

INSTALLATION

(1) Peel off the adhesive backing on the back of the replacement heating element and stick directly over the original heating element (Fig. 11).

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

80c91c/2

Fig. 11 HEATING ELEMENT INSTALLATION

2 - REPLACEMENT HEATING ELEMENT

HEATED SEAT ELEMENT (Continued)

(2) Connect the new heating element electrical connectors (Fig. 12) .

80c91d10

Fig. 12 HEATING ELEMENT INSTALLED

- 1 - SEAT BACK WIRE HARNESS
- 2 - HEATED SEAT WIRE HARNESS CONNECTOR
- 3 - HEATED SEAT CUSHION ELEMENT

(3) Connect the negative battery cable.
 (4) Verify heated seat system operation.
 (5) Install the appropriate seat cushion or seat back trim cover. Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover. (Fig. 13).

HEATED SEAT RELAY

DESCRIPTION

The heated seat relay is an electromechanical device that switches battery current to the heated seat module when the relay control coil is energized. The heated seat relay is located in the Junction Block (JB), on the left end of the instrument panel in the passenger compartment (Fig. 14). The heated seat relay is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the phys-

- 1 - JUNCTION BLOCK
- 2 - HEATED SEAT RELAY
- 3 - INSTRUMENT PANEL
- 4 - COMBINATION FLASHER

HEATED SEAT RELAY (Continued)

ical dimensions are smaller than those of the conventional ISO relay.

The heated seat relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact. When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The heated seat relay is controlled by the premium version of the Central Timer Module (CTM), which controls the ground feed to the coil ground terminal of the relay to energize and de-energize the electromagnetic coil of the relay. The CTM monitors engine operation through messages it receives from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus network. The CTM is programmed to energize the relay only when the engine is running, and to de-energize the relay when the engine is not running. Refer to **Central Timer Module** in the index of this service manual for the location of more information on the premium CTM.

DIAGNOSIS AND TESTING - HEATED SEAT RELAY

The heated seat relay (Fig. 15) is located in the Junction Block (JB) on the left end of the instrument panel in the passenger compartment of the vehicle. Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

RELAY TEST

(1) Remove the heated seat relay from the JB. Refer to **Heated Seat Relay** in this section for the location of the proper heated seat relay removal procedures.

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.

Fig. 15 Heated Seat Relay

TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fused B(+) fuse in the Power Distribution Center (PDC) as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the heated seat module. There should be continuity between the cavity for relay terminal 87 and the B(+) to heated seat module circuit cavity of the heated seat module wire harness connector at all times. If OK, go to Step 4. If not OK, repair the open

HEATED SEAT RELAY (Continued)

B(+) to heated seat module circuit to the heated seat module as required.

(4) The coil battery terminal (86) is connected to the electromagnet in the relay. It is connected to battery voltage and should be hot at all times. Check for battery voltage at the cavity for relay terminal 86. If OK, go to Step 5. If not OK, repair the open circuit to the fused B(+) fuse in the PDC as required.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. It is grounded by the premium version of the Central Timer Module (CTM) in response to an engine speed message received over the Chrysler Collision Detection (CCD) data bus from the Powertrain Control Module (PCM) when the engine is running. Check for continuity between the cavity for relay terminal 85 and the heated seat relay control circuit cavity of the CTM wire harness connector. There should be continuity at all times. If OK, use a DRBIII® scan tool and the proper diagnostic procedures manual to test the operation of the CTM and CCD data bus. If not OK, repair the open heated seat relay control circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the fuse access panel by inserting a finger in the finger recess molded into the panel and then pulling the panel sharply away from the left outboard end of the instrument panel.

(3) The heated seat relay is located on the forward side of the Junction Block (JB), just above the combination flasher (Fig. 16) .

(4) Grasp the heated seat relay firmly and pull it straight out from the JB.

INSTALLATION

(1) Position the heated seat relay in the proper receptacle in the JB.

(2) Align the heated seat relay terminals with the terminal cavities in the JB receptacle.

(3) Push in firmly on the heated seat relay until the terminals are fully seated in the terminal cavities in the JB receptacle.

(4) Insert the tabs on the forward edge of the fuse access panel in the notches on the forward edge of the instrument panel fuse access panel opening.

(5) Press the rear edge of the fuse access panel in toward the instrument panel until the panel snaps back into place.

(6) Reconnect the battery negative cable.

Fig. 16 Heated Seat

PASSENGER SEAT HEATER SWITCH

DESCRIPTION

The heated seat switches are both mounted in a heated seat switch bezel (Fig. 17), which replaces the standard equipment cubby bin located in the lower right corner of the instrument cluster bezel next to the radio receiver. The two switches are snapped into the mounting holes of the heated seat switch bezel, and the heated seat switch bezel is secured with three screws to the instrument panel. The mounts for the heated seat switch bezel are concealed behind the instrument cluster bezel. The two heated seat switches are identical in appearance and construction, except for the location of a keyway in the single connector receptacle on the back of each switch. The instrument panel wire harness connectors for the heated seat switches are keyed to match the connector receptacles on the switches so that the two heated seat switches can only be connected to the proper heated seat electrical.

The momentary, bidirectional rocker-type heated seat switch provides a resistor-multiplexed signal to the heated seat module on the mux circuit. Each switch has a center neutral position and momentary Low and High positions so that both the driver and

PASSENGER SEAT HEATER SWITCH (Continued)

Fig. 17 Heated Seat Switches

- 1 - Driver Switch
- 2 - Passenger Switch
- 3 - Indicator Lamps
- 4 - Heated Seat Switch Bezel

the front seat passenger can select a preferred level of seat heating. Each heated seat switch has two Light-Emitting Diode (LED) indicator lamps, which indicate the selected mode (Low or High) of the seat heater. These indicator lamps also provide diagnostic feedback for the heated seat system. Each switch also has an incandescent bulb, which provides dimmer controlled back lighting of the switch when the headlamps or park lamps are on.

The two LED indicator lamps and the incandescent bulb in each heated seat switch cannot be repaired. If the indicator lamps or back lighting bulb are faulty or damaged, the individual heated seat switch must be replaced.

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch rocker to its momentary High or Low position provides a hard-wired resistor multiplexed voltage request signal to the heated seat module to power the heated seat element of the selected seat and maintain the requested temperature setting. If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the heated seat module will change states to support the new selection. If a heated seat switch is depressed a second time to the

same position as the currently selected state, the heated seat module interprets the second input as a request to turn the seat heater off. The heated seat module will then turn the heated seat elements for that seat off.

The indicator lamps in the heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. The ground side of each indicator lamp is controlled by a separate (high or low/driver or passenger) indicator lamp driver circuit by the heated seat module. The heated seat module control of the switch indicator lamps also allows the module to provide diagnostic feedback to the vehicle operator to indicate monitored heated seat system faults by flashing the indicator lamps on and off. One side of the incandescent back lighting bulb in each heated seat switch is connected to ground at all times. The other side of the incandescent bulb is connected to the fused panel lamps dimmer switch signal circuit. These bulbs are energized when the park lamps or headlamps are turned on, and their illumination intensity is controlled by the panel lamps dimmer switch.

DIAGNOSIS AND TESTING - HEATED SEAT SWITCH

Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) If the problem being diagnosed involves inoperative heated seat switch back lighting and the cluster illumination lamps operate, go to Step 2. If the problem being diagnosed involves inoperative heated seat switch back lighting and the cluster illumination lamps are also inoperative, refer to **Instrument Cluster** in the index of this service manual for the proper cluster illumination lamps diagnosis and testing procedures. If the problem being diagnosed involves inoperative heated seat switch indicator lamps and the heated seat elements do not heat, refer to Step 4. If the problem being diagnosed

PASSENGER SEAT HEATER SWITCH (Continued)

involves inoperative heated seat switch indicator lamps and the heated seat elements do heat, go to Step 8. If the problem being diagnosed involves a heated seat switch indicator lamp that remains illuminated after the heated seat has been turned Off, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

(2) Disconnect and isolate the battery negative cable. Remove the heated seat switch and bezel unit from the instrument panel. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the heated seat switch to be tested. Check for continuity between the ground circuit cavity of the instrument panel wire harness connector for the heated seat switch and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open ground circuit to ground as required.

(3) Reconnect the battery negative cable. Turn the park lamps on with the headlamp switch. Rotate the panel lamps dimmer thumbwheel on the headlamp switch upward to just before the interior lamps detent. Check for battery voltage at the fused panel lamps dimmer switch signal circuit cavity of the instrument panel wire harness connector for the heated seat switch. If OK, replace the faulty heated seat switch. If not OK, repair the open fused panel lamps dimmer switch signal circuit to the fuse in the Junction Block (JB) as required.

(4) Check the fused ignition switch output (run) fuse in the Junction Block (JB). If OK, go to Step 5. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(5) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) fuse in the JB. If OK, go to Step 6. If not OK, repair the open fused ignition switch output (run) circuit to the ignition switch as required.

(6) Disconnect and isolate the battery negative cable. Remove the heated seat switch and bezel unit from the instrument panel. Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the heated seat switch to be tested. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the instrument panel wire harness connector for the heated seat switch. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (run) circuit to the JB fuse as required.

(7) Check the continuity and resistance values of the heated seat switch in the Neutral, Low and High positions as shown in the Heated Seat Switch Conti-

nuity chart (Fig. 18). If OK, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures. If not OK, replace the faulty heated seat switch.

NOTE: ANY RESISTANCE VALUES (OHMS Ω) GIVEN IN THE FOLLOWING TEXT ARE SUPPLIED USING THE AUTOMATIC RANGE GENERATED BY A FLUKE® AUTOMOTIVE METER. IF ANOTHER TYPE OF MEASURING DEVICE IS USED THE VALUES GENERATED MAY NOT BE THE SAME AS THE RESULTS SHOWN HERE, OR MAY HAVE TO BE CONVERTED TO THE RANGE USED HERE.

80be464b

Fig. 18 Heated Seat Switch

Heated Seat Switch Continuity		
Switch Position	Continuity Between	Resistance
Neutral	4 & 6	2.2 Kilohms
Low	4 & 6	.415 Kilohms
High	4 & 6	33 Ohms

(8) Replace the inoperative heated seat switch with a known good unit and test the operation of the switch indicator lamps. If OK, discard the faulty heated seat switch. If not OK, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

REMOVAL

Both heated seat switches and the heated seat switch bezel are available individually for service replacement.

PASSENGER SEAT HEATER SWITCH (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. Refer to **Cluster Bezel** in the index of this service manual for the location of the proper cluster bezel removal procedures.

(3) Remove the three screws that secure the heated seat switch bezel to the instrument panel (Fig. 19).

Fig. 19 Heated Seat Switch and Bezel Remove/Install

1 - INSTRUMENT PANEL

2 - SCREW (3)

3 - HEATED SEAT SWITCHES AND BEZEL UNIT

(4) Pull the heated seat switch bezel out from the instrument panel far enough to access and disconnect the two instrument panel wire harness connectors from the connector receptacles on the backs of the heated seat switches.

(5) Remove the heated seat switch bezel and both switches from the instrument panel as a unit.

(6) From the back of the heated seat switch bezel, gently push the heated seat switch out through the front of the bezel.

INSTALLATION

Both heated seat switches and the heated seat switch bezel are available individually for service replacement.

NOTE: When installing the heated seat switches, be certain they are installed in the proper mounting holes of the heated seat switch bezel. Note that the driver side and passenger side switches are identical in appearance except for the keyway in the connector receptacle on the backs of the switches. The driver side switch has the keyway located near the bottom of the connector receptacle and should be installed in the left mounting hole of the heated seat switch bezel. The passenger side switch has the keyway located near the top of the connector receptacle and should be installed in the right mounting hole of the heated seat switch bezel.

(1) From the front of the heated seat switch bezel, align the back of the heated seat switch with the proper mounting hole in the heated seat switch bezel and gently push the switch into the bezel until it snaps into place.

(2) Position the heated seat switch bezel and both switches to the instrument panel as a unit.

(3) Reconnect the two instrument panel wire harness connectors to the connector receptacles on the backs of the heated seat switches.

(4) Position the heated seat switch bezel and both switches in the instrument panel mounting hole as a unit.

(5) Install and tighten the three screws that secure the heated seat switch bezel to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Install the cluster bezel onto the instrument panel. Refer to **Cluster Bezel** in the index of this service manual for the location of the proper cluster bezel installation procedures.

(7) Reconnect the battery negative cable.

DESCRIPTION	3		

HORN

DESCRIPTION

An electric horn system is standard factory-installed equipment on this model. Two horn systems are offered on this model. The standard equipment horn system features a single low-note electromagnetic horn unit, while the optional dual horn system features one low-note horn unit and one high-note horn unit. Both horn systems use a non-switched source of battery current so that the system will remain functional, regardless of the ignition switch position. The horn system includes the following components:

- Clockspring
- High-line or premium Central Timer Module (CTM)
- Horn(s)
- Horn relay
- Horn switch

(Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCK-SPRING - DESCRIPTION) for more information on this component. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODUL - DESCRIPTION) for more information on this component. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. Following are general descriptions of the remaining major components in the horn system.

OPERATION

Each horn system is activated by a horn switch concealed beneath the driver side airbag module trim cover in the center of the steering wheel. Depressing the center of the driver side airbag module trim cover closes the horn switch. Closing the horn switch activates the horn relay. The activated horn relay then switches the battery current needed to energize the horn(s).

Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the horn system.

CENTRAL TIMER MODULE

The high-line or premium Central Timer Module (CTM) can also operate the horn system. A high-line CTM is used on high-line versions of this vehicle. A premium CTM is used on vehicles equipped with the optional heated seats. The CTM combines the functions of a chime/buzzer module, an intermittent wipe module, an illuminated entry module, a remote keyless entry module, and a vehicle theft security system module in a single unit.

The high-line or premium CTM also controls and integrates many of the additional electronic functions and features included on models with this option. The horn relay is one of the hard wired outputs of the CTM. The high-line or premium CTM is programmed to energize or de-energize the horn relay in response to certain inputs from the Vehicle Theft Security System (VTSS) and/or the Remote Keyless Entry (RKE) system.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODUL - DESCRIPTION) for more information on the high-line or premium CTM. (Refer to 8 -

HORN (Continued)

ELECTRICAL/VEHICLE THEFT SECURITY - GENERAL INFORMATION) for more information on the VTSS. (Refer to 8 - ELECTRICAL/POWER LOCKS - GENERAL INFORMATION) for more information on the RKE system.

HORN

DESCRIPTION

The standard single, low-note, electromagnetic diaphragm-type horn is secured with a bracket to the right front fender wheel house extension in the engine compartment. The high-note horn for the optional dual-note horn system is connected in parallel with and secured with a bracket just forward of the low-note horn. Each horn is grounded through its wire harness connector and circuit to a ground splice joint connector, and receives battery feed through the closed contacts of the horn relay.

The horns cannot be repaired or adjusted and, if faulty or damaged, they must be individually replaced.

OPERATION

Within the two halves of the molded plastic horn housing are a flexible diaphragm, a plunger, an electromagnetic coil and a set of contact points. The diaphragm is secured in suspension around its perimeter by the mating surfaces of the horn housing. The plunger is secured to the center of the diaphragm and extends into the center of the electromagnet. The contact points control the current flow through the electromagnet.

When the horn is energized, electrical current flows through the closed contact points to the electromagnet. The resulting electromagnetic field draws the plunger and diaphragm toward it until that movement mechanically opens the contact points. When the contact points open, the electromagnetic field collapses allowing the plunger and diaphragm to return to their relaxed positions and closing the contact points again. This cycle continues repeating at a very rapid rate producing the vibration and movement of air that creates the sound that is directed through the horn outlet.

DIAGNOSIS AND TESTING - HORN

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect the wire harness connector(s) from the horn connector receptacle(s). Measure the resistance between the ground circuit cavity of the horn(s) wire harness connector(s) and a good ground. There should be no measurable resistance. If OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.

(2) Check for battery voltage at the horn relay output circuit cavity of the horn(s) wire harness connector(s). There should be zero volts. If OK, go to Step 3. If not OK, repair the shorted horn relay output circuit or replace the faulty horn relay as required.

(3) Depress the horn switch. There should now be battery voltage at the horn relay output circuit cavity of the horn(s) wire harness connector(s). If OK, replace the faulty horn(s). If not OK, repair the open horn relay output circuit to the horn relay as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the wire harness connector(s) from the horn connector receptacle(s) (Fig. 1).

(3) Remove the screw that secures the horn and mounting bracket unit(s) to the right fender wheel house front extension.

(4) Remove the horn and mounting bracket unit(s) from the right fender wheel house front extension.

HORN (Continued)

INSTALLATION

- (1) Position the horn and mounting bracket unit(s) onto the right fender wheel house front extension.
- (2) Install and tighten the screw that secures the horn and mounting bracket unit(s) to the right fender wheel house front extension. Tighten the screw to 11 N·m (95 in. lbs.).
- (3) Reconnect the wire harness connector(s) to the horn connector receptacle(s).
- (4) Reconnect the battery negative cable.

HORN RELAY**DESCRIPTION**

The horn relay is a electromechanical device that switches battery current to the horn when the horn switch grounds the relay coil. The horn relay is located in the Power Distribution Center (PDC) in the engine compartment. If a problem is encountered with a continuously sounding horn, it can usually be quickly resolved by removing the horn relay from the PDC until further diagnosis is completed. See the fuse and relay layout label affixed to the inside surface of the PDC cover for horn relay identification and location.

The horn relay is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay.

The horn relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

DIAGNOSIS AND TESTING - HORN RELAY

The horn relay (Fig. 2) is located in the Power Distribution Center (PDC) behind the battery on the driver side of the engine compartment. If a problem is encountered with a continuously sounding horn, it can usually be quickly resolved by removing the horn relay from the PDC until further diagnosis is completed. See the fuse and relay layout label affixed to the inside surface of the PDC cover for horn relay identification and location. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Remove the horn relay from the PDC. (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - REMOVAL) for the procedures.

- (2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

- (3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

- (4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.

RELAY CIRCUIT TEST

- (1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

- (2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

- (3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the horn(s). There should be continuity between the cavity for relay terminal 87 and the horn relay output circuit cavity of each horn wire harness con-

HORN RELAY (Continued)

87A	NORMALLY CLOSED

nector at all times. If OK, go to Step 4. If not OK, repair the open circuit to the horn(s) as required.

(4) The coil battery terminal (86) is connected to the electromagnet in the relay. It is connected to battery voltage and should be hot at all times. Check for battery voltage at the cavity for relay terminal 86. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the PDC as required.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. It is grounded through the horn switch when the horn switch is depressed. On vehicles equipped with the Vehicle Theft Security System (VTSS), the horn relay coil ground terminal can also be grounded by the Central Timer Module (CTM) in response to certain inputs related to the VTSS or Remote Keyless Entry (RKE) system. Check for continuity to ground at the cavity for relay terminal 85. There should be continuity with the horn switch depressed, and no continuity with the horn switch released. If not OK, (Refer to 8 - ELECTRICAL/HORN/HORN SWITCH - DIAGNOSIS AND TESTING).

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 3) .

(3) See the fuse and relay layout label affixed to the underside of the PDC cover for horn relay identification and location.

(4) Remove the horn relay from the PDC.

**Fig. 3 Power Distribution Center**

- 1 - COVER
2 - POWER DISTRIBUTION CENTER

INSTALLATION

(1) See the fuse and relay layout label affixed to the underside of the PDC cover for the proper horn relay location.

(2) Position the horn relay in the proper receptacle in the PDC.

(3) Align the horn relay terminals with the terminal cavities in the PDC receptacle.

(4) Push down firmly on the horn relay until the terminals are fully seated in the terminal cavities in the PDC receptacle.

(5) Install the cover onto the PDC.

(6) Reconnect the battery negative cable.

HORN SWITCH**DESCRIPTION**

A center-blow, normally open, resistive membrane-type horn switch is secured with heat stakes to the back side of the driver side airbag module trim cover in the center of the steering wheel (Fig. 4) . The switch consists of two plastic membranes, one that is flat and one that is slightly convex. These two membranes are secured to each other around the perimeter. Inside the switch, the centers of the facing surfaces of these membranes each has a grid made with an electrically conductive material applied to it. One of the grids is connected to a circuit that provides it with continuity to ground at all times. The grid of the other membrane is connected to the horn relay control circuit.

The steering wheel and steering column must be properly grounded in order for the horn switch to function properly. The horn switch is only serviced as a part of the driver side airbag module trim cover. If

HORN SWITCH (Continued)

Fig. 4 Driver Side Airbag Module Trim Cover and Horn Switch

- 1 - RETAINER SLOTS
- 2 - LOCKING BLOCKS
- 3 - RETAINER SLOTS
- 4 - HORN SWITCH

the horn switch is damaged or faulty, or if the driver side airbag is deployed, the driver side airbag module trim cover and horn switch must be replaced as a unit.

OPERATION

When the center area of the driver side airbag trim cover is depressed, the electrically conductive grids on the facing surfaces of the horn switch membranes contact each other, closing the switch circuit. The completed horn switch circuit provides a ground for the control coil side of the horn relay, which activates the relay. When the horn switch is released, the resistive tension of the convex membrane separates the two electrically conductive grids and opens the switch circuit.

DIAGNOSIS AND TESTING - HORN SWITCH

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS

BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Remove the steering column opening cover from the instrument panel.

(2) Check for continuity between the metal steering column jacket and a good ground. There should be continuity. If OK, go to Step 3. If not OK, (Refer to 19 - STEERING/COLUMN - INSTALLATION) for proper installation of the steering column.

(3) Remove the driver side airbag module from the steering wheel. Disconnect the horn switch wire harness connectors from the driver side airbag module.

(4) Remove the horn relay from the Power Distribution Center (PDC). Check for continuity between the steering column half of the horn switch feed wire harness connector and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted horn relay control circuit to the horn relay in the PDC as required.

(5) Check for continuity between the steering column half of the horn switch feed wire harness connector and the horn relay control circuit cavity for the horn relay in the PDC. There should be continuity. If OK, go to Step 6. If not OK, repair the open horn relay control circuit to the horn relay in the PDC as required.

(6) Check for continuity between the horn switch feed wire and the horn switch ground wire on the driver side airbag module. There should be no continuity. If OK, go to Step 7. If not OK, replace the faulty horn switch.

(7) Depress the center of the driver side airbag module trim cover and check for continuity between the horn switch feed wire and the horn switch ground wire on the driver side airbag module. There should now be continuity. If not OK, replace the faulty horn switch.

REMOVAL

If the horn switch is damaged or faulty, or if the driver side airbag is deployed, the driver side airbag module trim cover and horn switch must be replaced as a unit. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

IGNITION CONTROL

DESCRIPTION - 8.0L V-10

The ignition system used on the 8.0L V-10 engine does not use a conventional mechanical distributor. The system will be referred to as a distributor-less ignition system.

OPERATION

OPERATION - 8.0L V-10

The ignition coils are individually fired, but each coil is a dual output. Refer to Ignition Coil for additional information.

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

The ignition system consists of:

- Spark Plugs
- Ignition Coil packs containing individual coils
- Secondary Ignition Cables

- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position and MAP Sensors

OPERATION - V-8

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

The ignition system consists of:

- Spark Plugs
- Ignition Coil
- Secondary Ignition Cables
- Distributor (contains rotor and camshaft position sensor)
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position and MAP Sensors

Primary Resistance: 0.53-0.65 Ohms. Test across the primary connector. Refer to text for test procedures.

Secondary Resistance: 10.9-14.7K Ohms. Test across the individual coil towers. Refer to text for test procedures.

IGNITION TIMING

Ignition timing is not adjustable on any engine.

AUTOMATIC SHUT DOWN RELAY

DESCRIPTION - PCM OUTPUT

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

OPERATION

OPERATION - PCM OUTPUT

The ASD relay supplies battery voltage (12+ volts) to the fuel injectors and ignition coil(s). With certain emissions packages it also supplies 12-volts to the oxygen sensor heating elements.

The ground circuit for the coil within the ASD relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay will be shut-down, meaning the 12-volt power supply to the ASD relay will be de-activated by the PCM if:

- the ignition key is left in the ON position. This is if the engine has not been running for approximately 1.8 seconds.
- there is a crankshaft position sensor signal to the PCM that is lower than pre-determined values.

OPERATION - ASD SENSE - PCM INPUT

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The relay is used to connect the oxygen sensor heater element, ignition coil and fuel injectors to 12 volt + power supply.

This input is used only to sense that the ASD relay is energized. If the Powertrain Control Module (PCM) does not see 12 volts at this input when the ASD should be activated, it will set a Diagnostic Trouble Code (DTC).

DIAGNOSIS AND TESTING - ASD AND FUEL PUMP RELAYS

The following description of operation and tests apply only to the Automatic Shutdown (ASD) and fuel pump relays. The terminals on the bottom of each relay are numbered. Two different types of relays may be used, (Fig. 1) or (Fig. 2).

Fig. 1 ASD and Fuel Pump Relay Terminals—Type 1

TERMINAL LEGEND

NUMBER	IDENTIFICATION

Fig. 2 ASD and Fuel Pump Relay Terminals—Type 2

TERMINAL LEGEND

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

AUTOMATIC SHUT DOWN RELAY (Continued)

- Terminal number 30 is connected to battery voltage. For both the ASD and fuel pump relays, terminal 30 is connected to battery voltage at all times.
- The PCM grounds the coil side of the relay through terminal number 85.
- Terminal number 86 supplies voltage to the coil side of the relay.
- When the PCM de-energizes the ASD and fuel pump relays, terminal number 87A connects to terminal 30. This is the Off position. In the off position, voltage is not supplied to the rest of the circuit. Terminal 87A is the center terminal on the relay.
- When the PCM energizes the ASD and fuel pump relays, terminal 87 connects to terminal 30. This is the On position. Terminal 87 supplies voltage to the rest of the circuit.

The following procedure applies to the ASD and fuel pump relays.

- (1) Remove relay from connector before testing.
- (2) With the relay removed from the vehicle, use an ohmmeter to check the resistance between terminals 85 and 86. The resistance should be 75 ohms +/- 5 ohms.
- (3) Connect the ohmmeter between terminals 30 and 87A. The ohmmeter should show continuity between terminals 30 and 87A.
- (4) Connect the ohmmeter between terminals 87 and 30. The ohmmeter should not show continuity at this time.
- (5) Connect one end of a jumper wire (16 gauge or smaller) to relay terminal 85. Connect the other end of the jumper wire to the ground side of a 12 volt power source.
- (6) Connect one end of another jumper wire (16 gauge or smaller) to the power side of the 12 volt power source. **Do not attach the other end of the jumper wire to the relay at this time.**

WARNING: DO NOT ALLOW OHMMETER TO CONTACT TERMINALS 85 OR 86 DURING THIS TEST. DAMAGE TO OHMMETER MAY RESULT.

- (7) Attach the other end of the jumper wire to relay terminal 86. This activates the relay. The ohmmeter should now show continuity between relay terminals 87 and 30. The ohmmeter should not show continuity between relay terminals 87A and 30.
- (8) Disconnect jumper wires.

- (9) Replace the relay if it did not pass the continuity and resistance tests. If the relay passed the tests, it operates properly. Check the remainder of the ASD and fuel pump relay circuits. Refer to 8, Wiring Diagrams.

REMOVAL

The ASD relay is located in the Power Distribution Center (PDC) (Fig. 3). Refer to label on PDC cover for relay location.

Fig. 3 Power Distribution Center (PDC)

1 - POWER DISTRIBUTION CENTER (PDC)

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The ASD relay is located in the Power Distribution Center (PDC) (Fig. 3). Refer to label on PDC cover for relay location.

- (1) Install relay to PDC.
- (2) Install cover to PDC.

CAMSHAFT POSITION SENSOR

DESCRIPTION

DESCRIPTION - DIESEL

The three-wire Camshaft Position Sensor (CMP) is located below the fuel injection pump (Fig. 4). It is attached to the back of the timing gear cover housing.

Fig. 4 Camshaft Position Sensor (CMP) Location

- 1 - CAMSHAFT POSITION SENSOR (CMP)
- 2 - BOTTOM OF FUEL INJECTION PUMP

DESCRIPTION - 5.9L

The Camshaft Position (CMP) sensor is located in the distributor.

DESCRIPTION - 8.0L

The Camshaft Position (CMP) sensor is located on the timing chain case/cover on the left-front side of the engine (Fig. 5).

OPERATION

OPERATION - DIESEL

The Camshaft Position Sensor (CMP) performs multiple functions. One function is to detect engine speed (rpm). Another function is to relate crankshaft position and Top Dead Center (TDC) of the number 1 cylinder. Because the CMP is now used to relate

Fig. 5 CMP Sensor Location—8.0L V-10 Engine

- 1 - CAMSHAFT POSITION SENSOR
- 2 - MOUNTING BOLT
- 3 - TIMING CHAIN CASE/COVER

crankshaft position, the **Crankshaft Position Sensor (CKP)** is no longer used.

The CMP (Fig. 6) contains a hall effect device called a sync signal generator to generate a sync signal.

Fig. 6 Camshaft Position Sensor (CMP)

- 1 - GEAR HOUSING
- 2 - O-RING
- 3 - CMP SENSOR
- 4 - CMP HEX HEAD BOLT

The CMP uses three wires (circuits) for operation. One wire supplies a 5-volt signal from the Engine Control Module (ECM). Another wire supplies a sensor ground. The third wire supplies a signal back to

CAMSHAFT POSITION SENSOR (Continued)

Fig. 7 Notches at Rear Of Camshaft Drive Gear

- 1 - CAMSHAFT DRIVE GEAR
- 2 - NOTCHES
- 3 - CAMSHAFT POSITION SENSOR (CKP)
- 4 - NO NOTCH

the ECM relating engine speed and crankshaft position.

The sensor detects machined notches on the rear face of the camshaft drive gear (Fig. 7) to sense engine speed.

The CMP also detects an area on the camshaft drive gear that has no notch (Fig. 7). When the sensor passes this area, it tells the Engine Control Module (ECM) that Top Dead Center (TDC) of the number 1 cylinder is occurring. The ECM will then adjust fuel timing accordingly.

As the tip of the sensor passes the notches, the interruption of magnetic field causes voltage changes from 5 volts to 0 volts.

OPERATION - 5.9L

The sensor contains a hall effect device called a sync signal generator to generate a fuel sync signal. This sync signal generator detects a rotating pulse ring (shutter) on the distributor shaft. The pulse ring rotates 180 degrees through the sync signal generator. Its signal is used in conjunction with the Crankshaft Position (CKP) sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

When the leading edge of the pulse ring (shutter) enters the sync signal generator, the following occurs: The interruption of magnetic field causes the voltage

to switch high resulting in a sync signal of approximately 5 volts.

When the trailing edge of the pulse ring (shutter) leaves the sync signal generator, the following occurs: The change of the magnetic field causes the sync signal voltage to switch low to 0 volts.

OPERATION - 8.0L

The CMP sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders. The sensor generates electrical pulses. These pulses (signals) are sent to the Powertrain Control Module (PCM). The PCM will then determine crankshaft position from both the camshaft position sensor and crankshaft position sensor.

A low and high area are machined into the camshaft drive gear (Fig. 8). The sensor is positioned in the timing gear cover so that a small air gap (Fig. 8) exists between the face of sensor and the high machined area of cam gear.

When the cam gear is rotating, the sensor will detect the machined low area. Input voltage from the sensor to the PCM will then switch from a low (approximately 0.3 volts) to a high (approximately 5 volts). When the sensor detects the high machined area, the input voltage switches back low to approximately 0.3 volts.

REMOVAL

REMOVAL - DIESEL

The camshaft position sensor (CMP) is located below the fuel injection pump (Fig. 9). It is attached to the back of the timing gear cover housing.

(1) Disconnect both negative cables from both batteries.

(2) Clean area around CMP.

(3) Disconnect electrical at CMP (Fig. 9).

(4) Remove CMP mounting bolt. Bolt head is female-hex (Fig. 10).

(5) Remove CMP from engine by twisting and pulling straight back.

(6) Discard CMP o-ring (Fig. 10).

REMOVAL - 5.9L

The camshaft position sensor is located in the distributor (Fig. 11).

Distributor removal is not necessary to remove camshaft position sensor.

(1) Remove air cleaner assembly.

(2) Disconnect negative cable from battery.

(3) Remove distributor cap from distributor (two screws).

(4) Disconnect camshaft position sensor wiring harness from main engine wiring harness.

(5) Remove distributor rotor from distributor shaft.

(6) Lift the camshaft position sensor assembly from the distributor housing (Fig. 11).

REMOVAL - 8.0L

The camshaft position sensor is located on the timing chain case/cover on the left-front side of the engine (Fig. 12).

CAMSHAFT POSITION SENSOR (Continued)

**Fig. 12 CMP Location - 8.0L**

- 1 - CAMSHAFT POSITION SENSOR
- 2 - MOUNTING BOLT
- 3 - TIMING CHAIN CASE/COVER

A thin plastic rib is molded into the face of the sensor (Fig. 13) to position the depth of sensor to the upper cam gear (sprocket). This rib can be found on both the new replacement sensors and sensors that were originally installed to the engine. The first time the engine has been operated, part of this rib may be sheared (ground) off. Depending on parts tolerances, some of the rib material may still be observed after removal.

**Fig. 13 Sensor Depth Positioning Rib—8.0L V-10 Engine**

- 1 - CAMSHAFT POSITION SENSOR
- 2 - PAPER SPACER
- 3 - RIB MATERIAL (FOR SENSOR DEPTH POSITIONING)

Refer to either of the following procedures; Replacing Old Sensor With Original, or Replacing With New Sensor:

REPLACING OLD SENSOR WITH ORIGINAL

If the original camshaft position sensor is to be removed and installed, such as when servicing the timing chain, timing gears or timing chain cover, use this procedure.

- (1) Disconnect the sensor harness connector from the sensor.
- (2) Remove the sensor mounting bolt (Fig. 12).
- (3) Carefully pry the sensor from the timing chain case/cover in a rocking action with two small screwdrivers.
- (4) Remove the sensor from vehicle.
- (5) Check condition of sensor o-ring (Fig. 14).

**Fig. 14 Camshaft Sensor O-Ring—8.0L**

- 1 - SLOTTED MOUNTING HOLE
- 2 - SCRIBE LINE
- 3 - CAMSHAFT POSITION SENSOR O-RING

REPLACING WITH NEW SENSOR

If a new replacement camshaft position sensor is to be installed, use this procedure.

- (1) Disconnect the sensor wiring harness connector from sensor.
- (2) Remove the sensor mounting bolt (Fig. 12).
- (3) Carefully pry the sensor from the timing chain case/cover in a rocking action with two small screwdrivers.
- (4) Remove the sensor from vehicle.

INSTALLATION**INSTALLATION - DIESEL**

The camshaft position sensor (CMP) is located below the fuel injection pump (Fig. 9). It is attached to the back of the timing gear cover housing.

- (1) Install new o-ring to CMP. Apply clean engine oil to o-ring.
- (2) Clean area around CMP mounting hole.
- (3) To prevent tearing o-ring, install CMP into gear housing using a twisting action.

CAMSHAFT POSITION SENSOR (Continued)

- (4) Install mounting bolt and tighten to 20 Nm (15 ft. lbs.) torque.
- (5) Install electrical connector to CMP.
- (6) Connect both negative cables to both batteries.

INSTALLATION - 5.9L

The camshaft position sensor is located in the distributor (Fig. 11).

- (1) Install camshaft position sensor to distributor. Align sensor into notch on distributor housing.
- (2) Connect wiring harness.
- (3) Install rotor.
- (4) Install distributor cap. Tighten mounting screws.
- (5) Install air cleaner assembly.

INSTALLATION - 8.0L

If Replacing Old Sensor With Original

The camshaft position sensor is located on the timing chain case/cover on the left-front side of the engine (Fig. 12).

When installing a used camshaft position sensor, the sensor depth must be adjusted to prevent contact with the camshaft gear (sprocket).

(1) Observe the face of the sensor. If any of the original rib material remains (Fig. 13), it must be cut down flush to the face of the sensor with a razor knife. Remove only enough of the rib material until the face of the sensor is flat. Do not remove more material than necessary as damage to sensor may result. Due to a high magnetic field and possible electrical damage to the sensor, never use an electric grinder to remove material from sensor.

(2) From the parts department, obtain a peel-and-stick paper spacer (Fig. 13). These special paper spacers are of a certain thickness and are to be used as a tool to set sensor depth.

(3) Clean the face of sensor and apply paper spacer (Fig. 13).

(4) Apply a small amount of engine oil to the sensor o-ring (Fig. 14).

A low and high area are machined into the camshaft drive gear (Fig. 15). The sensor is positioned in the timing gear cover so that a small air gap (Fig. 15) exists between the face of sensor and the high machined area of cam gear.

Before the sensor is installed, the cam gear may have to be rotated. This is to allow the high machined area on the gear to be directly in front of the sensor mounting hole opening on the timing gear cover.

Do not install sensor with gear positioned at low area (Fig. 16) or (Fig. 15). When the engine is started, the sensor will be broken.

80570e18

Fig. 15 Sensor Operation—8.0L V-10 Engine

- 1 - CAM DRIVE GEAR
- 2 - LOW MACHINED AREA
- 3 - HIGH MACHINED AREA
- 4 - CAMSHAFT POSITION SENSOR
- 5 - AIR GAP

(5) Using a 1/2 in. wide metal ruler, measure the distance from the cam gear to the face of the sensor mounting hole opening on the timing gear cover (Fig. 16).

(6) If the dimension is approximately 1.818 inches, it is OK to install sensor. Proceed to step Step 9.

(7) If the dimension is approximately 2.018 inches, the cam gear will have to be rotated.

(8) Attach a socket to the vibration damper mounting bolt and rotate engine until the 1.818 inch dimension is attained.

(9) Install the sensor into the timing case/cover with a slight rocking action until the paper spacer contacts the camshaft gear. Do not install the sensor mounting bolt. Do not twist the sensor into position as damage to the o-ring or tearing of the paper spacer may result.

(10) Scratch a scribe line into the timing chain case/cover to indicate depth of sensor (Fig. 14).

(11) Remove the sensor from timing chain case/cover.

(12) Remove the paper spacer from the sensor. This step must be followed to prevent the paper spacer from getting into the engine lubrication system.

(13) Again, apply a small amount of engine oil to sensor o-ring.

CAMSHAFT POSITION SENSOR (Continued)

80570e1b

Fig. 16 Sensor Depth Dimensions

- 1 - 2.018" **DO NOT** INSTALL SENSOR
- 2 - SENSOR MOUNTING HOLE OPENING
- 3 - SENSOR CENTER LINE
- 4 - TIMING CHAIN COVER
- 5 - 1.818" **OK** TO INSTALL SENSOR
- 6 - CAM DRIVE GEAR
- 7 - HIGH MACHINED AREA
- 8 - LOW MACHINED AREA

(14) Again, install the sensor into the timing case/cover with a slight rocking action until the sensor is aligned to scribe line.

(15) Install sensor mounting bolt and tighten to 6 N·m (50 in. lbs.) torque.

(16) Connect engine wiring harness to sensor.

Replacing With a New Sensor

(1) Apply a small amount of engine oil to the sensor o-ring (Fig. 14).

A low and high area are machined into the camshaft drive gear (Fig. 15). The sensor is positioned in the timing gear cover so that a small air gap (Fig. 15) exists between the face of sensor and the high machined area of cam gear.

Before the sensor is installed, the cam gear may have to be rotated. This is to allow the high machined area on the gear to be directly in front of the sensor mounting hole opening on the timing gear cover.

Do not install sensor with gear positioned at low area (Fig. 16) or (Fig. 15). When the engine is started, the sensor will be broken.

(2) Using a 1/2 in. wide metal ruler, measure the distance from the cam gear to the face of the sensor mounting hole opening on the timing gear cover (Fig. 16).

(3) If the dimension is approximately 1.818 inches, it is OK to install sensor. Proceed to step Step 9.

(4) If the dimension is approximately 2.018 inches, the cam gear will have to be rotated.

(5) Attach a socket to the vibration damper mounting bolt and rotate engine until the 1.818 inch dimension is attained.

(6) Install the sensor into the timing case/cover with a slight rocking action. Do not twist the sensor into position as damage to the o-ring may result. Push the sensor all the way into the cover until the rib material on the sensor (Fig. 13) contacts the camshaft gear.

(7) Install the mounting bolt and tighten to 6 N·m (50 in. lbs.) torque.

(8) Connect sensor wiring harness to engine harness.

When the engine is started, the rib material will be sheared off the face of sensor. This will automatically set sensor air gap.

DISTRIBUTOR**DESCRIPTION**

All 5.9L engines are equipped with a camshaft driven mechanical distributor (Fig. 17) containing a shaft driven distributor rotor. All distributors are equipped with an internal camshaft position (fuel sync) sensor (Fig. 17).

80ae8314

Fig. 17 Distributor and Camshaft Position Sensor

- 1 - SYNC SIGNAL GENERATOR
- 2 - CAMSHAFT POSITION SENSOR
- 3 - PULSE RING
- 4 - DISTRIBUTOR ASSEMBLY

DISTRIBUTOR (Continued)

OPERATION

The camshaft position sensor provides fuel injection synchronization and cylinder identification.

The distributor does not have built in centrifugal or vacuum assisted advance. Base ignition timing and all timing advance is controlled by the Powertrain Control Module (PCM). Because ignition timing is controlled by the PCM, **base ignition timing is not adjustable.**

The distributor is held to the engine in the conventional method using a holddown clamp and bolt. **Although the distributor can be rotated, it will have no effect on ignition timing.**

All distributors contain an internal oil seal that prevents oil from entering the distributor housing. The seal is not serviceable.

REMOVAL

CAUTION: Base ignition timing is not adjustable on any engine. Distributors do not have built in centrifugal or vacuum assisted advance. Base ignition timing and timing advance are controlled by the Powertrain Control Module (PCM). Because a conventional timing light can not be used to adjust distributor position after installation, note position of distributor before removal.

- (1) Remove air cleaner assembly.
- (2) Disconnect negative cable from battery.
- (3) Remove distributor cap from distributor (two screws).
- (4) Mark the position of distributor housing in relationship to engine or dash panel. This is done to aid in installation.
- (5) Before distributor is removed, the number one cylinder must be brought to the Top Dead Center (TDC) firing position.
- (6) Attach a socket to the Crankshaft Vibration Damper mounting bolt.
- (7) Slowly rotate engine clockwise, as viewed from front, until indicating mark on crankshaft vibration damper is aligned to 0 degree (TDC) mark on timing chain cover (Fig. 18).
- (8) The distributor rotor should now be aligned to the CYL. NO. 1 alignment mark (stamped) into the camshaft position sensor (Fig. 19). If not, rotate the crankshaft through another complete 360 degree turn. Note the position of the number one cylinder spark plug cable (on the cap) in relation to rotor. Rotor should now be aligned to this position.

Fig. 18 Damper-To-Cover Alignment Marks—Typical

- 1 - ALIGNMENT MARK
- 2 - TIMING CHAIN COVER MARKS
- 3 - CRANKSHAFT VIBRATION DAMPER

Fig. 19 Rotor Alignment Mark

- 1 - CAMSHAFT POSITION SENSOR ALIGNMENT MARK
- 2 - ROTOR
- 3 - DISTRIBUTOR

(9) Disconnect camshaft position sensor wiring harness from main engine wiring harness.

(10) Remove distributor rotor from distributor shaft.

(11) Remove distributor holddown clamp bolt and clamp (Fig. 20). Remove distributor from vehicle.

CAUTION: Do not crank engine with distributor removed. Distributor/crankshaft relationship will be lost.

DISTRIBUTOR (Continued)

Fig. 20 Distributor Holddown Clamp

- 1 - CLAMP BOLT
- 2 - HOLDDOWN CLAMP
- 3 - DISTRIBUTOR HOUSING

INSTALLATION

If engine has been cranked while distributor is removed, establish the relationship between distributor shaft and number one piston position as follows:

Rotate crankshaft in a clockwise direction, as viewed from front, until number one cylinder piston is at top of compression stroke (compression should be felt on finger with number one spark plug removed). Then continue to slowly rotate engine clockwise until indicating mark (Fig. 18) is aligned to 0 degree (TDC) mark on timing chain cover.

(1) Clean top of cylinder block for a good seal between distributor base and block.

(2) Lightly oil the rubber o-ring seal on the distributor housing.

(3) Install rotor to distributor shaft.

(4) Position distributor into engine to its original position. Engage tongue of distributor shaft with slot in distributor oil pump drive gear. Position rotor to the number one spark plug cable position.

(5) Install distributor holddown clamp and clamp bolt. Do not tighten bolt at this time.

(6) Rotate the distributor housing until rotor is aligned to CYL. NO. 1 alignment mark on the camshaft position sensor (Fig. 19).

(7) Tighten clamp holddown bolt (Fig. 20) to 22.5 N·m (200 in. lbs.) torque.

(8) Connect camshaft position sensor wiring harness to main engine harness.

(9) Install distributor cap. Tighten mounting screws.

(10) Refer to the following, Checking Distributor Position.

Checking Distributor Position

To verify correct distributor rotational position, the DRB scan tool must be used.

WARNING: WHEN PERFORMING THE FOLLOWING TEST, THE ENGINE WILL BE RUNNING. BE CAREFUL NOT TO STAND IN LINE WITH THE FAN BLADES OR FAN BELT. DO NOT WEAR LOOSE CLOTHING.

(1) Connect DRB scan tool to data link connector. The data link connector is located in passenger compartment, below and to left of steering column.

(2) Gain access to SET SYNC screen on DRB.

(3) Follow directions on DRB screen and start engine. Bring to operating temperature (engine must be in "closed loop" mode).

(4) With engine running at **idle speed**, the words **IN RANGE** should appear on screen along with 0°. This indicates correct distributor position.

(5) If a plus (+) or a minus (-) is displayed next to degree number, and/or the degree displayed is not zero, loosen but do not remove distributor holddown clamp bolt. Rotate distributor until **IN RANGE** appears on screen. Continue to rotate distributor until achieving as close to 0° as possible. After adjustment, tighten clamp bolt to 22.5 N·m (200 in. lbs.) torque.

The degree scale on SET SYNC screen of DRB is referring to fuel synchronization only. **It is not referring to ignition timing.** Because of this, do not attempt to adjust ignition timing using this method. Rotating distributor will have no effect on ignition timing. All ignition timing values are controlled by powertrain control module (PCM).

After testing, install air cleaner assembly.

DISTRIBUTOR CAP

DIAGNOSIS AND TESTING - DISTRIBUTOR CAP

Remove the distributor cap and wipe it clean with a dry lint free cloth. Visually inspect the cap for cracks, carbon paths, broken towers or damaged rotor button (Fig. 21) or (Fig. 22). Also check for white deposits on the inside (caused by condensation entering the cap through cracks). Replace any cap that displays charred or eroded terminals. The machined surface of a terminal end (faces toward rotor) will indicate some evidence of erosion from normal operation. Examine the terminal ends for evidence of mechanical interference with the rotor tip.

J918D-9

Fig. 21 Cap Inspection—External—Typical

- 1 - BROKEN TOWER
- 2 - DISTRIBUTOR CAP
- 3 - CARBON PATH
- 4 - CRACK

J918D-10

Fig. 22 Cap Inspection—Internal—Typical

J908D-48

Fig. 23 Rotor Inspection—Typical

- 1 - INSUFFICIENT SPRING TENSION
- 2 - CRACKS
- 3 - EVIDENCE OF PHYSICAL CONTACT WITH CAP
- 4 - ROTOR TIP CORRODED

DISTRIBUTOR ROTOR

DIAGNOSIS AND TESTING - DISTRIBUTOR ROTOR

Visually inspect the rotor (Fig. 23) for cracks, evidence of corrosion or the effects of arcing on the metal tip. Also check for evidence of mechanical interference with the cap. Some charring is normal on the end of the metal tip. The silicone-dielectric-varnish-compound applied to the rotor tip for radio interference noise suppression, will appear charred. This is normal. **Do not remove the charred compound.** Test the spring for insufficient tension. Replace a rotor that displays any of these adverse conditions.

IGNITION COIL

DESCRIPTION

DESCRIPTION - 5.9L

A single ignition coil is used. The coil is not oil filled. The coil windings are embedded in an epoxy compound. This provides heat and vibration resistance that allows the coil to be mounted on the engine.

DESCRIPTION - 8.0L

Two separate coil packs containing a total of five independent coils are attached to a common mounting bracket. They are located above the right engine valve cover (Fig. 24). The coil packs are not oil filled. The front coil pack contains three independent epoxy filled coils. The rear coil pack contains two independent epoxy filled coils.

Fig. 24 Ignition Coil Packs—8.0L V-10 Engine

OPERATION

OPERATION - 5.9L

The Powertrain Control Module (PCM) opens and closes the ignition coil ground circuit for ignition coil operation.

Battery voltage is supplied to the ignition coil positive terminal from the ASD relay. If the PCM does not see a signal from the crankshaft and camshaft sensors (indicating the ignition key is ON but the engine is not running), it will shut down the ASD circuit.

Base ignition timing is not adjustable on any engine. By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

OPERATION - 8.0L

When one of the 5 independent coils discharges, it fires two paired cylinders at the same time (one cylinder on compression stroke and the other cylinder on exhaust stroke).

Coil firing is paired together on cylinders:

- Number 5 and 10
- Number 9 and 8
- Number 1 and 6
- Number 7 and 4
- Number 3 and 2

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

Battery voltage is supplied to all of the ignition coils positive terminals from the ASD relay. If the PCM does not see a signal from the crankshaft and camshaft sensors (indicating the ignition key is ON but the engine is not running), it will shut down the ASD circuit.

Base ignition timing is not adjustable on the 8.0L V-10 engine. By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The PCM adjusts ignition timing based on inputs it receives from:

- The engine coolant temperature sensor
- The crankshaft position sensor (engine speed)
- The manifold absolute pressure (MAP) sensor
- The throttle position sensor
- Transmission gear selection

REMOVAL

REMOVAL - 5.9L

The ignition coil is an epoxy filled type. If the coil is replaced, it must be replaced with the same type.

5.9L V-8 HDC-Gas Engine: The coil is mounted to a bracket that is bolted to the air injection pump (AIR pump) mounting bracket (Fig. 25).

(1) Disconnect the primary wiring from the ignition coil.

(2) Disconnect the secondary spark plug cable from the ignition coil.

(3) Remove ignition coil from coil mounting bracket (two bolts).

IGNITION COIL (Continued)

Fig. 25 Ignition Coil—5.9L V-8 HDC-Gas Engine

- 1 - COIL MOUNTING BOLTS
- 2 - IGNITION COIL
- 3 - COIL ELEC. CONNECTOR
- 4 - SECONDARY CABLE

REMOVAL - 8.0L

Two separate coil packs containing a total of five independent coils are attached to a common mounting bracket located above the right engine valve cover (Fig. 26). The front and rear coil packs can be serviced separately.

Fig. 26 Ignition Coil Packs—8.0L V-10 Engine

- (1) Remove the secondary spark plug cables from the coil packs. Note position of cables before removal.
- (2) Disconnect the primary wiring harness connectors at coil packs.

(3) Remove the four (4) coil pack-to-coil mounting bracket bolts for the coil pack being serviced (Fig. 26).

- (4) Remove coil(s) from mounting bracket.

INSTALLATION

INSTALLATION - 5.9L

The ignition coil is an epoxy filled type. If the coil is replaced, it must be replaced with the same type.

(1) Install the ignition coil to coil bracket. If nuts and bolts are used to secure coil to coil bracket, tighten to 11 N·m (100 in. lbs.) torque. If the coil mounting bracket has been tapped for coil mounting bolts, tighten bolts to 5 N·m (50 in. lbs.) torque.

- (2) Connect all wiring to ignition coil.

INSTALLATION - 8.0L

(1) Position coil packs to mounting bracket (primary wiring connectors face downward).

(2) Install coil pack mounting bolts. Tighten bolts to 10 N·m (90 in. lbs.) torque.

(3) Install coil pack-to-engine mounting bracket (if necessary).

(4) Connect primary wiring connectors to coil packs (four wire connector to front coil pack and three wire connector to rear coil pack).

(5) Connect secondary spark plug cables to coil packs. Refer to (Fig. 27) for correct cable order.

SPARK PLUG

DESCRIPTION

The 5.9L V-8 engines use resistor type spark plugs. The 8.0L V-10 engine uses inductive type spark plugs.

Spark plug resistance values range from 6,000 to 20,000 ohms (when checked with at least a 1000 volt spark plug tester). **Do not use an ohmmeter to check the resistance values of the spark plugs. Inaccurate readings will result.**

OPERATION

To prevent possible pre-ignition and/or mechanical engine damage, the correct type/heat range/number spark plug must be used.

Always use the recommended torque when tightening spark plugs. Incorrect torque can distort the spark plug and change plug gap. It can also pull the plug threads and do possible damage to both the spark plug and the cylinder head.

Remove the spark plugs and examine them for burned electrodes and fouled, cracked or broken porcelain insulators. Keep plugs arranged in the order

SPARK PLUG (Continued)

**Fig. 27 Spark Plug Cable Order—8.0L V-10 Engine**

in which they were removed from the engine. A single plug displaying an abnormal condition indicates that a problem exists in the corresponding cylinder. Replace spark plugs at the intervals recommended in Group O, Lubrication and Maintenance

Spark plugs that have low mileage may be cleaned and reused if not otherwise defective, carbon or oil fouled. Also refer to Spark Plug Conditions.

CAUTION: Never use a motorized wire wheel brush to clean the spark plugs. Metallic deposits will remain on the spark plug insulator and will cause plug misfire.

DIAGNOSIS AND TESTING - SPARK PLUG CONDITIONS

NORMAL OPERATING

The few deposits present on the spark plug will probably be light tan or slightly gray in color. This is evident with most grades of commercial gasoline (Fig. 28). There will not be evidence of electrode burning. Gap growth will not average more than approximately 0.025 mm (.001 in) per 3200 km (2000 miles) of operation. Spark plugs that have normal

wear can usually be cleaned, have the electrodes filed, have the gap set and then be installed.

J908D-15

Fig. 28 Normal Operation and Cold (Carbon) Fouling

- 1 - NORMAL
- 2 - DRY BLACK DEPOSITS
- 3 - COLD (CARBON) FOULING

Some fuel refiners in several areas of the United States have introduced a manganese additive (MMT) for unleaded fuel. During combustion, fuel with MMT causes the entire tip of the spark plug to be coated with a rust colored deposit. This rust color can be misdiagnosed as being caused by coolant in the combustion chamber. Spark plug performance may be affected by MMT deposits.

COLD FOULING/CARBON FOULING

Cold fouling is sometimes referred to as carbon fouling. The deposits that cause cold fouling are basically carbon (Fig. 28). A dry, black deposit on one or two plugs in a set may be caused by sticking valves or defective spark plug cables. Cold (carbon) fouling of the entire set of spark plugs may be caused by a clogged air cleaner element or repeated short operating times (short trips).

WET FOULING OR GAS FOULING

A spark plug coated with excessive wet fuel or oil is wet fouled. In older engines, worn piston rings, leaking valve guide seals or excessive cylinder wear can cause wet fouling. In new or recently overhauled engines, wet fouling may occur before break-in (normal oil control) is achieved. This condition can usually be resolved by cleaning and reinstalling the fouled plugs.

OIL OR ASH ENCRUSTED

If one or more spark plugs are oil or oil ash encrusted (Fig. 29), evaluate engine condition for the

SPARK PLUG (Continued)

cause of oil entry into that particular combustion chamber.

Fig. 29 Oil or Ash Encrusted

ELECTRODE GAP BRIDGING

Electrode gap bridging may be traced to loose deposits in the combustion chamber. These deposits accumulate on the spark plugs during continuous stop-and-go driving. When the engine is suddenly subjected to a high torque load, deposits partially liquefy and bridge the gap between electrodes (Fig. 30). This short circuits the electrodes. Spark plugs with electrode gap bridging can be cleaned using standard procedures.

J908D-11

Fig. 30 Electrode Gap Bridging

- 1 - GROUND ELECTRODE
- 2 - DEPOSITS
- 3 - CENTER ELECTRODE

J908D-12

Fig. 31 Scavenger Deposits

- 1 - GROUND ELECTRODE COVERED WITH WHITE OR YELLOW DEPOSITS
- 2 - CENTER ELECTRODE

SCAVENGER DEPOSITS

Fuel scavenger deposits may be either white or yellow (Fig. 31). They may appear to be harmful, but this is a normal condition caused by chemical additives in certain fuels. These additives are designed to change the chemical nature of deposits and decrease spark plug misfire tendencies. Notice that accumulation on the ground electrode and shell area may be heavy, but the deposits are easily removed. Spark plugs with scavenger deposits can be considered normal in condition and can be cleaned using standard procedures.

CHIPPED ELECTRODE INSULATOR

A chipped electrode insulator usually results from bending the center electrode while adjusting the spark plug electrode gap. Under certain conditions, severe detonation can also separate the insulator from the center electrode (Fig. 32). Spark plugs with this condition must be replaced.

PREIGNITION DAMAGE

Preignition damage is usually caused by excessive combustion chamber temperature. The center electrode dissolves first and the ground electrode dissolves somewhat latter (Fig. 33). Insulators appear relatively deposit free. Determine if the spark plug has the correct heat range rating for the engine. Determine if ignition timing is over advanced or if other operating conditions are causing engine overheating. (The heat range rating refers to the operating temperature of a particular type spark plug. Spark plugs are designed to operate within specific temperature ranges. This depends upon the thickness and length of the center electrodes porcelain insulator.)

SPARK PLUG (Continued)

J908D-13

Fig. 32 Chipped Electrode Insulator

- 1 - GROUND ELECTRODE
- 2 - CENTER ELECTRODE
- 3 - CHIPPED INSULATOR

J908D-14

Fig. 33 Preignition Damage

- 1 - GROUND ELECTRODE STARTING TO DISSOLVE
- 2 - CENTER ELECTRODE DISSOLVED

SPARK PLUG OVERHEATING

Overheating is indicated by a white or gray center electrode insulator that also appears blistered (Fig. 34). The increase in electrode gap will be considerably in excess of 0.001 inch per 2000 miles of operation. This suggests that a plug with a cooler heat range rating should be used. Over advanced ignition timing, detonation and cooling system malfunctions can also cause spark plug overheating.

J908D-16

Fig. 34 Spark Plug Overheating

- 1 - BLISTERED WHITE OR GRAY COLORED INSULATOR

REMOVAL

On 5.9L engines, spark plug cable heat shields are pressed into the cylinder head to surround each cable boot and spark plug (Fig. 35).

J9314-94

Fig. 35 Heat Shields—5.9L Engines

- 1 - AIR GAP
- 2 - SPARK PLUG BOOT HEAT SHIELD

(1) Always remove spark plug or ignition coil cables by grasping at the cable boot (Fig. 37). Turn the cable boot 1/2 turn and pull straight back in a steady motion. Never pull directly on the cable. Internal damage to cable will result.

SPARK PLUG (Continued)

(2) Prior to removing the spark plug, spray compressed air around the spark plug hole and the area around the spark plug. This will help prevent foreign material from entering the combustion chamber.

(3) Remove the spark plug using a quality socket with a rubber or foam insert.

(4) Inspect the spark plug condition. Refer to Spark Plug Condition in the Diagnostics and Testing section of this group.

CLEANING

The plugs may be cleaned using commercially available spark plug cleaning equipment. After cleaning, file center electrode flat with a small point file or jewelers file before adjusting gap.

CAUTION: Never use a motorized wire wheel brush to clean spark plugs. Metallic deposits will remain on spark plug insulator and will cause plug misfire.

INSTALLATION

Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap or a cracked porcelain insulator.

When replacing the spark plug and ignition coil cables, route the cables correctly and secure them in the appropriate retainers. Failure to route the cables properly can cause the radio to reproduce ignition noise. It could cause cross ignition of the spark plugs or short circuit the cables to ground.

(1) Start the spark plug into the cylinder head by hand to avoid cross threading.

(2) Tighten spark plugs to 35-41 N·m (26-30 ft. lbs.) torque.

(3) Install spark plug cables over spark plugs.

SPARK PLUG CABLE

DESCRIPTION

Spark plug cables are sometimes referred to as secondary ignition wires.

OPERATION

The spark plug cables transfer electrical current from the ignition coil(s) and/or distributor, to individual spark plugs at each cylinder. The resistive spark plug cables are of nonmetallic construction. The cables provide suppression of radio frequency emissions from the ignition system.

DIAGNOSIS AND TESTING - SPARK PLUG CABLES

Cable routing is important on certain engines. To prevent possible ignition crossfire, be sure the cables are clipped into the plastic routing looms. Try to prevent any one cable from contacting another. Before removing cables, note their original location and routing. Never allow one cable to be twisted around another.

Check the spark plug cable connections for good contact at the coil(s), distributor cap towers, and spark plugs. Terminals should be fully seated. The insulators should be in good condition and should fit tightly on the coil, distributor and spark plugs. Spark plug cables with insulators that are cracked or torn must be replaced.

Clean high voltage ignition cables with a cloth moistened with a non-flammable solvent. Wipe the cables dry. Check for brittle or cracked insulation.

On 5.9L engines, spark plug cable heat shields are pressed into the cylinder head to surround each spark plug cable boot and spark plug (Fig. 36). These shields protect the spark plug boots from damage (due to intense engine heat generated by the exhaust manifolds) and should not be removed. After the spark plug cable has been installed, the lip of the cable boot should have a small air gap to the top of the heat shield (Fig. 36).

Fig. 36 Heat Shields—5.9L Engines

1 - AIR GAP

2 - SPARK PLUG BOOT HEAT SHIELD

TESTING

When testing secondary cables for damage with an oscilloscope, follow the instructions of the equipment manufacturer.

If an oscilloscope is not available, spark plug cables may be tested as follows:

SPARK PLUG CABLE (Continued)

CAUTION: Do not leave any one spark plug cable disconnected for longer than necessary during testing. This may cause possible heat damage to the catalytic converter. Total test time must not exceed ten minutes.

With the engine running, remove spark plug cable from spark plug (one at a time) and hold next to a good engine ground. If the cable and spark plug are in good condition, the engine rpm should drop and the engine will run poorly. If engine rpm does not drop, the cable and/or spark plug may not be operating properly and should be replaced. Also check engine cylinder compression.

With the engine not running, connect one end of a test probe to a good ground. Start the engine and run the other end of the test probe along the entire length of all spark plug cables. If cables are cracked or punctured, there will be a noticeable spark jump from the damaged area to the test probe. The cable running from the ignition coil to the distributor cap can be checked in the same manner. Cracked, damaged or faulty cables should be replaced with resistance type cable. This can be identified by the words ELECTRONIC SUPPRESSION printed on the cable jacket.

Use an ohmmeter to test for open circuits, excessive resistance or loose terminals. If equipped, remove the distributor cap from the distributor. **Do not remove cables from cap.** Remove cable from spark plug. Connect ohmmeter to spark plug terminal end of cable and to corresponding electrode in distributor cap. Resistance should be 250 to 1000 Ohms per inch of cable. If not, remove cable from distributor cap tower and connect ohmmeter to the terminal ends of cable. If resistance is not within specifications as found in the SPARK PLUG CABLE RESISTANCE chart, replace the cable. Test all spark plug cables in this manner.

SPARK PLUG CABLE RESISTANCE

MINIMUM	MAXIMUM
250 Ohms Per Inch	1000 Ohms Per Inch
3000 Ohms Per Foot	12,000 Ohms Per Foot

To test ignition coil-to-distributor cap cable, do not remove the cable from the cap. Connect ohmmeter to rotor button (center contact) of distributor cap and terminal at ignition coil end of cable. If resistance is not within specifications as found in the Spark Plug Cable Resistance chart, remove the cable from the distributor cap. Connect the ohmmeter to the terminal ends of the cable. If resistance is not within specifications as found in the Spark Plug Cable

Resistance chart, replace the cable. Inspect the ignition coil tower for cracks, burns or corrosion.

REMOVAL

CAUTION: When disconnecting a high voltage cable from a spark plug or from the distributor cap, twist the rubber boot slightly (1/2 turn) to break it loose (Fig. 37). Grasp the boot (not the cable) and pull it off with a steady, even force.

958D-9

Fig. 37 Cable Removal

- 1 - SPARK PLUG CABLE AND BOOT
- 2 - SPARK PLUG BOOT PULLER
- 3 - TWIST AND PULL
- 4 - SPARK PLUG

INSTALLATION

Install cables into the proper engine cylinder firing order (Fig. 38) or (Fig. 39).

J9314-79

Fig. 38 Engine Firing Order—5.9L V-8 Engines

SPARK PLUG CABLE (Continued)

When replacing the spark plug and coil cables, route the cables correctly and secure in the proper retainers. Failure to route the cables properly can cause the radio to reproduce ignition noise. It could also cause cross ignition of the plugs or short circuit the cables to ground.

When installing new cables, make sure a positive connection is made. A snap should be felt when a good connection is made between the plug cable and the distributor cap tower.

Fig. 39 Spark Plug Cable Order—8.0L V-10 Engine

- 5 - LENS
- 6 - CIRCUIT BOARD
- 7 - ODOMETER RESET BUTTON

The instrument cluster for this model is an ElectroMechanical Instrument Cluster (EMIC) module that is located in the instrument panel above the steering column opening, directly in front of the driver (Fig. 1). The EMIC gauges and indicators are protected by an integral clear plastic cluster lens, and are visible through a dedicated opening in the cluster bezel on the instrument panel. Just behind the cluster lens is the cluster hood. The cluster hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare. Behind the cluster hood is the cluster overlay and gauges. The overlay is a multi-layered unit. The dark, visible surface of the outer layer of the overlay is marked with all of the gauge identification and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the various indicators and illumination lamps behind it to be visible through the outer layer of the overlay only through predetermined cutouts. On the lower edge of the cluster lens just left of center, the odometer/trip odometer switch knob protrudes

through a dedicated hole in the lens. The remainder of the EMIC, including the mounts and the electrical connections, are concealed behind the cluster bezel. The molded plastic EMIC housing has four integral mounting tabs, two each on the upper and lower edges of the housing. The EMIC is secured to the molded plastic instrument panel cluster carrier with four screws. All electrical connections to the EMIC are made at the back of the cluster housing through two take outs of the instrument panel wire harness, each equipped with a self-docking connector.

A single EMIC module is offered on this model. This module utilizes integrated circuitry and information carried on the Chrysler Collision Detection (CCD) data bus network for control of all gauges and many of the indicators. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION). The EMIC also uses several hard wired inputs in order to perform its many functions. In addition to instrumentation and indicators, the EMIC has hardware and/or software to support the following functions:

- **Chime Warning Requests** - The EMIC sends chime tone requests over a hard wired circuit to the Central Timer Module (CTM) when it monitors certain conditions or inputs. The CTM replaces the chime or buzzer module and performs the functions necessary to provide audible alerts that are synchronized with the visual alerts provided by the EMIC. (Refer to 8 - ELECTRICAL/CHIME/BUZZER - DESCRIPTION).

- **Vacuum Fluorescent Display (VFD) Dimming Service** - The EMIC performs the functions necessary to eliminate the need for a separate VFD dimming module by providing control and synchronization of the illumination intensity of all vacuum fluorescent displays in the vehicle, as well as a parade mode.

The EMIC module incorporates a blue-green digital VFD for displaying odometer and trip odometer information, as well as the amber cruise-on indicator display function. Some variations of the EMIC are necessary to support optional equipment and regulatory requirements. The EMIC includes the following analog gauges:

- **Coolant Temperature Gauge**
- **Fuel Gauge**
- **Oil Pressure Gauge**
- **Speedometer**
- **Tachometer**
- **Voltage Gauge**

The EMIC also includes provisions for the following indicators:

- **Airbag Indicator**
- **Antilock Brake System (ABS) Indicator**
- **Brake Indicator**

INSTRUMENT CLUSTER (Continued)

- **Check Gauges Indicator**
- **Cruise Indicator (Odometer VFD)**
- **Four-Wheel Drive Indicator**
- **High Beam Indicator**
- **Low Fuel Indicator**
- **Washer Fluid Indicator**
- **Malfunction Indicator Lamp (MIL)**
- **Overdrive-Off Indicator**
- **Seatbelt Indicator**
- **Service Reminder Indicator (SRI)**
- **Transmission Overtemp Indicator**
- **Turn Signal (Right and Left) Indicators**
- **Upshift Indicator**
- **Wait-To-Start Indicator (Diesel Only)**
- **Water-In-Fuel Indicator (Diesel Only)**

Some of these indicators are either programmable or automatically configured when the EMIC is connected to the vehicle electrical system. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. The EMIC also includes a provision for mounting the automatic transmission gear selector indicator in the lower right corner of the cluster. The spring-loaded, cable driven, mechanical gear selector indicator gives an indication of the transmission gear that has been selected with the automatic transmission gear selector lever. The gear selector indicator pointer is easily visible through an opening provided in the front of the cluster overlay, and is also lighted by the cluster illumination lamps for visibility at night. Models equipped with a manual transmission have a block-out plate installed in place of the gear selector indicator.

Cluster illumination is accomplished by adjustable incandescent back lighting, which illuminates the gauges for visibility when the exterior lighting is turned on. The EMIC high beam indicator, turn signal indicators, and wait-to-start indicator are also illuminated by dedicated incandescent bulbs. The remaining indicators in the EMIC are each illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the electronic circuit board. Each of the incandescent bulbs is secured by an integral bulb holder to the electronic circuit board from the back of the cluster housing.

Hard wired circuitry connects the EMIC to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring dia-

grams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC modules for this model are serviced only as complete units. The EMIC module cannot be adjusted or repaired. If a gauge, an LED indicator, the VFD, the electronic circuit board, the circuit board hardware, the cluster overlay, or the EMIC housing are damaged or faulty, the entire EMIC module must be replaced. The cluster lens and hood unit, the rear cluster housing cover, the automatic transmission gear selector indicator, and the incandescent lamp bulbs with holders are available for individual service replacement.

OPERATION

The ElectroMechanical Instrument Cluster (EMIC) is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the EMIC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The EMIC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service. The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Chrysler Collision Detection (CCD) data bus network. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist, such as low/high battery voltage, low oil pressure, or high coolant temperature, the algorithm drives the gauge pointer to an extreme position and the microprocessor turns on the Check Gauges indicator to provide a distinct visual indication of a problem to the vehicle operator. The instrument cluster circuitry may also generate a hard wired chime tone request to the Central Timer Module (CTM) when it monitors certain conditions or inputs, in order to provide the vehicle operator with an audible alert.

INSTRUMENT CLUSTER (Continued)

The EMIC circuitry operates on battery current received through a fused B(+) fuse in the Junction Block (JB) on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (st-run) fuse in the JB on a fused ignition switch output (st-run) circuit. This arrangement allows the EMIC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the Start or On positions. The EMIC circuitry is grounded through two separate ground circuits located in one of the two instrument cluster connectors and take outs of the instrument panel wire harness. One ground circuit receives ground through a take out with an eyelet terminal connector of the instrument panel wire harness that is secured by a nut to a ground stud located on the left instrument panel end bracket, while the other ground circuit receives ground through a take out with an eyelet terminal connector of the instrument panel wire harness that is secured by a nut to a ground stud located on the back of the instrument panel armature above the inboard side of the instrument panel steering column opening.

The EMIC also has a self-diagnostic actuator test capability, which will test each of the CCD bus message-controlled functions of the cluster by lighting the appropriate indicators and positioning the gauge needles at several predetermined locations on the gauge faces in a prescribed sequence. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). See the owner's manual in the vehicle glove box for more information on the features, use and operation of the EMIC.

GAUGES

All gauges receive battery current through the EMIC circuitry when the ignition switch is in the On or Start positions. With the ignition switch in the Off position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions. All of the EMIC gauges, except the odometer, are air core magnetic units. Two fixed electromagnetic coils are located within each gauge. These coils are wrapped at right angles to each other around a movable permanent magnet. The movable magnet is suspended within the coils on one end of a pivot shaft, while the gauge needle is attached to the other end of the shaft. One of the coils has a fixed current flowing through it to maintain a constant magnetic field strength. Current flow through the second coil changes, which causes changes in its magnetic field

strength. The current flowing through the second coil is changed by the EMIC circuitry in response to messages received over the CCD data bus. The gauge needle moves as the movable permanent magnet aligns itself to the changing magnetic fields created around it by the electromagnets.

The gauges are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CCD data bus and the data bus message inputs to the EMIC that control each gauge require the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service manual.

VACUUM-FLUORESCENT DISPLAY

The Vacuum-Fluorescent Display (VFD) module is soldered to the EMIC circuit board. The display is active with the ignition switch in the On or Start positions, and inactive when the ignition switch is in any other position. The VFD has several display capabilities including odometer, trip odometer, and an amber "CRUISE" indication whenever the optional speed control system is turned On. The cruise indicator function of the VFD is automatically enabled or disabled by the EMIC circuitry based upon whether the vehicle is equipped with the speed control option. An odometer/trip odometer switch on the EMIC circuit board is used to control several of the display modes. This switch is actuated manually by depressing the odometer/trip odometer switch knob that extends through the lower edge of the cluster lens, just right of center. Actuating this switch momentarily with the ignition switch in the On position will toggle the VFD between the odometer and trip odometer modes. The word "TRIP" will also appear in blue-green text when the VFD trip odometer mode is active. Depressing the switch button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero. Holding this switch depressed while turning the ignition switch from the Off position to the On position will activate the EMIC self-diagnostic actuator test. The EMIC will automatically flash the odometer or trip odometer information on and off if there is a loss of CCD data bus communication. The VFD will also display various information used in several diagnostic procedures. Refer to the appropriate diagnostic information for additional details on this VFD function.

The VFD is diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CCD data bus and the data bus message inputs to the EMIC that con-

INSTRUMENT CLUSTER (Continued)

trol some of the VFD functions requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer and trip odometer functions of the VFD may be found elsewhere in this service manual.

INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC circuit board. The four-wheel drive indicator, high beam indicator, washer fluid indicator, turn signal indicators, and wait-to-start indicator are hard wired. The brake indicator is controlled by CCD data bus messages from the Controller Anti-lock Brake (CAB) and the hard wired park brake switch input to the EMIC. The seatbelt indicator is controlled by the EMIC programming, CCD data bus messages from the Airbag Control Module (ACM), and the hard wired seat belt switch input to the EMIC. The Malfunction Indicator Lamp (MIL) is normally controlled by CCD data bus messages from the Powertrain Control Module (PCM); however, if the EMIC loses CCD data bus communications, the EMIC circuitry will automatically turn the MIL on, and flash the odometer VFD on and off repeatedly until CCD data bus communication is restored. The EMIC uses CCD data bus messages from the Powertrain Control Module (PCM), the diesel engine only Engine Control Module (ECM), the ACM, and the CAB to control all of the remaining indicators. Different indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry cluster and have a switched ground, while others are grounded through the EMIC circuitry and have a switched battery feed.

In addition, certain indicators in this instrument cluster are programmable or configurable. This feature allows the programmable indicators to be activated or deactivated with a DRBIII® scan tool, while the configurable indicators will be automatically enabled or disabled by the EMIC circuitry for compatibility with certain optional equipment. The only programmable indicator for this model is the upshift indicator. The cruise indicator, four-wheel drive indicator, overdrive-off indicator, service reminder indicator, and the transmission overtemp indicator are automatically configured, either electronically or mechanically.

The hard wired indicators are diagnosed using conventional diagnostic methods. The EMIC and CCD bus message controlled indicator lamps are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CCD data bus and the data bus message inputs to the EMIC that control each indicator lamp require

the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. Specific operation details for each indicator may be found elsewhere in this service manual.

CLUSTER ILLUMINATION

The EMIC has several illumination lamps that are illuminated when the exterior lighting is turned on with the headlamp switch. The illumination brightness of these lamps is adjusted by the panel lamps dimmer rheostat when the headlamp switch thumbwheel is rotated (down to dim, up to brighten). The illumination lamps receive battery current through the panel lamps dimmer rheostat and a fuse in the JB on a fused panel lamps dimmer switch signal circuit. The illumination lamps are grounded at all times.

In addition, an analog/digital (A/D) converter in the EMIC converts the analog panel lamps dimmer rheostat input from the headlamp switch to a digital dimming level signal for controlling the lighting level of the VFD. The EMIC also broadcasts this digital dimming information as a message over the CCD data bus for use by the Compass Mini-Trip Computer (CMTC) in synchronizing the lighting level of its VFD with that of the EMIC. The headlamp switch thumbwheel also has a Parade position to provide a parade mode. The EMIC monitors the request for this mode through a hard wired day brightness sense circuit input from the headlamp switch. In this mode, the EMIC will override the selected panel dimmer switch signal and send a message over the CCD data bus to illuminate all vacuum fluorescent displays at full brightness for easier visibility when driving in daylight with the exterior lighting turned on. The parade mode has no effect on the incandescent bulb illumination intensity.

The hard wired cluster illumination lamps are diagnosed using conventional diagnostic methods. Proper testing of the VFD dimming level and the CCD data bus dimming level message functions requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

CHIME WARNING REQUESTS

The EMIC is programmed to request chime service from the Central Timer Module (CTM) when certain indicator lamps are illuminated. When the programmed conditions are met, the EMIC generates a chime request signal and sends it over a hard wired tone request circuit to the CTM. Upon receiving the proper chime request, the CTM activates an integral chime tone generator to provide the audible chime tone to the vehicle operator. (Refer to 8 - ELECTRICAL/CHIME/BUZZER - OPERATION). Proper testing of the CTM and the EMIC chime requests

INSTRUMENT CLUSTER (Continued)

requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

If all of the instrument cluster gauges and/or indicators are inoperative, refer to PRELIMINARY DIAGNOSIS . If an individual gauge or Chrysler Collision Detection (CCD) data bus message-controlled indicator is inoperative, refer to ACTUATOR TEST . If an individual hard wired indicator is inoperative, refer to the diagnosis and testing information for that specific indicator. If the instrument cluster chime warning request function is inoperative, refer to CHIME WARNING REQUEST DIAGNOSIS . If the instrument cluster illumination lighting is inoperative, refer to CLUSTER ILLUMINATION DIAGNOSIS . If the instrument cluster Vacuum-Fluorescent Display (VFD) dimmer service is inoperative, use a DRBIII® scan tool to diagnose the problem. Refer to the appropriate diagnostic procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

NOTE: Certain indicators in this instrument cluster are programmable. This feature allows those indicators to be activated or deactivated with a DRBIII® scan tool for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the upshift indicator, use a DRBIII® scan tool to be certain that the instrument cluster has been programmed with the proper vehicle equipment option settings.

PRELIMINARY DIAGNOSIS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) If the indicators operate, but none of the gauges operate, go to Step 2. If all of the gauges and the CCD data bus message-controlled indicators are inoperative, go to Step 5.

(2) Check the fused B(+) fuse (Fuse 14 - 10 ampere) in the Junction Block (JB). If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(3) Check for battery voltage at the fused B(+) fuse (Fuse 14 - 10 ampere) in the JB. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit between the JB and the Power Distribution Center (PDC) as required.

(4) Disconnect and isolate the battery negative cable. Remove the instrument cluster. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. If OK, refer to ACTUATOR TEST . If not OK, repair the open fused B(+) circuit between the instrument cluster and the JB as required.

(5) Check the fused ignition switch output (st-run) fuse (Fuse 17 - 10 ampere) in the JB. If OK, go to Step 6. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(6) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (st-run) fuse (Fuse 17 - 10 ampere) in the JB. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (st-run) circuit between the instrument cluster and the JB as required.

(7) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Reinstall the instrument cluster. Reconnect the battery negative cable. Turn the ignition switch to the On position. Set the park brake. The brake indicator in the instrument cluster should light. If OK, go to Step 8. If not OK, go to Step 9.

(8) Turn the ignition switch to the Off position. Turn on the park lamps and adjust the panel lamps dimmer thumbwheel in the headlamp switch to the full bright position. The cluster illumination lamps should light. If OK, go to Step 10. If not OK, repair the open ground circuit (Z3) between the instrument cluster and ground (G201) as required.

(9) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (st-run) circuit cavity of the instrument panel wire harness connector (Connector C1). If OK, refer to ACTUATOR TEST . If not OK, repair the open fused ignition switch output (st-run) circuit between the instrument cluster and the JB as required.

INSTRUMENT CLUSTER (Continued)

(10) Disconnect and isolate the battery negative cable. Remove the instrument cluster. Check for continuity between the ground circuit (Z2) cavity of the instrument panel wire harness connector (Connector C1) and a good ground. There should be continuity. If OK, refer to ACTUATOR TEST . If not OK, repair the open ground circuit to ground (G200) as required.

ACTUATOR TEST

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, and the CCD data bus message-controlled indicators are capable of operating as designed. During the actuator test the instrument cluster circuitry position each of the gauge

needles at various calibration points, illuminate each of the segments in the Vacuum-Fluorescent Display (VFD), and turn all of the CCD data bus message-controlled indicators on and off.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CCD data bus, the Powertrain Control Module (PCM), the Engine Control Module (ECM), the Airbag Control Module (ACM), the Controller Anti-lock Brake (CAB), or the inputs to one of these electronic control modules. Use a DRBIII® scan tool to diagnose these components. Refer to the appropriate diagnostic information.

(1) Begin the test with the ignition switch in the Off position.

(2) Depress the odometer/trip odometer switch button.

(3) While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the On position, but do not start the engine.

(4) Keep the odometer/trip odometer switch button depressed for about ten seconds, until **CHEC** appears in the odometer display, then release the odometer/trip odometer switch button.

(5) A series of three-digit numeric failure messages may appear in the odometer display, depending upon the failure mode. If a failure message appears, refer to the Instrument Cluster Failure Message chart for the description and proper correction. If no failure message appears, the actuator test will proceed as described in Step 6.

INSTRUMENT CLUSTER FAILURE MESSAGE		
Message	Description	Correction
110	A failure has been identified in the cluster CPU, RAM, or EEPROM.	1. Replace the faulty cluster.
900	The CCD data bus is not operational.	1. Check the CCD data bus connections at the cluster. 2. Check the cluster fuses. 3. Check the CCD data bus bias. 4. Check the CCD data bus voltage. 5. Check the CCD data bus terminations.
920	The cluster is not receiving a vehicle speed message from the PCM.	1. Check the PCM software level and reflash if required. 2. Use a DRBIII® scan tool to verify that the vehicle speed message is being sent by the PCM.
921	The cluster is not receiving a distance pulse message from the PCM.	1. Check the PCM software level and reflash if required. 2. Use a DRBIII® scan tool to verify that the distance pulse message is being sent by the PCM.

INSTRUMENT CLUSTER (Continued)

INSTRUMENT CLUSTER FAILURE MESSAGE		
Message	Description	Correction
940	The cluster is not receiving an airbag lamp-on message from the ACM.	1. Check the CCD data bus connections at the ACM. 2. Check the ACM fuse.
950	The cluster is not receiving an ABS lamp-on message from the CAB.	1. Check the CCD data bus connections at the CAB. 2. Check the CAB fuse.
999	An error has been discovered.	1. Record the failure message. 2. Depress the trip odometer reset button to continue the Self-Diagnostic Test.

(6) The instrument cluster will begin the Vacuum Fluorescent Display (VFD) walking segment test. This test will require the operator to visually inspect each VFD segment as it is displayed to determine a pass or fail condition. First, all of the segments will be illuminated at once; then, each individual segment of the VFD will be illuminated in sequence. If any segment in the display fails to illuminate, repeat the test to confirm the failure. If the failure is confirmed, replace the faulty instrument cluster. Following completion of the VFD walking segment test, the actuator test will proceed as described in Step 7.

(7) The instrument cluster will perform a bulb check of each indicator that the instrument cluster circuitry controls. If the wait-to-start indicator does not illuminate during this test, the instrument cluster should be removed. However, check that the incandescent bulb is not faulty and that the bulb holder is properly installed on the instrument cluster electronic circuit board before considering instrument cluster replacement. If the bulb and bulb holder check OK, replace the faulty instrument cluster. Each of the remaining instrument cluster circuitry controlled indicators except the cruise indicator are illuminated by a Light Emitting Diode (LED). If an LED or the cruise indicator in the VFD, fails to illuminate during this test, the instrument cluster must be replaced. Following the bulb check test, the actuator test will proceed as described in Step 8.

(8) The instrument cluster will perform a gauge actuator test. In this test the instrument cluster circuitry positions each of the gauge needles at three different calibration points, then returns the gauge needles to their relaxed positions. If an individual gauge does not respond properly, or does not respond

at all during the gauge actuator test, the instrument cluster should be removed. However, check that the gauge terminal pins are properly inserted through the spring-clip terminal pin receptacles on the instrument cluster electronic circuit board before considering instrument cluster replacement. If the gauge terminal connections are OK, replace the faulty instrument cluster.

(9) The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test, if the ignition switch is turned to the Off position during the test, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM on the CCD data bus during the test.

(10) Go back to Step 1 to repeat the test, if required.

CHIME WARNING REQUEST DIAGNOSIS

Before performing this test, complete the testing of the seat belt switch and the Central Timer Module (CTM). (Refer to 8 - ELECTRICAL/RESTRAINTS/SEAT BELT SWITCH - DIAGNOSIS AND TESTING) and (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODULE - DIAGNOSIS AND TESTING). The diagnosis found here consists of confirming the viability of the hard wired tone request circuit between the instrument cluster and the Central Timer Module (CTM). For diagnosis of the CCD data bus and the data bus message inputs that cause the instrument cluster to issue a request for chime service, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

INSTRUMENT CLUSTER (Continued)

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Move the CTM away from its mounting bracket far enough to access the instrument panel wire harness connector(s) for the CTM. Disconnect the instrument panel wire harness connector (Connector C1) from the CTM connector receptacle.

(2) Check for continuity between the tone request circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted tone request circuit between the instrument cluster and the CTM as required.

(3) Check for continuity between the tone request circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the instrument panel wire harness connector (Connector C1) for the CTM. There should be continuity. If OK, replace the faulty instrument cluster. If not OK, repair the open tone request circuit between the instrument cluster and the CTM as required.

CLUSTER ILLUMINATION DIAGNOSIS

The diagnosis found here addresses an inoperative instrument cluster illumination lamp condition. If the problem being diagnosed is a single inoperative illumination lamp, be certain that the bulb and bulb holder unit are properly installed in the instrument cluster electronic circuit board. If no installation problems are found replace the faulty bulb and bulb holder unit. If all of the cluster illumination lamps are inoperative and the problem being diagnosed includes inoperative exterior lighting controlled by the headlamp switch, that system needs to be repaired first. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP - DIAGNOSIS AND TESTING). If no exterior lighting system problems are found, the following procedure will help locate a short or open in the cluster illumination lamp circuit. If the problem being diagnosed involves

a lack of dimming control for the odometer/trip odometer Vacuum Fluorescent Display (VFD), but all of the other cluster illumination lamps can be dimmed, test and repair the day brightness circuit between the instrument cluster and the headlamp switch as required. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the instrument panel dimmer fuse (Fuse 5 - 5 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the exterior lamps On with the headlamp switch. Rotate the headlamp switch panel lamps dimmer thumbwheel upward to just before the interior lamps detent. Check for battery voltage at the panel lamps dimmer fuse (Fuse 5 - 5 ampere) in the JB. Rotate the panel lamps dimmer thumbwheel downward while observing the test voltmeter. The reading should go from battery voltage to zero volts. If OK, go to Step 3. If not OK, repair the open panel lamps dimmer switch signal circuit between the headlamp switch and the JB as required.

(3) Turn the exterior lamps Off. Disconnect and isolate the battery negative cable. Remove the instrument cluster. Remove the instrument panel dimmer fuse (Fuse 5 - 5 ampere) from the JB. Probe the fused panel lamps dimmer switch signal circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster. Check for continuity to a good ground. There should be no continuity. If OK, go to Step 4. If not OK, repair the shorted fused panel lamps dimmer switch signal circuit between the instrument cluster and the JB as required.

(4) Reinstall the instrument panel dimmer fuse (Fuse 5 - 5 ampere) in the JB. Reconnect the battery negative cable. Turn the exterior lamps On with the

INSTRUMENT CLUSTER (Continued)

headlamp switch. Rotate the headlamp switch panel lamps dimmer thumbwheel upward to just before the interior lamps detent. Check for battery voltage at the fused panel lamps dimmer switch signal circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster. If OK, replace the faulty bulb and bulb holder units. If not OK, repair the open fused panel lamps dimmer switch signal circuit between the instrument cluster and the JB as required.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the four screws that secure the instrument cluster to the instrument panel (Fig. 2).

Fig. 2 Instrument Cluster Remove/Install

- 1 - INSTRUMENT CLUSTER
- 2 - SCREW
- 3 - PRNDL CABLE
- 4 - SELF-DOCKING WIRE HARNESS CONNECTOR

(4) If the vehicle is equipped with an automatic transmission, place the automatic transmission gear selector lever in the Park position.

(5) Pull the instrument cluster rearward far enough to disengage the two self-docking instrument panel wire harness connectors from the cluster connector receptacles.

(6) If the vehicle is equipped with an automatic transmission, pull the instrument cluster rearward far enough to access and remove the two screws that secure the gear selector indicator to the back of the instrument cluster housing (Fig. 3).

(7) If the vehicle is equipped with an automatic transmission, disengage the gear selector indicator from the back of the instrument cluster housing.

(8) Remove the instrument cluster from the instrument panel.

DISASSEMBLY

Some of the components for the instrument cluster used in this vehicle are serviced individually. The serviced components include: the automatic transmission gear selector indicator, the incandescent instrument cluster indicator lamp and illumination lamp bulbs (including the integral bulb holders), the cluster lens and hood unit, and the cluster housing rear cover. The remaining components are serviced only as a part of the cluster housing unit, which includes: the cluster housing, the electronic circuit board unit, the cluster overlay, the gauges, and the odometer/trip odometer reset switch button. Following are the procedures for disassembling the serviced components from the instrument cluster unit.

INSTRUMENT CLUSTER (Continued)

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

GEAR SELECTOR INDICATOR

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
- (3) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
- (4) Reach through the instrument panel steering column opening to access and disengage the loop end of the gear selector indicator cable from the PRNDL driver lever on the left side of the steering column (Fig. 4).

Fig. 4 Gear Selector Indicator Cable Remove/Install

- 1 - STEERING COLUMN
- 2 - CABLE
- 3 - LOOP END
- 4 - LEVER
- 5 - ADJUSTER AND BRACKET

- (5) Squeeze the sides of the plastic adjuster and bracket unit to disengage the tabs that secure it to the sides of the steering column window.

- (6) Remove the gear selector indicator mechanism and cable unit through the instrument panel cluster opening.

CLUSTER BULB

This procedure applies to each of the incandescent cluster illumination lamp or indicator lamp bulb and bulb holder units. However, the illumination lamps and the indicator lamps use different bulb and bulb holder unit sizes. They must never be interchanged.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
- (3) Turn the bulb holder counterclockwise about sixty degrees on the cluster electronic circuit board (Fig. 5).

80a92a79

Fig. 5 Cluster Bulb Remove/Install

- 1 - INSTRUMENT CLUSTER
- 2 - BULB AND HOLDER

- (4) Pull the bulb and bulb holder unit straight back to remove it from the bulb mounting hole in the cluster electronic circuit board.

CLUSTER LENS AND HOOD

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

INSTRUMENT CLUSTER (Continued)

(3) Remove the seven screws that secure the lens and hood unit to the cluster housing (Fig. 6).

80a953e3

- 1 - COVER
- 2 - HOUSING
- 3 - MASK AND GAUGES
- 4 - HOOD
- 5 - LENS
- 6 - CIRCUIT BOARD
- 7 - ODOMETER RESET BUTTON

(4) Gently pull the lens and hood unit away from the cluster housing.

CAUTION: Do not touch the face of the gauge overlay or the back of the cluster lens with your finger. It will leave a permanent finger print.

CLUSTER HOUSING REAR COVER

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the six screws that secure the rear cover to the back of the cluster housing (Fig. 7).

(4) Remove the rear cover from the back of the cluster housing.

CLUSTER HOUSING

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the lens and hood unit from the cluster housing. Refer to CLUSTER LENS AND HOOD .

(4) Remove the rear cover from the cluster housing. Refer to CLUSTER HOUSING REAR COVER .

ASSEMBLY

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

GEAR SELECTOR INDICATOR

(1) Position the gear selector indicator mechanism and cable unit into the instrument panel cluster opening.

(2) Route the cable through the instrument panel and under the steering column to the PRNDL driver lever on the left side of the steering column.

(3) Squeeze the sides of the plastic adjuster and bracket unit and engage the tabs that secure it with the sides of the steering column window.

(4) Engage the loop end of the gear selector indicator cable onto the PRNDL driver lever on the left side of the steering column (Fig. 4).

(5) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

(6) Confirm proper operation of the gear selector indicator. Calibrate the indicator, if required. (Refer to 19 - STEERING/COLUMN - INSTALLATION).

(7) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/IN-

INSTRUMENT CLUSTER (Continued)

INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

- (8) Reconnect the battery negative cable.

CLUSTER BULB

This procedure applies to each of the incandescent cluster illumination lamp or indicator lamp bulb and bulb holder units. However, the illumination lamps and the indicator lamps use different bulb and bulb holder unit sizes. They must never be interchanged.

CAUTION: Be certain that any bulb and bulb holder unit removed from the cluster electronic circuit board is reinstalled in the correct position. Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the instrument cluster, the electronic circuit board and/or the gauges.

- (1) Insert the bulb and bulb holder unit straight into the correct bulb mounting hole in the cluster electronic circuit board (Fig. 5).
- (2) With the bulb holder fully seated against the cluster electronic circuit board, turn the bulb holder clockwise about sixty degrees to lock it into place.
- (3) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (4) Reconnect the battery negative cable.

CLUSTER LENS AND HOOD

CAUTION: Do not touch the face of the gauge overlay or the back of the cluster lens with your finger. It will leave a permanent finger print.

- (1) Align the cluster lens and hood unit with the cluster housing. Be certain that the odometer/trip odometer switch button is installed through the clearance hole in the lens (Fig. 6).
- (2) Install and tighten the seven screws that secure the lens and hood unit to the cluster housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (3) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (4) Reconnect the battery negative cable.

CLUSTER HOUSING REAR COVER

- (1) Position the rear cover onto the back of the cluster housing (Fig. 7).
- (2) Install and tighten the six screws that secure the rear cover to the back of the cluster housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (3) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

- (4) Reconnect the battery negative cable.

CLUSTER HOUSING

- (1) Assemble the rear cover onto the cluster housing. Refer to CLUSTER HOUSING REAR COVER .
- (2) Assemble the lens and hood unit onto the cluster housing. Refer to CLUSTER LENS AND HOOD .
- (3) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
- (4) Reconnect the battery negative cable.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the instrument cluster to the instrument panel.
- (2) If the vehicle is equipped with an automatic transmission, position the gear selector indicator onto the back of the cluster housing (Fig. 3).
- (3) If the vehicle is equipped with an automatic transmission, install and tighten the two screws that secure the gear selector indicator mechanism to the back of the cluster housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (4) Align the instrument cluster with the cluster opening in the instrument panel and push the cluster firmly and evenly into place. The instrument panel wire harness has two self-docking connectors that will be automatically aligned with, and connected to the instrument cluster connector receptacles when the cluster is properly installed in the instrument panel.
- (5) Install and tighten the four screws that secure the instrument cluster to the instrument panel (Fig. 2). Tighten the screws to 2.2 N·m (20 in. lbs.).
- (6) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
- (7) If the vehicle is equipped with an automatic transmission, confirm proper operation of the gear selector indicator. Calibrate the indicator, if required.

INSTRUMENT CLUSTER (Continued)

(Refer to 19 - STEERING/COLUMN - INSTALLATION).

(8) Reconnect the battery negative cable.

NOTE: Some of the indicators in this instrument cluster are either programmable (upshift indicator) or automatically configured (cruise, overdrive-off, and transmission overtemp indicators) when the cluster is connected to the vehicle electrical system. This feature allows those indicator lamps to be enabled or disabled for compatibility with certain optional equipment. If a new instrument cluster is being installed, use a DRBIII® scan tool to program the instrument cluster with the proper vehicle equipment option setting to enable and/or disable the upshift indicator lamp. Refer to the appropriate diagnostic information.

ABS INDICATOR

DESCRIPTION

An Antilock Brake System (ABS) indicator is standard equipment on all instrument clusters. This indicator serves both the standard equipment Rear Wheel Anti-Lock (RWAL) and optional equipment 4-Wheel Anti-Lock (4WAL) brake systems. The ABS indicator is located near the lower edge of the instrument cluster overlay, to the left of center. The ABS indicator consists of a stencilled cutout of the International Control and Display Symbol icon for "Failure of Anti-lock Braking System" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The ABS indicator is serviced as a unit with the instrument cluster.

OPERATION

The ABS indicator gives an indication to the vehicle operator when the ABS system is faulty or inoperative. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Chrysler Collision Detection (CCD) data bus. The ABS indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the

LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ABS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the ABS indicator is illuminated by the cluster for about two seconds as a bulb test.

- **ABS Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Communication Error** - If the cluster receives no lamp-on or lamp-off messages from the CAB for six consecutive seconds, the ABS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the ABS indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

- **ABS Diagnostic Test** - The ABS indicator is blinked on and off by lamp-on and lamp-off messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the CAB of the condition, and the CAB will store a DTC. For proper diagnosis of the antilock brake system, the CAB, the CCD data bus, or the message inputs to the instrument cluster that control the ABS indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

AIRBAG INDICATOR

DESCRIPTION

An airbag indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with airbags, this indicator is electronically disabled. The airbag indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The airbag indicator consists of a stenciled cutout of the word "AIRBAG" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the "AIRBAG" text to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The airbag indicator is serviced as a unit with the instrument cluster.

OPERATION

The airbag indicator gives an indication to the vehicle operator when the airbag system is faulty or inoperative. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Airbag Control Module (ACM) over the Chrysler Collision Detection (CCD) data bus. The airbag indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the airbag indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the airbag indicator is illuminated for about seven seconds. The first two seconds is the cluster bulb test function, and the remainder is the ACM bulb test function.
- **ACM Lamp-On Message** - Each time the cluster receives a lamp-on message from the ACM, the airbag indicator will be illuminated. The indicator remains illuminated for about twelve seconds or until the cluster receives a lamp-off message from the ACM, whichever is longer.
- **Communication Error** - If the cluster receives no airbag messages for three consecutive seconds, the airbag indicator is illuminated. The indicator remains illuminated for about twelve seconds or until

the cluster receives a single lamp-off message from the ACM, whichever is longer.

- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The ACM continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ACM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the ACM sends a lamp-on message after the bulb test, it indicates that the ACM has detected a system malfunction and/or that the airbags may not deploy when required, or may deploy when not required. The ACM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ACM of the condition, the ACM will store a DTC, and the cluster begins blinking the seat belt indicator. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SEATBELT INDICATOR - OPERATION). For proper diagnosis of the airbag system, the ACM, the CCD data bus, or the message inputs to the instrument cluster that control the airbag indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

BRAKE/PARK BRAKE INDICATOR

DESCRIPTION

A brake indicator is standard equipment on all instrument clusters. The brake indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The brake indicator consists of a stenciled cutout of the word "BRAKE" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the "BRAKE" text to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The brake indicator is serviced as a unit with the instrument cluster.

OPERATION

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, or when there are certain brake hydraulic system malfunctions. This indicator is controlled by a transistor

BRAKE/PARK BRAKE INDICATOR (Continued)

on the instrument cluster circuit board based upon a hard wired input to the instrument cluster, cluster programming, and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Chrysler Collision Detection (CCD) data bus. The brake indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the brake indicator is illuminated by the instrument cluster for about four seconds as a bulb test.

- **Park Brake-On** - If the park brake is applied or not fully released with the ignition switch in the On position, the brake indicator is illuminated solid. The brake indicator will blink on and off repeatedly when the park brake is applied or not fully released and the ignition switch is in the On position if a vehicle with an automatic transmission is not in Park or Neutral, or if the engine is running on vehicles with a manual transmission.

- **Brake Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the brake indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch on the park brake pedal mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The CAB continually monitors the brake pressure switch on the brake combination valve to determine if the pressures in the two halves of the split brake hydraulic system are unequal. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it

detects. The park brake switch input to the instrument cluster can be diagnosed using conventional diagnostic tools and methods. For proper diagnosis of the antilock brake system, the CAB, the CCD data bus, or the message inputs to the instrument cluster that control the brake indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - BRAKE INDICATOR

The diagnosis found here addresses an inoperative brake indicator condition. If the brake indicator comes on or stays on with the ignition switch in the On position and the park brake released, or comes on while driving, the brake system must be diagnosed and repaired prior to performing the following tests. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING). If no brake system problem is found, the following procedure will help locate a faulty park brake switch or park brake switch sense circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector for the park brake switch from the switch terminal. With the park brake released, check for continuity between the park brake switch terminal and a good ground. There should be no continuity. If OK, go to Step 2. If not OK, adjust or replace the faulty park brake switch.

- (2) Remove the instrument cluster from the instrument panel. With the park brake switch still disconnected, check for continuity between the park brake switch sense circuit cavity of the instrument panel wire harness connector for the park brake switch and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the shorted park

BRAKE/PARK BRAKE INDICATOR (Continued)

brake switch sense circuit between the park brake switch and the instrument cluster as required.

(3) Check for continuity between the park brake switch sense circuit cavities of the instrument panel wire harness connector for the park brake switch and the instrument panel wire harness connector (Connector C1) for the instrument cluster. There should be continuity. If OK, proceed with diagnosis of the instrument cluster. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If not OK, repair the open park brake switch sense circuit between the park brake switch and the instrument cluster as required.

CHECK GAUGES INDICATOR

DESCRIPTION

A check gauges indicator is standard equipment on all instrument clusters. The check gauges indicator is located on the lower edge of the instrument cluster overlay, to the right of center. The check gauges indicator consists of a stenciled cutout of the words "CHECK GAGES" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the "CHECK GAGES" text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The check gauges indicator is serviced as a unit with the instrument cluster.

OPERATION

The check gauges indicator gives an indication to the vehicle operator when certain instrument cluster gauge readings reflect a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The check gauges indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the check gauges indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the check gauges indicator is illuminated for about two seconds as a bulb test.

- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature of a gasoline engine is about 122° C (253° F) or higher, or a diesel engine is about 112° C (233° F) or higher, the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the temperature of a gasoline engine is about 119° C (246° F) or lower, a diesel engine is about 109° C (226° F) or lower, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Oil Pressure Low Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure of a gasoline engine is about 3.45 kPa (0.5 psi) or lower, or a diesel engine is about 51.71 kPa (7.5 psi) or lower, the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine oil pressure of a gasoline engine is above 3.45 kPa (0.5 psi), a diesel engine is above 51.71 kPa (7.5 psi), or until the ignition switch is turned to the Off position, whichever occurs first. The cluster will only turn the indicator on in response to an engine oil pressure low message if the engine speed is greater than zero.

- **System Voltage Low Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is less than 11.5 volts, the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is greater than 12.0 volts (but less than 16.6 volts), or until the ignition switch is turned to the Off position, whichever occurs first.

- **System Voltage High Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is greater than 16.6 volts, the check gauges indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is less than 16.1 volts (but greater than 11.5 volts), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine temperature, oil pressure, and electrical system voltage, then sends the proper messages to the instrument cluster. For further diagnosis of the check gauges

CHECK GAUGES INDICATOR (Continued)

indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the check gauges indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

CRUISE INDICATOR

DESCRIPTION

A cruise indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional speed control system, this indicator is electronically disabled. The cruise indicator consists of the word "CRUISE", which appears in the lower portion of the odometer/trip odometer Vacuum-Fluorescent Display (VFD). The VFD is part of the cluster electronic circuit board, and is visible through a cutout located in the lower left corner of the cluster overlay. The dark lens of the VFD prevents the indicator from being clearly visible when it is not illuminated. The word "CRUISE" appears in an amber color and at the same lighting level as the odometer/trip odometer information when it is illuminated by the instrument cluster electronic circuit board. The cruise indicator is serviced as a unit with the VFD in the instrument cluster.

OPERATION

The cruise indicator gives an indication to the vehicle operator when the speed control system is turned On, regardless of whether the speed control is engaged. This indicator is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The cruise indicator receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The indicator only illuminates when it is switched to ground by the instrument cluster circuitry. The instrument cluster will turn on the cruise indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the cruise indicator is illuminated for about two seconds as a bulb test.
- **Cruise Lamp-On Message** - Each time the cluster receives a cruise lamp-on message from the PCM indicating the speed control system has been

turned On, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a cruise lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the cruise indicator will be turned on during the VFD portion of the test to confirm the functionality of the VFD, and again during the bulb check portion of the test to confirm the functionality of the cluster control circuitry.

The PCM continually monitors the speed control switches to determine the proper outputs to the speed control servo. The PCM then sends the proper cruise indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the cruise indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the speed control system, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the cruise indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE GAUGE

DESCRIPTION

An engine coolant temperature gauge is standard equipment on all instrument clusters. The engine coolant temperature gauge is located in the lower left quadrant of the instrument cluster, below the voltage gauge. The engine coolant temperature gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from 54° C (130° F) to 127° C (260° F) for gasoline engines, or from 60° C (140° F) to 116° C (240° F) for diesel engines. An International Control and Display Symbol icon for "Engine Coolant Temperature" is located on the cluster overlay, directly below the lowest graduation of the gauge scale. The engine coolant temperature gauge graphics are white against a black field except for a single red graduation at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear blue-green and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The

ENGINE TEMPERATURE GAUGE (Continued)

engine coolant temperature gauge is serviced as a unit with the instrument cluster.

OPERATION

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The engine coolant temperature gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is between the low end of normal [about 57° C (130° F) for gasoline engines, or 60° C (140° F) for diesel engines] and the high end of normal [about 129° C (264° F) for gasoline engines, or 116° C (240° F) for diesel engines], the gauge needle is moved to the actual temperature position on the gauge scale.

- **Engine Temperature Low Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is below the low end of normal [about 57° C (130° F) for gasoline engines, or 60° C (140° F) for diesel engines], the gauge needle is held at the lowest increment [57° C (130° F) for gasoline engines, or 60° C (140° F) for diesel engines] at the far left end of the gauge scale. The gauge needle remains at the far left end of the scale until the cluster receives a message from the PCM indicating that the engine temperature is above about 57° C (130° F) for gasoline engines, or 60° C (140° F) for diesel engines, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is above about 122° C (253° F) for gasoline engines, or 112° C (233° F) for diesel engines, the gauge needle is moved to the appropriate position on the gauge scale, the check gauges indicator is illuminated, and a single chime tone is sounded. The check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine tem-

perature is below about 119° C (246° F) for gasoline engines, or 109° C (226° F) for diesel engines, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the check gauges indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.

- **Message Failure** - If the cluster fails to receive an engine temperature message, it will hold the gauge needle at the last indication until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine coolant temperature gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the check gauges indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service. For proper diagnosis of the engine coolant temperature sensor, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the engine coolant temperature gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

FUEL GAUGE**DESCRIPTION**

A fuel gauge is standard equipment on all instrument clusters. The fuel gauge is located in the lower right quadrant of the instrument cluster, below the oil pressure gauge. The fuel gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from E (or Empty) to F (or Full). An International Control and Display Symbol icon for "Fuel" is located on the cluster overlay, directly below the highest graduation of the gauge scale. The text "FUEL DOOR" and an arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay directly below the fuel gauge to provide the driver with a reminder as

FUEL GAUGE (Continued)

to the location of the fuel filler access. The fuel gauge graphics are white against a black field except for a single red graduation at the low end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear blue-green and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The fuel gauge is serviced as a unit with the instrument cluster.

OPERATION

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The fuel gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full, the cluster programming applies an algorithm to calculate the proper gauge needle position, then moves the gauge needle to the proper position on the gauge scale. The algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the PCM.

- **Less Than 12.5 Percent Tank Full Message** - Each time the cluster receives messages from the PCM indicating the percent tank full is 12.5 (one-eighth) or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to the proper position on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the cluster receives messages from the PCM indicating that the percent tank full is greater than 12.5 (one-eighth) for 10 consecutive seconds and the vehicle speed is zero, or for 60

consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate percent tank full messages from the PCM.

- **Less Than Empty Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is less than empty, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is a short circuit.

- **More Than Full Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is more than full, the gauge needle is moved to the far left (low) end of the gauge scale and the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is an open circuit.

- **Message Failure** - If the cluster fails to receive a percent tank full message, it will hold the gauge needle at the last indication until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the fuel tank sending unit, then sends the proper messages to the instrument cluster. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the fuel tank sending unit, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the fuel gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

GEAR SELECTOR INDICATOR

DESCRIPTION

A mechanical automatic transmission gear selector indicator is standard factory-installed equipment on this model, when it is also equipped with an optional automatic transmission. The gear selector indicator consists of a molded black plastic housing with integral mounting tabs that is secured to the back of the

GEAR SELECTOR INDICATOR (Continued)

instrument cluster housing with two screws. A face plate on the indicator housing is visible through a rectangular cutout in the lower right corner of the instrument cluster overlay, just below the fuel gauge. Vehicles with a manual transmission have a block-off plate mounted to the back of the instrument cluster behind this cutout in the overlay, in place of the gear selector indicator. Near the top of this face plate the following characters are imprinted from left to right: "P," "R," "N," "D," "2," and "1." Respectively, these characters represent the park, reverse, neutral, drive, second gear, and first gear positions of the transmission gear selector lever on the steering column. Directly below each character on the face plate is a small, rectangular window, and behind these windows is a single, movable red pointer.

The gear selector indicator graphics are white against a black field except for the single red pointer, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear blue-green, while the red pointer still appears red. Indicator illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The gear selector indicator is available for service replacement separate from the instrument cluster. The instrument cluster must be removed from the instrument panel for service access to the gear selector indicator. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

OPERATION

The mechanical gear selector indicator gives an indication of the transmission gear that has been selected with the automatic transmission gear selector lever. A red pointer appears in a window below the character in the indicator representing the transmission gear that has been selected. The small, spring-loaded pointer moves on a track through a trolley-like mechanism within the indicator housing. A short length of small diameter stranded cable is attached to one side of the pointer trolley and is encased in a tubular plastic housing that exits the right side of the indicator. The cable is routed through the instrument panel and under the steering column to the left side of the column. The looped end of the cable is hooked over the end of the PRNDL driver lever on the steering column gearshift mechanism, and the cable housing is secured in a molded plastic adjuster and bracket on the column housing. When the gear selector lever is moved the PRNDL driver lever moves, which moves the pointer through the mechanical actuator cable. The cable adjuster and bracket unit mounted on the steering column

housing provides a mechanical means of calibrating the gear selector indicator mechanism. (Refer to 19 - STEERING/COLUMN - INSTALLATION).

HIGH BEAM INDICATOR

DESCRIPTION

A high beam indicator is standard equipment on all instrument clusters. The high beam indicator is located near the upper edge of the instrument cluster overlay, between the tachometer and the speedometer. The high beam indicator consists of a stenciled cutout of the International Control and Display Symbol icon for "High Beam" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A blue lens behind the cutout in the opaque layer of the overlay causes the icon to appear in blue through the translucent outer layer of the overlay when it is illuminated from behind by a replaceable incandescent bulb and bulb holder unit located on the instrument cluster electronic circuit board. The high beam indicator is serviced as a unit with the instrument cluster.

OPERATION

The high beam indicator gives an indication to the vehicle operator when the headlamp high beams are illuminated. This indicator is hard wired on the instrument cluster electronic circuit board, and is controlled by a headlamp beam select switch input to the cluster. The headlamp high beam indicator bulb receives battery current on the instrument cluster electronic circuit board through a fused B(+) circuit at all times; therefore, the indicator remains operational regardless of the ignition switch position. The headlamp beam select switch is integral to the multi-function switch on the left side of the steering column, and is connected in series between ground and the headlamp high beam indicator. The indicator bulb only illuminates when it is provided with a path to ground through the high beam indicator driver circuit by the headlamp beam select switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - OPERATION). The high beam indicator can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - HIGH BEAM INDICATOR

The diagnosis found here addresses an inoperative headlamp high beam indicator condition. If the problem being diagnosed is related to inoperative headlamp high beams, be certain to repair the headlamp system before attempting to diagnose or repair the

HIGH BEAM INDICATOR (Continued)

high beam indicator. If no headlamp system problems are found, the following procedure will help locate a short or open in the high beam indicator circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INDICATOR DOES NOT ILLUMINATE WITH HIGH BEAMS SELECTED

(1) Check the fused B(+) fuse (Fuse 14 - 10 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse (Fuse 14 - 10 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit between the JB and the Power Distribution Center (PDC) as required.

(3) Be certain that the headlamp high beams are selected with the headlamp beam select switch by turning the headlamp switch to the On position, pulling the multi-function switch stalk toward the steering wheel, then inspecting the headlamps at the front of the vehicle. Once the headlamp high beams are selected, turn the headlamp switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the instrument panel wire harness connector (Connector C1) for the instrument cluster. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit between the instrument cluster and the JB as required.

(4) Disconnect and isolate the battery negative cable. Check for continuity between the high beam indicator driver circuit cavity of the instrument panel wire harness connector (Connector C2) for the instru-

ment cluster and a good ground. There should be continuity. If OK, replace the faulty headlamp high beam indicator bulb and bulb holder unit. If not OK, repair the open high beam indicator driver circuit between the instrument cluster and the headlamp beam select (multi-function) switch as required.

INDICATOR STAYS ILLUMINATED WITH HIGH BEAMS NOT SELECTED

(1) Be certain that the headlamp low beams are selected with the headlamp beam select switch by turning the headlamp switch to the On position, pulling the multi-function switch stalk toward the steering wheel, then inspecting the headlamps at the front of the vehicle. Once the headlamp low beams are selected, turn the headlamp switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Check for continuity between the high beam indicator driver circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, replace the faulty instrument cluster. If not OK, repair the shorted high beam indicator driver circuit between the instrument cluster and the headlamp beam select (multi-function) switch as required.

LOW FUEL INDICATOR

DESCRIPTION

A low fuel indicator is standard equipment on all instrument clusters. The low fuel indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The low fuel indicator consists of a stenciled cutout of the International Control and Display Symbol icon for "Fuel" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The low fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision

LOW FUEL INDICATOR (Continued)

Detection (CCD) data bus. The low fuel indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about two seconds as a bulb test.

- **Less Than 12.5 Percent Tank Full Message** - Each time the cluster receives messages from the PCM indicating the percent tank full is 12.5 (one-eighth) or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the low fuel indicator is illuminated and a single chime tone is sounded. The low fuel indicator remains illuminated until the cluster receives messages from the PCM indicating that the percent tank full is greater than 12.5 (one-eighth) for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate percent tank full messages from the PCM.

- **Less Than Empty Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is less than empty, the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is a short circuit.

- **More Than Full Percent Tank Full Message** - Each time the cluster receives a message from the PCM indicating the percent tank full is more than full, the low fuel indicator is illuminated immediately. This message would indicate that the fuel tank sender input to the PCM is an open circuit.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel tank sending unit, then sends the proper messages to the instrument cluster. For further diagnosis of the low fuel indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TEST-

ING). For proper diagnosis of the fuel tank sending unit, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the low fuel indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

MALFUNCTION INDICATOR
LAMP MIL

DESCRIPTION

A Malfunction Indicator Lamp (MIL) is standard equipment on all instrument clusters. The MIL is located near the lower edge of the instrument cluster overlay, to the left of center. The MIL consists of a stencilled cutout of the International Control and Display Symbol icon for "Engine" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The MIL is serviced as a unit with the instrument cluster.

OPERATION

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. In addition, on models with a diesel engine an Engine Control Module (ECM) supplements the PCM, and can also record an OBDII DTC. The MIL is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM or ECM over the Chrysler Collision Detection (CCD) data bus. The MIL Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the MIL for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about seven seconds as a bulb test.

MALFUNCTION INDICATOR LAMP MIL (Continued)

- **PCM Lamp-On Message** - Each time the cluster receives a lamp-on message from the PCM or ECM, the indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM or ECM message. For some DTC's, if a problem does not recur, the PCM or ECM will send a lamp-off message automatically. Other DTC's may require that a fault be repaired and the PCM or ECM be reset before a lamp-off message will be sent. For more information on the PCM, the ECM, and the DTC set and reset parameters, (Refer to 25 - EMISSIONS CONTROL - OPERATION).

- **Communication Error** - If the cluster receives no lamp-on message from the PCM or ECM for twenty seconds, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid lamp-on message is received from the PCM or ECM.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM/ECM continually monitor the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM or ECM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the MIL or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems may require service. For proper diagnosis of the fuel and emissions systems, the PCM, the ECM, the CCD data bus, or the message inputs to the instrument cluster that control the MIL, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

ODOMETER

DESCRIPTION

An odometer and trip odometer are standard equipment in all instrument clusters. The odometer and trip odometer information are displayed in a common electronic Vacuum-Fluorescent Display (VFD), which is visible through a small window cut-out located in the left lower quadrant of the cluster overlay. However, the odometer and trip odometer information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster circuit board toggles the display between odometer

and trip odometer modes by depressing the odometer/trip odometer switch knob that extends through the lower edge of the cluster lens, just right of the tachometer. Both the odometer and the trip odometer information is stored in the instrument cluster memory.

The odometer can display values up to 499,999 kilometers (499,999 miles). The odometer latches at these values, and will not roll over to zero. The trip odometer can display values up to 999.9 kilometers (999.9 miles) before it rolls over to zero. The odometer display does not have a decimal point and will not show values less than a full unit (kilometer or mile), the trip odometer display does have a decimal point and will show tenths of a unit (kilometer or mile). The unit of measure (kilometers or miles) for the odometer and trip odometer display is not shown in the VFD. The unit of measure for the instrument cluster odometer/trip odometer is selected at the time that it is manufactured, and cannot be changed. During daylight hours (exterior lamps Off) the VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are On) the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer thumbwheel on the headlamp switch. However, a "Parade" mode position of the panel lamps dimmer thumbwheel allows the VFD to be illuminated at full brightness while the exterior lamps are turned On during daylight hours. The VFD, the trip odometer switch, and the trip odometer switch button are serviced as a unit with the instrument cluster.

OPERATION

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The odometer and trip odometer information is displayed by the instrument cluster Vacuum Fluorescent Display (VFD), and the VFD will not display odometer or trip odometer information after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch momentarily with the ignition switch in the On position will toggle the VFD between the odometer and trip odometer display. Each time the ignition switch is turned to the On position the VFD will automatically return to the mode (odometer or trip odometer) last dis-

ODOMETER (Continued)

played when the ignition switch was turned to the Off position.

- **Trip Odometer Reset** - When the trip odometer reset switch is pressed and held for longer than about two seconds, the trip odometer will be reset to 000.0 kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to be reset.

- **Message Failure** - If the cluster fails to receive a distance message during normal operation, it will flash the odometer/trip odometer distance information on and off repeatedly until a distance message is received, or until the ignition switch is turned to the Off position, whichever occurs first. If the cluster does not receive a distance message within one second after the ignition switch is turned to the On position, it will display the last distance message stored in the cluster memory. If the cluster is unable to display distance information due to an error internal to the cluster, the VFD display will be blank.

- **Actuator Test** - Each time the cluster is put through the actuator test, the VFD will display all of its characters at once, then step through each character segment individually during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed sensor, then sends the proper distance messages to the instrument cluster. For further diagnosis of the odometer/trip odometer or the instrument cluster circuitry that controls these functions, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the vehicle speed sensor, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the odometer/trip odometer, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

OIL PRESSURE GAUGE

DESCRIPTION

An oil pressure gauge is standard equipment on all instrument clusters. The oil pressure gauge is located in the upper right quadrant of the instrument cluster, above the fuel gauge. The oil pressure gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right either from 0 kPa (0 psi) to 758 kPa (110 psi). An International Control and Display Symbol icon for "Engine Oil" is located on the cluster overlay, directly below the highest graduation of the gauge scale. The oil pressure gauge graphics are white against a black field except for a single red graduation at the low

end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear blue-green and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The oil pressure gauge is serviced as a unit with the instrument cluster.

OPERATION

The oil pressure gauge gives an indication to the vehicle operator of the engine oil pressure. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The oil pressure gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Oil Pressure Message** - The instrument cluster circuitry restricts the oil pressure gauge needle operation in order to provide readings that are consistent with customer expectations. Each time the cluster receives a message from the PCM indicating the engine oil pressure is between about 6.9 kPa (1 psi) and 137.9 kPa (20 psi) for gasoline engines, or 55 kPa (8 psi) and 58.6 kPa (8.5 psi) for diesel engines, the cluster holds the gauge needle at a point about 11 degrees above the low end of normal increment on the gauge scale. Each time the cluster receives a message from the PCM indicating the engine oil pressure is between about 517.1 kPa (75 psi) and 755 kPa (109.5 psi) for gasoline engines, or 551.6 kPa (80 psi) and 755 kPa (109.5 psi) for diesel engines, the cluster holds the gauge needle at a point about 7.4 degrees below the high end of normal increment on the gauge scale. When the cluster receives messages from the PCM indicating the engine oil pressure is between about 137.9 kPa (20 psi) and 517.1 kPa (75 psi) for gasoline engines, or 58.6 kPa (8.5 psi) and 551.6 kPa (80 psi) for diesel engines, the gauge needle is moved to the actual pressure position on the gauge scale.

OIL PRESSURE GAUGE (Continued)

- **Engine Oil Pressure Low Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is below about 6.9 kPa (1 psi) for gasoline engines, or 55 kPa (8 psi) for diesel engines, the gauge needle is moved to the 0 kPa (0 psi) graduation at the far left (low) end of the gauge scale, the check gauges indicator is illuminated, and a single chime tone is generated. The gauge needle remains at the low end of the scale and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine oil pressure is above about 6.9 kPa (1 psi) for gasoline engines, or 55 kPa (8 psi) for diesel engines, or until the ignition switch is turned to the Off position, whichever occurs first. The cluster will only turn the check gauges indicator lamp on in response to an engine oil pressure low message if the engine speed message is greater than zero.

- **Engine Oil Pressure High Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is above about 755 kPa (109.5 psi) for gasoline or diesel engines, the gauge needle is moved to the 758.4 kPa (110 psi) graduation at the far right (high) end of the gauge scale. The gauge needle remains at the high end of the scale until the cluster receives a message from the PCM indicating that the engine oil pressure is below about 755 kPa (109.5 psi) for gasoline or diesel engines, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Message Failure** - If the cluster fails to receive an engine oil pressure message, it will hold the gauge needle at the last indication until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper engine oil pressure messages to the instrument cluster. For further diagnosis of the oil pressure gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the check gauges indicator due to a low oil pressure gauge reading, it may indicate that the engine or the engine oiling system requires service. For proper diagnosis of the engine oil pressure sensor, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the oil pressure

gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

OVERDRIVE OFF INDICATOR

DESCRIPTION

An overdrive off indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional overdrive automatic transmission, this indicator is electronically disabled. The overdrive off indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The overdrive off indicator consists of a stencilled cutout of the words "O/D OFF" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the "O/D OFF" text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The overdrive off indicator is serviced as a unit with the instrument cluster.

OPERATION

The overdrive off indicator gives an indication to the vehicle operator when the Off position of the overdrive off switch has been selected, disabling the electronically controlled overdrive feature of the automatic transmission. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The overdrive off indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the overdrive off indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the overdrive off indicator is illuminated for about two seconds as a bulb test.

- **Overdrive Off Lamp-On Message** - Each time the cluster receives an overdrive off lamp-on message from the PCM indicating that the Off position of the overdrive off switch has been selected, the overdrive off indicator will be illuminated. The indicator

OVERDRIVE OFF INDICATOR (Continued)

remains illuminated until the cluster receives an overdrive off lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the overdrive off switch to determine the proper outputs to the automatic transmission, then sends the proper messages to the instrument cluster. For further diagnosis of the overdrive off indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the overdrive control system, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the overdrive off indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

SEATBELT INDICATOR

DESCRIPTION

A seatbelt indicator is standard equipment on all instrument clusters. The seatbelt indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The seatbelt indicator consists of a stencilled cutout of the International Control and Display Symbol icon for "Seat Belt" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The seatbelt indicator is serviced as a unit with the instrument cluster.

OPERATION

The seatbelt indicator gives an indication to the vehicle operator of the status of the driver side front seatbelt buckle. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming, and a hard wired input from the seatbelt switch in the driver side front seatbelt through the seat belt switch sense circuit. The seatbelt indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition

switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is switched to ground by the instrument cluster transistor. The instrument cluster will turn on the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (st-run) circuit, the indicator will be illuminated as a seatbelt reminder for about seven seconds, or until the ignition switch is turned to the Off position, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch input to the cluster.

- **Driver Side Front Seatbelt Not Buckled** - Following the seatbelt reminder function, each time the cluster receives a ground input on the seat belt switch sense circuit (seatbelt switch closed - seatbelt unbuckled) with the ignition switch in the Start or On positions, the indicator will be illuminated. The seatbelt indicator remains illuminated until the seat belt switch sense input to the cluster is an open circuit (seatbelt switch opened - seatbelt buckled), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The seatbelt switch input to the instrument cluster circuitry can be diagnosed using conventional diagnostic tools and methods. For further diagnosis of the seatbelt indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

SERVICE REMINDER INDICATOR

DESCRIPTION

A Service Reminder Indicator (SRI) is standard equipment on all instrument clusters. However, on vehicles not equipped with certain optional heavy duty emission cycle gasoline engines, this indicator is electronically disabled. The SRI is located near the lower edge of the instrument cluster overlay, to the left of center. The SRI consists of a stencilled cutout of the words "MAINT REQD" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the

SERVICE REMINDER INDICATOR (Continued)

overlay causes the "MAINT REQD" text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The SRI is serviced as a unit with the instrument cluster.

OPERATION

The Service Reminder Indicator (SRI) gives an indication to the vehicle operator when engine emissions maintenance procedures should be performed. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The SRI Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the SRI for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the SRI is illuminated for about two seconds as a bulb test.

- **Service Required Lamp-On Message** - Each time the cluster receives a service required lamp-on message from the PCM indicating that an emissions maintenance interval has been reached, the SRI will be illuminated. The indicator remains illuminated until the cluster receives a service required lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the SRI will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the vehicle speed sensor to determine the distance the vehicle has been driven, then sends the proper messages to the instrument cluster. Once the SRI has been illuminated and the required emissions maintenance procedures have been completed, the PCM must be reset using a DRBIII® scan tool before it will send the proper service required lamp-off message to the instrument cluster. Refer to the appropriate diagnostic information. For further diagnosis of the SRI or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis

of the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the SRI, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

SHIFT INDICATOR (TRANSFER CASE)

DESCRIPTION

A four-wheel drive indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system, this indicator is mechanically disabled. The four-wheel drive indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The four-wheel drive indicator consists of a stencilled cutout of the text "4WD" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the "4WD" text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The four-wheel drive indicator is serviced as a unit with the instrument cluster.

OPERATION

The four-wheel drive indicator lamp gives an indication to the vehicle operator that a four-wheel drive operating mode is engaged. The indicator will be illuminated when either high range (4H) or low range (4L) have been selected with the transfer case shift lever. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming, and a hard wired input from the four-wheel drive switch on the front axle disconnect housing. The four-wheel drive indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the lamp will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is switched to ground by the instrument cluster transistor.

The four-wheel drive switch is connected in series between ground and the four-wheel drive switch sense input to the instrument cluster. For further information on the transfer case and the transfer case operating ranges, (Refer to 21 - TRANSMISSION/TRANSAXLE/TRANSFER CASE - OPERATION. For further information on the front axle

SHIFT INDICATOR (TRANSFER CASE) (Continued)

disconnect mechanism, (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE/AXLE VACUUM MOTOR - OPERATION). The four-wheel drive switch input to the instrument cluster circuitry can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - FOUR-WHEEL DRIVE INDICATOR

The diagnosis found here addresses an inoperative four-wheel drive indicator condition. If the problem being diagnosed is related to indicator accuracy, be certain to confirm that the problem is with the indicator and not with a damaged or inoperative front axle disconnect mechanism. (Refer to 3 - DIFFERENTIAL & DRIVELINE/FRONT AXLE/AXLE VACUUM MOTOR - DIAGNOSIS AND TESTING). If no front axle disconnect problem is found, the following procedure will help locate a short or open in the four-wheel drive switch input to the instrument cluster. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INDICATOR DOES NOT ILLUMINATE WITH FOUR-WHEEL DRIVE MODE SELECTED

(1) Disconnect and isolate the battery negative cable. Disconnect the engine wire harness connector for the four-wheel drive switch from the switch connector receptacle. Check for continuity between the ground circuit cavity of the engine wire harness connector for the four-wheel drive switch and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground (G100) as required.

(2) Reconnect the battery negative cable. Turn the ignition switch to the On position. Install a jumper wire between the 4WD switch sense circuit cavity of

the engine wire harness connector for the four-wheel drive switch and a good ground. The four-wheel drive indicator should light. If OK, replace the faulty four-wheel drive switch. If not OK, go to Step 3.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument cluster from the instrument panel. Check for continuity between the 4WD switch sense circuit cavities of the instrument panel wire harness connector (Connector C2) for the instrument cluster and the engine wire harness connector for the four-wheel drive switch. There should be continuity. If OK, replace the faulty instrument cluster. If not OK, repair the open 4WD switch sense circuit between the instrument cluster and the four-wheel drive switch as required.

INDICATOR STAYS ILLUMINATED WITH FOUR-WHEEL DRIVE MODE NOT SELECTED

(1) Disconnect and isolate the battery negative cable. Disconnect the engine wire harness connector for the four-wheel drive switch from the switch connector receptacle. Check for continuity between the ground circuit terminal and the 4WD switch sense circuit terminal in the four-wheel drive switch connector receptacle. There should be no continuity. If OK, repair the shorted 4WD switch sense circuit between the four-wheel drive switch and the instrument cluster as required. If not OK, replace the faulty four-wheel drive switch.

SPEEDOMETER**DESCRIPTION**

A speedometer is standard equipment on all instrument clusters. The speedometer is located just to the right of the tachometer near the center of the instrument cluster. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree primary scale on the gauge dial face that reads left-to-right either from 0 to 120 mph, or from 0 to 200 km/h, depending upon the market for which the vehicle is manufactured. Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. Text appearing on the cluster overlay just below the hub of the speedometer needle abbreviates the unit of measure for the primary scale in all upper case letters (i.e.: MPH or KM/H), followed by the unit of measure for the secondary scale in all lower case letters (i.e.: mph or km/h). The speedometer graphics are white (primary scale) and red (secondary scale) against a black field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster

SPEEDOMETER (Continued)

illumination lighting with the exterior lamps turned On, the white graphics appear blue-green, while the red graphics still appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The speedometer is serviced as a unit with the instrument cluster.

OPERATION

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The speedometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Message Failure** - If the cluster fails to receive a speedometer message, it will hold the gauge needle at the last indication for about four seconds, or until the ignition switch is turned to the Off position, whichever occurs first. If a new speedometer message is not received after about four seconds, the gauge needle will return to the far left (low) end of the scale.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the vehicle speed sensor to determine the vehicle road speed, then sends the proper vehicle speed messages to the instrument cluster. For further diagnosis of the speedometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the vehicle speed sensor, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the speedometer, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

TACHOMETER

DESCRIPTION

A tachometer is standard equipment on all instrument clusters. The tachometer is located just to the left of the speedometer near the center of the instrument cluster. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree scale on the gauge dial face that reads left-to-right either from 0 to 6 for gasoline engines, or from 0 to 4 for diesel engines. The text "RPM X 1000" imprinted on the cluster overlay directly below the hub of the tachometer needle identifies that each number on the tachometer scale is to be multiplied times 1000 rpm. The gauge scale of the gasoline engine tachometer is red lined at 5000 rpm, while the diesel engine tachometer is red lined at 3375 rpm. The diesel engine tachometer also includes text that specifies "DIESEL FUEL ONLY" located just above the hub of the tachometer needle. The tachometer graphics are white and red against a black field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear blue-green, while the red graphics still appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The tachometer is serviced as a unit with the instrument cluster.

OPERATION

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The tachometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Message Failure** - If the cluster fails to receive an engine speed message, it will hold the gauge needle at the last indication for about four seconds, or until the ignition switch is turned to the Off position, whichever occurs first. If a new engine speed mes-

TACHOMETER (Continued)

sage is not received after about four seconds, the gauge needle will return to the far left (low) end of the scale.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the crankshaft position sensor to determine the engine speed, then sends the proper engine speed messages to the instrument cluster. For further diagnosis of the tachometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the crankshaft position sensor, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the tachometer, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

TRANS OVERTEMP INDICATOR

DESCRIPTION

A transmission over-temperature indicator lamp is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional automatic transmission, this indicator is electronically disabled. The transmission over-temperature indicator is located near the lower edge of the instrument cluster overlay, to the left of center. The transmission over-temperature indicator consists of a stencilled cutout of the words "TRANS TEMP" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens behind the cutout in the opaque layer of the overlay causes the "TRANS TEMP" text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The transmission over-temperature indicator is serviced as a unit with the instrument cluster.

OPERATION

The transmission over-temperature indicator gives an indication to the vehicle operator when the transmission fluid temperature is excessive, which may lead to accelerated transmission component wear or failure. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming and electronic messages

received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The transmission over-temperature indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the transmission over-temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the transmission over-temperature indicator is illuminated for about two seconds as a bulb test.

- **Trans Over-Temp Lamp-On Message** - Each time the cluster receives a trans over-temp lamp-on message from the PCM indicating that the transmission fluid temperature is 135° C (275° F) or higher, the indicator will be illuminated and a single chime tone is sounded. The lamp remains illuminated until the cluster receives a trans over-temp lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the transmission over-temperature indicator is cycled off and then on again by the appropriate trans over-temp messages from the PCM.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the transmission temperature sensor to determine the transmission operating condition, then sends the proper messages to the instrument cluster. If the instrument cluster turns on the transmission over-temperature indicator due to a high transmission oil temperature condition, it may indicate that the transmission and/or the transmission cooling system are being overloaded or that they require service. For further diagnosis of the transmission over-temperature indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the transmission temperature sensor, the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the transmission over-temperature indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

TURN SIGNAL INDICATOR

DESCRIPTION

Two turn signal indicators are standard equipment on all instrument clusters. The turn signal indicators are located near the upper edge of the instrument cluster overlay, between the speedometer and the tachometer. Each turn signal indicator consists of a stenciled cutout of the International Control and Display Symbol icon for "Turn Warning" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents these icons from being clearly visible when their lamps are not illuminated. The icons appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by a replaceable incandescent bulb and bulb holder unit located on the instrument cluster electronic circuit board. The turn signal indicators are serviced as a unit with the instrument cluster.

OPERATION

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected. These indicators are controlled by two individual hard wired inputs to the instrument cluster electronic circuit board. The turn signal indicator bulbs are grounded on the instrument cluster electronic circuit board at all times. The turn signal indicator bulbs only illuminate when they are provided with battery current by the turn signal and hazard warning switch circuitry of the left multi-function switch on the steering column through separate left and right turn signal inputs to the instrument cluster; therefore, these indicators can be illuminated, regardless of the ignition switch position.

The turn signal indicators are connected in series between ground and the output of the turn signal and hazard warning switch circuitry, but in parallel with the other turn signal circuits. This arrangement allows the turn signal indicators to remain functional regardless of the condition of the other circuits in the turn signal and hazard warning system. For more information on the turn signal and hazard warning system, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - OPERATION - TURN SIGNAL & HAZARD WARNING SYSTEM). The turn signal indicators can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - TURN SIGNAL INDICATOR

The diagnosis found here addresses an inoperative turn signal indicator lamp condition. If the problem being diagnosed is related to inoperative turn signals or hazard warning lamps, be certain to repair the turn signal and hazard warning system before attempting to diagnose or repair the turn signal indicators. If no turn signal or hazard warning system problems are found, the following procedure will help locate a short or open in the left or right turn signal indicator circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

- (1) Disconnect and isolate the battery negative cable. Remove the instrument cluster.

- (2) Connect the battery negative cable. Activate the hazard warning system by moving the hazard warning switch button to the On position. Check for battery voltage at the inoperative (right or left) turn signal circuit cavity of the instrument panel wire harness connector (Connector C2) for the instrument cluster. There should be a switching (on and off) battery voltage signal. If OK, replace the faulty turn signal indicator bulb. If not OK, repair the open (right or left) turn signal circuit to the left multi-function switch as required.

UPSHIFT INDICATOR

DESCRIPTION

An upshift indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with a manual transmission, this indicator is disabled. The upshift indicator is located near the fuel gauge in the instrument cluster overlay, to the left of center. The upshift indicator consists of an upward pointed arrow icon that is a stenciled cutout in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by a replaceable incandescent bulb and bulb holder unit located on the instrument cluster electronic circuit board. The upshift indicator is serviced as a unit with the instrument cluster.

UPSHIFT INDICATOR (Continued)

OPERATION

The upshift indicator gives an indication to the vehicle operator when the transmission should be shifted to the next highest gear in order to achieve the best fuel economy. This indicator is controlled by a transistor on the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The upshift indicator bulb receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the lamp will always be off when the ignition switch is in any position except On or Start. The bulb only illuminates when it is provided a path to ground by the instrument cluster transistor. On models not equipped with a manual transmission, the incandescent bulb and bulb holder unit are not installed at the factory when the vehicle is built. The instrument cluster will turn on the upshift indicator for the following reasons:

- **Upshift Lamp-On Message** - Each time the cluster receives an upshift lamp-on message from the PCM indicating the engine speed and load conditions are right for a transmission upshift to occur, the upshift indicator is illuminated. The indicator remains illuminated until the cluster receives an upshift lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first. The PCM will normally send an upshift lamp-off message three to five seconds after a lamp-on message, if an upshift is not performed. The indicator will then remain off until the vehicle stops accelerating and is brought back into the range of indicator operation, or until the transmission is shifted into another gear.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the indicator and the cluster control circuitry.

The PCM continually monitors the engine speed and load conditions to determine the proper fuel and ignition requirements. The PCM then sends the proper messages to the instrument cluster. If the upshift indicator fails to light during normal vehicle operation, replace the bulb with a known good unit. For further diagnosis of the upshift indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the PCM, the CCD data bus, or the message inputs to the instrument cluster that control the upshift indicator, a DRBIII® scan tool is

required. Refer to the appropriate diagnostic information.

VOLTAGE GAUGE

DESCRIPTION

A voltage gauge is standard equipment on all instrument clusters. The voltage gauge is located in the upper left quadrant of the instrument cluster, above the temperature gauge. The voltage gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from 8 volts to 18 volts. An International Control and Display Symbol icon for "Battery Charging Condition" is located directly below the lowest graduation of the gauge scale. The voltage gauge graphics are white against a black field except for a single red graduation at each end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white graphics appear blue-green and the red graphics appear red. The orange gauge needle is internally illuminated. Gauge illumination is provided by replaceable incandescent bulb and bulb holder units located on the instrument cluster electronic circuit board. The voltage gauge is serviced as a unit with the instrument cluster.

OPERATION

The voltage gauge gives an indication to the vehicle operator of the electrical system voltage. This gauge is controlled by the instrument cluster circuit board based upon the cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus. The voltage gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Charge Fail Message** - Each time the cluster receives a message from the PCM indicating a charge fail condition (system voltage is 10.8 volts or lower), the gauge needle is moved to the 8 volt graduation on the gauge scale and the check gauges indicator is illuminated. The gauge needle remains on the 8 volt

VOLTAGE GAUGE (Continued)

graduation and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating there is no charge fail condition (system voltage is 10.9 volts or higher, but lower than 16.7 volts), or until the ignition switch is turned to the Off position, whichever occurs first. On models equipped with the optional diesel engine, the instrument cluster is programmed to support the voltmeter gauge needle above the low end of normal graduation and suppress the check gauges indicator operation until ten seconds after the engine intake manifold air heater has completed its cycle.

- **Voltage High Message** - Each time the cluster receives a message from the PCM indicating a voltage high condition (system voltage is 16.7 volts or higher), the gauge needle is moved to the 18 volt graduation on the gauge scale and the check gauges indicator is illuminated. The gauge needle remains on the 18 volt graduation and the check gauges indicator remains illuminated until the cluster receives a message from the PCM indicating there is no voltage high condition (system voltage is 16.6 volts or lower, but higher than 10.9 volts), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Message Failure** - If the cluster fails to receive a system voltage message, it will hold the gauge needle at the last indication until a new message is received, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the system voltage to control the generator output. The PCM then sends the proper system voltage messages to the instrument cluster. For further diagnosis of the voltage gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the check gauges indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service. For proper diagnosis of the charging system, the CCD data bus, or the message inputs to the instrument cluster that control the voltage gauge, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

WAIT-TO-START INDICATOR

DESCRIPTION

A wait-to-start indicator is standard equipment on all instrument clusters, but is only functional in vehicles equipped with an optional diesel engine. The wait-to-start indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The wait-to-start indicator consists of a stenciled cutout of the text "WAIT TO START" in the opaque layer of the cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red lens located behind the cutout causes the "WAIT TO START" text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) that is soldered onto the instrument cluster electronic circuit board. The wait-to-start indicator is serviced as a unit with the instrument cluster.

OPERATION

The wait-to-start indicator gives an indication to the vehicle operator when the diesel engine intake air heater is energized in its preheat operating mode. This indicator is controlled by a hard wired input to the instrument cluster from the Engine Control Module (ECM). The wait-to-start indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the lamp will always be off when the ignition switch is in any position except On or Start. The indicator LED only illuminates when it is switched to ground by the input from the ECM. The ECM will turn on the wait-to-start indicator by pulling the wait-to-start indicator driver circuit to ground each time the ignition switch is turned to the On or Start positions. The indicator then remains illuminated until the ECM detects that the air within the intake manifold is the proper temperature to ensure reliable and efficient engine starting, until the ECM detects that the engine is running, or until the ignition switch is turned to the Off position, whichever occurs first.

The ECM continually monitors the intake manifold air temperature sensor, the Manifold Absolute Pressure (MAP) sensor, and many other vehicle conditions to determine when the wait-to-start indicator should be illuminated. For proper diagnosis of the wait-to-start indicator, the ECM, or the inputs the ECM uses to control the wait-to-start indicator operation, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

WASHER FLUID INDICATOR

DESCRIPTION

A washer fluid indicator is standard equipment on all instrument clusters. The washer fluid indicator is located near the lower edge of the instrument cluster overlay, to the right of center. The washer fluid indicator consists of a stenciled cutout of the words "LOW WASHER" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber lens behind the cutout in the opaque layer of the overlay causes the "LOW WASHER" text to appear in amber through the translucent outer layer of the overlay when it is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The washer fluid indicator is serviced as a unit with the instrument cluster.

OPERATION

The washer fluid indicator gives an indication to the vehicle operator when the fluid level in the washer fluid reservoir is low. This indicator is controlled by a transistor on the instrument cluster electronic circuit board based upon cluster programming and a hard wired washer fluid level switch input to the cluster. The washer fluid indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the washer fluid indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about two seconds as a bulb test.
- **Washer Fluid Level Switch Input** - Immediately after the bulb test, if the cluster senses ground on the washer fluid switch sense circuit for more than about thirty seconds, it turns on the washer fluid indicator. Any time after the bulb test, the cluster must sense ground on the washer fluid switch sense circuit for more than about sixty seconds before it turns on the indicator. Once illuminated, the indicator will remain illuminated until the ignition switch is cycled and the cluster senses an open circuit on the low washer fluid sense input. This strategy is intended to reduce the effect that fluid sloshing within the washer reservoir can have on reliable indicator operation.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The washer fluid level switch is connected in series between ground and the washer fluid switch sense input to the instrument cluster. For more information on the washer fluid level switch, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER FLUID LEVEL SWITCH - OPERATION). For further diagnosis of the washer fluid indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The washer fluid level switch input to the cluster can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - WASHER FLUID INDICATOR

The diagnosis found here addresses an inoperative washer fluid indicator condition. If the problem being diagnosed is related to indicator accuracy, be certain to confirm that the problem is with the indicator or washer fluid level switch input and not with a damaged or empty washer fluid reservoir, or inoperative instrument cluster indicator control circuitry. Inspect the washer fluid reservoir for proper fluid level and signs of damage or distortion that could affect washer fluid level switch performance and perform the instrument cluster actuator test before you proceed with the following diagnosis. If no washer fluid reservoir or instrument cluster control circuitry problem is found, the following procedure will help to locate a short or open in the washer fluid switch sense circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WASHER FLUID INDICATOR (Continued)

INDICATOR DOES NOT ILLUMINATE WITH WASHER RESERVOIR EMPTY

(1) Disconnect and isolate the battery negative cable. Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the washer fluid level switch connector receptacle. Check for continuity between the ground circuit cavity of the headlamp and dash wire harness connector for the washer fluid level switch and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground (G100) as required.

(2) Remove the instrument cluster from the instrument panel. Check for continuity between the washer fluid switch sense circuit cavities of the headlamp and dash wire harness connector for the washer fluid level switch and the instrument panel wire harness connector (Connector C2) for the instrument cluster. If OK, replace the faulty washer fluid level switch. If not OK, repair the open washer fluid switch sense circuit between the washer fluid level switch and the instrument cluster as required.

INDICATOR STAYS ILLUMINATED WITH WASHER RESERVOIR FULL

(1) Disconnect and isolate the battery negative cable. Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the washer fluid level switch connector receptacle. Check for continuity between the ground circuit terminal and the washer fluid switch sense terminal in the washer fluid level switch connector receptacle. There should be no continuity. If OK, go to Step 2. If not OK, replace the faulty washer fluid level switch.

(2) Remove the instrument cluster from the instrument panel. Check for continuity between the washer fluid switch sense circuit cavity of the headlamp and dash wire harness connector for the washer fluid level switch and a good ground. There should be no continuity. If not OK, repair the shorted washer fluid switch sense circuit between the washer fluid level switch and the instrument cluster as required.

WATER-IN-FUEL INDICATOR

DESCRIPTION

A water-in-fuel indicator is standard equipment on all instrument clusters, but is only functional in vehicles equipped with an optional diesel engine. The water-in-fuel indicator is located near the lower edge of the instrument cluster overlay, to the left of center. The water-in-fuel indicator consists of a stencilled cutout of the text "WATER IN FUEL" in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red

lens located behind the cutout causes the "WATER IN FUEL" text to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by a Light Emitting Diode (LED) soldered onto the instrument cluster electronic circuit board. The water-in-fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

The water-in-fuel indicator gives an indication to the vehicle operator when the water accumulated in the diesel engine fuel filter/separator filter bowl requires draining. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Engine Control Module (ECM) over the Chrysler Collision Detection (CCD) data bus. The water-in-fuel indicator Light Emitting Diode (LED) receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (st-run) circuit whenever the ignition switch is in the On or Start positions; therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is switched to ground by the instrument cluster transistor. The instrument cluster will turn on the water-in-fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about two seconds as a bulb test.

- **Water-In-Fuel Lamp-On Message** - Each time the cluster receives a water-in-fuel lamp-on message from the ECM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a water-in-fuel lamp-off message from the ECM or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The ECM continually monitors the water-in-fuel sensor, then sends the proper messages to the instrument cluster. For further diagnosis of the water-in-fuel indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). For proper diagnosis of the water-in-fuel sensor, the ECM, the CCD data bus, or the message inputs to the instrument cluster that control the water-in-fuel indicator, a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

LAMPS/LIGHTING - EXTERIOR

DESCRIPTION - TURN SIGNAL & HAZARD WARNING SYSTEM

A turn signal and hazard warning system is standard factory-installed safety equipment on this model. The turn signal and hazard warning system includes the following major components, which are described in further detail elsewhere in this service information:

- **Combination Flasher** - The electronic combination flasher is installed in the Junction Block (JB), which is located behind the fuse access panel on the left outboard end of the instrument panel.
- **Hazard Warning Switch** - The hazard warning switch is integral to the multi-function switch on the left side of the steering column. The hazard warning switch button protrudes from a dedicated opening in the shroud on the top of the steering column, just below the steering wheel.
- **Turn Signal Cancel Cam** - The turn signal cancel cam is integral to the clockspring, which is located beneath the steering column shrouds at the top of the steering column, just below the steering wheel.
- **Turn Signal Indicators** - The two turn signal indicators, one right and one left, are integral to the ElectroMechanical Instrument Cluster (EMIC) located in the instrument panel.
- **Turn Signal Lamps** - The front turn signal lamps are integral to the lower front outboard ends of the headlamp modules, located just outboard of the two sides of the radiator grille opening. The rear turn signal lamps are integral to the taillamp modules located on either side of the vehicle. For pickup models the taillamp modules are secured to the rear of the quarter panels at each side of the tailgate

opening. For cab and chassis models the taillamp modules are secured by a stamped steel bracket on the outboard side of each frame rail near the rear of the vehicle.

- **Turn Signal Switch** - The turn signal switch is integral to the multi-function switch on the left side of the steering column. The multi-function switch control stalk that actuates the turn signal switch protrudes from a dedicated opening in the steering column shrouds on the left side of the column, just below the steering wheel.

Hard wired circuitry connects the turn signal and hazard warning system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the turn signal and hazard warning system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

OPERATION - TURN SIGNAL & HAZARD WARNING SYSTEM

The turn signal system operates on battery current received on a fused ignition switch output (run-acc) circuit so that the turn signals will only operate with the ignition switch in the On or Accessory positions. The hazard warning system operates on non-

LAMPS/LIGHTING - EXTERIOR (Continued)

switched battery current received on a fused B(+) circuit so that the hazard warning remains operational regardless of the ignition switch position. When the turn signal (multi-function) switch control stalk is moved up (right turn) or down (left turn), the turn signal system is activated. When the turn signal system is activated, the circuitry of the turn signal switch and the combination flasher will cause the selected (right or left) turn signal indicator, front park/turn signal lamp, and rear tail/stop/turn signal lamp to flash on and off. With the hazard warning (multi-function) switch in the On position, the hazard warning system is activated. When the hazard warning system is activated, the circuitry of the hazard warning switch and the combination flasher will cause both the right side and the left side turn signal indicators, front park/turn signal lamps, and rear tail/stop/turn signal lamps to flash on and off.

Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the turn signal and hazard warning system.

DIAGNOSIS AND TESTING - TURN SIGNAL & HAZARD WARNING SYSTEM

When diagnosing the turn signal and hazard warning circuits, remember that high generator output can burn out bulbs rapidly and repeatedly. If this is a problem on the vehicle being diagnosed, be certain to diagnose and repair the charging system as required. If the problem being diagnosed is related to a failure of the turn signals to automatically cancel following completion of a turn, inspect the multi-function switch for a faulty or damaged cancel actuator and inspect the turn signal cancel cam on the clockspring for damaged lobes or improper installation. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-

BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Turn the ignition switch to the On position. Actuate the turn signal switch or the hazard warning switch. Observe the turn signal indicator lamp(s) in the instrument cluster. If the flash rate is very high, check for a turn signal bulb that is not lit or is very dimly lit. Repair the circuits to that lamp or replace the faulty bulb, as required. If the turn signal indicator(s) fail to light, go to Step 2.

(2) Turn the ignition switch to the Off position. Check the fused ignition switch output (run-acc) fuse (Fuse 10 - 10 ampere) in the Junction Block (JB) and the fused B(+) fuse (Fuse 4 - 20 ampere) in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).

(3) Check for battery voltage at the fused B(+) fuse (Fuse 4 - 20 ampere) in the PDC. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit between the PDC and the battery as required.

(4) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) fuse (Fuse 10 - 10 ampere) in the JB. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run-acc) circuit between the JB and the ignition switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the combination flasher from the JB and replace it with a known good unit. Reconnect the battery negative cable. Test the operation of the turn signal and hazard warning systems. If OK, discard the faulty combination flasher. If not OK, remove the test flasher and go to Step 6.

(6) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) circuit cavity in the JB receptacle for the combination flasher. If OK, go to Step 7. If not OK, repair the open fused ignition switch output (run-acc) circuit between the combination flasher and the fused ignition switch output (run-acc) fuse (Fuse 10 - 10 ampere) in the JB as required.

(7) Turn the ignition switch to the Off position. Check for battery voltage at the fused B(+) circuit cavity of the JB receptacle for the combination flasher. If OK, go to Step 8. If not OK, repair the open fused B(+) circuit between the combination flasher and the fused B(+) fuse (Fuse 4 - 20 ampere) in the PDC as required.

(8) Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the JB receptacle for the combination flasher and a good ground. There should be continuity. If OK, go to Step 9. If not OK, repair the open ground circuit to ground (G201) as required.

LAMPS/LIGHTING - EXTERIOR (Continued)

(9) Disconnect the instrument panel wire harness connector for the multi-function switch from the switch connector receptacle. Check for continuity between the hazard flasher signal circuit cavities in the JB receptacle for the combination flasher and the instrument panel wire harness connector for the multi-function switch. There should be continuity. If OK, go to Step 10. If not OK, repair the open hazard flasher signal circuit between the JB and the multi-function switch as required.

(10) Check for continuity between the flasher output circuit cavities of the JB receptacle for the combination flasher and in the instrument panel wire harness connector for the multi-function switch. There should be continuity. If OK, test the multi-function switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). If not OK, repair the open flasher output circuit between the JB and the multi-function switch as required.

BRAKE LAMP SWITCH

DESCRIPTION

The plunger type brake lamp switch is mounted on a bracket attached to the brake pedal support under the instrument panel.

CAUTION: The switch can only be adjusted during initial installation. If the switch is not adjusted properly a new switch must be installed.

OPERATION

The brake lamp switch is used for the brake lamp, speed control brake sensor circuits and electronic brake distribution (EBD). The brake lamp circuit is open until the plunger is depressed. The speed control and brake sensor circuits are closed until the plunger is depressed.

When the brake light switch is activated, the Powertrain Control Module (PCM) receives an input indicating that the brakes are being applied. After receiving this input, the PCM maintains idle speed to a scheduled rpm through control of the Idle Air Control (IAC) motor. The brake switch input is also used to disable vent and vacuum solenoid output signals to the speed control servo.

Vehicles equipped with the speed control option use a dual function brake lamp switch. The PCM monitors the state of the dual function brake lamp switch. Refer to the Brake section for more information on brake lamp switch service and adjustment procedures.

BRAKE LAMP SWITCH (Continued)

The brake switch is equipped with three sets of contacts, one normally open and the other two normally closed (brakes disengaged). The PCM sends a 12 volt signal to one of the normally closed contacts in the brake switch, which is returned to the PCM as a brake switch state signal. With the contacts closed, the 12 volt signal is pulled to ground causing the signal to go low. The low voltage signal, monitored by the PCM, indicates that the brakes are not applied. When the brakes are applied, the contacts open, causing the PCM's output brake signal to go high, disengaging the speed control, cutting off PCM power to the speed control solenoids.

The second set of normally closed contacts supplies 12 volts from the PCM any time speed control is turned on. Through the brake switch, current is routed to the speed control servo solenoids. The speed control solenoids (vacuum, vent and dump) are provided this current any time the speed control is ON and the brakes are disengaged.

When the driver applies the brakes, the contacts open and current is interrupted to the solenoids. The normally open contacts are fed battery voltage. When the brakes are applied, battery voltage is supplied to the brake lamps.

DIAGNOSIS AND TESTING - BRAKE LAMP SWITCH

The brake lamp switch can be tested with an ohmmeter. The ohmmeter is used to check continuity between the pin terminals (Fig. 1).

SWITCH CIRCUIT IDENTIFICATION

2 - PLUNGER TEST POSITIONS

SWITCH CONTINUITY TEST

NOTE: Disconnect switch harness before testing switch continuity.

With switch plunger extended, attach test leads to pins 1 and 2. Replace switch if meter indicates no continuity.

With switch plunger retracted, attach test leads to pins 3 and 4. Replace switch if meter indicates no continuity.

With switch plunger retracted, attach test leads to pins 5 and 6. Replace switch if meter indicates no continuity.

REMOVAL

- (1) Remove knee bolster for access to brake lamp switch and pedal.
- (2) Disconnect switch harness (Fig. 2) .
- (3) Press and hold brake pedal in applied position.
- (4) Rotate switch counterclockwise about 30° to align switch lock tabs with notch in bracket.
- (5) Pull switch rearward out of mounting bracket and release brake pedal.

BRAKE LAMP SWITCH (Continued)

INSTALLATION

- (1) Connect harness wires to **new** switch.
- (2) Press and hold brake pedal down.
- (3) Align tabs on switch with notches in switch bracket, install the switch and rotate it in bracket clockwise approximately 30° to lock it in place. (Fig. 3). Make sure the switch lever is in the 45° position as illustrated in figure 2.

**Fig. 3 Brake Lamp Switch**

 2 - SWITCH PLUNGER
 3 - SWITCH TAB

- (4) Release brake pedal. Without moving the pedal, move the lever so that it is parallel with the connector. The switch is now adjusted and can not be adjusted again.

- (5) Install the knee bolster.

CENTER HIGH MOUNTED STOP LAMP

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the CHMSL from the roof panel.
- (3) Rotate sockets 1/4 turn clockwise and remove from lamp. (The two center bulbs light the stoplamp and the outside bulbs light the cargo lamp, if equipped.)
- (4) Pull bulb from socket.

INSTALLATION

- (1) Push bulb into socket.
- (2) Position socket in lamp and rotate socket 1/4 turn counterclockwise.
- (3) Install the CHMSL.
- (4) Connect the battery negative cable.

CENTER HIGH MOUNTED STOP LAMP UNIT

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws holding CHMSL to roof panel (Fig. 4).
- (3) Separate CHMSL from roof.
- (4) Disengage wire connector from body wire harness.
- (5) Separate CHMSL from vehicle.

**Fig. 4 Center High Mounted Stop Lamp**

- 1 - CHMSL CARGO LAMP HOUSING
 2 - CHMSL
 3 - CARGO LAMPS
 4 - SCREW
 5 - CLIP
 6 - CAB

INSTALLATION

- (1) Position lamp at cab roof and connect wire connector.
- (2) Install screws holding CHMSL to roof panel. Tighten securely.
- (3) Connect the battery negative cable.

CLEARANCE LAMP

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws holding clearance lamp lens to roof panel (Fig. 5).
- (3) Rotate socket 1/4 turn counterclockwise and separate socket from lamp.

- 5 - PLASTIC NUTS

INSTALLATION

- (1) Install socket in lamp and rotate socket 1/4 turn clockwise.
- (2) Position clearance lamp on roof.
- (3) Install screws holding clearance lamp lens to roof panel. Tighten to 1 N·m (13 in. lbs.).
- (4) Connect the battery negative cable.

COMBINATION FLASHER

DESCRIPTION

The combination flasher is located in the Junction Block (JB) behind the fuse access panel on the left outboard end of the instrument panel. The combination flasher is a smart relay that functions as both the turn signal system and the hazard warning system flasher. The combination flasher contains active electronic Integrated Circuitry (IC) elements. This flasher is designed to handle the current flow requirements of the factory-installed lighting. If supplemental lighting is added to the turn signal lamp circuits, such as when towing a trailer with lights, the combination flasher will automatically try to compensate to keep the flash rate the same.

The combination flasher has five blade-type terminals that connect it to the vehicle electrical system through five matching cavities in the receptacle of the JB. While the combination flasher has a International Standards Organization (ISO)-type relay terminal configuration or footprint, the internal circuitry is much different. The combination flasher does not use standard ISO-relay inputs or provide ISO-relay type outputs or functions. The combination flasher should never be substituted for an ISO-relay or replaced with an ISO-relay, or else component and vehicle damage may occur.

The combination flasher cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The combination flasher has five blade-type terminals intended for the following inputs and outputs: fused B(+), fused ignition switch output, ground, turn signal circuit, and hazard warning circuit. Constant battery voltage and ground are supplied to the flasher so that it can perform the hazard warning function, and ignition switched battery voltage is supplied for the turn signal function.

COMBINATION FLASHER (Continued)

The Integrated Circuitry (IC) within the combination flasher (Fig. 6) contains the logic that controls the flasher operation and the flash rate. Pin 6 of the IC receives a sense voltage from the hazard warning circuit of the multi-function switch. When the hazard warning switch is turned on, the "hazard on sense" voltage will become low due to the circuit being grounded through the turn signal bulbs. This low voltage sense signals the IC to energize the flash control Positive-Negative-Positive (PNP) transistor at a pre-calibrated flash rate or frequency. Each time the PNP transistor energizes the hazard warning circuit, the pin 6 "hazard on sense" voltage will become high and the IC signals the PNP transistor to de-energize the circuit. This cycling will continue until the hazard warning switch is turned off.

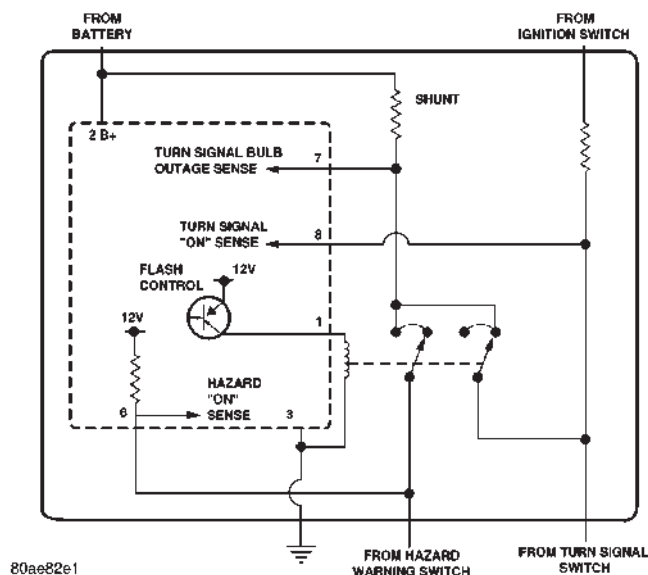

Fig. 6 Combination Flasher - Typical

Likewise, pin 8 of the IC receives a sense voltage from the turn signal circuits of the multi-function switch. When the left or right turn signal switch is turned on, the "turn signal on sense" voltage will become low due to the circuit being grounded through the turn signal bulbs. This low voltage sense signals the IC to energize the flash control PNP transistor at a pre-calibrated flash rate or frequency. Each time the PNP transistor energizes the turn signal circuit, the pin 8 "turn signal on sense" voltage will become high and the IC signals the PNP transistor to de-energize the circuit. This cycling will continue until the right or left turn signal switch is turned off.

A special design feature of the combination flasher allows it to "sense" that a turn signal circuit or bulb is not operating, and provide the driver an indication of the condition by flashing the remaining bulbs in the affected circuit at a higher rate (120 flashes-per-minute or higher). Conventional flashers either continue flashing at their typical rate (heavy-duty type), or discontinue flashing the affected circuit entirely (standard-duty type). During turn signal operation, the combination flasher IC compares normal battery voltage input on pin 2 with the shunt resistor voltage input on pin 7. If the IC "senses" that the voltage difference between pin 2 and pin 7 is different than the pre-calibrated value of the IC, it will increase the rate at which it signals the PNP transistor to energize the pin 1 output. Thus, the inoperative half (left or right side) of the turn signal circuit will flash faster.

Because of the active electronic elements within the combination flasher, it cannot be tested with conventional automotive electrical test equipment. If the combination flasher is believed to be faulty, test the turn signal system and hazard warning system. Then replace the combination flasher with a known good unit to confirm system operation. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TURN SIGNAL & HAZARD WARNING SYSTEM - DIAGNOSIS AND TESTING).

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the fuse access panel by unsnapping it from the left outboard end of the instrument panel.
- (3) Remove the combination flasher from the Junction Block (JB) (Fig. 7).

COMBINATION FLASHER (Continued)

80b171c0

Fig. 7 Junction Block

- 1 - JUNCTION BLOCK

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the combination flasher in the proper receptacle of the Junction Block (JB).
- (2) Align the terminals of the combination flasher with the terminal cavities in the JB receptacle for the flasher.
- (3) Push in firmly and evenly on the combination flasher until the terminals are fully seated in the terminal cavities of the JB receptacle for the flasher.
- (4) Reinstall the fuse access panel by snapping it onto the left outboard end of the instrument panel.
- (5) Reconnect the battery negative cable.

DAYTIME RUNNING LAMP MODULE

DESCRIPTION

The Daytime Running Lights (Headlamps) System is installed on vehicles manufactured for sale in Canada only. A separate module, mounted on the cowl, controls the DRL.

OPERATION

The headlamps are illuminated when the ignition switch is turned to the ON position. The DRL module receives a vehicle-moving signal from the vehicle speed sensor. This provides a constant **head-lamps-on** condition as long as the vehicle is moving. The lamps are illuminated at less than 50 percent of normal intensity.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Disengage wire connector from DRLM (Fig. 8).
- (3) Remove screws attaching DRLM to left front inner fender panel.
- (4) Separate DRLM from fender.

80b04f2a

Fig. 8 Daytime Running Lamp Module (DRLM)

- 1 - HEADLAMP AND DASH WIRING HARNESS
2 - LEFT FENDER SIDE SHIELD
3 - DAYTIME RUNNING LAMP MODULE

INSTALLATION

- (1) Position DRLM on fender.
- (2) Install screws attaching DRLM to left front inner fender panel.
- (3) Engage wire connector to DRLM.
- (4) Connect the battery negative cable.

FOG LAMP UNIT

REMOVAL

SLT

The fog lamps are serviced from the rearward side of the front bumper.

- (1) Disconnect and isolate the battery negative cable.
- (2) Disengage fog lamp harness connector.
- (3) Remove fog lamp to bumper attaching nuts (Fig. 10).
- (4) Separate fog lamp from bumper.

SPORT

The fog lamps are serviced from the rearward side of the front fascia.

- (1) Disconnect and isolate the battery negative cable.
- (2) Disengage fog lamp harness connector.
- (3) Remove fog lamp to fascia attaching nuts (Fig. 11).
- (4) Separate fog lamp from fascia.

INSTALLATION

SLT

- (1) Position fog lamp in bumper.
- (2) Install fog lamp to bumper attaching nuts.
- (3) Connect fog lamp harness connector.
- (4) Connect the battery negative cable.
- (5) Check for proper operation and beam alignment.

**Fig. 11 Fog Lamp — SPORT**

- 1 - FOG LAMP
- 2 - ADJUSTMENT SCREW
- 3 - FASCIA

FOG LAMP UNIT (Continued)

SPORT

- (1) Position fog lamp in fascia.
- (2) Install screws attaching fog lamp to fascia.
- (3) Connect wire connector to fog lamp.
- (4) Connect the battery negative cable.
- (5) Check for proper operation and beam alignment.

ADJUSTMENTS

Prepare an alignment screen. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - ADJUSTMENTS)

A properly aligned fog lamp will project a pattern on the alignment screen 100 mm (4 in.) below the fog lamp centerline and straight ahead (Fig. 12).

To adjust fog lamp aim, rotate adjustment screw on the rear of fog lamp to achieve the specified height.

HEADLAMP

DESCRIPTION

Headlamps on the Ram Pick-Up are modular in design. The turn/park lamp module is incorporated into the headlamp module. The module contains two bulbs; a dual filament headlamp bulb, and a dual filament turn/park bulb. The Sport headlamp module has two separate bulbs for the headlamp illumination.

OPERATION

Headlamps and parking lamps are controlled by the headlamp switch. The multifunction switch mounted on the steering column controls the high beam function, and the turn signal function.

HEADLAMP (Continued)

DIAGNOSIS AND TESTING - HEADLAMP

A good ground is necessary for proper lighting operation. Grounding is provided by the lamp socket when it comes in contact with the metal body, or through a separate ground wire.

Always begin any diagnosis by testing all of the fuses and circuit breakers in the system. For com-

plete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

CONDITION	POSSIBLE CAUSES	CORRECTION

*Canada vehicles must have lamps ON.		

REMOVAL

On the driver side, the battery and battery tray must be removed to service the headlamp bulb.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL).

(3) Disengage wire connector from headlamp bulb(s).

(4) Remove retaining ring holding bulb(s) to headlamp (Fig. 13).

(5) Pull bulb(s) from headlamp.

INSTALLATION

CAUTION: Do not touch the bulb glass with fingers or other oily surfaces. Reduced bulb life will result.

(1) Position bulb(s) in headlamp.

(2) Install retaining ring holding bulb(s) to headlamp.

(3) Connect wire connector to headlamp bulb(s).

HEADLAMP RELAY

DESCRIPTION

Fig. 14 Power Distribution Center

1 - COVER

2 - POWER DISTRIBUTION CENTER

The headlamp (or security) relay is located in the Power Distribution Center (PDC) near the battery in the engine compartment (Fig. 14). See the fuse and relay layout label affixed to the inside surface of the PDC cover for headlamp relay identification and location. The headlamp relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained within a small, rectangular, molded plastic housing. The relay is connected to all of the required inputs and outputs through its PDC receptacle by five male spade-type terminals that extend from the bottom of the relay base. The ISO designation for each terminal is molded into the base adjacent to the terminal. The ISO terminal designations are as follows:

- **30 (Common Feed)** - This terminal is connected to the movable contact point of the relay.
- **85 (Coil Ground)** - This terminal is connected to the ground feed side of the relay control coil.
- **86 (Coil Battery)** - This terminal is connected to the battery feed side of the relay control coil.
- **87 (Normally Open)** - This terminal is connected to the normally open fixed contact point of the relay.
- **87A (Normally Closed)** - This terminal is connected to the normally closed fixed contact point of the relay.

The headlamp relay cannot be adjusted or repaired. If the relay is damaged or faulty, it must be replaced.

OPERATION

The headlamp (or security) relay is an electromechanical switch that uses a low current input from the high-line or premium Central Timer Module (CTM) to control a high current output to the headlamps. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The headlamp relay terminals are connected to the vehicle electrical system through a connector receptacle in the Power Distribution Center (PDC). The inputs and outputs of the headlamp relay include:

- The common feed terminal (30) is connected to ground at all times through a take out and eyelet terminal connector of the right headlamp and dash wire harness that is secured by a ground screw to the left fender inner shield near the PDC in the engine compartment.
- The coil ground terminal (85) is connected to the Central Timer Module (CTM) through the security relay control circuit. The CTM energizes the headlamp relay control coil by internally pulling this circuit to ground.
- The coil battery terminal (86) is connected to battery current at all times through a fused B(+) circuit that is internal to the PDC.
- The normally open terminal (87) is connected to the headlamps at all times through the beam select switch low beam output circuit. This circuit provides a path to ground for the headlamps through the common feed terminal when the headlamp relay control coil is energized by the CTM.
- The normally closed terminal (87A) is not connected to any circuit in this application, but is grounded through the common feed terminal when the headlamp relay control coil is de-energized.

The headlamp relay can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - HEADLAMP RELAY

The headlamp (or security) relay (Fig. 15) is located in the Power Distribution Center (PDC) near the battery in the engine compartment. See the fuse and relay layout label affixed to the inside surface of

HEADLAMP RELAY (Continued)

the PDC cover for headlamp relay identification and location. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Remove the headlamp relay from the PDC. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP RELAY - REMOVAL).

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, test the relay input and output circuits. If not OK, replace the faulty relay.

Fig. 15 Headlamp Relay

- 30 - COMMON FEED
- 85 - COIL GROUND
- 86 - COIL BATTERY
- 87 - NORMALLY OPEN
- 87A - NORMALLY CLOSED

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and remove the cover from the Power Distribution Center (PDC) (Fig. 16).

(3) See the fuse and relay layout label affixed to the underside of the PDC cover for headlamp (or security) relay identification and location.

(4) Remove the headlamp relay by grasping it firmly and pulling it straight out from the receptacle in the PDC.

Fig. 16 Power Distribution Center

- 1 - COVER
- 2 - POWER DISTRIBUTION CENTER

INSTALLATION

(1) See the fuse and relay layout label affixed to the underside of the PDC cover for the proper headlamp (or security) relay location.

(2) Position the headlamp relay in the proper receptacle in the PDC.

(3) Align the headlamp relay terminals with the terminal cavities in the PDC receptacle.

(4) Push firmly and evenly on the top of the headlamp relay until the terminals are fully seated in the terminal cavities in the PDC receptacle.

(5) Reinstall and latch the cover onto the PDC.

(6) Connect the battery negative cable.

HEADLAMP SWITCH

DESCRIPTION

The headlamp switch module is located on the instrument panel. The headlamp switch controls the parking lamps, and the headlamps. A separate switch in the module controls the interior lamps and instrument cluster illumination. This switch also contains a rheostat for controlling the illumination level of the cluster lamps.

OPERATION

The headlamp switch has an off position, a parking lamp position, and a headlamp on position. High beams are controlled by the multifunction switch on the steering column. The headlamp switch cannot be repaired. It must be replaced.

HEADLAMP SWITCH (Continued)

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Remove the headlamp switch from the instrument panel. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - REMOVAL) for the procedures. Unplug the headlamp switch wire harness connectors. Check for continuity between the left door jamb switch sense circuit cavity of the headlamp switch wire harness connector and a good ground. There should be continuity with the driver door open, and no continuity with the driver door closed. If OK, go to Step 2. If not OK, repair the circuit to the driver door jamb switch as required.

(2) Remove the Central Timer Module (CTM) from its mounting bracket to access the CTM wire harness connectors. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODUL - REMOVAL) for the procedures. Unplug the 14-way CTM wire harness connector. Remove the key from the ignition lock cylinder. Check for continuity between the key-in ignition switch sense circuit cavity of the 14-way CTM wire harness connector and a good ground. There should be no continuity. If OK, go to Step 3. If not OK, repair the short circuit as required.

(3) Check for continuity between the key-in ignition switch sense circuit cavities of the 14-way CTM wire harness connector and the headlamp switch wire harness connector. There should be continuity. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) Check for continuity between the left front door jamb switch sense circuit terminal and the key-in ignition switch sense circuit terminal of the headlamp switch. There should be no continuity with the switch in the Off position, and continuity with the switch in the park or head lamps On position. If OK, (Refer to 8 - ELECTRICAL/ELECTRONIC CON-

TROL MODULES/BODY CONTROL/CENTRAL TIMER MODUL - DIAGNOSIS AND TESTING) If not OK, replace the faulty headlamp switch.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the three screws that secure the headlamp switch to the instrument panel (Fig. 17).

80689641

Fig. 17 Headlamp Switch Removal

1 - SCREWS (3)

2 - HEADLAMP SWITCH

3 - INSTRUMENT PANEL WIRE HARNESS CONNECTORS

HEADLAMP SWITCH (Continued)

(4) Pull the headlamp switch away from the instrument panel far enough to access the instrument panel wire harness connectors.

(5) Disconnect the two instrument panel wire harness connectors for the headlamp switch from the connector receptacles on the back of the switch.

(6) Remove the headlamp switch from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the headlamp switch to the instrument panel.

(2) Reconnect the two instrument panel wire harness connectors for the headlamp switch to the connector receptacles on the back of the switch.

(3) Position the headlamp switch into the instrument panel.

(4) Install and tighten the three screws that secure the headlamp switch to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(6) Connect the battery negative cable.

HEADLAMP UNIT

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove push-in fastener attaching seal to radiator closure panel.

(3) Remove park and turn signal lamp.

(4) Remove screws attaching top of headlamp module to radiator closure panel (Fig. 18).

(5) From behind front bumper, remove screws attaching bottom of headlamp module to radiator closure panel.

(6) From behind the bumper, loosen the bumper mounting nuts to allow the bumper to lower for

clearance. This is only necessary on the side to be removed.

(7) Separate headlamp module from radiator closure panel.

(8) Disengage wire connector from headlamp bulb(s) (Fig. 19).

(9) Separate headlamp module from vehicle.

80a7e2b8

HEADLAMP UNIT (Continued)

INSTALLATION

- (1) If removed, install headlamp bulb(s).
- (2) Connect headlamp bulb wire connector(s).
- (3) Position headlamp in radiator closure panel.
- (4) From behind front bumper, install the screws attaching bottom of headlamp module to radiator closure panel.
- (5) From behind the bumper, tighten the bumper mounting nuts.
- (6) Install the screws attaching top of headlamp module to radiator closure panel.
- (7) Install park and turn signal lamp.
- (8) Install push-in fastener attaching seal to radiator closure panel.
- (9) Connect the battery negative cable.

ADJUSTMENTS**LAMP ALIGNMENT SCREEN PREPARATION**

- (1) Position vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 ft) away from front of headlamp lens (Fig. 20).

(2) If necessary, tape a line on the floor 7.62 meters (25 ft) away from and parallel to the wall.

(3) Up 1.27 meters (5 feet) from the floor, tape a line on the wall at the centerline of the vehicle. Sight along the centerline of the vehicle (from rear of vehicle forward) to verify accuracy of the line placement.

(4) Rock vehicle side-to-side three times to allow suspension to stabilize.

(5) Jounce front suspension three times by pushing downward on front bumper and releasing.

(6) Measure the distance from the center of headlamp lens to the floor. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference.

(7) Measure distance from the centerline of the vehicle to the center of each headlamp being aligned. Transfer measurements to screen (with tape) to each side of vehicle centerline. Use these lines for left/right adjustment reference.

1 - CENTER OF VEHICLE
2 - CENTER OF HEADLAMP

3 - 7.62 METERS (25 FT.)
4 - FRONT OF HEADLAMP

HEADLAMP UNIT (Continued)

VEHICLE PREPARATION FOR HEADLAMP ALIGNMENT

- (1) Verify headlamp dimmer switch and high beam indicator operation.
- (2) Verify headlamps are set for low beam operation.
- (3) Correct defective components that could hinder proper headlamp alignment.
- (4) Verify proper tire inflation.
- (5) Clean headlamp lenses.
- (6) Verify that luggage area is not heavily loaded.
- (7) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

HEADLAMP ADJUSTMENT

Headlamps can be aligned using the screen method provided or alignment tool C-4466-A or equivalent can be used. refer to the instructions provided with the tool for proper procedures.

A properly aimed low beam headlamp will project top edge of high intensity pattern on screen from 50 mm (2 in.) above to 50 mm (2 in.) below headlamp centerline. The side-to-side outboard edge of high intensity pattern should be from 50 mm (2 in.) left to 50 mm (2 in.) right of headlamp centerline. (Fig. 20) **The preferred headlamp alignment is 1" down for the up/down adjustment and 0 for the left/right adjustment.** The high beam pattern should be correct when the low beams are aligned properly.

To adjust headlamp aim, rotate alignment screws (Fig. 21) to achieve the specified high intensity pattern.

LICENSE PLATE LAMP

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove license plate lamp lens.
- (3) Pull bulb from license plate lamp.

INSTALLATION

- (1) Install bulb in license plate lamp.
- (2) Install license plate lamp lens.
- (3) Connect the battery negative cable.

LICENSE PLATE LAMP UNIT

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws attaching license plate panel to cargo box.
- (3) Disengage license plate lamp wire connector from body wire harness (Fig. 22).
- (4) Separate license plate lamp from vehicle.

J948L-7

Fig. 22 License Plate Lamp Panel

- 1 - LIGHTING HARNESS
2 - BUMPER
3 - LICENSE PLATE LAMP
4 - SCREW
5 - LAMP PANEL

INSTALLATION

- (1) Position license plate lamp in vehicle.

LICENSE PLATE LAMP UNIT (Continued)

- (2) Engage license plate lamp wire connector to body wire harness.
- (3) Install screws attaching license plate panel to cargo box.
- (4) Connect the battery negative cable.

MARKER LAMP

REMOVAL

Individual lamps may be replaced by removing the lamp from the light bar. Using a flat blade screwdriver, carefully pry lamp to disengage clips attaching ID lamp to retainer.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove four screws attaching rear ID lamps to tailgate (Fig. 23).
- (3) Separate ID lamps from tailgate.
- (4) Disengage ID lamp wire connector from body wire harness.
- (5) Separate ID lamp from vehicle.

Fig. 23 Rear Identification Lamps

- 1 - BUMPER
- 2 - SCREW
- 3 - TAILGATE MARKER LAMPS
- 4 - TAILGATE

INSTALLATION

- (1) Position ID lamp on vehicle.
- (2) Engage ID lamp wire connector to body wire harness.
- (3) Install screws attaching rear ID lamps to tailgate.
- (4) Connect the battery negative cable.

MULTI-FUNCTION SWITCH

DESCRIPTION

Fig. 24 Multi-Function Switch

- 1 - WINDSHIELD WASHER BUTTON
- 2 - CONTROL STALK
- 3 - HAZARD WARNING BUTTON
- 4 - WINDSHIELD WIPER CONTROL
- 5 - MULTI-FUNCTION SWITCH

The multi-function switch is secured with two screws to the left side of the upper steering column housing at the top of the steering column, just below the steering wheel (Fig. 24). The only visible parts of the multi-function switch are the control stalk that extends through a dedicated opening in the left side of the upper steering column shrouds, and the hazard warning switch push button that protrudes through an opening in the upper steering column shroud on the top of the steering column. The remainder of the switch, its mounting provisions, and its electrical connections are all concealed beneath the steering column shrouds. The multi-function switch control stalk has both nomenclature and International Control and Display Symbol graphics applied to it, which identify its many functions. An International Control and Display Symbol icon for "Hazard Warning" is applied to the top of the hazard warning switch push button.

The switch housing and its controls are constructed of molded black plastic. A single connector receptacle with up to twenty-four terminals is located on the back of the switch housing and connects the switch to the vehicle electrical system through a take out and connector of the instrument panel wire harness. The connector receptacle also has a threaded receptacle for a screw, which secures the wire harness connector to the switch connector receptacle.

The multi-function switch supports the following functions and features:

MULTI-FUNCTION SWITCH (Continued)

- **Continuous Wipe Modes** - The control knob of the multi-function switch provides two continuous wipe switch positions, low speed or high speed.

- **Hazard Warning Control** - The internal circuitry and hardware of the multi-function switch provide detent switching for activation and deactivation of the hazard warning system.

- **Headlamp Beam Selection** - The internal circuitry and hardware of the multi-function switch provide detent switching for selection of the headlamp high or low beams.

- **Headlamp Optical Horn** - The internal circuitry and hardware of the multi-function switch includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.

- **Intermittent Wipe Mode** - The control knob of the multi-function switch provides an intermittent wipe mode with multiple delay interval positions.

- **Turn Signal Control** - The internal circuitry and hardware of the multi-function switch provide both momentary non-detent switching and detent switching with automatic cancellation for both the left and right turn signals.

- **Washer Mode** - A button on the end of the control stalk of the multi-function switch provides washer system operation when the button is depressed towards the steering column.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is faulty, or if the switch is damaged, the entire switch unit must be replaced.

OPERATION

The multi-function switch uses conventionally switched outputs and a variable resistor to control the many functions and features it provides using hard wired circuitry. The switch is grounded at all times through a single wire take out with an eyelet terminal connector of the instrument panel wire harness that is secured by a nut to a ground stud located on the instrument panel armature, just above and to the left of the glove box opening. When the ignition switch is in the Accessory or On positions, battery current from a fuse in the Junction Block (JB) is provided through a fused ignition switch output (run-acc) circuit. Following are descriptions of how the multi-function switch operates to control the many functions and features it provides:

- **Continuous Wipe Modes** - When the control knob of the multi-function switch is rotated to the High or Low positions, the circuitry within the switch provides a battery current output directly to the high or low speed brush of the wiper motor. When the control knob is in the Off position, the circuitry within the switch connects the output of the wiper motor park switch to the low speed brush of the wiper motor.

- **Hazard Warning Control** - The hazard warning push button is pushed down to unlatch the switch and activate the hazard warning system, and pushed down again to latch the switch and turn the system off. When the hazard warning switch is latched (hazard warning off), the push button will be in a lowered position on the top of the steering column shroud; and, when the hazard warning switch is unlatched (hazard warning on), the push button will be in a raised position. The multi-function switch hazard warning circuitry simultaneously provides a signal to the hazard warning sense of the combination flasher to activate or deactivate the flasher output, and directs the output of the flasher to the hazard warning lamps.

- **Headlamp Beam Selection** - The multi-function switch control stalk is pulled towards the steering wheel past a detent, then released to actuate the headlamp beam selection switch. Each time the control stalk is actuated in this manner, the opposite headlamp mode from what is currently selected will be activated. The internal circuitry of the headlamp beam selection switch directs the output of the headlamp switch through hard wired circuitry to activate the selected headlamp beam.

- **Headlamp Optical Horn** - The left multi-function switch control stalk is pulled towards the steering wheel to just before a detent, to momentarily activate the headlamp high beams. The high beams will remain illuminated until the control stalk is released. The internal circuitry of the headlamp beam selection switch provides a momentary ground path to the headlamp high beams.

- **Intermittent Wipe Mode** - When the multi-function switch control knob is rotated to the Delay position, the circuitry within the switch connects the output of the wiper motor relay to the low speed brush of the wiper motor and provides a battery current signal to the Central Timer Module (CTM). If the Delay mode is selected, the control knob can then be rotated to multiple minor detent positions, which actuates a variable resistor within the switch and provides a hard wired output to the CTM that signals the desired delay interval for the intermittent wiper feature.

MULTI-FUNCTION SWITCH (Continued)

- **Turn Signal Control** - The multi-function switch control stalk actuates the turn signal switch. When the control stalk is moved in the upward direction, the right turn signal circuitry is activated; and, when the control stalk is moved in the downward direction, the left turn signal circuitry is activated. The multi-function switch turn signal circuitry simultaneously provides a signal to the turn signal sense of the combination flasher to activate or deactivate the flasher output, and directs the output of the flasher to the proper turn signal lamps. The turn signal switch has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that provides turn signals only until the multi-function switch control stalk is released. When the control stalk is moved to a turn signal switch detent position, the cancel actuator extends toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring mechanism rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the two turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. In other words, if the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral Off position.

- **Washer Mode** - Pushing the button on the end of the multi-function switch control knob towards the steering column provides a battery current output through the momentary single pole, single throw washer switch circuitry to operate the washer pump/motor and provides a signal to the CTM. If the wipers are not operating when the washer switch is actuated, the CTM will operate the wiper motor for as long as the washer switch is depressed plus about three additional wipe cycles. If the wipers are operating in the intermittent mode when the washer switch is actuated, the CTM will operate the wiper motor at a fixed low speed for as long as the washer switch is depressed plus about three additional wipe cycles before the wipers return to the selected intermittent wipe interval.

DIAGNOSIS AND TESTING - MULTI-FUNCTION SWITCH

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector from the multi-function switch connector receptacle.

- (2) Using an ohmmeter, perform the continuity and resistance tests at the terminals in the multi-function switch connector receptacle as shown in the Multi-Function Switch Tests chart (Fig. 25).

MULTI-FUNCTION SWITCH (Continued)

(3) If the multi-function switch fails any of the continuity or resistance tests, replace the faulty switch unit as required.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) If the vehicle is so equipped, unscrew the lever from the tilt steering column adjuster mechanism located on the left side of the column just below the multi-function switch control stalk. Turn the lever counterclockwise to unscrew it from the adjuster.

(3) From below the steering column, remove the two outboard screws that secure the upper shroud to the lower outer shroud (Fig. 26).

(4) Press carefully inward on each side of the outer shrouds to release the snap features and remove the upper outer shroud from the lower outer shroud.

(5) From below the steering column, remove the one center screw that secures the lower outer shroud to the steering column housing.

(6) Remove the lower outer shroud from the steering column.

(7) From below the steering column, remove the two screws that secure the lower inner shroud to the steering column housing and the upper inner shroud.

(8) Press carefully inward on the gearshift lever side of the inner shrouds to release the snap features and remove the lower inner shroud from the steering column.

(9) Carefully lift the upper inner shroud upward far enough to access the multi-function switch mounting screws.

J9419-17

Fig. 26 Steering Column Shrouds Remove/Install - Typical

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the multi-function switch next to the steering column.
- (2) Reconnect the instrument panel wire harness connector for the multi-function switch to the switch connector receptacle (Fig. 27).
- (3) Install and tighten the screw that secures the instrument panel wire harness connector for the multi-function switch to the switch connector receptacle. Tighten the screw to 2 N·m (18 in. lbs.).
- (4) Position the multi-function switch onto the steering column.

(5) Carefully lift the upper inner shroud upward far enough to access the multi-function switch mounting screws.

(6) Install and tighten the two tamper proof screws (a Snap On tamper proof Torx bit TTXR20B2 or equivalent is required) that secure the multi-function switch to the steering column housing. Tighten the screws to 2 N·m (18 in. lbs.).

(7) Position the lower inner shroud onto the steering column (Fig. 26). Be certain to insert the gearshift lever hider strip into the channel located on the inside surface of the shroud.

(8) Align the locking tabs on the gearshift lever side of the upper inner shroud with the receptacles on the lower inner shroud and apply hand pressure to snap them together.

(9) From below the steering column, install and tighten the two screws that secure the lower inner shroud to the steering column housing and the upper inner shroud. Tighten the screws to 2 N·m (18 in. lbs.).

(10) Position the lower outer shroud onto the steering column.

(11) From below the steering column, install and tighten the one center screw that secures the lower outer shroud to the steering column housing. Tighten the screw to 2 N·m (18 in. lbs.).

(12) Align the locking tabs on the upper outer shroud with the receptacles on the lower outer shroud and apply hand pressure to snap them together.

(13) From below the steering column, install and tighten the two outboard screws that secure the lower outer shroud to the upper outer shroud. Tighten the screws to 2 N·m (18 in. lbs.).

(14) If the vehicle is so equipped, reinstall the lever into the tilt steering column adjuster on the left side of the column. Turn the lever clockwise to screw it into the adjuster.

(15) Reconnect the battery negative cable.

OUTBOARD IDENTIFICATION LAMP**REMOVAL**

- (1) Disconnect and isolate the battery negative cable.
- (2) Using a flat blade screw driver, carefully pry lamp to disengage clips attaching ID lamp to retainer (Fig. 28).
- (3) Separate ID lamp from retainer.
- (4) Disengage lamp bulb socket from lamp.
- (5) Remove screws attaching lamp retainer to rear fender.
- (6) Separate retainer from rear fender.

OUTBOARD IDENTIFICATION LAMP (Continued)

**Fig. 28 Side Identification Lamps**

- 1 - FENDER
- 2 - U-NUT
- 3 - IDENTIFICATION LAMP
- 4 - RETAINER
- 5 - U-NUT

INSTALLATION

- (1) Position retainer on rear fender.
- (2) Install screws attaching lamp retainer to rear fender.
- (3) Engage lamp bulb socket to lamp.
- (4) Position and press ID lamp in retainer.
- (5) Connect the battery negative cable.

PARK/TURN SIGNAL LAMP**REMOVAL**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove park and turn signal lamp.
- (3) Rotate bulb socket 1/4 turn counterclockwise and pull turn signal lamp socket from back of lamp.
- (4) Pull park and turn signal lamp bulb from socket.

INSTALLATION

- (1) Install park and turn signal lamp bulb in socket.
- (2) Install park and turn signal lamp socket into back of lamp.
- (3) Install park/turn signal lamp.
- (4) Connect the battery negative cable.

PARK/TURN SIGNAL LAMP UNIT**REMOVAL**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screw attaching the park lamp to headlamp module.
- (3) Grasp lamp and pull forward to disengage clip attaching park/turn lamp to headlamp module.
- (4) Separate park lamp headlamp module.
- (5) Rotate park/turn signal socket 1/4 turn counter-clockwise and remove from back of lamp.
- (6) Remove side marker socket from back of lamp.
- (7) Separate park/turn signal lamp from vehicle.

INSTALLATION

- (1) Install side marker socket from back of lamp.
- (2) Install park/turn signal socket in back of lamp.
- (3) Install park/turn signal lamp in vehicle.
- (4) Install screw attaching the park lamp to headlamp module.
- (5) Connect the battery negative cable.

TAIL LAMP**DESCRIPTION**

There are two types of tail lamp modules used on the Ram Truck. One type is integrated into the pick-up bed, The other is a bracket mounted module used on the Ram Truck Cab and Chassis. The Cab and Chassis module is made up of a housing, lens, and two bulbs. This type of module has license plate illumination built into the lens. The integrated pick up module contains a housing, lens, and two bulbs. A dual filament bulb is used for tail, stop, and turn signal operations. A separate bulb is used for back-up illumination.

OPERATION

Tail lamp functions are controlled by the headlamp switch. Turn signal operations are controlled by the multifunction switch. Stop lamp functions are controlled by the stoplamp switch. The back-up lamps are controlled by the back-up lamp switch on the transmission.

REMOVAL**CHASSIS CAB**

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws holding tail lamp lens to lamp body.

TAIL LAMP (Continued)

- (3) Separate lens from lamp.
- (4) Grasp bulb, push in slightly and rotate 1/2 turn counter-clockwise.

PICKUP

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws from tail lamp.
- (3) Grasp lamp, firmly pull lamp rearward to disengage retaining studs.
- (4) Remove socket from tail lamp.
- (5) Separate tail lamp from cargo box.
- (6) Pull bulb from socket.

INSTALLATION

CHASSIS CAB

- (1) Install bulb in socket.
- (2) Install lamp lens.
- (3) Connect the battery negative cable.

PICKUP

- (1) Install bulb in socket.
- (2) Install socket in tail lamp.
- (3) Position tail lamp in cargo box, engage retaining studs and install screws.
- (4) Connect the battery negative cable.

TAIL LAMP UNIT

REMOVAL

CAB CHASSIS

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove nuts attaching tail lamp to mounting bracket (Fig. 29).
- (3) Disengage tail lamp wire connector from body wire harness.
- (4) Separate tail lamp from vehicle.

PICKUP

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove screws from tail lamp (Fig. 30).
- (3) Grasp lamp, firmly pull lamp rearward to disengage retaining studs.
- (4) Remove socket from tail lamp.
- (5) Separate tail lamp from cargo box.
- (6) Pull bulb from socket.

TURN SIGNAL CANCEL CAM

DESCRIPTION

The turn signal cancel cam is concealed within the steering column below the steering wheel. The turn signal cancel cam consists of two lobes that are integral to the lower surface of the clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the horn switch, driver airbag, speed control switches, and remote radio switches on the steering wheel and the instrument panel wire harness on the steering column. The housing of the clockspring is secured to the steering column and remains stationary. The rotor of the clockspring, including the turn signal cancel cam lobes rotate with the steering wheel.

The turn signal cancel cam is serviced as a unit with the clockspring and cannot be repaired. If faulty or damaged, the entire clockspring unit must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

OPERATION

The turn signal cancel cam has two lobes molded into the lower surface of the clockspring rotor. When the turn signals are activated by moving the multi-function switch control stalk to a detent position, a turn signal cancel actuator is extended from the inside surface of the multi-function switch housing toward the center of the steering column and the turn signal cancel cam. When the steering wheel is rotated during a turning maneuver, one of the two turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. In other words, if the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral Off position.

UNDERHOOD LAMP

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Insert a small flat blade in the access slot between the lamp base and lamp lens.
- (3) Pry the lamp lens upward and remove the lamp lens (Fig. 31).
- (4) Depress the bulb terminal inward (Fig. 32) to release the bulb.

80ad847e

Fig. 31 Underhood Lamp Lens

- 1 - LAMP
- 2 - LAMP LENS

UNDERHOOD LAMP (Continued)

80add414

Fig. 32 Underhood Lamp Bulb

- 1 - BULB
- 2 - DEPRESS TERMINAL INWARD
- 3 - BULB WIRE LOOP
- 4 - LAMP BASE

INSTALLATION

- (1) Engage the replacement bulb wire loop to the terminal closest to the lamp base wire connector.
- (2) Depress the opposite terminal inward and engage the remaining bulb wire loop.
- (3) Position the lamp lens on the lamp base and press into place.
- (4) Connect the battery negative cable.

UNDERHOOD LAMP UNIT**REMOVAL**

- (1) Disconnect and isolate the battery negative cable.
- (2) Disconnect the wire harness connector from the lamp.
- (3) Remove lamp lens.
- (4) Remove bulb.
- (5) Remove screw attaching underhood lamp to the inner hood panel (Fig. 33).
- (6) Separate underhood lamp from vehicle.

80b5cc96

Fig. 33 Underhood Lamp

- 1 - UNDER HOOD LAMP
- 2 - HOOD
- 3 - CONNECTOR

INSTALLATION

- (1) Install bulb.
- (2) Install lamp lens.
- (3) Position the underhood lamp on the hood inner panel.
- (4) Install the attaching screw through the lamp and into the hood panel. Tighten the screw securely.
- (5) Fold lamp housing over and firmly press onto base to snap into place.
- (6) Connect the wire harness connector to the lamp.
- (7) Connect the battery negative cable.

DOME LAMP

REMOVAL

- (1) Using a small flat blade, pry the left side (driver's side) of the dome lamp lens downward from dome lamp.
- (2) Allow the lens to hang down (Fig. 1) , this will disengage the right side of the lamp (passenger's side) from the headliner.
- (3) Pull the right side of the lamp down and slide the lamp to the right (Fig. 2) .
- (4) Separate the lamp from the headliner.
- (5) Disengage dome lamp wire connector from body wire harness.
- (6) Separate dome lamp from vehicle.

- 5 - BULB

80a8eb3f

Fig. 2 Dome Lamp

- 1 - SLIDE LAMP

INSTALLATION

- (1) Position dome lamp at headliner.
- (2) Connect dome lamp wire connector to body wire harness.
- (3) Position the left side of the lamp in the headliner opening and slide lamp to the left.
- (4) Push the right side of the lamp in the headliner opening and push the lamp lens up into the lamp to secure.

DOOR AJAR SWITCH

DESCRIPTION

The door ajar switches are mounted to the door hinge pillars. The switches close a path to ground for the Central Timer Module (CTM) when a door is opened, and open the ground path when a door is closed.

The door ajar switches cannot be repaired and, if faulty or damaged, they must be replaced.

DIAGNOSIS AND TESTING - DOOR AJAR SWITCH

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Rotate the headlamp switch knob counterclockwise to ensure that the dome lamps are not switched off. Open the driver door and note whether the interior lamps light. They should light. If OK, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - DIAGNOSIS AND TESTING). If not OK, go to Step 2.

- (2) Disconnect and isolate the battery negative cable. Unplug the driver door ajar switch from its wire harness connector. Check for continuity between the ground circuit cavity of the driver door ajar switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the circuit to ground as required.

DOOR AJAR SWITCH (Continued)

(3) Check for continuity between the door ajar switch ground circuit terminal and each of the other two terminals of the driver door ajar switch. There should be continuity with the switch plunger released, and no continuity with the switch plunger depressed. If OK, go to Step 4. If not OK, replace the faulty switch.

(4) Remove the Central Timer Module (CTM) from its mounting bracket to access the CTM wire harness connectors (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODUL - REMOVAL). Unplug the 14-way CTM wire harness connector. Check for continuity between the driver door switch sense circuit cavity of the 14-way CTM wire harness connector and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the short circuit as required.

(5) Check for continuity between the driver door switch sense circuit cavities of the 14-way CTM wire harness connector and the driver door ajar switch wire harness connector. There should be continuity. If OK, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - DIAGNOSIS AND TESTING) If not OK, repair the open circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Grasp the body of the door ajar switch with a pair of pliers and move the switch gently back-and-forth while pulling it out of the door hinge pillar mounting hole.

(3) Pull the door ajar switch out from the pillar far enough to access the wire harness connector (Fig. 3).

(4) Unplug the door ajar switch from the wire harness connector.

INSTALLATION

(1) Install the door ajar switch to the wire harness connector.

(2) Push the door ajar switch into the pillar.

(3) Connect the battery negative cable.

GLOVE BOX LAMP AND SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL) for the procedures.

Fig. 3 Door Ajar Switch Remove/Install

- 1 - DOOR HINGE PILLAR
- 2 - DOOR AJAR SWITCH
- 3 - CONNECTOR

(3) Reach through the glove box opening and behind the glove box lamp and switch mounting bracket to access the instrument panel wire harness connector on the glove box lamp and switch (Fig. 4).

Fig. 4 Glove Box Lamp and Switch Remove/Install

- 1 - RETAINER
- 2 - WIRE HARNESS CONNECTOR
- 3 - GLOVE BOX LAMP AND SWITCH
- 4 - MOUNTING BRACKET

(4) Disconnect the instrument panel wire harness connector from the connector receptacle on the back of the glove box lamp and switch unit.

GLOVE BOX LAMP AND SWITCH (Continued)

(5) Reach through the glove box opening and behind the glove box lamp and switch mounting bracket to depress the retaining tabs on the top and bottom of the glove box lamp and switch housing.

(6) While holding the retaining tabs depressed, push the glove box lamp and switch unit out through the hole in the mounting bracket on the instrument panel glove box opening upper reinforcement.

(7) Remove the glove box lamp and switch unit from the instrument panel.

INSTALLATION

(1) Reach through the glove box opening and behind the glove box lamp and switch mounting bracket to feed the instrument panel wire harness connectors out through the hole in the glove box lamp and switch housing mounting bracket.

(2) Position the glove box lamp and switch unit to the instrument panel.

(3) Reconnect the instrument panel wire harness connector to the connector receptacle on the back of the glove box lamp and switch unit.

(4) Push the glove box lamp and switch unit into the hole in the mounting bracket on the instrument panel glove box opening upper reinforcement.

(5) Install the glove box onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION) for the procedures.

(6) Close the glove box.

(7) Reconnect the battery negative cable.

READING LAMP**DESCRIPTION**

The overhead console in this vehicle is equipped with two individual reading and courtesy lamps. The lamp lenses are the only visible components of these lamps. The reading and courtesy lamp lenses are mounted in the overhead console housing between the garage door opener storage bin and the sunglasses storage bin. Each lamp has its own switch, bulb, reflector and lens; but both lamps share a common lamp housing within the overhead console.

The overhead console reading and courtesy lamps operate on battery current that is provided at all times, regardless of the ignition switch position. The ground feed for the lamps is switched through the integral reading and courtesy lamp switches or through the door jamb switches. Each lamp is designed and aimed to provide illumination that will be directed only to that side of the vehicle on which the lamp is located.

The reading and courtesy lamp lenses, bulbs and the lamp housing and reflector unit are available for service replacement. The reading and courtesy lamp switches, bulb holders and wiring are only available as part of the overhead console wire harness. If either of the lamp switches or bulb holders is faulty or damaged, the entire overhead console wire harness assembly must be replaced.

For service of the reading and courtesy lamp bulbs, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

OPERATION

All reading and courtesy lamps located in the overhead console are activated by the door jamb switches. When all of the doors are closed, these lamps can be individually activated by depressing the corresponding lens. When any door is open, depressing the lamp lenses to activate the lamp switches will not turn the lamps off.

See the owner's manual in the vehicle glove box for more information on the use and operation of the overhead console reading and courtesy lamps.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Insert a long, narrow, flat-bladed tool between the curved (outboard) edge of the reading and courtesy lamp lens and the overhead console housing (Fig. 5).

(3) Gently pry inward and downward against the lens until the latch tab in the center of the outboard edge of the reading and courtesy lamp lens is disengaged from the overhead console housing.

(4) Pull firmly on the lens toward the outboard side of the vehicle to disengage the two pivot tabs on the inboard edge of the reading and courtesy lamp lens are disengaged from the overhead console housing.

(5) Remove the reading and courtesy lamp lens from the overhead console housing.

READING LAMP (Continued)

Fig. 5 Overhead Console Reading Lamp Bulb Removal

- 1 - LENS
- 2 - FLAT BLADE
- 3 - CONSOLE

INSTALLATION

- (1) Position the reading and courtesy lamp lens onto the overhead console housing.
- (2) Align the two pivot tabs on the inboard edge of the reading and courtesy lamp lens with the two pivot holes in the overhead console housing.

(3) Push firmly on the lens toward the inboard side of the vehicle to insert the two pivot tabs on the inboard edge of the reading and courtesy lamp lens into the two pivot holes in the overhead console housing.

(4) Pivot the lens back up into position and press upward firmly until the latch tab in the center of the outboard edge of the reading and courtesy lamp lens snaps back into the overhead console housing.

(5) Reconnect the battery negative cable.

VANITY LAMP**REMOVAL**

- (1) Insert a flat blade into the slot at front of lens.
- (2) Rotate blade until lens pops out of lamp.
- (3) Remove lens from housing.
- (4) Remove bulb from lamp terminals.

INSTALLATION

- (1) Install bulb into lamp terminals.
- (2) Place one side of lens into housing.
- (3) Insure dim control is in place, and snap lens into housing.

OVERHEAD CONSOLE

DESCRIPTION

Three different overhead console units are available factory-installed options on this model, base, premium and premium with vehicle theft security. The base overhead console unit features a garage door opener storage bin, a sunglasses storage bin and two reading and courtesy lamps. The premium overhead console has all of the features of the base unit, but adds a compass mini-trip computer and/or vehicle theft security LED. See the owner’s manual in the vehicle glove box for more information on the features, use and operation of all of the overhead console components and systems. Refer to **Overhead Console** in the Contents of Wiring Diagrams for complete circuit diagrams.

The premium overhead console (Fig. 1) includes two front-mounted reading and courtesy lamps, a garage door opener storage bin, and a sunglasses storage bin. The premium overhead console includes

a compass mini-trip computer. The base overhead console uses the same overhead console housing, but has a computer cover plug installed in place of the compass mini-trip computer display module lens and push buttons.

The rear of the overhead console is secured to two rear mounting holes in the inner roof panel by two plastic hook formations that are integral to the overhead console housing. The front of the overhead console is secured to the two front mounting holes of the inner roof panel by two plastic latches that are integral to the overhead console housing. A single electrical connection joins the overhead console wire harness to the roof wire harness for both the base and premium overhead console units.

Following are general descriptions of the major components used in the overhead console. See the owner’s manual in the vehicle glove box for more information on the use and operation of the various overhead console features.

GARAGE DOOR OPENER STORAGE BIN

A compartment near the front of the overhead console is designed to hold most garage door opener remote control transmitters. The transmitter is mounted within the compartment with an adhesive-backed hook and loop fastener patch and, when the compartment is closed, a push button in the center of the compartment door is depressed to actuate the transmitter.

A transmitter mounting kit including the adhesive-backed hook and loop fastener material is available for service. The garage door opener storage bin door and the push button with three assorted length adapter pegs are also available for service replacement.

The garage door opener storage compartment door is opened by pressing the integral latch towards the front of the vehicle. When the compartment door is opened, the push button unit is removed from the compartment by squeezing the latch tabs and pulling the unit downward. With the push button removed, the garage door opener can be installed in the compartment using the adhesive-backed hook and loop fastener material provided.

With the transmitter mounted in the storage bin, adapter pegs located on the garage door opener push button unit are selected and mounted on one of two posts on the back side of the push button. The combination of the adapter peg length and the push button post location must be suitable to depress the button of the transmitter when the push button in the center of the garage door opener storage bin door is depressed. When the proper combination has been selected, the push button is reinstalled in the compartment and the compartment door is closed.

SUNGLASS STORAGE BIN

A sunglasses storage bin is included in the overhead console. The storage bin is located near the rear of the overhead console and is held in the closed position by a latch that is integral to the storage bin door. The interior of the bin is lined with a foam rubber padding material to protect the sunglasses from being scratched. Dampening springs that are located on the back of the overhead console reading and

courtesy lamp housing contact the hinges of the sunglasses storage bin for a smooth opening action.

The sunglasses storage bin and door unit is available for service replacement. The hinge dampening springs are serviced as a unit with the overhead console reading and courtesy lamp housing.

The sunglasses storage bin is opened by pressing the latch on the rear edge of the door towards the front of the vehicle, then pulling the bin downward to the open position. The integral latch on the sunglasses bin door will automatically engage when the bin is closed. See the owner's manual in the vehicle glove box for more information on the use and operation of the sunglasses storage bin.

COMPASS

While in the compass/temperature mode, the compass will display the direction in which the vehicle is pointed using the eight major compass headings (Examples: north is N, northeast is NE), along with the outside ambient temperature. When the compass unit is placed in the compass/compass in degrees mode, the compass will display the direction the vehicle is heading using the eight major compass headings and in degrees (0 to 359 degrees). North is 0 degrees, East is 90 degrees, South is 180 degrees and West is 270 degrees. It will not display the headings in minutes or seconds.

The self-calibrating compass unit requires no adjusting in normal use. The compass unit will compensate for magnetism the body of the vehicle may acquire during normal use. However, avoid placing anything magnetic directly on the roof of the vehicle. Magnetic mounts for an antenna, a repair order hat, or a funeral procession flag can exceed the compensating ability of the compass unit if placed on the roof panel. If the vehicle roof should become magnetized, the demagnetizing and calibration procedures found in this group may be required to restore proper compass operation.

THERMOMETER

The thermometer displays the outside ambient temperature in whole degrees. The temperature display can be changed from Fahrenheit to Celsius

OVERHEAD CONSOLE (Continued)

using the U.S./Metric push button. The displayed temperature is not an instant reading of conditions, but an average temperature. It may take the thermometer display several minutes to respond to a major temperature change, such as driving out of a heated garage into winter temperatures.

When the ignition switch is turned to the Off position, the last displayed temperature reading stays in the thermometer unit memory. When the ignition switch is turned to the On position again, the thermometer will display the memory temperature if the engine coolant temperature is above about 43° C (109° F). If the engine coolant temperature is below about 43° C (109° F), the thermometer will display the actual temperature sensed by the ambient temperature sensor. The thermometer temperature display update interval varies with the vehicle speed; therefore, if the temperature reading seems inaccurate, drive the vehicle for at least three minutes while maintaining a speed of 48 kilometers-per-hour (30 miles-per-hour) or higher.

The thermometer function is supported by an ambient temperature sensor. The sensor is mounted outside the passenger compartment near the front and center of the vehicle, and is hard wired to the module. The ambient temperature sensor is available as a separate service item.

STANDARD PROCEDURE

STANDARD PROCEDURE - COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not use magnetic tools when servicing the overhead console.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or out of calibration, perform the following calibration procedure. Also, new service replacement compass mini-trip computer modules must have their compass calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

(1) Start the engine. If the compass/temperature data is not currently being displayed, momentarily depress and release the Step push button to step

through the display options until you have reached the compass/temperature display.

(2) Depress both the U.S./Metric and the Step push buttons at the same time for more than six seconds, until "CAL" appears in the display, then release both push buttons. The "CAL" in the display indicates that the compass is in the calibration mode.

(3) Drive the vehicle on a level surface, at least fifty feet away from large metal objects and power lines, in all four compass directions, such as driving around a city block several times or driving in two to three complete circles at a slow to medium speed.

(4) When the calibration is successfully completed, "CAL" will disappear from the display and normal compass mini-trip computer operation will resume.

NOTE: If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the unit is faulty. Repeat the calibration procedure at least one more time.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance must be set. There are two methods that can be used to enter this information into the compass mini-trip computer module. They are the zone method and the direct method.

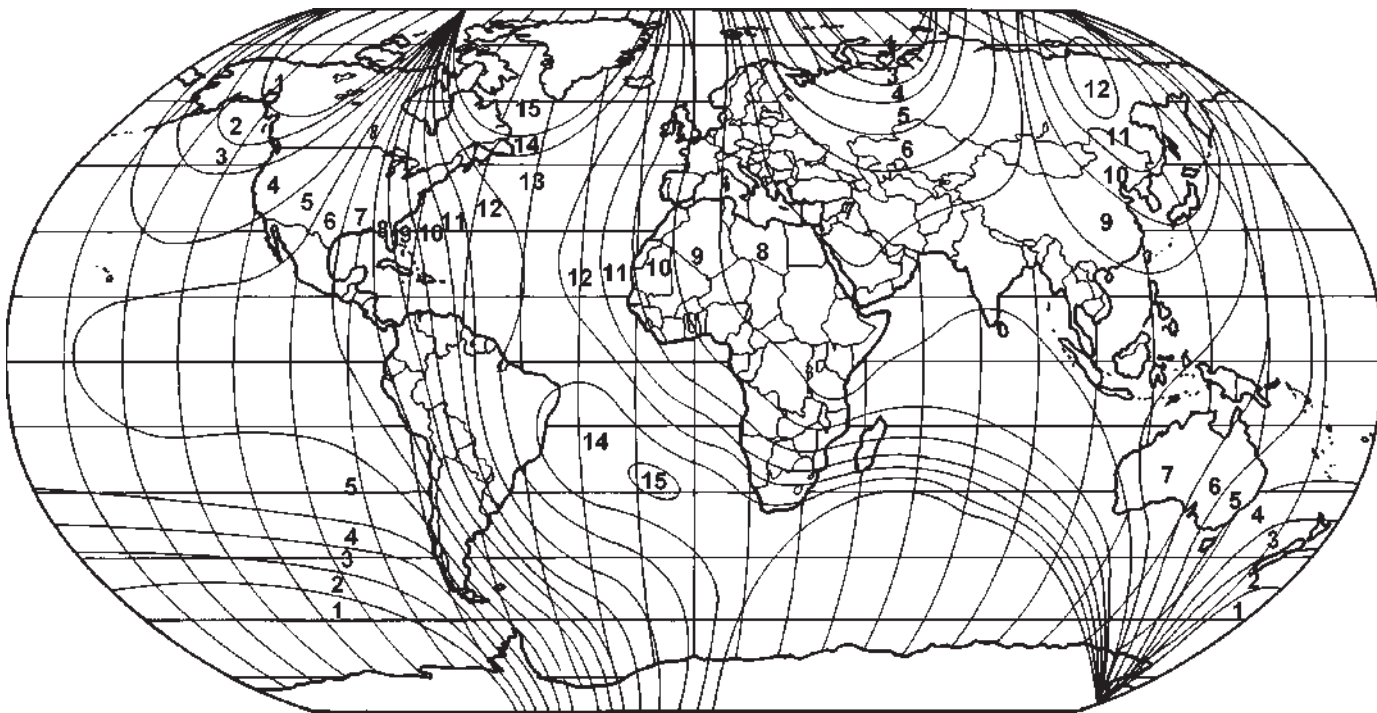

ZONE METHOD

(1) Using the Variance Settings map, find your geographic location and note the zone number (Fig. 2).

(2) Turn the ignition switch to the On position. If the compass/temperature data is not currently being displayed, momentarily depress and release the Step push button to step through the display options until you have reached the compass/temperature display.

(3) Depress both the U.S./Metric and the Step push buttons at the same time and hold them down for more than 100 milliseconds, but not more than one second. The compass mini-trip computer will enter the variation adjustment mode and "VAR" along with the current variance zone will appear in the display.

OVERHEAD CONSOLE (Continued)

80a13863

Fig. 2 Variance Settings

(4) Momentarily depress and release the Step push button to step through the zone numbers, until the zone number for your geographic location appears in the display.

(5) After five seconds, the displayed zone will automatically be set in the compass mini-trip computer module memory and normal operation will resume.

(6) Confirm that the correct directions are now indicated by the compass.

DIRECT METHOD

(1) Turn the vehicle so it is headed in either the north or south direction. The vehicle must be headed within 45 degrees of north or south for this procedure to work. The vehicle may be moving or stationary.

(2) Turn the ignition switch to the On position. If the compass/temperature data is not currently being displayed, momentarily depress and release the Step push button to step through the display options until you have reached the compass/temperature display.

(3) Depress both the U.S./Metric and the Step push buttons at the same time and hold them down for more than 100 milliseconds, but not more than one second. The compass mini-trip computer will enter the variation adjustment mode and "VAR" along with the current variance zone will appear in the display.

(4) Within the next five seconds, momentarily depress and release the U.S./Metric push button. The variance zone will automatically be set in the com-

pass mini-trip computer module memory and normal operation will resume.

(5) If the "VAR" in the display flashes twice before the compass mini-trip computer module resumes normal operation, the new variance zone setting was not accepted. Reorient the vehicle so it is headed within 45 degrees of north or south and repeat this procedure.

STANDARD PROCEDURE - COMPASS DEMAGNETIZING

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the overhead console forward mounting screw and the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel and the overhead console forward mounting screw, proceed as follows:

(1) Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.

(2) Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.

(3) Slowly approach the head of the overhead console forward mounting screw with the degaussing tool connected.

OVERHEAD CONSOLE (Continued)

(4) Contact the head of the screw with the plastic coated tip of the degaussing tool for about two seconds.

(5) With the degaussing tool still energized, slowly back it away from the screw. When the tip of the tool is at least 61 centimeters (2 feet) from the screw head, disconnect the tool.

(6) Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header (Fig. 3). The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.

J908E-27

Fig. 3 Roof Demagnetizing Pattern

(7) Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.

(8) Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.

(9) Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of

the roof center line, and 28 centimeters (11 inches) back from the windshield header.

(10) With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.

(11) Calibrate the compass and adjust the compass variance (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - STANDARD PROCEDURE).

REMOVAL

OVERHEAD CONSOLE REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Open the garage door opener storage bin door and locate the two overhead console latch tabs near the front of the bin (Fig. 4).

Fig. 4 Overhead Console Latch Tabs

- 1 - PUSH BUTTON
- 2 - GARAGE DOOR OPENER STORAGE BIN DOOR
- 3 - LATCH TABS

(3) While pulling gently downward on the front of the overhead console, push the latch tabs forward until each latch is disengaged from its receptacle in the inner roof panel.

(4) Slide the overhead console rearward far enough to disengage the two mounting hooks on the rear of the housing from the mounting holes in the inner roof panel (Fig. 5).

(5) Lower the overhead console from the headliner far enough to access the wire harness connector.

(6) Disconnect the roof wire harness connector from the overhead console wire harness connector.

(7) Remove the overhead console from the vehicle.

OVERHEAD CONSOLE (Continued)

- 4 - GARAGE DOOR OPENER STORAGE BIN DOOR
- 5 - WIRE HARNESS CONNECTOR
- 6 - INNER ROOF PANEL

DISASSEMBLY

OVERHEAD CONSOLE DISASSEMBLY

GARAGE DOOR OPENER STORAGE BIN

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(3) If the vehicle is so equipped, remove the three screws that secure the compass mini-trip computer module to the back side of the overhead console housing. Move the module aside as needed for access to the pivot latches that are integral to the overhead console housing for the garage door opener storage bin door pivot pins.

(4) Open the garage door opener storage bin door.

(5) From the back side of the of the overhead console housing, gently pry one of the pivot latches (Fig. 6) forward while pulling the garage door opener storage bin door pivot arm rearward until the pivot pin is disengaged from the latch. Repeat this step to disengage the second pivot pin from its pivot latch.

(6) From the face side of the overhead console housing, remove the garage door opener storage bin door from the storage bin.

**Fig. 6 Garage Door Opener Storage Bin Door Pivot Latches**

- 1 - PIVOT LATCHES
- 2 - COMPASS MINI-TRIP COMPUTER MODULE
- 3 - GARAGE DOOR OPENER STORAGE BIN DOOR PIVOT ARMS

SUNGLASS STORAGE BIN

REMOVAL

(1) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(2) Remove the four screws that secure the reading and courtesy lamp housing to the back side of the overhead console housing. Move the lamp housing aside as needed for access to the pivot latches that are integral to the overhead console housing for the sunglasses storage bin pivot pins.

(3) Open the sunglasses storage bin.

(4) From the back side of the of the overhead console housing, gently pry one of the pivot latches forward while pulling the sunglasses storage bin pivot arm rearward until the pivot pin is disengaged from the latch. Repeat this step to disengage the second pivot pin from its pivot latch.

(5) From the face side of the overhead console housing, remove the sunglasses storage bin from the overhead console.

COMPASS MINI-TRIP LENS

REMOVAL

Overhead consoles equipped with the optional compass mini-trip computer have a lens installed in the front of the overhead console housing through which the Vacuum-Fluorescent Display can be viewed. If the overhead console is not equipped with the compass mini-trip computer option, a plastic cover plug is installed in the front of the overhead console housing in place of the lens.

(1) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

OVERHEAD CONSOLE (Continued)

(2) If the vehicle is so equipped, remove the compass mini-trip computer module from the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/COMPASS/MINI-TRIP COMPUTER - REMOVAL).

(3) From the back side of the overhead console, push downward firmly and evenly on the rear of the trip computer lens to disengage the rear mounting boss, or the snap features of the cover plug from the overhead console housing.

(4) From the face of the overhead console, pull the trip computer lens or the cover plug rearward far enough to disengage the four forward mounting tabs from the overhead console housing.

(5) Remove the trip computer lens or the cover plug from the overhead console housing.

ASSEMBLY

OVERHEAD CONSOLE ASSEMBLY

GARAGE DOOR OPENER STORAGE BIN

INSTALLATION

(1) From the face side of the overhead console housing, position the garage door opener storage bin door pivot arms through the openings in the front of the storage bin.

(2) From the back side of the of the overhead console housing, align one of the pivot pins of the garage door opener storage bin door with the pivot latch integral to the overhead console housing. Press the pivot arm forward until the pivot pin is engaged in the latch. Repeat this step to engage the second pivot pin with its pivot latch.

(3) Close the garage door opener storage bin door.

(4) If the vehicle is so equipped, position the compass mini-trip computer module to the back side of the overhead console housing. Install and tighten the three screws that secure the module to the housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Install the overhead console onto the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

SUNGLASS STORAGE BIN

INSTALLATION

(1) From the face side of the overhead console housing, position the sunglasses storage bin pivot arms through the openings in the front of the storage bin housing in the overhead console.

(2) From the back side of the of the overhead console housing, align one of the pivot pins of the sunglasses storage bin with the pivot latch integral to the overhead console housing. Press the pivot arm

forward until the pivot pin is engaged in the latch. Repeat this step to engage the second pivot pin with its pivot latch.

(3) Close the sunglasses storage bin.

(4) Position the reading and courtesy lamp housing to the back side of the overhead console housing. Install and tighten the four screws that secure the lamp housing to the back of the overhead console housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Install the overhead console onto the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

MINI-TRIP COMPUTER LENS

INSTALLATION

Overhead consoles equipped with the optional compass mini-trip computer have a lens installed in the front of the overhead console housing through which the Vacuum-Fluorescent Display can be viewed. If the overhead console is not equipped with the compass mini-trip computer option, a plastic cover plug is installed in the front of the overhead console housing in place of the lens.

(1) Remove the trip computer lens or the cover plug onto the overhead console housing.

(2) From the face of the overhead console, push the trip computer lens or the cover plug forward far enough to engage the four forward mounting tabs in the overhead console unit.

(3) From the face of the overhead console, align the rear mounting boss of the trip computer lens or the alignment pin of the cover plug with the receptacle in the overhead console housing.

(4) Press firmly and evenly on the rear edge of the trip computer lens or the cover plug until the rear mounting boss is fully seated in the receptacle, or the snap features of the cover plug are fully engaged in the overhead console housing.

(5) Install the compass mini-trip computer module onto the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/COMPASS/MINI-TRIP COMPUTER - INSTALLATION).

(6) Install the overhead console onto the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

INSTALLATION

OVERHEAD CONSOLE INSTALLATION

(1) Position the overhead console near the mounting location on the headliner in the vehicle.

(2) Reconnect the roof wire harness connector to the overhead console wire harness connector.

OVERHEAD CONSOLE (Continued)

(3) Engage the two mounting hooks on the rear of the overhead console housing in the mounting holes in the inner roof panel.

(4) Slide the overhead console forward far enough to align the two latches on the front of the housing with their receptacles in the inner roof panel.

(5) Push upward firmly and evenly on the front of the overhead console until each of the two latches is fully engaged in its receptacle in the inner roof panel.

(6) Close the garage door opener storage bin door.

(7) Reconnect the battery negative cable.

SPECIAL TOOLS

OVERHEAD CONSOLE SPECIAL TOOL

Degaussing Tool 6029

COMPASS/MINI-TRIP COMPUTER

DESCRIPTION

The compass mini-trip computer is located in the premium overhead console on models equipped with this option. Two compass mini-trip computer units are available. One unit is used on vehicles not equipped with the Vehicle Theft Security System (VTSS) option, and the other is used on vehicles with the VTSS option. Both compass mini-trip computer units include the electronic control module, a Vacuum-Fluorescent Display (VFD), a compass flux-gate unit and two push button function switches.

Compass mini-trip computer units for vehicles equipped with the VTSS include a red Light-Emitting Diode (LED) on their electronic circuit board. This LED protrudes through the bottom of the lens on the front of the overhead console unit, and serves as the security indicator lamp. Refer to **Security Indicator Lamp** in Vehicle Theft/Security Systems for more information on this feature.

The compass mini-trip computer module contains a central processing unit and interfaces with other electronic modules in the vehicle on the Chrysler Collision Detection (CCD) data bus network. The CCD data bus network allows the sharing of sensor information. This helps to reduce wire harness complexity, reduce internal controller hardware, and reduce component sensor current loads. At the same time, this

system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities.

The compass mini-trip computer provides several electronic functions and features. Some of the functions and features that the compass mini-trip computer module supports and/or controls, include the following display options:

- **Compass and temperature** - provides the outside temperature and one of eight compass readings to indicate the direction the vehicle is facing.

- **Compass and compass in degrees** - provides one of eight compass readings to indicate the direction the vehicle is facing and provides the compass direction in degrees.

- **Trip odometer (ODO)** - shows the distance travelled since the last trip computer reset.

- **Average fuel economy (AVG ECO)** - shows the average fuel economy since the last trip computer reset.

- **Instant fuel economy (ECO)** - shows the present fuel economy based upon the current vehicle distance and fuel used information.

- **Distance to empty (DTE)** - shows the estimated distance that can be travelled with the fuel remaining in the fuel tank. This estimated distance is computed using the average miles-per-gallon from the last 30 gallons of fuel used.

- **Elapsed time (ET)** - shows the accumulated ignition-on time since the last trip computer reset.

- **Blank screen** - the compass mini-trip VFD is turned off.

The ambient temperature sensor is hard wired to the compass mini-trip computer module. Data input for all other compass mini-trip computer functions, including VFD dimming level, is received through CCD data bus messages. The compass mini-trip computer uses its internal programming and all of these inputs to calculate and display the requested data. If the data displayed is incorrect, perform the self-diagnostic tests as described in this group. If these tests prove inconclusive, the use of a DRBIII® scan tool and the proper Diagnostic Procedures manual are recommended for further testing of the compass mini-trip computer module and the CCD data bus.

The compass mini-trip computer module cannot be repaired, and is available for service only as a unit. If faulty or damaged, the complete module must be replaced.

OPERATION

The compass mini-trip computer only operates with the ignition switch in the On position. When the ignition switch is turned to the On position, all of the segments in the compass mini-trip computer VFD will be turned on for one second, then the display

COMPASS/MINI-TRIP COMPUTER (Continued)

will return to the last function being displayed before the ignition was turned to the Off position. With the ignition switch in the On position, momentarily depressing and releasing the Step push button switch will cause the compass-mini-trip computer to change its mode of operation, and momentarily depressing and releasing the U.S./Metric push button will cause the unit to toggle between U.S. and Metric measurements. While in either compass mode, depressing the U.S./Metric push button for more than ten seconds will toggle the display between the compass/temperature and the compass/compass in degrees modes.

This compass mini-trip computer features several functions that can be reset. If both the Step and U.S./Metric push buttons are depressed at the same time with the ignition switch in the On position, the trip computer information that can be reset is reset. Depressing and releasing the Step and U.S./Metric push buttons at the same time for more than 100 milliseconds, but not more than one second while in any display mode (except the compass/temperature mode) will cause a local reset. A local reset affects only the function currently displayed. See the Reset Chart below for more information on this feature. Performing a local reset while in the compass/temperature mode enters the module into the compass variance setting mode.

Depressing and releasing the Step and U.S./Metric push buttons at the same time for more than two seconds while in any display mode (except the compass/temperature mode) will cause a global reset. A global reset changes all of the trip computer functions that can be reset.

For more information on the features and control functions of the compass mini-trip computer, see the owner's manual in the vehicle glove box.

DIAGNOSIS AND TESTING - COMPASS MINI-TRIP COMPUTER

If the problem with the compass mini-trip computer module is an inoperative security indicator lamp, refer to **Security Indicator Lamp** in Vehicle Theft/Security Systems. If the problem with the compass mini-trip computer module is an "OC" or "SC" in the compass/thermometer display, refer to **Ambient Temperature Sensor** in this section. If the problem with the compass mini-trip computer module is an inaccurate or scrambled display, refer to **CMTC Self-Diagnostic Test** in this section. If the problem with the compass mini-trip computer module is incorrect Vacuum Fluorescent Display (VFD) dimming levels, use a DRB® scan tool and the proper Diagnostic Procedures manual to test for the correct dimming message inputs being received from the instrument cluster over the Chrysler Collision Detection (CCD) data bus. If the problem is a no-display condition,

use the following procedures. For complete circuit diagrams, refer to **Overhead Console** in the Contents of Wiring Diagrams.

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the battery as required.

(3) Check the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 4. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(4) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the junction block. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run/start) circuit to the ignition switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the overhead console. Check for continuity between the ground circuit cavities of the roof wire harness connector for the overhead console and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the roof wire harness connector for the overhead console. If OK, go to Step 7. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

(7) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the roof wire harness connector for the overhead console. If OK, refer to **Self-Diagnostic Test** in the Diagnosis and Testing section of this group for further diagnosis of the compass mini-trip computer module and the CCD data bus. If not OK, repair the open fused ignition switch output (run/start) circuit to the junction block fuse as required.

CMTC SELF-DIAGNOSTIC TEST

A self-diagnostic test is used to determine that the compass mini-trip computer module is operating properly electrically. Initiate the self-diagnostic test as follows:

(1) With the ignition switch in the Off position, simultaneously depress and hold the Step button and the U.S./Metric button.

(2) Turn the ignition switch to the On position.

(3) Continue to hold both buttons depressed until the compass mini-trip computer module enters the

COMPASS/MINI-TRIP COMPUTER (Continued)

display segment test. In this test, all of the Vacuum Fluorescent Display (VFD) segments are lighted while the compass mini-trip computer module performs the following checks:

- Microprocessor RAM read/write test
- Non-volatile memory read/write test
- Microprocessor ROM verification test
- CCD communications test.

(4) Following completion of these tests, the compass mini-trip computer will display one of three messages: "PASS," "FAIL," or "CCd." Respond to the respective test results as follows:

- If the "PASS" message is displayed, but compass mini-trip computer operation is still improper, the use of a DRB scan tool and the proper Diagnostic Procedures manual are required for further diagnosis.

- If the "FAIL" message is displayed, the compass mini-trip computer module is faulty and must be replaced.

- If the "CCd" message is displayed, the use of a DRB® scan tool and the proper Diagnostic Procedures manual are required for further diagnosis.

- If any VFD segment should fail to light during the display segment test, the compass mini-trip computer module is faulty and must be replaced.

(5) If all tests are passed, or if the ignition switch is turned to the Off position, the compass mini-trip computer module will automatically return to normal operation.

NOTE: If the compass functions, but accuracy is suspect, it may be necessary to perform a variation adjustment. This procedure allows the compass unit to accommodate variations in the earth's magnetic field strength, based on geographic location. Refer to Compass Variation Adjustment in the Service Procedures section of this group.

NOTE: If the compass reading has blanked out, and only "CAL" appears in the display, demagnetizing may be necessary to remove excessive residual magnetic fields from the vehicle. Refer to Compass Demagnetizing in the Service Procedures section of this group.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

(3) Remove the three screws that secure the compass mini-trip computer module to the overhead console housing (Fig. 7).

Fig. 7 Overhead Console Compass Mini-Trip Computer

- 1 - WIRE HARNESS CONNECTOR
- 2 - SCREWS (3)
- 3 - COMPASS MINI-TRIP COMPUTER MODULE
- 4 - FRONT LATCHES

(4) Pull the compass mini-trip computer module away from the overhead console far enough to access the wire harness connector.

(5) Disconnect the overhead console wire harness connector from the compass mini-trip computer module connector receptacle.

(6) Remove the compass mini-trip computer module from the overhead console housing.

INSTALLATION

(1) Position the compass mini-trip computer module onto the overhead console housing.

(2) Reconnect the overhead console wire harness connector to the compass mini-trip computer module connector receptacle.

(3) Install and tighten the three screws that secure the compass mini-trip computer module to the overhead console housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) Install the overhead console onto the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).

(5) Reconnect the battery negative cable.

NOTE: If a new compass mini-trip computer has been installed, the compass will have to be calibrated and the variance set. Refer to Compass Variation Adjustment and Compass Calibration in the Service Procedures section of this group for the procedures.

AMBIENT TEMP SENSOR

DESCRIPTION

Ambient air temperature is monitored by the compass mini-trip computer module through the ambient temperature sensor. The ambient temperature sensor is a variable resistor mounted to a bracket that is secured with a screw to the underside of the hood panel near the hood latch striker in the engine compartment (Fig. 8).

For complete circuit diagrams, refer to **Overhead Console** in the Contents of Wiring Diagrams. The ambient temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent to it by the compass mini-trip computer module. The resistance in the sensor changes as temperature changes, changing the return circuit voltage to the compass mini-trip computer module. Based upon the resistance in the sensor, the compass mini-trip computer module senses a specific voltage on the return circuit, which it is programmed to correspond to a specific temperature.

DIAGNOSIS AND TESTING - AMBIENT TEMPERATURE SENSOR

The thermometer function is supported by the ambient temperature sensor, a wiring circuit, and a portion of the compass mini-trip computer module. If any portion of the ambient temperature sensor circuit fails, the compass/thermometer display function will self-diagnose the circuit. If 55° C (131° F) appears in the display, the sensor is being exposed to temperatures above 55° C (131° F), or the sensor circuit is shorted. If -40° C (-40° F) appears in the display, the sensor is being exposed to temperatures below -40° C (-40° F), or the sensor circuit is open.

The ambient temperature sensor circuit can also be diagnosed using the following Sensor Test, and Sensor Circuit Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, refer to **Diagnosis and Testing the Compass Mini-Trip Computer**. For complete circuit diagrams, refer to **Wiring Diagrams**.

SENSOR TEST

(1) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector.

(2) Measure the resistance of the ambient temperature sensor. At -40° C (-40° F), the sensor resistance is 336 kilohms. At 55° C (131° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If OK, refer to the **Sensor Circuit Test below**. If not OK, replace the faulty ambient temperature sensor.

SENSOR CIRCUIT TEST

(1) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor wire harness connector and the overhead console wire harness connector.

(2) Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor wire harness connector.

(3) Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the roof wire harness overhead console connector. There should be continuity. If OK, go to Step 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.

(4) Remove the jumper wire from the body half of the ambient temperature sensor wire harness connector. Check for continuity between the sensor return circuit cavity of the roof wire harness overhead console connector and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted sensor return circuit as required.

(5) Check for continuity between the ambient temperature sensor signal circuit cavity of the roof wire harness overhead console connector and a good ground. There should be no continuity. If OK, refer to **Diagnosis and Testing the Compass Mini-Trip Computer** in this section. If not OK, repair the shorted ambient temperature sensor signal circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Locate the ambient temperature sensor, on the underside of the hood near the hood latch striker (Fig. 8).

(3) Disconnect the wire harness connector from the ambient temperature sensor connector receptacle.

(4) Remove the one screw that secures the ambient temperature sensor bracket to the inner hood reinforcement.

(5) Remove the ambient temperature sensor from the inner hood reinforcement.

AMBIENT TEMP SENSOR (Continued)

**Fig. 8 Ambient Temperature Sensor Remove/Install**

- 1 - HOOD
- 2 - SCREW
- 3 - SENSOR AND BRACKET
- 4 - WIRE HARNESS CONNECTOR
- 5 - HOOD LATCH STRIKER

INSTALLATION

(1) Position the ambient temperature sensor onto the inner hood reinforcement.

(2) Install and tighten the one screw that secures the ambient temperature sensor bracket to the inner hood reinforcement. Tighten the screw to 5.6 N·m (50 in. lbs.).

(3) Reconnect the wire harness connector to the ambient temperature sensor connector receptacle.

(4) Reconnect the battery negative cable.

POWER LOCKS

DESCRIPTION

DESCRIPTION - POWER LOCKS

Two different power lock systems are offered as optional factory-installed equipment on this model. Both power lock systems are offered only on models that are also equipped with power windows. On models without the optional Remote Keyless Entry (RKE) system, a base version of the Central Timer Module (CTM) is used. In this version of the power lock system, the power lock switches provide the only control

over the operation of the power lock motors. On models with the optional RKE system, a high-line or premium version of the CTM is used to provide many electronic features and conveniences that are not possible with the base version CTM. In this power lock system, the power lock motors are controlled by the microprocessor-based high-line or premium version of the CTM based upon the CTM programming and electronic message inputs received from other electronic modules in the vehicle over the Chrysler Collision Detection (CCD) data bus network, Radio Frequency (RF) inputs received from the RKE transmitters, as well as many hard wired inputs.

POWER LOCKS (Continued)

Both versions of the power lock system include the following major components, which are described in further detail elsewhere in this service manual:

- **Power Lock Motors** - A reversible electric motor integral to the door latch of each front door locks or unlocks the front door latch when provided with the appropriate electrical inputs.

- **Power Lock Switches** - A power lock switch integral to the power window/lock switch unit located near the forward end of the arm rest on each front door trim panel allows the power door lock system to be operated by either the driver or the front seat passenger.

On those models equipped with the optional RKE system, the power lock system also includes the following components, which are described in further detail elsewhere in this service manual:

- **Central Timer Module** - The high-line or premium Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. The high-line or premium CTM contains a microprocessor and software that allow it to provide the many electronic functions and features not available with base version of the power lock system.

- **Door Cylinder Lock Switches** - A resistor-multiplexed switch located on the back of each front door lock cylinder allows the power door lock system to be operated using a key inserted in either the driver or passenger front door lock cylinder.

Some of the additional features of the power lock system found in vehicles with the RKE system option include:

- **Automatic Door Lock** - The high-line/premium CTM provides an optional automatic door lock feature (also known as rolling door locks). This is a programmable feature.

- **Central Locking** - The high-line/premium CTM provides an optional central locking/unlocking feature.

- **Door Lock Inhibit** - The high-line/premium CTM provides a door lock inhibit feature.

- **Enhanced Accident Response** - The high-line/premium CTM provides an optional enhanced accident response feature. This is a programmable feature.

Hard wired circuitry connects the power lock system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power lock system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors

and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Many of the electronic features in the vehicle controlled or supported by the high-line or premium versions of the CTM are programmable using the DRBIII® scan tool. In addition, the high-line/premium CTM software is Flash compatible, which means it can be reprogrammed using Flash reprogramming procedures. However, if any of the CTM hardware components are damaged or faulty, the entire CTM unit must be replaced. The power lock system components and the hard wired inputs or outputs of the CTM can be diagnosed using conventional diagnostic tools and methods; however, for diagnosis of the high-line or premium versions of the CTM or the CCD data bus, the use of a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

DESCRIPTION - REMOTE KEYLESS ENTRY SYSTEM

A Remote Keyless Entry (RKE) system is an available option on this model. The Remote Keyless Entry (RKE) system is a Radio Frequency (RF) system that allows the remote operation of the power lock system and, if the vehicle is so equipped, the Vehicle Theft Security System (VTSS). (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - DESCRIPTION). The RKE system includes the following major components, which are described in further detail elsewhere in this service manual:

- **Central Timer Module** - The high-line or premium Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. The high-line or premium CTM contains a microprocessor, an RF receiver, and the software that allow it to provide the many electronic functions and features of the RKE system.

- **Keyless Entry Transmitter** - The keyless entry transmitter is a small, battery-powered, RF transmitter that is contained within a molded plastic case that is designed to also serve as a convenient key fob.

Some additional features of the RKE system include:

- **Horn Chirp** - This feature provides a short, sharp chirp of the vehicle horn to give an audible confirmation that a valid Lock signal has been received from the RKE transmitter. This feature can be enabled or disabled and, if enabled, one of two

POWER LOCKS (Continued)

optional horn chirp durations (twenty or forty milliseconds) can also be selected.

- **Illuminated Entry** - This feature turns on the courtesy lamps in the vehicle for a timed interval (about thirty seconds) each time a valid Unlock signal has been received from the RKE transmitter.

- **Panic Mode** - This feature allows the vehicle operator to cause the vehicle horn to pulse, the headlights to flash, and the courtesy lamps to illuminate for about three minutes by depressing a Panic button on the RKE transmitter. Pressing the Panic button a second time will cancel the Panic mode. A vehicle speed of about 24 kilometers-per-hour (15 miles-per-hour) will also cancel the panic mode.

OPERATION

OPERATION - POWER LOCKS

All versions of the power lock system allow both doors to be locked or unlocked electrically by operating the power lock switch on either front door trim panel. On vehicles that are also equipped with the optional Remote Keyless Entry (RKE) system, both doors may also be locked or unlocked using a key in either front door lock cylinder, or by using the RKE transmitter. On vehicles with the RKE system, if certain features have been electronically enabled, the locks may also be operated automatically by the high-line or premium Central Timer Module (CTM) based upon various other inputs. Those features and their inputs are:

- **Automatic Door Lock** - If enabled, the high-line/premium CTM will automatically lock the doors when it receives a message from the Powertrain Control Module (PCM) indicating that the vehicle speed is about 24 kilometers-per-hour (15 miles-per-hour) or greater. The CTM also monitors the door ajar switches, and will not activate the automatic door lock feature until both doors have been closed for at least five seconds. If this feature is enabled and a door is opened after the vehicle is moving, the CTM will also lock the doors five seconds after both doors are closed.

- **Central Locking** - Vehicles equipped with a high-line/premium CTM also have a resistor-multiplexed door cylinder lock switch mounted to the back of the door lock cylinder within each front door. The CTM continually monitors the input from these switches to provide the central locking/unlocking feature. The CTM will automatically lock or unlock both front doors when either front door is locked or unlocked using a key.

- **Door Lock Inhibit** - The high-line/premium CTM receives inputs from the key-in ignition switch,

the headlamp switch, and the door ajar switches. The logic within the CTM allows it to monitor these inputs to provide a door lock inhibit feature. The door lock inhibit feature prevents the power lock system from being energized with a power lock switch input if the driver door is open with the headlamps on or the key still in the ignition switch. However, the locks can still be operated with the manual door lock button or with a key in the door lock cylinder, and the power locks will still operate using the RKE transmitter while the driver door is open with the headlamps on or a key in the ignition.

- **Enhanced Accident Response** - If enabled, the high-line/premium CTM provides an enhanced accident response feature. This feature uses electronic message inputs received by the CTM from the Airbag Control Module (ACM) to determine when an airbag has been deployed. The CTM also monitors the state of the power lock system and the vehicle speed messages from the PCM in order to provide this feature. If the airbag has been deployed and the vehicle has stopped moving, the CTM will automatically unlock the doors, prevent the doors from being locked, and turn on the courtesy lamps inside the vehicle. Of course, these responses are dependent upon a functional battery and electrical circuitry following the impact.

All versions of the power lock system operate on battery current received through a fused B(+) circuit from a fuse in the Junction Block (JB) so that the system remains functional, regardless of the ignition switch position. Also, in both versions of the power lock system, each power lock switch receives battery current independent of the other. In vehicles with the base version of the power lock system, the driver side power lock switch receives ground through the body wire harness. A single wire take out of the body wire harness with an eyelet terminal connector is secured by a ground screw to the lower left B-pillar (regular cab, extended cab) or lower left quarter inner panel (quad cab). The passenger side power lock switch receives ground through the driver side power lock switch in the base version of the power lock system. The base version power lock switches direct the appropriate battery current and ground feeds to the power lock motors. In the power lock system for vehicles with the RKE system, the power lock switches direct a battery current Lock or Unlock request signal to the high-line or premium CTM, and the CTM energizes internal relays to direct the appropriate battery current and ground feeds to the power lock motors.

POWER LOCKS (Continued)

OPERATION - REMOTE KEYLESS ENTRY SYSTEM

On vehicles with the Remote Keyless Entry (RKE) system, the power locks can be operated remotely using the RKE transmitter. If the vehicle is so equipped, the RKE transmitter also arms and disarms the factory-installed Vehicle Theft Security System (VTSS). Three small, recessed buttons on the outside of the transmitter case labelled Lock, Unlock, and Panic allow the user to choose the function that is desired. The RKE transmitter then sends the appropriate Radio Frequency (RF) signal. An RF receiver that is integral to the high-line or premium version of the Central Timer Module (CTM) receives the transmitted signal, then uses its internal electronic programming to determine whether the received signal is valid and what function has been requested. If the signal is valid, the CTM provides the programmed features.

Besides operating the power lock system and arming or disarming the VTSS, the RKE system also controls the following features:

- **Horn Chirp** - If this feature is enabled, the CTM provides a horn chirp by internally pulling the control coil of the horn relay to ground through a hard wired circuit output.

- **Illuminated Entry** - The CTM provides illuminated entry by internally controlling the current flow to the courtesy lamps in the vehicle through a hard wired output circuit.

- **Panic Mode** - The CTM provides the horn pulse and headlight flash by internally pulling the control coils of the horn relay and headlamp relay to ground through hard wired circuit outputs. The CTM controls the current flow to the courtesy lamps in the vehicle through a hard wired output circuit. The CTM also monitors the vehicle speed through electronic messages it receives from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus network.

The RKE system operates on battery current received through a fused B(+) circuit from a fuse in the Junction Block (JB) so that the system remains functional, regardless of the ignition switch position. The RKE system can retain the vehicle access codes of up to four RKE transmitters. The transmitter codes are retained in RKE system memory, even if the battery is disconnected. If a transmitter is faulty or is lost, new transmitter vehicle access codes can be programmed into the system using a DRBIII® scan tool. Refer to the appropriate diagnostic information. Many of the electronic features in the vehicle controlled or supported by the high-line or premium versions of the CTM are programmable using the DRBIII® scan tool. In addition, the high-line/premium CTM software is Flash compatible, which

means it can be reprogrammed using Flash reprogramming procedures. However, if any of the CTM hardware components are damaged or faulty, the entire CTM unit must be replaced. The hard wired inputs or outputs of the CTM can be diagnosed using conventional diagnostic tools and methods; however, for diagnosis of the high-line or premium versions of the CTM or the CCD data bus, the use of a DRBIII® scan tool is required. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCKS

The following tests provide a preliminary diagnosis for the power lock system used **only** on vehicles equipped with a base version of the Central Timer Module (CTM). These tests **do not** apply to the diagnosis of the power lock system used on vehicles equipped with the optional Remote Keyless Entry (RKE) system, which includes a high-line or premium CTM. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING - POWER LOCK & REMOTE KEYLESS ENTRY SYSTEM). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY TESTS

To begin this test, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches. Then, proceed as follows:

- If the entire power lock system fails to function with both of the power lock switches, check the fused B(+) fuse in the Junction Block (JB). If the fuse is OK, check the ground circuit between the driver side power lock switch and ground (G301). If the ground circuit is OK, proceed to the diagnosis of the power lock motors. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK MOTOR - DIAGNOSIS AND TESTING).

- If the entire power lock system fails to function with only one of the power lock switches, proceed to diagnosis of the power lock switches. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK SWITCH - DIAGNOSIS AND TESTING).

- If only one power lock motor fails to operate with both power lock switches, proceed to diagnosis of the power lock motor. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK MOTOR - DIAGNOSIS AND TESTING).

POWER LOCKS (Continued)

DIAGNOSIS AND TESTING - POWER LOCK & REMOTE KEYLESS ENTRY SYSTEM

The following tests include a preliminary diagnosis for the power lock system used **only** on vehicles equipped with the optional Remote Keyless Entry (RKE) system, which includes a high-line or premium Central Timer Module (CTM). These tests **do not** apply to the diagnosis of the power lock system on vehicles equipped with a base version of the CTM. (Refer to 8 - ELECTRICAL/POWER LOCKS - DIAGNOSIS AND TESTING - POWER LOCK SYSTEM).

These tests will help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock and RKE system, the Chrysler Collision Detection (CCD) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the power lock and RKE system components must be checked.

The most reliable, efficient, and accurate means to diagnose the power lock and RKE system requires the use of a DRBIII® scan tool. The DRBIII® scan tool can provide confirmation that the CCD data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CCD data bus, that the CTM is receiving the proper hard wired inputs, and that the power lock motors are being sent the proper hard wired outputs by the CTM.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY TESTS

To begin this test, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches, the door cylinder lock switches, and the RKE transmitter. Then, proceed as follows:

- If the entire power lock system fails to function with the power lock switches, the door cylinder lock switches, or the RKE transmitter, check the fused B(+) fuse in the Junction Block (JB). If the fuse is OK, proceed to the diagnosis of the power lock motors. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK MOTOR - DIAGNOSIS AND TESTING).

- If the power lock system functions with both power lock switches, and both door cylinder lock switches, but not with the RKE transmitter, proceed to the diagnosis of the transmitter. (Refer to 8 - ELECTRICAL/POWER LOCKS/REMOTE KEYLESS

ENTRY TRANSMITTER - DIAGNOSIS AND TESTING).

- If the entire power lock system functions with the RKE transmitter, and both door cylinder lock switches, but not with one or both of the power lock switches, proceed to diagnosis of the power lock switches. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK SWITCH - DIAGNOSIS AND TESTING).

- If the entire power lock system functions with the RKE transmitter, and both power lock switches, but not with one or both of the door cylinder lock switches, proceed to diagnosis of the door cylinder lock switches. (Refer to 8 - ELECTRICAL/POWER LOCKS/DOOR CYLINDER LOCK SWITCH - DIAGNOSIS AND TESTING).

- If one power lock motor fails to operate with both of the power lock switches, both of the door cylinder lock switches and/or the RKE transmitter, proceed to diagnosis of the power lock motor. (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK MOTOR - DIAGNOSIS AND TESTING).

If the problem being diagnosed is related to one or more of the electronic features (automatic locks, door lock inhibit, enhanced accident response, illuminated entry, panic mode, or RKE horn chirp), further diagnosis should be performed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

DOOR CYLINDER LOCK SWITCH**DESCRIPTION**

A door cylinder lock switch is snapped onto the back of the key lock cylinder inside each front door of vehicles equipped with a high-line or premium Central Timer Module (CTM). The door cylinder lock switch is a resistor multiplexed momentary switch that is hard wired in series between a body ground and the CTM through the front door wire harness. The door cylinder lock switches are driven by the key lock cylinders and contain three internal resistors. One resistor is used for the neutral switch position, one for the Lock position, and one for the Unlock position.

The door cylinder lock switches cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

OPERATION

The door cylinder lock switches are actuated by the key lock cylinder when the key is inserted in the lock cylinder and turned to the lock or unlock positions. The door cylinder lock switch closes a path to ground through one of three internal resistors for the Cen-

DOOR CYLINDER LOCK SWITCH (Continued)

tral Timer Module (CTM) when the front door key lock cylinder is in the Lock, Unlock, or Neutral positions. The CTM reads the switch status through an internal pull-up, then uses this information as an input for both power lock system and Vehicle Theft Security System (VTSS) operation.

The door cylinder lock switches and circuits can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - DOOR CYLINDER LOCK SWITCH

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect the door cylinder lock switch pigtail wire connector from the door wire harness connector.

(2) Using an ohmmeter, perform the switch resistance checks between the two cavities of the door cylinder lock switch pigtail wire connector. Actuate the switch by rotating the key in the door lock cylinder to test for the proper resistance values in each of the three switch positions, as shown in the Door Cylinder Lock Switch chart.

DOOR CYLINDER LOCK SWITCH		
Switch Position		Resistance
Driver Side	Passenger Side	
Neutral	Neutral	12 Kilohms
Lock (Clockwise)	Lock (Counter Clockwise)	644 Ohms
Unlock (Counter Clockwise)	Unlock (Clockwise)	1565 Ohms

(3) If a door cylinder lock switch fails any of the resistance tests, replace the faulty switch as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the door outside latch handle mounting hardware and linkage from the inside of the door. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL).

(3) From the outside of the door, pull the door outside latch handle out from the door far enough to access the door cylinder lock switch (Fig. 1).

(4) Disengage the door cylinder lock switch from the back of the lock cylinder.

80a98216

Fig. 1 Door Cylinder Lock Switch - Typical

- 1 - DOOR OUTSIDE LATCH HANDLE
- 2 - DOOR
- 3 - DOOR CYLINDER LOCK SWITCH
- 4 - CONNECTOR
- 5 - RETAINERS

(5) Disconnect the door cylinder lock switch pigtail wire connector from the door wire harness connector.

(6) Disengage the retainers that secure the door cylinder lock switch pigtail wire harness to the inner door panel.

(7) Remove the door cylinder lock switch from the door.

INSTALLATION

(1) Position the door cylinder lock switch into the door (Fig. 1).

(2) Engage the retainers that secure the door cylinder lock switch pigtail wire harness to the inner door panel.

(3) Reconnect the door cylinder lock switch pigtail wire connector to the door wire harness connector.

(4) Reinstall the door cylinder lock switch onto the back of the lock cylinder.

(5) Reinstall the door outside latch handle mounting hardware and linkage on the inside of the door. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION).

(6) Reconnect the battery negative cable.

POWER LOCK MOTOR

DESCRIPTION

Models equipped with the optional power lock system have a power operated door locking mechanism located within each front door. The lock mechanisms are actuated by a reversible electric power lock motor that is integral to the door latch unit within each front door. A single short pigtail wire with a molded plastic connector insulator connects the door lock motor to the vehicle electrical system through a take out and connector of each front door wire harness.

The power lock motors cannot be adjusted or repaired and, if faulty or damaged, the entire door latch unit must be replaced.

OPERATION

On models with a base version of the Central Timer Module (CTM), the power lock motor is controlled by the battery and ground feeds from the power lock switches. On models with the high-line or premium versions of the CTM, the power lock motor is controlled by the battery and ground feeds from the power lock and unlock relays, which are integral and internal to the high-line and premium versions of the CTM. A positive and negative battery connection to the two motor terminals will cause the power lock motor plunger to move in one direction. Reversing the current through these same two connections will cause the power lock motor plunger to move in the opposite direction.

The power lock motors and circuits can be tested using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - POWER LOCK MOTOR

On models with a base version of the Central Timer Module (CTM), confirm proper power lock switch operation before you proceed with this diagnosis. On models with a high-line or premium version of the CTM, confirm proper power lock switch, power lock switch output circuit, and CTM operation before you proceed with this diagnosis. Remember, the power lock switch controls the output to the power lock motors on models with a base CTM, while the CTM controls the output to the power lock motors on models with a high-line or premium CTM. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Check each power lock motor for correct operation while moving the power lock switch to both the

Lock and Unlock positions. If both of the power lock motors are inoperative, go to Step 2. If one power lock motor is inoperative, go to Step 3.

(2) If both of the power lock motors are inoperative, the problem may be caused by one shorted motor. Disconnecting a shorted power lock motor from the power lock circuit will allow the good power lock motors to operate. Disconnect the wire harness connector from each power lock motor, one at a time, and recheck both the lock and unlock functions by operating the power lock switch. If both power lock motors are still inoperative after the above test, check for a short or open circuit between the power lock motors and either the power lock switch (base CTM) or the CTM (high-line or premium CTM). If disconnecting one power lock motor causes the other motor to become functional, go to Step 3 to test the disconnected motor.

(3) Once it is determined which power lock motor is inoperative, that motor can be tested as follows. Disconnect the door wire harness connector from the inoperative power lock motor. Apply 12 volts to the lock and unlock driver circuit cavities of the power lock motor pigtail wire connector to check its operation in one direction. Reverse the polarity to check the motor operation in the opposite direction. If OK, repair the shorted or open circuits between the power lock motor and the power lock switch (base CTM) or the CTM (high-line or premium CTM) as required. If not OK, replace the faulty power lock motor.

REMOTE KEYLESS ENTRY TRANSMITTER

DESCRIPTION

The Remote Keyless Entry (RKE) system Radio Frequency (RF) transmitter is equipped with three buttons, labeled Lock, Unlock, and Panic. It is also equipped with a key ring and is designed to serve as a key fob. The operating range of the transmitter radio signal is up to 7 meters (23 feet) from the RKE receiver. The RKE receiver is integral to the high-line or premium Central Timer Module (CTM) in this vehicle.

Each RKE transmitter has a different vehicle access code, which must be programmed into the memory of the RKE receiver in the vehicle in order to operate the RKE system. The RKE receiver can retain the access codes for up to four transmitters in its memory. (Refer to 8 - ELECTRICAL/POWER LOCKS/REMOTE KEYLESS ENTRY TRANSMITTER - STANDARD PROCEDURE - RKE TRANSMITTER PROGRAMMING).

REMOTE KEYLESS ENTRY TRANSMITTER (Continued)

The RKE transmitter operates on two Duracell DL2016, Panasonic CR2016 (or equivalent) batteries. Typical battery life is from one to two years. The RKE transmitter cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the Remote Keyless Entry (RKE) transmitters.

DIAGNOSIS AND TESTING - REMOTE KEYLESS ENTRY TRANSMITTER

(1) Replace the Remote Keyless Entry (RKE) transmitter batteries. (Refer to 8 - ELECTRICAL/POWER LOCKS/REMOTE KEYLESS ENTRY TRANSMITTER - STANDARD PROCEDURE - RKE TRANSMITTER BATTERIES). Test each of the RKE transmitter functions. If OK, discard the faulty batteries. If not OK, go to Step 2.

(2) Program the suspect RKE transmitter and another known good transmitter into the RKE receiver. (Refer to 8 - ELECTRICAL/POWER LOCKS/REMOTE KEYLESS ENTRY TRANSMITTER - STANDARD PROCEDURE - RKE TRANSMITTER PROGRAMMING).

(3) Test the RKE system operation with both transmitters. If both transmitters fail to operate the power lock system, a DRBIII® scan tool is required for further diagnosis of the RKE system. Refer to the appropriate diagnostic information. If the known good RKE transmitter operates the power locks and the suspect transmitter does not, replace the faulty RKE transmitter.

NOTE: Be certain to perform the RKE Transmitter Programming procedure again following this test. This procedure will erase the access code of the test transmitter from the RKE receiver.

STANDARD PROCEDURE**STANDARD PROCEDURE - RKE TRANSMITTER PROGRAMMING**

To program the Remote Keyless Entry (RKE) transmitter access codes into the RKE receiver in the high-line or premium Central Timer Module (CTM) requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE - REMOTE KEYLESS ENTRY TRANSMITTER BATTERIES

The Remote Keyless Entry (RKE) transmitter case snaps open and shut for battery access. To replace the RKE transmitter batteries:

(1) Using a trim stick or a thin coin, gently pry at the notch in the center seam of the RKE transmitter case halves located near the key ring until the two halves unsnap.

(2) Lift the back half of the transmitter case off of the RKE transmitter.

(3) Remove the two batteries from the RKE transmitter.

(4) Replace the two batteries with new Duracell DL2016, or their equivalent. Be certain that the batteries are installed with their polarity correctly oriented.

(5) Align the two RKE transmitter case halves with each other, and squeeze them firmly and evenly together using hand pressure until they snap back into place.

POWER LOCK SWITCH**DESCRIPTION**

The power lock system can be controlled by a two-way momentary switch integral to the power window and lock switch and bezel unit on the trim panel of each front door. Each power lock switch is illuminated by a Light-Emitting Diode (LED) that is integral to the switch paddle. The LED of each switch is illuminated whenever the ignition switch is in the On position.

The power lock switches and their LEDs cannot be adjusted or repaired and, if faulty or damaged, the entire power window and lock switch and bezel unit must be replaced.

OPERATION

On models with a base version of the Central Timer Module (CTM), the power lock switches are hard-wired to the power lock motors. The power lock switch provides the correct battery and ground feeds to the power lock motors to lock or unlock the door latches.

On models with a high-line or premium version of the CTM, the power lock switch controls battery current signals to the lock and unlock sense inputs of the CTM. The CTM then relays the correct battery and ground feeds to the power lock motors to lock or unlock the door latches.

POWER LOCK SWITCH (Continued)

DIAGNOSIS AND TESTING - POWER LOCK SWITCH

The Light-Emitting Diode (LED) illumination lamps for all of the power window and lock switch and bezel unit switch paddles receive battery current through the power window circuit breaker in the Junction Block (JB). If all of the LEDs are inoperative in either or both power window and lock switch and bezel units, be certain to diagnose the power window system before replacing the switch unit. (Refer to 8 - ELECTRICAL/POWER WINDOWS - DIAGNOSIS AND TESTING). If only one LED in a power window and lock switch and bezel unit is inoperative, replace the faulty switch and bezel unit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Check the fused B(+) fuse (Fuse 13 - 10 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse (Fuse 13 - 10 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit between the JB and the Power Distribution Center (PDC) as required.

(3) Disconnect and isolate the battery negative cable. Remove the power window and lock switch and bezel unit from the door trim panel. Disconnect the door wire harness connector for the power window and lock switch unit from the switch connector receptacle.

(4) Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the door wire harness connector for the power window and lock switch unit. If OK, go to Step 5. If not OK, repair the open fused B(+) circuit between the power window and lock switch unit and the JB as required.

(5) Test the power lock switch continuity. See the Power Lock Switch Continuity charts to determine if the continuity is correct in the Neutral, Lock, and Unlock switch positions (Fig. 2) or (Fig. 3). If OK, repair the door lock switch output (lock and/or unlock) circuit(s) between the power window and lock switch unit and the power lock motors (base Central Timer Module [CTM]) or the CTM (high-line or premium CTM) as required. If not OK, replace the faulty power window and lock switch and bezel unit.

POWER MIRRORS

DESCRIPTION

AUTOMATIC DAY / NIGHT MIRROR

The automatic day/night mirror system is able to automatically change the reflectance of the inside rear view mirror in order to reduce the glare of headlamps approaching the vehicle from the rear. The automatic day/night rear view mirror receives battery current through a fuse in the junction block only when the ignition switch is in the On position.

OUTSIDE REAR VIEW MIRROR

The heated mirror option includes an electric heating grid behind the mirror glass in each outside mirror, which can clear the mirror glass of ice, snow, or fog. The heating grid receives fused battery current through the heated mirror relay in the heater and air conditioner control only when the ignition switch is in the On position, and the heated mirror system is turned on. (Refer to 8 - ELECTRICAL/HEATED MIRRORS - DESCRIPTION) for more information.

Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the power mirror system.

OPERATION

AUTOMATIC DAY / NIGHT MIRROR

A switch located on the bottom of the automatic day/night mirror housing allows the vehicle operator to select whether the automatic dimming feature is operational. When the automatic day/night mirror is

turned on, the mirror switch is lighted by an integral Light-Emitting Diode (LED). The mirror will automatically disable its self-dimming feature whenever the vehicle is being driven in reverse.

Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the automatic day/night mirror system.

OUTSIDE REAR VIEW MIRROR

The heated mirror option includes an electric heating grid behind the mirror glass in each outside mirror, which can clear the mirror glass of ice, snow, or fog. The heating grid receives fused battery current through the heated mirror relay in the heater and air conditioner control only when the ignition switch is in the On position, and the heated mirror system is turned on. (Refer to 8 - ELECTRICAL/HEATED MIRRORS - OPERATION) for more information.

Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the power mirror system.

AUTOMATIC DAY / NIGHT MIRROR

DESCRIPTION

The automatic day/night mirror uses a thin layer of electrochromic material between two pieces of conductive glass to make up the face of the mirror. When the mirror switch is in the On position, two photocell sensors are used by the mirror circuitry to monitor external light levels and adjust the reflectance of the mirror.

AUTOMATIC DAY / NIGHT MIRROR (Continued)

OPERATION

The ambient photocell sensor is located on the forward-facing (windshield side) of the rear view mirror housing, and detects the ambient light levels outside of the vehicle. The headlamp photocell sensor is located inside the rear view mirror housing behind the mirror glass and faces rearward, to detect the level of the light being received at the rear window side of the mirror. When the circuitry of the automatic day/night mirror detects that the difference between the two light levels is too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), it begins to darken the mirror.

The automatic day/night mirror circuitry also monitors the transmission using an input from the backup lamp circuit. The mirror circuitry is programmed to automatically disable its self-dimming feature whenever it senses that the transmission backup lamp circuit is energized.

The automatic day/night mirror is a completely self-contained unit and cannot be repaired. If faulty or damaged, the entire mirror assembly must be replaced.

DIAGNOSIS AND TESTING - AUTOMATIC DAY/NIGHT MIRROR

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Check the fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fuse in the junction block. If OK, go to Step 3. If not OK, repair the open circuit to the ignition switch as required.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror (Fig. 1). Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the junction block as required.

(4) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity

Fig. 1 Automatic Day/Night Mirror

ity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the circuit to ground as required.

(5) Connect the battery negative cable. Turn the ignition switch to the On position. Set the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 6. If not OK, repair the open circuit as required.

(6) Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic day/night mirror wire harness connector. Connect the battery negative cable. Turn the ignition switch to the On position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the On (LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

NOTE: The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.

(7) Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, go to Step 8. If not OK, replace the faulty automatic day/night mirror unit.

(8) With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror unit.

AUTOMATIC DAY / NIGHT MIRROR (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the automatic day/night mirror (Fig. 2).

80b1b318

Fig. 2 AUTOMATIC DAY/NIGHT MIRROR REMOVE

- 1 - SCREW
- 2 - WIRE HARNESS CONNECTOR
- 3 - AUTOMATIC DAY/NIGHT MIRROR
- 4 - SUPPORT BUTTON

(3) Remove the set screw that secures the automatic day/night mirror to the windshield support button.

(4) Push the automatic day/night mirror upwards far enough for the mounting bracket to clear the support button and remove the mirror from the windshield.

INSTALLATION

- (1) Install the mirror to the support button.
- (2) Tighten the set screw.
- (3) Reconnect the harness connector to the mirror.
- (4) Reconnect the negative battery cable.

POWER MIRROR SWITCH**DESCRIPTION**

Both the right and left power outside mirrors are controlled by a single multi-function switch unit located on and mounted to the upper flag area of the driver side door trim panel.

OPERATION

The switch knob is rotated clockwise (right mirror control), or counterclockwise (left mirror control) to

select the mirror to be adjusted. The switch knob is then moved in a joystick fashion to control movement of the selected mirror up, down, right, or left.

The power mirror switch cannot be repaired and, if faulty or damaged, it must be replaced. The power mirror switch knob is available for service replacement.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the control knob rearward to remove it from the power mirror switch stem (Fig. 3).

80b1b301

Fig. 3 POWER MIRROR SWITCH REMOVE/INSTALL

- 1 - DOOR
- 2 - SWITCH
- 3 - DOOR TRIM PANEL
- 4 - KNOB
- 5 - NUT

(3) Remove the nut that secures the power mirror switch to the driver side front door trim panel.

(4) Remove the trim panel from the inside of the driver side front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL) for the procedures.

(5) Pull the trim panel away from the inner door far enough to access the power mirror switch wire harness connector.

(6) Unplug the power mirror switch wire harness connector.

(7) Remove the power mirror switch from the back of the door trim panel.

POWER MIRROR SWITCH (Continued)

INSTALLATION

- (1) Insert the power mirror switch to the back of the door trim panel.
- (2) Connect the power mirror switch to the harness connector.
- (3) Install the trim panel to the inside of the driver side door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
- (4) Install the nut that secures the power mirror switch to the driver side front door.
- (5) Push the control knob on to the power mirror switch.
- (6) Connect the battery negative cable.

SIDEVIEW MIRROR

DESCRIPTION

Each power mirror head contains two electric motors, two drive mechanisms, and the mirror glass. One motor and drive controls mirror up-and-down movement, and the other controls right-and-left movement.

OPERATION

The power mirrors in vehicles equipped with the available heated mirror system option also include an electric heating grid located behind the mirror glass. This heating grid is energized by the heated mirror relay in the heater and air conditioner control only when the ignition switch is in the On position, and the heated mirror system is turned on. (Refer to 8 - ELECTRICAL/HEATED MIRRORS - DESCRIPTION) for more information.

The power mirror assembly cannot be repaired. If any component of the power mirror unit is faulty or damaged, the entire assembly must be replaced.

DIAGNOSIS AND TESTING - SIDEVIEW MIRROR

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

- (1) Check the fuses in the Power Distribution Center (PDC) and the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).

- (2) Check for battery voltage at the fuse in the junction block. If OK, go to Step 3. If not OK, repair the open circuit to the PDC as required.
- (3) Disconnect and isolate the battery negative cable. Remove the driver side door trim panel and unplug the wire harness connector from the power mirror switch. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity in the door wire harness half of the power mirror switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the junction block as required.
- (4) Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity in the door wire harness half of the power mirror switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the circuit to ground as required.
- (5) Check the power mirror switch continuity as shown in (Fig. 4). If OK, go to Step 6. If not OK, replace the faulty switch.

DOWN	Pins 6 and 7, 1 and 8, 4 and 8
LEFT	Pins 6 and 8, 2 and 7, 5 and 7

SIDEVIEW MIRROR (Continued)

(6) Unplug the wire harness connector at the inoperative power mirror. Use two jumper wires, one connected to a 12-volt battery feed, and the other connected to a good body ground. See the Power Mirror Test chart for the correct jumper wire connections to the power mirror half of the power mirror wire harness connector (Fig. 5). If the power mirror(s) do not respond as indicated in the chart, replace the faulty power mirror assembly. If the power mirror(s) do respond as indicated in the chart, repair the circuits between the power mirror and the power mirror switch for a short or open as required.

REMOVAL

For removal procedures (Refer to 23 - BODY/EXTERIOR/SIDE VIEW MIRROR - REMOVAL).

POWER SEAT SYSTEM

DESCRIPTION

The power seat system option allows the driver (or passenger on SLT Plus with power seats) to electrically adjust the seat position for optimum control and comfort using the power seat switches located on the outboard seat cushion side shield. The power seat system allows the seating position to be adjusted forward, rearward, front up, front down, rear up, or rear down. The power seat system receives battery current through a fuse in the Power Distribution Center and a circuit breaker in the junction block, regardless of the ignition switch position.

The quad cab models equipped with the power seat option also feature a power operated lumbar support in the seat back. The power lumbar support allows the user to inflate or deflate a bladder located in the lower seat back to achieve optimum comfort and support in the lower lumbar region of the spinal column. The power lumbar support shares the battery feed circuit of the power seat system.

The power seat system includes the power seat adjuster and motors unit, the power lumbar support bladder and electric pump (quad cab only), the power seat switch, and the circuit breaker. Following are general descriptions of the major components in the power seat system. Refer to **Heated Seat System**

for information on the individually controlled heated front seats. Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the power seat system.

OPERATION

The power seat system allows the driver and/or front passenger seating positions to be adjusted electrically and independently using the separate power seat switches found on the outboard seat cushion side shield of each front seat. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the power seat system.

DIAGNOSIS AND TESTING - POWER SEAT SYSTEM

Before any testing of the power seat system is attempted, the battery should be fully-charged and all wire harness connections and pins cleaned and tightened to ensure proper continuity and grounds. For circuit descriptions and diagrams, refer to Wiring Diagrams.

With the dome lamp on, apply the power seat switch in the direction of the failure. If the dome lamp dims, the seat may be jamming. Check under and behind the seat for binding or obstructions. If the dome lamp does not dim, proceed with testing of the individual components and circuits.

DRIVER POWER SEAT SWITCH

DESCRIPTION

Fig. 1 Power Seat Switch - Standard Cab

1 - SEAT SWITCH BEZEL

The power seat in standard cab models can be adjusted in eight different directions, up, down, front up, front down, rear up, rear down, rearward and forward. The power seat switch for quad cab models has an additional switch knob for adjusting the power lumbar support. The switch is located on the lower outboard side of the seat cushion on the seat cushion side shield (Fig. 1) on all models. Refer to the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

The individual switches in the power seat switch module cannot be repaired. If one switch is damaged or faulty, the entire power seat switch module must be replaced.

OPERATION

When a power switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged.

DIAGNOSIS AND TESTING - DRIVER POWER SEAT SWITCH

The following procedure can be used to test the power seat switch on standard and quad cab models. Some quad cab trucks utilize a additional power lumbar option, if the switch being tested does not have the lumbar option simply ignore the lumbar portion of the test. For circuit descriptions and diagrams, refer to Wiring Diagrams.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the power seat switch from the power seat.
- (3) Use an ohmmeter to test the continuity of the power seat switches in each position. See the Power Seat Switch Continuity chart (Fig. 2). If OK, see Power Seat Adjuster and Motors or Power Lumbar Adjuster and Motor in the Diagnosis and Testing section of this group. If not OK, replace the faulty power seat switch unit.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Standard cab models, remove the two screws that secure the power seat switch and bezel unit to the seat cushion frame.

(3) Quad cab models, remove the seat cushion side shield from the seat. Refer to Body for the procedure.

(4) Pull the switch bezel or side shield unit out from the seat far enough to access the switch wire harness connector. Gently pry the locking tabs of the switch away from the wire harness connector and carefully unplug the connector from the power seat switch module (Fig. 3).

80abd26d

Fig. 4 Power Seat Switch Remove/Install - Quad Cab

- 1 - SEAT SIDE SHIELD
- 2 - POWER SEAT SWITCH
- 3 - SCREWS

INSTALLATION

(1) Position the power seat switch on the seat cushion side shield and connect the electrical connector.

(2) Install the screws that secure the power seat switch to seat cushion side shield.

(3) Install the seat cushion side shield on the seat. Refer to Body for the procedure.

(4) If equipped, install the recliner lever on the recliner mechanism release shaft.

(5) If equipped, install the screw that secures the recliner lever to the recliner mechanism release shaft on the outboard side of the front seat.

(6) Connect the battery negative cable.

LUMBAR CONTROL SWITCH

DESCRIPTION

The power lumbar seat option includes an electrically operated lumbar support mechanism. A single two-way momentary power lumbar switch is integral with the power seat switches. The power lumbar switch is secured to the back of the seat cushion side shield with screws, and the switch paddle protrudes through a hole to the outside of the shield. The switch paddle is located in a shallow depression molded into the outer surface of the seat cushion side shield that helps to shroud it from unintentional actuation when entering or leaving the vehicle.

The power lumbar switches cannot be adjusted or repaired and, if faulty or damaged, the seat switch assembly must be replaced.

LUMBAR CONTROL SWITCH (Continued)

OPERATION

When the power lumbar switch paddle is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar adjuster motor. The motor operates to move the lumbar adjuster through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the motor to run in the opposite direction.

The power lumbar switch should not be held applied in either direction after the adjuster has reached its travel limit. The power lumbar adjuster motor contains a self-resetting circuit breaker to protect it from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged.

REMOVAL

The power lumbar switch is integral with the other power seat switches. Refer to the appropriate driver or passenger power front seat switch removal and/or installation procedure.

LUMBAR MOTOR**DESCRIPTION**

The power lumbar seat option includes an electrically operated lumbar support mechanism. The only visible evidence of this option is the separate power lumbar switch control paddle that is located on the outboard seat cushion side shield, next to the other power seat switch control knobs. The power lumbar adjuster and motor are concealed beneath the seat back trim cover and padding, where they are secured to a molded plastic back panel and to the seat back frame.

The power lumbar adjuster cannot be repaired, and is serviced only as a unit with the seat back frame. If the power lumbar adjuster or the seat back frame are damaged or faulty, the entire seat back frame unit must be replaced (Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).

OPERATION

The power lumbar adjuster mechanism includes a reversible electric motor that is secured to the inboard side of the seat back panel and is connected to a worm-drive gearbox. The motor and gearbox operate the lumbar adjuster mechanism in the center of the seat back by extending and retracting a cable that actuates a lever. The action of this lever compresses or relaxes a grid of flexible slats. The more

this grid is compressed, the more the slats bow outward against the center of the seat back padding, providing additional lumbar support.

DIAGNOSIS AND TESTING - LUMBAR MOTOR

Actuate the power lumbar switch to move the power lumbar adjuster in each direction. The power lumbar adjuster should move in both directions. It should be noted that the power lumbar adjuster normally operates very quietly and exhibits little visible movement. If the power lumbar adjuster fails to operate in only one direction, move the adjuster a short distance in the opposite direction and test again to be certain that the adjuster is not at its travel limit. If the power lumbar adjuster still fails to operate in only one direction, (Refer to 8 - ELECTRICAL/POWER SEATS/DRIVER SEAT SWITCH - DIAGNOSIS AND TESTING). If the power lumbar adjuster fails to operate in either direction, perform the following tests. For complete circuit diagrams, refer to **Wiring Diagrams**.

(1) Check the power seat circuit breaker in the junction block. If OK, go to Step 2. If not OK, replace the faulty power seat circuit breaker.

(2) Check for battery voltage at the power seat circuit breaker in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the fuse in the Power Distribution Center as required.

(3) Remove the outboard seat cushion side shield from the seat. Disconnect the seat wire harness connector from the power lumbar switch connector receptacle. Check for battery voltage at the fused B(+) circuit cavity of the power seat wire harness connector for the power lumbar switch. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the power seat circuit breaker in the junction block as required.

(4) Check for continuity between the ground circuit cavity of the power seat wire harness connector for the power lumbar switch and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open ground circuit to ground as required.

(5) Test the power lumbar switch. . If the switch tests OK, test the circuits of the power seat wire harness between the power lumbar adjuster motor and the power lumbar switch for shorts or opens. If the circuits check OK, replace the faulty seat back frame assembly. If the circuits are not OK, repair the power seat wire harness as required.

PASSENGER POWER SEAT SWITCH

DESCRIPTION

Fig. 5 Power Seat Switch - Standard Cab

1 - SEAT SWITCH BEZEL

The power seat in standard cab models can be adjusted in eight different directions, up, down, front up, front down, rear up, rear down, rearward and forward. The power seat switch for quad cab models has an additional switch knob for adjusting the power lumbar support. The switch is located on the lower outboard side of the seat cushion on the seat cushion side shield (Fig. 5) on all models. Refer to the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

The individual switches in the power seat switch module cannot be repaired. If one switch is damaged or faulty, the entire power seat switch module must be replaced.

OPERATION

When a power switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged.

DIAGNOSIS AND TESTING - PASSENGER POWER SEAT SWITCH

The following procedure can be used to test the power seat switch on standard and quad cab models. Some quad cab trucks utilize a additional power lumbar option, if the switch being tested does not have the lumbar option simply ignore the lumbar portion of the test. For circuit descriptions and diagrams, refer to Wiring Diagrams.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the power seat switch from the power seat.
- (3) Use an ohmmeter to test the continuity of the power seat switches in each position. See the Power Seat Switch Continuity chart below (Fig. 6). If OK, see Power Seat Adjuster and Motors or Power Lumbar Adjuster and Motor in the Diagnosis and Testing section of this group. If not OK, replace the faulty power seat switch unit.

- (5) Remove the screws that secure the power seat switch (Fig. 8).

Fig. 8 Power Seat Switch Remove/Install - Quad Cab

- 1 - SEAT SIDE SHIELD
- 2 - POWER SEAT SWITCH
- 3 - SCREWS

INSTALLATION

- (1) Position the power seat switch on the seat cushion side shield and connect the electrical connector.
- (2) Install the screws that secure the power seat switch to seat cushion side shield.
- (3) Install the seat cushion side shield on the seat. Refer to Body for the procedure.
- (4) If equipped, install the recliner lever on the recliner mechanism release shaft.
- (5) If equipped, install the screw that secures the recliner lever to the recliner mechanism release shaft on the outboard side of the front seat.
- (6) Connect the battery negative cable.

POWER SEAT TRACK

DESCRIPTION

There are three reversible motors that operate the power seat adjuster. The motors are connected to worm-drive gearboxes that move the seat adjuster through a combination of screw-type drive units.

The front and rear of a seat are operated by different motors. They can be raised or lowered independently of each other. When the center seat switch is pushed in the Up or Down direction, both the front and rear motors operate in unison. On standard cab models the entire seat is moved up or down, on quad cab models the seat cushion moves independently of the seat back in the up or down directions. The forward-rearward motor is operated by pushing the center seat switch in the Forward or Rearward direction, which moves the entire seat in the selected direction on all models.

POWER SEAT TRACK (Continued)

Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers must not be allowed to continue, or the motors may be damaged.

The power seat adjuster and motors cannot be repaired, and are serviced only as a complete unit. If any component in this unit is faulty or damaged, the entire power seat adjuster and motors assembly must be replaced.

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the power seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction.

DIAGNOSIS AND TESTING - POWER SEAT TRACK

For complete power seat circuit descriptions and diagrams, refer to Wiring Diagrams.

Operate the power seat switch to move all three seat motors in each direction. The seat should move in each of the selected directions. If the power seat track fails to operate in only one direction, move the seat track a short distance in the opposite direction and test again to be certain that the track is not at its travel limit. If the power seat track still fails to operate in only one direction, refer to Diagnosis and Testing of the Power Seat Switch in this section. If the power seat track fails to operate in more than one direction, proceed as follows:

(1) Check the power seat fuse in the power distribution center. If OK, go to Step 2. If not OK, replace the faulty fuse.

(2) Remove the power seat switch from the seat. Check for battery voltage at the fused B(+) circuit cavity of the power seat switch wire harness connector. If OK, go to Step 3. If not OK, repair the open circuit to the power distribution center as required.

(3) Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 4. If not OK, repair the open circuit to ground as required.

(4) Test the power seat switch as described in this group. If the switch tests OK, check the wire harness between the power seat switch and the motor for shorts or opens. If the circuits check OK, replace the faulty power seat track (adjuster) assembly. If the circuits are not OK, repair the wire harness as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the seat, power seat track from the vehicle as a unit (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(3) Unplug the power seat wire harness connectors at each of the three power seat motors.

(4) Release the power seat wire harness retainers from the seat track.

(5) Remove the fasteners that secure the center seat cushion section to the brackets on the power seat track.

(6) Remove the screws that secure the power seat track assembly to the seat cushion frame.

(7) Remove the power seat track assembly from the seat cushion frame.

INSTALLATION

(1) Position the power seat track assembly on the seat cushion frame.

(2) Install the fasteners that secure the center seat cushion section to the brackets on the power seat adjuster.

(3) Install the screws that secure the power seat track assembly to the seat cushion frame.

(4) Connect the power seat wire harness connectors at each of the three power seat motors.

(5) Install the power seat wire harness retainers on the seat track assembly.

(6) Install the seat, power seat track as a unit (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(7) Connect the battery negative cable.

OPERATION	24		
DIAGNOSIS AND TESTING - POWER			
WINDOW SWITCH	24		

POWER WINDOWS

DESCRIPTION

Power windows are available as factory-installed optional equipment on this model. The power lock system is included on vehicles equipped with the power window option.

OPERATION

The power window system allows each of the front door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. Additionally, the master switch on the driver side door trim panel allows the driver to raise or lower the passenger side front door window. The power window system receives battery feed through a circuit breaker in the junction block, only when the ignition switch is in the On position.

The power window system includes the power window switches on each front door trim panel, the circuit breaker in the junction block, and the power window motors inside each front door. This group covers diagnosis and service of only the electrical components in the power window system. For service of mechanical components, such as the regulator, lift plate, window tracks, or glass refer to Group 23 - Body.

Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the power window system.

DIAGNOSIS AND TESTING - POWER WINDOWS

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness

routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

ALL WINDOWS INOPERATIVE

(1) Check the circuit breaker in the junction block. If OK, go to Step 2. If not OK, replace the faulty circuit breaker.

(2) Disconnect and isolate the battery negative cable. Remove the power window and lock switch and bezel unit from the driver side front door trim panel. Unplug the wire harness connector from the switch and bezel unit.

(3) Check for continuity between the ground circuit cavity of the switch and bezel unit wire harness connector and a good ground. If OK, (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - DIAGNOSIS AND TESTING). If not OK, repair the circuit to ground as required.

ONE WINDOW INOPERATIVE

The window glass must be free to slide up and down for the power window motor to function properly. If the glass is not free to move up and down, the motor will overload and trip the integral circuit breaker. To determine if the glass is free, disconnect the regulator plate from the glass. Then slide the window up and down by hand.

There is an alternate method to check if the glass is free. Position the glass between the up and down stops. Then, shake the glass in the door. Check that the glass can be moved slightly from side to side, front to rear, and up and down. Then check that the glass is not bound tight in the tracks. If the glass is free, proceed with the diagnosis that follows. If the glass is not free, (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).

POWER WINDOWS (Continued)

(1) Disconnect and isolate the battery negative cable. Remove the power window and lock switch and bezel unit from the door trim panel on the side of the vehicle with the inoperative window. Unplug the wire harness connector from the switch and bezel unit.

(2) Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity in the body half of the switch and bezel unit wire harness connector. If OK, and the inoperative power window is on the driver side, go to Step 4. If OK, and the inoperative power window is on the passenger side, go to Step 3. If not OK, repair the open circuit to the junction block as required.

(3) Disconnect and isolate the battery negative cable. Check for continuity between each of the two master window switch right up/down control circuit cavities in the body half of the passenger side switch and bezel unit wire harness connector and a good ground. In each case, there should be continuity. If OK, go to Step 4. If not OK, repair the open circuit to the driver side switch and bezel unit as required.

(4) Test the power window switch continuity. (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - DIAGNOSIS AND TESTING). If OK, go to Step 5. If not OK, replace the faulty power window and lock switch and bezel unit.

(5) Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. Check the continuity in each circuit between the inoperative power window and lock switch and bezel unit wire harness connector cavities and the corresponding power window motor wire harness connector cavities. If OK, (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - DIAGNOSIS AND TESTING). If not OK, repair the open circuit(s) as required.

NOTE: The passenger side power window switch receives the ground feed for operating the passenger side power window motor through the driver side power window switch and wire harness connector.

POWER WINDOW SWITCH

DESCRIPTION

The power windows are controlled by two-way switches integral to the power window and lock switch and bezel unit on the trim panel of each front

door. A second power window switch in the driver side switch and bezel unit allows the driver to control the passenger side window. A Light-Emitting Diode (LED) in the paddle of each switch is illuminated whenever the ignition switch is in the On position.

OPERATION

The power window switch for the driver side front door has an Auto label on it. This switch has a second detent position beyond the normal Down position that provides an automatic one-touch window down feature. This feature is controlled by an electronic circuit and a relay that are integral to the driver side front door power window and lock switch unit.

The power window switches control the battery and ground feeds to the power window motors. The passenger side power window switch receives a ground feed through the driver side power window switch for operating the passenger side power window motor.

The power window and lock switch and bezel unit cannot be repaired and, if faulty or damaged, the entire switch and bezel unit must be replaced.

DIAGNOSIS AND TESTING - POWER WINDOW SWITCH

The auto down feature of the driver side power window switch is controlled by an electronic circuit within the switch unit. The auto down circuitry is activated when the driver side power window switch is moved to the second detent in the Down direction. The outputs from the auto down circuitry are carried through the same switch pins that provide the normal down function. The auto down circuit cannot be tested. If the driver side power window switch continuity tests are passed, but the auto down feature is inoperative, replace the faulty driver side power window switch unit.

The Light-Emitting Diode (LED) illumination lamps for all of the power window and lock switch and bezel unit switch paddles receive battery current through the power window circuit breaker in the junction block. If all of the LEDs are inoperative in either or both power window and lock switch and bezel units and the power windows are inoperative, perform the diagnosis for Power Window System in this group. If the power windows operate, but any or all of the LEDs are inoperative, the power window and lock switch and bezel unit with the inoperative LED(s) is faulty and must be replaced. For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location

POWER WINDOW SWITCH (Continued)

views for the various wire harness connectors, splices and grounds.

(1) Check the circuit breaker in the junction block. If OK, go to Step 2. If not OK, replace the faulty circuit breaker.

(2) Turn the ignition switch to the On position. Check for battery voltage at the circuit breaker in the junction block. If OK, turn the ignition switch to the Off position and go to Step 3. If not OK, repair the circuit to the ignition switch as required.

(3) Disconnect and isolate the battery negative cable. Remove the power window and lock switch and bezel unit from the door trim panel. Unplug the wire harness connector from the switch and bezel unit.

(4) Test the power window switch continuity. See the Power Window Switch Continuity charts to determine if the continuity is correct in the Neutral, Up and Down switch positions (Fig. 1) or (Fig. 2). If OK, (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - DIAGNOSIS AND TESTING) If not OK, replace the faulty switch.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Using a wide flat-bladed tool such as a trim stick, gently pry the upper edge of the switch bezel at the front and the rear to release the retainer clips that secure the switch bezel to the door trim panel opening (Fig. 3).

80b1b30e

Fig. 3 Power Window and Lock Switch and Bezel Unit Remove/Install

- 1 - ELECTRICAL CONNECTOR
- 2 - POWER WINDOW/LOCK SWITCH PANEL
- 3 - WIRE HARNESS

(3) Pull the switch and bezel unit away from the door trim panel opening far enough to access and unplug the wire harness connector.

(4) Remove the power window and lock switch and bezel unit from the door trim panel.

POWER WINDOW SWITCH (Continued)

INSTALLATION

- (1) Connect the power window switch to the harness connector.
- (2) Insert the rear of the switch and bezel unit into the opening.
- (3) Push down on the front and rear of the switch until the retaining tabs snap into place.
- (4) Reconnect the battery negative cable.

WINDOW MOTOR**DESCRIPTION**

A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals will cause the motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction.

In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads. The power window motor and gearbox assembly cannot be repaired and, if faulty or damaged, the entire power window regulator assembly must be replaced.

DIAGNOSIS AND TESTING - WINDOW MOTOR

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. Before you proceed with

this diagnosis, confirm proper switch operation. (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - DIAGNOSIS AND TESTING).

- (1) Disconnect and isolate the battery negative cable. Remove the trim panel from the door with the inoperative power window.

- (2) Unplug the power window motor wire harness connector. Apply 12 volts across the motor terminals to check its operation in one direction. Reverse the connections across the motor terminals to check the operation in the other direction. Remember, if the window is in the full up or full down position, the motor will not operate in that direction by design. If OK, repair the circuits from the power window motor to the power window switch as required. If not OK, replace the faulty motor.

- (3) If the motor operates in both directions, check the operation of the window glass and lift mechanism through its complete up and down travel. There should be no binding or sticking of the window glass or lift mechanism through the entire travel range. If not OK, (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL).

REMOVAL

The power window motor and mechanism is integral to the power window regulator unit. If the power window motor or mechanism is faulty or damaged, the entire power window regulator unit must be replaced. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL) for the window regulator service procedures.

RESTRAINTS

DESCRIPTION

A dual front airbag system is standard factory-installed safety equipment on this model. The airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and vehicles with this equipment can be readily identified by the "SRS - AIRBAG" logo molded into the driver airbag trim cover

in the center of the steering wheel and also into the passenger airbag door on the instrument panel above the glove box (Fig. 1). Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the instrument cluster for about seven seconds as a bulb test each time the ignition switch is turned to the On position.

The dual front airbag system consists of the following major components, which are described in further detail elsewhere in this service manual:

RESTRAINTS (Continued)

8098029e

Fig. 1 SRS Logo

- **Airbag Control Module** - The Airbag Control Module (ACM) is located in a stamped mounting bracket on the floor panel transmission tunnel, below the center of the instrument panel.

- **Airbag Indicator** - The airbag indicator is integral to the ElectroMechanical Instrument Cluster (EMIC), which is located on the instrument panel in front of the driver.

- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.

- **Driver Airbag** - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.

- **Driver Knee Blocker** - The driver knee blocker is a molded plastic structural unit secured to the back side of and integral to the instrument panel steering column opening cover.

- **Passenger Airbag** - The passenger airbag is located on the instrument panel, beneath the passenger airbag door on the instrument panel above the glove box on the passenger side of the vehicle.

- **Passenger Airbag On/Off Switch** - The passenger airbag on/off switch is located in a dedicated opening in the upper right corner of the instrument panel cluster bezel, to the right of the center panel outlets of the climate control system.

- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.

The ACM and the EMIC each contain a central processing unit and programming that allow them to communicate with each other using the Chrysler Collision Detection (CCD) data bus network. This method of communication is used for control of the airbag indicator on all models. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION).

Hard wired circuitry connects the airbag system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the airbag system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The airbag system is referred to as a supplemental restraint system because it was designed and is intended to enhance the protection for the front seat occupants of the vehicle **only** when used in conjunction with the seat belts. It is referred to as a passive system because the vehicle occupants are not required to do anything to make it work. The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts. Seat belts are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them. The vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed airbag system.

The airbag system electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Airbag Control Module (ACM). An airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) lights for about seven seconds as a bulb test each time the ignition switch is turned to the On or Start positions. Following the bulb test, the airbag indicator is turned on or off by the ACM to indicate the status of the airbag system. If the airbag indicator comes on at any time other than during the bulb test, it indicates that there is a problem in the airbag system electrical circuits. Such a problem may cause the airbags not to deploy when required, or to deploy when not required.

The clockspring on the top of the steering column allows a continuous electrical circuit to be maintained between the stationary steering column and the driver airbag inflator, which rotates with the steering wheel. The passenger airbag on/off switch allows the passenger side airbag to be disabled when

RESTRAINTS (Continued)

circumstances necessitate that a child, or an adult with certain medical conditions be placed in the front passenger seating position. Refer to the owner's manual in the vehicle glove box for specific recommendations concerning the specific circumstances where the passenger airbag on/off switch should be used to disable the passenger airbag.

Deployment of the airbags depends upon the angle and severity of the impact. The airbag system is designed to deploy upon a frontal impact within a thirty degree angle from either side of the vehicle center line. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the airbag system impact sensor, which is integral to the ACM. When a frontal impact is severe enough, the microprocessor in the ACM signals the inflator units of both airbag modules to deploy the airbags. During a frontal vehicle impact, the knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel.

Typically, the driver and front seat passenger recall more about the events preceding and following a collision than they have of the airbag deployment itself. This is because the airbag deployment and deflation occur so rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until both airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, both airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ACM monitors a problem in any of the airbag system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to turn on the airbag indicator. Proper testing of the airbag system components, the Chrysler Collision Detection (CCD) data bus, the data bus message inputs to and outputs from the EMIC or the ACM, as well as the retrieval or erasure of a DTC from the ACM requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the factory-installed passenger restraints, including the airbag system.

WARNING

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTROMECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY AIRBAG SYSTEM OR RELATED STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE DRIVER AIRBAG INFLATOR UNIT CONTAINS SODIUM AZIDE AND POTASSIUM NITRATE. THESE MATERIALS ARE POISONOUS AND EXTREMELY FLAMMABLE. CONTACT WITH ACID, WATER, OR HEAVY METALS MAY PRODUCE HARMFUL AND IRRITATING GASES (SODIUM HYDROXIDE IS FORMED IN THE PRESENCE OF MOISTURE) OR COMBUSTIBLE COMPOUNDS. THE PASSENGER AIRBAG UNIT CONTAINS ARGON GAS PRESSURIZED TO OVER 2500 PSI. DO NOT ATTEMPT TO DISMANTLE AN AIRBAG UNIT OR TAMPER WITH ITS INFLATOR. DO NOT PUNCTURE, INCINERATE, OR BRING INTO CONTACT WITH ELECTRICITY. DO NOT STORE AT TEMPERATURES EXCEEDING 93° C (200° F).

WARNING: REPLACE AIRBAG SYSTEM COMPONENTS ONLY WITH PARTS SPECIFIED IN THE DAIMLERCHRYSLER MOPAR PARTS CATALOG. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION.

WARNING: THE FASTENERS, SCREWS, AND BOLTS ORIGINALLY USED FOR THE AIRBAG SYSTEM COMPONENTS HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANY TIME A NEW FASTENER IS NEEDED, REPLACE IT WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR SPECIFIED IN THE DAIMLERCHRYSLER MOPAR PARTS CATALOG.

RESTRAINTS (Continued)

WARNING: WHEN A STEERING COLUMN HAS AN AIRBAG UNIT ATTACHED, NEVER PLACE THE COLUMN ON THE FLOOR OR ANY OTHER SURFACE WITH THE STEERING WHEEL OR AIRBAG UNIT FACE DOWN.

DIAGNOSIS AND TESTING - AIRBAG SYSTEM

Proper diagnosis and testing of the airbag system components, the Chrysler Collision Detection (CCD) data bus, the data bus message inputs to and outputs from the ElectroMechanical Instrument Cluster (EMIC) or the Airbag Control Module (ACM), as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) from the ACM requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

STANDARD PROCEDURE**STANDARD PROCEDURE - HANDLING NON-DEPLOYED AIRBAGS**

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment. In addition, the airbag system should be disarmed whenever any steering wheel, steering column, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, faulty, or non-deployed airbags which are replaced on vehicles are to be handled and disposed of properly. If an airbag unit is faulty or damaged

and non-deployed, refer to the Hazardous Substance Control System for proper disposal. Dispose of all non-deployed and deployed airbags in a manner consistent with state, provincial, local and federal regulations.

AIRBAG STORAGE

An airbag must be stored in its original, special container until it is used for service. Also, it must be stored in a clean, dry environment; away from sources of extreme heat, sparks, and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

STANDARD PROCEDURE - SERVICE AFTER AN AIRBAG DEPLOYMENT

Any vehicle which is to be returned to use following an airbag deployment, must have both airbags, the driver airbag trim cover, the clockspring, and the steering column assembly replaced. These components are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. Other vehicle components should be closely inspected, but are to be replaced only as required by the extent of the visible damage incurred.

CLEANUP PROCEDURE

Following an airbag deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge used to initiate the propellant used to deploy the airbags. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the nitrogen gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be sure to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup (Fig. 2).

WARNING: IF YOU EXPERIENCE SKIN IRRITATION DURING CLEANUP, RUN COOL WATER OVER THE AFFECTED AREA. ALSO, IF YOU EXPERIENCE IRRITATION OF THE NOSE OR THROAT, EXIT THE VEHICLE FOR FRESH AIR UNTIL THE IRRITATION CEASES. IF IRRITATION CONTINUES, SEE A PHYSICIAN.

Begin the cleanup by removing both airbags from the vehicle. Refer to the appropriate service removal procedures.

RESTRAINTS (Continued)

918M-4

Fig. 2 Wear Safety Glasses and Rubber Gloves - Typical

CAUTION: All damaged, faulty, or non-deployed airbags which are replaced on vehicles are to be handled and disposed of properly. If an airbag unit is faulty or damaged and non-deployed, refer to the Hazardous Substance Control System for proper disposal. Dispose of all non-deployed and deployed airbags in a manner consistent with state, provincial, local and federal regulations.

Next, use a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area. Be certain to vacuum the heater and air conditioning outlets as well (Fig. 3). Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

918M-2

Fig. 3 Vacuum Heater and A/C Outlets - Typical

STANDARD PROCEDURE - VERIFICATION TEST

The following procedure should be performed using a DRBIII® scan tool to verify proper airbag system operation following the service or replacement of any airbag system component.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) During the following test, the battery negative cable remains disconnected and isolated, as it was during the airbag component removal and installation procedures.

(2) Be certain that the DRBIII® scan tool contains the latest version of the proper DRBIII® software. Connect the DRBIII® to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column (Fig. 4).

(3) Turn the ignition switch to the On position and exit the vehicle with the DRBIII®.

(4) Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.

(5) Using the DRBIII®, read and record the active (current) Diagnostic Trouble Code (DTC) data.

(6) Next, use the DRBIII® to read and record any stored (historical) DTC data.

(7) If any DTC is found in Step 5 or Step 6, refer to the appropriate diagnostic information.

(8) Use the DRBIII® to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to Step 9.

(9) Turn the ignition switch to the Off position for about fifteen seconds, and then back to the On position. Observe the airbag indicator in the instrument cluster. It should light for six to eight seconds, and then go out. This indicates that the airbag system is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays on, there is still an active airbag system

RESTRAINTS (Continued)

2 - BOTTOM OF INSTRUMENT PANEL

fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

SPECIAL TOOLS - AIRBAG SYSTEM

Puller C-3428-B

AIRBAG CONTROL MODULE

DESCRIPTION

The Airbag Control Module (ACM) is concealed underneath the plastic ACM trim cover (automatic transmission) or center console (manual transmission), directly below the instrument panel in the passenger compartment of the vehicle. The ACM is secured with screws to a stamped steel mounting bracket located under the instrument panel center support bracket on the floor panel transmission tunnel. The ACM contains an electronic microprocessor, an electronic impact sensor, an electromechanical safing sensor, and an energy storage capacitor. The

ACM is connected to the vehicle electrical system through a take out and connector of the instrument panel wire harness.

The ACM cannot be repaired or adjusted and, if damaged or faulty, it must be replaced.

OPERATION

The microprocessor in the ACM contains the airbag system logic circuits, and it monitors and controls all of the airbag system components. The ACM also uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the DRBIII® scan tool using the Chrysler Collision Detection (CCD) data bus network. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and for airbag system diagnosis and testing through the 16-way data link connector located on the lower left edge of the instrument panel. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION). The ACM microprocessor continuously monitors all of the airbag system electrical circuits to determine the system readiness. If the ACM detects a monitored system fault, it sets an active Diagnostic Trouble Code (DTC) and sends messages to the EMIC over the CCD data bus to turn on the airbag indicator. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/AIRBAG INDICATOR - OPERATION). If the airbag system fault is still present when the ignition switch is turned to the Off position, the DTC is stored in memory by the ACM. However, if a fault does not recur for a number of ignition cycles, the ACM will automatically erase the stored DTC.

The ACM receives battery current through two circuits, on a fused ignition switch output (run) circuit through a fuse in the Junction Block (JB), and on a fused ignition switch output (start-run) circuit through a second fuse in the JB. The ACM is grounded through a ground circuit and take out of the instrument panel wire harness. This take out has a single eyelet terminal connector secured by a nut to a ground stud located on the forward extension of the left front fender wheel housing in the engine compartment. Therefore, the ACM is operational whenever the ignition switch is in the Start or On positions. The ACM also contains an energy-storage capacitor. When the ignition switch is in the Start or On positions, this capacitor is continually being charged with enough electrical energy to deploy the airbags for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup airbag system protection in case there is a loss of battery current supply to the ACM during an impact. The capacitor is only serviced as a unit with the ACM.

AIRBAG CONTROL MODULE (Continued)

Two sensors are contained within the ACM, an electronic impact sensor and a safing sensor. The electronic impact sensor is an accelerometer that senses the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. A pre-programmed decision algorithm in the ACM microprocessor determines when the deceleration rate as signaled by the impact sensor indicates an impact that is severe enough to require airbag system protection. When the programmed conditions are met, the ACM sends an electrical signal to deploy the airbags. The safing sensor is an electromechanical sensor within the ACM that is connected in series between the ACM microprocessor airbag deployment circuit and the airbags. The safing sensor is a normally open switch that is used to verify or confirm the need for an airbag deployment by detecting impact energy of a lesser magnitude than that of the electronic impact sensor, and must be closed in order for the airbags to deploy. The impact sensor and safing sensor are calibrated for the specific vehicle, and are only serviced as a unit with the ACM.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE AIRBAG CONTROL MODULE CONTAINS THE IMPACT SENSOR, WHICH ENABLES THE SYSTEM TO DEPLOY THE AIRBAGS. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed,

wait two minutes for the system capacitor to discharge before further service.

(2) If the vehicle is equipped with a manual transmission, remove the center floor console from the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

(3) If the vehicle is equipped with an automatic transmission, remove the two screws that secure the trim cover to the Airbag Control Module (ACM) mounting bracket on the floor panel transmission tunnel and remove the trim cover (Fig. 5).

Fig. 5 Airbag Control Module Trim Cover Remove/Install

- 1 - INSTRUMENT PANEL SUPPORT BRACKET
- 2 - ACM MOUNTING BRACKET
- 3 - TRIM COVER
- 4 - SCREW

(4) Loosen the screw that secures each side of the instrument panel center support bracket to the ACM mounting bracket (Fig. 6). Do not remove these screws.

(5) Remove the two nuts that secure the instrument panel center support bracket to the studs on the lower instrument panel structural support.

(6) Disengage the retainer on the instrument panel wire harness take out to the ACM from the retainer hole in the left side of the instrument panel center support bracket.

(7) Pull the top of the instrument panel center support bracket rearward and down from the instrument panel studs. Fold it down over the top of the ACM until it is laying flat on the floor panel transmission tunnel.

(8) Disconnect the instrument panel wire harness connector for the ACM from the ACM connector receptacle. To disconnect this connector:

(a) Slide the red Connector Position Assurance (CPA) lock on the top of the connector toward the side of the vehicle.

AIRBAG CONTROL MODULE (Continued)

**Fig. 6 Airbag Control Module Remove/Install**

- 1 - INSTRUMENT PANEL
- 2 - SUPPORT BRACKET
- 3 - SCREW (2)
- 4 - FLOOR PANEL
- 5 - SCREW (4)
- 6 - MOUNTING BRACKET
- 7 - CONNECTOR
- 8 - ACM
- 9 - RETAINER
- 10 - NUT

(b) Depress the connector latch tab and pull the connector straight away from the ACM connector receptacle.

NOTE: Always remove and replace the ACM and its mounting bracket as a unit. Replacement modules include a replacement mounting bracket. Do not transfer the ACM to another mounting bracket.

(9) Remove the four screws that secure the ACM mounting bracket to the floor panel transmission tunnel.

(10) Remove the ACM, the mounting bracket, and the instrument panel center support bracket from the floor panel transmission tunnel as a unit.

INSTALLATION

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR

SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE AIRBAG CONTROL MODULE CONTAINS THE IMPACT SENSOR, WHICH ENABLES THE SYSTEM TO DEPLOY THE AIRBAGS. NEVER STRIKE OR KICK THE AIRBAG CONTROL MODULE, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.

(1) Carefully position the Airbag Control Module (ACM), the mounting bracket, and the instrument panel center support bracket onto the floor panel transmission tunnel as a unit (Fig. 6). When the ACM is correctly positioned, the arrow on the ACM label will be pointed forward in the vehicle.

(2) Install and tighten the four screws that secure the ACM mounting bracket to the floor panel transmission tunnel. Tighten the screws to 14 N·m (125 in. lbs.).

(3) With the instrument panel center support bracket still folded down flat on the floor panel transmission tunnel, reconnect the instrument panel wire harness connector for the ACM to the ACM connector receptacle. Be certain that the connector latch and the red Connector Position Assurance (CPA) lock are fully engaged.

(4) Fold the top of the instrument panel center support bracket up over the top of the ACM and forward over the studs on the lower instrument panel structural support.

(5) Install and tighten the nuts that secure the instrument panel center support bracket to the studs on the lower instrument panel structural support. Tighten the nuts to 14 N·m (125 in. lbs.).

(6) Engage the retainer on the instrument panel wire harness take out for the ACM in the retainer hole on the left side of the instrument panel center support bracket.

(7) Tighten the screws that secure each side of the instrument panel center support bracket to the ACM mounting bracket. Tighten the screws 14 N·m (125 in. lbs.).

(8) If the vehicle is equipped with an automatic transmission, position the ACM trim cover to the ACM mounting bracket on the floor panel transmission tunnel (Fig. 5).

AIRBAG CONTROL MODULE (Continued)

(9) If the vehicle is equipped with an automatic transmission, install and tighten the two screws that secure the ACM trim cover to the ACM mounting bracket. Tighten the screws to 2.2 N·m (20 in. lbs.).

(10) If the vehicle is equipped with a manual transmission, reinstall the center floor console onto the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

(11) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

CHILD TETHER

REMOVAL

Standard cab models have two child tether anchors secured near the top of the cab back panel. Club cab and quad cab models have three child tethers secured near the top of the cab back panel.

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT

THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Remove the trim from the inside of the cab back panel. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - REMOVAL).

(2) Remove the screw that secures the child tether anchor (standard cab) or child tether (club/quad cab) to the cab back panel (Fig. 7).

(3) Remove the child tether anchor (standard cab) or child tether (club/quad cab) from the cab back panel.

INSTALLATION

Standard cab models have two child tether anchors secured near the top of the cab back panel. Club cab and quad cab models have three child tethers secured near the top of the cab back panel.

CHILD TETHER (Continued)

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Position the child tether anchor (standard cab) or child tether (club/quad cab) onto the cab back panel (Fig. 7).

(2) Install and tighten the screw that secures the child tether anchor (standard cab) or child tether (club/quad cab) onto the cab back panel. Tighten the screw to 13.5 N·m (120 in. lbs.).

(3) Reinstall the trim onto the inside of the cab back panel. (Refer to 23 - BODY/INTERIOR/REAR CLOSURE PANEL TRIM - INSTALLATION).

CLOCKSPRING

DESCRIPTION

The clockspring assembly is secured with two integral plastic latches onto the steering column lock housing near the top of the steering column, behind the steering wheel. The clockspring consists of a flat, round molded plastic case with a stubby tail that hangs below the steering column and contains a connector receptacle and a long pigtail wire with connector that face toward the instrument panel. Within the plastic housing is a spool-like molded plastic rotor with a large exposed hub. The upper surface of the rotor hub has a large center hole, two large flats, two auto-locking tabs, and three short pigtail wires with connectors that face toward the steering wheel. The lower surface of the rotor hub has two integral turn signal cancelling cam lobes. Within the plastic case and wound around the rotor spool is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at the connector receptacle and pigtail wire that face the instrument panel, while the inner end of the tape terminates at the pigtail wires on the hub of the clockspring rotor that face the steering wheel.

Service replacement clocksprings are shipped pre-centered and with a piece of tape covering the

engaged auto-locking tabs. The auto-locking tabs secure the centered clockspring rotor to the clockspring case during shipment, but these tabs are automatically disengaged once the clockspring is installed on the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

The clockspring cannot be repaired. If the clockspring is faulty, damaged, or if the driver airbag has been deployed, the clockspring must be replaced.

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and the electrical components mounted on or in the rotating steering wheel. On this model the rotating electrical components include the driver airbag, the horn switch, the speed control switches, and the remote radio switches if the vehicle is so equipped. The clockspring case is positioned and secured to the upper steering column lock housing by two integral plastic latches. The connector receptacle on the tail of the fixed clockspring housing connect the clockspring to the vehicle electrical system through a take out with connector from the instrument panel wire harness. The lower clockspring pigtail on the tail of the clockspring housing connect the clockspring driver airbag circuits to a separate take out and connector of the instrument panel wire harness located near the lower instrument panel reinforcement, below the steering column. The clockspring rotor is movable and is keyed to the hub of the steering wheel by two large flats that are molded into the rotor hub. The two lobes on the lower surface of the clockspring rotor hub contact a turn signal cancel actuator of the multi-function switch to provide automatic turn signal cancellation. The pigtail wires on the upper surface of the clockspring connect the clockspring to the horn switch, the two speed control switches, and the remote radio switches on vehicles that are so equipped.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring must be centered when it is installed on the steering column. Centering the clockspring indexes the clockspring spool to the movable steering components so that the tape can operate within its designed travel limits. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool can change position relative to the movable steering components and must be re-centered following completion of the service or the tape

CLOCKSPRING (Continued)

may be damaged. Service replacement clocksprings are shipped pre-centered and with the auto-locking tabs engaged. A piece of tape covers the auto-locking tabs to discourage tampering. These auto-locking tabs should not be disengaged until the clockspring has been installed on the steering column. If this shipping tape is removed or damaged, or if the auto-locking tabs are disengaged before the clockspring is installed on a steering column, the clockspring centering procedure must be performed. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

STANDARD PROCEDURE - CLOCKSPRING CENTERING

The clockspring is designed to wind and unwind when the steering wheel is rotated, but is only designed to rotate the same number of turns (about five complete rotations) as the steering wheel can be turned from stop to stop. Centering the clockspring indexes the clockspring tape to other steering components so that it can operate within its designed travel limits. The rotor of a centered clockspring can be rotated two and one-half turns in either direction from the centered position, without damaging the clockspring tape.

However, if the clockspring is removed for service or if the steering column is disconnected from the steering gear, the clockspring tape can change position relative to the other steering components. The clockspring must then be re-centered following completion of such service or the clockspring tape may be damaged. Service replacement clocksprings are shipped pre-centered and with the auto-locking tabs engaged (raised). These auto-locking tabs should not be disengaged until the clockspring has been installed on the steering column. If the auto-locking tabs are disengaged before the clockspring is installed on a steering column, the clockspring centering procedure must be performed.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

- (1) Place the front wheels in the straight-ahead position.
- (2) Remove the clockspring from the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).
- (3) Depress the two plastic clockspring auto-locking tabs (Fig. 8).

Fig. 8 Clockspring Auto-Locking Tabs

- 1 - AIRBAG MODULE WIRE
- 2 - SPEED CONTROL WIRING
- 3 - HORN WIRE
- 4 - CLOCKSPRING ASSEMBLY
- 5 - AUTO-LOCKING TABS

(4) Keeping the auto-locking tabs depressed, rotate the clockspring rotor clockwise to the end of its travel. **Do not apply excessive torque.**

(5) From the end of the clockwise travel, rotate the rotor about two and one-half turns counterclockwise, then release the auto-locking tabs. The clockspring pigtail wire for the horn switch should end up at the top, and the pigtail wires for the airbag, optional speed control switches, and optional remote radio switches at the bottom. The clockspring is now centered.

(6) The front wheels should still be in the straight-ahead position. Reinstall the clockspring onto the steering column. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

CLOCKSPRING (Continued)

REMOVAL

The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

(1) Place the front wheels in the straight-ahead position.

(2) Remove the driver airbag from the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(3) If the vehicle is so equipped, disconnect the clockspring pigtail wire connectors from the speed control switches and the remote radio switches located within the hub cavity of the steering wheel.

(4) Remove the nut that secures the steering wheel armature to the steering column upper shaft, which is located within the hub cavity of the steering wheel.

(5) Pull the steering wheel off of the steering column upper shaft spline using a steering wheel puller (Special Tool C-3428-B).

(6) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(7) If the vehicle is so equipped, unscrew the lever from the tilt steering column adjuster mechanism located on the left side of the column just below the multi-function switch control stalk. Turn the lever counterclockwise to unscrew it from the adjuster.

(8) From below the steering column, remove the two outboard screws that secure the upper shroud to the lower outer shroud (Fig. 9).

(9) Press carefully inward on each side of the outer shrouds to release the snap features and remove the upper outer shroud from the lower outer shroud.

(10) From below the steering column, remove the one center screw that secures the lower outer shroud to the steering column housing.

J938J-5

Fig. 9 Steering Column Shrouds Remove/Install - Typical

- 1 - NUT
- 2 - TILT LEVER
- 3 - UPPER SHROUD
- 4 - LOWER SHROUD
- 5 - SCREWS
- 6 - CLOCK SPRING
- 7 - STEERING WHEEL

(11) Remove the lower outer shroud from the steering column.

(12) From below the steering column, remove the two screws that secure the lower inner shroud to the steering column housing and the upper inner shroud.

(13) Press carefully inward on the gearshift lever side of the inner shrouds to release the snap features and remove the lower inner shroud from the steering column.

(14) Disconnect the instrument panel wire harness connector for the clockspring from the lower clockspring connector receptacle.

(15) Disconnect the lower clockspring pigtail wire connector from the instrument panel wire harness, located on the instrument panel lower reinforcement below the steering column.

(16) Carefully disengage the plastic latches of the clockspring assembly from the steering column lock housing and remove the clockspring from the column. The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.

(17) If the removed clockspring is to be reused, secure the clockspring rotor to the clockspring case to maintain clockspring centering until it is reinstalled on the steering column. If clockspring centering is

CLOCKSPRING (Continued)

not maintained, the clockspring must be centered again before it is reinstalled. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

INSTALLATION

The clockspring cannot be repaired. It must be replaced if faulty or damaged, or if the driver airbag has been deployed.

If the clockspring is not properly centered in relation to the steering wheel, steering shaft and steering gear, it may be damaged. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING). Service replacement clocksprings are shipped pre-centered and with a piece of tape covering the engaged clockspring auto-locking tabs. This tape should not be removed until the clockspring has been installed on the steering column. If the tape is removed before the clockspring is installed on a steering column, the clockspring centering procedure must be performed.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before starting this procedure, be certain that the front wheels are still in the straight-ahead position.

(1) Carefully slide the centered clockspring down over the steering column upper shaft until the clockspring latches engage the steering column lock housing (Fig. 9).

(2) Reconnect the lower clockspring pigtail wire connector to the instrument panel wire harness connector located near the instrument panel lower reinforcement, below the steering column. Be certain that the pigtail wire locator clips are properly seated on the outside of the wiring trough and that the connector latches are fully engaged.

(3) Reconnect the instrument panel wire harness connector for the clockspring to the lower clockspring connector receptacle.

(4) Position the lower inner shroud onto the steering column. Be certain to insert the gearshift lever hider strip into the channel located on the inside surface of the shroud.

(5) Align the locking tabs on the gearshift lever side of the upper inner shroud with the receptacles on the lower inner shroud and apply hand pressure to snap them together.

(6) From below the steering column, install and tighten the two screws that secure the lower inner shroud to the steering column housing and the upper inner shroud. Tighten the screws to 2 N·m (18 in. lbs.).

(7) Position the lower outer shroud onto the steering column. Be certain that the lower clockspring pigtail wire is routed inside the shrouds.

(8) From below the steering column, install and tighten the one center screw that secures the lower outer shroud to the steering column housing. Tighten the screw to 2 N·m (18 in. lbs.).

(9) Align the locking tabs on the upper outer shroud with the receptacles on the lower outer shroud and apply hand pressure to snap them together.

(10) From below the steering column, install and tighten the two outboard screws that secure the lower outer shroud to the upper outer shroud. Tighten the screws to 2 N·m (18 in. lbs.).

(11) If the vehicle is so equipped, reinstall the lever into the tilt steering column adjuster on the left side of the column. Turn the lever clockwise to screw it into the adjuster.

(12) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(13) Reinstall the steering wheel onto the steering column upper shaft. Be certain to index the flats on the hub of the steering wheel with the formations on the inside of the clockspring hub. Pull the upper clockspring pigtail wires through the upper and lower holes between the steering wheel back trim cover and the steering wheel armature.

(14) Install and tighten the steering wheel mounting nut. Tighten the nut to 61 N·m (45 ft. lbs.). Be certain not to pinch the pigtail wires between the steering wheel and the nut.

(15) If the vehicle is so equipped, reconnect the upper clockspring pigtail wire connectors to the speed control switches and/or the remote radio switches. Be certain that the upper clockspring pigtail wires are routed between the steering wheel back trim cover and the steering wheel armature.

(16) Reinstall the driver airbag onto the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

DRIVER AIRBAG

DESCRIPTION

The driver airbag protective trim cover is the most visible part of the driver airbag. The airbag used in this model is a Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The driver airbag is located in the center of the steering wheel, where it is secured with two screws to the steering wheel armature. Concealed beneath the driver airbag trim cover are the horn switch, the folded airbag cushion, the airbag retainer or housing, the airbag inflator, and the retainers that secure the trim cover to the airbag housing. The resistive membrane-type horn switch is secured with heat stakes to the inside surface of the airbag trim cover, between the trim cover and the folded airbag cushion. The airbag inflator is a conventional pyrotechnic-type unit that is secured with nuts to four studs on the back of the stamped metal airbag housing.

The driver airbag trim cover has locking blocks molded into the back side of it that engage a lip formed around the perimeter of the airbag housing. Two stamped metal retainers then fit over the inflator mounting studs on the back of the airbag housing and tabs on the retainer are engaged in slots on the inside of the trim cover, securely locking the cover into place. One horn switch pigtail wire has an eyelet terminal connector that is captured on the upper left inflator mounting stud between the inflator and the upper trim cover retainer. The connector insulator of the other horn switch pigtail wire is routed between the upper right inflator mounting stud and the inflator, where it is captured by a small plastic retainer that is pushed onto the stud. The driver airbag cannot be repaired, and must be replaced if deployed or in any way damaged. The driver airbag trim cover and horn switch are available as a unit, and may be disassembled from the driver airbag for service replacement.

OPERATION

The driver airbag is deployed by an electrical signal generated by the Airbag Control Module (ACM) through the driver airbag line 1 and line 2 (or squib) circuits. When the ACM sends the proper electrical signal to the airbag inflator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn, ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of nitrogen gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the nitrogen gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver

airbag trim cover will split at predetermined break-out lines, then fold back out of the way along with the horn switch. Following an airbag deployment, the airbag cushion quickly deflates by venting the nitrogen gas towards the instrument panel through the porous fabric material used on the steering wheel side of the airbag cushion.

Some of the chemicals used to create the nitrogen gas are considered hazardous in their solid state, before they are burned, but they are securely sealed within the airbag inflator. However, the nitrogen gas that is produced when the chemicals are burned is harmless. A small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noticed, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breathe. If the irritation is not alleviated by these actions, contact a physician.

REMOVAL

The following procedure is for replacement of a faulty or damaged driver airbag. If the driver airbag has been deployed, the clockspring and the steering column assembly must also be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL) (Refer to 19 - STEERING/COLUMN - REMOVAL).

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: WHEN REMOVING A DEPLOYED AIRBAG, RUBBER GLOVES, EYE PROTECTION, AND A LONG-SLEEVED SHIRT SHOULD BE WORN. THERE MAY BE DEPOSITS ON THE AIRBAG CUSHION AND OTHER INTERIOR SURFACES. IN LARGE DOSES, THESE DEPOSITS MAY CAUSE IRRITATION TO THE SKIN AND EYES.

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

DRIVER AIRBAG (Continued)

Fig. 10 Driver Airbag Remove/Install

1 - DRIVER SIDE AIRBAG MODULE

2 - HORN SWITCH FEED WIRE CONNECTOR

3 - CLOCKSPring WIRE HARNESS CONNECTOR

4 - SCREW (2)

(2) From the underside of the steering wheel, remove the two screws that secure the driver airbag to the steering wheel armature (Fig. 10).

(3) Pull the driver airbag away from the steering wheel far enough to access the two wire harness connectors at the back of the airbag.

(4) Disconnect the clockspring horn switch pigtail wire connector from the horn switch feed pigtail wire connector, which is located at the back of the driver airbag.

CAUTION: Do not pull on the clockspring pigtail wire to disengage the connector from the driver airbag inflator connector receptacle.

(5) The clockspring driver airbag pigtail wire connector is a tight snap-fit into the airbag inflator connector receptacle, which is located at the back of the driver airbag. Firmly grasp and pull or gently pry on the clockspring driver airbag wire harness connector to disconnect it from the airbag inflator connector receptacle.

(6) Remove the driver airbag from the steering wheel.

(7) If the driver airbag has been deployed, the clockspring and the steering column must be replaced. (Refer to 8 - ELECTRICAL/RESTRAINTS/

CLOCKSPring - REMOVAL) (Refer to 19 - STEERING/COLUMN - REMOVAL).

DISASSEMBLY

The horn switch is integral to the driver airbag trim cover. If either component is faulty or damaged, the entire driver airbag trim cover and horn switch unit must be replaced.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

DRIVER AIRBAG (Continued)

WARNING: THE HORN SWITCH IS INTEGRAL TO THE DRIVER AIRBAG UNIT. SERVICE OF THIS UNIT SHOULD BE PERFORMED ONLY BY DAIMLERCHRYSLER-TRAINED AND AUTHORIZED DEALER SERVICE TECHNICIANS. FAILURE TO TAKE THE PROPER PRECAUTIONS OR TO FOLLOW THE PROPER PROCEDURES COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Remove the driver airbag from the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

(3) Remove the plastic wire retainer that captures the horn switch feed pigtail wire between the upper left inflator stud and the inflator on the back of the driver airbag housing (Fig. 11).

ASSEMBLY

The horn switch is integral to the driver airbag trim cover. If either component is faulty or damaged,

DRIVER AIRBAG (Continued)

the entire driver airbag trim cover and horn switch unit must be replaced.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE HORN SWITCH IS INTEGRAL TO THE DRIVER AIRBAG UNIT. SERVICE OF THIS UNIT SHOULD BE PERFORMED ONLY BY DAIMLERCHRYSLER-TRAINED AND AUTHORIZED DEALER SERVICE TECHNICIANS. FAILURE TO TAKE THE PROPER PRECAUTIONS OR TO FOLLOW THE PROPER PROCEDURES COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER AIRBAG DEPLOYMENT AND POSSIBLE OCCUPANT INJURIES.

WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE DRIVER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE DRIVER AIRBAG CUSHION AND THE DRIVER AIRBAG TRIM COVER. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

WARNING: THE DRIVER AIRBAG TRIM COVER MUST NEVER BE PAINTED. REPLACEMENT TRIM COVERS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE TRIM COVER RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) Carefully position the driver airbag in the trim cover. Be certain that the horn switch feed and ground pigtail wires are not pinched between the airbag housing and the trim cover locking blocks.

(2) Engage the upper and lower trim cover locking blocks with the lip of the driver airbag housing, then engage the locking blocks on each side of the trim cover with the lip of the housing. Be certain that each of the locking blocks is fully engaged on the lip of the airbag housing (Fig. 14).

80a0f19f

Fig. 14 Driver Airbag Trim Cover Locking Blocks Engaged

- 1 - LIP
- 2 - TRIM COVER
- 3 - HORN SWITCH
- 4 - AIRBAG HOUSING
- 5 - LOCKING BLOCK

(3) Reinstall the horn switch ground pigtail wire eyelet terminal over the left upper airbag housing stud.

(4) Reinstall the upper and lower airbag trim cover retainers over the airbag housing studs. Be certain that the tabs on the retainers are engaged in the retainer slots of the trim cover locking blocks (Fig. 13).

(5) Install and tighten the nuts that secure the trim cover retainers to the airbag housing studs. Tighten the nuts to 10 N·m (90 in. lbs.).

(6) Route the horn switch feed pigtail wire between the inflator housing and the right upper airbag housing stud.

(7) Reinstall the plastic wire retainer onto the right upper airbag housing stud to capture horn switch feed pigtail wire.

(8) Reinstall the driver airbag onto the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

INSTALLATION

The following procedure is for replacement of a faulty or damaged driver airbag. If the driver airbag has been deployed, the clockspring and the steering column assembly must also be replaced. (Refer to 8 -

DRIVER AIRBAG (Continued)

ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL) and (Refer to 19 - STEERING/COLUMN - REMOVAL).

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE DRIVER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE DRIVER AIRBAG CUSHION AND THE DRIVER AIRBAG TRIM COVER. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

WARNING: THE DRIVER AIRBAG TRIM COVER MUST NEVER BE PAINTED. REPLACEMENT TRIM COVERS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE TRIM COVER RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) Assemble the driver airbag trim cover onto the airbag housing. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - ASSEMBLY).

(2) When installing the driver airbag, reconnect the clockspring driver airbag pigtail wire harness connector to the airbag inflator connector receptacle by pressing straight in on the connector (Fig. 10). You can be certain that the connector is fully engaged by listening carefully for a distinct, audible click as the connector snaps into place.

(3) Reconnect the clockspring horn switch pigtail wire harness connector to the horn switch feed pigtail wire connector, which is located on the back of the driver airbag.

(4) Carefully position the driver airbag in the steering wheel. Be certain that the clockspring pigtail wires in the steering wheel hub area are not pinched between the driver airbag and the steering wheel.

(5) From the underside of the steering wheel, install and tighten the two screws that secure the driver airbag to the steering wheel armature. Tighten the screws to 10.2 N·m (90 in. lbs.).

(6) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

FRONT SEAT BELT & RETRACTOR

REMOVAL

REMOVAL - STANDARD CAB

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Move the front seats to their most forward position for easiest access to the front shoulder belt lower seat belt anchor plate, the retractor, and the B-pillar.

(2) Remove the screw that secures the lower seat belt anchor plate to the floor panel near the base of the B-pillar.

(3) Unsnap and lift the front shoulder belt turning loop cover to access the screw that secures the turning loop to the height adjuster (Fig. 15).

(4) Remove the screw that secures the shoulder belt turning loop to the height adjuster.

(5) Remove the shoulder belt turning loop from the height adjuster.

(6) Remove the trim from the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

(7) Disengage the front seat shoulder belt turning loop and lower seat belt anchor plate from the B-pillar trim.

FRONT SEAT BELT & RETRACTOR (Continued)

**Fig. 15 Front Shoulder Belt - Standard Cab**

(8) Remove the screw that secures the retractor to the B-pillar.

(9) Remove the front shoulder belt and retractor from the B-pillar.

REMOVAL - CLUB/QUAD CAB

The front seat shoulder belt and retractor are integral to the driver and passenger front seat backs on club cab and quad cab models.

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Remove the trim cover from the front seat back frame. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - REMOVAL).

(2) Remove the screws that secure the retractor cover to the seat back frame.

(3) Remove the retractor cover from the seat back frame.

(4) Remove the two screws that secure the seat belt retractor to the seat back frame (Fig. 16).

(5) Remove the front shoulder belt and retractor from the seat back frame.

**Fig. 16 Seat Belt Retractor**

- 1 - RETRACTOR SCREWS
2 - SEAT BACK FRAME

INSTALLATION**INSTALLATION - STANDARD CAB**

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Position the retractor onto the B-pillar (Fig. 15).

(2) Install and tighten the screw that secures the retractor to the B-pillar. Tighten the screw to 40 N·m (29 ft. lbs.).

(3) Engage the front seat shoulder belt turning loop and lower seat belt anchor plate with the B-pillar trim.

(4) Reinstall the trim onto the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

(5) Position the shoulder belt turning loop onto the height adjuster.

FRONT SEAT BELT & RETRACTOR (Continued)

(6) Install and tighten the screw that secures the shoulder belt turning loop to the height adjuster. Tighten the screw to 30 N·m (22 ft. lbs.).

(7) Fold and snap the cover over the front shoulder belt turning loop to conceal the screw that secures the turning loop to the height adjuster.

(8) Install and tighten the screw that secures the lower seat belt anchor plate to the floor panel near the base of the B-pillar. Tighten the screw to 40 N·m (29 ft. lbs.).

INSTALLATION - CLUB/QUAD CAB

The front seat shoulder belt and retractor are integral to the driver and passenger front seat backs on club cab and quad cab models.

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Position the front shoulder belt and retractor onto the seat back frame.

(2) Install and tighten the two screws that secure the seat belt retractor to the seat back frame (Fig. 16). Tighten the screws to 16 N·m (12 ft. lbs.).

(3) Position the retractor cover onto the seat back frame.

(4) Install and tighten the screws that secure the retractor cover to the seat back frame. Tighten the screws to 2 N·m (17 in. lbs.).

(5) Reinstall the trim cover onto the front seat back frame. (Refer to 23 - BODY/SEATS/SEAT BACK COVER - INSTALLATION).

FRONT SEAT BELT BUCKLE**REMOVAL**

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT

THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Move the front seat to its most forward position for easiest access to the front seat belt buckle anchors.

(2) Tilt both front seat backs forward far enough to access the seat belt buckle anchor screws.

(3) On the driver's side only, disconnect the body wire harness connector for the seat belt switch from the seat belt switch pigtail wire connector on the seat belt buckle.

(4) Remove the screw that secures the seat belt buckle to the anchor on the seat cushion frame.

(5) Remove the front seat belt buckle from the seat cushion frame.

INSTALLATION

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Position the front seat belt buckle onto the seat cushion frame.

(2) On the driver's side only, reconnect the body wire harness connector for the seat belt switch to the seat belt switch pigtail wire connector on the seat belt buckle.

(3) Install and tighten the screw that secures the seat belt buckle to the anchor on the seat cushion frame. Tighten the screw to 40 N·m (29 ft. lbs.).

PASSENGER AIRBAG

DESCRIPTION

The rearward facing surface of the passenger airbag door above the glove box is the most visible part of the passenger airbag. The airbag used in this model is a Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The passenger airbag is located in the instrument panel in front of the front seat passenger seating position, where it is secured to the instrument panel. Concealed beneath the passenger airbag door are the folded airbag cushion, the airbag retainer or housing, and the airbag inflator. The airbag inflator is a hybrid-type unit that is secured to and sealed within the stamped steel airbag housing along with the folded airbag cushion. The airbag housing stamping also includes the two mounting brackets, one front and one rear. The front bracket is secured beneath the instrument panel top cover with screws to the instrument panel structural support. The rear bracket is secured with screws to the upper glove box opening reinforcement. A yellow connector on the end of a short, two-wire pigtail harness connects the passenger airbag inflator to the vehicle electrical system.

The molded plastic passenger airbag door has predetermined breakout lines concealed beneath its decorative cover. The lower edge of the passenger airbag door is secured to the airbag housing, and includes the two passenger side panel outlets. The sides and upper edges are secured to the instrument panel top cover with five molded tabs that are each fit with a small metal retainer. The five retainers are snapped into five slotted receptacles located around the sides and top of the airbag door opening in the instrument panel top cover. Following a passenger airbag deployment, the passenger airbag and airbag door unit must be replaced. The passenger airbag cannot be repaired, and must be replaced if faulty or in any way damaged. The passenger airbag door is serviced only as a unit with the passenger airbag, and includes the two passenger side heating and air conditioning panel outlet housings and barrels.

OPERATION

The passenger airbag is deployed by an electrical signal generated by the Airbag Control Module (ACM) through the passenger airbag line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly includes a small canister of highly compressed argon gas. When the ACM sends the proper electrical signal to the airbag inflator, the electrical energy generates enough heat to ignite chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce the pressure necessary to rup-

ture a containment disk in the argon gas canister. The inflator and argon gas canister are sealed to the airbag cushion so that all of the released argon gas is directed into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door will split at the breakout lines and the door will pivot out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the argon gas through the porous fabric material used on each end panel of the airbag cushion.

Some of the chemicals used to create the pressure to burst the argon gas containment disk are considered hazardous in their solid state, before they are burned, but they are securely sealed within the airbag inflator. However, the gas that is produced when the chemicals are burned is harmless. A small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noticed, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician immediately.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: WHEN REMOVING A DEPLOYED AIRBAG, RUBBER GLOVES, EYE PROTECTION, AND A LONG-SLEEVED SHIRT SHOULD BE WORN. THERE MAY BE DEPOSITS ON THE AIRBAG UNIT AND OTHER INTERIOR SURFACES. IN LARGE DOSES, THESE DEPOSITS MAY CAUSE IRRITATION TO THE SKIN AND EYES.

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

PASSENGER AIRBAG (Continued)

(2) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

(3) Remove the glove box opening upper trim from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX OPENING UPPER TRIM - REMOVAL).

(4) Remove the four screws that secure the two plastic support brackets for the passenger airbag door panel outlet housing to the glove box opening upper reinforcement.

(5) Reach through and above the glove box opening to access and disconnect the passenger airbag pigtail wire connector from the instrument panel wire harness (Fig. 17).

Fig. 17 Passenger Airbag Connector

- 1 - PASSENGER SIDE AIRBAG MODULE
- 2 - WIRE HARNESS CONNECTOR
- 3 - GLOVE BOX OPENING

(6) Remove the two screws that secure the passenger airbag front bracket to the instrument panel structural support (Fig. 18).

(7) Remove the three screws that secure the passenger airbag rear bracket to the glove box opening upper reinforcement.

(8) Using a trim stick or another suitable wide flat-bladed tool and starting at the lower left edge, gently pry the passenger airbag door away from the instrument panel far enough to disengage the five molded tabs and snap retainers securing it to the receptacles in the instrument panel top cover (Fig. 19).

(9) Remove the passenger airbag, the airbag door, and the panel outlet housing and barrel assemblies from the instrument panel as a unit.

PASSENGER AIRBAG (Continued)

INSTALLATION

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: WHEN REMOVING A DEPLOYED AIRBAG, RUBBER GLOVES, EYE PROTECTION, AND A LONG-SLEEVED SHIRT SHOULD BE WORN. THERE MAY BE DEPOSITS ON THE AIRBAG UNIT AND OTHER INTERIOR SURFACES. IN LARGE DOSES, THESE DEPOSITS MAY CAUSE IRRITATION TO THE SKIN AND EYES.

WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE PASSENGER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE PASSENGER AIRBAG CUSHION AND THE PASSENGER AIRBAG DOOR. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

WARNING: THE PASSENGER AIRBAG DOOR MUST NEVER BE PAINTED. REPLACEMENT PASSENGER AIRBAG DOORS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE AIRBAG DOOR RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) Carefully inspect the five receptacle slots around the top and sides of the passenger airbag door opening of the instrument panel top cover. Remove any of the small metal airbag door snap retainers that did not remain on the molded airbag door tabs during the removal procedure.

(2) If the removed passenger airbag module is being reinstalled, install the metal snap retainers recovered in Step 1 onto the proper airbag door tabs. Each of the five molded airbag door tabs must have a snap retainer on it before it is installed in the instru-

ment panel. New replacement passenger airbags come with new airbag door snap retainers installed.

(3) Carefully position the passenger airbag onto the instrument panel.

(4) Align the five tabs and retainers on the upper edge and sides of the passenger airbag door with the receptacles in the instrument panel top cover.

(5) Using hand pressure, press firmly on the passenger airbag door over each of the tab and retainer locations until each of them is fully engaged in its receptacle. Be certain that each of the metal snap retainers is in position on the airbag door tabs.

(6) Install and tighten the five screws that secure the passenger airbag front and rear mounting brackets to the instrument panel (Fig. 18). Tighten the screws to 9 N·m (80 in. lbs.).

(7) Install and tighten the four screws that secure the two plastic support brackets of the passenger airbag door panel outlet housing to the glove box opening upper reinforcement. Tighten the screws to 2.2 N·m (20 in. lbs.).

(8) Reach through and above the glove box opening to access and reconnect the passenger airbag pigtail wire connector to the instrument panel wire harness connector (Fig. 17). Be certain that the passenger airbag pigtail wire connector is fully engaged with and latched to the instrument panel wire harness connector.

(9) Reinstall the glove box opening upper trim onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX OPENING UPPER TRIM - INSTALLATION).

(10) Reinstall the glove box onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(11) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

PASSENGER AIRBAG ON/OFF SWITCH

DESCRIPTION

The passenger airbag on-off switch is standard equipment on this model when it is not equipped with a full size rear seat. This switch is a single pole, single throw switch with a single integral red Light-Emitting Diode (LED), and a non-coded key cylinder-type actuator. The switch is located in the upper right corner of instrument panel cluster bezel, near the center of instrument panel to make the Off indicator visible to all front seat occupants. When the

PASSENGER AIRBAG ON/OFF SWITCH (Continued)

switch is in its installed position, the only components visible through the dedicated opening of the cluster bezel are the switch face plate and nomenclature, the key cylinder actuator, and a small round lens with the text "Off" imprinted on it. The "On" position of the switch is designated by text imprinted upon the face plate of the switch, but is not illuminated. The remainder of the switch is concealed behind the switch face plate and the instrument panel cluster bezel.

The passenger airbag on-off switch housing is constructed of molded plastic and has three integral mounting tabs. These mounting tabs are used to secure the switch to the back of the molded plastic switch face plate with three small screws. The molded plastic face plate also has three integral mounting tabs that are used to secure the switch and face plate unit to the instrument panel carrier with three additional screws. Two short pigtail wires with molded plastic connector insulators exit the back of the switch housing and connect the switch to the vehicle electrical system through two dedicated take outs of the instrument panel wire harness. The harness take outs are equipped with molded plastic connector insulators that are keyed and latched to ensure proper and secure switch electrical connections. The passenger airbag on/off switch cannot be adjusted or repaired and, if faulty or damaged, the switch must be replaced.

OPERATION

The passenger airbag on/off switch allows the customer to turn the passenger airbag function On or Off to accommodate certain uses of the right front seating position where airbag protection may not be desired. See the owner's manual in the vehicle glove box for specific recommendations on when to enable or disable the passenger airbag. The Off indicator of the switch will be illuminated whenever the switch is turned to the Off position. The ignition key is the only key or object that should ever be inserted into the switch. The on/off switch requires only a partial key insertion to fully depress a spring-loaded locking plunger. The spring-loaded locking plunger prevents the user from leaving the key in the switch. The key will be automatically ejected when force is not applied. To actuate the passenger side airbag on/off switch, insert the ignition key into the switch key actuator far enough to fully depress the plunger and rotate to the desired switch position. When the switch key actuator is rotated to its clockwise stop (the key actuator slot will be aligned with the Off indicator lamp), the Off indicator is illuminated and the passenger airbag is disabled. When the switch is rotated to its counterclockwise stop (the key actuator slot will be in a vertical position), the Off indicator

will be extinguished and the passenger airbag is enabled.

The passenger airbag on/off switch is connected in series between the Airbag Control Module (ACM) and the passenger airbag inflator unit. When the switch is in the On position, the switch connects the ACM directly to the passenger airbag inflator. When the switch is in the Off position it interrupts the inflator circuits, but replaces the normal resistance in these circuits with an internal resistor. Thus, the ACM is unable to distinguish the mode of the switch and still sends an electrical signal as though it were deploying the passenger airbag when it detects a sufficient impact. However, the switch position should not be changed while the ignition switch is in the On position, as the ACM may detect a fault, record a Diagnostic Trouble Code (DTC), and illuminate the Airbag indicator in response to a momentary open it senses in the passenger airbag inflator circuits as the on/off switch changes states.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

(4) Reach through the glove box opening to access and disconnect the two passenger airbag on/off switch pigtail wire harness connectors from the instrument panel wire harness connectors. These connectors are retained on a bracket located on the inboard glove box opening reinforcement (Fig. 20).

(5) Remove the three screws that secure the passenger airbag on/off switch face plate to the instrument panel (Fig. 21).

- 3 - SWITCH BEZEL

(8) Remove the passenger airbag on/off switch from the face plate.

INSTALLATION

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the passenger airbag on/off switch to the back of the face plate (Fig. 22).

(2) Install and tighten the three screws that secure the passenger airbag on/off switch to the face plate. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Route the passenger airbag on/off switch pigtail wires through the switch opening of the instrument panel.

(4) Reach through the glove box opening to access and reconnect the two passenger airbag on/off switch pigtail wire connectors to the instrument panel wire harness connectors. These connectors are retained on a bracket located on the inboard glove box opening reinforcement (Fig. 20). Be certain that both connectors are fully engaged and latched.

PASSENGER AIRBAG ON/OFF SWITCH (Continued)

(5) Position the passenger airbag on/off switch and face plate unit to the opening in the instrument panel (Fig. 21).

(6) Install and tighten the three screws that secure the passenger airbag on/off switch face plate to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

(7) Reinstall the glove box onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

(8) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(9) Do not reconnect the battery negative cable at this time. The airbag system verification test procedure should be performed following service of any airbag system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

REAR SEAT BELT & RETRACTOR

REMOVAL

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Remove the rear seat from the passenger compartment. (Refer to 23 - BODY/SEATS/REAR SEAT - REMOVAL).

(2) Remove the trim cover from the door sill. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove the screw that secures the lower seat belt anchor plate to the quarter inner panel near the base of the C-pillar (Fig. 23).

(4) Unsnap and lift the rear shoulder belt turning loop cover to access the screw that secures the turning loop to the quarter inner panel near the top of the C-pillar.

Fig. 23 Rear Seat Belt & Retractor - Typical

- 1 - TURNING LOOP
- 2 - REAR SEAT BELT AND RETRACTOR
- 3 - QUARTER TRIM PANEL

(5) Remove the screw that secures the shoulder belt turning loop to the quarter inner panel.

(6) Remove the trim from the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(7) Disengage the rear seat shoulder belt turning loop and lower seat belt anchor plate from the quarter trim panel.

(8) Remove the screw that secures the retractor to the quarter inner panel near the C-pillar.

(9) Remove the rear shoulder belt and retractor from the quarter inner panel.

INSTALLATION

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Position the rear shoulder belt retractor onto the quarter inner panel (Fig. 23).

REAR SEAT BELT & RETRACTOR (Continued)

(2) Install and tighten the screw that secures the retractor to the quarter inner panel. Tighten the screw to 40 N·m (29 ft. lbs.).

(3) Engage the rear seat shoulder belt turning loop and lower seat belt anchor plate with the quarter trim panel.

(4) Reinstall the trim onto the quarter inner panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

(5) Position the shoulder belt turning loop onto the quarter inner panel near the top of the C-pillar.

(6) Install and tighten the screw that secures the shoulder belt turning loop to the quarter inner panel. Tighten the screw to 40 N·m (29 ft. lbs.).

(7) Fold and snap the cover over the rear shoulder belt turning loop to conceal the screw that secures the turning loop to the quarter inner panel.

(8) Position the lower seat belt anchor plate onto the quarter inner panel near the base of the C-pillar.

(9) Install and tighten the screw that secures the lower seat belt anchor plate to the quarter inner panel near the base of the C-pillar. Tighten the screw to 40 N·m (29 ft. lbs.).

(10) Reinstall the trim cover onto the door sill. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(11) Reinstall the rear seat into the passenger compartment. (Refer to 23 - BODY/SEATS/REAR SEAT - INSTALLATION).

(2) Fold the rear seat unit up and back against the cab back panel (stowed position) for access to the rear seat belt buckle anchors.

(3) Reach through the opening between the rear seat back and the floor panel to access and remove the nut that secures the rear seat belt buckle/buckle unit (right side) or lap belt/buckle unit (left side) anchor plate to the stud on the rear floor panel (Fig. 24).

Fig. 24 Rear Seat Belt Buckle Remove/Install

REAR SEAT BELT BUCKLE

REMOVAL

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Disengage the rear seat latch by pulling the release handle on the underside of the rear seat cushion.

(4) Remove the rear seat belt buckle/buckle unit (right side) or lap belt/buckle unit (left side) from the rear floor panel.

INSTALLATION

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

REAR SEAT BELT BUCKLE (Continued)

(1) Reach through the opening between the rear seat back and the floor panel to position the rear seat belt buckle/buckle unit (right side) or lap belt/buckle unit (left side) onto the stud on the rear floor panel (Fig. 24).

(2) Install and tighten the nut that secures the rear seat belt buckle/buckle unit (right side) or lap belt/buckle unit (left side) anchor plate to the stud on the rear floor panel. Tighten the nut to 40 N·m (29 ft. lbs.).

(3) Route the lap belt and buckles between the rear seat back and rear seat cushion.

(4) Disengage the rear seat from its stowed position by pulling the release handle on the underside of the rear seat cushion.

(5) Fold the rear seat cushion down toward the rear floor panel until the unit is latched in its open position.

SEAT BELT SWITCH

DESCRIPTION

The seat belt switch is a small, normally closed, single pole, single throw, leaf contact, momentary switch. Only one seat belt switch is installed in the vehicle, and it is integral to the buckle of the driver seat belt buckle-half, located near the inboard side of the driver side front seating position. The seat belt switch is connected to the vehicle electrical system through a two-wire pigtail wire and connector on the seat belt buckle-half, which is connected to a wire harness connector and take out of the body wire harness.

The seat belt switch cannot be adjusted or repaired and, if faulty or damaged, the entire driver seat belt buckle-half unit must be replaced.

OPERATION

The seat belt switch is designed to control a path to ground for the seat belt switch sense input of the Electro-Mechanical Instrument Cluster (EMIC). When the driver side seat belt tip-half is inserted in the seat belt buckle, the switch opens the path to ground; and, when the driver side seat belt tip-half is removed from the seat belt buckle, the switch closes the ground path. The switch is actuated by the latch mechanism within the seat belt buckle. The EMIC monitors the driver seat belt switch status, then controls the seatbelt indicator and sends hard wired chime requests to the Central Timer Module (CTM) based upon that input.

The seat belt switch receives ground through its pigtail wire connection to the body wire harness from another take out of the body wire harness. An eyelet terminal connector on that ground take out is

secured under a nut to a ground stud on the left lower B-pillar (standard cab models) or the left lower cowl side inner panel (club cab and quad cab models). The seat belt switch is connected in series between ground and the seat belt switch sense input of the EMIC.

DIAGNOSIS AND TESTING - SEAT BELT SWITCH

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the seat belt switch from the seat belt switch pigtail wire connector located near the floor panel under the driver side front seat cushion. Check for continuity between the seat belt switch sense circuit and the ground circuit cavities in the seat belt switch pigtail wire connector. There should be continuity with the driver side seat belt tip-half and buckle-half unfastened, and no continuity with tip-half and buckle-half fastened. If OK, go to Step 2. If not OK, replace the faulty driver side seat belt buckle-half unit.

(2) Check for continuity between the ground circuit cavity in the body wire harness connector for the seat belt switch and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open ground circuit to ground (G301 - standard cab, or G300 - club/quad cab) as required.

(3) Remove the instrument cluster from the instrument panel. Check for continuity between the seat belt switch sense circuit cavity in the instrument panel wire harness connector (Connector C2) for the instrument cluster and a good ground. There should be no continuity. If OK, go to Step 4. If not OK, repair the shorted seat belt switch sense circuit

SEAT BELT SWITCH (Continued)

between the seat belt switch and the instrument cluster as required.

(4) Check for continuity between the seat belt switch sense circuit cavities in the body wire harness connector for the seat belt switch and the instrument panel wire harness connector (Connector C2) for the instrument cluster. There should be continuity. If OK, proceed to the diagnosis for the instrument cluster. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If not OK, repair the open seat belt switch sense circuit between the seat belt switch and the instrument cluster as required.

SEAT BELT TURNING LOOP
ADJUSTER

REMOVAL

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Remove the knob from the lever of the seat belt turning loop adjuster. (Refer to 8 - ELECTRICAL/RESTRAINTS/TURNING LOOP HEIGHT ADJUSTER KNOB - REMOVAL).

(2) Remove the screw that secures the shoulder belt turning loop to the height adjuster.

(3) Remove the trim from the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

(4) Remove the screw that secures the upper end of the height adjuster to the B-pillar.

(5) Pull the upper end of the height adjuster away from the B-pillar far enough to disengage the hooks on the lower end of the adjuster from the slots in the pillar.

(6) Remove the adjuster from the B-pillar.

INSTALLATION

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Position the height adjuster to the B-pillar with the hook formations oriented toward the lower end of the adjuster.

(2) Engage the hooks on the lower end of the adjuster into the slots in the B-pillar.

(3) Tilt the upper end of the height adjuster up into position against the B-pillar.

(4) Install and tighten the screw that secures the upper end of the height adjuster to the B-pillar. Tighten the screw to 41 N·m (30 ft. lbs.).

(5) Reinstall the trim onto the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

(6) Install and tighten the anchor screw that secures the seat belt turning loop to the adjuster. Tighten the screw to 30 N·m (22 ft. lbs.).

(7) Reinstall the knob onto the lever of the seat belt turning loop adjuster. (Refer to 8 - ELECTRICAL/RESTRAINTS/TURNING LOOP HEIGHT ADJUSTER KNOB - INSTALLATION).

TURNING LOOP HGT ADJUSTER KNOB

REMOVAL

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Unsnap and lift the seat belt turning loop cover to expose the anchor screw that secures the turning loop to the height adjuster.

(2) Using the head of the turning loop anchor screw as a fulcrum, carefully pry the knob from the height adjuster lever with a suitable trim tool (Fig. 25).

INSTALLATION

WARNING: DURING AND FOLLOWING ANY SEAT BELT SERVICE, CAREFULLY INSPECT ALL SEAT BELTS, BUCKLES, MOUNTING HARDWARE, AND RETRACTORS FOR PROPER INSTALLATION, OPERATION, OR DAMAGE. REPLACE ANY BELT THAT IS CUT, FRAYED, OR TORN. STRAIGHTEN ANY BELT THAT IS TWISTED. TIGHTEN ANY LOOSE FASTENERS. REPLACE ANY BELT THAT HAS A DAMAGED OR INOPERATIVE BUCKLE OR

**Fig. 25 Turning Loop Height Adjuster Knob
Removal - Typical**

- 1 - KNOB
- 2 - ADJUSTER LEVER
- 3 - SEAT BELT TURNING LOOP
- 4 - TRIM TOOL (SNAP-ON A179A)

RETRACTOR. REPLACE ANY BELT THAT HAS A BENT OR DAMAGED LATCH PLATE OR ANCHOR PLATE. NEVER ATTEMPT TO REPAIR A SEAT BELT COMPONENT. ALWAYS REPLACE DAMAGED OR FAULTY SEAT BELT COMPONENTS WITH THE CORRECT, NEW AND UNUSED REPLACEMENT PARTS LISTED IN THE MOPAR PARTS CATALOG.

(1) Fold and snap the seat belt turning loop cover back into place over the anchor screw that secures the turning loop to the adjuster.

(2) Position the height adjuster knob to the seat belt turning loop height adjuster lever.

(3) Using hand pressure, push the knob firmly and evenly onto the lever until it is fully engaged.

SPEED CONTROL

DESCRIPTION

DESCRIPTION - SPEED CONTROL SYSTEM

Gas Engines and/or Diesel With Automatic Trans.

The speed control system is operated by the use of a cable and a vacuum controlled servo. Electronic control of the speed control system is integrated into the Powertrain Control Module (PCM). The controls consist of two steering wheel mounted switches. The switches are labeled: ON/OFF, RES/ACCEL, SET, COAST, and CANCEL.

The system is designed to operate at speeds above 30 mph (50 km/h).

WARNING: THE USE OF SPEED CONTROL IS NOT RECOMMENDED WHEN DRIVING CONDITIONS DO NOT PERMIT MAINTAINING A CONSTANT SPEED, SUCH AS IN HEAVY TRAFFIC OR ON ROADS THAT

ARE WINDING, ICY, SNOW COVERED, OR SLIPPERY.

Diesel With Manual Trans.

The speed control system is fully electronically controlled by the Engine Control Module (ECM). **A cable and a vacuum controlled servo are not used if the vehicle is equipped with a manual transmission and a diesel engine. This is a servo-less system.** The controls consist of two steering wheel mounted switches. The switches are labeled: ON/OFF, RES/ACCEL, SET, COAST, and CANCEL.

The system is designed to operate at speeds above 30 mph (50 km/h).

WARNING: THE USE OF SPEED CONTROL IS NOT RECOMMENDED WHEN DRIVING CONDITIONS DO NOT PERMIT MAINTAINING A CONSTANT SPEED, SUCH AS IN HEAVY TRAFFIC OR ON ROADS THAT ARE WINDING, ICY, SNOW COVERED, OR SLIPPERY.

SPEED CONTROL (Continued)

DESCRIPTION - VEHICLE SPEED INPUT

Gas Engines and/or Diesel With Automatic Trans.

The Vehicle Speed Sensor (VSS) is no longer used for any Dodge Truck.

Vehicle speed and distance covered are measured by the Rear Wheel Speed Sensor. The sensor is mounted to the rear axle. A signal is sent from this sensor to the Controller Antilock Brake (CAB) computer. A signal is then sent from the CAB to the Powertrain Control Module (PCM) to determine vehicle speed and distance covered. The PCM will then determine strategies for speed control system operation.

Diesel With Manual Trans.

The Vehicle Speed Sensor (VSS) is no longer used for any Dodge Truck.

Vehicle speed and distance covered are measured by the Rear Wheel Speed Sensor. The sensor is mounted to the rear axle. A signal is sent from this sensor to the Controller Antilock Brake (CAB) computer. A signal is then sent from the CAB to the Engine Control Module (ECM) to determine vehicle speed and distance covered. The ECM will then determine strategies for speed control system operation.

OPERATION - SPEED CONTROL SYSTEM

Gas Engines and/or Diesel With Automatic Trans.

When speed control is selected by depressing the ON switch, the PCM allows a set speed to be stored in PCM RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral.

The speed control can be disengaged manually by:

- Stepping on the brake pedal.
- Depressing the OFF switch.
- Depressing the CANCEL switch.
- Depressing the clutch pedal (if equipped).

NOTE: Depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the PCM.

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of Park or Neutral.
- A rapid increase of rpm (indication that the clutch has been disengaged).

- Excessive engine rpm (indicates that the transmission may be in a low gear).

- The speed signal increases at a rate of 10 mph per second (indicates that the coefficient of friction between the road surface and tires is extremely low).

- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate).

Once the speed control has been disengaged, depressing the RES/ACCEL switch (when speed is greater than 30 mph) restores the vehicle to the target speed that was stored in the PCM.

While the speed control is engaged, the driver can increase the vehicle speed by depressing the RES/ACCEL switch. The new target speed is stored in the PCM when the RES/ACCEL is released. The PCM also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the RES/ACCEL switch.

A "tap down" feature is used to decelerate without disengaging the speed control system. To decelerate from an existing recorded target speed, momentarily depress the COAST switch. For each switch activation, speed will be lowered approximately 1 mph.

Diesel With Manual Trans.

When speed control is selected by depressing the ON switch, the Engine Control Module (ECM) allows a set speed to be stored in ECM RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied. The speed control can be disengaged manually by:

- Stepping on the brake pedal.
- Depressing the OFF switch.
- Depressing the CANCEL switch.
- Depressing the clutch pedal.

NOTE: Depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the ECM.

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- A rapid increase of rpm (indication that the clutch has been disengaged).

- Excessive engine rpm (indicates that the transmission may be in a low gear).

- The speed signal increases at a rate of 10 mph per second (indicates that the coefficient of friction between the road surface and tires is extremely low).

- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate).

SPEED CONTROL (Continued)

Once the speed control has been disengaged, depressing the RES/ACCEL switch (when speed is greater than 30 mph) restores the vehicle to the target speed that was stored in the ECM.

While the speed control is engaged, the driver can increase the vehicle speed by depressing the RES/ACCEL switch. The new target speed is stored in the ECM when the RES/ACCEL is released. The ECM also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the RES/ACCEL switch.

A "tap down" feature is used to decelerate without disengaging the speed control system. To decelerate from an existing recorded target speed, momentarily depress the COAST switch. For each switch activation, speed will be lowered approximately 1 mph.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - VACUUM SUPPLY TEST

Gas Powered Engines

On gasoline powered engines: actual engine vacuum, a vacuum reservoir, a one-way check valve and vacuum lines are used to supply vacuum to the speed control servo.

(1) Disconnect vacuum hose at speed control servo and install a vacuum gauge into the disconnected hose.

(2) Start engine and observe gauge at idle. Vacuum gauge should read at least ten inches of mercury.

(3) If vacuum is less than ten inches of mercury, determine source of leak. Check vacuum line to engine for leaks. Also check actual engine intake manifold vacuum. If manifold vacuum does not meet this requirement, check for poor engine performance and repair as necessary.

(4) If vacuum line to engine is not leaking, check for leak at vacuum reservoir. To locate and gain access to reservoir, refer to Vacuum Reservoir Removal/Installation in this group. Disconnect vacuum line at reservoir and connect a hand-operated vacuum pump to reservoir fitting. Apply vacuum. Reservoir vacuum should not bleed off. If vacuum is being lost, replace reservoir.

(5) Verify operation of one-way check valve and check it for leaks.

(a) Locate one-way check valve. The valve is located in vacuum line between vacuum reservoir

and engine vacuum source. Disconnect vacuum hoses (lines) at each end of valve.

(b) Connect a hand-operated vacuum pump to reservoir end of check valve. Apply vacuum. Vacuum should not bleed off. If vacuum is being lost, replace one-way check valve.

(c) Connect a hand-operated vacuum pump to vacuum source end of check valve. Apply vacuum. Vacuum should flow through valve. If vacuum is not flowing, replace one-way check valve. Seal the fitting at opposite end of valve with a finger and apply vacuum. If vacuum will not hold, diaphragm within check valve has ruptured. Replace valve.

Diesel Engines With Automatic Trans.

On diesel powered engines equipped with an automatic transmission: an engine driven vacuum pump, a one-way check valve and vacuum lines are used to supply vacuum to the speed control servo. A vacuum reservoir is not used.

(1) Disconnect vacuum hose at speed control servo and install a vacuum gauge into the disconnected hose.

(2) Start engine and observe gauge at idle. For vacuum testing and vacuum specifications, refer to Vacuum Pump Output—Diesel Engine in 9, Engines.

(3) If vacuum pump output is OK, determine other source of leak. Check all vacuum lines to: speed control servo, engine vacuum pump and heating/air conditioning system for leaks.

(4) Verify operation of one-way check valve and check it for leaks.

(a) Locate one-way check valve. The valve is located in vacuum line between speed control servo and engine vacuum pump. Disconnect vacuum hoses (lines) at each end of valve.

(b) Connect a hand-operated vacuum pump to reservoir end of check valve. Apply vacuum. Vacuum should not bleed off. If vacuum is being lost, replace one-way check valve.

(c) Connect a hand-operated vacuum pump to vacuum source end of check valve. Apply vacuum. Vacuum should flow through valve. If vacuum is not flowing, replace one-way check valve. Seal the fitting at opposite end of valve with a finger and apply vacuum. If vacuum will not hold, diaphragm within check valve has ruptured. Replace valve.

Diesel Engine With Manual Trans.

Vacuum is not used for any part of the speed control system if equipped with a diesel engine and a manual transmission.

SPEED CONTROL (Continued)

DIAGNOSIS AND TESTING - ROAD TEST

Perform a vehicle road test to verify reports of speed control system malfunction. The road test should include attention to the speedometer.

If a road test verifies a system problem and the speedometer operates properly, check for:

- A Diagnostic Trouble Code (DTC). If a DTC exists, conduct tests per the Powertrain Diagnostic Procedures service manual.
- A misadjusted brake (stop) lamp switch. This could also cause an intermittent problem.
- Loose, damaged or corroded electrical connections at the servo. Corrosion should be removed from electrical terminals and a light coating of Mopar® MultiPurpose Grease, or equivalent, applied.

- Leaking vacuum reservoir.
- Loose or leaking vacuum hoses or connections.
- Defective one-way vacuum check valve.
- Secure attachment of both ends of the speed control servo cable.
- Smooth operation of throttle linkage and throttle body air valve.
- Failed speed control servo. Do the servo vacuum test.

CAUTION: When test probing for voltage or continuity at electrical connectors, care must be taken not to damage connector, terminals or seals. If these components are damaged, intermittent or complete system failure may occur.

Servo Mounting Bracket Nuts	8.5	-	75
Switch Module Mounting Screws	3	-	26
Vacuum Reservoir Mounting Screws	2.2	-	20

CABLE

DESCRIPTION

The speed control servo cable is connected between the speed control vacuum servo diaphragm and the throttle body control linkage.

OPERATION

This cable causes the throttle control linkage to open or close the throttle valve in response to movement of the vacuum servo diaphragm.

REMOVAL

REMOVAL - GAS ENGINES

- (1) Disconnect negative battery cable at battery.
- (2) Remove air cleaner (all except 8.0L V-10 engine).

(3) Using finger pressure only, remove speed control cable connector at bellcrank by pushing connector off the bellcrank pin (Fig. 1) or (Fig. 2). **DO NOT try to pull connector off perpendicular to the bellcrank pin. Connector will be broken.**

Fig. 1 Servo Cable at Throttle Body—V6/V-8 Engine

CABLE (Continued)

J948H-10

Fig. 2 Servo Cable at Throttle Body—V-10 Engine

1 - THROTTLE CABLE
2 - THROTTLE VALVE CABLE

3 - SPEED CONTROL SERVO CABLE

(4) Squeeze 2 tabs on sides of speed control cable at throttle body mounting bracket (locking plate) and push out of bracket.

(5) Remove servo cable from servo. Refer to Speed Control Servo Removal/Installation in this group.

REMOVAL - DIESEL WITH AUTO. TRANS.

(1) Disconnect both negative battery cables at both batteries.

(2) Remove cable/lever/linkage cover. Refer to Speed Control Servo Removal/Installation.

(3) Remove (disconnect) servo cable from servo. Refer to Speed Control Servo Removal/Installation.

(4) Using finger pressure only, disconnect end of servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 3). **DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(5) Squeeze 2 pinch tabs (Fig. 3) on sides of speed control cable at mounting bracket and push cable rearward out of bracket.

(6) Remove cable from vehicle.

INSTALLATION**INSTALLATION - GAS ENGINES**

(1) Install end of cable to speed control servo. Refer to Speed Control Servo Removal/Installation.

(2) Install cable into throttle body mounting bracket. Cable snaps into bracket.

(3) Install speed control cable connector at throttle body bellcrank pin. Connector snaps onto pin.

(4) Connect negative battery cable to battery.

(5) Before starting engine, operate accelerator pedal to check for any binding.

- 9 - CONNECTOR
- 10 - SPEED CONTROL CABLE

INSTALLATION - DIESEL WITH AUTO. TRANS.

(1) Install (connect) end of speed control servo cable to speed control servo. Refer to Speed Control Servo Removal/Installation.

(2) Install cable through mounting hole on mounting bracket. Cable snaps into bracket.

(3) Connect servo cable to throttle lever by pushing cable connector rearward onto lever pin while holding lever forward.

(4) Connect negative battery cables to both batteries.

(5) Before starting engine, operate accelerator pedal to check for any binding.

(6) Install cable/lever cover.

SPEED CONTROL SERVO

DESCRIPTION

A speed control servo is not used if equipped with both a diesel engine and a manual transmission.

The servo unit consists of a solenoid valve body, and a vacuum chamber. The solenoid valve body contains three solenoids:

- Vacuum

- Vent
- Dump

The vacuum chamber contains a diaphragm with a cable attached to control the throttle linkage.

OPERATION

A speed control servo is not used if equipped with both a diesel engine and a manual transmission.

The Powertrain Control Module (PCM) controls the solenoid valve body. The solenoid valve body controls the application and release of vacuum to the diaphragm of the vacuum servo. The servo unit cannot be repaired and is serviced only as a complete assembly.

Power is supplied to the servo's by the PCM through the brake switch. The PCM controls the ground path for the vacuum and vent solenoids.

The dump solenoid is energized anytime it receives power. If power to the dump solenoid is interrupted, the solenoid dumps vacuum in the servo. This provides a safety backup to the vent and vacuum solenoids.

The vacuum and vent solenoids must be grounded at the PCM to operate. When the PCM grounds the vacuum servo solenoid, the solenoid allows vacuum to enter the servo and pull open the throttle plate using the cable. When the PCM breaks the ground, the solenoid closes and no more vacuum is allowed to enter the servo. The PCM also operates the vent solenoid via ground. The vent solenoid opens and closes a passage to bleed or hold vacuum in the servo as required.

The PCM duty cycles the vacuum and vent solenoids to maintain the set speed, or to accelerate and decelerate the vehicle. To increase throttle opening, the PCM grounds the vacuum and vent solenoids. To decrease throttle opening, the PCM removes the grounds from the vacuum and vent solenoids. When the brake is released, if vehicle speed exceeds 30 mph to resume, 35 mph to set, and the RES/ACCEL switch has been depressed, ground for the vent and vacuum circuits is restored.

REMOVAL

REMOVAL

V-8 ENGINE

- (1) Disconnect negative battery cable at battery.
- (2) Disconnect electrical connector at servo (Fig. 4).
- (3) Disconnect vacuum hose at servo.
- (4) Disconnect servo cable at throttle body. Refer to Servo Cable Removal/Installation in this group.

SPEED CONTROL SERVO (Continued)

(8) Disconnect servo cable at throttle body. Refer to Servo Cable Removal/Installation in this group.

(9) Position battery tray up far enough for access to speed control servo electrical connector and vacuum line.

(10) Disconnect electrical connector and vacuum line at servo.

(11) Position battery tray with attached servo assembly to gain access to 2 servo mounting nuts (Fig. 5) or (Fig. 6).

(12) Remove 2 mounting nuts holding servo cable sleeve to bracket (Fig. 6).

(13) Pull speed control cable sleeve and servo away from servo mounting bracket to expose cable retaining clip (Fig. 6) and remove clip. Note: The servo mounting bracket displayed in (Fig. 6) is a typical bracket and may/may not be applicable to this model vehicle.

(14) Remove servo from mounting bracket. While removing, note orientation of servo to bracket.

REMOVAL - DIESEL WITH AUTO. TRANS.

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect positive battery cable at battery (drivers side battery).

(3) Remove battery holddown bolts (Fig. 11).

(4) If equipped, pull up on battery heat shield to remove it (Fig. 12).

(5) Remove battery from vehicle.

(6) From under vehicle, and in front of left front wheelhouse, remove 2 lower battery tray nuts (Fig. 13).

(7) Remove 2 nuts and 2 bolts holding battery tray to vehicle (Fig. 14).

SPEED CONTROL SERVO (Continued)

- (4) Insert servo studs through holes in servo cable sleeve.
- (5) Install servo mounting nuts and tighten to 8.5 N·m (75 in. lbs.) torque.
- (6) Connect vacuum line to servo.
- (7) Connect electrical connector to servo terminals.
- (8) Connect servo cable to throttle body. Refer to Servo Cable Removal/Installation in this group.
- (9) Install battery tray. Tighten all battery tray mounting hardware to 16 N·m (140 in. lbs.) torque.
- (10) Position battery into battery tray.
- (11) If equipped, install battery heat shield.
- (12) Install battery holddown clamp. Tighten bolt to 4 N·m (35 in. lbs.) torque.
- (13) Connect positive battery cable to battery.
- (14) Connect negative battery cable to battery.
- (15) Before starting engine, operate accelerator pedal to check for any binding.

INSTALLATION - DIESEL WITH AUTO. TRANS.

- (1) Position servo to mounting bracket.
- (2) Align hole in cable connector with hole in servo pin. Install cable-to-servo retaining clip.
- (3) Insert servo studs through holes in servo mounting bracket.
- (4) Insert servo studs through holes in servo cable sleeve.
- (5) Install servo mounting nuts and tighten to 8.5 N·m (75 in. lbs.) torque.
- (6) Connect vacuum line to servo.
- (7) Connect electrical connector to servo terminals.
- (8) Connect servo cable to throttle lever by pushing cable connector rearward onto lever pin while holding lever forward.
- (9) Install battery tray. Tighten all battery tray mounting hardware to 16 N·m (140 in. lbs.) torque.
- (10) Position battery into battery tray.
- (11) If equipped, install battery heat shield.
- (12) Install battery holddown clamp. Tighten bolt to 4 N·m (35 in. lbs.) torque.
- (13) Connect positive battery cable to battery.
- (14) Connect negative battery cables to both batteries.
- (15) Before starting engine, operate accelerator pedal to check for any binding.
- (16) Install cable/lever cover.

SWITCH**DESCRIPTION****Gas Engines and Diesel With Auto. Trans.**

There are two separate switch pods that operate the speed control system. The steering-wheel-mounted switches use multiplexed circuits to provide

inputs to the Powertrain Control Module (PCM) for ON, OFF, RESUME, ACCELERATE, SET, DECEL and CANCEL modes. Refer to the owner's manual for more information on speed control switch functions and setting procedures.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

Diesel With Manual Trans.

There are two separate switch pods that operate the speed control system. The steering-wheel-mounted switches use multiplexed circuits to provide inputs to the Engine Control Module (ECM) for ON, OFF, RESUME, ACCELERATE, SET, DECEL and CANCEL modes. Refer to the owner's manual for more information on speed control switch functions and setting procedures.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

OPERATION**Gas Engines and Diesel With Auto. Trans.**

When speed control is selected by depressing the ON, OFF switch, the Powertrain Control Module (PCM) allows a set speed to be stored in its RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between approximately 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral.

The speed control can be disengaged manually by:

- Stepping on the brake pedal.
- Depressing the OFF switch.
- Depressing the CANCEL switch.

The speed control can be disengaged also by any of the following conditions:

- An indication of Park or Neutral.
- The vehicle speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low).
- Depressing the clutch pedal.
- Excessive engine rpm (indicates that the transmission may be in a low gear).
- The vehicle speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate).
- If the actual speed is not within 20 mph of the set speed.

The previous disengagement conditions are programmed for added safety.

SWITCH (Continued)

Once the speed control has been disengaged, depressing the ACCEL switch restores the vehicle to the target speed that was stored in the PCM's RAM.

NOTE: Depressing the OFF switch will erase the set speed stored in the PCM's RAM.

If, while the speed control is engaged, the driver wishes to increase vehicle speed, the PCM is programmed for an acceleration feature. With the ACCEL switch held closed, the vehicle accelerates slowly to the desired speed. The new target speed is stored in the PCM's RAM when the ACCEL switch is released. The PCM also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the ACCEL switch.

The PCM also provides a means to decelerate without disengaging speed control. To decelerate from an existing recorded target speed, depress and hold the COAST switch until the desired speed is reached. Then release the switch. The ON, OFF switch operates two components: the PCM's ON, OFF input, and the battery voltage to the brake switch, which powers the speed control servo.

Diesel With Manual Trans.

When speed control is selected by depressing the ON, OFF switch, the Engine Control Module (ECM) allows a set speed to be stored in its RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between approximately 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied.

The speed control can be disengaged manually by:

- Stepping on the brake pedal.
- Depressing the OFF switch.
- Depressing the CANCEL switch.

The speed control can be disengaged also by any of the following conditions:

- The vehicle speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low).
- Depressing the clutch pedal.
- Excessive engine rpm (indicates that the transmission may be in a low gear).
- The vehicle speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate).
- If the actual speed is not within 20 mph of the set speed.

The previous disengagement conditions are programmed for added safety.

Once the speed control has been disengaged, depressing the ACCEL switch restores the vehicle to the target speed that was stored in the ECM's RAM.

NOTE: Depressing the OFF switch will erase the set speed stored in the ECM's RAM.

If, while the speed control is engaged, the driver wishes to increase vehicle speed, the ECM is programmed for an acceleration feature. With the ACCEL switch held closed, the vehicle accelerates slowly to the desired speed. The new target speed is stored in the ECM's RAM when the ACCEL switch is released. The ECM also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the ACCEL switch.

The ECM also provides a means to decelerate without disengaging speed control. To decelerate from an existing recorded target speed, depress and hold the COAST switch until the desired speed is reached. Then release the switch. The ON, OFF switch operates two components: the ECM's ON, OFF input, and the battery voltage to the brake switch, which powers the speed control servo.

REMOVAL

WARNING: BEFORE BEGINNING ANY AIRBAG SYSTEM COMPONENT REMOVAL OR INSTALLATION, REMOVE AND ISOLATE THE NEGATIVE (-) CABLE(S) FROM THE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. THEN WAIT TWO MINUTES FOR SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE INJURY.

- (1) Disconnect and isolate negative battery cable(s).
- (2) Remove airbag module. Refer to 8, Restraint Systems for procedures.
- (3) Remove switch-to-steering wheel mounting screws (Fig. 20).
- (4) Remove switch.
- (5) Remove electrical connector at switch.

SWITCH (Continued)

**Fig. 20 Speed Control Switches**

- 1 - MOUNTING SCREWS (2)
2 - SPEED CONTROL SWITCHES (2)

INSTALLATION

- (1) Install electrical connector to switch.
- (2) Install switch and mounting screws.
- (3) Tighten screws to 3 N-m (26 in. lbs. +/- 2 in. lbs.) torque.
- (4) Install airbag module. Refer to 8, Restraint Systems for procedures.
- (5) Connect negative battery cable(s).

VACUUM RESERVOIR**DESCRIPTION**

Gasoline Powered Engines : A vacuum reservoir is used to supply the vacuum needed to maintain proper speed control operation when engine vacuum drops, such as in climbing a grade while driving. A one-way check valve is used in the vacuum line between the reservoir and the vacuum source. This check valve is used to trap engine vacuum in the reservoir. On certain vehicle applications, this reservoir is shared with the heating/air-conditioning system. The vacuum reservoir cannot be repaired and must be replaced if faulty.

Diesel Powered Engines With Auto. Trans. : A vacuum reservoir is not used if equipped with a diesel powered engine. Instead, an engine driven pump (vacuum pump) is used to supply vacuum for speed control operation. This vacuum pump is used with the diesel engine only if it is equipped with an automatic transmission. Refer to Vacuum Pump in 9, Engines for information.

REMOVAL

The vacuum reservoir is located under the plastic cowl plenum cover at lower base of windshield. The vacuum reservoir is not used if equipped with a diesel engine.

- (1) Disconnect and isolate battery negative cable.
- (2) Remove both windshield wiper arm/blade assemblies. Refer to 8, Wiper and Washer Systems.
- (3) Remove rubber weather-strip at front edge of cowl grill (Fig. 21).

**Fig. 21 Cowl Grille Panel Weather-strip**

- 1 - COWL GRILLE
2 - WEATHERSTRIP

- (4) Release cowl grill plastic anchor screws (Fig. 22).

**Fig. 22 Plastic Anchor Screws Remove/Install**

- 1 - PLASTIC SCREW ANCHOR
2 - COWL GRILLE

VACUUM RESERVOIR (Continued)

- (5) Lift cowl plenum cover/grille panel from vehicle far enough to access vacuum reservoir.
- (6) Disconnect vacuum supply line from vacuum reservoir (Fig. 23).
- (7) Remove 2 vacuum reservoir mounting screws.
- (8) Remove vacuum reservoir from vehicle.

INSTALLATION

The vacuum reservoir is located under the plastic cowl plenum cover at lower base of windshield. The vacuum reservoir is not used if equipped with a diesel engine.

- (1) Install vacuum reservoir and two mounting screws. Tighten screws to 2.2 N·m (20 in. lbs.) torque.
- (2) Connect vacuum supply hose to vacuum reservoir.
- (3) Position cowl plenum cover/grille panel to vehicle.
- (4) Install and tighten cowl cover fasteners to vehicle body.
- (5) Install rubber weather-strip at front edge of cowl grill.
- (6) Install windshield wiper arms. Refer to 8, Wiper and Washer Systems.
- (7) Connect negative battery to cable.

DIAGNOSIS AND TESTING - VEHICLE THEFT		DIAGNOSIS AND TESTING - VTSS	
SECURITY SYSTEM	3	INDICATOR	4

VEHICLE THEFT SECURITY

DESCRIPTION

The Vehicle Theft Security System (VTSS) is an available factory-installed option on this model when it is also equipped with the high-line or premium Central Timer Module (CTM). The VTSS is designed to provide perimeter protection against unauthorized use or tampering by monitoring the vehicle doors and the ignition system. If unauthorized vehicle use or tampering is detected, the system responds by pulsing the horn, flashing the headlamps, and preventing the engine from operating.

The VTSS includes the following major components, which are described in further detail elsewhere in this service manual:

- **Central Timer Module** - The high-line or premium Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. The high-line or premium CTM contains a microprocessor and software that allow it to provide many electronic functions and features not available with base version of the CTM, including the VTSS. The CTM provides all of the proper VTSS features and outputs based upon the monitored inputs. The CTM circuitry monitors hard wired switch inputs, as well as message inputs received from other vehicle electronic modules over the Chrysler Collision Detection (CCD) data bus network. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODULE - DESCRIPTION).

- **Door Ajar Switch** - A door ajar switch is located on the hinge pillar of each front door in the vehicle. These switches provide an input to the VTSS indicating whether the door is opened or closed. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOOR AJAR SWITCH - DESCRIPTION).

- **Door Cylinder Lock Switch** - A door cylinder lock switch is located on the back of each front door lock cylinder. This switch provides an input to the

VTSS indicating whether the system should remain armed or be disarmed. (Refer to 8 - ELECTRICAL/POWER LOCKS/DOOR CYLINDER LOCK SWITCH - DESCRIPTION).

- **Horn Relay** - The horn relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery. The horn relay is normally activated by the horn switch to control the sounding of the vehicle horn or horns. However, it can also be activated by an output of the Central Timer Module (CTM) to provide an audible indication that unauthorized vehicle use or tampering has been detected. (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - DESCRIPTION).

- **Headlamp Relay** - The headlamp relay (also known as the security relay) is located in the Power Distribution Center (PDC) in the engine compartment near the battery. The headlamp relay is normally activated by the Central Timer Module (CTM) based upon inputs from the Remote Keyless Entry (RKE) panic mode feature. However, it can also be activated by an output of the CTM to flash the headlamp low beams to provide a highly visible indication that unauthorized vehicle use or tampering has been detected. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP RELAY - DESCRIPTION).

- **VTSS Indicator** - A red Light Emitting Diode (LED) located on the lower surface of the overhead console near the windshield is illuminated by an output of the Central Timer Module (CTM) to indicate the status of the VTSS. This LED is integral to the electronic circuit board for the Compass Mini-Trip Computer (CMTC). (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/COMPASS/MINI-TRIP COMPUTER - DESCRIPTION).

The engine no-run feature of the VTSS relies upon communication between the high-line or premium CTM and the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus network.

VEHICLE THEFT SECURITY (Continued)

Hard wired circuitry connects many of the VTSS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the VTSS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

A Central Timer Module (CTM) is used on this model to control and integrate many of the electronic functions and features included in the Vehicle Theft Security System (VTSS). In the VTSS, the CTM receives inputs indicating the status of the door ajar switches, the door cylinder lock switch, and the ignition switch. The programming in the CTM allows it to process the information from all of these inputs and send control outputs to energize or de-energize the horn relay, the headlamp relay, and the VTSS indicator. The control of these inputs and outputs are what constitute all of the features of the VTSS. Following is information on the operation of each of the VTSS features. Refer to the owner's manual in the vehicle glove box for more information on the features, use and operation of the VTSS.

ENABLING

The high-line or premium version of the CTM must have the VTSS function electronically enabled in order for the VTSS to perform as designed. The logic in the CTM keeps its VTSS function dormant until it is enabled using a DRBIII® scan tool. The VTSS function of the high-line or premium CTM is enabled on vehicles equipped with the VTSS option at the factory, but a service replacement CTM must be VTSS-enabled by the dealer using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

The VTSS engine no-run feature is disabled when it is shipped from the factory. This is done by programming within the Powertrain Control Module (PCM). The logic in the PCM prevents the VTSS engine no-run feature from arming until the engine start counter within the PCM sees twenty engine

starts. The VTSS no-run feature must be enabled by the dealer when the vehicle is received from the assembly plant. Once the VTSS engine no-run feature has been enabled, it cannot be disabled unless the PCM is replaced with a new unit. The same VTSS engine no-run feature enable logic will apply anytime the PCM is replaced with a new unit.

ARMING

Passive arming of the VTSS occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps are turned off, and the doors are locked while they are open using the power lock switch, or locked after they are closed by turning either front door lock cylinder to the lock position using the key. The power lock switch will not function if the key is in the ignition switch or the headlamps are turned on with the driver side front door open. The VTSS will not arm if the doors are locked using the mechanical lock button. Active arming of the VTSS occurs when the "Lock" button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors must be closed and the ignition switch must be in the Off position when the RKE transmitter "Lock" button is depressed. However, once the VTSS arming process has been completed, the ignition switch can be turned to the Accessory position without triggering the alarm.

Once the VTSS begins passive or active arming, the security indicator lamp in the overhead console will flash rapidly for about fifteen seconds. This indicates that the VTSS arming is in progress. Turning a key in the ignition switch, opening a door, or unlocking a door by any means during the fifteen second arming process will cause the VTSS indicator to stop flashing and the arming process to abort. Once the fifteen second arming function is successfully completed, the indicator will flash at a slower rate, indicating that the VTSS is armed.

DISARMING

Passive disarming of the VTSS occurs when the vehicle is unlocked using the key to unlock either front door. Active disarming of the VTSS occurs when the vehicle is unlocked by depressing the "Unlock" button of the RKE transmitter. Once the alarm has been activated (horn pulsing, headlamps flashing, and the engine no-run feature), either disarming method will also deactivate the alarm. Depressing the "Panic" button on the RKE transmitter will **not** disarm the VTSS.

VEHICLE THEFT SECURITY (Continued)

POWER-UP MODE

When the armed VTSS senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode the alarm system remains armed following a battery failure or disconnect. If the VTSS was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The engine no-run feature will prevent the engine from starting until the alarm system has been actively or passively disarmed. The VTSS will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTSS is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

TAMPER ALERT

The VTSS tamper alert feature will sound the horn three times upon disarming, if the alarm was triggered and has since timed-out (about fifteen minutes). This feature alerts the vehicle operator that the VTSS alarm was activated while the vehicle was unattended.

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

The VTSS-related hard wired inputs to and outputs from the high-line or premium Central Timer Module (CTM) may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the CTM, the Powertrain Control Module (PCM), or the Chrysler Collision Detection (CCD) data bus network. In order to obtain conclusive testing of the VTSS, the CTM, the PCM, and the CCD data bus network must also be checked. The most reliable, efficient, and accurate means to diagnose the VTSS requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. The DRBIII® scan tool can provide confirmation that the CCD data bus network is functional, that all of the electronic modules are sending and receiving the proper messages over the CCD data bus, and that these modules are receiving the proper hard wired inputs and responding with the

proper hard wired outputs needed to perform their functions. See the "Vehicle Theft Security System" menu item on the DRBIII® scan tool.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

VTSS INDICATOR**DESCRIPTION**

The Vehicle Theft Security System (VTSS) indicator consists of a red Light-Emitting Diode (LED) located on the electronic circuit board of the Compass Mini-Trip Computer (CMTC) within the overhead console. The LED extends through a hole in the CMTC lens located near the forward end of the overhead console housing near the windshield.

The VTSS indicator cannot be adjusted or repaired and, if faulty or damaged, the entire CMTC unit must be replaced. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/COMPASS/MINI-TRIP COMPUTER - DESCRIPTION).

OPERATION

The Vehicle Theft Security System (VTSS) indicator gives a visible indication of the VTSS arming status. One side of Light-Emitting Diode (LED) in the VTSS indicator is connected to battery current through a fused B(+) circuit and a fuse in the Junction Block (JB), so the indicator remains functional regardless of the ignition switch position. The other side of the LED is hard wired to the Central Timer Module (CTM), which controls the operation of the VTSS indicator by pulling this side of the LED circuit to ground. When the VTSS arming is in progress, the CTM will flash the LED rapidly on and off for about fifteen seconds. When the VTSS has been successfully armed, the CTM will flash the LED on and off continually at a much slower rate until the VTSS has been disarmed. The VTSS indicator can be diagnosed using conventional diagnostic tools and methods.

VTSS INDICATOR (Continued)

DIAGNOSIS AND TESTING - VTSS INDICATOR

The diagnosis found here addresses an inoperative Vehicle Theft Security System (VTSS) indicator condition. If the problem being diagnosed is related to indicator accuracy, be certain to confirm that the problem is with the indicator and not with an inoperative VTSS. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY SYSTEM- DIAGNOSIS AND TESTING). If no VTSS problem is found, the following procedure will help to locate a short or open in the VTSS indicator control circuit. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused B(+) fuse (Fuse 12 - 10 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse (Fuse 12 - 10 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit between the JB and the Power Distribution Center (PDC) as required.

(3) Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the Compass Mini-Trip Computer (CMTC) from the CMTC connector receptacle. Reconnect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the body wire harness connector for the CMTC. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit between the CMTC indicator and the JB as required.

(4) Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector (Connector C2) for the Central Timer Module (CTM) from the CTM connector receptacle. Check for continuity between the VTSS indicator driver circuit cavity of the body wire harness connector for the CMTC and a good ground. There should be no continuity. If OK, go to Step 5. If not OK, repair the shorted VTSS indicator driver circuit between the CMTC and the CTM as required.

(5) Check for continuity between the VTSS indicator driver circuit cavities of the instrument panel wire harness connector (Connector C2) for the CTM and the body wire harness connector for the CMTC. There should be continuity. If OK, replace the faulty CMTC indicator. If not OK, repair the open VTSS indicator driver circuit between the CMTC and the CTM as required.

WIPERS/WASHERS

DESCRIPTION

An electrically operated intermittent wiper and washer system is standard factory-installed safety equipment on this model. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Central Timer Module** - The Central Timer Module (CTM) is located under the driver side end of the instrument panel, inboard of the instrument panel steering column opening. A base version of the CTM is used on base models of this vehicle. The base version of the CTM combines the functions of a chime module and an intermittent wipe module in a single unit. The high-line version of the CTM is used on high-line vehicles. The high-line CTM provides all of the functions of the base version of the CTM, but also is used to control and integrate many additional

electronic functions and features included on high-line models. The premium version of the CTM is the same as the high-line version, but is used only on models equipped with the heated seat option. The high-line and premium versions of the CTM contain integrated circuitry, a central processing unit and the programming to provide all of the proper wiper and washer system features based upon the monitored inputs. The high-line and premium CTM circuitry monitors hard wired switch inputs, as well as message inputs received from other vehicle electronic modules on the Chrysler Collision Detection (CCD) data bus network. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/BODY CONTROL/CENTRAL TIMER MODULE - DESCRIPTION).

- **Multi-Function Switch** - The multi-function switch is secured to the left side of the steering column, just below the steering wheel. Only the control stalk for the multi-function switch is visible, the remainder of the switch is concealed beneath the steering column shrouds. The multi-function switch

WIPERS/WASHERS (Continued)

contains all of the switches for both the wiper and washer systems.

- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower rear side of the washer reservoir, above the washer pump/motor unit near the left front corner of the engine compartment.

- **Washer Nozzles** - The dual fluidic washer nozzles are secured with integral snap features to dedicated openings in the cowl plenum cover/grille panel located near the base of the windshield. The washer plumbing fittings for the washer nozzles are concealed beneath the cowl plenum cover/grille panel.

- **Washer Pump/Motor** - The washer pump/motor unit is located in a dedicated hole on the lower rear side of the washer reservoir near the left front corner of the engine compartment.

- **Washer Reservoir** - The washer reservoir is secured to the left side of the radiator fan shroud in the left front corner of the engine compartment.

- **Wiper Arms** - The two wiper arms are secured to the two wiper pivots, which extend through the cowl plenum cover/grille panel located near the base of the windshield.

- **Wiper Blades** - The two wiper blades are secured to the two wiper arms, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.

- **Wiper Module** - The wiper pivots are the only visible components of the wiper module. The remainder of the module is concealed within the cowl plenum beneath the cowl plenum cover/grille panel. The wiper module includes the module bracket, the single wiper motor, the wiper linkage, and the two wiper pivots.

- **Wiper Relay** - The wiper relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery.

Features of the wiper and washer system include the following:

- **Continuous Wipe Modes** - The two-speed wiper motor and the internal circuitry of the multi-function switch work in concert to provide two continuous wipe cycles, low speed or high speed.

- **Intermittent Wipe Mode** - The internal circuitry of the multi-function switch, the CTM, and the wiper relay work in concert to provide an intermittent wipe mode with multiple delay interval selections. On models with a high-line or premium CTM, the CTM also automatically adjusts each manually selected delay interval to compensate for vehicle speed.

- **Washer Mode** - When the washer system is activated with the multi-function switch while the wiper system is operating, washer fluid will be dispensed onto the windshield glass through the washer

nozzles for as long as the washer pump/motor is energized.

- **Wipe-After-Wash Mode** - The internal circuitry of the CTM provides a wipe-after-wash feature which, if the wipers are turned Off, will operate the washer pump/motor and the wipers for as long as the washer system is activated, then provide several additional wipe cycles after the washer system is deactivated before parking the wiper blades near the base of the windshield.

Hard wired circuitry connects the wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The wiper and washer system is intended to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outside windshield glass surface that might be encountered while driving the vehicle under numerous types of inclement operating conditions. The vehicle operator initiates all wiper and washer system functions with the multi-function switch control stalk that extends from the left side of the steering column, just below the steering wheel. Rotating the knob on the end of the multi-function switch control stalk selects the desired wiper system operating mode. The wiper system allows the vehicle operator to select from two continuous wiper speeds, Hi or Lo, or one of several intermittent wipe Delay mode intervals. Pushing the button on the end of the control stalk downwards towards the steering column

WIPERS/WASHERS (Continued)

activates the washer pump/motor, which dispenses washer fluid onto the windshield glass through the washer nozzles.

When the ignition switch is in the Accessory or On positions, battery current from a fuse in the Junction Block (JB) is provided through a fused ignition switch output (run-acc) circuit to the wiper motor park switch, the wiper relay, and the multi-function switch. The internal circuitry of the multi-function switch provides a direct hard wired battery current output to the low speed or high speed brushes of the wiper motor when the Lo or Hi switch setting is selected, which causes the wipers to cycle at the selected speed. The intermittent wipe, and wipe-after-wash features of the wiper and washer system are provided by the electronic intermittent wipe logic circuit within the Central Timer Module (CTM). In order to provide the intermittent wipe feature, the CTM monitors the wiper switch state and the wiper motor park switch state. In order to provide the wipe-after-wash feature, the CTM monitors both the washer switch state and the wiper motor park switch state. When a Delay position is selected with the multi-function switch control knob, the CTM logic circuit responds by calculating the correct delay interval. The CTM then energizes the wiper relay by pulling the relay control coil to ground. The energized wiper relay directs battery current through the normally open contact of the relay back through the internal circuitry of the multi-function switch to the low speed brush of the wiper motor. The CTM monitors the wiper motor operation through the wiper park switch sense circuit, which allows the CTM to determine the proper timing to begin the next wiper blade sweep. The normal delay intervals are driver adjustable from about one-half second to about eighteen seconds.

The high-line and premium CTM also provides a speed sensitive intermittent wipe feature. By monitoring vehicle speed messages received from the Powertrain Control Module (PCM) over the Chrysler Collision Detection (CCD) data bus network, the high-line or premium CTM is able to adjust the delay intervals to compensate for vehicle speed. Above about sixteen kilometers-per-hour (ten miles-per-hour) the delay is driver adjustable from about one-half second to about eighteen seconds. Below about sixteen kilometers-per-hour (ten miles-per-hour) the delay times are doubled by the CTM, from about one second to about thirty-six seconds.

When the Off position of the multi-function switch wiper control knob is selected, one of two events is possible. The event that will occur depends upon the position of the wiper blades on the windshield at the moment that the Off position is selected. If the wiper blades are in the down position on the windshield

when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is closed to battery current through a fused ignition switch output (run-acc) circuit. The park switch sense circuit directs this battery current to the low speed brush of the wiper motor through the normally closed contact of the wiper relay and the internal Off position circuitry of the multi-function switch. This causes the wiper motor to continue running until the wiper blades are in the down position on the windshield and the park switch is again closed to ground.

When the Wash position of the multi-function switch is selected, the Wash position circuitry within the switch directs battery current to the washer pump/motor. The CTM monitors the washer switch state through a washer switch sense input. When the washer switch is closed with the wiper system turned Off, the CTM operates the wiper motor through the wiper relay in the same manner as it does to provide the Delay mode operation. After the state of the washer switch changes to open, the CTM monitors the wiper motor through the wiper park switch sense circuit, which allows the CTM to monitor the number of wiper blade sweeps.

Proper testing of the CTM, the PCM, or the CCD data bus vehicle speed messages requires a DRBIII® scan tool. Refer to the appropriate diagnostic information. Refer to the owner's manual in the vehicle glove box for more information on the features and operation of the wiper and washer system.

DIAGNOSIS AND TESTING - WIPER & WASHER SYSTEM

WIPER SYSTEM

The diagnosis found here addresses an electrically inoperative wiper system. If the wiper motor operates, but the wipers do not move on the windshield, replace the faulty wiper module. If the wipers operate, but chatter, lift, or do not clear the glass, clean and inspect the wiper system components as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSPECTION) and (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The following tests will help to diagnose the hard wired components and circuits of the wiper system.

WIPERS/WASHERS (Continued)

However, these tests may not prove conclusive in the diagnosis of this system on models equipped with a high-line or premium Central Timer Module (CTM). In order to obtain conclusive testing of the wiper system on models with a high-line or premium CTM, the Chrysler Collision Detection (CCD) data bus network and all of the electronic modules that provide inputs to or receive outputs from the wiper system components must be checked. The most reliable, efficient, and accurate means to diagnose the wiper system on models with a high-line or premium CTM requires the use of a DRBIII® scan tool. Refer to the appropriate diagnostic information. The DRBIII® scan tool can provide confirmation that the CCD data bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CCD data bus, and that the wiper relay is being sent the proper hard wired outputs by the CTM for it to perform its wiper system functions.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused ignition switch output (run-acc) fuse (Fuse 6 - 25 ampere) in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) fuse (Fuse 6 - 25 ampere) in the JB. If OK, go to Step 3. If not OK, repair the open fused ignition switch output (run-acc) circuit between the JB and the ignition switch as required.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector for the multi-function switch from the switch connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run-acc) circuit cavity of the instrument panel wire harness connector for the multi-function switch. If OK, go to Step 4. If not OK, repair the

open fused ignition switch output circuit between the multi-function switch and the JB as required.

(4) If the problem being diagnosed involves only the intermittent wipe feature, go to Step 5. If the problem being diagnosed involves all wiper modes, or only the Low and/or High speed modes, go to Step 7.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector (Connector C1) for the Central Timer Module (CTM) from the CTM connector receptacle. Check for continuity between the wiper switch mode sense circuit cavities of the instrument panel wire harness connector for the multi-function switch and the instrument panel wire harness connector (Connector C1) for the CTM. There should be continuity. If OK, go to Step 6. If not OK, repair the open wiper switch mode sense circuit between the multi-function switch and the CTM as required.

(6) Check for continuity between the wiper switch mode signal circuit cavities of the instrument panel wire harness connector for the multi-function switch and the instrument panel wire harness connector (Connector C1) for the CTM. There should be continuity. If OK, proceed to the diagnosis for the wiper relay. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER RELAY - DIAGNOSIS AND TESTING). If not OK, repair the open wiper switch mode signal circuit between the multi-function switch and the CTM as required.

(7) Check for continuity between the two wiper switch low speed output circuit cavities of the instrument panel wire harness connector for the multi-function switch. There should be continuity. If OK, go to Step 8. If not OK, repair the open wiper switch low speed output circuit between the two cavities of the instrument panel wire harness connector for the multi-function switch as required.

(8) Test the multi-function switch continuity. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DIAGNOSIS AND TESTING). If the multi-function switch tests OK, reconnect the instrument panel wire harness connector for the multi-function switch to the switch connector receptacle and go to Step 9. If not OK, replace the faulty multi-function switch and test the wiper system operation again. If still not OK, go to Step 9.

(9) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Measure the resistance between the headlamp and dash wire harness ground wire for the wiper motor and a good ground. The meter should read zero ohms. If OK, go to Step 10. If not OK, repair the open ground circuit to ground (G100) as required.

WIPERS/WASHERS (Continued)

(10) Disconnect the headlamp and dash wire harness connector for the wiper module from the wiper motor pigtail wire connector. Reconnect the battery negative cable. Turn the ignition switch to the On position. Place the multi-function switch in the positions indicated in the tests below, and check for battery voltage at the appropriate cavity of the headlamp and dash wire harness connector for the wiper motor.

(a) Check for battery voltage at the fused ignition switch output (run-acc) circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in any position. If OK, go to Step b. If not OK, repair the open fused ignition switch output (run-acc) circuit between the wiper module and the JB as required.

(b) Check for battery voltage at the wiper switch low speed output circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in the Lo position. If OK, go to Step c. If not OK, repair the open wiper switch low speed output circuit between the wiper module and the multi-function switch as required.

(c) Check for battery voltage at the wiper switch high speed output circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in the Hi position. If OK, go to Step d. If not OK, repair the open wiper switch high speed output circuit between the wiper module and the multi-function switch as required.

(d) Check for battery voltage at the wiper park switch sense circuit cavity of the headlamp and dash wire harness connector for the wiper module with the multi-function switch in the Lo or Hi position, then move the switch to the Off position. The meter should switch between battery voltage and zero volts while the wipers are cycling. The meter should read battery voltage when the switch is first moved to the Off position until the wipers park, and then read a steady zero volts. If not OK, replace the faulty wiper module.

WASHER SYSTEM

The diagnosis found here addresses an electrically inoperative washer system. If the washer pump/motor operates, but no washer fluid is emitted from the washer nozzles, be certain to check the fluid level in the reservoir. Also inspect the washer system components as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - INSPECTION). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness

routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Turn the ignition switch to the On position. Turn the multi-function switch wiper control knob to the Lo or Hi speed position. Check whether the wipers operate. If OK, go to Step 2. If not OK, repair the wiper system as required before proceeding with the following tests. Refer to WIPER SYSTEM .

(2) Turn the multi-function switch wiper control knob to the Off position. Depress the washer button. The washer pump should operate and the wipers should operate for as long as the washer button is depressed. The wipers should continue to operate for about three sweep cycles after the button is released before they park. If the wipers are OK, but the washers are not, go to Step 3. If the washers are OK, but the wipers are not, go to Step 5.

(3) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the headlamp and dash wire harness connector for the washer pump/motor from the motor connector receptacle. Measure the resistance between the ground circuit cavity of the headlamp and dash wire harness connector for the washer pump/motor and a good ground. The meter should read zero ohms. If OK, go to Step 4. If not OK, repair the open ground circuit to ground (G100) as required.

(4) Reconnect the battery negative cable. Turn the ignition switch to the On position. With the washer button depressed, check for battery voltage at the washer switch output circuit cavity of the headlamp and dash wire harness connector for the washer pump/motor. If OK, replace the faulty washer pump/motor. If not OK, repair the open washer switch output circuit between the washer pump/motor and the multi-function switch as required.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector (Connector C1) for the Central Timer Module

WIPERS/WASHERS (Continued)

(CTM) from the CTM connector receptacle. Reconnect the battery negative cable. Turn the ignition switch to the On position. With the washer button depressed, check for battery voltage at the washer switch sense circuit cavity of the instrument panel wire harness connector (Connector C1) for the CTM. If OK, proceed to the diagnosis for the wiper relay. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER RELAY - DIAGNOSIS AND TESTING). If not OK, repair the open washer switch sense circuit between the CTM and the multi-function switch as required.

CLEANING - WIPER & WASHER SYSTEM**WIPER SYSTEM**

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms, and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

WASHER SYSTEM

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the front washer pump/motor from the reservoir. Clean foreign material from the inside of the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted washer nozzles should be carefully back-flushed using compressed air. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

INSPECTION - WIPER & WASHER SYSTEM**WIPER SYSTEM**

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

(1) Inspect the wiper arms for any indications of damage, or contamination. If the wiper arms are contaminated with any foreign material, clean them as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). If a wiper arm is damaged or corrosion is evident, replace the wiper arm with a new unit. Do not attempt to repair a wiper arm that is damaged or corroded.

(2) Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

(3) Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. Compare the scale readings between the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.

(4) Inspect the wiper blades and squeegees for any indications of damage, contamination, or rubber deterioration (Fig. 1). If the wiper blades or squeegees are contaminated with any foreign material, clean them and the glass as required. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING). After cleaning the wiper blade and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade. Also, if a wiper blade is damaged or the squeegee rubber is damaged or deteriorated, replace

WIPERS/WASHERS (Continued)

the wiper blade with a new unit. Do not attempt to repair a wiper blade that is damaged.

809ac961

Fig. 1 Wiper Blade Inspection

- 2 - ROAD FILM OR FOREIGN MATERIAL DEPOSITS
- 3 - HARD, BRITTLE, OR CRACKED
- 4 - DEFORMED OR FATIGUED
- 5 - SPLIT
- 6 - DAMAGED SUPPORT COMPONENTS

WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

(1) Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - CLEANING).

(2) Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also,

sharp bends that might pinch the washer hose must be avoided.

WASHER FLUID LEVEL SWITCH

DESCRIPTION

The washer fluid level switch is a single pole, single throw reed-type switch mounted on the rear of the washer reservoir above the washer pump/motor, in the left front corner of the engine compartment. Only the molded plastic switch mounting flange and connector receptacle are visible when the switch is installed in the reservoir. A short nipple formation extends from the inner surface of the switch mounting flange, and a barb on the nipple near the switch mounting flange is press-fit into a rubber grommet seal installed in the mounting hole of the reservoir. A small plastic float pivots on the end of a bracket that extends from the switch nipple formation. Within the float is a small magnet, which actuates the reed switch. The washer fluid level switch cannot be adjusted or repaired. If faulty or damaged, the switch must be replaced.

OPERATION

The washer fluid level switch uses a pivoting, oblong float to monitor the level of the washer fluid in the washer reservoir. The float contains a small magnet. When the float pivots, the changing proximity of its magnetic field will cause the contacts of the small, stationary reed switch to open or close. When the fluid level in the washer reservoir is at or above the float level, the float moves to a vertical position and the switch contacts open. When the fluid level in the washer reservoir falls below the pivoting float, the float moves to a horizontal position and the switch contacts close. The switch contacts are connected in series between ground and the washer fluid switch sense input of the instrument cluster. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. The switch receives ground through another take out of the headlamp and dash wire harness with a single eyelet terminal connector that is secured under a nut to a ground stud located on the front extension of the left front wheel housing in the engine compartment. The washer fluid level switch can be diagnosed using conventional diagnostic tools and methods. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/WASHER FLUID INDICATOR - DIAGNOSIS AND TESTING).

WASHER FLUID LEVEL SWITCH (Continued)

REMOVAL

The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor unit and allow the washer fluid to drain into a clean container for reuse.

(3) Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle (Fig. 2).

Fig. 2 Washer Reservoir

- 1 - FAN SHROUD
- 2 - LOW WASHER FLUID SENSOR
- 3 - WASHER PUMP
- 4 - WASHER RESERVOIR

NOTE: The pivoting float of the washer fluid level switch must be in a horizontal position within the reservoir in order to be removed. With the reservoir empty and in an upright position, the pivoting float will orient itself to the horizontal position when the switch connector receptacle is pointed straight downwards.

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level switch out of the rubber grommet seal on the rear of the reservoir. Care must be taken not to damage the reservoir.

(5) Remove the washer fluid level switch and float from the washer reservoir.

(6) Remove the rubber grommet seal from the washer fluid level switch mounting hole in the washer reservoir and discard.

INSTALLATION

(1) Install a new rubber grommet seal into the washer fluid level switch mounting hole in the front of the washer reservoir. Always use a new rubber grommet seal on the reservoir.

(2) Position the float of the washer fluid level switch through the rubber grommet seal in the washer reservoir (Fig. 2). The connector receptacle of the washer fluid level switch should be pointed downward.

(3) Press firmly and evenly on the washer fluid level switch using hand pressure until the barbed nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.

(4) Reconnect the headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle.

(5) Reconnect the washer hose to the barbed outlet nipple of the washer pump/motor unit.

(6) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(7) Reconnect the battery negative cable.

WASHER HOSES/TUBES

DESCRIPTION

The washer plumbing consists of a small diameter rubber hose that is routed from the barbed outlet nipple of the washer pump/motor on the washer reservoir through the engine compartment along the left inner fender shield to a molded plastic in-line fitting with barbed nipples near the dash panel. A second section of washer hose passes from the engine compartment into the cowl plenum area through a dedicated hole with a rubber grommet near the left end of the cowl plenum panel. Beneath the cowl plenum cover/grille panel, a molded plastic wye fitting with barbed nipples joins the engine compartment hose to the two washer nozzle hoses. The two washer hoses are routed through locating clips on the underside of the cowl plenum cover/grille panel to the two washer nozzles.

Washer hose is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings cannot be repaired. If these fittings are faulty or damaged, they must be replaced.

OPERATION

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor through the washer system plumbing and fittings to the two washer nozzles. Whenever routing the washer hose or a wire harness containing a washer hose, it must

WASHER HOSES/TUBES (Continued)

be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the hose must be avoided.

WASHER NOZZLE

DESCRIPTION

The two washer nozzles have integral snap features that secure them in dedicated holes in the cowl plenum cover/grille panel located near the base of the windshield. The domed upper surface of the washer nozzle is visible on the top of the plenum cover/grille panel, and the nozzle orifice is oriented towards the windshield glass. The washer plumbing fittings for the washer nozzles are concealed beneath the cowl plenum cover/grille panel. These fluidic washer nozzles are constructed of molded plastic. The cowl plenum cover/grille panel must be removed from the vehicle to access the nozzles for service. The washer nozzles cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

OPERATION

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor through rubber hoses, which are attached to a barbed nipple on each washer nozzle below the cowl plenum cover/grille panel. The washer nozzles incorporate a fluidic design, which causes the nozzle to emit the pressurized washer fluid as an oscillating stream to more effectively cover a larger area of the glass area to be cleaned.

REMOVAL

(1) Remove the cowl plenum cover/grille panel from the cowl top. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

(2) From the underside of the cowl plenum cover/grille panel, disconnect the washer hose from the nozzle fitting.

(3) From the underside of the cowl plenum cover/grille panel, compress the snap features of the washer nozzle and push the nozzle out through the top of the panel.

INSTALLATION

(1) From the top of the cowl plenum cover/grille panel, insert the barbed nipple of the washer nozzle through the nozzle mounting hole.

(2) With the orifice of the washer nozzle oriented toward the windshield, use hand pressure to push the nozzle into the mounting hole until the snap fea-

tures of the nozzle are fully engaged with the underside of the cowl plenum cover/grille panel.

(3) From the underside of the cowl plenum cover/grille panel, reconnect the washer hose to the washer nozzle fitting.

(4) Reinstall the cowl plenum cover/grille panel onto the cowl top. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

WASHER PUMP/MOTOR

DESCRIPTION

The washer pump/motor unit is located on the rear of the washer reservoir, near the bottom in the left front corner of the engine compartment. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump. A seal flange with a large barbed inlet nipple on the pump housing passes through a rubber grommet seal installed in the dedicated mounting hole near the bottom of the washer reservoir. A smaller barbed outlet nipple on the pump housing connects the unit to the washer hose. The washer pump/motor unit is retained on the reservoir by the interference fit between the barbed pump inlet nipple and the grommet seal, which is a light press fit. An integral electrical connector receptacle is located on the motor housing. The washer pump/motor unit cannot be repaired. If faulty or damaged, the entire washer pump/motor unit must be replaced.

OPERATION

The washer pump/motor unit is connected to the vehicle electrical system through a single take out and two-cavity connector of the headlamp and dash wire harness. The washer pump/motor is grounded at all times through a take out of the headlamp and dash wire harness with a single eyelet terminal connector that is secured by a nut to a ground stud located on the forward extension of the left front fender wheel housing in the engine compartment. The washer pump/motor receives battery current on a fused ignition switch output (run-acc) circuit through the closed contacts of the momentary washer switch within the multi-function switch only when the washer button on the end of the switch control stalk is depressed towards the steering column. Washer fluid is gravity-fed from the washer reservoir to the inlet side of the washer pump. When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through the pump outlet nipple, the washer plumbing, and the washer nozzles onto the windshield glass.

WASHER PUMP/MOTOR (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the headlamp and dash wire harness connector for the washer pump/motor from the motor connector receptacle (Fig. 3).

J948K-18

Fig. 3 Washer Reservoir

- 1 - FAN SHROUD
- 2 - LOW WASHER FLUID SENSOR
- 3 - WASHER PUMP
- 4 - WASHER RESERVOIR

(3) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor and allow the washer fluid to drain into a clean container for reuse.

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed inlet nipple of the washer pump out of the rubber grommet seal in the reservoir. Care must be taken not to damage the reservoir.

(5) Remove the rubber grommet seal from the washer pump mounting hole in the washer reservoir and discard.

INSTALLATION

(1) Install a new rubber grommet seal into the washer pump mounting hole in the washer reservoir. Always use a new rubber grommet seal on the reservoir.

(2) Position the barbed inlet nipple of the washer pump to the rubber grommet seal in the reservoir.

(3) Press firmly and evenly on the washer pump until the barbed inlet nipple is fully seated in the rubber grommet seal in the washer reservoir mounting hole.

(4) Reconnect the washer hose to the barbed outlet nipple of the washer pump.

(5) Reconnect the headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle (Fig. 3).

(6) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(7) Reconnect the battery negative cable.

WASHER RESERVOIR**DESCRIPTION**

The molded plastic washer fluid reservoir is secured with integral mounting tabs to keyed slots on the left side of the radiator fan shroud in the left front corner of the engine compartment. A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for "Windshield Washer" and the text "Washer Fluid Only" molded into it snaps over the open end of the filler neck. A bail strap that is integral to the cap secures the cap to the reservoir filler neck when it is removed for inspecting or adjusting the fluid level in the reservoir. There are separate, dedicated holes on the rear side of the reservoir provided for the mounting of the washer/pump motor unit and the washer fluid level switch.

The washer reservoir cannot be repaired and, if faulty or damaged, it must be replaced. The washer reservoir, the grommet seals for the washer pump/motor unit and the washer fluid level switch, and the filler cap are each available for service replacement.

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the washer system. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir. The washer/pump motor unit is located in a sump area near the bottom of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the washer system will no longer operate.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Drain the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - DRAIN/ALL EXCEPT DIESEL ENGINE) or (Refer to 7 -

WASHER RESERVOIR (Continued)

COOLING - STANDARD PROCEDURE - DRAIN/ DIESEL ENGINE).

(3) Disconnect the upper radiator hose from the radiator.

(4) Disconnect the headlamp and dash wire harness connector for the washer fluid level switch from the switch connector receptacle.

(5) Disconnect the headlamp and dash wire harness connector for the washer pump/motor unit from the motor connector receptacle.

(6) Disconnect the washer hose from the barbed outlet nipple of the washer pump/motor and allow the washer fluid to drain into a clean container for reuse.

(7) While pulling the washer reservoir away from the fan shroud, lift the reservoir upwards far enough to disengage the reservoir mounting tabs from the keyed upper and lower mounting slots in the fan shroud (Fig. 4).

Fig. 4 Washer Reservoir

- 1 - FAN SHROUD
- 2 - WASHER FLUID LEVEL SWITCH
- 3 - WASHER PUMP
- 4 - WASHER RESERVOIR

(8) Remove the washer reservoir from the engine compartment.

INSTALLATION

(1) Position the washer reservoir into the engine compartment (Fig. 4).

(2) Align and insert the upper and lower washer reservoir mounting tabs into the keyed upper and lower mounting slots in the radiator fan shroud. When all the tabs are inserted, use hand pressure to push the reservoir downwards far enough to engage the mounting tabs in the keyways of the mounting slots.

(3) Reconnect the washer hose to the barbed outlet nipple of the washer pump.

(4) Reconnect the headlamp and dash wire harness connector for the washer pump/motor unit to the motor connector receptacle.

(5) Reconnect the headlamp and dash wire harness connector for the washer fluid level switch to the switch connector receptacle.

(6) Reconnect the upper radiator hose to the radiator.

(7) Refill the engine cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE - REFILL/ ALL EXCEPT DIESEL ENGINE) or (Refer to 7 - COOLING - STANDARD PROCEDURE - REFILL/ DIESEL ENGINE).

(8) Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

(9) Reconnect the battery negative cable.

WIPER ARM

DESCRIPTION

The wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. The wiper arm has a die cast metal pivot end. On the underside of this pivot end is a socket formation with internal serrations and a small, movable, stamped steel latch plate that is secured loosely under a small strap that is staked to the pivot end. The wide end of a tapered, stamped steel channel hinges on and is secured with a hinge pin to the pivot end of the wiper arm. One end of a long, rigid, stamped steel strap, with a small hole near its pivot end, is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook. Concealed within the stamped steel channel, one end of a long spring is hooked through a hole in a small stamped steel strap on the hinge pin within the die cast pivot end, while the other end of the spring is hooked through the small hole in the steel strap. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

A wiper arm cannot be adjusted or repaired. If damaged or faulty, the entire wiper arm unit must be replaced.

OPERATION

The wiper arms are designed to mechanically transmit the motion from the wiper pivots to the wiper blades. The wiper arm must be properly indexed to the wiper pivot in order to maintain the

WIPER ARM (Continued)

proper wiper blade travel on the glass. The socket formation with internal serrations in the wiper arm pivot end interlocks with the serrations on the outer circumference of the wiper pivot driver, allowing positive engagement and finite adjustment of this connection. The latch plate on the underside of the wiper arm pivot end locks the wiper arm to the wiper pivot when in its installed position and, when in its unlocked position, also serves as a blocker to hold the spring-loaded wiper arm off of the glass to facilitate removal and installation. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REMOVAL

- (1) Unlatch and open the hood.
- (2) Lift the wiper arm far enough to raise the wiper blade off of the glass and permit the wiper arm latch plate to be pulled out to its holding position, then release the arm (Fig. 5). The wiper arm and blade will remain off the glass with the latch in this position.

J948K-21

Fig. 5 Wiper Arm Remove/Install - Typical

CAUTION: The use of a screwdriver or other prying tool to remove a wiper arm may distort it. This distortion could allow the arm to come off of the wiper pivot during wiper operation, regardless of how carefully it is reinstalled.

- (3) Using a slight rocking motion, remove the wiper arm pivot end from the wiper pivot.

INSTALLATION

NOTE: Be certain that the wiper motor is in the park position before attempting to install the wiper arms. Turn the ignition switch to the On position and move the wiper control knob on the end of the multi-function switch control stalk to its Off position. If the wiper pivots move, wait until they stop moving, then turn the ignition switch back to the

Off position. The wiper motor is now in its park position.

- (1) The wiper arms must be indexed to the wiper pivots with the wiper motor in the park position to be properly installed (Fig. 6). Position the wiper arm pivot ends onto the wiper pivots so that the lower edge of the wiper arm tip is on the upper edge of the lower windshield blackout area ± 22 millimeters (± 0.86 inches).

Fig. 6 Wiper Arm Installation

- (2) Once the wiper arm is indexed to the wiper pivot, lift the wiper arm away from the windshield slightly to relieve the spring tension on the latch plate, then push the latch plate into the locked position. Gently lower the wiper arm until the wiper blade rests on the glass.

- (3) Wet the windshield glass, then operate the wipers. Turn the wiper control knob on the end of the multi-function switch control stalk to the Off position, then check for the correct wiper arm position and adjust as required.

WIPER BLADE

DESCRIPTION

Each wiper blade is secured by an integral latching pivot block to the hook formation on the tip of the wiper arms, and rests on the glass near the base of the windshield when the wipers are not in operation. The wiper blade consists of the following components:

- **Superstructure** - The superstructure includes several stamped steel bridges and links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

- **Element** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.

- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

WIPER BLADE (Continued)

All Ram truck models have two 50 centimeter (19.69 inch) wiper blades with non-replaceable rubber elements (squeegees). These wiper blades also include an anti-lift feature. The wiper blades cannot be adjusted or repaired. If faulty, worn, or damaged the entire wiper blade unit must be replaced.

OPERATION

The wiper blade is moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface. The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

NOTE: The driver side and passenger side wiper blades are not interchangeable. The driver side wiper blade has an extra bridge and eight pairs of claws securing the wiper element. The passenger side wiper blade has six pairs of claws securing the wiper element. The notched retainer end of both wiper elements should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

(1) Turn the wiper control knob on the end of the multi-function switch control stalk to the On position. Cycle the wiper blades to a convenient working location on the windshield by turning the ignition switch to the On and Off positions.

(2) Lift the wiper arm to raise the wiper blade and element off of the glass.

(3) To remove the wiper blade from the wiper arm, push the pivot block latch release tab under the tip of the arm and slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook (Fig. 7).

(4) Extract the hook formation on the tip of the wiper arm from the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit.

Fig. 7 Wiper Blade Remove/Install - Typical

1 - RELEASE TAB

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

(5) Gently lower the wiper arm tip onto the glass.

INSTALLATION

NOTE: The driver side and passenger side wiper blades are not interchangeable. The driver side wiper blade has an extra bridge and eight pairs of claws securing the wiper element. The passenger side wiper blade has six pairs of claws securing the wiper element. The notched retainer end of both wiper elements should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

(1) Lift the wiper arm off of the windshield glass.

(2) Position the wiper blade near the hook formation on the tip of the arm with the notched retainer for the wiper element oriented towards the end of the wiper arm that is nearest to the wiper pivot.

(3) Insert the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure ahead of the wiper blade pivot block/latch unit far enough to engage the pivot block with the hook (Fig. 7).

(4) Slide the wiper blade pivot block/latch up into the hook formation on the tip of the wiper arm until the latch release tab snaps into its locked position.

(5) Gently lower the wiper blade onto the glass.

WIPER MODULE

DESCRIPTION

The wiper module is secured with screws to the cowl plenum panel and concealed within the cowl plenum area beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts that protrude through dedicated openings in the cowl plenum

WIPER MODULE (Continued)

cover/grille panel to drive the wiper arms and blades are the only visible components of the wiper module. The wiper module consists of the following major components:

- **Bracket** - The wiper module bracket consists of a long tubular steel main member that has a stamped pivot bracket formation near each end where the two wiper pivots are secured. A stamped steel mounting plate for the wiper motor is secured with welds near the center of the main member.

- **Crank Arm** - The wiper motor crank arm is a stamped steel unit that has a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.

- **Linkage** - The two wiper linkage members are each constructed of stamped steel. A driver side drive link with a plastic socket-type bushing in the left end, and a plastic sleeve-type bushing in the right end. Socket bushing is snap-fit over the pivot ball stud on the left pivot, while the sleeve bushing is fit over the longer wiper motor crank arm pivot stud. The passenger side drive link has a plastic socket-type bushing on each end. One end of this drive link is snap-fit over the pivot ball stud on the right pivot, while the other end is snap-fit over the exposed end of the longer ball stud on the wiper motor crank arm.

- **Motor** - The wiper motor is secured with three screws to the motor mounting plate near the center of the wiper module bracket. The wiper motor output shaft passes through a hole in the module bracket, where a nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal Positive Temperature Coefficient (PTC) circuit breaker.

- **Pivots** - The two wiper pivots are secured to the ends of the wiper module bracket. The crank arms that extend from the bottom of the pivot shafts each have a ball stud on their end. The upper end of each pivot shaft where the wiper arms will be fastened each has an externally serrated drum secured to it.

The wiper module cannot be adjusted or repaired. If any component of the module is faulty or damaged, the entire wiper module unit must be replaced.

OPERATION

The wiper module operation is controlled by the vehicle operator through battery current inputs received by the wiper motor from the multi-function switch on the steering column. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission compo-

nents. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads. The wiper motor crank arm, the two wiper linkage members, and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.

- (2) Remove the wiper arms from the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

- (3) Remove the cowl plenum cover/grille panel from the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

- (4) Remove the four screws that secure the wiper module bracket to the cowl plenum panel and the dash panel (Fig. 8).

Fig. 8 Wiper Module Remove/Install

1 - WIPER MODULE MOUNTING SCREWS

- (5) Reach into the cowl plenum to move the wiper module far enough to access the wiper module electrical connections (Fig. 9).

- (6) Disconnect the headlamp and dash wire harness connector for the wiper motor from the wiper motor pigtail wire connector.

- (7) Disconnect the headlamp and dash wire harness ground connector from the wiper motor ground terminal.

- (8) Remove the wiper module from the cowl plenum as a unit.

INSTALLATION

- (1) Position the wiper module into the cowl plenum as a unit.

WIPER MODULE (Continued)

Fig. 9 Wiper Module Electrical Connections

- 1 - GROUND CONNECTOR
2 - WIPER MOTOR CONNECTOR
3 - GROUND TERMINAL

(2) Reconnect the headlamp and dash wire harness ground connector to the wiper motor ground terminal (Fig. 9).

(3) Reconnect the headlamp and dash wire harness connector for the wiper motor to the wiper motor pig-tail wire connector.

(4) Reach into the cowl plenum to align the wiper module mounting bracket with the locations for the mounting screws (Fig. 8).

(5) Install and tighten the four screws that secure the wiper module bracket to the cowl plenum panel and the dash panel. Tighten the screws to 8 N·m (72 in. lbs.).

(6) Reinstall the cowl plenum cover/grille panel onto the cowl plenum. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

(7) Reinstall the wiper arms onto the wiper pivots. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

(8) Reconnect the battery negative cable.

WIPER RELAY

DESCRIPTION

The wiper relay (or intermittent wipe relay) is located in the Power Distribution Center (PDC) near the battery in the engine compartment. See the fuse and relay layout label affixed to the inside surface of the PDC cover for wiper relay identification and location. The wiper relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The relay is contained

within a small, rectangular, molded plastic housing. The relay is connected to all of the required inputs and outputs through its PDC receptacle by five male spade-type terminals that extend from the bottom of the relay base. The ISO designation for each terminal is molded into the base adjacent to the terminal. The ISO terminal designations are as follows:

- **30 (Common Feed)** - This terminal is connected to the movable contact point of the relay.
- **85 (Coil Ground)** - This terminal is connected to the ground feed side of the relay control coil.
- **86 (Coil Battery)** - This terminal is connected to the battery feed side of the relay control coil.
- **87 (Normally Open)** - This terminal is connected to the normally open fixed contact point of the relay.
- **87A (Normally Closed)** - This terminal is connected to the normally closed fixed contact point of the relay.

The wiper relay cannot be adjusted or repaired. If the relay is damaged or faulty, it must be replaced.

OPERATION

The wiper relay (or intermittent wipe relay) is an electromechanical switch that uses a low current input from the Central Timer Module (CTM) to control a high current output to the low speed brush of the wiper motor. The movable common feed contact point is held against the fixed normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact point away from the fixed normally closed contact point, and holds it against the fixed normally open contact point. When the relay coil is de-energized, spring pressure returns the movable contact point back against the fixed normally closed contact point. A resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The wiper relay terminals are connected to the vehicle electrical system through a connector receptacle in the Power Distribution Center (PDC). The inputs and outputs of the wiper relay include:

- The common feed terminal (30) is connected to the wiper motor low speed brush through the wiper control circuitry of the multi-function switch on the steering column. When the wiper relay is de-energized, the common feed terminal is connected to the wiper park switch output through the wiper park switch sense circuit. The wiper park switch output may be battery current (wipers are not parked), or ground (wipers are parked). When the wiper relay is energized, the common feed terminal of the wiper is

WIPER RELAY (Continued)

connected to battery current from a fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit.

- The coil ground terminal (85) is connected to the relay control output of the CTM through the wiper motor relay control circuit. The CTM controls the ground path for this circuit internally to energize or de-energize the wiper relay based upon its programming and inputs from the wiper and washer control circuitry of the multi-function switch and from the wiper motor park switch.

- The coil battery terminal (86) is connected to battery current from a fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit whenever the ignition switch is in the On or Accessory positions.

- The normally open terminal (87) is connected to battery current from a fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit whenever the wiper relay control coil is energized by the CTM. This circuit provides fused ignition switch output (run-acc) current to the wiper motor low speed brush only when the wiper relay control coil is energized.

- The normally closed terminal (87A) is connected to the output of the wiper motor park switch through the wiper motor park switch sense circuit. This circuit provides battery current (wipers are not parked) or ground (wipers are parked) to the wiper motor low speed brush whenever the wiper relay control coil is de-energized and the Off position of the wiper control of the multi-function switch is selected.

The wiper relay can be diagnosed using conventional diagnostic tools and methods.

DIAGNOSIS AND TESTING - WIPER RELAY

The wiper relay (or intermittent wiper relay) (Fig. 10) is located in the Power Distribution Center (PDC) in the engine compartment. See the fuse and relay layout label affixed to the inside surface of the PDC cover for wiper relay identification and location. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Remove the wiper relay from the PDC. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER RELAY - REMOVAL).

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, test the relay input and output circuits. Refer to RELAY CIRCUIT TEST. If not OK, replace the faulty relay.

Fig. 10 Wiper Relay

- 30 - COMMON FEED
- 85 - COIL GROUND
- 86 - COIL BATTERY
- 87 - NORMALLY OPEN
- 87A - NORMALLY CLOSED

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to the multi-function switch. There should be continuity between the receptacle for terminal 30 of the wiper relay in the PDC and both driver low speed wiper motor driver circuit cavities of the instrument panel wire harness connector for the multi-function switch at all times. If OK, go to Step 2. If not OK, repair the open driver low speed wiper motor driver circuit(s) between the PDC and the multi-function switch as required.

(2) The relay normally closed terminal (87A) is connected to the wiper motor park switch through the wiper motor park switch sense circuit. There should be continuity between the receptacle for terminal 87A of the wiper relay in the PDC and the wiper motor park switch sense circuit cavity of the headlamp and dash wire harness connector for the wiper motor at all times. If OK, go to Step 3. If not OK, repair the open wiper motor park switch sense circuit between the PDC and the wiper motor as required.

(3) The relay normally open terminal (87) is connected to a fused ignition switch output (run-acc) fuse in the Junction Block (JB) through a fused ignition switch output (run-acc) circuit. There should be battery voltage at the receptacle for terminal 87 of

WIPER RELAY (Continued)

the wiper relay in the PDC whenever the ignition switch is in the On or Accessory positions. If OK, go to Step 4. If not OK, repair the open fused ignition switch output (run-acc) circuit between the PDC and the JB as required.

(4) The coil battery terminal (86) is connected to a fused ignition switch output (run-acc) fuse in the JB through a fused ignition switch output (run-acc) circuit. There should be battery voltage at the receptacle for terminal 86 of the wiper relay in the PDC whenever the ignition switch is in the On or Accessory positions. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run-acc) circuit between the PDC and the JB as required.

(5) The coil ground terminal (85) is connected to the output of the Central Timer Module (CTM) through the wiper motor relay control circuit. There should be continuity between the receptacle for terminal 85 of the wiper relay in the PDC and the wiper motor relay control circuit cavity of the instrument panel wire harness connector (Connector C1) for the CTM at all times. If not OK, repair the open wiper motor relay control circuit between the PDC and the CTM as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 11).

(3) See the fuse and relay layout label affixed to the underside of the PDC cover for wiper relay identification and location.

(4) Remove the wiper relay by grasping it firmly and pulling it straight out from the receptacle in the PDC.

Fig. 11 Power Distribution Center

1 - COVER

2 - POWER DISTRIBUTION CENTER

INSTALLATION

(1) See the fuse and relay layout label affixed to the underside of the PDC cover for the proper wiper relay location (Fig. 11).

(2) Position the wiper relay in the proper receptacle in the PDC.

(3) Align the wiper relay terminals with the terminal cavities in the PDC receptacle.

(4) Push firmly and evenly on the top of the wiper relay until the terminals are fully seated in the terminal cavities in the PDC receptacle.

(5) Reinstall the cover onto the PDC.

WIRING DIAGRAM
INFORMATION

DESCRIPTION

DESCRIPTION - HOW TO USE WIRING
DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicle wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

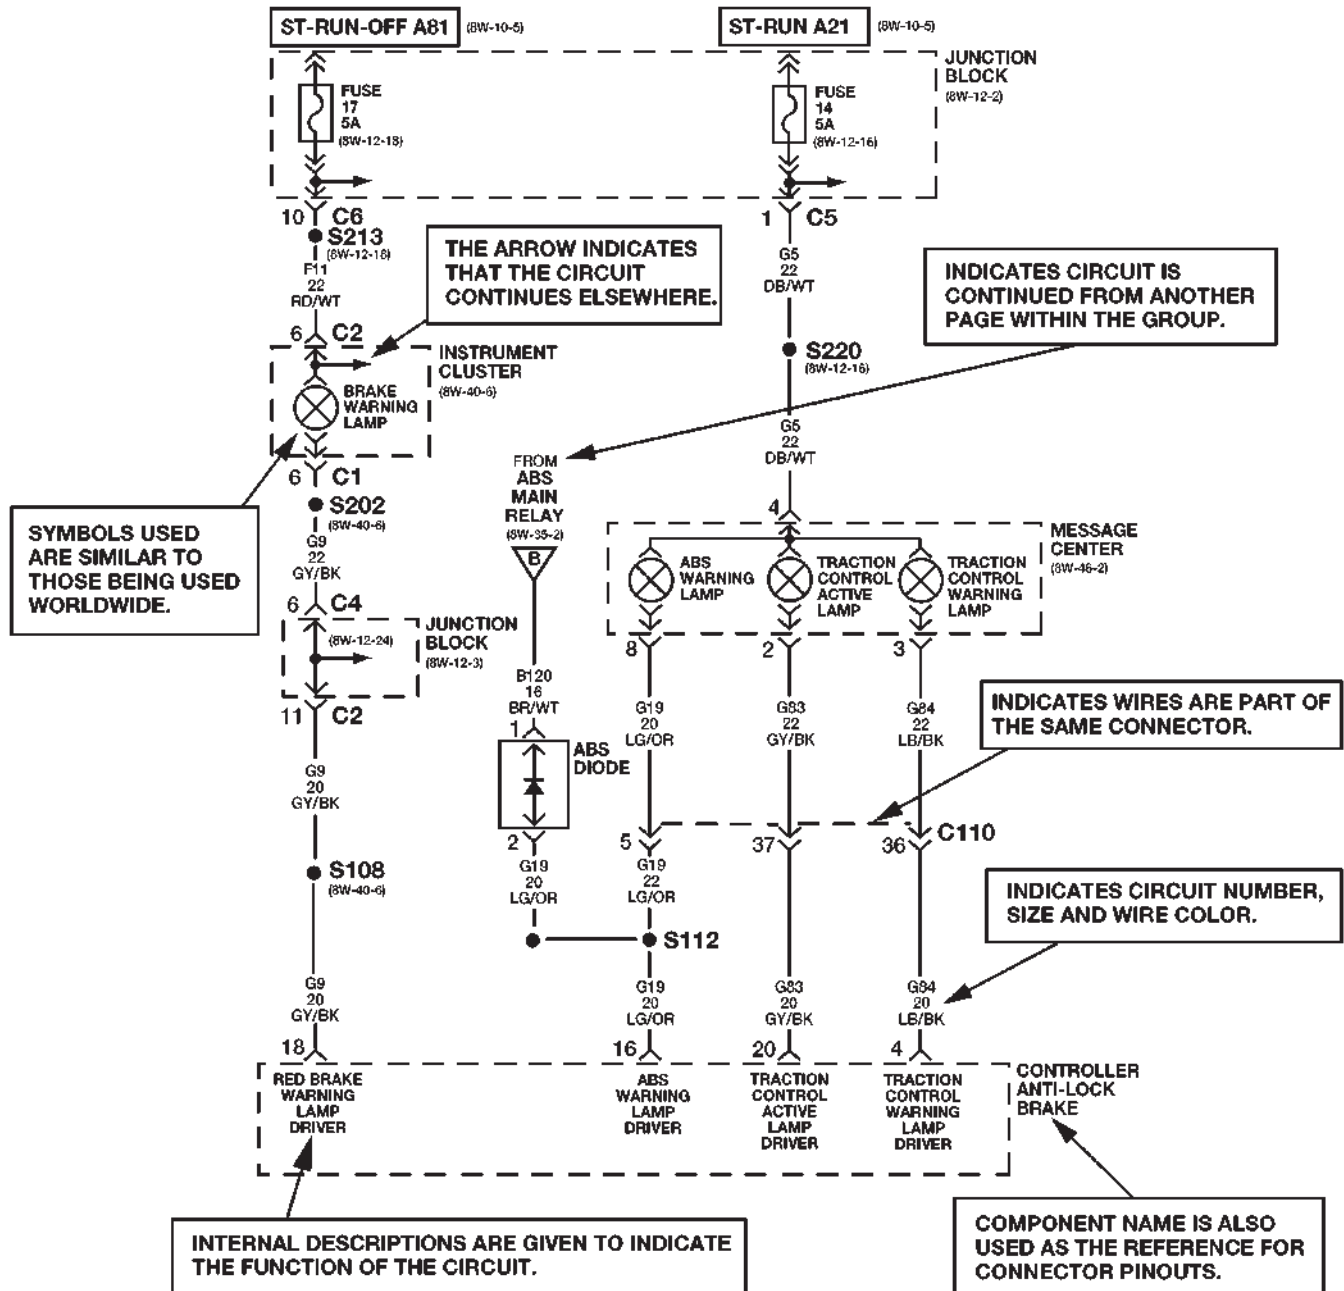

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

WIRING DIAGRAM INFORMATION (Continued)

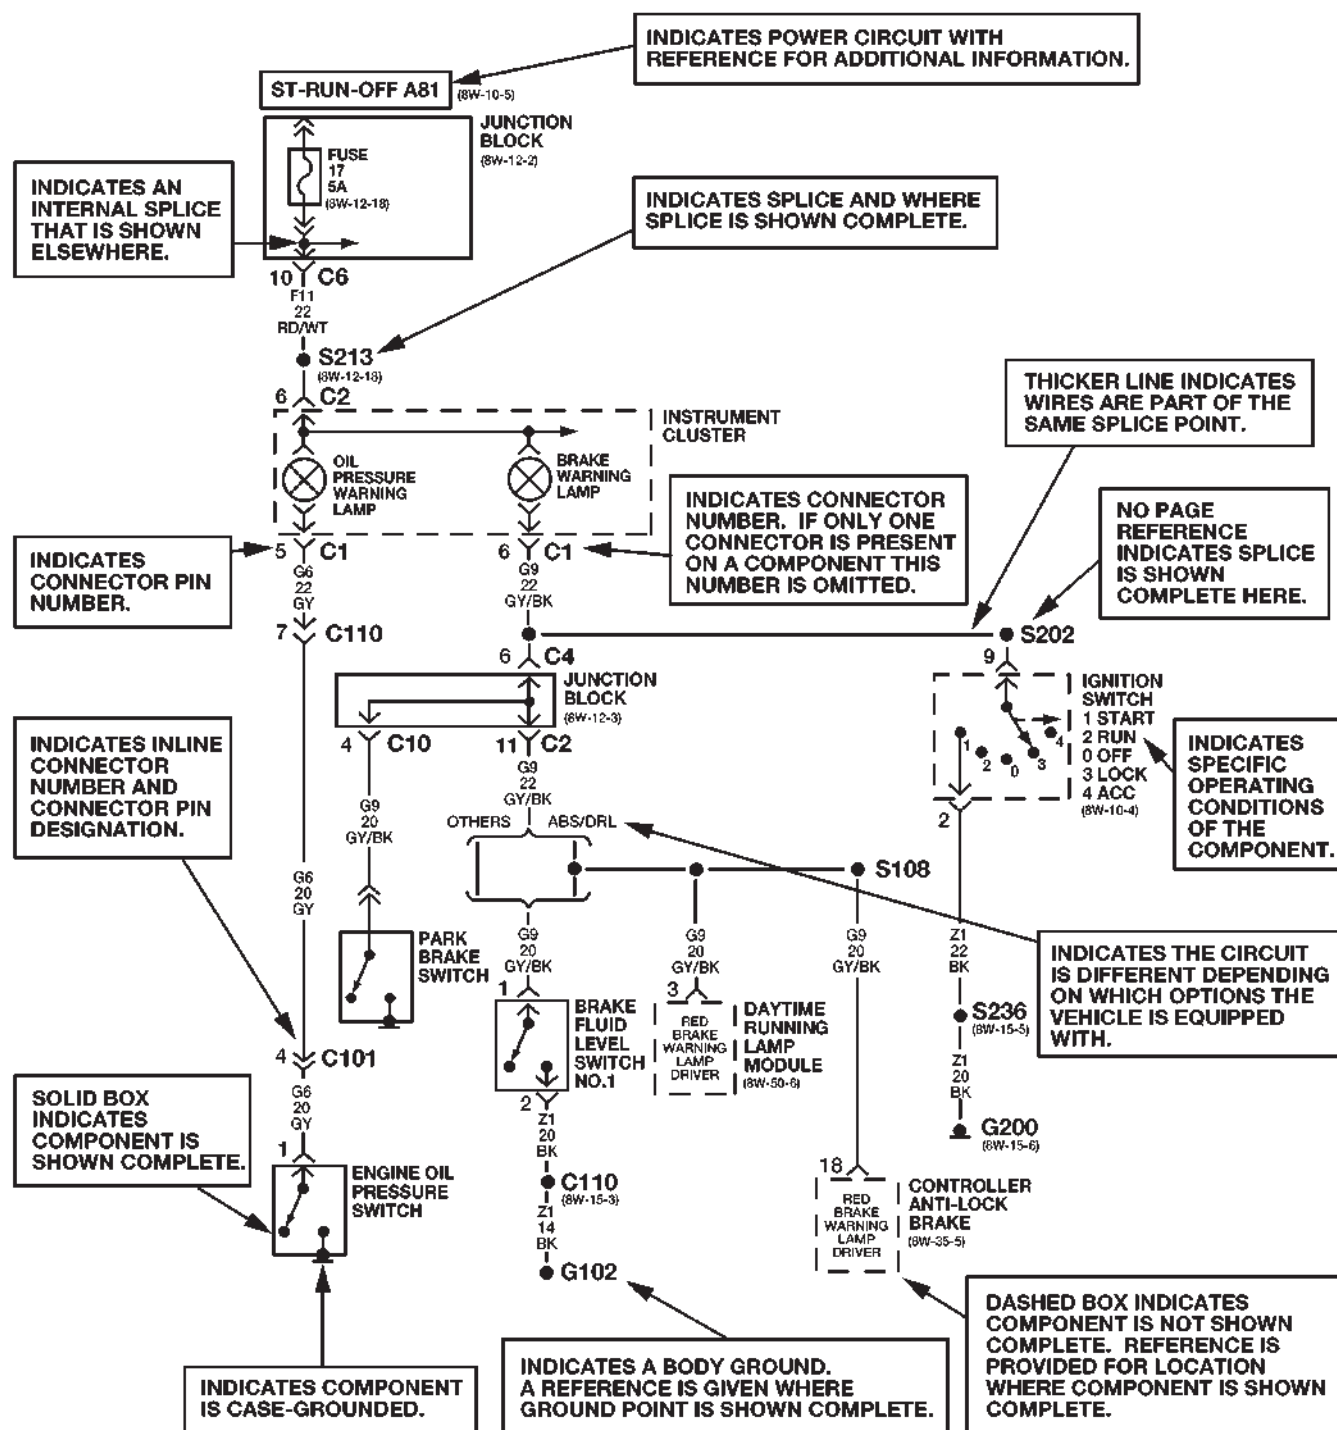

DIAGRAMS ARE ARRANGED WITH THE POWER B+ SIDE OF THE CIRCUIT NEAR THE TOP OF THE PAGE, AND THE GROUND SIDE OF THE CIRCUIT NEAR THE BOTTOM OF THE PAGE.

The System shown here is an **EXAMPLE ONLY**. It does not represent the actual circuit shown in the **WIRING DIAGRAM SECTION**.

Fig. 1 WIRING DIAGRAM EXAMPLE 1

WIRING DIAGRAM INFORMATION (Continued)

The System shown here is an EXAMPLE ONLY. It does not represent the actual circuit shown in the WIRING DIAGRAM SECTION.

Fig. 2 WIRING DIAGRAM EXAMPLE 2

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

This is a list of terms and definitions used in the wiring diagrams.

DESCRIPTION - CIRCUIT INFORMATION

Each wire shown in the diagrams contains a code which identifies the main circuit, part of the main circuit, gage of wire, and color (Fig. 4).

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW
*	WITH TRACER

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT	FUNCTION

- 3 - PART OF MAIN CIRCUIT (VARIES DEPENDING ON EQUIPMENT)
- 4 - MAIN CIRCUIT IDENTIFICATION

DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

8W-80	Connector Pin Outs
8W-91	Connector, Ground and Splice Locations

DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION

CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

IDENTIFICATION

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers
- In-line connectors located in the Instrument Panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a "G" and follow the same series numbering as the in-line connectors.
- Splices are identified with an "S" and follow the same series numbering as the in-line connectors.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

LOCATIONS

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

WIRING DIAGRAM INFORMATION (Continued)

WARNINGS - GENERAL

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING:: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND AVOID LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS**TROUBLESHOOTING TOOLS**

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- **Jumper Wire** - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- **Voltmeter** - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

- **Ohmmeter** - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

- **Probing Tools** - These tools are used for probing terminals in connectors (Fig. 5). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

948W-233

Fig. 5 PROBING TOOL

- 1 - SPECIAL TOOL 6801
2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

- Connectors are fully seated
- Spread terminals, or terminal push out

WIRING DIAGRAM INFORMATION (Continued)

- Terminals in the wiring assembly are fully seated into the connector/component and locked into position

- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem

- Damaged connector/component casing exposing the item to dirt or moisture

- Wire insulation that has rubbed through causing a short to ground

- Some or all of the wiring strands broken inside of the insulation

- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

- (1) Verify the problem.

- (2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.

- (3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.

- (4) Isolate the problem area.

- (5) Repair the problem area.

- (6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE**STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES**

All ESD sensitive components are solid state and a symbol (Fig. 6) is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

- (1) Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.

- (2) Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.

- (3) When using a voltmeter, be sure to connect the ground lead first.

- (4) Do not remove the part from it's protective packing until it is time to install the part.

- (5) Before removing the part from it's package, ground the package to a known good ground on the vehicle.

80ce3cd47

Fig. 6 ELECTROSTATIC DISCHARGE SYMBOL
STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL

- (1) Connect the ground lead of a voltmeter to a known good ground (Fig. 7).

- (2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

948W-194

Fig. 7 TESTING FOR VOLTAGE POTENTIAL

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING FOR CONTINUITY

- (1) Remove the fuse for the circuit being checked or, disconnect the battery.
- (2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 8).
- (3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

948W-195

Fig. 8 TESTING FOR CONTINUITY

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

- (1) Remove the fuse and disconnect all items involved with the fuse.
- (2) Connect a test light or a voltmeter across the terminals of the fuse.
- (3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.
- (4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

- (1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.
- (2) Replace the blown fuse.

- (3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.
- (4) Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

- (1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 9).
- (2) Connect the other lead of the voltmeter to the other side of the switch, component or circuit.
- (3) Operate the item.
- (4) The voltmeter will show the difference in voltage between the two points.

948W-196

TERMINAL REMOVING TOOLS 6932 AND 8638**TERMINAL REMOVING TOOL 6934****CONNECTOR****REMOVAL**

- (1) Disconnect battery.
- (2) Release Connector Lock (Fig. 10).
- (3) Disconnect the connector being repaired from its mating half/component.
- (4) Remove the dress cover (if applicable) (Fig. 10).

**Fig. 10 REMOVAL OF DRESS COVER**

- 1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR

- (5) Release the Secondary Terminal Lock, if required (Fig. 11).

- (6) Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector (Fig. 12).

INSTALLATION

- (1) Insert the removed terminal in the same cavity on the repair connector.

- (2) Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.

- (3) When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.

- (4) Replace dress cover (if applicable).

- (5) Connect connector to its mating half/component.

- (6) Connect battery and test all affected systems.

DIODE

REMOVAL

- (1) Disconnect the battery.
- (2) Locate the diode in the harness, and remove the protective covering.
- (3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 13).

948W-197

Fig. 13 DIODE IDENTIFICATION

- 1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

- (1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.
- (2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 13).
- (3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**
- (4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.
- (5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

- (1) Follow steps for removing terminals described in the connector removal section.
- (2) Cut the wire 6 inches from the back of the connector.

INSTALLATION

- (1) Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.
- (2) Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
- (3) Splice the repair wire to the wire harness (see wire splicing procedure).
- (4) Insert the repaired wire into the connector.
- (5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
- (6) Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
- (7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

- (1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.
- (2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.
- (3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 14).

80c4f3f1

Fig. 14 SPLICE BAND

- 1 - SPLICE BAND

- (4) Using crimping tool, Mopar p/n 05019912AA, crimp the splice clip and wires together (Fig. 15).
- (5) Solder the connection together using rosin core type solder only (Fig. 16).

WIRE (Continued)
